In API version 46.0 and later, this object supports custom fields, validation rules, and Apex triggers. Deleting a schedule now also invokes delete triggers. If customizable product schedules are enabled, you can use custom fields in default schedules and customize their layout. But if you’ve applied validation rules or Apex triggers, they’re bypassed when they’re first inserted.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

<td>Required. The date the associated OpportunityLineItem is to be scheduled for an event: delivery, shipping, or any other date you wish to track.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>picklist</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Restricted picklist, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The type of the schedule. Required when inserting an OpportunityLineItemSchedule. Valid values include Quantity, Revenue, or Both.</td>
</tr>
</tbody>
</table>

### Allowed Type Field Values

The allowed Type values for an OpportunityLineItemSchedule depend on the product-level schedule preferences and whether the line item has any existing schedules. The following criteria must be met:

- The Product2 on which the OpportunityLineItem is based must have the appropriate CanUseRevenueSchedule or CanUseQuantitySchedule fields (or both) set to true.
- When you create a schedule for a line item that does not have any existing schedules, you can specify any valid value.
- If you create a schedule for a line item that already has existing schedules, the new schedule must be consistent with the existing schedules. The following matrix outlines the allowable values:
### Allowed Quantity and Revenue Field Values

The allowable Quantity and Revenue field values depend on the value of the Type field:

<table>
<thead>
<tr>
<th>Type Value</th>
<th>Allowable Quantity Value</th>
<th>Allowable Revenue Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revenue</td>
<td>Null</td>
<td>Non-null</td>
</tr>
<tr>
<td>Quantity</td>
<td>Non-null</td>
<td>Null</td>
</tr>
<tr>
<td>both</td>
<td>Non-null</td>
<td>Non-null</td>
</tr>
</tbody>
</table>

The Quantity and Revenue fields have the following restrictions when this object is updated:

- For a schedule of Type Quantity, you can’t update a null Revenue value to non-null. Likewise for a schedule of Type Revenue, you can’t update a null Quantity value to non-null.
- You can’t null out the Quantity field for a schedule of Type Quantity. Likewise you can’t null out the Revenue field for a schedule of Type Revenue.
- You can’t null out either the Revenue or Quantity fields for a schedule of type Both.

### Usage

OpportunityLineItemSchedule supports two types of schedules:

- Quantity schedules
- Revenue schedules

The user must have edit access rights on the Opportunity in order to create or update line item schedules on that opportunity.

### Products and Schedules Must Be Enabled

The OpportunityLineItemSchedule object is defined only for those organizations that have the products and schedules features enabled. If the organization does not have the products and schedules features, the OpportunityLineItemSchedule object is not returned in a describe, and you can’t describe or query OpportunityLineItemSchedule records.

### Effects on Opportunities and Opportunity Line Items

OpportunityLineItemSchedule records affect opportunities and opportunity line items in the following ways:
• Inserting an OpportunityLineItemSchedule of Type “Revenue” or “Quantity” increments the TotalPrice field on the OpportunityLineItem by the OpportunityLineItemSchedule Revenue amount. Inserting an OpportunityLineItemSchedule of Type Quantity or Both increments the Quantity field on the OpportunityLineItem by the OpportunityLineItemSchedule Quantity amount.

• Creating an OpportunityLineItemSchedule record affects the original opportunity:
  1. The Opportunity Amount is incremented by OpportunityLineItemSchedule revenue amount.
  2. The Opportunity ExpectedRevenue is incremented by the line item schedule amount multiplied by the Opportunity Probability.

• Deleting an OpportunityLineItemSchedule has a similar effect on the related OpportunityLineItem and Opportunity. Deleting an OpportunityLineItemSchedule decrements the OpportunityLineItem TotalPrice by the deleted OpportunityLineItemSchedule Quantity or Revenue amount. The Opportunity Amount is also decremented by the OpportunityLineItemSchedule Quantity or Revenue amount, and the Opportunity ExpectedRevenue is reduced by OpportunityLineItemSchedule Quantity or Revenue amount multiplied by the Opportunity Probability.

Deleting an Opportunity Line Item Schedule
Deleting the last remaining schedule will set the corresponding HasQuantitySchedule or HasRevenueSchedule flags (or both) to false on the parent line item.

  delete()

OpportunityOwnerSharingRule

Represents a rule for sharing an opportunity with users other than the owner.

Note: To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The SharingRules Metadata API type is enabled for all orgs.

Supported Calls
create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Field | Details |
---|---|
**Properties** | Create, Filter, Group, Restricted picklist, Sort, Update |
**Description** | A value that represents the type of sharing being allowed. The possible values are:  
- Read  
- Edit |
UserOrGroupId | **Type**  
reference |
**Properties** | Create, Filter, Group, Sort |
**Description** | The ID representing the target user or group. The target user or group is being given access. |

**Usage**

Use this object to manage the sharing rules for opportunities. General sharing and Territory-related sharing use this object.

金融服务:  
The original territory management feature is now unavailable. For more information, see [The Original Territory Management Module Will Be Retired in the Summer ’21 Release](#). The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

**SEE ALSO:**  
Case  
[Metadata API Developer Guide: SharingRules](#)  

**OpportunityPartner**

This object represents a partner relationship between an Account and an Opportunity. An OpportunityPartner record is created automatically when a Partner record is created for a partner relationship between an account and an opportunity.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), query(), retrieve()  

**Special Access Rules**

Customer Portal users can’t access this object.

### Creating an Account-Opportunity Partner Relationship

When you create a partner relationship between an account and an opportunity (when you create a Partner record and specify the OpportunityId field), the API automatically creates an OpportunityPartner record with the corresponding values:

- The value of the Partner field `AccountToId` maps to the value of the OpportunityPartner field `AccountToId`.
- The values of the `OpportunityId`, `Role`, and `IsPrimary` fields in both records are the same.
- If you set the `IsPrimary` value to 1 (true) upon insert of a new OpportunityPartner, the `IsPrimary` value is automatically set to 0 (false) for any existing primary partners for that opportunity.

This mapping allows the API to manage the records and their relationships efficiently.

**SEE ALSO:**
- Partner
- AccountPartner

---

### OpportunityShare

Represents a sharing entry on an Opportunity.

**Supported Calls**

describeSObjects(), create(), delete(), query(), retrieve(), update(), upsert()

**Special Access Rules**

As of Summer '20 and later, only users with access to the Opportunity object can access this object.
## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| RowCause              | **Type** picklist |

2320
**Properties**
Create, Filter, Group, Nillable, Restricted picklist, Sort

**Description**
Reason that this sharing entry exists. You can write to this field when its value is either omitted or set to Manual (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.

Valid values include:
- **Owner**—The User is the owner of the opportunity.
- **Manual**—The User or Group has access because a user with "All" access manually shared the opportunity with the user or group.
- **Rule**—The User or Group has access via an opportunity sharing rule.
- **GuestRule**—The User or Group has access via an opportunity guest user sharing rule.
- **ImplicitChild**—The User or Group has access to the opportunity on the account associated with this opportunity.
- **LpuImplicit**—The User has access to records owned by high-volume Experience Cloud site users via a share group.
- **ARImplicit**—The User, who belongs to a partner or customer account, has access to the opportunity via an account relationship data sharing rule.
- **Sales Team**—The User has access to the opportunity because the user is on the opportunity sales team for the opportunity. The OpportunityTeamMember object sets the access level. See OpportunityTeamMember for more information.
- **Territory**—The forecast manager has access because they are assigned to a territory above the territory that is assigned the opportunity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Nillable, Restricted picklist, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Reason that this sharing entry exists. You can write to this field when its value is either omitted or set to Manual (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings. Valid values include: Owner—The User is the owner of the opportunity. Manual—The User or Group has access because a user with &quot;All&quot; access manually shared the opportunity with the user or group. Rule—The User or Group has access via an opportunity sharing rule. GuestRule—The User or Group has access via an opportunity guest user sharing rule. ImplicitChild—The User or Group has access to the opportunity on the account associated with this opportunity. LpuImplicit—The User has access to records owned by high-volume Experience Cloud site users via a share group. ARImplicit—The User, who belongs to a partner or customer account, has access to the opportunity via an account relationship data sharing rule. Sales Team—The User has access to the opportunity because the user is on the opportunity sales team for the opportunity. The OpportunityTeamMember object sets the access level. See OpportunityTeamMember for more information. Territory—The forecast manager has access because they are assigned to a territory above the territory that is assigned the opportunity.</td>
</tr>
</tbody>
</table>
Usage

This object allows you to determine which users and groups can view or edit opportunities owned by other users.

If you attempt to create a record that matches an existing record, any modified fields are updated, the system returns the existing record.

If an opportunity is shared in multiple ways with a user, you don't always see multiple sharing records. If a user has access to an opportunity for one or more of the following RowCause values, the records in the OpportunityShare object are compressed into one record with the highest level of access.

- Manual
- Owner

|                  | **Description** Split percentage that this team member will receive. If the split type is validated to a 100% total, this number can range from 0 to 100. If the total isn’t validated, this number can range from 0 to 1,000. Label is Split (%). |
| SplitTypeId      | **Type** reference                                                       |
|                  | **Properties** Create, Filter, Group, Sort                               |
|                  | **Description** Auto-generated, numeric ID for the split type defined by the OpportunitySplitType object. This field is available in API version 28 and later. |
If this field is blank, the system automatically specifies the default split type for the opportunity amount, which is validated to 100%.

**Usage**

Use the OpportunitySplit object to manage splits for an opportunity.

If you change the opportunity owner using the API, the old owner remains on the opportunity team with either Read-only access, or the level of access specified in your organization-wide defaults.

**Associated Objects**

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

*OpportunitySplitChangeEvent (API version 48.0)*

Change events are available for the object.

**OpportunitySplitType**

OpportunitySplitType provides unique labels and behavior for each split type. This object is available in API version 28.0 and later.

There are two default split types: revenue splits, which must total 100%, and overlay splits, which can total any percentage.

**Supported Calls**

`describeSObjects(), query(), retrieve(), update()`

</table>
| IsActive    | **Type**
               boolean

**Properties**
Defaulted on create, Filter, Group, Sort

**Description**
Indicates whether this opportunity stage value is active (true) or not (false). Inactive opportunity stage values are not available in the picklist and are retained for historical purposes only.

| IsClosed    | **Type**
               boolean

**Properties**
Defaulted on create, Filter, Group, Sort

**Description**
Indicates whether this opportunity stage value represents a closed opportunity (true) or not (false). Multiple opportunity stage values can represent a closed opportunity. Label is **Closed**.

| IsWon       | **Type**
               boolean

**Properties**
Defaulted on create, Filter, Group, Sort

**Description**
Indicates whether this opportunity stage value represents a won opportunity (true) or not (false). Multiple opportunity stage values can represent a won opportunity. Label is **Won**.

| MasterLabel | **Type**
               string

**Properties**
Filter, Group, Nillable, Sort

**Description**
Master label for this opportunity stage value. This display value is the internal label that does not get translated. Limit: 255 characters.

| SortOrder   | **Type**
               int

**Properties**
Filter, Group, Nillable, Sort

**Description**
Number used to sort this value in the opportunity stage picklist. These numbers are not guaranteed to be sequential, as some previous opportunity stage values might have been deleted.
Usage

This object represents a value in the opportunity stage picklist, which provides additional information about the stage of an Opportunity, such as its probability or forecast category. Query this object to retrieve the set of values in the opportunity stage picklist, and then use that information while processing Opportunity records to determine more information about a given opportunity. For example, the application could test whether a given opportunity is won or not based on its StageName value and the value of the IsWon property in the associated OpportunityStage object.

This object is read-only via the API.

SEE ALSO:
Object Basics

OpportunityTag

Associates a word or short phrase with an Opportunity.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ItemId</td>
<td><strong>Type</strong> reference&lt;br&gt;&lt;br&gt;<strong>Properties</strong> Create, Filter&lt;br&gt;&lt;br&gt;<strong>Description</strong> ID of the tagged item.</td>
</tr>
<tr>
<td>Name</td>
<td><strong>Type</strong> string&lt;br&gt;&lt;br&gt;<strong>Properties</strong> Create, Filter&lt;br&gt;&lt;br&gt;<strong>Description</strong> Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</td>
</tr>
<tr>
<td>TagDefinitionId</td>
<td><strong>Type</strong> reference&lt;br&gt;&lt;br&gt;<strong>Properties</strong> Filter</td>
</tr>
</tbody>
</table>
Usage
OpportunityTag stores the relationship between its parent TagDefinition and the Opportunity being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

OpportunityTeamMember

Represents a User on the opportunity team of an Opportunity.

See also UserTeamMember, which represents a User who is on the default opportunity team of another user.

Supported Calls
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Fields

<table>

</tr>
<tr>
<td><strong>Description</strong></td>
<td>Available only for orgs with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the org.</td>
</tr>
</tbody>
</table>
| **IsDeleted**         | **Type** boolean  
**Properties** Defaulted on create, Filter  
**Description** Indicates whether the object has been moved to the Recycle Bin (true) or not (false). Label is Deleted.  
**Note:** An OpportunityTeamMember record that is deleted is not moved to the Recycle Bin and cannot be undeleted, unless the record was cascade-deleted when deleting a related Opportunity. For directly deleted OpportunityTeamMember records, don’t use the isDeleted field to detect deleted records in SOQL queries or queryAll() calls. Instead, use getDeleted(). |
| **Name**              | **Type** string  
**Properties** Filter, Nillable, Sort  
**Description** The team member name. This read-only field is available in API version 30.0 and later. |
| **OpportunityAccessLevel** | **Type** picklist  
**Properties** Filter, Nillable, Restricted picklist  
**Description** Opportunity access level for this team member. Valid values:  
- Read  
- Edit  
This field is supported in triggers, but not in workflows or validation rules. It is editable in API version 36.0 and later. |
| **OpportunityId**     | **Type** reference  
**Properties** Create, Filter  
**Description** Required. ID of the Opportunity associated with this opportunity team. This field can’t be updated. |

|                  | **Description**
|                  | Read only. Retrieves the user’s title. This field is available in API version 36.0 and later.                                           |
| UserId           | **Type**
|                  | reference                                                                                                                               |
|                  | **Properties**
|                  | Create, Filter                                                                                                                           |
|                  | **Description**
|                  | Required. ID of the User who is a member of the opportunity team. This field can’t be updated.                                            |

**Usage**

If you create a record for this object and it matches an existing record, the system updates any modified fields and returns the existing record.

In the user interface, users can set up an opportunity team for the opportunities they own. The opportunity team includes other users that are working on the opportunity with them. This object is available only in organizations that have enabled team selling.

**Note:** The behavior for changing ownership of opportunities is different using the user interface when the previous owner is on an opportunity team. For example, when you change the owner of an opportunity using the API, the previous owner’s access becomes Read Only or the access specified in your organization-wide default for opportunities, whichever is greater. However,
performing this same action in the user interface allows you to select the access level for the previous owner when the previous owner is on an opportunity team.

**Description** Date at which the order ends. Label is **Order End Date**. |
### GrandTotalAmount

**Type**
currency

**Properties**
Filter, Nillable, Sort

**Description**
Sum of OrderTotalAmount and OrderTotalTaxAmount.
To access Commerce Orders fields, your org must have a Salesforce Order Management license or a B2B Commerce on Lightning Experience License.
This field is available in API v48.0 and later.

### IsReductionOrder

**Type**
boolean

**Properties**
Create, Defaulted on create, Filter, Group, Sort

**Description**
Read-only. Determines whether an order is a reduction order. Label is Reduction Order.

### LastReferencedDate

**Type**
dateTime

**Properties**
Filter, Nillable, Sort

**Description**
The timestamp when the current user last accessed this record, a record related to this record, or a list view.

### LastViewedDate

**Type**
dateTime

**Properties**
Filter, Nillable, Sort

**Description**
The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (LastReferencedDate) but not viewed it.

### Name

**Type**
string

**Properties**
Create, Filter, Group, Nillable, Sort, Update

**Description**
Name for this order.

### Field Name: Details

- **Description**
  Roll up of all tax on the order. Includes delivery taxes, price adjustment taxes, and product taxes.

  To access Commerce Orders fields, your org must have a Salesforce Order Management license or a B2B Commerce on Lightning Experience License.

  This field is available in API v48.0 and later.

- **Type**
  picklist

- **Properties**
  Create, Filter, Group, Nillable, Sort, Update

- **Description**
  If you want to show more information about your order, you can add custom values to the **Type** picklist. By default, the **Type** field doesn't perform any actions or show any values.

### Usage

The **Status** field specifies the current state of an order. Status strings represent its current state (**Draft** or **Activated**).

When a client application creates an order, the **Status Code** must be **Draft** and the **Status** must be any value that corresponds to a **Status Code** of **Draft**. The application can then activate an order by updating it and setting the value in its **Status** field to an **Activated** state; however, the **Status** field is the only field you can update when activating the order.

After an order is activated, your client application can change the **Status** back to the **Draft** state—but only if the order doesn’t have any child reduction order products. Your client application can delete orders when the **Status** is **Draft**, but not when its **Status** is **Activated**.

Client applications can use the API to create, update, delete, and query any Attachment associated with an order.

### Orders Without Price Books

If your organization manages products and Price books in an external platform, you can use Salesforce API to create orders and order items without values for their Price book and Price book entry fields. This feature is available only for Salesforce orgs with the B2B Commerce, B2B Commerce Starter, B2B Commerce Growth, or B2B Commerce Plus packages. Admins enable orders without Price books by going to Salesforce Order Settings and selecting the Optional Price Book setting.

In a standard order, Salesforce prompts the sales rep to select a Price book when they add the first order product to the order. The sales rep can then add order products that have price book entries in the selected price book. In an order without a Price book, Salesforce hides the order’s Add Products button and Edit Products button so that sales reps must manage their products and price books using their external system.

You can create orders without Price books only by creating an order with Salesforce API and leaving the **Pricebook2Id** field null. Orders without Price books follow several different guidelines compared to standard orders.

- Orders without price books don’t support reduction orders or change orders.
- Order products without price book entries require list prices.
Orders without price books support only order items without price book entries. Orders with price books support only order items with price book entries.

**Important:** Orders without Price books are supported with B2B licenses only. Salesforce Order Management requires price books for orders and price book entries for order products.

**Associated Objects**

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**OrderChangeEvent (API version 44.0)**
Change events are available for the object.

**OrderFeed (API version 29.0)**
Feed tracking is available for the object.

**OrderHistory**
History is available for tracked fields of the object.

**OrderOwnerSharingRule**
Sharing rules are available for the object.

</table>
OrderAdjustmentGroupSummary

Represents the current properties and state of a group of related price adjustments. Associated with a set of OrderItemAdjustmentLineSummaries that apply to OrderItemSummaries belonging to one OrderSummary. Corresponds to one or more order adjustment group objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

An OrderAdjustmentGroupSummary can represent an adjustment to an entire order as a group of adjustments to each of its products. For example, representing “10% off the order” as a set of 10% off adjustments to each product on the order. It can also represent an adjustment that applies to a subset of the products on an order. For example, representing “buy one, get one 50% off” as a 25% off adjustment to each of two products.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

This object is only available in Salesforce Order Management orgs or if the B2B Commerce on Lightning Experience license is enabled.

### OrderDeliveryGroup

A group of order items that share a delivery method and address. The delivery method and address are used during the fulfillment process, such as shipping as a gift, downloading, picking up in store, or shipping to a standard address. This object is available in API version 48.0 and later.

#### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

#### Special Access Rules

To access Commerce Orders entities, your org must have a Salesforce Order Management license. Commerce Orders entities are available only in Lightning Experience.

**OrderDeliveryGroupSummary**

Represents the current properties and state of a group of OrderItemSummaries, belonging to one OrderSummary, to be fulfilled using the same delivery method and delivered to the same address. A single shipment can include them all, but that isn’t guaranteed. Corresponds to one or more order delivery group objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.
Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

This object is only available in Salesforce Order Management orgs or if the B2B Commerce on Lightning Experience license is enabled.

### TotalLineAmtWithTax

**Type**
currency

**Properties**
Filter, Nillable, Sort

**Description**
Total of the delivery charges associated with the OrderDeliveryGroupSummary, inclusive of tax. This amount is equal to TotalLineAmount + TotalLineTaxAmount.

This field is available in API version 49.0 and later.

---

### TotalLineTaxAmount

**Type**
currency

**Properties**
Filter, Nillable, Sort

**Description**
Tax on the TotalLineAmount.

---

### TotalTaxAmount

**Type**
currency

**Properties**
Filter, Nillable, Sort

**Description**
Tax on the TotalAmount.

---

- OrderItemSummary

### OrderDeliveryMethod

Shows the customizations and options that a buyer selected for their delivery method. This object is available in API version 48.0 and later.

**Supported Calls**
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

**Special Access Rules**
To access Commerce Orders entities, your org must have a Salesforce Order Management license. Commerce Orders entities are available only in Lightning Experience.

</table>

### OrderHistory

OrderHistory represents historical information about changes that have been made to the standard fields of the associated order, or to any custom fields with history tracking enabled.
### Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See [Enable delete of Field History and Field History Archive](#).

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DataType</strong></td>
<td>Type: picklist  &lt;br&gt;Properties: Filter, Group, Nillable, Restricted picklist, Sort  &lt;br&gt;Description: Data type of the field that was changed.</td>
</tr>
<tr>
<td><strong>Field</strong></td>
<td>Type: picklist  &lt;br&gt;Properties: Filter, Group, Restricted picklist, Sort  &lt;br&gt;Description: Name of the order field that was modified, or a special value to indicate some other modification to the order.</td>
</tr>
<tr>
<td><strong>NewValue</strong></td>
<td>Type: anyType  &lt;br&gt;Properties: Nillable, Sort  &lt;br&gt;Description: New value of the modified order field. Maximum of 255 characters.</td>
</tr>
<tr>
<td><strong>OldValue</strong></td>
<td>Type: anyType  &lt;br&gt;Properties: Nillable, Sort  &lt;br&gt;Description: Previous value of the modified order field. Maximum of 255 characters.</td>
</tr>
<tr>
<td><strong>OrderId</strong></td>
<td>Type: reference  &lt;br&gt;Properties: Filter, Group, Sort</td>
</tr>
</tbody>
</table>
**Usage**

Order history entries are automatically created each time an order is modified.

Two rows are added to this record when foreign key fields change. One row contains the foreign key object names that display in the online application. For example, Jane Doe is recorded as the name of a Contact. The other row contains the actual foreign key ID that is only returned to and visible from the API.

This object respects field-level security on the parent object.

SEE ALSO:

- Order

**OrderItem**

Represents an order product that your organization sells.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

</tbody>
</table>

**Type**
currency

**Properties**
Filter, Sort

**Description**
Sum of the order product’s tax and any adjustments.

To access Commerce Orders fields, your org must have a Salesforce Order Management license. Commerce Orders fields are available only in Lightning Experience.

This field is available in API v48.0 and later.

**Type**
picklist

**Properties**
Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**
Describes what the order item represents.

Possible values are:
- Delivery Charge — An extra charge made against an order.
- Order Product — An item that the customer has bought.

To access Commerce Orders fields, your org must have a Salesforce Order Management license. Commerce Orders fields are available only in Lightning Experience.

This field is available in API v48.0 and later.

**TypeCode**
picklist

**Properties**
Filter, Group, Nillable, Restricted picklist, Sort

**Description**
Code for the order product.

Possible values are:
- Charge
- Product
To access Commerce Orders fields, your org must have a Salesforce Order Management license. Commerce Orders fields are available only in Lightning Experience.

This field is available in API v48.0 and later.

### UnitPrice

**Type**
- currency

**Properties**
- Create, Filter, Nillable, Sort, Update

**Description**
- Unit price for the order product.

### Usage

An order can have associated order product records only if the order has a price book associated with it. An order product must correspond to a product that is listed in the order's price book.

### Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

- **OrderItemChangeEvent** *(API version 44.0)*
  - Change events are available for the object.

- **OrderItemFeed** *(API version 29.0)*
  - Feed tracking is available for the object.

- **OrderItemHistory**
  - History is available for tracked fields of the object.

### OrderItemAdjustmentLineItem

An adjustment that has been made to an order item. This object is available in API version 48.0 and later.

### Supported Calls

- create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()
## Special Access Rules
To access Commerce Orders entities, your org must have a Salesforce Order Management license. Commerce Orders entities are available only in Lightning Experience.

</table>
| **Description** | Status of the OrderItemSummary. The default value is ORDERED. When a quantity value changes, each status formula is evaluated in order. If a formula is true, no more evaluations are performed for that change. Possible values and their formulas, in the order of evaluation, are:  
  - RETURNINITIATED—Return Initiated — (Quantity > 0) & (QuantityReturnInitiated = QuantityFulfilled) & (QuantityReturned < QuantityReturnInitiated)  
  - RESHIIPPED—Reshipped — (QuantityReshipped = QuantityFulfilled) & (QuantityFullfilled > 0) & (QuantityReturnInitiated = 0) & (QuantityFulfilled = QuantityOrdered)  
  - RETURNED—Returned — (Quantity = 0) & (QuantityReturned > 0)  
  - CANCELED—Canceled — (Quantity = 0) & (QuantityCancelled > 0) & (QuantityReturned = 0)  
  - FULFILLED—Fulfilled — (Quantity > 0) & ((QuantityOrdered - QuantityCancelled) <= QuantityFulfilled)  
  - PARTIALLYFULFILLED—Partially Fulfilled — (QuantityFulfilled > 0) & (QuantityFulfilled < (QuantityOrdered - QuantityCancelled))  
  - ALLOCATED—Allocated — (Quantity > 0) & (Quantity <= QuantityAllocated)  
  - PARTIALLYALLOCATED—Partially Allocated — (QuantityAllocated > 0) & (QuantityAllocated < Quantity)  
  - ORDERED—Ordered — None of the other formulas apply  
  - PAID—Paid — N/A |

</tbody>
</table>
**OrderItemSummaryChange**

Represents a change to an OrderItemSummary, usually a reduction in quantity due to a cancel or return. Corresponds to a change order item. This object is available in API version 48.0 and later.

This object is used for calculations and doesn't have a default record page.

**Supported Calls**

`delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

**Special Access Rules**

This object is only available in Salesforce Order Management orgs.

|                  | **Description** Code indicating the type of order item. Possible values are: 
• Charge—API Name DeliveryCharge.  
• Product—For API Name Product. |

**OrderOwnerSharingRule**

Represents a rule which determines order sharing access for the order’s owners.

Note: To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The **SharingRules** Metadata API type is enabled for all orgs.

**Supported Calls**

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()
## Special Access Rules
Customer Portal users can’t access this object.

### Field: UserOrGroupId

**Details**

**Type**
- reference

**Properties**
- Create, Filter, Group, Sort

**Description**
ID of the user or group with whom order access is shared.

---

### Usage

Use this object to manage the sharing rules for orders. For example, the following code creates an order owner sharing rule between two public groups, which can also contain portal users.

```java
OrderOwnerSharingRule rule = new OrderOwnerSharingRule();
rule.setName("RuleName"); // Set the sharing rule name
rule.setDeveloperName("RuleDeveloperName"); // Set the sharing rule developer name
rule.setGroupId("00Gx00000000000"); // Set the group of users to share records from
rule.setUserOrGroupId("00Gx00000000001"); // Set the group of users to share records to
rule.setOrderAccessLevel("Edit");
connection.create(rule);
```

---

### OrderPaymentSummary

Represents the current properties and state of payments using a single payment method that are applied to one OrderSummary. This object is available in API version 48.0 and later.

⚠️ **Note:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Unlike most summary objects, an OrderPaymentSummary is not related to a similarly named order payment object. Instead, it combines values from multiple payment objects that use the same payment method and apply to the same OrderSummary.

#### Supported Calls

- create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

#### Special Access Rules

This object is only available in Salesforce Order Management orgs or if the B2B Commerce on Lightning Experience license is enabled.

### Field Details

**CapturedAmount**
- **Type**: currency
- **Properties**: Filter, Nillable, Sort
- **Description**: Amount of the OrderPaymentSummary that has been captured.

**CurrencyIsoCode**
- **Type**: picklist
- **Properties**: Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update
- **Description**: Available only for orgs with the multicurrency feature enabled. Contains the ISO code for the currency of the OrderSummary associated with the OrderPaymentSummary. Order Management APIs and actions that create an OrderPaymentSummary for an OrderSummary set this value. The default value is USD.

  Possible values are:
  - **DKK**—Danish Krone
  - **EUR**—Euro
  - **GBP**—British Pound
  - **USD**—U.S. Dollar
  
  This field is available in API version 49.0 and later.

**FullName**
- **Type**: string
- **Properties**: Create, Filter, Group, Nillable, Sort, Update
- **Description**: The full name of the payment method user.

**LastPaymentGatewayLogId**
- **Type**: reference
- **Properties**: Filter, Group, Nillable, Sort
- **Description**: ID of the most recent payment gateway log associated with the OrderPaymentSummary.

**LastPaymentGatewayMessage**
- **Type**: string
- **Properties**: Create, Filter, Nillable, Sort, Update

**OrderId**

**Type**
- reference

**Properties**
- Filter, Group, Sort

**Description**
- ID of the order associated with this sharing entry. This field can't be updated.
  
  This is a relationship field.

**Relationship Name**
- Order

**Relationship Type**
- Lookup

**Refers To**
- Order

**RowCause**

**Type**
- picklist

**Properties**
- Filter, Group, Nillable, Restricted picklist, Sort

**Description**
- The reason that the user has access to the order.

**UserOrGroupId**

**Type**
- reference

**Properties**
- Filter, Group, Sort

**Description**
- ID of the user or group that has been given access to the order. This field can't be updated.
  
  This is a polymorphic relationship field.

**Relationship Name**
- UserOrGroup

**Relationship Type**
- Lookup

**Refers To**
- Group, User
Usage

This object allows you to determine which users and groups can view or edit orders owned by other users.

If you attempt to create a record that matches an existing record, any modified fields are updated, the system returns the existing record.

OrderStatus

Represents the status of the order entity. This object is available in API version 48.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()

**Description**
Number used to sort this value in the order status picklist. These numbers aren’t guaranteed to be sequential, as some previous contract status values might have been deleted.

<table>
<thead>
<tr>
<th>StatusCode</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>picklist</td>
<td></td>
</tr>
</tbody>
</table>

**Properties**
Filter, Group, Nillable, Restricted picklist, Sort

**Description**
Status of the order.
Possible values are:
- Activated
- Draft

**Usage**
This object represents a value in the order status picklist. The order status picklist provides additional information about the status of an Order, such as its current state (Draft or Activated). You can query these records to retrieve the set of values in the order status picklist, and then use that information while processing Order objects to determine more information about a given order. For example, the application could test whether a given order is activated based on its Status value and the value of the StatusCode property in the associated OrderStatus object.

**OrderSummary**

Represents the current properties and state of an order. Corresponds to one or more order objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

**Supported Calls**
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

**Special Access Rules**
This object is only available in Salesforce Order Management orgs or if the B2B Commerce on Lightning Experience license is enabled.

</table>
### Description

The system used to handle tax on the original Order associated with the OrderSummary. Gross usually applies to taxes like value-added tax (VAT), and Net usually applies to taxes like sales tax.

Possible values are:

- **Gross** (displays most prices and taxes as combined values)
- **Net** (displays most prices and taxes as separate values)

If the `OrderLifeCycleType` field on the associated OrderSummary is set to UNMANAGED, then users with the Edit Unmanaged Order Summaries or B2B Commerce Integrator user permission can modify this field.

This field is available in API version 49.0 and later.

### TotalAdjDeliveryAmtWithTax

**Type**  
currency

**Properties**  
Filter, Nillable, Sort

**Description**  
Total amount of all OrderItemSummaries of type code Charge belonging to this OrderSummary, inclusive of item-level adjustments and tax. This amount is equal to `TotalAdjustedDeliveryAmount + TotalAdjustedDeliveryTaxAmount`.

This field is available in API version 49.0 and later.

### TotalAdjDistAmount

**Type**  
currency

**Properties**  
Filter, Nillable, Sort

**Description**  
Total of distributed adjustments applied to OrderItemSummaries belonging to this OrderSummary. This amount is equal to `TotalProductAdjDistAmount + TotalDeliveryAdjDistAmount`.

### TotalAdjDistAmountWithTax

**Type**  
currency

**Properties**  
Filter, Nillable, Sort

**Description**  
Total of distributed adjustments applied to OrderItemSummaries belonging to this OrderSummary, inclusive of tax. This amount is equal to `TotalAdjDistAmount + TotalAdjDistTaxAmount`.

This field is available in API version 49.0 and later.

OrderSummaryRoutingSchedule

Represents an attempt to route an order summary to one or more inventory locations for fulfillment. You can use it to schedule future attempts and to record completed attempts. This object is available in API version 51.0 and later.

Supported Calls
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules
This object is only available in Salesforce Order Management orgs or if the B2B Commerce on Lightning Experience license is enabled.

**Description**

Identifies when this routing attempt was run or is scheduled to run. If the ScheduleStatus is ABANDONED or COMPLETED, then you can’t modify this value.

---

**Associated Objects**

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **OrderSummaryRoutingScheduleOwnerSharingRule**
  - Sharing rules are available for the object.
- **OrderSummaryRoutingScheduleShare**
  - Sharing is available for the object.

**SEE ALSO:**

OrderSummary

---

**Organization**

Represents key configuration information for an organization.

Executing a SOQL SELECT query returns the value of fields in this object, but no value is visible for some of the fields.

**Supported Calls**

- describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update()

**Special Access Rules**

Customer Portal users can't access this object.

</tr>
</thead>
</table>
|       | • ControlledByLeadOrContact  
|       | • ControlledByCampaign  
|       | In versions before 10.0,  
|       | DefaultAccountAndContactAccess represented this value. |

### DefaultAccountAndContactAccess

**Type**
- picklist

**Properties**
- Filter, Nillable, Restricted picklist

**Description**
Default access level for accounts, contacts, contracts, and assets. This field is supported for backward compatibility only and is not available in API version 10.0 or later. In version 10.0 and later, use either DefaultAccountAccess or DefaultContactAccess.

### DefaultCalendarAccess

**Type**
- picklist

**Properties**
- Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort

**Description**
Default access level for calendars. The possible values are listed, followed by the user interface labels in parentheses:
- HideDetails (Hide Details)  
- HideDetailsInsert (Hide Details and Add Events)  
- ShowDetails (Show Details)  
- ShowDetailsInsert (Show Details and Add Events)  
- AllowEdits (Full Access)

### DefaultCampaignAccess

**Type**
- picklist

**Properties**
- Filter, Group, Nillable, Restricted picklist, Sort

**Description**
Default access level for campaigns. The possible values are:
- None  
- Read  
- Edit  
- All

### Field: NamespacePrefix

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter, Group, idLookup, Nillable, Sort</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The namespace prefix can have one of the following values.</td>
</tr>
</tbody>
</table>

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.

- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix. |

**Usage**

Query this object to obtain information about an organization's settings. Only one organization object exists per organization.

**OrgDeleteRequest**

Represents a request to delete a developer edition (DE) org. This object is available in API version 42.0 and later. It is available only in Developer and Database.com editions.

**Supported Calls**

create(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()
## Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| Name       | **Type** string  
**Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort  
**Description** The auto-generated ID of this OrgDeleteRequest object. |
| OwnerId    | **Type** reference  
**Properties** Create, Defaulted on create, Filter, Group, Sort  
**Description** The ID of the user who initiated the org delete request. |
| RequestType| **Type** picklist  
**Properties** Create, Filter, Group, Restricted picklist, Sort  
**Description** Specifies whether you want to deactivate or reactivate the org. When you deactivate an org, you have 30 days to change your mind and reactivate it. After 30 days, the org is locked, and you must contact Salesforce Customer Support to reactivate it. After 60 days, the org is permanently deleted from Salesforce servers.  
**Valid values:**  
- Deactivate  
- Reactivate |

## Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **OrgDeleteRequestOwnerSharingRule**  
  Sharing rules are available for the object.
- **OrgDeleteRequestShare**  
  Sharing is available for the object.
OrgWideEmailAddress

 Represents an organization-wide email address for user profiles.

 Supported Calls

 `create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieves()`, `update()`,  
 `upsert()`

 Special Access Rules

 Only authenticated users with the View Setup and Configuration permission can access this object.

| IsAllowAllProfiles   |                   |
| **Type**            | boolean           |
| **Properties**      | Create, Defaulted on create, Filter, Group, Sort, Update |
| **Description**     | If `true`, any user profile in your organization can use this object. If `false`, only specified user profiles can use this object when sending email. If you do not have the appropriate user profile, you can't use this object. |

| DisplayName         |                   |
| **Type**            | string            |
| **Properties**      | Create, Filter, Sort, Update |
| **Description**     | The name that is used to identify the sender of the email. |
Usage
This object represents an email alias for user profiles. You can pass in the ID to an OrgWideEmailAddress record when calling sendEmail() for a SingleEmailMessage.

OutOfOffice

Represents a user-set value on a profile that shows when the user intends to be out of the office. This object is available in API version 41.0 and later.

Supported Calls
create(), delete(), query(), undelete(), upsert(), update()

Special Access Rules
In Lightning Experience, lets users set a message next to their name in Chatter to show when they plan to be out of the office. The message appears in Lightning Experience, Salesforce Classic, and mobile views. Messages expire automatically after their end date. You can control whether out-of-office functionality is available to your users. Set it up in the Out of Office section in Setup > Chatter Settings. Only internal users can set an out-of-office message.

<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The ID of the user associated with the out-of-office message.</td>
</tr>
</tbody>
</table>

### Usage
- Maximum message length is 40 characters.
- Users can set only their own out-of-office message. An admin can set an out-of-office message for any user.
- The out-of-office message can be set only for internal users.

### OutgoingEmail
For internal use only.

### OutgoingEmailRelation
For internal use only.

### OwnedContentDocument
Represents a file owned by a user. This object is available in version 30.0 and later.
### Supported Calls

`describeSObjects()`

### Fields

</table>
### OwnerChangeOptionInfo

Represents default and optional actions that can be performed when a record’s owner is changed. Available in API version 35.0 and later, but to query for change owner metadata, use the OwnerChangeOptionInfo object in Tooling API instead. For more information, see OwnerChangeOptionInfo in the Tooling API.

**Supported Calls**

- `describeSObjects()`, `query()`, `retrieve()`

Use `EntityId` or `DurableId` when querying this object.

### PackageLicense

Represents a license for an installed managed package. This object is available in API version 31.0 and later.

**Supported Calls**

- `describeSObjects()`, `query()`, `retrieve()`

**Special Access Rules**

Customer Portal users can’t access this object.

</tr>
</tbody>
</table>
Usage

Use this object to determine the number of licenses allowed and in use for a managed package installed in your organization.

The following example demonstrates the use of the API to manage licenses for a package. The example defines an Apex class that does the following.

- Retrieves the PackageLicense record for the specified package (identified by its namespace prefix).
- Defines a function that returns a list of all users with the specified profile.
- Creates a UserPackageLicense record for each user with that profile, which has the effect of assigning a license for the package to all users with that profile.
- Returns an error message if the number of users exceeds the number of available licenses.

```apex
public class AssignPackageLicense {

    static String PACKAGE_NAMESPACE_PREFIX = 'acme_101';
    static String PROFILE_ID = '00exx000000jz1SAAQ';
    public static String exceptionText {get; set;}

    public AssignPackageLicense() {
        exceptionText = 'Initialized';
    }

    static List<User> getUsersWithProfile() {
        String userQuery = 'SELECT Id FROM User WHERE ProfileId = :PROFILE_ID';
        List<User> matchingUsers = new List<User>();
        matchingUsers = SELECT Id FROM User WHERE ProfileId = :PROFILE_ID;
        return matchingUsers;
    }

    public static void assignLicenseByProfile() {
        // find the PackageLicense Id
        PackageLicense pl = SELECT Id, NamespacePrefix, AllowedLicenses, UsedLicenses,
                        ExpirationDate, Status FROM PackageLicense WHERE
                        NamespacePrefix = :PACKAGE_NAMESPACE_PREFIX;
        System.assert(pl != null, 'PackageLicense cannot be null.');
        List<User> usersToAssignLicenses = getUsersWithProfile();
        List<UserPackageLicense> firstUPLs = new List<UserPackageLicense>();

        // create a new UserPackageLicense record for each user with the specified profile
        for (Integer i = 0; i < usersToAssignLicenses.size(); i++) {
            UserPackageLicense upl = new UserPackageLicense();
            upl.PackageLicenseId = pl.Id;
            upl.UserId = usersToAssignLicenses[i].Id;
            firstUPLs.add(upl);
        }

        try {
            // bulk insert
            insert(firstUPLs);
        } catch(DmlException e) {
            for (Integer i = 0; i < e.getNumDml(); i++) {
                // process exception here
            }
        }
    }
}
```
PackagePushError

Represents an error encountered during a push request. The number of PackagePushError records created depends on the number of push jobs in the request that result in an error.

**Supported Calls**

describeSObjects(), query(), retrieve()

<td><strong>Description</strong> Required. The parent push job record ID.</td>
</tr>
</tbody>
</table>

**Usage**

Suppose that your push upgrade request wasn’t successful due to some of its jobs failing. Let’s write some code to find out what those errors were.
This code sample uses the Web Services Connector (WSC).

```java
// Retrieves all PackagePushError objects associated with the PackagePushJob with the given
// ID
final String PACKAGE_PUSH_ERROR_QUERY = "Select ErrorMessage, ErrorDetails, ErrorTitle,"
+ " ErrorSeverity, ErrorType from PackagePushError where PackagePushJobId = '%s';"

// job is a PackagePushJob instance
QueryResult queryResult = conn.query(String.format(PACKAGE_PUSH_ERROR_QUERY, job.getId()));
StringBuilder errorMessages = new StringBuilder();
errorMessages.append("Errors for PackagePushJob [").append(job.getId()).append("]:"
 .append("\n"));

// There can be multiple PackagePushErrors for a given PackagePushJob
for(SObject r : queryResult.getRecords()) {
    PackagePushError e = (PackagePushError) r;
    errorMessages.append("Title: ").append(e.getErrorTitle()).append("\n");
    errorMessages.append("Severity: ").append(e.getErrorSeverity()).append("\n");
    errorMessages.append("Type: ").append(e.getErrorType()).append("\n");
    errorMessages.append("Message: ").append(e.getErrorMessage()).append("\n");
    errorMessages.append("Details: ").append(e.getErrorDetails()).append("\n");
    errorMessages.append("\n");
}
String errors errorMessages.toString();
```

---

### PackagePushJob

Represents an individual push job for upgrading a package in an org from one version to another version. There can be multiple push jobs created for one push request. For example, if you want to upgrade five orgs as part of one push, you have one PackagePushRequest record and five PackagePushJob records.

### Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DurationSeconds</td>
<td></td>
</tr>
</tbody>
</table>

**Type**

`int`

**Properties**

- `Group`, `Nillable`

**Description**

The length of time in seconds, that the push upgrade took to complete. This field is new in API version 51.0.
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| EndTime             | **Type** `dateTime`  
|                     | **Properties** `Create, Nillable, Update`  
|                     | **Description** The date and time (UTC) at which the push upgrade ended, in ISO 8601 format. This field is new in API version 51.0. |
| PackagePushRequestId| **Type** `reference`  
|                     | **Properties** `Create, Filter, Group, Nillable, Sort, Update`  
|                     | **Description** Required. The ID of the parent push request record which must have been created. |
| StartTime           | **Type** `dateTime`  
|                     | **Properties** `Create, Nillable, Update`  
|                     | **Description** The date and time (UTC) at which the push upgrade actually started, in ISO 8601 format. This field is new in API version 51.0. |
| Status              | **Type** `picklist`  
|                     | **Properties** `Create, Filter, Group, Nillable, Restricted picklist, Sort`  
|                     | **Description** The status of the job. Valid values are:  
|                     | • Canceled  
|                     | • Created (default)  
|                     | • Failed  
|                     | • In Progress  
|                     | • Pending  
|                     | • Succeeded  
|                     | Don’t specify this value when you create the push job. The default value of Created is used. |
| SubscriberOrganizationKey | **Type** `string` |
### Usage

Suppose that you want to push version 3.4.6 of your package to all orgs. You’ve already identified the orgs eligible for the upgrade by using `MetadataPackageVersion` and created the push request using `PackagePushRequest`. Now let’s write some code to create a push job for each eligible org.

This code sample uses the Web Services Connector (WSC).

```java
PackageSubscriber[] subscribers = new PackageSubscriber[];

// ... populate eligible and desired subscribers

// Create the PackagePushJob array
PackagePushJob[] jobs = new PackagePushJob[subscribers.length];

for (int i = 0; i < subscribers.length; i++) {
    // create a job for each subscriber...
    PackagePushJob job = new PackagePushJob();
    // ... associate it to the PackagePushRequest ppr...
    job.setPackagePushRequestId(ppr.getId());
    // ... and add the orgKey
    job.setSubscriberOrganizationKey(subscribers[i].getOrgKey());
    jobs[i] = job;
}

// Save the jobs
SaveResult[] saveResults = conn.create(jobs);

// Add the newly generated id's to the PackagePushJob objects
for (int i = 0; i < saveResults.length; i++) {
    if (saveResults[i].isSuccess()) {
        jobs[i].setId(saveResults[i].getId());
    }
}

Or, if you’re using REST API, submit a POST request to the `PackagePushJob` sObject endpoint, as in the following example. SOAP API is also supported. This example returns the push job ID (starting with 0DX) that is required to query the status of the job.

```json
POST
/services/data/v38.0/sobjects/packagepushjob/
{
    "PackagePushRequestId" : "0DV...",
    "SubscriberOrganizationKey" : "00DR00..."
}
```
Checking the Status of a Push Job

To check the job status, simply query the Status field. For example:

```
SELECT Id, Status FROM PackagePushJob WHERE PackagePushRequestId = '0DV...'
```

Here's an example in Java.

```
// Finds the status of the PackagePushJob with the given id
String PACKAGE_PUSH_JOB_STATUS_QUERY = "Select status from PackagePushJob where Id = '\%s'";

// job is a PackagePushJob instance
QueryResult queryResult = conn.query(String.format(PACKAGE_PUSH_JOB_STATUS_QUERY, 
job.getId()));

// extract the status from the QueryResult
String status = ((PackagePushJob) queryResult.getRecords()[0]).getStatus();

// optionally, update the PackagePushJob instance with the latest status
job.setStatus(status);
```

You can also continuously poll the job status until the job is done. The following Java example polls the status every 10 seconds.

```
// The set of states that indicate a PackagePushJob has completed
final Set<String> TERMINAL_STATES = new HashSet<>();
TERMINAL_STATES.add("Succeeded");
TERMINAL_STATES.add("Failed");
TERMINAL_STATES.add("Canceled");

String status = queryJobStatus(job); // this method returns the status as retrieved in the
// previous code sample

// If the status is not one of the completed statuses...
while(!TERMINAL_STATES.contains(status)) {
    Thread.sleep(10 * 1000); // ... wait 10 seconds and try again
    status = queryJobStatus(job);
}
```

PackagePushRequest

Represents the push request for upgrading a package in one or many orgs from one version to another version.

Supported Calls

create(), describeSObjects(), query(), retrieve(), update(), upsert()

</tr>
<tr>
<td>• Succeeded</td>
</tr>
<tr>
<td>Don’t specify this value when you create the push request. The default value of Created is used. Later, change the status to Pending to schedule the push upgrade.</td>
</tr>
</tbody>
</table>

### Usage

Suppose that you want to push version 3.4.6 of your package to all orgs. You’ve already identified the orgs eligible for the upgrade by using MetadataPackageVersion. Now let’s write some code to create a push request, which holds a push job for each eligible org.

This code sample uses the Web Services Connector (WSC).

```java
// Create a new PackagePushRequest for the versionId to upgrade to // (for example, versionId is the "04t..." id of version // 3.4.6 of the package
PackagePushRequest ppr = new PackagePushRequest();
ppr.setPackageVersionId(versionId);

// Optionally, set the start time of the PackagePushRequest to schedule it to begin // automatically; scheduledStartTime is a java.util.Calendar instance
ppr.setScheduledStartTime(scheduledStartTime);

// Save the PackagePushRequest
SaveResult[] saveResults = conn.create(new SObject[] { ppr });
if (saveResults[0].isSuccess()) {
    // Add the newly generated Id to the object
    ppr.setId(saveResults[0].getId());
} else {
    for (Error error : saveResults[0].getErrors()) {
        System.out.println(error.getMessage());
    }
}
```

Or, if you’re using REST API, submit a POST request to the PackagePushRequest sObject endpoint, as in the following example. SOAP API is also supported.

This example returns the push request ID (starting with 0DV) that’s required to create push jobs.

```
POST
/services/data/v38.0/objects/packagepushrequest/
```
As your next step, create a push job for each eligible subscriber you want to upgrade using PackagePushJob.

**Scheduling the Push Upgrade**

To signal that the push upgrade is ready to be processed, change the status of the push request to Pending. If you didn’t set a `ScheduledStartTime`, the push upgrade starts immediately after you change the status.

See the following Java example.

```java
// ppr is the PackagePushRequest instance
ppr.setStatus("Pending");
conn.update(new SObject[]{ ppr });
```

If you’re using REST API, submit a PATCH request to the PackagePushRequest sObject endpoint, as in the following example. SOAP API is also supported.

```json
PATCH /services/data/v38.0/sobjects/packagepushrequest/0DV...
{
  "Status" : "Pending"
}
```

**Checking the Status of a Push Request**

The PackagePushRequest status is **Succeeded** if all its associated jobs are successful; it’s **Failed** if at least one job failed.

```java
// Finds the status of the PackagePushRequest for a given Id
final String PACKAGE_PUSH_REQUEST_STATUS_QUERY = "Select status from PackagePushRequest"
+ " where Id = '%s'";

// ppr is a PackagePushRequest instance
QueryResult queryResult = conn.query(String.format(PACKAGE_PUSH_REQUEST_STATUS_QUERY, ppr.getId()));

// extract the status from the QueryResult
String status = ((PackagePushRequest) queryResult.getRecords()[0]).getStatus();

// optionally, update the PackagePushRequest instance with the latest status
ppr.setStatus(status);
```

You can also check the status of a job by querying the PackagePushJob’s `Status` field.

**Aborting a Push Request**

You can abort a package push request by changing its status to Canceled.

For example, if you’re using the REST API, submit a PATCH request to the PackagePushRequest sObject endpoint.

```json
PATCH /services/data/v38.0/sobjects/packagepushrequest/0DV...
{
  "Status" : "Canceled"
}
```
The following example is for Java.

```java
// ppr is the PackagePushRequest instance
ppr.setStatus("Canceled");
```

You can abort a package push request only if its status is Created or Pending. If the abort succeeds, all associated push jobs are also canceled. If you try to abort when the current PackagePushRequest status is Canceled, Succeeded, Failed, or In Progress, the abort doesn’t occur, and an error message is returned.

---

**PackageSubscriber**

Represents an installation of a package in an org. This object contains installation information for managed or unlocked packages developed in the org you’re logged in to.

One record is created per installation. For example, if 5 orgs installed 2 packages, 10 records are created.

---

**Supported Calls**

describeSObjects(), query(), retrieve()

---

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>

</tr>
<tr>
<td>Sandbox</td>
<td></td>
</tr>
</tbody>
</table>

**Type**
string

**Properties**
Filter, Group, Nillable, Sort

**Description**
The production org from which a sandbox was created.

## Usage
Here are examples of the types of API queries you can perform.

<table>
<thead>
<tr>
<th>Query</th>
<th>String</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get all package subscriber orgs with a specific package ID</td>
<td>SELECT Id, OrgKey, OrgStatus, OrgName, OrgType FROM PackageSubscriber WHERE MetadataPackageVersionId = '04t...'</td>
</tr>
<tr>
<td>Get all package subscriber orgs that have an installed package created by the org you’re logged in to</td>
<td>SELECT Id, OrgKey, OrgStatus, OrgName, OrgType FROM PackageSubscriber WHERE InstalledStatus = 'i'</td>
</tr>
</tbody>
</table>

## Filter PackageSubscriber Objects by Instance
If you have packages with many subscribers, querying PackageSubscriber objects can take a while. To improve query performance, add filters to your PackageSubscriber queries, such as an InstanceName filter. InstanceName is a field that represents the instance that the subscriber org is hosted on.

1. Get the org’s package and the latest released version of the package.

```java
/**
 * Get the MetadataPackage object corresponding to this org's managed package
 */
public MetadataPackage getMetadataPackage() throws ConnectionException {
    // retrieve the managed package, which won’t have an empty namespace
    QueryResult result = conn.query("select id from MetadataPackage where namespaceprefix <> ''");

    return (MetadataPackage) result.getRecords()[0];
}
```
* Get the latest MetadataPackageVersion object of the given MetadataPackage

```java
public MetadataPackageVersion getLatestMetadataPackageVersion(MetadataPackage metadataPackage)
throws ConnectionException {
    // get the latest released version of the given package
    String query = "Select id, ReleaseState, MajorVersion, MinorVersion, PatchVersion,
    MetadataPackageId
    From MetadataPackageVersion
    Where MetadataPackageId = '%s' and ReleaseState = 'Released'
    Order by majorversion desc, minorversion desc, patchversion desc";

    QueryResult result = conn.query(String.format(query, metadataPackage.getId()));

    return (MetadataPackageVersion) result.getRecords()[0];
}
```

2. Get eligible subscribers. The following query strings and methods are modified to allow querying for PackageSubscribers filtered by an instance.

```java
static final String PACKAGE_SUBSCRIBER_ORG_KEY_QUERY = "Select OrgKey from
PackageSubscribers where OrgStatus = 'Active'
+ " and InstalledStatus = 'I'
+ " and InstanceName = '%s'"; // placeholder for instance values

static final String METADATA_PACKAGE_VERSION_QUERY = "Select Id, Name, ReleaseState,
(%s) from MetadataPackageVersion
+ " where MetadataPackageId = '%s' AND ReleaseState = 'Released'
+ " AND (MajorVersion < %s OR (MajorVersion = %s and MinorVersion < %s)
+ " OR (MajorVersion = %s and MinorVersion = %s and PatchVersion < %s))";

/**
* Get all PackageSubscribers on the given instance that are eligible to upgrade to the
given
* MetadataPackageVersion
*/

public PackageSubscriber[] getEligibleSubscriberIds(MetadataPackageVersion version,
String instanceName) throws ConnectionException {
    String allPackageId = version.getMetadataPackageId();
    Integer major = version.getMajorVersion();
    Integer minor = version.getMinorVersion();
    Integer patch = version.getPatchVersion();

    return getEligibleSubscriberIds(major, minor, patch, allPackageId, instanceName);
}

public PackageSubscriber[] getEligibleSubscriberIds(Integer major, Integer minor, Integer
patch, String packageId, String instanceName) throws ConnectionException {
    String subscriberQuery = String.format(PACKAGE_SUBSCRIBER_ORG_KEY_QUERY,instanceName);
    QueryResult results = conn.query(String.format(METADATA_PACKAGE_VERSION_QUERY,
subscriberQuery, packageId, major, major, minor, major, minor, patch));

    return Arrays.stream(results.getRecords()).map(MetadataPackageVersion.class::cast)
    .filter(mpv -> mpv.getPackageSubscribers() != null)
3. Put it all together. The following code sample shows how to use the previous methods to modify the workflow to perform package pushes by instance.

```java
String[] instances = { "NA4" }; // Here we list the instances we would like to push to
MetadataPackage metadataPackage = api.getMetadataPackage();
MetadataPackageVersion version = api.getLatestMetadataPackageVersion(metadataPackage);

// do pushes by instance to avoid API timeouts retrieving PackageSubscribers
for (String instanceName : instances) {
    PackageSubscriber[] eligibleSubscribers = api.getEligibleSubscriberIds(version,
                                      instanceName);
    // ... proceed with creating PushRequests and PushJobs as before
}
```

### Partner

Represents a partner relationship between two Account records or between an Opportunity record and an Account record.

#### Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieves()`

#### Special Access Rules

Customer Portal users can't access this object.

#### Fields

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
Details

OpportunityPartner record. If you specify the AccountFromId field, you can’t also specify this field.

This is a relationship field.

**Relationship Name**
Opportunity

**Relationship Type**
Lookup

**Refers To**
Opportunity

**ReversePartnerId**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Filter, Group, Nillable, Sort</td>
<td>ID of the account in a partner relationship.</td>
</tr>
</tbody>
</table>

**Role**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Create, Filter, Group, Nillable, Sort</td>
<td>UserRole that the account has toward the related opportunity or account, such as consultant or distributor.</td>
</tr>
</tbody>
</table>

**Roles**

In the Salesforce user interface, system administrators can set up the valid role values and their corresponding reverse role values in the PartnerRole object. Each account in the relationship is assigned a Role (such as Consultant or Distributor) designating that account’s role toward the related account or opportunity.

**Creating an Account-Opportunity Partner Relationship**

When you create a partner relationship between an account and an opportunity (when you create a Partner record and specify the OpportunityId field), the API automatically creates an OpportunityPartner record with the corresponding values:

- The value of the Partner field AccountToId maps to the value of the OpportunityPartner field AccountToId.
- The values of the OpportunityId, Role, and IsPrimary fields in both records are the same.
- If you set the IsPrimary value to 1 (true) upon insert of a new OpportunityPartner, the IsPrimary value is automatically set to 0 (false) for any existing primary partners for that opportunity.

This mapping allows the API to manage the records and their relationships efficiently.
Creating an Account-Account Partner Relationship

When you create a partner relationship between two accounts (when you create a Partner record and specify the `AccountFromId`), the API automatically creates two AccountPartner records, one for the forward relationship and one for the reverse. For example, if you create a Partner relationship with “Acme, Inc.” as the `AccountFromId` and “Acme Consulting” as the `AccountToId`, the API automatically creates two AccountPartner records:

- The forward relationship AccountPartner with “Acme, Inc.” as the `AccountFromId` and “Acme Consulting” as the `AccountToId`.
- The reverse relationship AccountPartner with “Acme Consulting” as the `AccountFromId` and “Acme, Inc.” as the `AccountToId`.
- The value of the `Role` field in the reverse relationship AccountPartner is set to the PartnerRole record `ReverseRole` value associated with the value of the `Role` field in the forward relationship AccountPartner.

This mapping allows the API to manage the records and their relationships efficiently.

Details

- Co-Operated Budget—Funds accrue based on a percentage of partner sales. The funds are available based on previous activity.
- Marketing Funds—Funds are issued to partners in advance of sales. The funds are awarded based on predicted or expected behavior.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- PartnerMarketingBudgetFeed
  Feed tracking is available for the object.
- PartnerMarketingBudgetHistory
  History is available for tracked fields of the object.
- PartnerMarketingBudgetOwnerSharingRule
  Sharing rules are available for the object.
- PartnerMarketingBudgetShare
  Sharing is available for the object.

PartnerNetworkConnection

Represents a Salesforce to Salesforce connection between Salesforce organizations.

Supported Calls

create(), describeSObjects(), query(), retrieve()

Special Access Rules

As of Winter ’21 and later, only authenticated internal and external users can access this object.

Usage

Represents Salesforce to Salesforce standard and replication connections. This object is referenced by all objects that have been shared with other organizations, enabling you to determine which connections shared a record with you. If the organization does not have Salesforce to Salesforce enabled, the PartnerNetworkConnection object is not available, and you can’t access it via the API.

SEE ALSO:

PartnerNetworkRecordConnection

PartnerNetworkRecordConnection

Represents a record shared between Salesforce organizations using Salesforce to Salesforce.

Supported Calls

create(), query()

Special Access Rules

As of Winter ’21 and later, only authenticated internal and external users can access this object.

<td></td>
<td>• Active (received)</td>
</tr>
<tr>
<td></td>
<td>• Active (sent)</td>
</tr>
</tbody>
</table>
### Usage

When you create a PartnerNetworkRecordConnection, you forward a record to a connection.

**Note:** Attempting to forward a record from an object to which the connection is not subscribed results in an **Invalid Partner Network Status** error.

When you delete a PartnerNetworkRecordConnection, you stop sharing a record with a connection.

- To share a record, use the following fields: `LocalRecordID` and `ConnectionId`
- To share a child of a parent record, use the following fields: `LocalRecordID`, `ConnectionId`, and `ParentRecordID`
- To share a child of a parent record and its child records, use the following fields: `LocalRecordID`, `ConnectionId`, `ParentRecordID`, and `RelatedRecords`

If the organization does not have Salesforce to Salesforce enabled, the PartnerNetworkRecordConnection object is not available, and you can’t access it using the API.

### Sample Code—Apex

The following example shows how to forward a record.

```apex
List<PartnerNetworkConnection> connMap = new List<PartnerNetworkConnection>(
    [select Id, ConnectionStatus, ConnectionName from PartnerNetworkConnection
     where ConnectionStatus = 'Accepted']
);
List<PartnerNetworkRecordConnection> PNRecordList = new List<PartnerNetworkRecordConnection>();
for (PartnerNetworkConnection network : connMap) {
    PartnerNetworkRecordConnection newrecord = new PartnerNetworkRecordConnection();
    newrecord.ConnectionId = network.Id;
    newrecord.LocalRecordId = accountId;
    newrecord.RelatedRecords = 'Contact,Opportunity,Orders__c';
    newrecord.SendClosedTasks = true;
    newrecord.SendOpenTasks = true;
    newrecord.SendEmails = true;
    PNRecordList.add(newrecord);
}
//One DML call for the entire list of new records
insert PNRecordList;
```

---

**Field**

**Details**

- Connected
- Inactive
- Inactive (converted)
- Inactive (deleted)
- Pending (sent)
The following example shows how to stop sharing a record.

```java
List<PartnerNetworkRecordConnection> recordConns = new List<PartnerNetworkRecordConnection>{
    [select Id, Status, ConnectionId, LocalRecordId from PartnerNetworkRecordConnection
    where LocalRecordId in :accounts]
};

List<PartnerNetworkRecordConnection> DeleteRecordList = new List<PartnerNetworkRecordConnection>();
for(PartnerNetworkRecordConnection recordConn : recordConns) {
    if(recordConn.Status.equalsignorecase('Sent')) { //account is connected - outbound
        DeleteRecordList.add(recordConn);
    }
}
delete DeleteRecordList;
```

SEE ALSO:
- PartnerNetworkConnection

**PartnerNetworkSyncLog**

Represents the Org Sync Log tab in Salesforce, where Salesforce administrators can track the replication of record inserts and updates being performed in Organization Sync. The Connection Detail page for the replication connection also displays the Org Sync Log’s twenty most recent entries, and provides a link to the log.

**Supported Calls**

- `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

**Special Access Rules**

The Org Sync Log tab can only be added in organizations where Organization Sync has been enabled. To add the tab to the Salesforce user interface, users must also have the “Manage Connections” user permission.

</tbody>
</table>
| An item is added to the Organization Sync Log if it failed to be replicated to the linked organization. This picklist includes the following values:
| • **Failed**: The replication continued to fail after multiple retries, and won’t be retried further. |
| • **Resolved**: The replication succeeded after retrying. |
| • **Retrying**: Salesforce is retrying the replication. |
| This field is available in API version 35.0 and later. |

**PartnerRole**

Represents a role for an account Partner, such as consultant, supplier, and so on.

**Supported Calls**

describeSObjects(), query(), retrieve()

**Special Access Rules**

Customer Portal users can’t access this object.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>

</tr>
</tbody>
</table>
ReverseRole

**Details**

**Type**
- picklist

**Properties**
- Filter, Group, Nillable, Sort

**Description**
Name of the reverse role that corresponds to this partner role. For example, if the role is “subcontractor,” then the reverse role might be “general contractor.” In the user interface, assigning a partner role to an account creates a reverse partner relationship so that both accounts list the other as a partner.

SortOrder

**Details**

**Type**
- int

**Properties**
- Filter, Group, Nillable, Sort

**Description**
Number used to sort this value in the partner role picklist. These numbers are not guaranteed to be sequential, as some previous partner role values might have been deleted.

### Usage

This object represents a value in the partner role picklist. In the user interface, the partner role picklist provides additional information about the role of a Partner, such as their corresponding reverse role. Query this object to retrieve the set of values in the partner role picklist, and then use that information while processing PartnerRole records to determine more information about a given partner role. For example, the application could determine the reverse role of a given Partner Role value and the value of the ReverseRole property in the associated PartnerRole object.

### PartyConsent

Represents consent preferences for an individual. This object is available in API version 48.0 and later.

### Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

### Field Details

**Properties**
Create, Filter, Group, Sort, Update

**Description**
Required. Represents the record based on the Individual object you want to associate consent with.

This is a relationship field.

**Relationship Name**
Party

**Relationship Type**
Lookup

**Refers To**
Individual

---

**PrivacyConsentStatus**

**Type**
picklist

**Properties**
Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update

**Description**
Required. Identifies whether the individual associated with this record agrees to this form of contact.

Possible values are:
- NotSeen
- OptIn
- OptOut
- Seen

---

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **PartyConsentChangeEvent**
  Change events are available for the object.

- **PartyConsentFeed**
  Feed tracking is available for the object.

- **PartyConsentHistory**
  History is available for tracked fields of the object.

- **PartyConsentOwnerSharingRule**
  Sharing rules are available for the object.

- **PartyConsentShare**
  Sharing is available for the object.
Payment

Represents a single event where the customer creates a payment. For credit cards, this is a payment capture or payment sale, which won’t show up in the end user’s credit card statement. This object is available in API version 48.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

To access Commerce Payments entities, your org must have a Salesforce Order Management license with the Payment Platform org permission activated. Commerce Payments entities are available only in Lightning Experience.

</tr>
<tr>
<td>Possible values</td>
<td>• Decline: The gateway call failed, but it may still work if the transaction is attempted again. For example, the customer had insufficient funds or briefly lost their connection.</td>
<td></td>
</tr>
</tbody>
</table>
### Details

- **Indeterminate**: The gateway didn’t respond to the call. This response usually happens when Salesforce times out while waiting for a response from the gateway.
- **PermanentFail**: The gateway call failed and won’t work even if tried again. Gateway calls fail permanently for one of two reasons:
  - Hard Decline: The customer’s payment account has been closed or terminated.
  - Fraud: The gateway recognized the payment or payment method as known fraud.
- **RequiresReview**: The customer bank requires more information before completing the payment.
- **Success**: The gateway call succeeded.
- **SystemError**: Salesforce ended the payment request before receiving a response. For example, Salesforce lost credentials or access to its server. Salesforce ends payment calls if it doesn’t receive a response from the gateway within two minutes.
- **ValidationError**: Customer payment data was incorrect, such as a misspelling in the credit card address or an incorrect CVV.

### Status

**Type**
- picklist

**Properties**
- Create, Filter, Group, Restricted picklist, Sort, Update

**Description**
Defines the state of this payment.

Possible values are:
- **Canceled**: This payment has been unapplied from its target and can no longer be allocated.
- **Draft**: The payment can be edited before posting it and allocating it to a target.
- **Processed**: This payment has been finalized and can be allocated against a target.

Users can manually change the Status field’s values as follows:
- Draft to Processed
- Processed to Canceled
- Draft to Canceled

### TotalApplied

**Type**
- currency

**Properties**
- Filter, Nillable, Sort

**Description**
The total amount of this payment’s balance that has been applied against an invoice.

### TotalRefundApplied

**Type**
- currency
### PaymentAuthAdjustment

Shows information about an adjustment made to an authorized transaction. This object is available in API version 51.0 and later.

PaymentAuthorization

Represents a single payment authorization event where users can capture or reverse a payment against a reserve of funds. This object is available in API version 48.0 and later.

A common type of payment authorization occurs when a user sees a pending transaction against their credit card account.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

To access Commerce Payments entities, your org must have a Salesforce Order Management license with the Payment Platform org permission activated. Commerce Payments entities are available only in Lightning Experience.

<td>Description — Defines whether the payment has been made outside of the payment platform. Possible values are: - External — Transactions happened outside of the Salesforce payments platform. - Salesforce — Salesforce made and recorded an external call to the payment gateway.</td>
</tr>
<tr>
<td>SfResultCode</td>
<td>Type — picklist</td>
</tr>
<tr>
<td></td>
<td>Properties — Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</td>
</tr>
<tr>
<td></td>
<td>Description — Salesforce-specific result code that can map to one or more gateway result codes. We recommend configuring the payment gateway adapter layer to map gateway result codes to the appropriate Salesforce result code. Possible values are: - Decline — The gateway call failed, but it may still work if the transaction is attempted again. For example, the customer had insufficient funds or briefly lost their connection. - Indeterminate — The gateway didn’t respond to the call. This response usually happens when Salesforce times out while waiting for a response from the gateway. - PermanentFail — The gateway call failed and won’t work even if tried again. Gateway calls fail permanently for one of two reasons: - Hard Decline: The customer’s payment account has been closed or terminated. - Fraud: The gateway recognized the payment or payment method as known fraud.</td>
</tr>
</tbody>
</table>
Details

- **RequiresReview**—The customer bank requires more information before completing the payment.
- **Success**—The gateway call succeeded.
- **SystemError**—Salesforce ended the payment request before receiving a response. For example, Salesforce lost credentials or access to its server. Salesforce ends payment calls if it doesn’t receive a response from the gateway within two minutes.
- **ValidationError**—Customer payment data was incorrect, such as a misspelling in the credit card address or an incorrect CVV.

**Status**

**Type**

picklist

**Properties**

Create, Filter, Group, Restricted picklist, Sort, Update

**Description**

Defines the state of this payment. Possible values are:

- **Canceled**—This payment has been unapplied from its target and can no longer be allocated.
- **Draft**—The payment can be edited before posting it and allocating it to a target.
- **Failed**—Authorization for the payment failed.
- **Pending**—
- **Processed**—This payment has been finalized and can be allocated against a target.

Users can manually change the Status field’s values as follows:

- Draft to Processed
- Processed to Canceled
- Draft to Canceled

**TotalAuthReversalAmount**

**Type**

currency

**Properties**

Filter, Nillable, Sort

**Description**

The sum of all processed authorization reversals against the payment authorization. This is a calculated field.

**TotalPaymentCaptureAmount**

**Type**

currency

**Properties**

Filter, Nillable, Sort
The sum of all authorization captures related to this payment authorization.

OrderPaymentSummary

PaymentGateway

Platform entity that represents the connection to the external payment gateway. This object is available in API version 48.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

To access Commerce Payments entities, your org must have a Salesforce Order Management license with the Payment Platform org permission activated. Commerce Payments entities are available only in Lightning Experience.

### Status
- **Type**: picklist
- **Properties**: Create, Filter, Group, Restricted picklist, Sort, Update
- **Description**: Defines whether the Payments Platform can use this payment gateway for calls to the external payment gateway. Inactive payment gateways can’t be used.
  - Possible values are:
    - **Active**
    - **Inactive**

---

**PaymentGatewayLog**

Stores information exchanged between the Salesforce payments platform and external payment gateways. Gateway logs can also record payloads from external payment entities. This object is available in API version 48.0 and later.

Deleting or archiving a payment gateway log doesn’t impact financial data on other payment entities.

**Supported Calls**

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

**Special Access Rules**

To access Commerce Payments entities, your org must have a Salesforce Order Management license with the Payment Platform org permission activated. Commerce Payments entities are available only in Lightning Experience.

### PaymentGatewayProvider

Setup entity for payment gateways. Defines the connection to a payment gateway Apex adapter. This object is available in API version 48.0 and later.
Supported Calls

`create(), delete(), describeSObjects(), query(), retrieve(), search(), update(), upsert()`

Special Access Rules

To access Commerce Payments entities, your org must have the Payment Platform org permission. This permission is available in the following licenses:

- Salesforce Order Management
- Salesforce B2B
- Salesforce B2C

Commerce Payments entities are available only in Lightning Experience.

2543
### PaymentGroup

Top-level object that groups all the payment transactions that have been processed an order or contract. PaymentGroup is a standalone object, so it isn’t required for users to execute payment transactions (authorizations, captures, refunds, and sales). This object is available in API version 48.0 and later.

#### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

#### Special Access Rules

To access Commerce Payments entities, your org must have a Salesforce Order Management license with the Payment Platform org permission activated. Commerce Payments entities are available only in Lightning Experience.

</tbody>
</table>
Usage

Use a payment line to apply all or part of a payment’s balance to an invoice. The PaymentLineInvoice object represents the balance taken from the payment and applied toward the invoice. You can apply a payment’s balance when you create the payment record or afterward. The payment line must have the same currency as the parent payment.

A payment line has an amount, which represents the total amount taken from the payment, and balance, which represents the remaining amount after the payment line has been applied to an invoice. A payment’s amount can’t be less than the sum of all of its payment line amounts.

One payment can have multiple payment lines. A payment line must be related to only payment.
You can create multiple payment lines on a payment apply each line to different invoices on the same account, or to invoices on different accounts.

Here's one way you could use Salesforce API to apply a payment to an invoice using a payment line.

**PaymentMethod**

The method that a buyer uses to compensate the seller of a good or service. Common payment methods include cash, checks, credit or debit cards, money orders, bank transfers, and online payment services. This object is available in API version 48.0 and later.

**Supported Calls**

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

**Special Access Rules**

To access Commerce Orders entities, your org must have a Salesforce Order Management license. Commerce Orders entities are available only in Lightning Experience.

## Standard Objects

### PaymentMethodPostalCode
**Type:** string  
**Properties:** Filter, Group, Nillable, Sort  
**Description:** Part of the address for this payment method.

### PaymentMethodState
**Type:** string  
**Properties:** Filter, Group, Nillable, Sort  
**Description:** Part of the address for this payment method.

### PaymentMethodStreet
**Type:** textarea  
**Properties:** Filter, Group, Nillable, Sort  
**Description:** Part of the address for this payment method.

### Status
**Type:** picklist  
**Properties:** Filter, Group, Restricted picklist, Sort  
**Description:** The state of the payment method. Possible values are:  
- **Active**—The Payments Platform can use the payment method to make payments.  
- **Canceled**—The Payments Platform can no longer use the payment method to make payments.  
- **InActive**—The Payments Platform currently can’t use the payment method to make payments. Admins can change this value to Active when needed.

### PendingServiceRouting

Represents a work assignment that’s waiting to be routed. This object is available in API version 40.0 and later.
## Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

## Special Access Rules

To access this object, Omni-Channel must be enabled.

## Fields

|                  | **Description**
|                  | ID of the work item.                                                    |
Usage
When you use PendingServiceRouting objects for queue-based routing, the PendingServiceRouting objects don’t invoke triggers before or after insert, or any action (trigger, workflow rule, validation) that could interfere with the creation of the PendingServiceRouting object.

Associated Objects
This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- PendingServiceRoutingOwnerSharingRule
  - Sharing rules are available for the object.
- PendingServiceRoutingShare
  - Sharing is available for the object.

PendingServiceRoutingInteractionInfo

Represents PendingServiceRouting interaction information that’s used when work is routed to an agent. For a screen pop, it specifies which records to open when work is routed to an agent from a specific channel. PendingServiceRoutingInteractionInfo is read-only. This object is available in API version 53.0 and later.

Supported Calls
- describeSObjects(), query(), retrieve()

Special Access Rules
To access this object, Omni-Channel must be enabled. To view this object, you must have the “Manage Flow” user permission.

</tbody>
</table>
### Field Details

**Properties**
Filter, Group, Nillable, Restricted picklist, Sort

**Description**
Indicates whether the period is of type Month, Quarter, Week, or Year. Label is the field value.

### Usage

In API version 36.0 and earlier, querying the Period object yields no results. In API version 37.0 and later, a query returns period records.

SEE ALSO:
- FiscalYearSettings

### PermissionSet

Represents a set of permissions that’s used to grant more access to one or more users without changing their profile or reassigning profiles. This object is available in API version 22.0 and later.

PermissionSet has a read-only child relationship with PermissionSetGroup. PermissionSet contains the aggregated permissions for the group.

You can use permission sets to grant access, but not to deny access.

### Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), search(), update(), upsert()

### Special Access Rules

As of Summer ’20 and later, only users who have one of these permissions can access this object:

- View Setup and Configuration
- Manage Session Permission Set Activations
- Assign Permission Sets
- Manage Profiles and Permission Sets

To view the following settings, assignments, and permissions for standard and custom objects in a specified permission set, the View Setup and Configuration permission is required:

- Client settings
- Field permissions
- Layout assignments
- Object permissions
- Permission dependencies
- Permission set tab settings

</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Type</th>
<th>reference</th>
</tr>
</thead>
</table>
Usage

Use the PermissionSet object to query existing permission sets.

For example, to search for all permission sets that contain the “Modify All Data” permission:

```sql
SELECT Name, PermissionsModifyAllData
FROM PermissionSet
WHERE PermissionsModifyAllData=true
```

When combined with the PermissionSetAssignment object, you can create a nested query that returns all users assigned to a particular permission like “Modify All Data”:

```sql
SELECT Name, (SELECT AssigneeId FROM Assignments)
FROM PermissionSet
WHERE PermissionsModifyAllData=true
```

If the permission set isn’t assigned to a user, you can also create or delete a permission set.

User Licenses

The user license controls the permissions that are available in a permission set.

Every permission set can be associated with a user license or permission set license. If you plan to assign a permission set to multiple users with different user and permission set licenses, leave LicenseId empty. If only users with one type of license use this permission set, set the LicenseId to that single user or permission set license. If you want a permission set associated with a permission set license, then set LicenseId to the permission set license. To get the LicenseId, run this query:

```sql
SELECT Id, Name
FROM UserLicense
```

Alternatively, to query a user or profile for the LicenseId:

```sql
SELECT Id, Profile.UserLicenseId
FROM User
```
**Child Objects**

When using the API, think of each permission set or related set of access controls as an empty container that you fill with permission records.

In the API, a permission set can contain user, object, and field permissions, and setup entity access settings for other settings, such as Apex classes.

- ObjectPermissions and FieldPermissions objects are available in API version 24.0 and later.
- The SetupEntityAccess object is available in API version 25.0 and later.
- The PermissionSetGroupComponent object is available in API version 45 and later.

Only user permissions are managed in the PermissionSet API object; all other permission types are managed in child API objects.

In these child objects, access is stored in a record, while the absence of a record indicates no access. To return a record in a SOQL query, a minimum permission or setting is required for each child object.

Because permissions are stored in related objects, it's important to understand what questions to ask when using SOQL. For example, let's say you want to know which permission sets have "Delete" on an object. You also want to know which ones include permissions that allow approval of a return merchandise authorization (where the approval checkbox is controlled with field permissions). Asking the right questions when using SOQL with permission sets ensures that you get the information you need, such as whether to migrate permissions or assign a permission set to a user.

For example, the following returns all permission sets where the "Read" permission is enabled for the Merchandise__c object.

```sql
SELECT SobjectType, ParentId, PermissionsRead
FROM ObjectPermissions
WHERE PermissionsRead = True AND SobjectType = 'Merchandise__c'
```

You can query for all permission sets that have "Read" on an object. However, you can't query for permission sets that have no access on an object, because no records exist for that object. For example, the following returns no records because the object must have at least "Read" to return any records.

```sql
SELECT SobjectType, ParentId, PermissionsRead
FROM ObjectPermissions
WHERE PermissionsRead = False AND SobjectType = 'Merchandise__c'
```

If you have at least the "Read" permission on an object, you can create a conditional query on other permissions in the same object. For example, the following returns any records where the object has at least the "Read" permission but not the "Edit" permission.

```sql
SELECT ParentId, PermissionsRead, PermissionsEdit
FROM ObjectPermissions
WHERE PermissionsEdit = False AND SobjectType = 'Merchandise__c'
```

To set an object or field permission to no access, delete the record that contains the permission. For example, to disable all object permissions in the Merchandise__c object for a particular permission set, first query to retrieve the ID of the object permission record.

```sql
SELECT Id
FROM ObjectPermissions
WHERE SobjectType = 'Merchandise__c'
```

Then delete the IDs returned from the query.

⚠️ **Note:** If you try to update the object or field permissions by setting all permissions to false, the permission record is automatically deleted. Any subsequent queries for the record ID won’t return results and you must add a new permission record to grant access.
View a Permission Set with Nested Queries

You can build on the `PermissionSet` object using child relationships that show all of the permissions in a single permission set. For example, the following returns all permission sets and displays the “Transfer Leads” permission, as well as any “Read” permissions on any objects and fields.

```
SELECT Label, PermissionsTransferAnyLead,
     (SELECT SobjectType, PermissionsRead FROM ObjectPerms),
     (SELECT SobjectType, Field, PermissionsRead FROM FieldPerms)
FROM PermissionSet
```

Associated Profiles

In API version 25.0 and later, every profile is associated with a permission set that stores the profile’s user, object, and field permissions, as well as setup entity access settings. You can query permission sets that are owned by profiles but not modify them.

The following example returns all permission sets, including those owned by a profile.

```
SELECT Id, Label, ProfileId, Profile.Name
FROM PermissionSet
```

The following returns all permission sets except those permissions owned by profiles.

```
SELECT Id, Label, ProfileId, Profile.Name, IsOwnedByProfile
FROM PermissionSet
WHERE IsOwnedByProfile = FALSE
```

Because permission sets have child objects in the API, you can query their values on permission sets owned by a profile. For example, the following returns all enabled object permission records for profiles only.

```
SELECT Id,ParentId, PermissionsRead, SobjectType, Parent.ProfileId
FROM ObjectPermissions
WHERE Parent.IsOwnedByProfile = TRUE
```

Once you have the IDs for permission sets that are owned and not owned by profiles, use the `PermissionSetAssignment` object to see if users can access objects or fields via their profile permissions or their permission sets. For example, the following SOQL query returns all users who have the “Read” permission on the `Merchandise__c` object. It also specifies whether the permission is granted through a profile or permission set.

```
SELECT Assignee.Name, PermissionSet.Id, PermissionSet.isOwnedByProfile
FROM PermissionSetAssignment
WHERE PermissionSetId
IN (SELECT ParentId
FROM ObjectPermissions
WHERE SObjectType = 'Merchandise__c' AND PermissionsRead = true)
```
Note: For permission sets that are owned by profiles, don't use Name and Label values that are returned in a query. Name and Label values from queries can change.

SEE ALSO:
- ObjectPermissions
- FieldPermissions
- SetupEntityAccess
- PermissionSetAssignment
- Profile

PermissionSetAssignment

Represents the association between a User and a PermissionSet. This object is available in API version 22.0 and later.

Supported Calls
- create(), delete(), describeSObjects(), query(), retrieve(), update()

Special Access Rules
As of Summer '20 and later, only users who have one of these permissions can access this object:
- View Setup and Configuration
- Assign Permission Sets
- Manage User

## Usage

### Finding Permission Set Assignments

Use the PermissionSetAssignment object to query permission set assignments to find out which permission sets are assigned to which users. Because each user can be assigned to many permission sets and each permission set can be assigned to many users, each PermissionSetAssignment ID represents the association of a single user and single permission set.

For example, to search for all permission sets assigned to a particular user:

```sql
SELECT Id, PermissionSetId
FROM PermissionSetAssignment
WHERE AssigneeId = '005600000017cKt'
```

To search for all users assigned to a particular permission set:

```sql
SELECT Id, AssigneeId
FROM PermissionSetAssignment
WHERE PermissionSetId = '0PS30000000000e'
```

You can also create a new permission set assignment, or use delete to remove a permission set that's assigned to a user. To update an assignment, delete an existing assignment and insert a new one.

### User Licenses

When assigning a permission set, if the PermissionSet has a `UserLicenseId`, its `UserLicenseId` and the Profile `UserLicenseId` must match. To determine a user's license assignment, query the user's profile and then query the profile's license.

For example, to find a user's profile ID:

```sql
SELECT Id, ProfileId
FROM User
WHERE Id = '005D0000001GMAT'
```

To find a permission set's `UserLicenseId`:

```sql
SELECT Id, LicenseId
FROM PermissionSet
WHERE Id = '0PS30000000000e'
```

If the IDs match, the assignment succeeds.
To find all the permission sets with no license that are assigned to any user:

```sql
SELECT Id, Assignee.Name, PermissionSet.Name
FROM PermissionSetAssignment
WHERE PermissionSet.LicenseId = null
```

SEE ALSO:

- **PermissionSet**

### PermissionSetGroup

Represents a group of permission sets and the permissions within them. Use permission set groups to organize permissions based on job functions or tasks. Then, you can package the groups as needed. This object is available in API version 45.0 and later.

#### Supported Calls

- `create()`, `delete()`, `describeSObject()`, `query()`, `retrieve()`, `update()`, `upsert()`

#### Special Access Rules

As of Summer '20 and later, only users who have one of these permissions can access this object:

- View Setup and Configuration
- Manage Session Permission Set Activations
- Assign Permission Sets

#### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>

</tr>
</tbody>
</table>
| HasActivationRequired | **Type**  
  boolean   
  **Properties**  
  Create, Defaulted on create, Filter, Group, Sort, Update   
  **Description**  
  Indicates whether the permission set group requires an associated active session (true) or not (false). The default value is false. This field is available in API version 53.0 and later. |
| Language            | **Type**  
  picklist   
  **Properties**  
  Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update   
  **Description**  
  The Permission Set Group language. Possible values are:  
  - da (Danish)  
  - de (German)  
  - en_US (English)  
  - es (Spanish)  
  - es_MX (Spanish - Mexican)  
  - fi (Finnish)  
  - fr (French)  
  - it (Italian)  
  - ja (Japanese)  
  - ko (Korean)  
  - nl_NL (Dutch)  
  - no (Norwegian)  
  - pt_BR (Portuguese - Brazilian)  
  - ru (Russian)  
  - sv (Swedish)  
  - th (Thai)  
  - zh_CN (Chinese - Simplified)  
  - zh_TW (Chinese - Traditional) |
| MasterLabel         | **Type**  
  string   
  **Properties**  
  Create, Filter, Group, Sort, Update |
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>The permission set group label for the aggregated permissions.</td>
</tr>
<tr>
<td>NamespacePrefix</td>
<td>Type: string - Properties: Filter, Group, Nillable, Sort - Description: The permission set group namespace prefix.</td>
</tr>
<tr>
<td>Status</td>
<td>Type: picklist - Properties: Defaulted on create, Filter, Group, Restricted picklist, Sort - Description: Indicates permission set group recalculation status. - Updated: The group is current. - Outdated: The group requires recalculation. - Updating: The group is in recalculation mode. - Failed: The group recalculation failed.</td>
</tr>
</tbody>
</table>

**Usage**

Use the PermissionSetGroup object to query existing permission set groups and to find which aggregated permissions are included in the group.

For example, to search for all object permissions in a permission set group named StandardAccountingUsers:

```sql
SELECT SObjectType FROM ObjectPermissions WHERE Parent.PermissionSetGroup.DeveloperName = 'StandardAccountingUsers'
```

To create a permission set group using REST API, you can submit a POST request:

```json
POST /services/data/v45.0/tooling/objects/PermissionSetGroup/
{
  "DeveloperName":"Sales", "MasterLabel": "sales_label"
}
```
PermissionSetGroupComponent

A junction object that relates the PermissionSetGroup and PermissionSet objects via their respective IDs; enables permission set group recalculation to determine the aggregated permissions for the group. This object is available in API version 45.0 and later.

PermissionSetGroupComponent is a child object of PermissionSet and PermissionSetGroup.

Supported Calls

create(), delete(), describeSObject(), query(), retrieve()

Special Access Rules

As of Spring '20 and later, only users with the "View Setup and Configuration" permission can access this object.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>PermissionSetGroupId</td>
<td>Type reference</td>
</tr>
<tr>
<td></td>
<td>Properties Create, Filter, Group, Sort</td>
</tr>
<tr>
<td></td>
<td>Description The unique permission set group ID. This is a relationship field.</td>
</tr>
<tr>
<td></td>
<td>Relationship Name PermissionSetGroup</td>
</tr>
<tr>
<td></td>
<td>Relationship Type Lookup</td>
</tr>
<tr>
<td></td>
<td>Refers To PermissionSetGroup</td>
</tr>
<tr>
<td>PermissionSetId</td>
<td>Type reference</td>
</tr>
<tr>
<td></td>
<td>Properties Create, Filter, Group, Sort</td>
</tr>
<tr>
<td></td>
<td>Description The unique permission set ID of a permission set in a permission set group. This is a relationship field.</td>
</tr>
<tr>
<td></td>
<td>Relationship Name PermissionSet</td>
</tr>
</tbody>
</table>
Use the PermissionSetGroupComponent object to add members to or delete members from a permission set group, or to query for group members.

PermissionSetLicense

Represents a license that's used to enable one or more users to receive a specified permission without changing their profile or reassigning profiles. You can use permission set licenses to grant access, but not to deny access. This object is available in API version 29.0 and later.

Supported Calls

describeLayout(), describeSObjects(), query(), retrieve()

Special Access Rules

As of Spring '20 and later, only your Salesforce org's internal users can access this object.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DeveloperName</td>
<td>Type: string, Properties: Filter, Group, Sort, Description: The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record.</td>
</tr>
</tbody>
</table>
### Field Name

<table>

</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>TotalLicenses</th>
<th>Type</th>
<th>int</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Filter, Group, Sort</td>
<td></td>
</tr>
<tr>
<td>Description</td>
<td>The total number of this permission set license that are available to your organization.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>UsedLicenses</th>
<th>Type</th>
<th>int</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Filter, Group, Sort</td>
<td></td>
</tr>
<tr>
<td>Description</td>
<td>The number of this permission set license that are currently assigned to users.</td>
<td></td>
</tr>
</tbody>
</table>

### Usage

Users with the “View Setup and Configuration” permission can use the PermissionSetLicense object to view the set of currently defined permission set licenses in your organization.
Use the PermissionSetLicense object to query existing permission licenses.

For example, to return a list of all active permission set licenses:

```sql
SELECT MasterLabel
FROM PermissionSetLicense
WHERE Status = 'Active'
```

When combined with the PermissionSetLicenseAssign object, you can create a nested query that returns all users assigned to a particular permission set license like “Identity Connect”:

```sql
SELECT MasterLabel, (SELECT AssigneeId FROM PermissionSetLicenseAssignments)
FROM PermissionSetLicense
WHERE MaximumPermissionsIdentityConnect=true
```

SEE ALSO:

- [PermissionSetLicenseAssign](#)

## PermissionSetLicenseAssign

Represents the association between a User and a PermissionSetLicense. This object is available in API version 29.0 and later.

**Note:** The relationship name for PermissionSetLicenseAssign is `PermissionSetLicenseAssignments`.

### Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

### Special Access Rules

As of Summer '20 and later, only users who have one of these permissions can access this object:

- View Setup and Configuration
- Assign Permission Sets

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AssigneeId</td>
<td></td>
</tr>
</tbody>
</table>

**Type**

reference

**Properties**

Create, Filter, Group, Sort

**Description**

ID of the User to assign the permission set license specified in `PermissionSetLicenseId`.

This is a relationship field.
Usage

Use the PermissionSetLicenseAssign object for querying permission set license assignments to find out which permission set licenses are assigned to which users. Because each user can be assigned to many permission set licenses, each PermissionSetLicenseAssign ID represents the association of a single user and single permission set license.

For example, to search for all of the permission sets assigned to a particular user:

```
SELECT Id, PermissionSetLicenseId
FROM PermissionSetLicenseAssign
WHERE AssigneeId = '005D0000001RFek'
```

To search for all users assigned to a particular permission set license:

```
SELECT AssigneeId
FROM PermissionSetLicenseAssign
WHERE PermissionSetLicenseId = '0PLD000000003mwOAA'
```

You can also create a new permission set license assignment, or use delete to remove a permission set license that’s been assigned to a user. To update an assignment, delete an existing assignment and insert a new one.

SEE ALSO:

PermissionSetLicense
PermissionSetTabSetting

Represents a permission set tab setting. Requires the View Setup permission. Use this object to query all tab settings of the permission set. This object is available in API version 45.0 and later.

Supported Calls

- create()
- delete()
- describeSObjects()
- query()
- retrieve()
- update()
- upsert()

Special Access Rules

As of Spring '20 and later, only users with "View Setup and Configuration" permission can access this object.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Group, Sort</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The tab name.</td>
</tr>
<tr>
<td>ParentId</td>
<td><strong>Type</strong> reference</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Group, Sort</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The permission set Id. This is a relationship field.</td>
</tr>
<tr>
<td></td>
<td><strong>Relationship Name</strong> Parent</td>
</tr>
<tr>
<td></td>
<td><strong>Relationship Type</strong> Lookup</td>
</tr>
<tr>
<td></td>
<td><strong>Refers To</strong> PermissionSet</td>
</tr>
<tr>
<td>Visibility</td>
<td><strong>Type</strong> picklist</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Group, Restricted picklist, Sort, Update</td>
</tr>
</tbody>
</table>
Details

### Field Name

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>

<td>Indicates whether the tab is visible by default. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• DefaultOff</td>
</tr>
<tr>
<td></td>
<td>• DefaultOn</td>
</tr>
</tbody>
</table>

### Usage

Use the `PermissionSetTabSetting` object to find tab setting visibility settings, parent permission sets, and so forth.

For example, to find the visibility setting of a tab named “standard-Lead,” do something like the following.

```sql
SELECT Visibility
FROM PermissionSetTabSetting
WHERE Name = 'standard-Lead'
```

### PersonalizationTargetInfo

Represents a target for an audience. This object is available in API version 47.0 and later.

#### Supported Calls

describeSObjects(), query(), retrieve()

#### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ContainerId</strong></td>
<td>Type: reference</td>
</tr>
<tr>
<td></td>
<td>Properties: Filter, Group, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: ID of the Experience Cloud site or org that contains the target.</td>
</tr>
</tbody>
</table>

<p>| <strong>DraftRowId</strong> | Type: reference |
|               | Properties: Filter, Group, Nillable, Sort |

**PipelineInspectionListView**

Represents a pipeline view or saved filter. A pipeline view specifies a set of opportunity records, based on specific criteria. This object is available in API version 53.0 and later.
Supported Calls

create(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

To access this object, enable the Pipeline Inspection user permission and the Pipeline Inspection setting. To create and modify list views, users must have the Create and Customize List Views permission. To create and modify public list views, users must have the Manage Public List Views permission.

Fields

<table>

</table>

**PlatformAction**

PlatformAction is a virtual read-only object. It enables you to query for actions displayed in the UI, given a user, a context, device format, and a record ID. Examples include standard and custom buttons, quick actions, and productivity actions.
**Supported Calls**

describeSObjects(), query()

**Fields**

<table>
<thead>

<td>• <strong>QuickAction</strong>—A global or object-specific action.</td>
</tr>
<tr>
<td></td>
<td>• <strong>StandardButton</strong>—A predefined Salesforce button such as New, Edit, and Delete.</td>
</tr>
</tbody>
</table>

### Usage

PlatformAction can be described using `describeSObjects()`. You can directly query for PlatformAction. For example, this query returns all fields for actions associated with each of the records of the listed objects:

```sql
SELECT ExternalId, ActionTargetType, ActionTargetUrl, ApiName, Category, ConfirmationMessage, ExternalId, GroupId, UiTheme, IconUrl, IconContentType,
```
IconHeight, IconWidth, PrimaryColor, InvocationStatus, InvokedByUserId, IsGroupDefault, Label, LastModifiedDate, Subtype, SourceEntity, Type
FROM PlatformAction
WHERE SourceEntity IN ('001xx000003DGsH', '001xx000003DHBq', 'Task') AND ActionListContext = 'Record';

Note: To query PlatformAction, provide the ActionListContext and SourceEntity. If you query for ActionListContext with a value of RelatedList, and don't specify a RelatedSourceEntity, the query returns the API name of the related list. In API v43.0 and before, SourceEntity = 'Object API Name' and ActionListContext = 'ListView' is an invalid combination to fetch quick actions in a SOQL query. Use SourceEntity = 'Object ID' and ActionListContext = 'ListView' instead.

This query uses multiple ActionListContext values in its WHERE clause to return all actions in the Lightning Experience user interface (DeviceFormat = 'Desktop') for the specified object:

SELECT ActionListContext, Label, Type, Subtype, Section, SourceEntity, RelatedSourceEntity, ActionTarget, ActionTargetType, ApiName, Category, ConfirmationMessage, DeviceFormat, ExternalId, GroupId, IconContentType, IconHeight, IconUrl, IconWidth, Id, InvocationStatus, InvokedByUserId, IsGroupDefault, LastModifiedDate, PrimaryColor
FROM PlatformAction
WHERE ActionListContext IN ('Record','Chatter','RelatedList') AND SourceEntity = '001xx000003DlvX' AND DeviceFormat = 'Desktop'

PlatformEventUsageMetric

Contains usage data for event publishing and CometD-client delivery. Usage data is available for the last 24 hours, ending at the last hour, and for historical daily usage. PlatformEventUsageMetric contains separate usage metrics for platform events and change data capture events. This object is available in API version 50.0 and later.

Supported Calls
describeSObjects(),query()

</table>
Usage

For more information, see Monitor Platform Event Publishing and Delivery Usage in the Platform Events Developer Guide.

PlatformStatusAlertEvent

The documentation has moved to PlatformStatusAlertEvent in the Platform Events Developer Guide.

PortalDelegablePermissionSet

PortalDelegablePermissionSet is a base platform object used to store permission sets that can be assigned by a delegated portal/external user admin (DPUA) to portal users. This object is available in API version 47.0 and later.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Fields

<table>

</tr>
</tbody>
</table>
### PresenceConfigDeclineReason

Represents the settings for a decline reason that a presence user provides when declining work. This object is available in API version 37.0 and later.

#### Supported Calls

create(), delete(), describeSObjects(), update(), query(), retrieve()

#### Special Access Rules

To access this object, **Omni-Channel** must be enabled.

As of Spring ’20 and later, only authenticated internal and external users can access this object.
Fields

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

PresenceDeclineReason

Represents an Omni-Channel decline reason that agents can select when declining work requests. This object is available in API version 37.0 and later.

⚠️ Important: Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

Supported Calls

create(), delete(), describeSObjects(), update(), query(), retrieve()

Special Access Rules

To access this object, Omni-Channel must be enabled.
As of Spring ’20 and later, only authenticated internal and external users can access this object.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DeveloperName</td>
<td>Type string</td>
</tr>
<tr>
<td></td>
<td>Properties</td>
</tr>
<tr>

<td>Create, Filter, Group, Sort</td>
</tr>
</tbody>
</table>
**DetailsField**

**Description**
The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization.

**Note:** When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance slows down while Salesforce generates one for each record.

**Note:** Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.

**PresenceUserConfig**

Represents a configuration that determines a presence user’s settings. This object is available in API version 32.0 and later.

**Supported Calls**

`create(), delete(), describeSObjects(), update(), query(), retrieve()`

**Special Access Rules**

To access this object, Omni-Channel must be enabled.

As of Spring ’20 and later, only authenticated internal and external users can access this object.

</tr>
</tbody>
</table>
PriceAdjustmentSchedule

Represents a series of tiered discounts based on the number of items purchased. This object is available in API version 47.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

This object is available only if the B2B Commerce license is enabled.

<td>Create, Defaulted on create, Filter, Group, Sort, Update</td>
</tr>
</tbody>
</table>
Usage

As you create a PriceAdjustmentSchedule, you associate PriceAdjustmentTiers with it. A PriceAdjustmentSchedule is inactive until at least one PriceAdjustmentTier is added to it. A PriceAdjustmentSchedule comprises all related PriceAdjustmentTiers, with a limit of 25.

To use PriceAdjustmentSchedule, associate it with a PriceBookEntry.
A PriceBookEntry can be associated with up to five PriceAdjustmentSchedules, but only one PriceAdjustmentSchedule can be associated with a PriceBookEntry.

When you activate or deactivate a PriceAdjustmentSchedule, its PriceBookEntry association is also activated or deactivated.

An adjustment to a PriceBookEntry is applied only if the associated PriceAdjustmentSchedule is active.

After a PriceAdjustmentSchedule is associated with a PriceBookEntry, if multicurrency is enabled, the currencyIsoCode field can’t be modified.

When you associate a PriceAdjustmentSchedule with a PricebookEntry, a junction object PricebookEntryAdjustment is created. The PriceAdjustmentTier object and the ScheduleType and AdjustmentMethod fields can be modified only when a PriceAdjustmentSchedule is inactive.

**PriceAdjustmentTier**

Represents a discount tier in a price adjustment schedule. This object is available in API version 47.0 and later.

**Supported Calls**

create(), delete(), describesSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

**Special Access Rules**

This object is available only if the B2B Commerce license is enabled.

**Fields**

<td><strong>Description</strong> The value of the discount.</td>
</tr>
<tr>
<td>UpperBound</td>
<td><strong>Type</strong> double</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Nullable, Sort, Update</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The maximum quantity the discount can be applied to. Must be a positive integer. Not inclusive. Set this value one digit higher than the quantity you want the tier to include. For example, if a tier’s upper bound is 99, set the value of UpperBound to 100. For the last tier, the value is optional.</td>
</tr>
</tbody>
</table>

**Usage**

To use PriceAdjustmentTiers, associate them with a PriceAdjustmentSchedule.
Tiers can’t overlap, and no gaps are allowed between tiers.

SEE ALSO:

PriceAdjustmentSchedule

**Pricebook2**

Represents a price book that contains the list of products that your org sells.

黨  Note: Price books are represented by Pricebook2 objects. As of API version 8.0, the Pricebook object is no longer available. Requests containing Pricebook are refused, and responses don’t contain the Pricebook object.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

</tbody>
</table>
Usage

A price book is a list of products that your org sells.

- Each org has one standard price book that defines the standard or generic list price for each product or service that it sells.
- An org can have multiple custom price books to use for specialized purposes, such as for discounts, different channels or markets, or select accounts or opportunities. While your client application can create, delete, and update custom price books, your client application can only update the standard price book.
- For some orgs, the standard price book is the only price needed. If you set up other price books, you can reference the standard price book when setting up list prices in custom price books.

Use this object to query standard and custom price books that have been configured for your org. A common use of this object is to allow your client application to obtain valid Pricebook2 object IDs for use when configuring PricebookEntry records via the API.

Your client application can perform the following tasks on PricebookEntry objects:

- Query
- Create for the standard price book or custom price books.
- Update
- Delete
- Change the IsActive field when creating or updating records

PriceBook2, Product2, and PricebookEntry Relationships

In the API:

- Price books are represented by Pricebook2 records (as of version 8.0, the Pricebook object is no longer available).
- Products are represented by Product2 records (as of version 8.0, the Product object is no longer available).
- Each price book contains zero or more entries (represented by PricebookEntry records) that specify the products that are associated with the price book. A price book entry defines the price for which you sell a product at a particular currency.
These objects are defined only for those orgs that have products enabled as a feature. If the org doesn’t have the products feature enabled, the Pricebook2 object doesn’t appear in the describeGlobal() call, and you can’t access it via the API.

If you delete a Pricebook2 while a line item references PricebookEntry in the price book, the line item is unaffected, but the Pricebook2 is archived and unavailable from the API.

For a visual diagram of the relationships between Pricebook2 and other objects, see Product and Price Book Objects.

**Price Book Setup**

The process of setting up a price book via the API usually means:

1. Load product data into Product2 records (creating one Product2 record for each product that you want to add).
2. For each Product2 record, create a PricebookEntry that links the Product2 record to the standard Pricebook2. Define a standard price for a product at a given currency (if you have multicurrency enabled) before defining a price for that product in the same currency in a custom price book.
3. Create a Pricebook2 record to represent a custom price book.
4. For each Pricebook2 record, creating a PricebookEntry for every Product2 that you want to add, specifying unique properties for each PricebookEntry (such as the UnitPrice and CurrencyIsoCode) as needed.

**Code Sample—Java**

```java
public void pricebookSample() {
    try {
        //Create a custom pricebook
        Pricebook2 pb = new Pricebook2();
        pb.setName("Custom Pricebook");
        pb.setIsActive(true);
        SaveResult[] saveResults = connection.create(new SObject[]{pb});
        pb.setId(saveResults[0].getId());

        // Create a new product
        Product2 product = new Product2();
        product.setIsActive(true);
        product.setName("Product");
        saveResults = connection.create(new SObject[]{product});
        product.setId(saveResults[0].getId());

        // Add product to standard pricebook
        QueryResult result = connection.query("select Id from Pricebook2 where isStandard=true");
        SObject[] records = result.getRecords();
        String stdPbId = records[0].getId();

        // Create a pricebook entry for standard pricebook
        PricebookEntry pbe = new PricebookEntry();
        pbe.setPricebook2Id(stdPbId);
        pbe.setProduct2Id(product.getId());
        pbe.setIsActive(true);
        pbe.setUnitPrice(100.0);
        saveResults = connection.create(new SObject[]{pbe});
    }
}
```
// Create a pricebook entry for custom pricebook
pbe = new PricebookEntry();
pbe.setPricebook2Id(pb.getId());
pbe.setProduct2Id(product.getId());
pbe.setIsActive(true);
pbe.setUnitPrice(100.0);
saveResults = connection.create(new SObject[]{pbe});
} catch (ConnectionException ce) {
    ce.printStackTrace();
}

</tr>
</tbody>
</table>
DetailsField

Field | Details
--- | ---
OldValue | Type
 | anyType
Properties | Nillable, Sort
Description | Previous value of the modified price book field. Maximum of 255 characters.

Usage

Price book history entries are indirectly created each time a price book is modified.

Two rows are added to this record when foreign key fields change. One row contains the foreign key object names that display in the online application. For example, Jane Doe is recorded as the name of a Contact. The other row contains the actual foreign key ID that is only returned to and visible from the API.

This object respects field level security on the parent object.

SEE ALSO:
Pricebook2

PricebookEntry

Represents a product entry (an association between a Pricebook2 and Product2) in a price book.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Fields

Field | Details
--- | ---
ActivePriceAdjustmentQuantity | Type
 | int
Properties | Filter, Group, Nillable, Sort
Description | The count of active price adjustment schedules associated with the price book entry. This field is available in API version 49.0 and later.
<table>

### Description

**CurrencyIsoCode**

- **Type**: picklist
- **Properties**: Create, Defaulted on create, Filter, Group, Restricted picklist, Sort
- **Description**: Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.

**IsActive**

- **Type**: boolean
- **Properties**: Create, Defaulted on create, Filter, Group, Sort, Update
- **Description**: Indicates whether this price book entry is active (true) or not (false). Although you can never delete PricebookEntry records, your client application can set this flag to false. Inactive PricebookEntry records are hidden in many areas in the user interface. You can change this flag on a PricebookEntry record as often as necessary.

**IsArchived**

- **Type**: boolean
- **Properties**: Defaulted on create, Filter, Group, Sort
- **Description**: Indicates whether the PricebookEntry has been archived (true) or not (false). This is set to true when the Product2 record it’s associated with is archived, or when the Pricebook2 record is archived. This field is read only. Available in API version 45.0 and later. Label is Archived.

**Name**

- **Type**: string
- **Properties**: Filter, Group, Nillable, Sort
- **Description**: Name of this PricebookEntry record. This read-only field references the value in the Name field of the Product2 record. Label is Product Name.

**Pricebook2Id**

- **Type**: reference
- **Properties**: Create, Filter, Group, Sort

<tr>
<td><strong>Description</strong></td>
<td>Indicates whether this price book entry uses the standard price defined in the standard Pricebook2 record (true) or not (false). If set to true, then the UnitPrice field is read-only, and the value will be the same as the UnitPrice value in the corresponding PricebookEntry in the standard price book (that is, the PricebookEntry record whose Pricebook2Id refers to the standard price book and whose Product2Id and CurrencyIsoCode are the same as this record). For PricebookEntry records associated with the standard Pricebook2 record, this field must be set to true.</td>
</tr>
</tbody>
</table>

**Usage**

Use this object to define the association between your organization’s products (Product2) and your organization’s standard price book or to other, custom-defined price books (Pricebook2). Create one PricebookEntry record for each standard or custom price and currency combination for a product in a Pricebook2.

When creating these records, you must specify the IDs of the associated Pricebook2 record and Product2 record. Once created, your client application can’t update these IDs.

This object is defined only for those organizations that have products enabled as a feature. If the organization does not have the products feature enabled, then the PricebookEntry object does not appear in the `describeGlobal()` call, and you can’t access it.

If you delete a PriceBookEntry while a line item references it, the line item is unaffected, but the PriceBookEntry will be archived and unavailable from the API. Deleted PriceBookEntry records can’t be recovered.

You must load the standard price for a product before you are permitted to load its custom price(s).

**Associated Objects**

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**PricebookEntryHistory**

History is available for tracked fields of the object.

**PricebookEntryAdjustment**

Read-only junction object created when you associate a price adjustment schedule with a price book entry. This object is available in API version 47.0 and later.
Supported Calls
create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules
This object is available only if the B2B Commerce license is enabled.

*2625*
Details

Description
The type of this process.
- Approval Process—Used to control the action taken for a record.
- State-based Process—Used internally to track various control processes, such as for developing Salesforce Knowledge articles.

Usage
Use this object to read the description of an approval process. The definition is read-only.

ProcessException

Represents a processing failure on an order summary. A separate process is required to resolve the failure that caused the process exception before order summary processing can continue. This object is available in API version 50.0 and later.

Supported Calls
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

### Description
Severity category of the ProcessException. Each severity category corresponds to one or more severity values. The severity category is used to show the severity icon in the ProcessException list view.

Possible values are:
- High
- Low

### Status

#### Type
picklist

#### Properties
Create, Defaulted on create, Filter, Group, Sort, Update

#### Description
Status of the ProcessException. Each status corresponds to one status category, shown here in parentheses. You can customize the status picklist to represent your business processes. If you customize the status picklist, include at least one status value for each status category.

Possible values are:
- Ignored (Inactive)
- New (Active)
- Paused (Inactive)
- Resolved (Resolved)
- Triaged (Active)
- Voided (Inactive)

### StatusCategory

#### Type
picklist

#### Properties
Filter, Group, Restricted picklist, Sort

#### Description
Status category of the ProcessException. Each status category corresponds to one or more statuses.

Possible values are:
- ACTIVE
- INACTIVE
- RESOLVED

### Associated Objects
This object has the following associated objects. Unless noted, they are available in the same API version as this object.
**ProcessExceptionOwnerSharingRule**
Sharing rules are available for the object.

**ProcessExceptionShare**
Sharing is available for the object.

---

**ProcessInstance**

Represents an instance of a single, end-to-end approval process. Use this and the node, step, and workitem process instance objects to create approval history reports.

*Note: Exceptions apply to approval history data retrieved with this object and available only via the SOAP API. For each approval process instance that was pending when Summer ’14 became available for your organization, some field values are never populated or are populated only after the approval process instance is next acted upon—such as when a user approves, rejects, or reassigns an approval request—after the Summer ’14 rollout.*

For approval process instances that were completed before the Summer ’14 rollout, all Process Instance fields are automatically populated, with one exception: `CompletedDate` is never populated for approval process instances that were completed before January 1, 2013. For approval process instances that were pending during the Summer ’14 rollout, all ProcessInstance fields are automatically populated, with two exceptions: `CompletedDate` and `LastActorId` are populated only after the approval process instance is complete.

---

**Supported Calls**
describeSObjects(), query(), retrieve()

Usage

Use this object to query or retrieve an approval process.

The following SOQL query returns details for all the ProcessInstanceStep records related to individual ProcessInstance records. The nested query references Steps, which is the child relationshipName for ProcessInstanceStep in the ProcessInstance object.

```
SELECT Id, (SELECT Id, StepStatus, Comments FROM Steps)
FROM ProcessInstance
```

The following SOQL query returns details for all the ProcessInstanceWorkitem records related to individual ProcessInstance records. The nested query references Workitems, which is the child relationshipName for ProcessInstanceWorkitem in the ProcessInstance object.

```
SELECT Id, (SELECT Id, ActorId, ProcessInstanceId FROM Workitems)
FROM ProcessInstance
```

ProcessInstanceHistory can help provide a unified read-only view of the ProcessInstanceStep and ProcessInstanceWorkitem objects.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.
**ProcessInstanceHistory**
History is available for tracked fields of the object.

SEE ALSO:
- ProcessInstanceHistory
- ProcessInstanceStep
- ProcessInstanceWorkitem

**ProcessInstanceHistory**
This read-only object shows all steps and pending approval requests associated with an approval process (ProcessInstance).

**Supported Calls**

describeSObjects()

You can also enable `delete()` in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

**Usage**

This object helps you replicate the related list functionality of the Salesforce user interface for approval processes. Use ProcessInstanceHistory for a unified read-only view of the ProcessInstanceStep and ProcessInstanceWorkitem objects. You can’t query ProcessInstanceHistory. Instead, you can query ProcessInstanceHistory by including it in a nested query on the parent ProcessInstance object. For example, the following SOQL query returns all the ProcessInstanceHistory records related to individual ProcessInstance records. The nested query references StepsAndWorkitems, which is the child relationshipName for ProcessInstanceHistory in the ProcessInstance object.

```
SELECT Id, (SELECT Id, StepStatus, Comments FROM StepsAndWorkitems)
FROM ProcessInstance
```

This object respects field-level security on the parent object.

SEE ALSO:
- ProcessInstance
- ProcessInstanceStep
- ProcessInstanceWorkitem

**ProcessInstanceStep**

Represents one work item in an approval process (ProcessInstance).

Note: Exceptions apply to approval history data retrieved with this object and available only via the SOAP API. For each approval process instance that was pending when Summer ’14 became available for your organization, some field values are never populated.
or are populated only after the approval process instance is next acted upon—such as when a user approves, rejects, or reassigns an approval request—after the Summer ’14 rollout.

ProcessInstanceStep fields are never populated for approval process instances that were completed before the Summer ’14 rollout. For approval process instances that were pending during the Summer ’14 rollout, all ProcessInstanceStep fields are populated only after the approval process instance is next acted upon after the Summer ’14 rollout.

**Supported Calls**

describeSObjects(), query(), retrieve()

### StepNodeId

**Type**
- reference

**Properties**
- Filter, Group, Nillable, Sort

**Description**
- ID of the node currently assigned to this approval step.

### StepStatus

**Type**
- picklist

**Properties**
- Filter, Group, Nillable, Restricted picklist, Sort

**Description**
- The current status of this approval step.
  - Approved
  - Fault
  - Held
  - NoResponse
  - Pending
  - Reassigned
  - Rejected
  - Removed
  - Started

If the approval step requires unanimous approval and one approver rejects the request, the value of this field for the other approvers changes to NoResponse. Likewise, if approval is based on the first response and an approver responds, the value of this field for the other approvers changes to NoResponse.

### Usage

Query or retrieve a new step in an approval process (ProcessInstance).

SEE ALSO:
- ProcessInstance
- ProcessInstanceHistory
- ProcessInstanceWorkitem

### ProcessInstanceNode

Represents a step in an instance of an approval process. Compare to ProcessNode, which describes the step in a process definition. Use this object to retrieve approval history.
**Note:** Exceptions apply to approval history data retrieved with this object and available only via the SOAP API. For each approval process instance that was pending when Summer '14 became available for your organization, some field values are never populated or are populated only after the approval process instance is next acted upon—such as when a user approves, rejects, or reassigns an approval request—after the Summer '14 rollout.

ProcessInstanceNode fields are never populated for approval process instances that were completed before the Summer '14 rollout. For approval process instances that were pending during the Summer '14 rollout, all ProcessInstanceNode fields are populated only after the approval process instance is next acted upon after the Summer '14 rollout.

**Supported Calls**

### ProcessInstanceWorkitem

**ProcessInstanceWorkitem**

Represents a user’s pending approval request.

**Note:** Exceptions apply to approval history data retrieved with this object and available only via the SOAP API. For each approval process instance that was pending when Summer ’14 became available for your organization, some field values are never populated or are populated only after the approval process instance is next acted upon—such as when a user approves, rejects, or reassigns an approval request—after the Summer ’14 rollout.

ProcessInstanceWorkitem fields are never populated for approval process instances that were completed before the Summer ’14 rollout. For approval process instances that were pending during the Summer ’14 rollout, all ProcessInstanceWorkitem fields are populated after the approval process instance is next acted upon after the Summer ’14 rollout, with three exceptions: `ElapsedTimeInDays`, `ElapsedTimeInHours`, and `ElapsedTimeInMinutes` fields are never populated in ProcessInstanceWorkitem records for which equivalent ProcessInstanceStep records were created before the Summer ’14 rollout.

For all other ProcessInstanceWorkitem records, these three fields are populated after the approval process instance is next acted upon after the Summer ’14 rollout.

**Note:** Because ProcessInstanceHistory combines fields from ProcessInstanceStep and ProcessInstanceWorkitem, you may notice incorrect elapsed times of 0 in ProcessInstanceHistory records because the elapsed time fields were never populated in the related ProcessInstanceWorkitem record.

**Supported Calls**

delete(), describeSObjects(), query(), retrieve(), update()

|               | **Relationship Name**
|               | ProcessDefinition                                                      |
|               | **Relationship Type**
|               | Lookup                                                                  |
|               | **Refers To**
|               | ProcessDefinition                                                      |

## Usage

Use this object to get the description of a process definition.
The following SOQL query returns details for all the ProcessInstanceStep records related to individual ProcessInstance records. The nested query references Steps, which is the child relationshipName for ProcessInstanceStep in the ProcessInstance object.

```sql
SELECT Id, (SELECT Id, StepStatus, Comments FROM Steps)
FROM ProcessInstance
```

The following SOQL query returns details for all the ProcessInstanceWorkitem records related to individual ProcessInstance records. The nested query references Workitems, which is the child relationshipName for ProcessInstanceWorkitem in the ProcessInstance object.

```sql
SELECT Id, (SELECT Id, ActorId, ProcessInstanceId FROM Workitems)
FROM ProcessInstance
```

ProcessInstanceHistory can help provide a unified read-only view of the ProcessInstanceStep and ProcessInstanceWorkitem objects.

### ProducerCommission

Represents a producer's commission for an insurance policy. The commission can be calculated from the commissionable transactions or can be populated from an external system. This object is available in API version 51.0 and later.

#### Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

</table>
Product2

Represents a product that your org sells.

This object has several fields that are used only for quantity and revenue schedules (for example, annuities). Schedules are available only for orgs that have enabled the products and schedules features. If these features aren’t enabled, the schedule fields don’t appear in the DescribeSObjectResult, and you can’t query, create, or update the fields.

**Note:** Product2 objects represent products. As of API version 8.0, the Product object is no longer available. Requests that contain Product are refused, and responses don’t contain the Product object.

**Supported Calls**

`create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()`

### Field: DisplayUrl

**Type:** url  
**Properties:** Create, Filter, Nillable, Sort, Update  
**Description:** URL leading to a specific version of a record in the linked external data source.

### Field: ExternalDataSourceId

**Type:** reference  
**Properties:** Create, Filter, Group, Nillable, Sort, Update  
**Description:** ID of the related external data source.

### Field: ExternalId

**Type:** string  
**Properties:** Create, Filter, Group, Nillable, Sort, Update  
**Description:** The unique identifier of a record in the linked external data source. For example, ID #123.

### Field: Family

**Type:** picklist  
**Properties:** Create, Filter, Group, Nillable, Sort, Update  
**Description:** Name of the product family associated with this record. Product families are configured as picklists in the user interface. To obtain a list of valid values, call `describeSObjects()` and process the `DescribeSObjectResult` for the values associated with the `Family` field. Label is Product Family.

### Field: IsActive

**Type:** boolean  
**Properties:** Create, Defaulted on create, Filter, Group, Sort, Update  
**Description:** Indicates whether this record is active (true) or not (false). Inactive Product2 records are hidden in many areas in the user interface. You can change the IsActive flag on a Product2 object as often as necessary. Label is Active.

### Field: IsArchived

**Type:** boolean

<td><strong>Properties</strong> Create, Filter, Group, Nillable, Sort, Update</td>
</tr>
</tbody>
</table>
### Field Details

**NumberOfRevenueInstallments**

**Type**

- `int`

**Properties**

- Create, Filter, Group, Nillable, Sort, Update

**Description**

If the product has a revenue schedule, the number of installments.

---

**ProductClass**

**Type**

- `picklist`

**Properties**

- Defaulted on create, Filter, Group, Restricted picklist, Sort

**Description**

This field is read-only. Its value is determined by the value of the `Type` field and whether the product is associated with a `ProductAttribute` record. It describes whether a product is a simple product, a variation parent, or a product variation. Possible values are:

- **Simple**—This product has no variations
- **VariationParent**—This product is a variation parent. It's the base product for one or more product variations and, though it has its own stock-keeping unit (SKU), isn't a sellable entity. Instead, it's the parent of sellable entities—its variations.
- **Variation**—This product is a variation of a parent product. Each variation has its own SKU.

When the value of `ProductClass` = `VariationParent`, it never changes. The value of `ProductClass` changes between `Simple` and `Variation` when you attach or detach a `ProductAttribute` record to the product.

The default value is `Simple`. This field is available in API version 50.0 and later. It was introduced in support of commerce implementations.

---

**ProductCode**

**Type**

- `string`

**Properties**

- Create, Filter, Group, Nillable, Sort, Update

**Description**

Default product code for this record. Your org defines the product code naming pattern.

---

**QuantityInstallmentPeriod**

**Type**

- `picklist`

**Properties**

- Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

</tbody>
</table>
### StockKeepingUnit

**Type**

string

**Properties**

Create, Filter, Group, Nillable, Sort, Update

**Description**

The SKU for the product. Use in tandem with or instead of the ProductCode field. For example, you can track the manufacturer’s identifying code in the Product Code field and assign the product a SKU when you resell it.

### Type

**Type**

picklist

**Properties**

Create, Filter, Group, Nillable, Restricted picklist, Sort

**Description**

The type of product. The value of Type affects the read-only value of the ProductClass field. Possible values are Base and Null.

- When Type = Base, then ProductClass = VariationParent.
- When Type = Null, then ProductClass = Simple.
- If you attach a ProductAttribute record to a product, then the product’s ProductClass value changes to Variation. Conversely, when you detach all ProductAttribute records from a product, the ProductClass value changes to Simple.

This field is available in API version 50.0 and later. It was introduced in support of commerce implementations.

### Schedule Enabled Flags

When enabling the schedules feature, orgs can decide whether to enable quantity schedules, revenue schedules, or both. In addition, you can use the API to control quantity and revenue scheduling at the product level via the CanUseQuantitySchedule and CanUseRevenueSchedule flags. A value of true for either flag indicates that the product and any OpportunityLineItems can have a schedule of that type. These flags can be set when creating or updating Product2 records.

### Default Schedule Fields

The remaining schedule fields for this object define default schedules. Default schedule values are used to create an OpportunityLineItemSchedule when an OpportunityLineItem is created for the Product.

The default schedule fields support the following valid values (all fields are also nillable).

<table>
<thead>
<tr>
<th>Field</th>
<th>Valid Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>RevenueScheduleType</td>
<td>Divide, Repeat</td>
</tr>
<tr>
<td>RevenueInstallmentPeriod</td>
<td>Daily, Weekly, Monthly, Quarterly, Yearly</td>
</tr>
</tbody>
</table>
### Field Valid Values

<table>
<thead>
<tr>
<th>Field</th>
<th>Valid Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>NumberOfRevenueInstallments</td>
<td>Integer between 1 and 150, inclusive.</td>
</tr>
<tr>
<td>QuantityScheduleType</td>
<td>Divide, Repeat</td>
</tr>
<tr>
<td>QuantityInstallmentPeriod</td>
<td>Daily, Weekly, Monthly, Quarterly, Yearly</td>
</tr>
<tr>
<td>NumberOfQuantityInstallments</td>
<td>Integer between 1 and 150, inclusive</td>
</tr>
</tbody>
</table>

When you attempt to set the schedule fields when creating or updating, the API applies cross-field integrity checks. The integrity requirements are:

- If the schedule type is nil, the installment period and number of installments must be nil.
- If the schedule type is set to any value, then the installment period and number of installments must be non-nil.

Any create or update that fails these integrity checks is rejected with an error.

These default schedule fields, `CanUseQuantitySchedule`, and `CanUseRevenueSchedule`, are restricted picklist fields and are available only if the org has the schedules feature enabled.

### Usage

Use this object to define the default product information for your org. This object is associated by reference with Pricebook2 objects via PricebookEntry objects. The same product can be represented in different price books as price book entries. In fact, the same product can be represented multiple times (as separate PricebookEntry records) in the same price book with different prices or currencies. A product can only have one price for a given currency within the same price book. To be used in custom price books, all standard prices must be added as price book entries to the standard price book.

You can query the products that have been configured for your org. For example, you can allow your client application to obtain valid product IDs for use when configuring PricebookEntry records via the API. Your client application can perform the following tasks on PricebookEntry objects:

- Query
- Create for the standard price book or custom price books.
- Update
- Delete
- Change the `IsActive` field when creating or updating records

This object is defined only for those orgs that have products enabled as a feature. If the org doesn’t have the products feature, this object doesn’t appear in the `describeGlobal()` call, and you can’t describe or query this object.

If you try to delete a product via the API but there’s an opportunity that uses that product, the delete fails. The workaround is to delete the product in the user interface, which gives you an option to archive the product.

**Note:** On opportunities and opportunity products, the workflow rules, validation rules, and Apex triggers fire when an update to a child opportunity product or schedule causes an update to the parent record. This means your custom application logic is enforced when there are updates to the parent record, ensuring higher data quality and compliance with your organization’s business policies.
Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**Product2ChangeEvent (API version 44.0)**
Change events are available for the object.

**Product2Feed (API version 18.0)**
Feed tracking is available for the object.

**Product2History**
History is available for tracked fields of the object.

Object Basics

Product2DataTranslation

Represents the translated values of the data stored within a Product2 record’s fields. This object is available in API version 45.0 and later.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

- Your organization must be using Enterprise, Performance, Unlimited, or Developer edition.
- Translation Workbench and data translation must be enabled in your org.
- To view this object, you must have the “View Setup and Configuration” permission

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td><strong>Type</strong> textarea</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Nillable, Sort, Update</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The translated value for the Product2 description.</td>
</tr>
<tr>
<td>IsOutOfDate</td>
<td><strong>Type</strong> boolean</td>
</tr>
</tbody>
</table>
### Details

**Properties**
- Defaulted on create, Filter, Group, Sort

**Description**
Indicates whether the translation is out-of-date (true) or current (false). A translation is out-of-date if the parent Product2 record is updated after the last translation was filed.

### Language

**Type**
- picklist

**Properties**
- Create, Filter, Group, Restricted picklist, Sort

**Description**
The language for these translated values.

### Name

**Type**
- string

**Properties**
- Create, Filter, Group, idLookup, Sort, Update

**Description**
The translated value for the Product2 record name. This field is required to translate the text in other fields.

### ParentId

**Type**
- reference

**Properties**
- Create, Filter, Group, Sort, Update

**Description**
The record ID of the Product2 associated with the data that is being translated.

### Usage
Use this object to translate the data stored in a Product2 record into the different languages supported by Salesforce. If data translation is enabled for custom fields on the Product2 object, additional Product2DataTranslation fields exist for translating the data contained within those fields.

### ProductAttribute

Represents the attributes that can be associated with a product. This object is available in API version 50.0 and later.
Supported Calls
create, delete, describeLayout(), describeSObjects(), getDeleted, getUpdated, query(), retrieve(), undelete, update, upsert

Special Access Rules
You must have the B2B Commerce license and a CMS workspace to access products.

---

### ProductAttributeSet

Represents a group of attributes that can be associated with a product. This object is available in API version 50.0 and later.

**Supported Calls**

create, delete, describeSObjects(), query(), retrieve(), update, upsert

**Special Access Rules**

You must have the B2B Commerce license and a CMS workspace to access products.

### Fields

<table>
<thead>
<tr>
<th>Field</th>

- **sv**—Swedish
- **th**—Thai
- **zh_CN**—Chinese (Simplified)
- **zh_TW**—Chinese (Traditional)

### MasterLabel

**Type**
- string

**Properties**
- Create, Filter, Group, Sort, Update

**Description**
Label of the product attribute set.

---

**ProductAttributeSetItem**

Represents a set of attributes that can be associated with a product. This object is available in API version 50.0 and later.

**Supported Calls**
- `create`, `delete`, `describeSObjects()`, `query()`, `retrive()`, `update`, `upsert`
Special Access Rules
You must have the B2B Commerce license and a CMS workspace to access products.

</tr>
</tbody>
</table>
Usage

Use this object to translate the data stored in a Product Category record into the different languages supported by Salesforce. If data translation is enabled for custom fields on the ProductCategory object, additional ProductCategoryDataTranslation fields exist for translating the data contained within those fields.

ProductConsumed

Represents an item from your inventory that was used to complete a work order or work order line item in field service.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

Field Service must be enabled.

Note: To create or delete products consumed, you need Create permission on product items.

</tbody>
</table>

**Usage**

When a product is consumed during the completion of a work order, create a product consumed record to track its consumption. You can add products consumed to work orders or work order line items. Track product consumption at the line item level if you want to know which products were used for each line item's tasks.

The way you use products consumed depends on how closely you want to track the state of your inventory in Salesforce. If you want to track the entire lifecycle of items in your inventory, including their storage, transfer, and consumption, link your products consumed records to product items. This approach ensures that your inventory numbers auto-update to reflect the consumption of products from...
your inventory. If you want to track product consumption only, however, specify a Price Book Entry on each product consumed record and leave the Product Item field blank.

**Associated Objects**

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **ProductConsumedChangeEvent (API version 48.0)**  
  Change events are available for the object.

- **ProductConsumedFeed**  
  Feed tracking is available for the object.

- **ProductConsumedHistory**  
  History is available for tracked fields of the object.

**ProductEntitlementTemplate**

Represents predefined terms of customer support (Entitlement) that users can add to products (Product2).

**Supported Calls**

create(), delete(), describeSObjects(), query(), retrieve()

**Special Access Rules**

As of Summer ’20 and later, only Salesforce admins, users with access to the Case, Entitlement, or Work Order objects, and users with the View Setup and Configuration permission can access this object.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>

</tr>
</thead>
</table>
| EntitlementTemplateId | **Type** reference  
                        | **Properties** Create, Filter, Group, Sort  
                        | **Description** Required. ID of the entitlement template. Must be a valid ID. |
| Product2Id         | **Type** reference  
                        | **Properties** Create, Filter, Group, Sort |
Details

**Description**
Required. ID of the Product2 associated with the entitlement template. Must be a valid ID.

**Usage**
Use to query and manage entitlement templates.

**SEE ALSO:**
- Entitlement

**ProductItem**

Represents the stock of a particular product at a particular location in field service, such as all bolts stored in your main warehouse.

**Supported Calls**
- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

**Special Access Rules**
Field Service must be enabled.

**Field Name** | **Details**
--- | ---
**Description**
A unique number for identification purposes. If you want to enter a serial number, the Quantity on Hand must be 1.

---

**Usage**
Each product item is associated with a product and a location in Salesforce. If a product is stored at multiple locations, the product will be tracked in a different product item for each location.

**Associated Objects**
This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **ProductItemChangeEvent (API version 48.0)**
  Change events are available for the object.

- **ProductItemFeed**
  Feed tracking is available for the object.

- **ProductItemHistory**
  History is available for tracked fields of the object.

- **ProductItemOwnerSharingRule**
  Sharing rules are available for the object.

- **ProductItemShare**
  Sharing is available for the object.

**ProductItemTransaction**
Represents an action taken on a product item in field service. Product item transactions are auto-generated records that help you track when a product item is replenished, consumed, or adjusted.

**Supported Calls**
create(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

**Special Access Rules**
Field Service must be enabled.
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
<th>Description</th>
</tr>

</tr>
<tr>
<td></td>
<td>Description (Read Only) The product consumed or product transfer related to the action. If the action wasn’t related to consumption or transfer, the related record is blank. This is a polymorphic relationship field.</td>
</tr>
<tr>
<td>TransactionType</td>
<td>Type    picklist</td>
</tr>
<tr>
<td></td>
<td>Properties Create, Filter, Group, Restricted picklist, Sort</td>
</tr>
<tr>
<td></td>
<td>Description The action that the transaction tracks.</td>
</tr>
<tr>
<td></td>
<td>• Replenished: When a part is stocked at a location. A Replenished transaction is created when a product item is created.</td>
</tr>
<tr>
<td></td>
<td>• Consumed: When parts are consumed to complete a work order. A Consumed transaction is created when a record is added to the Products Consumed related list on a work order or work order line item.</td>
</tr>
</tbody>
</table>
Adjusted: When there is a discrepancy or a change in consumption. An Adjusted transaction is created when a product item's Quantity on Hand is edited, a product consumed is updated or delete, or a product transfer is deleted.

Transferred: When parts are transferred between locations.

Associated Objects
This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **ProductItemTransactionFeed**: Feed tracking is available for the object.
- **ProductItemTransactionHistory**: History is available for tracked fields of the object.

ProductMedia
Represents the rich media, including images and attachments, that can be added to products. This object is available in API version 49.0 and later.

Supported Calls
- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules
You must have the B2B Commerce license and a CMS workspace to access product media.

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.
ProductRequestChangeEvent (API version 48.0)
Change events are available for the object.

ProductRequestFeed
Feed tracking is available for the object.

ProductRequestHistory
History is available for tracked fields of the object.

ProductRequestOwnerSharingRule
Sharing rules are available for the object.

ProductRequestShare
Sharing is available for the object.

ProductRequestLineItem

Represents a request for a part in field service. Product request line items are components of product requests.

Supported Calls
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules
Field Service must be enabled.

### LastViewedDate

- **Type**: `dateTime`
- **Properties**: Filter, Nillable, Sort
- **Description**: The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (LastReferencedDate) but not viewed it.

### NeedByDate

- **Type**: `dateTime`
- **Properties**: Create, Filter, Nillable, Sort, Update
- **Description**: Date the product must be delivered by.

### ParentId

- **Type**: `reference`
- **Properties**: Create, Filter, Group, Sort
- **Description**: The product request that the line item belongs to.
This is a relationship field.

Quantity Unit of Measure picklist values are inherited from the Quantity Unit of Measure field on products.</td>
</tr>
</tbody>
</table>

#### Usage

Required products can be added to work types, work orders, and work order line items to ensure that the assigned service resource arrives with the right equipment.

Adding required products to work types saves you time and keeps your business processes consistent. Work orders and work order line items inherit their work type’s required products. For example, if all light bulb replacement jobs require a ladder and a light bulb, add the ladder and light bulb as required products to your Light Bulb Replacement work type. When it’s time to create a work order for a customer’s light bulb replacement, applying that work type to the work order adds the required products.

#### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **ProductRequiredFeed**<br>Feed tracking is available for the object.
- **ProductRequiredHistory**<br>History is available for tracked fields of the object.

#### ProductServiceCampaign

Represents a set of activities to be performed on a product service campaign asset, such as a product recall for safety issues or product defects. This object is available in API version 51.0 and later.

#### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

#### Special Access Rules

Field Service must be enabled.

### Field Details

**Properties**
Create, Filter, Group, Nillable, Sort, Update

**Description**
The priority of the product service campaign.
Possible values are:
- Critical
- High
- Low
- Medium

**Product2Id**

**Type**
reference

**Properties**
Create, Filter, Group, Nillable, Sort, Update

**Description**
ID of the Product2 associated with this campaign. The UI label is Product.

**ProductServiceCampaignName**

**Type**
string

**Properties**
Create, Filter, Group, idLookup, Sort, Update

**Description**
The name of the product service campaign.

**StartDate**

**Type**
date

**Properties**
Create, Filter, Group, Sort, Update

**Description**
The date on which the product service campaign starts.

**Status**

**Type**
picklist

**Properties**
Create, Defaulted on create, Filter, Group, Sort, Update

**Description**
The status of the product service campaign. The picklist includes the following values, which can be customized:
- New—Product service campaign created, but there hasn't yet been any activity.
- In Progress—Product service campaign has begun.
<table>
<thead>
<tr>

<tr>
<td></td>
<td>• Closed—All work and associated activity is complete.</td>
</tr>
<tr>
<td></td>
<td>• Canceled—Work is canceled, typically before any work began.</td>
</tr>
</tbody>
</table>

**StatusCategory**

- **Type**: picklist
- **Properties**: Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort
- **Description**: The category that each Status value falls into. The StatusCategory field has eight default values: seven values that are identical to the default Status values, and None for statuses without a status category.

If you create custom Status values, you must indicate which category it belongs to. For example, if you create a Waiting for Response value, add it the On Hold category. To learn which processes reference StatusCategory, see How are Status Categories Used?

**Type**

- **Type**: picklist
- **Properties**: Create, Filter, Group, Sort, Update
- **Description**: The type of the product service campaign. The picklist includes the following values, which can be customized:
  - **Modification**—The asset requires an on-site alteration.
  - **Recall**—The asset must be returned to the manufacturer for modification or upgrade.
  - **Service**—The asset needs to be serviced.
  - **Upgrade**—The asset needs updating.

**WorkTypeId**

- **Type**: reference
- **Properties**: Create, Filter, Group, Nillable, Sort, Update
- **Description**: The work type associated with the product service campaign. A customer uses this field as a guide when setting work type for work orders for the product service campaign. Duration, Duration Type, and required skills.
Associated Objects

**ProductServiceCampaignItemFeed**
- Feed tracking is available for the object.

**ProductServiceCampaignItemHistory**
- History is available for tracked fields of the object.

**ProductServiceCampaignItemOwnerSharingRule**
- Sharing rules are available for the object.

**ProductServiceCampaignItemShare**
- Sharing is available for the object.

**ProductServiceCampaignItemStatus**

Represents a status for a product service campaign item in field service. This object is available in API version 51.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()

Special Access Rules

Field Service must be enabled.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| ApiName     | **Type**
|             | string  |
|             | **Properties**
|             | Filter, Group, idLookup, Sort |
|             | **Description**
|             | The API name of the status value. |
| IsDefault   | **Type**
|             | boolean |
|             | **Properties**
|             | Defaulted on create, Filter, Group, Sort |
|             | **Description**
|             | Indicates that the status value is the default status on product service campaign items when true. Only one status value can be the default. |
| MasterLabel | **Type**
|             | string |
|             | **Properties**
|             | Filter, Group, Nillable, Sort |
|             | **Description**
|             | The label for the picklist value in the UI. |
| SortOrder   | **Type**
|             | int     |
|             | **Properties**
|             | Filter, Group, Nillable, Sort |
|             | **Description**
|             | The value’s position in the dropdown list in the UI. |
| StatusCode  | **Type**
|             | picklist |
|             | **Properties**
|             | Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort |
|             | **Description**
|             | The status category that the value corresponds to. The Status Category field has seven values that are identical to the default Status values. |
Usage

The Status field on product service campaign items comes with the following values:

- **New**—Product service campaign item created, but there hasn’t been any activity.
- **In Progress**—Work has begun.
- **On Hold**—Work is paused.
- **Completed**—Work is complete.
- **Cannot Complete**—Work couldn’t be completed.
- **Closed**—All work and associated activity is complete.
- **Canceled**—Work is canceled, typically before any work began.

The ProductServiceCampaignItemStatus object corresponds to the Status field. Adding a value to the Status field—for example, Canceled By Supplier—creates a product service campaign item status record, and vice versa.

> Note: Product service campaign items also come with a Status Category field whose values are identical to the default status values. If you create custom status values, you must indicate which category it belongs to. For example, if you create a *Customer Absent* value, add it to the *Cannot Complete* category. To learn which processes reference StatusCategory, see How are Status Categories Used?

**ProductServiceCampaignStatus**

Represents a status for a product service campaign in field service. This object is available in API version 51.0 and later.

**Supported Calls**

`describeSObjects()`, `query()`, `retrieve()`

**Special Access Rules**

Field Service must be enabled.

<tr>
<td>IsDefault</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>boolean</td>
</tr>
</tbody>
</table>
**Usage**

The Status field on product service campaigns comes with the following values:

- **New**—Product service campaign created, but there hasn’t been any activity.
- **In Progress**—Work has begun.
- **On Hold**—Work is paused.
- **Completed**—Work is complete.
- **Cannot Complete**—Work couldn’t be completed.
- **Closed**—All work and associated activity is complete.
- **Canceled**—Work is canceled, typically before any work began.

The ProductServiceCampaignStatus object corresponds to the Status field. Adding a value to the Status field—for example, Canceled By Supplier—creates a product service campaign status record, and vice versa.
Note: Product service campaigns also come with a Status Category field whose values are identical to the default status values. If you create custom status values, you must indicate which category it belongs to. For example, if you create a Customer Absent value, add it to the Cannot Complete category. To learn which processes reference StatusCategory, see How are Status Categories Used?

ProductTransfer

Represents the transfer of inventory between locations in field service.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

Field Service must be enabled.

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **ProductTransferChangeEvent** *(API version 48.0)*
  Change events are available for the object.

- **ProductTransferFeed**
  Feed tracking is available for the object.

- **ProductTransferHistory**
  History is available for tracked fields of the object.

- **ProductTransferOwnerSharingRule**
  Sharing rules are available for the object.
**ProductWarrantyTerm**

Defines the relationship between a product or product family and warranty term. This object is available in API version 50.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

**Fields**

<table>
<thead>
<tr>

</tbody>
</table>

### Profile

Represents a profile, which defines a set of permissions to perform different operations. Operations can include creating a custom profile or querying, adding, updating, or deleting information.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieves()`, `search()`, `update()`, `upsert()`

### Special Access Rules

As of Summer '20 and later, Customer Portal and Partner Portal users can't access this object.

To view the following settings, assignments, and permissions for standard and custom objects in a specified profile, the View Setup and Configuration permission is required.

- Client settings
- Field permissions
- Layout assignments
- Object permissions
- Permission dependencies
- Permission set tab settings
- Permission set group components
- Record types
As of API version 50.0 and later, only users with correct permissions can view profile names other than their own if the Profile Filtering setting is enabled.

**Important:** Profile names are also exposed when users with permissions to perform the following tasks take these actions:
- Create a tab or record type with a wizard step that includes the assignment of tabs and record types to profiles.
- Configure a login flow where viewing profile lists is required to make flow associations.
- Set up delegated admins where looking up profiles is needed to identify assignable profiles.
- Administer an org as a delegated customer admin.
- Administer an org as a delegated admin to view and assign profiles of the delegated group.

</tr>
</tbody>
</table>
| **Name**       | **Type** string  
**Properties** Create, Filter, Group, idLookup, Sort, Update  
**Description** The name of the profile.                                                                                 |
| **Permissions**| **Type** boolean  
**Properties** Create, Filter, Update  
**Description** One field for each permission. If true, users assigned to this profile have the named permission. The number of fields varies depending on the permissions for the org and license type. |
| **UserLicenseId** | **Type** reference  
**Properties** Create, Filter, Group, Sort  
**Description** ID of the UserLicense associated with this profile. This is a relationship field. |  
| **UserType**   | **Type** picklist  
**Properties** Filter, Group, Nillable, Restricted picklist, Sort |
### Details

The category of user license. Each `UserType` is associated with one or more `UserLicense` records. Each `UserLicense` is associated with one or more profiles. In API version 10.0 and later, valid values include:

- **Standard**: user license. This user type also includes Salesforce Platform and Salesforce Platform One user licenses. Label is **Standard**.
- **PowerPartner**: User whose access is limited because they’re a partner and typically access the application through a partner portal or Experience Cloud site. Label is **Partner**.
- **CSPLitePortal**: user whose access is limited because they’re an org’s customer and access the application through a Customer Portal or Experience Cloud site. Label is **High Volume Portal**.
- **CustomerSuccess**: user whose access is limited because they’re an org’s customer and access the application through a Customer Portal. Label is **Customer Portal User**.
- **PowerCustomerSuccess**: user whose access is limited because they’re an org’s customer and access the application through a Customer Portal. Label is **Customer Portal Manager**.
  Users with this license type can view and edit data they directly own or data owned by or shared with users below them in the Customer Portal role hierarchy.
- **CsnOnly**: user whose access to the application is limited to Chatter. This user type includes Chatter Free and Chatter moderator users. Label is **Chatter Free**.
- **Guest**: user whose access is limited because they’re an unauthenticated user without login credentials. Label is **Guest**.

`UserType` replaces `LicenseType`, which is unavailable as of API version 10.0. In API versions 8.0 and 9.0 `LicenseType` is still available with the following valid values:

- **AUL**: Lightning Platform user license. Label is **Apex Platform**.
- **AUL1**: Lightning Platform user license with only one user. Label is **Apex Platform One**.
- **Salesforce**: Salesforce user license. Label is **Salesforce**.
- **PackageManager**: user who can create and work with managed packages for AppExchange. Label is **Package Manager**.
- **PRM**: user whose access is limited because they’re a partner and typically accesses the application through a partner portal. Label is **Partner**.
- **CustomerUser**: user whose access is limited because they’re an org’s customer and accesses the application through a Customer Portal. Label is **Customer Portal User**.
- **CustomerManager**: user whose access is limited because they’re an org’s customer and accesses the application through a Customer Portal. Label is **Customer Portal Manager**.
  Users with this license type can view and edit data they directly own or data owned by or shared with users below them in the Customer Portal role hierarchy.

In API version 53.0 and later, you cannot set the value of `UserType` using Apex.
Usage

Use the Profile object to create custom profiles that start without any permissions enabled except for required permissions for the profile’s user license. While you can use the Profile Metadata type to deploy profiles, we recommend that you use the Profile SOAP API object because it allows you to create empty profiles.

You can also query the set of currently configured user profiles in your org. Your client application can use Profile objects to obtain valid profile IDs for use when querying or modifying users through the API.

In the user interface, profiles can be used to assign user licenses from specific pools (Lightning Platform user license or Salesforce user license, for example). When users are reassigned to profiles with different license types, the number of available licenses in the old license type pool increases, one per user assignment updated. Also, the number of available licenses decreases by the same amount in the new license type pool.

- Object Basics
- PermissionSet

ProfileSkill

Represents a profile skill, which describes a user’s professional knowledge. This is a global record for the organization, and users are associated through the ProfileSkillUser object.

Note: For information about Live Agent skills, see the Skill topic.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

<tr>
<td><strong>UserCount</strong></td>
<td>Type: <code>int</code>&lt;br&gt;Properties: Filter, Group, Nillable, Sort&lt;br&gt;Description: The number of users with the profile skill.</td>
</tr>
</tbody>
</table>
Usage

Use the ProfileSkill object to look up the attributes of a skill that can be assigned to a user. This is a global object and is not owned by any specific user.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ProfileSkillFeed (API version 34.0)

Feed tracking is available for the object.

ProfileSkillHistory

History is available for tracked fields of the object.

ProfileSkillOwnerSharingRule

Sharing rules are available for the object.

ProfileSkillShare

Sharing is available for the object.

ProfileSkillEndorsement

Represents a detail relationship of ProfileSkillUser. An endorsement of a profile skill shows approval and support of another user's publicly declared skill.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| Name               | Type: string
|                    | Properties: Autonumber, Defaulted on create, Filter, idLookup, Sort
|                    | Description: The name of the profile skill being endorsed. |
| ProfileSkillUserld | Type: reference
|                    | Properties: Create, Filter, Group, Sort
|                    | Description: The ID of the ProfileSkillUser record that is being endorsed. |
### Usage

Use the ProfileSkillEndorsement object to query about a single endorsement given to a user about a specific skill. Users can’t endorse themselves, they can only be endorsed by others unless they are administrators with the “Modify All Data” permission.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **ProfileSkillEndorsementFeed (API version 34.0)**
  - Feed tracking is available for the object.

- **ProfileSkillEndorsementHistory**
  - History is available for tracked fields of the object.

### ProfileSkillShare

Represents a sharing entry on a ProfileSkill.
## Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()  

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AccessLevel</strong></td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>picklist</td>
</tr>
<tr>
<td>Properties</td>
<td>Create, Filter, Group, Restricted picklist, Sort, Update</td>
</tr>
</tbody>
</table>
| Description  | Level of access that the User or Group has to the ProfileSkill. The possible values are:  

- Read  
- Edit  
- All (This value is not valid for create() or update() calls.)  

This value must be set to an access level that is higher than the organization’s default access level for ProfileSkill objects. |

| **ParentId** |         |
| Type         | reference |
| Properties   | Create, Filter, Group, Sort |
| Description  | ID of the parent object, if any. This is a relationship field. |

| **Relationship Name** | Parent |
| **Relationship Type**  | Lookup |
| **Refers To**          | ProfileSkill |

| **RowCause** |         |
| Type         | picklist |
| Properties   | Create, Filter, Group, Nillable, Restricted picklist, Sort |
| Description  | Reason that this sharing entry exists. |
You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.

Values may include:

- **Manual**—The User or Group has access because a user with "All" access manually shared the ProfileSkill with them.
- **Owner**—The User is the owner of the ProfileSkill or is in a role above the ProfileSkill owner in the role hierarchy.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>UserOrGroupId</td>
<td>You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings. Values may include: - <strong>Manual</strong>—The User or Group has access because a user with &quot;All&quot; access manually shared the ProfileSkill with them. - <strong>Owner</strong>—The User is the owner of the ProfileSkill or is in a role above the ProfileSkill owner in the role hierarchy.</td>
</tr>
</tbody>
</table>

**Usage**

This object is read only. It is visible because of constraints to the ProfileSkill object, but it is ignored and does not control which users and groups can view and edit ProfileSkill records owned by other users.

**ProfileSkillUser**

Represents a detail relationship of User. The object connects profile skills with users.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

</tbody>
</table>
Usage

Use this object to assign specific skills to specific users. ProfileSkillUser appears on the Overview tab on the Chatter profile page. Users can only create a skill mapping for themselves, they can’t create skill mappings for others unless they are administrators with the “Modify All Data” permission. Additionally, users can only edit this object if they are the context user and are not editing the UserId field.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **ProfileSkillUserFeed** (API version 34.0)
  Feed tracking is available for the object.
- **ProfileSkillUserHistory**
  History is available for tracked fields of the object.

Prompt

Represents record details about an in-app guidance prompt or walkthrough. Available in API version 46.0 and later.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

Use prompts and walkthroughs to display announcements, training, or news to users within the app. Choose to add an action button or link that links to a URL of your choice. Track views, action button clicks, and walkthrough completes.

Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Admins have access to add or edit prompts and walkthroughs. For non-admin users, assign the Manage Prompts user permission. Everyone can see the In-App Guidance setup page. To show more than three walkthroughs to users, use the View Walkthroughs user permission, which is part of the Walkthroughs permission set license. The myTrailhead subscription includes this feature. For pricing details, contact your Salesforce account executive. Note the restrictions on user visibility of the walkthroughs you create in the Packaging Prompts and Walkthroughs section.

Packaging Prompts and Walkthroughs

See Creating Managed Packages in Salesforce Help for more information.

See Considerations for Prompts in Lightning Experience in Salesforce Help for more information about installing and managing prompt packages and about editing and cloning prompts installed from packages.
If the package includes a custom profile that isn’t part of a Salesforce org, the in-app guidance is installed, but it doesn’t include those custom items. For example, an org installs a prompt with several custom profiles not included in their org. The prompts are installed without those custom profiles.

If the package includes a custom permission that isn’t a part of your Salesforce org, the installation fails.

If the package includes a standard app that isn’t part of a Salesforce org, the in-app guidance is installed, but it’s not usable.

Unmanaged packages must contain a namespace prefix. For more information, see Register a Namespace Prefix and What happens to my namespace prefix when I install a package? in Salesforce Help.

For walkthrough packages:

- If a managed or unmanaged package includes walkthroughs for standard apps, walkthroughs are installed. However, production orgs can have only three active walkthroughs at a time without subscribing to myTrailhead.
- If a security-reviewed, first-generation managed package includes walkthroughs with at least one step on a page within a custom app, users can see the walkthroughs without a subscription to myTrailhead.

When orgs install in-app guidance from packages, the in-app guidance will retain publish state as indicated by the IsPublished field. For example, if the package prompt is active, it will also be active when installed by the org.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DeveloperName</td>
<td><strong>Type</strong> string  &lt;br&gt; <strong>Properties</strong> Create, Filter, Group, Sort, Update  &lt;br&gt; <strong>Description</strong> The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization.  &lt;br&gt; <strong>Note:</strong> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record.</td>
</tr>
<tr>
<td>Language</td>
<td><strong>Type</strong> picklist  &lt;br&gt; <strong>Properties</strong> Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update  &lt;br&gt; <strong>Description</strong> Indicates the language used in the org where the in-app guidance was created.</td>
</tr>
<tr>
<td>MasterLabel</td>
<td><strong>Type</strong> string</td>
</tr>
</tbody>
</table>

2733
### Field Details

**Properties**
Create, Filter, Group, Sort, Update

**Description**
The label. Maximum of 80 characters.

#### NamespacePrefix

**Type**
string

**Properties**
Filter, Group, Nillable, Sort

**Description**
The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.

- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

---

**PromptAction**

Represents how the user interacted with the in-app guidance prompt or walkthrough. Available in API version 46.0 and later.

Use prompts and walkthroughs to display announcements, training, or news to users within the app. Choose to add an action button or link that links to a URL of your choice. Track views, action button clicks, and walkthrough completes.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

**Special Access Rules**

Admins have access to add or edit prompts and walkthroughs. For non-admin users, assign the Manage Prompts user permission.

Everyone can see the In-App Guidance setup page. To show more than three walkthroughs to users, use the View Walkthroughs user permission, which is part of the Walkthroughs permission set license. The myTrailhead subscription includes this feature. For pricing details, contact your Salesforce account executive. Note the restrictions on user visibility of the walkthroughs you create in the Packaging Prompts and Walkthroughs section.

**Description** ID of the PromptAction that the PromptError is related to. |
| **StepNumber** | **Type** int  
**Properties** Create, Filter, Group, Nullable, Sort, Update  
**Description** Indicates the step number that the user encountered an error or warning in a walkthrough. |
| **Type** | **Type** picklist  
**Properties** Create, Filter, Group, Restricted picklist, Sort, Update |
DetailsField

Description
Indicates the type of error or warning. Possible values are:

- **NoAccessToApp**—A step on this walkthrough is on an app that some of your users don’t have access to.
- **NoAccessToPage**—A step on the walkthrough is on a page that some of your users don’t have access to.
- **ReferenceElementNotFound**—The target element has moved or is no longer on your page. Targeted prompts attached to unavailable elements convert to floating prompts. Check your access to the element, or enter targeting mode and reassign the targeted prompt.
- **Unavailable**—Users tried to open this walkthrough using its URL, but it’s inactive or the users aren’t licensed to see it. To make it accessible to users, check its settings or activate it.

**Associated Objects**

This object has the following associated objects. They are available in API version 52.0 and later.

**PromptErrorOwnerSharingRule**  
Sharing rules are available for the object.

**PromptErrorShare**  
Sharing is available for the object.

**PromptActionOwnerSharingRule**

Represents a rule which determines PromptAction sharing access for the owners. Available in API version 46.0 and later.

Use prompts and walkthroughs to display announcements, training, or news to users within the app. Choose to add an action button or link that links to a URL of your choice. Track views, action button clicks, and walkthrough completes.

**Supported Calls**

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

**Special Access Rules**

Admins have access to add or edit prompts and walkthroughs. For non-admin users, assign the Manage Prompts user permission. Everyone can see the In-App Guidance setup page. ### PromptLocalization

Represents the translated value of a label for record details about in-app guidance when the Translation Workbench is enabled for your org. Available in API version 48.0 and later.

Use prompts and walkthroughs to display announcements, training, or news to users within the app. Choose to add an action button or link that links to a URL of your choice. Track views, action button clicks, and walkthrough completes.

#### Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`
Special Access Rules

Admins have access to add or edit prompts and walkthroughs. For non-admin users, assign the Manage Prompts user permission. Everyone can see the In-App Guidance setup page. To show more than three walkthroughs to users, use the View Walkthroughs user permission, which is part of the Walkthroughs permission set license. The myTrailhead subscription includes this feature. For pricing details, contact your Salesforce account executive. Note the restrictions on user visibility of the walkthroughs you create in the Packaging Prompts and Walkthroughs section.

Packaging Prompts and Walkthroughs

See Creating Managed Packages in Salesforce Help for more information.

See Considerations for Prompts in Lightning Experience in Salesforce Help for more information about installing and managing prompt packages and about editing and cloning prompts installed from packages.

If the package includes a custom profile that isn’t part of a Salesforce org, the in-app guidance is installed, but it doesn’t include those custom items. For example, an org installs a prompt with several custom profiles not included in their org. The prompts are installed without those custom profiles.

If the package includes a custom permission that isn’t a part of your Salesforce org, the installation fails.

If the package includes a standard app that isn’t part of a Salesforce org, the in-app guidance is installed, but it’s not usable.

Unmanaged packages must contain a namespace prefix. For more information, see Register a Namespace Prefix and What happens to my namespace prefix when I install a package? in Salesforce Help.

For walkthrough packages:

- If a managed or unmanaged package includes walkthroughs for standard apps, walkthroughs are installed. However, production orgs can have only three active walkthroughs at a time without subscribing to myTrailhead.
- If a security-reviewed, first-generation managed package includes walkthroughs with at least one step on a page within a custom app, users can see the walkthroughs without a subscription to myTrailhead.

When orgs install in-app guidance from packages, the in-app guidance will retain publish state as indicated by the `IsPublished` field. For example, if the package prompt is active, it will also be active when installed by the org.

Details

Description
The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.

- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

ParentId

**Type**
reference

**Properties**
Create, Filter, Group, Sort

**Description**
ID of the in-app guidance.

Value

**Type**
textarea

**Properties**
Create, Filter, Sort, Update

**Description**
The actual translated record details for the in-app guidance.

PromptVersion

Represents an in-app guidance prompt or walkthrough. Available in API version 46.0 and later.

Use prompts and walkthroughs to display announcements, training, or news to users within the app. Choose to add an action button or link that links to a URL of your choice. Track views, action button clicks, and walkthrough completes.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`
Special Access Rules

- Targeted—the targeted prompt. Available in API version 52.0 and later.

### ElementRelativePosition

**Type**

picklist

**Properties**

Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**

Indicates the location of the prompt relative to the element. This field is available in API version 52.0 and later. Valid values are:

- BottomCenter
- BottomLeft
- BottomRight
- LeftBottom
- LeftCenter
- LeftTop
- RightBottom
- RightCenter
- RightTop
- TopCenter
- TopLeft
- TopRight

</tr>
</tbody>
</table>
| Description  | Indicates which color value, or saturation, is applied to in-app guidance that has a custom theme color applied. Required if ThemeColor is specified. Specify on the first step of the walkthrough to apply to the entire walkthrough. Valid values are:  
  • Dark  
  • Light |
| TimesToDisplay | Type int                                                                 |
| Properties   | Create, Filter, Group, Nillable, Sort, Update                           |
| Description  | Maximum number of times to display the in-app guidance (that is, the number of occurrences). Salesforce detects if the user interacts with (or ignores) the in-app guidance to determine if we should show the in-app guidance again or cancel scheduled recurrences. This may run counter to the number of occurrences scheduled. Maximum value of 30. For walkthroughs, this field can only be specified on the first step. |
| Title        | Type string                                                              |
| Properties   | Create, Filter, Group, Sort, Update                                     |
| Description  | The label for the title of the in-app guidance. Maximum of 36 characters. |
| UserAccess   | Type picklist                                                            |
| Properties   | Create, Filter, Group, Nillable, Restricted picklist, Sort, Update      |
| Description  | Indicates which permissions can see the in-app guidance. Valid values are:  
  • Everyone—there are no restrictions on who can see  
  • SpecificPermissions—only users with all the specific user permissions specified can see the in-app guidance |
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>UserProfileAccess</strong></td>
</tr>
<tr>
<td></td>
<td><strong>VersionNumber</strong></td>
</tr>
<tr>
<td></td>
<td><strong>VideoLink</strong></td>
</tr>
</tbody>
</table>

**UserProfileAccess**

**Type**: picklist

**Properties**: Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**: Indicates which profiles can see the in-app guidance. Valid values are:

- **Everyone**—there are no permission restrictions on who can see
- **SpecificProfiles**—users with any of the specific user profiles specified can see
  the in-app guidance

**VersionNumber**

**Type**: int

**Properties**: Create, Filter, Group, Sort, Update

**Description**: The number remains 1 since multiple versions aren't saved in the org.

**VideoLink**

**Type**: url

**Properties**: Create, Filter, Nillable, Sort, Update

**Description**: URL for the video in a docked prompt. Maximum of 1,000 characters. You can only specify
  this field or the ImageId field, not both.

  To find the embed code for a video, follow the instructions from the video host website. Usually the steps can be found by searching for the name of the website and "embed video." For example, here's what the embed code looks like for YouTube:

  `<iframe width="560" height="315"
  src="https://www.youtube.com/embed/di6iwHhrH6s"
  frameborder="0" allow="accelerometer; autoplay;
  encrypted-media; gyroscope; picture-in-picture"
  allowfullscreen"></iframe>`

  Then, you would enter the URL found in the `src` attribute. For the example used, enter
  `https://www.youtube.com/embed/di6iwHhrH6s`.

**PromptVersionLocalization**

Represents the translated value of a label for-app guidance when the Translation Workbench is enabled for your org. Available in API version 48.0 and later.
Use prompts and walkthroughs to display announcements, training, or news to users within the app. Choose to add an action button or link that links to a URL of your choice. Track views, action button clicks, and walkthrough completes.

**Supported Calls**

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

**Special Access Rules**

Admins have access to add or edit prompts and walkthroughs. For non-admin users, assign the Manage Prompts user permission. Everyone can see the In-App Guidance setup page. To show more than three walkthroughs to users, use the View Walkthroughs user permission, which is part of the Walkthroughs permission set license. The myTrailhead subscription includes this feature. For pricing details, contact your Salesforce account executive. Note the restrictions on user visibility of the walkthroughs you create in the Packaging Prompts and Walkthroughs section.

**Packaging Prompts and Walkthroughs**

See Creating Managed Packages in Salesforce Help for more information.

See Considerations for Prompts in Lightning Experience in Salesforce Help for more information about installing and managing prompt packages and about editing and cloning prompts installed from packages.

If the package includes a custom profile that isn’t part of a Salesforce org, the in-app guidance is installed, but it doesn’t include those custom items. For example, an org installs a prompt with several custom profiles not included in their org. The prompts are installed without those custom profiles.

If the package includes a custom permission that isn’t a part of your Salesforce org, the installation fails.

If the package includes a standard app that isn’t part of a Salesforce org, the in-app guidance is installed, but it’s not usable.

Unmanaged packages must contain a namespace prefix. For more information, see Register a Namespace Prefix and What happens to my namespace prefix when I install a package? in Salesforce Help.

For walkthrough packages:

- If a managed or unmanaged package includes walkthroughs for standard apps, walkthroughs are installed. However, production orgs can have only three active walkthroughs at a time without subscribing to myTrailhead.

- If a security-reviewed, first-generation managed package includes walkthroughs with at least one step on a page within a custom app, users can see the walkthroughs without a subscription to myTrailhead.

When orgs install in-app guidance from packages, the in-app guidance will retain publish state as indicated by the IsPublished field. For example, if the package prompt is active, it will also be active when installed by the org.

</tbody>
</table>

### PushTopic

Represents a query that is the basis for notifying Streaming API clients of changes to records in an org. This object is available in API version 21.0 and later.
**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

**Special Access Rules**

- This object is available only if Streaming API is enabled for your org.
- Users with the Create permission can create this record.
- To receive notifications, users must have read access on both the object in the PushTopic query and the PushTopic itself.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>

Streaming API Developer Guide

QueueRoutingConfig

Represents the settings that determine how work items are routed to agents. This object is available in API version 32.0 and later.

Supported Calls
create(), delete(), query(), retrieve(), update()

Special Access Rules
To access this object, Omni-Channel must be enabled.
As of Spring ’20 and later, only authenticated internal and external users can access this object.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>CapacityPercentage</td>
<td>Type</td>

---

**Question**

Represents a question in a zone that users can view and reply to.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

**Special Access Rules**

This object is only available if the Answers permission and AnswersEnabled preference or PortalFeed permission and PortalFeedEnabled preference are enabled in your org.

</tbody>
</table>

**Usage**

Use this object to track questions in a zone.
QuestionDataCategorySelection

A data category selection represents a data category that classifies a question.
This object can be used to associate a question with a data category from a data category group or to query the categorization for a question.

Supported Calls
create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Special Access Rules
To create, read or update data category selection, you must have create, read or update permission on the categorized question. Users who can update question can also delete its category selection. Users who can create questions can only select categories visible to their role.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DataCategoryGroupName</td>
<td></td>
</tr>
<tr>
<td>DataCategoryName</td>
<td></td>
</tr>
<tr>
<td>ParentId</td>
<td></td>
</tr>
</tbody>
</table>

**DataCategoryGroupName**
Type: DataCategoryGroupReference
Properties: Create
Description: Unique name of the data category group which has a category associated with the question.

**DataCategoryName**
Type: DataCategoryGroupReference
Properties: Create
Description: Unique name of the data category associated with the question.

**ParentId**
Type: reference
Properties: Create, Filter
Description: ID of the question associated with the data category selection.
Usage

Every question can be categorized in a data category. You can use the QuestionDataCategorySelection object to query and manage question categorization. Client applications can create categorization for a question. They can also delete, query, and retrieve question categorization.

⚠️ Warning: Even though the API lets you select more than one category for QuestionDataCategorySelection, the Answers tab only supports one data category selection for questions. Selecting multiple categories through QuestionDataCategorySelection may result in unexpected behavior in the Answers tab, such as losing your multiple selections. You should only select one data category when using QuestionDataCategorySelection.

Sample Code—Java

In the following example, the selectCategory method adds a category to a question data category selection. The retrieveCategorySelections method returns all the categories from a question data category selection.

```java
public void selectCategory(ID parentId, String categoryGroupName, String categoryName) {
    try {
        QuestionDataCategorySelection categorySelection = new QuestionDataCategorySelection();
        categorySelection.setParentId(parentId);
        categorySelection.setDataCategoryGroupName(categoryGroupName);
        categorySelection.setDataCategoryName(categoryName);
        binding.create(new SObject[]{categorySelection});
    } catch (RemoteException e) {
        System.out.println("An unexpected error has occurred." + e.getMessage());
    }
}

public String[] retrieveCategorySelections(String parentId) {
    QueryResult qr = null;
    try {
        qr = binding.query("SELECT DataCategoryName FROM QuestionDataCategorySelection WHERE Id = '' + parentId + "'");
    } catch (RemoteException e) {
        System.out.println("An unexpected error has occurred." + e.getMessage());
    }

    String[] categoryNames = new String[qr.getRecords().length];
    for (int index = 0; index < qr.getRecords().length; index++) {
        categoryNames[index] = ((QuestionDataCategorySelection)qr.getRecords()[index]).getDataCategoryName();
    }

    return categoryNames;
}
```
Salesforce Knowledge uses a similar object for article data category selection. See Article Type__DataCategorySelection for SOQL examples using this object.

<td></td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td></td>
</tr>
<tr>
<td>The reason the user reported abuse on the Question, such as Spam, Hateful, or Inappropriate.</td>
<td></td>
</tr>
</tbody>
</table>

**Usage**

Use this object to track user-reported abuse on questions created in a Chatter Answers zone.
**QuestionSubscription**

Represents a subscription for a user following a Question. This object is available in API version 24.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>CommunityId</td>
<td>Type: reference</td>
</tr>
<tr>
<td></td>
<td>Properties: Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: Required. ID of the zone associated with the Question the user is following. This field can’t be updated.</td>
</tr>
<tr>
<td>Name</td>
<td>Type: string</td>
</tr>
<tr>
<td></td>
<td>Properties: Autonumber, Defaulted on create, Filter, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: The name of the question subscription.</td>
</tr>
<tr>
<td>QuestionCreatedDate</td>
<td>Type: dateTime</td>
</tr>
<tr>
<td></td>
<td>Properties: Filter, Nillable, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: Required. Creation date of the Question which the user is following. This field can’t be updated.</td>
</tr>
<tr>
<td>QuestionId</td>
<td>Type: reference</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td></td>
<td>Description: Required. ID of the Question which the user is following. This field can’t be updated.</td>
</tr>
</tbody>
</table>
### Usage

Things to consider when following a Question:

- A user can only follow questions that they have permission to view.
- Administrators and users with the “Modify All Data” permission can configure other users to follow questions that the other user has read access to.
- Administrators and users with the “Modify All Data” permission can configure users to stop following questions.

Queries on QuestionSubscription:

- Users with the “Read” permission on Question can see which questions other users are following.
- A query must include a LIMIT clause and the limit can’t exceed 1,000.
- A query using a `WHERE` clause can only filter by fields on Question.

### QueueSobject

Represents the mapping between a queue Group and the sObject types associated with the queue, including custom objects.

**Supported Calls**

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

**Special Access Rules**

As of Summer ’20 and later, only authenticated internal and external users can access this object.

A queue is a Group whose `Type` is `Queue`. To create a Group, you must have the Manage Users permission.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>

<tr>
<td>Properties</td>
<td>Create, Filter, Group, Restricted picklist, Sort</td>
</tr>
<tr>
<td>Description</td>
<td>A list of object types that can be associated with the queue specified by the QueueId.</td>
</tr>
</tbody>
</table>

### Usage

Use this object to associate a queue with the sObject that can be associated with the queue, including custom objects.

⚠️ **Warning:** You can’t update or insert more than 18 queues at once when using the Bulk API.

- Object Basics

### QuickText

This object stores a snippet of text that allows users to send a quick response to a customer. Use quick text to create greetings, answers to common questions, short notes, and more. This object is available in API version 24.0 and later.

### Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`
## Standard Objects

</tr>
<tr>
<td><strong>Description</strong></td>
<td>(Used with Einstein Reply Recommendations.) The corresponding ReplyText record that the quick text record was created from. This field is not available in the UI.</td>
</tr>
</tbody>
</table>
**Usage**

Use this object to create and manage the quick text messages available to users. You can categorize multiple quick text records into groups using the Category field. The Category field can also be a parent to multiple custom-dependent Picklist fields to create a hierarchical structure of categories.

QuickText is also used in Einstein Reply Recommendations, a feature that recommends stock replies for support agents to use in chats in the Lightning Service Console. During setup, Einstein Reply Recommendations scans past chats to generate a list of commonly used replies. Each generated reply is a ReplyText record. The admin then publishes, or converts, the replies to quick text, creating a corresponding QuickText record for each reply. Therefore, certain QuickText fields are used only on quick text records that originated as a ReplyText record.

**Associated Objects**

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **QuickTextChangeEvent** *(API version 48.0)*
  - Change events are available for the object.

- **QuickTextHistory**
  - History is available for tracked fields of the object.
QuickTextOwnerSharingRule
Sharing rules are available for the object.

QuickTextShare
Sharing is available for the object.

QuickTextUsage

Represents the usage of quick text on a record, including which quick text was used, who used it, and how they used it. This object is available in API version 47.0 and later.

Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Special Access Rules

This object is always read-only.

Details

This is a relationship field.

**Relationship Name**
User

**Relationship Type**
Lookup

**Refers To**
User

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **QuickTextUsageOwnerSharingRule**
  Sharing rules are available for the object.

- **QuickTextUsageShare**
  Sharing is available for the object.

Quote

The Quote object represents a quote, which is a record showing proposed prices for products and services. Available in API version 18.0 and later.

Quotes can be created from and synced with opportunities, and emailed as PDFs to customers

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

### Usage

Use Quote to manage proposed product prices for customers. To update a Quote, your client application needs “Edit” permission.

- Client applications can create, update, delete, and query Attachment records associated with a quote via the API.
- You can sync a quote and its parent Opportunity.

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**QuoteChangeEvent (API version 44.0)**

Change events are available for the object.

**QuoteFeed (API version 39.0)**

Feed tracking is available for the object.

**QuoteOwnerSharingRule (API version 41.0)**

Sharing rules are available for the object.
**QuoteShare (API version 41.0)**
Sharing is available for the object.

SEE ALSO:
- QuoteLineItem
- QuoteDocument
- Opportunity

## QuoteDocument

Represents a quote in document format. Available in API version 18.0 and later.

### Supported Calls

- create()
- delete()
- describeSObjects()
- getDeleted()
- getUpdated()
- query()
- retrieve()
- undelete()

### Field Details

**Description**
The discount for the quote used in the document.

**Document**
- **Type**: base64
- **Properties**: Create, Nillable
- **Description**: The binary data of the document stored in the QuoteDocument object.

**GrandTotal**
- **Type**: currency
- **Properties**: Filter, Nillable, Sort
- **Description**: Grand total for the quote used in the document.

**Name**
- **Type**: string
- **Properties**: Filter, idLookup, Sort
- **Description**: Name of the quote document.

**QuoteId**
- **Type**: reference
- **Properties**: Create, Filter, GroupSort
- **Description**: ID for the quote used for the document.

### Usage

Use the QuoteDocument object to store a document that can be used to present the quote information to the customer.

### SEE ALSO:
- [Quote](#)
- [QuoteLineItem](#)
**QuoteLineItem**

The QuoteLineItem object represents a quote line item, which is a member of the list of Product2 products associated with a Quote, along with other information about those line items on that quote. Available in API version 18.0 and later.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

**Special Access Rules**

The user must have “Edit” permissions on Quote records in order to create or update quote line items on a quote. The user must have “Edit” permissions on Quote records to delete a quote line item.

### Field Details

**Properties**
Create, Filter, Group, Nillable, Sort, Update

**Description**
The value of where the line item is in the sorted order, such as 1, 2, and so on. The SortOrder value determines the order in which a quote line item displays in the Quote Line Items related list and the Quote PDF. Client applications can use this to match the sort order in Salesforce. This field is only available in API versions 21.0 and greater.

</tr>
</tbody>
</table>

---

### Usage

A Quote record can have QuoteLineItem records only if the Quote has a Pricebook2. A QuoteLineItem must correspond to a Product2 that is listed in the quote’s Pricebook2.

**Note:** If the multicurrency option has been enabled, the CurrencyIsoCode field is present. It can’t be modified, it is always set to the value of the CurrencyIsoCode of the parent Quote.
Effects on Quotes

Quotes that have associated QuoteLineItem objects are affected in the following ways:

- Creating a QuoteLineItem increments the Quote value by the TotalPrice of the QuoteLineItem.
- When you create or update a QuoteLineItem, the API verifies that the line item corresponds to a PricebookEntry in the Pricebook2 that is associated with the quote.

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**QuoteLineItemChangeEvent (API version 44.0)**

Change events are available for the object.

SEE ALSO:

- Quote
- QuoteDocument
- Opportunity

RecentFieldChange

Use this virtual object to see how an opportunity has changed in the past seven days. Learn the previous value of a field, who made the change, and when the change was made. This object is available in API version 52.0 and later.

Supported Calls

`describeSObjects()`, `query()`

Special Access Rules

To use RecentFieldChange, set up historical trend reporting for opportunities in your org. You must also have the Pipeline Inspection user permission and the Pipeline Inspection setting enabled.

</tbody>
</table>

### Usage

One recentFieldChange record is returned for each field that was changed in the past seven days. The supported fields are Amount, Close Date, Forecast Category, Next Step, and Stage Name. Only the most recent previous value is returned.

**Example:** To see the most recent previous amount for an opportunity, use the following query. Replace `006R0000003JkHBIA0` with the ID of the opportunity.

```sql
select PreviousTextValue from RecentFieldChange where ParentId = '006R0000003JkHBIA0' and FieldName = 'StageName'
```
If the sales rep didn’t change the opportunity stage name in the past seven days, no values are returned. If the sales rep changed the opportunity amount several times in the past seven days, only the most recent previous value is returned.

**Example:** To see the most recent previous amount, close date, forecast category, next step, and stage name for an opportunity, use the following query. Replace `006R0000XXXXXXXXXX` with the ID of the opportunity.

```sql
select PreviousTextValue, PreviousCurrencyValue, PreviousDateOnlyValue from RecentFieldChange where ParentId = '006R0000XXXXXXXXXX' and FieldName IN ('StageName', 'Amount', 'CloseDate')
```

If the opportunity amount, close date, forecast category, next step, and stage name didn’t change in the past seven days, no values are returned.

### RecentlyViewed

RecentlyViewed

Represents records or list views that the current user has recently viewed or referenced (by viewing a related record). List views are available in API version 29.0 and later.

### Supported Calls

`query()`, `update()`

### Special Usage Rules

The RecentlyViewed object does not support the Event, Task, Report, KnowledgeArticle, and Article objects.

The RecentlyViewed object supports only certain objects, and supports list views only for those supported objects. Supported objects have the fields `LastReferencedDate` and `LastViewedDate`.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **Alias** | Type: string  
Properties: Filter, Group, Nillable, Sort  
Description: The alias on the record. |

<td>If the recently viewed record is a user, this value is the user’s profile ID. This is a relationship field.</td>
</tr>
</tbody>
</table>

**Relationship Name** | Profile

**Relationship Type** | Lookup
Usage

This object provides a heterogeneous list of different object types. The list consists of recently viewed records, records that were recently referenced (a related record was viewed), or recently viewed list views. A record is considered viewed when the user sees the record details, but not when the user sees the record in a list with other records. Use this object to programatically construct a list of recently viewed items specific to the current user. For example, use this object on a custom user interface or for search auto-complete options. You can also retrieve a filtered list of records by object type (Type). The RecentlyViewed data is periodically truncated down to 200 records and 200 list views per object. RecentlyViewed data is retained for 90 days, after which it is removed on a periodic basis.
Use this query in your code to retrieve a list of all the records and list views that were recently viewed. The results are ordered from most to least recent.

```sql
SELECT Id, Name
FROM RecentlyViewed
WHERE LastViewedDate !=null
ORDER BY LastViewedDate DESC
```

Use this query to retrieve data that was either viewed or referenced, but only for a limited set of objects.

```sql
SELECT Id, Name
FROM RecentlyViewed
WHERE Type IN ('Account', 'Contact', 'Plan__c')
ORDER BY LastViewedDate DESC
```

This query retrieves a list of all recently viewed contacts with contact-specific fields, such as the contact’s account name, and the custom website field. Records are ordered from most to least recent.

```sql
SELECT Account.Name, Title, Email, Phone, Website__c
FROM Contact
WHERE LastViewedDate != NULL
ORDER BY LastViewedDate DESC
```

---

**Recommendation**

Represents the recommendations surfaced as offers and actions for Einstein Next Best Action. This object is available in API version 45.0 and later.

**Supported Calls**

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

**Special Access Rules**

You must have the Modify All Data or Manage Next Best Action Recommendations user permission to create and edit recommendations.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**RecommendationChangeEvent** *(API version 48.0)*

Change events are available for the object.
RecordAction

Represents a relationship between a record and an action, such as a flow. Create a RecordAction for every action that you want to associate with a particular record. Available in API version 42.0 and later.

Note: Access to the RecordAction object is determined by a user’s access to the associated parent record.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

As of Summer ’20 and later, only authenticated internal and external users can access this object.

| **Description** | Required. Record associated with the action. In version 46.0 and above, we support most object types. To learn about supported objects, see the Lightning Flow for Service Developer’s Guide.  
This is a relationship field. |

**Relationship Name**

Record

**Relationship Type**

Lookup

**Refers To**

### Field

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceTerritoryMember, Shipment, SkillRequirement, SocialPersona, SocialPost, TimeSlot, User, Visit, VoiceCall, WorkOrder, WorkOrderLineItem, WorkType, WorkTypeGroup</td>
</tr>
</tbody>
</table>

### Status

**Type**

picklist

**Properties**

Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**

Required. The current state of the action. Possible values are:

- New (default)
- Paused
- Complete
- Started
- Unlinked—The action was unlinked because the flow was paused and the current record for the flow interview changed.

Paused and unlinked statuses do not apply to quick actions. This field can't be set in Process Builder.

### Usage

The RecordAction object works with the Actions & Recommendations component in Lightning Experience. Although this junction object can be used to create relationships between records and actions in Salesforce Classic, those relationships can't be displayed in Salesforce Classic.

**Note:** API version 44.0 added a field, ActionDefinition, so that a RecordAction in future releases can support other types of actions in addition to flows. API version 44.0 and later maintain the FlowDefinition field to support processes that reference this field in earlier API versions. Upgrading an org to Winter '19 or later, which uses API version 44.0 or later, copies the FlowDefinition field to the ActionDefinition field. FlowDefinition will be deprecated in a future release, so use ActionDefinition instead.

When an action is deleted that's referenced in an ActionDefinition or FlowDefinition, the RecordAction object is deleted. RecordAction objects are also deleted when the associated parent record is deleted, or when a flow is paused and the current record context has changed. When an action is completed, the associated RecordAction object is also deleted.

Deleted RecordActions are removed from the list when the page is refreshed.

For more information about the Actions & Recommendations component and how it works with RecordActions, see the Lightning Flow for Service Developer Guide.

### Java Example

Here's an example of how to associate flows to a record using the RecordAction object.

```java
public void associateNewCustomerFlowWithAccount(Account a) {
    try {
        RecordAction newRecordAction = new RecordAction();
        newRecordAction.setRecordId(a.getId());
```
newRecordAction.setActionDefinition(“New_Customer_Flow”);
newRecordAction.setOrder(1);

SaveResult[] results = connection
    .create(new SObject[] { newRecordAction });
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
**RecordActionHistory**

Represents the lifecycle of a RecordAction as it goes through different states. Available in API version 44.0 and later.

**Supported Calls**

`describeSObjects()`, `query()`, `retrieve()`

You can also enable `delete()` in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

**Special Access Rules**

This object is always read-only.

**Fields**

<table>

**Relationship Type** Lookup  
| Pinned          | **Type** picklist  
**Properties** Defaulted on create, Nillable, Restricted picklist  
**Description** Optional. Specifies whether the action is pinned to the top or bottom, or unpinned. Possible values are:  
- None  
- Top  
- Bottom |
Usage

The RecordActionHistory object represents the lifecycle of an action on a record as it goes through different states.

The RecordActionHistory object is a big object. For this reason, when you use synchronous SOQL, SOAP, REST, Bulk, or Apex APIs to read this object, queries must follow a specific pattern or they fail. Queries must match one of these patterns and use fields in this precise order when more than one field is used.

- ParentRecordId
• ParentRecordId, LoggedTime (DESC)
• ParentRecordId, LoggedTime (DESC), RecordActionId

For example, this SOQL query follows the ParentRecordId, LoggedTime (DESC) pattern.

```
SELECT ActionDefinitionApiName, User, State FROM RecordActionHistory WHERE ParentRecordId = {CaseId} ORDER BY ParentRecordId, LoggedTime DESC
```

Asynchronous SOQL queries do not need to follow a pattern, and can query any field.

Apex triggers cannot reference big object records. Use SOQL queries if you want to query RecordActionHistory records in Apex.

For more information about the Actions & Recommendations component and how it works with RecordActions, see the Lightning Flow for Service Developer Guide. Learn more about big objects and how to query them in the Query Big Objects module on Trailhead.

### Java Example

Here’s a Java example of how to query a RecordActionHistory object.

```java
public void queryHBPOs(String parentRecordId) {
    try {
        SimpleDateFormat format = new SimpleDateFormat("yyyy-MM-dd");

        // query for the RecordActionHistory associated with ParentRecord
        QueryResult queryResults = connection.query("SELECT ActionDefinitionApiName, LoggedTime, State " +
                                                    "FROM RecordActionHistory WHERE ParentRecordId = '" + parentRecordId + "' LIMIT 50");

        if (queryResults.getSize() > 0) {
            for (int i=0;i<queryResults.getRecords().length;i++) {
                // cast the SObject to a strongly-typed RecordActionHistory
                RecordActionHistory raa = (RecordActionHistory)queryResults.getRecords()[i];
                System.out.println("ActionDefinitionApiName: " + raa.getActionDefinitionApiName() + " - LoggedTime: " + format.format(raa.getLoggedTime().getTime()) + " - State: " + raa.getState());
            }
        }
    } catch (Exception e) {
        e.printStackTrace();
    }
}
```

### RecordsetFilterCriteria

Represents a set of filters that can be used to match service appointments or assets based on your criteria fields. For example, you can create recordset filter criteria so that only service appointments that satisfy the filter criteria are matched to the filtered shifts, and likewise only maintenance work rules that satisfy your criteria are matched to assets. This object is available in API version 50.0 and later. Assets and maintenance work rules are available in API version 52.0 and later.

### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()
### Special Access Rules
Field Service must be enabled.

### Fields

<tr>
<td><strong>Description</strong></td>
<td>The source object that the filtered criteria are applied to. Shifts and maintenance work rules are available in API version 52.0 and later. Appointment bundle objects are available in API version 53.0 and later. Possible values are: • ApptBundleAggrPolicy—Appointment Bundle Aggregation Policy • ApptBundleConfig—Appointment Bundle Config</td>
</tr>
</tbody>
</table>
Usage

Let's say an employee is open to working a 9 am to 5 pm shift on a Sunday but only for emergency appointments. In this case, the SourceObject is Shift and the FilteredObject is ServiceAppointment. The service appointments available for that shift are filtered for emergency appointments using the RecordsetFilterCriteriaRule object.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

RecordsetFilterCriteriaFeed
Feed tracking is available for the object.

RecordsetFilterCriteriaHistory
History is available for tracked fields of the object.

RecordsetFilterCriteriaOwnerSharingRule
Sharing rules are available for the object.

RecordsetFilterCriteriaShare
Sharing is available for the object.

RecordsetFilterCriteriaRule

Represents a rule using fields from the designated source object to create filters on the filtered, or target, object. RecordsetFilterCriteriaRule is associated with the RecordsetFilterCriteria object. This object is available in API version 50.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

Field Service must be enabled.

Fields

<table>
<thead>
<tr>

<td>Description</td>
</tr>
<tr>
<td><code>Value</code></td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
</tbody>
</table>

### Usage

If you want to create a filter rule for service appointments with a dispatched status, set `CriteriaField` to `ServiceAppointment.Status` and `Value` to `Dispatched`. Then add the ID from a RecordsetFilterCriteria record to `RecordsetFilterCriteriaId` to associate this rule with a filter criteria for shifts.

### RecordType

Represents a record type.

### Supported Calls

create(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

### Fields

**Important:** Don’t use record types as an access control mechanism. Profile assignment governs create and edit access for an object but doesn’t govern read access. For example, a user assigned to a profile that isn’t enabled for a particular record type can’t create records with that record type, but can access records associated with that record type. Users with access to an object can read all record type information for that object. We strongly recommend against storing sensitive information in the record type.
description, name, or label. Instead, store sensitive information in a separate object or fields to which you’ve applied appropriate access controls.

<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Defaulted on create, Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Indicates whether this record has been designated as a person account (true) or not (false). Visible only if the organization has the person account feature enabled.</td>
</tr>
</tbody>
</table>

### Name

- **Type**: string
- **Properties**: Create, Filter, Group, idLookup, Sort, Update
- **Description**: Required. Label of the record type in the user interface. Limit: 80 characters. Label is Record Type Label.

### NamespacePrefix

- **Type**: string
- **Properties**: Filter, Group, Nillable, Sort
- **Description**: The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

  The namespace prefix can have one of the following values:
  
  - In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.
  
  - In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

### SobjectType

- **Type**: picklist
- **Properties**: Create, Filter, Group, Restricted picklist, Sort
- **Description**: Object to which this record type applies, including custom objects.
Usage

Use this object to offer different BusinessProcess records and subsets of picklist values to different users based on their Profile. Your client application can describe or query RecordType records.

Client applications can create or update values in `RecordTypeId` on these objects, specifying a valid record type ID associated with these objects.

⚠️ **Note:** You can't create or update the `RecordTypeId` field on the CampaignMember records. Set the CampaignMember record type using the `CampaignMemberRecordTypeId` field on Campaign.

A client application can retrieve the list of valid record type IDs for a given object by querying the RecordType.

SEE ALSO:
- Record Type Objects

**RecordTypeLocalization**

Represents the translated value of a label for a record type when the Translation Workbench is enabled for your organization.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

**Special Access Rules**

- Your organization must be using Professional, Enterprise, Developer, Unlimited, or Performance Edition and be enabled for the Translation Workbench.
- To view this object, you must have the “View Setup and Configuration” permission.

**Fields**

<table>
<thead>
<tr>

</tbody>
</table>
### Field Details

**Description**
The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.
- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

<table>

</tr>
<tr>
<td>Value</td>
<td>string</td>
<td>Create, Filter, Nullable</td>
<td>The actual translated label for the record type. Label is Translation.</td>
</tr>
</tbody>
</table>

**Usage**
Use this object to translate the labels of your record types into other supported languages.

**RecordVisibility (Pilot)**
Represents the visibility attributes that determine a record's read access. This object is read only and is available in API version 46.0 and later.

**Supported Calls**
describeSObjects(), query()
Special Access Rules

To access this object, you need a Tableau CRM license or to contact Salesforce to participate in the pilot program. You must also have the “View All Data” or “Enable RecordVisibility API” user permission.

Note: We provide the RecordVisibility object to selected customers through a pilot program that requires agreement to specific terms and conditions. To be nominated to participate in the program, contact Salesforce. Pilot programs are subject to change, and we can’t guarantee acceptance. The RecordVisibility object isn’t generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can’t guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features. You can provide feedback and suggestions for the RecordVisibility object in the group in the Trailblazer Community.

Fields

<table>

</tbody>
</table>

VisibilityAttribute

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>string</td>
</tr>
<tr>
<td>Properties</td>
<td>Filter, Nullable, Sort</td>
</tr>
<tr>
<td>Description</td>
<td>The visibility attributes that determine the read access of a given record. For example, a user ID, parent record ID, or group ID. The output of visibility attributes is in JSON format and must be deserialized.</td>
</tr>
</tbody>
</table>

Usage

Use this object to query the attributes that determine the visibility of one or more records. You can’t create, delete, or update any records using this object.

Up to 200 record IDs can be queried. You can include an ORDER BY clause for any field that is being selected in the query.

This sample query returns the visibility attributes for the indicated record.

```
SELECT RecordId, VisibilityAttribute
FROM RecordVisibility
WHERE RecordId=[single ID]  // or Record IN [list of IDs]
```

The RecordId and VisibilityAttribute fields must be a part of the fields that are being selected despite RecordId being used in the filter criteria as well.
RecordVisibility is a foreign key on the records. This query returns the visibility attributes for Account records:

```sql
SELECT Id, Name, RecordVisibility.VisibilityAttribute
FROM Account
```

You can't filter RecordId fields when using RecordVisibility as a lookup or foreign key.

You can use `RecordVisibilityContext` to filter WITH clauses in queries. For more information, see `WITH filteringExpression` in the SOQL and SOSL Reference.

RedirectWhitelistUrl

Represents a trusted URL that users can navigate to without being shown a warning message. This object is available in API version 48.0 and later.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object's name.

**Supported Calls**

- `create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

**Special Access Rules**

Only authenticated internal and external users with the View Setup and Configuration permission can access this object, and only users with the Customize Application permission can edit it.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DeveloperName</td>
<td><strong>Type</strong> string</td>
</tr>
<tr>

<td>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Salesforce-specific result code that can map to one or more gateway result codes. We recommend configuring the payment gateway adapter layer to map gateway result codes to the appropriate Salesforce result code.</td>
</tr>
<tr>
<td></td>
<td>Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Decline: The gateway call failed, but it may still work if the transaction is attempted again. For example, the customer had insufficient funds or briefly lost their connection.</td>
</tr>
<tr>
<td></td>
<td>• Indeterminate: The gateway didn’t respond to the call. This response usually happens when Salesforce times out while waiting for a response from the gateway.</td>
</tr>
<tr>
<td></td>
<td>• PermanentFail: The gateway call failed and won’t work even if tried again. Gateway calls fail permanently for one of two reasons:</td>
</tr>
<tr>
<td></td>
<td>‒ Hard Decline: The customer’s payment account has been closed or terminated.</td>
</tr>
<tr>
<td></td>
<td>‒ Fraud: The gateway recognized the payment or payment method as known fraud.</td>
</tr>
</tbody>
</table>
- **RequiresReview**: The customer bank requires more information before completing the payment.
- **Success**: The gateway call succeeded.
- **SystemError**: Salesforce ended the payment request before receiving a response. For example, Salesforce lost credentials or access to its server. Salesforce ends payment calls if it doesn’t receive a response from the gateway within two minutes.
- **Validation Error**: Customer payment data was incorrect, such as a misspelling in the credit card address or an incorrect CVV.

### Status

**Type**

picklist

**Properties**

Create, Filter, Group, Restricted picklist, Sort, Update

**Description**

Defines the state of this refund.

Possible values are:

- **Canceled**: This refund has been voided and can no longer be allocated.
- **Draft**: The refund can be edited before posting it and allocating it to a target.
- **Processed**: This refund has been finalized and can be allocated against a target.

Users can manually change the Status field’s values as follows:

- Draft to Processed
- Processed to Canceled
- Draft to Canceled

### TotalApplied

**Type**

currency

**Properties**

Filter, Nillable, Sort

**Description**

The sum of Amount fields across all of this refund’s applied refund lines.

### TotalUnapplied

**Type**

currency

**Properties**

Filter, Nillable, Sort

**Description**

The sum of Amount fields across all of this refund’s unapplied refund lines.

### Type

**Type**

picklist
RefundLinePayment

A refund line that has been applied to a payment. This object is available in API version 48.0 and later.

**Supported Calls**

create(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

**Special Access Rules**

To access Commerce Payments entities, your org must have a Salesforce Order Management license with the Payment Platform org permission activated.

</tr>
</tbody>
</table>
| EffectiveDate      | **Type**  
datetime  
**Properties**  
Create, Filter, Nullable, Sort  
**Description**  
Defines the date and time when the refund line application or unapplication becomes effective.                                                                                                                                                                                |
| EffectiveImpactAmount | **Type**  
currency  
**Properties**  
Filter, Nullable, Sort  
**Description**  
Shows how this payment refund line impacts a customer's accounts receivable. This value is positive when RefundLinePayment's Type field is Applied, and negative when RefundLinePayment's Type is Unapplied. If there's an unapplied line related to this record, EffectiveImpactAmount has a value of 0.  
**Note:** EffectiveImpactAmount evaluates only the applied and unapplied line pair. Therefore, the effective impact amount could be different for different lines within the same refund. |
| HasBeenUnapplied   | **Type**  
picklist  
**Properties**  
Create, Filter, Group, Restricted picklist, Sort  
**Description**  
Shows whether this refund line has been unapplied. Possible values are:  
• No                                                                                                                                                                                                                                                                         |
| ImpactAmount       | **Type**

</table>

**Usage**

When you’re ready to apply a refund’s balance to a payment, create a refund line (RefundLinePayment). The refund line represents the balance taken from the payment and applied toward the invoice. You can apply a refund’s balance when you create the refund record or afterward. The refund line must have the same currency as the parent refund.

A refund has an amount, which represents the total amount taken from the refund, and a balance, which represents the remaining amount after the refund line has been applied to a payment. A refund’s amount can’t be less than the sum of all of its refund line amounts. You can apply any portion of a refund’s balance to a payment.
You can apply a refund to transactions on the same account or to different transactions across different accounts.

RegisteredExternalService

Represents a registered external service used for checkout integrations by data integrators. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

The RegisteredExternalService object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DeveloperName</td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization.</td>
</tr>
</tbody>
</table>

**Note:** Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.
### Field Details

**ExternalServiceProviderId**
- **Type** reference
- **Properties** Create, Filter, Group, Sort, Update
- **Description**
  The ID of an Apex class that implements one of the following interfaces:
  - sfdc_checkout.CartInventoryValidation
  - sfdc_checkout.CartPriceCalculations
  - sfdc_checkout.CartShippingCharges
  - sfdc_checkout.CartTaxCalculations

**ExternalServiceProviderType**
- **Type** picklist
- **Properties** Create, Filter, Group, Restricted picklist, Sort, Update
- **Description**
  The types of external service providers.
  Possible values are:
  - Inventory
  - Price
  - Promotions (this value is available in API version 53.0 and later)
  - Shipment
  - Tax

**MasterLabel**
- **Type** string
- **Properties** Create, Filter, Group, Sort, Update
- **Description**
  The master label for the registered external service.

---

### RemoteKeyCalloutEvent

The documentation has moved to RemoteKeyCalloutEvent in the Platform Events Developer Guide.

### Reply

Represents a reply that a user has submitted to a question in an answers zone.
Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

</table>
% Field % Details

% Description % The total number of up votes for a reply.

VoteTotal

% Type % double

% Properties % Filter, Nillable, Sort

% Description % The total number of all votes for a reply, including up and down votes.

Usage

Use this object to track replies to a Question.

ReplyReportAbuse

Represents a user-reported abuse on a Reply in a Chatter Answers zone. This object is available in API version 24.0 and later.

Supported Calls

create(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Fields

% Field % Details

Name

% Type % string

% Properties % Autonumber, Defaulted on create, Filter, idLookup, Sort

% Description % The name of the Reply from which the user reported abuse.

Reason

% Type % picklist

% Properties % Create, Filter, Group, Restricted picklist, Sort

% Description % The reason the user reported abuse on the Reply, such as Spam, Hateful, or Inappropriate.
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Details</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Language</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>picklist</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable, Restricted picklist, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The language used in the reply. This field is available in API version 51.0 and later. Possible values are languages supported in Einstein Reply Recommendations.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Autonumber, Defaulted on create, Filter, idLookup, Sort</td>
</tr>
</tbody>
</table>
**Field** | **Details**
---|---
**Description** | Eight-digit auto-generated number identifying the reply.

**RawTextMessage** | **Type**
---|---
textarea

**Properties**

**Description** | The text of the reply.

**Source** | **Type**
---|---
picklist

**Properties**

**Description** | Indicates who last modified the reply.

Possible values are:

- **EINSTEIN_GENERATED**—Reply was generated by Einstein and has not been edited.
- **USER_EDITED**—Reply was generated by Einstein and then edited by a user.
- **USER_GENERATED**—This value is not currently in use.

**Status** | **Type**
---|---
picklist

**Properties**

**Description** | The status of the reply.

Possible values are:

- **NEW**—Einstein has generated the reply and it hasn’t yet been published.
- **PUBLISHED**—The reply has been published to quick text. When the reply recommendation model is activated, the reply can be recommended to support agents.
- **PUBLISH_FAILED**—An attempt to publish the reply to quick text failed. Publishing failure can be due to validation errors, access errors, or corrupted files. To hide the reply from the list of generated replies, delete it.

**Usage**

To get started with Einstein Reply Recommendations, create a predictive model that analyzes closed chats for frequently used text snippets. When the model is ready, Einstein generates a list of these snippets as ReplyText records for you to review and publish, or convert, to quick text. ReplyText records appear on the Einstein Reply Recommendations Setup page.
You can select one or more replies to publish at a time. If you publish a single reply, you can edit the reply text during publishing. If you publish multiple replies at once, you can edit each reply's text on the quick text page after publishing is complete. Replies aren't recommended to support agents until you activate your reply recommendation model.

When a reply is published, a corresponding QuickText record is created. During publishing, select a quick text folder to add the replies to and make sure that agents have access to the folder. To edit a reply after it is published, edit the related quick text record.

Einstein generates the list of replies only once, when your model finishes building. It’s not possible to generate a new list.

Rights of ALBERT EINSTEIN are used with permission of The Hebrew University of Jerusalem. Represented exclusively by Greenlight.

Report
Represents a report, a set of data that meets certain criteria, displayed in an organized way. Access is read-only. This object is available in API version 20.0 and later.

Supported Calls
describeSObjects(), query(), retrieve(), search()

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Filter, Group, Nullable, Sort</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The description of the report. Limit: 255 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>DeveloperName</th>
<th><strong>Type</strong> string</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Properties</strong> Filter, Group, Sort</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is <strong>Report Unique Name</strong>.</td>
</tr>
</tbody>
</table>

**Note:** When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record.
<table>

</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>LastRunDate</strong></th>
<th><strong>Type</strong> date</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Properties</strong> Filter, Nullable, Sort</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> Returns the date the report was last run. Label is <em>Last Run</em>.</td>
</tr>
</tbody>
</table>
## LastViewedDate

**Type**

datetime

**Properties**

Filter, Nillable, Sort

**Description**

The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (LastReferencedDate) but not viewed it.

## Name

**Type**

string

**Properties**

Filter, Group, idLookup, Sort

**Description**

Required. The report label used in the user interface.

## NamespacePrefix

**Type**

string

**Properties**

Filter, Group, Nillable, Sort

**Description**

The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.

- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

This field can’t be accessed unless the logged-in user has the Customize Application permission.

## OwnerId

**Type**

reference

**Properties**

Filter, Group, Sort
The ID of the folder that contains the report. There are 2 special folders:

- Private, where the ID is the user ID
- Public, where the ID is the org ID

This is a polymorphic relationship field.

**Relationship Name**
Owner

**Relationship Type**
Lookup

**Refers To**
Folder, Organization, User

## Supported Query Scopes

Use these scopes to help specify the data your SOQL query returns.

**allPrivate**
Records saved in all users’ private folders.

Requires the user permission "Manage All Private Reports and Dashboards" and Enhanced Analytics Folder Sharing. If your organization was created after the Summer '13 release, you already have Enhanced Analytics Folder Sharing. Available in API version 36.0 and later.

**created**
Records created by the user running the query.

**everything**
All records except records saved in other users’ private folders.

**mine**
Records saved in the private folder of the user running the query.

**organizationOwned**
Records saved in Unfiled Public Reports. In Lightning Experience, the Unfiled Public Reports folder is called Public Reports.

## Usage

Use the report object to get report metadata. Query, search, or retrieve specific metadata on reports. Report object fields are read-only.

### Example: Reports with “Sales” in Their Name

This SOQL query returns reports that contain the name “Sales” and lists their developer names, format, ID, and report name.

```
SELECT DeveloperName, Format, Id, Name FROM Report WHERE Name LIKE '%Sales%'
```
Example: Reports in an Inactive User’s Private Folder

This SOQL query returns reports saved in a specific user’s private folder.

```
SELECT Id FROM Report USING SCOPE allPrivate WHERE OwnerId = '005A0000000Bc2deFG'
```

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**ReportFeed**

Feed tracking is available for the object.

SEE ALSO:

- ReportTag
- Dashboard

ReportTag

Associates a word or short phrase with a Report. This object is available in API version 20.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ItemId</td>
<td>Type: reference&lt;br&gt;Properties: Create, Filter&lt;br&gt;Description: ID of the tagged item.</td>
</tr>
<tr>
<td>Name</td>
<td>Type: string&lt;br&gt;Properties: Create, Filter&lt;br&gt;Description: Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</td>
</tr>
</tbody>
</table>
## Field Name: TagDefinitionId

**Details**

**Type**
- reference

**Properties**
- Filter

**Description**
ID of the parent TagDefinition object that owns the tag.

## Field Name: Type

**Details**

**Type**
- picklist

**Properties**
- Create, Filter, Restricted picklist

**Description**
Defines the visibility of a tag.

Valid values:
- **Public**—The tag can be viewed and manipulated by all users in an organization.
- **Personal**—The tag can be viewed or manipulated only by a user with a matching OwnerId.

## Usage

ReportTag stores the relationship between its parent TagDefinition and the Report being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

- Report

## ReputationLevel

Represents a reputation level defined for an Experience Cloud site. This object is available in API version 32.0 and later.

### Supported Calls

describeSObjects(), query(), retrieve()
### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Label</strong></td>

<tr>
<td></td>
<td><strong>Description</strong> The lower limit of reputation points associated with this reputation level. The maximum number of reputation points a user can accrue is 999,999,999,999,999.</td>
</tr>
</tbody>
</table>

### ReputationLevelLocalization

Represents the translated value of a reputation level. Reputation level localization only applies for reputation levels in Experience Cloud sites. This object is available in API version 35.0 and later.

### Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()
Special Access Rules
This object is available only if digital experiences is enabled in your org and reputation is enabled in your Experience Cloud site.

ReputationPointsRule

Represents the reputation point rules for an Experience Cloud site. Each rule specifies an action that members can earn points from and the points associated with those actions in a particular site. This object is available in API version 32.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()
## Special Access Rules
This object is available only if digital experiences is enabled in your org. Only users with permissions to create or manage an Experience Cloud site can view the ReputationPointsRule records.

### Fields

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
### ResourceAbsence

Represents a time period in which a service resource is unavailable to work in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

### Supported Calls

- create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(), upsert()

### Special Access Rules

Field Service must be enabled.

### Usage

Resource absences you define periods of time when a service resource is unavailable to work. Unless you’re using the Field Service managed package, service resources can still be assigned to appointments that conflict with their absences.

⚠️ **Tip:** Create a trigger that sends an approval request to a supervisor when a service resource creates an absence.

If you’re not using the Field Service managed package, a calendar view isn’t available for individual service resources.

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **ResourceAbsenceChangeEvent (API version 48.0)**
  - Change events are available for the object.
- **ResourceAbsenceFeed**
  - Feed tracking is available for the object.
- **ResourceAbsenceHistory**
  - History is available for tracked fields of the object.

### ResourcePreference

Represents an account’s preference for a specified service resource on field service work.

Resource preferences indicate which service resources should be assigned to field service work. You can designate service resources as preferred, required, or excluded on specific accounts or work orders. Work orders inherit their associated account’s resource preferences.

### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()
### Special Access Rules

Field Service must be enabled.

### Fields

<table>

</tbody>
</table>
|                         | **Description** Resource preference type. Values include:  
|                         | • Preferred: Indicates that the customer would like their field service work assigned to the resource  
|                         | • Required: Indicates that the resource must be assigned to the customer’s field service work  
|                         | • Excluded: Indicates that the customer does not want their field service work assigned to the resource  
<p>|                         | Resource preferences serve more as a suggestion than a requirement. You can still assign a service appointment to any resource regardless of the related work order’s resource preferences. |
| RelatedRecordId         | <strong>Type</strong> reference           |

  - **Relationship Name** ServiceResource
  - **Relationship Type** Lookup
  - **Refers To** ServiceResource

**Associated Objects**
This object has the following associated objects. Unless noted, they are available in the same API version as this object.
- **ResourcePreferenceFeed**
  - Feed tracking is available for the object.
- **ResourcePreferenceHistory**
  - History is available for tracked fields of the object.
ReturnOrder

ReturnOrder represents the return or repair of inventory or products in Field Service, or the return of order products in Order Management. This object is available in API version 42.0 and later.

Return orders are available in Lightning Experience, Salesforce Classic, the Salesforce mobile app, the Field Service mobile app for Android and iOS, and communities built using Salesforce Tabs + Visualforce.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

Field Service or Order Management must be enabled. If return orders are enabled by a Salesforce Order Management license, they must be created with a Status corresponding to the Status Category Activated. The default Statuses corresponding to Activated are Submitted and Approved.

| **Relationship Name** | Owner |
| **Relationship Type** | Lookup |
| **Refers To** | Group, User |

| ProductRequestId | Type | reference |
| **Properties** | Create, Filter, Group, Nillable, Sort, Update |
| **Description** | The product request associated with the return order. When you associated a return order with a product request, you can associate the return order's line items with the product request's line items. A return order might be related to a product request if the return order tracks the return of unused products or products to be repaired or replaced. For example, a technician creates a product request for three motors to prepare for a field visit. If the technician finds that only two motors are needed, they can create a return order to return the third to the original location, and list the product request in this field. This is a relationship field. |

### Usage

You can use return orders to track customer returns, customer repairs, or the return of inventory from a technician’s van stock to a warehouse or supplier. Customers can initiate a return from a community, or agents can create return orders in response to a customer call or technician request.

Return orders are composed of return order line items, which allow you to add details about the items being returned. To represent the returned items, each line item must list one or more of the following: product, product item, asset, product request line item, and order product. Return orders can be associated with a product request, case, account, contact, and order if needed. This versatility lets you use return orders to track a wide range of return scenarios.

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **ReturnOrderChangeEvent (API version 48.0)**: Change events are available for the object.
- **ReturnOrderFeed**: Feed tracking is available for the object.
- **ReturnOrderHistory**: History is available for tracked fields of the object.
- **ReturnOrderOwnerSharingRule**: Sharing rules are available for the object.
- **ReturnOrderShare**: Sharing is available for the object.

### ReturnOrderItemAdjustment

Represents a price adjustment on a return order line item. This object is available in API version 50.0 and later.
Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(),
retrieve(), update(), upsert()

Special Access Rules

Order Management must be enabled.

Fields

</table>

**ReturnOrderLineItem**

Represents a specific product that is returned or repaired as part of a return order in Field service, or a specific order item that is returned as part of a return order in Order Management. This object is available in API version 42.0 and later.
Return orders are available in Lightning Experience, Salesforce Classic, the Salesforce mobile app, the Field Service mobile app for Android and iOS, and communities built using Salesforce Tabs + Visualforce.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

**Special Access Rules**

Field Service or Order Management must be enabled.

Details

delivery charge. Order Product indicates that it represents any other type of product, service, or charge. Each type corresponds to one type code.

Possible values are:

- Delivery Charge
- Order Product

This field is available in API version 50.0 and later.

TypeCode

<table>
<thead>
<tr>
<th>Type</th>
<th>currency</th>
</tr>
</thead>
</table>

Properties

Create, Defaulted on create, Filter, Nillable, Sort, Update

Description

Type code of the return order line item. Matches the type code of the associated order item summary. Processing depends on this value. Charge indicates that the return order line item represents a delivery charge. Product indicates that it represents an other type of product, service, or charge. Each type category corresponds to one or more types.

Possible values are:

- Charge
- Product

This field is available in API version 50.0 and later.

UnitPrice

<table>
<thead>
<tr>
<th>Type</th>
<th>picklist</th>
</tr>
</thead>
</table>

Properties

Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

Description

Unit price of the return order line item.

This field is available in API version 50.0 and later.

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

ReturnOrderLineItemChangeEvent (API version 48.0)
Change events are available for the object.

ReturnOrderLineItemFeed
Feed tracking is available for the object.

ReturnOrderLineItemHistory
History is available for tracked fields of the object.
ReturnOrderOwnerSharingRule

Represents the rules for sharing a return order with user records other than the owner or anyone above the owner in the role hierarchy. This object is available in API version 42.0 and later.

Note: To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The SharingRules Metadata API type is enabled for all orgs.

Supported Calls
describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Special Access Rules
Field Service must be enabled.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| Description   | **Type** textarea
Properties: Create, Filter, Nillable, Sort, Update
**Description**
A description of the sharing rule. Maximum size is 1000 characters. |
| DeveloperName | **Type** string
Properties: Create, Defaulted on create, Filter, Group, Sort, Update
**Description**
The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization. Corresponds to **Rule Name** in the user interface. Note: When creating large sets of data, always specify a unique **DeveloperName** for each record. If no **DeveloperName** is specified, performance slows down while Salesforce generates one for each record. |
<p>| GroupId       | <strong>Type</strong> reference |</p>
<table>

</tbody>
</table>

**RuleTerritory2Association**

Represents a record-assignment rule and its association to an object, such as Account. Available only if Enterprise Territory Management has been enabled for your organization.

**Supported Calls**

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()
Special Access Rules

As of Summer ’20 and later, only standard users can access this object. If a territory model is in Active state, any standard user can view that model, including its territories and assignment rules. For territories in an active model, any standard user can view assigned records and assigned users subject to your organization’s sharing settings. Users cannot view territory models in other states (such as Planning or Archived).

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>IsInherited</strong></td>
<td>Type: picklist Properties: Create, Filter, Group, Restricted picklist, Sort, Update Description: Indicates whether the rule is an inherited rule (true) or a local rule (false). Rule inheritance flows from the parent territory where the rule is created to the rule’s descendent territories (if any) in the territory model hierarchy. A local rule is created within a single territory and affects that territory only.</td>
</tr>
<tr>
<td><strong>RuleId</strong></td>
<td>Type: reference Properties: Create, Filter, Group, Sort Description: The ID of the rule.</td>
</tr>
<tr>
<td><strong>Territory2Id</strong></td>
<td>Type: reference Properties: Create, Filter, Group, Sort Description: The ID of the territory where the rule was created.</td>
</tr>
</tbody>
</table>

SalesAIScoreCycle

Represents the cycle type and ID used to score records. This object is available in API version 47.0 and later.

Supported Calls
describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()
## Special Access Rules

To see score cycle information, users need a Sales Cloud Einstein license with the View Scoring Model Factors permission enabled. The permission isn’t enabled by default. As of the Spring ’20 release, Pardot and High Velocity Sales users no longer have access to this object.

## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| CycleType        | **Type** picklist  
**Properties** Filter, Group, Restricted picklist, Sort  
**Description** The cycle used to create scores on opportunity records can be one of two types.  
- OpportunityScoreModeling—Provides model factors, which Sales Cloud Einstein uses to build a scoring model.  
- OpportunityScoreScoring—Provides scores and key factors to individual records, which are based on Sales Cloud Einstein’s scoring model.  
**Note:** When the value OpportunityScoreModeling is returned, use the Sales AI Score Model Factor object to get information about the model factors. |
| Name             | **Type** string  
**Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort  
**Description** The ID of the cycle. Currently, the name is a system-generated unique value. |

---

### SalesAI SCORE ModelFactor

Represents the factors that Sales Cloud Einstein uses to build a scoring model. Scoring models are used by features, such as Opportunity Scoring, to score individual records. This object is available in API version 47.0 and later.

## Supported Calls

- `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`
### Fields

<tr>
<td><strong>SecondarySourceFieldValueText</strong></td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td><strong>Filter, Group, Nillable, Sort</strong></td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>When the model factor is based on two source fields, this field represents the value of the secondary source field. For example, the factor HighSuccessMultipleSameFieldValue might use the opportunity’s related product as the primary field and pricebook as the secondary field. The product and pricebook names are indicated by the PrimarySourceFieldValueText and SecondarySourceFieldValueText, respectively. Not all model factors use a secondary source field. This field is available in API version 50.0 and later.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field’s value is retrieved from the SecondarySourceFieldValue field. If the SecondarySourceFieldValue field is a record ID, then SecondarySourceFieldValueText returns the name of the record. If OperatorType returns isNull, then SecondarySourceFieldValue returns true and SecondarySourceFieldValueText returns null.</td>
</tr>
<tr>
<td><strong>Status</strong></td>
<td><strong>Type</strong> picklist</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td><strong>Filter, Group, Restricted picklist, Sort</strong></td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Determines whether the model factor is active or inactive.</td>
</tr>
</tbody>
</table>
Usage

Use the SalesAIScoreModelFactor object to run a query that retrieves the latest highest influencing model factors.

```
SELECT Id, Factor, ScoreCorrelation, FactorSummaryOrgLanguage
FROM SalesAIScoreModelFactor
WHERE Status='Active' and SalesAIScoreCycle.CycleType='OpportunityScoreModeling'
ORDER BY ScoreCorrelation desc
```

SalesChannel

Represents the origin of an order. For example, a web storefront, physical store, marketplace, or mobile app. If you integrate Salesforce Order Management with Salesforce B2C Commerce, set up a SalesChannel corresponding to each Site in your B2C Commerce implementation. This object is available in API version 48.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

This object is only available in Salesforce Order Management orgs.

|             | **Description**
  Type Category of the SalesChannel. Each Type Category corresponds to one or more Types. This field isn't visible in the UI. This field is available in API version 53.0 and later.
  Possible values are:
  - B2B
  - B2C
  - Other |

SEE ALSO:
- Order
- OrderSummary

**SalesStoreCatalog**

Represents the catalog associated with a store. This object is available in API version 49.0 and later.

**Supported Calls**

describeSObjects(), query(), retrieve()

**Special Access Rules**

You must have the B2B Commerce license and a CMS workspace to access a store.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| CurrencyIsoCode | **Type**
  picklist |
|                | **Properties**

|                | **Description**
  The default value is USD. Possible values are:
  - USD—U.S. Dollar |
### SalesWorkQueueSettings

Represents settings used to customize work queue options for third-party scoring. Third-party scoring enables custom number fields on person accounts, contacts, and leads. You must be a High Velocity Sales customer to update this object. Previously, you could only use the Einstein Intelligence Score for third-party scoring. Available starting in Version 47.0.

**Note:** This object can’t be packaged.

### Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>

### SamlSsoConfig

Represents a SAML Single Sign-On configuration. This object is available in API version 32.0 and later.

Single sign-on is a process that allows network users to access all authorized network resources without having to log in separately to each resource. Single sign-on allows you to validate usernames and passwords against your corporate user database or other client application rather than having separate user passwords managed by Salesforce.

#### Supported Calls

- `describeSObjects()`, `query()`, `retrieve()`

#### Special Access Rules

As of Summer ’20 and later, only users with the View Setup and Configuration permission or both the Customize Application and Modify All Data permissions can access this object.
### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AttributeName</strong></td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The name of the identity provider's application. Get this name value from your identity provider.</td>
</tr>
</tbody>
</table>

| **AttributeFormat** | **Type** string  |
| **Properties** | Filter, Group, Nillable, Sort |
| **Description** | For SAML 2.0 only and when `identityLocation` is set to `Attribute`. Possible values include `unspecified`, `emailAddress`, or `persistent`. All legal values can be found in the "Name Identifier Format Identifiers" section of the Assertions and Protocols SAML 2.0 specification. |

| **Audience** | **Type** string |
| **Properties** | Filter, Group, Sort |
| **Description** | The Issuer, also called the “Entity ID.” The value is a URL that uniquely identifies the SAML identity provider. |

| **DeveloperName** | **Type** string |
| **Properties** | Filter, Group, Sort |
| **Description** | The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package, and the changes are reflected in a subscriber's organization. |

**Note:** Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.
<table>

<td>Filter, Group, Nullable, Sort</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation.</td>
</tr>
</tbody>
</table>

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.
- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

### SchedulingConstraint

Represents the scheduling constraints of each service resource. This object is available in API version 50.0 and later.

#### Supported Calls

`create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()`

#### Special Access Rules

The org must have the Workforce Engagement license. To view records, user needs to have the Workforce Engagement Agent permission set. To create, edit, or delete records, the user must have the Workforce Engagement Planner permission set.
## Fields

<table>

**Associated Objects**

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **SchedulingConstraintOwnerSharingRule** on page 3714
  - Sharing rules are available for the object.
- **SchedulingConstraintShare** on page 3719
  - Sharing is available for the object.

**SchedulingRule**

Represents scheduling rules that are hard constraints in the scheduling logic engine. This object is available in API version 52.0 and later.

**Supported Calls**

- create(), delete(), describeLayout(), describeSObjects(), query(), retrieve(), update(), upsert()

**Special Access Rules**

The org must have the Workforce Engagement license. To view, create, edit, and delete records, the user needs to have the Workforce Engagement Planner permission set.

Scontrol

A custom s-control, which is custom content that is hosted by the system but executed by the client application.

Important: Visualforce pages supersede s-controls. Organizations that haven’t previously used s-controls can’t create them. Existing s-controls are unaffected, and can still be edited. We recommend that you move your s-controls to Visualforce. We continue to support the Scontrol object.

Represents a custom s-control, which is custom content that the system hosts, but client applications execute. An s-control can contain any type of content that you can display or run in a Web browser.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

• Your organization must be using Enterprise, Developer, or Unlimited Edition and be enabled for custom s-controls.
• Customer Portal users can’t access this object.

|                    | **Properties**
|                    | Create, Filter, Group, Nillable, Restricted picklist, Sort, Update     |
|                    | **Description**
|                    | Specifies the source of the s-control content, either custom HTML, a    |
|                    | snippet (s-controls that are included in other s-controls), or a URL.     |
| ContentSource      | **Type**
|                    | picklist                                                                |
|                    | **Properties**
|                    | Create, Filter, Group, Nillable, Restricted picklist, Sort, Update      |
| Description        | **Description**
|                    | Description of the custom s-control.                                    |
| DeveloperName      | **Type**
|                    | string                                                                  |
|                    | **Properties**
|                    | Create, Filter, Group, Sort, Update                                     |
| DeveloperName      | **Description**
|                    | The unique name of the object in the API. This name can contain only    |
|                    | underscores and alphanumeric characters, and must be unique in your     |
|                    | org. It must begin with a letter, not include spaces, not end with an   |
|                    | underscore, and not contain two consecutive underscores. In managed     |
|                    | packages, this field prevents naming conflicts on package installations. |
|                    | With this field, a developer can change the object’s name in a managed  |
|                    | package and the changes are reflected in a subscriber’s organization.    |
|                    | Label is S-Control Name.                                               |
|                    | **Note:** When creating large sets of data, always specify a unique     |
|                    | DeveloperName for each record. If no DeveloperName is specified,        |
|                    | performance slows down while Salesforce generates one for each record.  |
| EncodingKey        | **Type**
|                    | picklist                                                                |
|                    | **Properties**
|                    | Create, Filter, Group, Restricted picklist, Sort, Update                |
| EncodingKey        | **Description**
<p>|                    | Picklist of character set encodings, including ISO-08859-1, UTF-8, EUC, |
|                    | JIS, Shift-JIS, Korean (ks_c_5601-1987), Simplified Chinese (GB2312),  |
|                    | and Traditional Chinese (Big5).                                         |</p>
<table>

</thead>
</table>
| Filename         | **Type** string  
**Properties** Create, Filter, Group, Nillable, Sort, Update  
**Description** An uploaded object to display when the custom s-control is added to a custom link. Can be a Java applet, an ActiveX control, or any other type of desired content. |
| HtmlWrapper      | **Type** textarea  
**Properties** Create, Update  
**Description** Required. HTML page that will be delivered when the user views this custom s-control. This HTML page can be the entire content of the custom s-control, or it can reference the binary. Limit: 1,048,576 characters. Label is **HTML Body**. |
| Name             | **Type** string  
**Properties** Create, Filter, Group, Sort, Update  
**Description** Required. Name of this custom s-control. Label is **Label**. |
| NamespacePrefix  | **Type** string  
**Properties** Filter, Group, Nillable, Sort  
**Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.  
The namespace prefix can have one of the following values.  
- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.  
- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix. |
**DetailsField**

**Type**
boolean

**Properties**
Create, Defaulted on create, Filter, Group, Sort, Update

**Description**
Indicates whether the s-control supports caching (true) or not (false).

### Usage

Use custom s-controls to manage custom content that extends application functionality. All users can view custom s-controls, but the “Customize Application” permission is required to create or update custom s-controls.

**SEE ALSO:**
Object Basics

### ScontrolLocalization

The translated value of the field label for an s-control.

**Important:** Visualforce pages supersede s-controls. Organizations that haven’t previously used s-controls can’t create them. Existing s-controls are unaffected, and can still be edited.

When the Translation Workbench is enabled for your organization, provides the translation of the field label of an s-control.

### Supported Calls

```
create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()
```

### Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, or Unlimited Edition and be enabled for the Translation Workbench.
- To view this object, you must have the “View Setup and Configuration” permission.

The values in this field are not related to the default locale selection.

**Type**

`string`

**Properties**

- Filter, Nullable

**Description**

The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values:

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed
### Usage

Use this object to translate your s-controls into a supported language. Users with the Translation Workbench enabled can view s-control translations, but either the "Customize Application" or "Manage Translation" permission is required to create or update s-control translations.

#### See Also:
- CategoryNodeLocalization
- WebLinkLocalization

### Scorecard

Use scorecards to measure partner performance and establish benchmarks for channel programs within Experience Cloud. Display any report summary results that your channel account manager or executive team wants to see. This object is available in API version 40.0 and later.

#### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| Description         | **Type** textarea  
                      **Properties** Create, Filter, Group, Nillable, Sort, Update 
                      **Description** The description of the scorecard. |
| LastReferencedDate  | **Type** dateTime  
                      **Properties** Filter, Nillable, Sort 
                      **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view. |
| LastViewedDate      | **Type** dateTime  
                      **Properties** Filter, Nillable, Sort 
                      **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (LastReferencedDate) but not viewed it. |
| Name                | **Type** string  
                      **Properties** Create, Filter, Group, idLookup, Sort, Update 
                      **Description** The name of the scorecard visible to end users. |
| OwnerId             | **Type** reference  
                      **Properties** Create, Defaulted on create, Filter, Group, Sort, Update 
                      **Description** The ID of the user who owns the scorecard. This is a polymorphic relationship field. |
The Scorecard object is used in tandem with the ScorecardMetric and ScorecardAssociation objects.

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **ScorecardOwnerSharingRule** on page 3714
  - Sharing rules are available for the object.
- **ScorecardShare** on page 3719
  - Sharing is available for the object.

ScorecardAssociation

Represents a connection between a specific scorecard and the associated account, channel program, or channel program level. This object is available in API version 41.0 and later.

Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `undelete()`, `update()`, `upsert()`

ScorecardMetric

Stores information about a Salesforce report that is run and summarized to get a single value. The stored value is added as a metric to the related Scorecard object. This object is available in API version 40.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Fields

Field | Details
---|---
Category | 
**Type** | picklist
**Properties** | Create, Defaulted on create, Filter, Group, Nillable, Sort, Update

**Description**
Groups metrics together. It comes with a predefined set of dropdown list entries and can be extended to address vendor's needs each category is user-generated and can be localized through translation workbench.

Possible values are:
- Adoption
- Field Enablement
- Marketing
- Sales
- Support

The default value is 'Sales'.

</tbody>
</table>
| ConnectedAppConsumerKey | **Type**
  string

**Properties**
Create, Filter, Group, Sort

**Description**
When used with `ConnectedAppCallbackUrl`, specifies a connected app that is approved automatically during the scratch org creation.

| Country                 | **Type**
  string

**Properties**
Create, Filter, Group, Nillable, Sort

**Description**
The two-character, upper-case ISO-3166 country code. You can find a full list of these codes at several sites, such as:
The language of the scratch org is auto-determined based on the value of this field. If you do not specify a value, this field defaults to the Dev Hub's country code.

| DeletedBy               | **Type**
  string

**Properties**
Filter, Group, Nillable, Sort

**Description**
The user who requested that the scratch org be deleted. This field is read-only.

| DeletedDate             | **Type**
  date

**Properties**
Filter, Group, Nillable, Sort

**Description**
The date when the `DeletedBy` user requested that the scratch org be deleted. This field is read-only.

| Description             | **Type**
  textarea

**Properties**
Create, Nillable, Update

**Description**
A free-form text field for you to enter a description of this scratch org.

|            | The username of the Administration user of this scratch org. |

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **ScratchOrgInfoFeed**
  Feed tracking is available for the object.

- **ScratchOrgInfoHistory**
  History is available for tracked fields of the object.

- **ScratchOrgInfoOwnerSharingRule**
  Sharing rules are available for the object.

- **ScratchOrgInfoShare**
  Sharing is available for the object.

### SEE ALSO:

- ActiveScratchOrg
- NamespaceRegistry
- Salesforce DX Developer Guide

### SearchPromotionRule

Represents a promoted search term, which is one or more keywords that you associate with a Salesforce Knowledge article. When a user’s search query includes these keywords, the associated article is returned first in search results. This object is available in API version 31.0 and later.

### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

### Special Access Rules

A user must have the “Manage Promoted Search Terms” permission.

</tbody>
</table>

## Usage

Use this object to optimize article search results in Salesforce Knowledge.

## SecurityCustomBaseline

Provides the ability to read, create, and delete user-defined custom security baselines, which define an org’s security standards. This object is available in API version 39.0 and later.

### Supported Calls

create(), delete(), describesSObjects(), query(), retrieve(), update(), upsert()

### Special Access Rules

You must have the “View Health Check” permission to read a custom baseline, and the “Manage Health Check” permission to create, edit, or delete one.
## Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| Baseline   | **Type**
> textarea
**Properties**
> Create, Nillable, Update
**Description**
The definition of an org’s security settings standards. |
| DeveloperName | **Type**
> string
**Properties**
> Create, Filter, Group, Sort, Update
**Description**
The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. **Note:** When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record. **Note:** Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field. |
| IsDefault | **Type**
> boolean
**Properties**
> Create, Defaulted on create, Filter, Group, Sort, Update
**Description**
Sets the baseline as the default in Security Health Check. |
| Language | **Type**
> picklist
**Properties**
> Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update
**Description**
The language of the presence status. |
| MasterLabel | **Type**
> string |
SelfServiceUser

Represents a Contact who has been enabled to use your organization’s Self-Service portal, where he or she can obtain online support.

Note: Starting with Spring ’12, the Self-Service portal isn’t available for new Salesforce orgs. Existing orgs continue to have access to the Self-Service portal.

Supported Calls

create(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

Customer Portal users can’t access this object.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContactId</td>
<td></td>
</tr>
</tbody>
</table>

Type

reference

Properties

Create, Filter, Group, Sort

Description

Required. All Self-Service users must be associated with a Contact. The contact’s email should match the Self-Service user email. The contact must have a value in the AccountId field or an error occurs.

</tbody>
</table>
### Field Details

**Properties**
Create, Filter, Group, Restricted picklist, Sort, Update

**Description**
Required. This is a restricted picklist field. The time zone of a affects the offset used when displaying or entering times in the Self-Service portal.

<table>
<thead>
<tr>
<th>Username</th>
<th><strong>Type</strong></th>
<th>string</th>
</tr>
</thead>
</table>

**Properties**
Create, Filter, Group, Sort, Update

**Description**
Required. This contains the name that a Self-Service user enters to log into the Self-Service portal. Value must be unique in your organization. If you try to create or update a user with a duplicate value, the operation is rejected and an error is returned.

### Usage
For security reasons, you can’t query Self-Service user passwords via the API or the user interface. However, the API allows you to set and reset Self-Service user passwords using the `setPassword()` and `resetPassword()` calls.

SelfServiceUser records created from the API don’t cause a notification email to be sent. If you want to notify the user, you must send them an email after creating the user.

SEE ALSO:
- Contact
- User

### Seller
Represents the seller role of an individual with respect to a particular company or organization. This object is available in API version 53.0 and later.

### Supported Calls
- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

### State

**Type**
- string

**Properties**
- Create, Filter, Group, Nillable, Sort, Update

**Description**
The state where the service appointment is completed. Maximum length is 80 characters.

### Status

**Type**
- picklist

**Properties**
- Create, Defaulted on create, Filter, Group, Nillable, Sort, Update

**Description**
The status of the appointment. The picklist includes the following values, which can be customized:
- None—Default value.
- Scheduled—Appointment has been assigned to a service resource.
- Dispatched—Assigned service resource has been notified about their assignment.
- In Progress—Work has begun.
- Completed—Work is complete.
- Cannot Complete—Work could not be completed.
- Canceled—Work is canceled, typically before any work began

### StatusCategory

**Type**
- picklist

**Properties**
- Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort

**Description**
The category that each Status value falls into. The Status Category field's values are identical to the default Status values.

If you create custom Status values, you must indicate which category it belongs to. For example, if you create a Customer Absent value, you may decide that it belongs in the Cannot Complete category. To learn which processes reference StatusCategory, see How are Status Categories Used?

<td>If Lightning Scheduler is also in use, this field is editable. However, users see an error if they update it to list a different work type than the parent record’s work type.</td>
</tr>
</tbody>
</table>

This is a relationship field.

**Relationship Name**
- WorkType

**Relationship Type**
- Lookup

**Refers To**
- WorkType

### Usage

Service appointments always have a parent record, which can be a work order, work order line item, opportunity, account, or asset. The type of parent record tells you about the nature of the service appointment:

- **Service appointments on work orders and work order line items** offer a more detailed view of the work being performed. While work orders and work order line items let you enter general information about a task, service appointments are where you add the details about scheduling and ownership.
- **Service appointments on assets** represent work being performed on the asset.
- **Service appointments on accounts** represent work being performed for the account.
- **Service appointments on opportunities** represent work that is related to the opportunity.
- **Service appointments on leads** represent work that is related to lead—for example, a site visit to pursue a promising lead.
**Associated Objects**

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **ServiceAppointmentChangeEvent (API version 48.0)**
  - Change events are available for the object.

- **ServiceAppointmentFeed**
  - Feed tracking is available for the object.

- **ServiceAppointmentHistory**
  - History is available for tracked fields of the object.

- **ServiceAppointmentOwnerSharingRule**
  - Sharing rules are available for the object.

- **ServiceAppointmentShare**
  - Sharing is available for the object.

---

**ServiceAppointmentStatus**

Represents a possible status of a service appointment in field service.

**Supported Calls**

describeSObjects(), query(), retrieve()

**Special Access Rules**

Field Service must be enabled.

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ApiName</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>string</td>
</tr>
<tr>
<td>Properties</td>
<td>Filter, Group, idLookup, Sort</td>
</tr>
<tr>
<td>Description</td>
<td>The API name of the status value.</td>
</tr>
<tr>
<td>IsDefault</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>boolean</td>
</tr>
<tr>
<td>Properties</td>
<td>Defaulted on create, Filter, Group, Sort</td>
</tr>
</tbody>
</table>
**Usage**

The Status field on service appointments comes with the following values:

- None—Default value.
- Scheduled—Appointment has been assigned to a service resource.
- Dispatched—Assigned service resource has been notified about their assignment.
- In Progress—Work has begun.
- Completed—Work is complete.
- Cannot Complete—Work could not be completed.
- Canceled—Work is canceled, typically before any work began.

The ServiceAppointmentStatus object corresponds to the Status field. Adding a value to the Status field—for example, Waiting—creates a service appointment status record, and vice versa.

Note: Service appointments also come with a StatusCategory field whose values are identical to the default Status values. If you create custom Status values, you must indicate which category it belongs to. For example, if you create a Customer Absent status.
value, you may decide that it belongs in the Cannot Complete category. To learn which processes reference StatusCategory, see How are Status Categories Used?

**ServiceChannel**

Represents a channel of work items that are received from your organization—for example, cases, chats, or leads. This object is available in API version 32.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

**Special Access Rules**

To access this object, Omni-Channel must be enabled.

As of Spring '20 and later, only authenticated internal and external users can access this object.

**Fields**

<table>
<thead>

<td>Create, Filter, Group, Nillable, RestrictedPicklist, Sort, Update</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>The method that determines when an agent’s capacity for a work item is released. With the Status-Based capacity routing model, work remains assigned and applied to an agent’s capacity until the work is completed or reassigned to a different agent. In contrast, the tab-based capacity model releases an agent’s capacity when a work tab is closed in the service console. Possible values are StatusBased and TabBased.</td>
</tr>
<tr>
<td>CapacityPercentage</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>percent</td>
</tr>
<tr>
<td>Field</td>
<td>Details</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Properties</td>
<td>Create, Filter, Nullable, Sort</td>
</tr>
<tr>
<td>Description</td>
<td>The percentage of an agent's capacity for work items that's consumed by a specific type of work item from this service channel. For example, you might give phone calls a capacity percentage of 1.00. If an agent receives a phone call, the agent won't receive new work items until the call ends, because at that point the agent's capacity will have reached 100%. This field is available in API version 32.0 and earlier. For later API versions, you can set the capacity percentage of work items on the QueueRoutingConfig object. The CapacityPercentage field was removed in API version 33.0.</td>
</tr>
<tr>
<td>CapacityWeight</td>
<td>Type double</td>
</tr>
<tr>
<td>Properties</td>
<td>Create, Filter, Nullable, Sort</td>
</tr>
<tr>
<td>Description</td>
<td>The amount of an agent's capacity for work items that's consumed by a work item from this service channel. For example, if an agent has a capacity of 6, and cases are assigned a capacity weight of 2, an agent can be assigned up to 3 cases before the agent is at capacity and can't receive new work items. This field is available in API version 32.0 and earlier. For later API versions, you can set the capacity weight of work items on the QueueRoutingConfig object. The CapacityWeight field was removed in API version 33.0.</td>
</tr>
<tr>
<td>DeveloperName</td>
<td>Type string</td>
</tr>
<tr>
<td>Properties</td>
<td>Create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td>Description</td>
<td>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber's organization. Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record.</td>

</thead>
</table>
| MasterLabel                | **Type**  
  string  
  **Properties**  
  Create, Filter, Group, Sort, Update  
  **Description**  
  The label of the service channel. |
| RelatedEntity              | **Type**  
  picklist  
  **Properties**  
  Create, Filter, Group, Restricted picklist, Sort, Update  
  **Description**  
  The type of object that’s associated with this service channel. This field is unique within your organization. |
| SecRoutingPriorityField    | **Type**  
  picklist  
  **Properties**  
  Create, Filter, Group, Nillable, Restricted picklist, Sort, Update  
  **Description**  
  The name of the standard field or the id of the custom field that is used for secondary routing priority. This field is unique within your organization. |
| StatusField                | **Type**  
  picklist  
  **Properties**  
  Create, Filter, Group, Nillable, Restricted picklist, Sort, Update  
  **Description**  
  The picklist field that you use to track work status in the Status-Based capacity routing model. Use ServiceChannelStatusField to specify the values that indicate completed and in-progress work-item status. |

**ServiceChannelFieldPriority**

Represents a secondary routing priority field-value mapping. This object is available in API version 47.0 and later.

**Supported Calls**

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()
### Special Access Rules
To access this object, **Omni-Channel** must be enabled.

### Fields

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

### ServiceChannelStatus

Represents the status that’s associated with a specific service channel. This object is available in API version 32.0 and later.

### Supported Calls
- `create()`, `delete()`, `query()`, `update()`, `retrieve()`

### Special Access Rules
To access this object, **Omni-Channel** must be enabled.

As of Spring ’20 and later, only authenticated internal and external users can access this object.
Fields

<table>

</tr>
</tbody>
</table>

ServiceChannelStatusField

Represents the values that you use to indicate completed and in-progress work item status for the status field in the Status-Based Capacity routing model. This object is available in API version 49.0 and later.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

To access this object, Omni-Channel and Status-Based Capacity Model must be enabled.

Fields

<table>
<thead>
<tr>
<th>Field</th>

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **ServiceContractChangeEvent (API version 44.0)**
  - Change events are available for the object.

- **ServiceContractFeed (API version 23.0)**
  - Feed tracking is available for the object.

- **ServiceContractHistory**
  - History is available for tracked fields of the object.

- **ServiceContractOwnerSharingRule**
  - Sharing rules are available for the object.
ServiceContractShare
Sharing is available for the object.

SEE ALSO:
ServiceContractOwnerSharingRule

ServiceContractOwnerSharingRule

Represents the rules for sharing a ServiceContract (customer service agreement) with users other than the owner. This object is available in API version 18.0 and later.

Note: To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The SharingRules Metadata API type is enabled for all orgs.

Supported Calls
create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

<tbody>
<tr>
<td><strong>Properties</strong></td>
</tr>
</tbody>
</table>
Create, Defaulted on create, Filter, Group, Sort, Update |
| **Description** | The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization. Corresponds to **Rule Name** in the user interface. |

This field is available in API version 24.0 and later.

**Note:** When creating large sets of data, always specify a unique **DeveloperName** for each record. If no **DeveloperName** is specified, performance slows down while Salesforce generates one for each record.

Usage

Use this object to manage the sharing rules for a service contract. General sharing and territory management-related sharing use this object.

SEE ALSO:

ServiceContract
Metadata API Developer Guide: SharingRules

ServiceCrew

Represents a group of service resources who can be assigned to service appointments as a unit.

A service crew is a group of service resources whose combined skills and experience make them a good fit to work together on appointments. For example, a wellhead repair crew might include a hydrologist, a mechanical engineer, and an electrician.

Service appointments can only be assigned to service resources. To assign a service crew to service appointments, you must create a service resource with a resource type of Crew that represents the crew, then use the resource for assignment purposes.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

Field Service must be enabled.

| UserOrGroupId       | **Type** string reference |
|                     | **Properties** Create, Filter, Group, Sort |
|                     | **Description** The ID representing the User or Group being granted access. |

### ServicePresenceStatus

Represents a presence status that can be assigned to a service channel. This object is available in API version 32.0 and later.
Supported Calls

`create()`, `delete()`, `query()`, `update()`, `retrieve()`

Special Access Rules

To access this object, **Omni-Channel** must be enabled.

As of Spring ’20 and later, only authenticated internal and external users can access this object.

**ServiceReport**

Represents a report that summarizes a work order, work order line item, or service appointment.

The fields that appear on a service report are determined by its service report template. Service reports can be signed by the customer and shared as a PDF.

**Supported Calls**

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete()

**Special Access Rules**

Field Service must be enabled.

### Details

**Field Name**

**Properties**
- Autonumber, Defaulted on create, Filter, Sort

**Description**
- An auto-generated number identifying the service report.

**Template**

**Type**
- string

**Properties**
- Create, Filter, Group, Nillable, Sort

**Description**
- The service report template used to generate the service report.

**Note:** If the person creating the service report doesn’t have access to certain objects or fields that are included in the service report template, those fields aren’t visible in the report they create.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**ServiceReportHistory**
- History is available for tracked fields of the object.

### ServiceReportLayout

Represented a service report template in field service.

### Supported Calls

- `describeSObjects()`, `query()`, `retrieve()`

### Special Access Rules

Field Service must be enabled. All users with Field Service Standard user permission can view the ServiceReportLayout object via the API.

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>

**Associated Objects**

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **ServiceResourceChangeEvent** *(API version 48.0)*
  - Change events are available for the object.

- **ServiceResourceFeed**
  - Feed tracking is available for the object.

- **ServiceResourceHistory**
  - History is available for tracked fields of the object.

- **ServiceResourceOwnerSharingRule**
  - Sharing rules are available for the object.

- **ServiceResourceShare**
  - Sharing is available for the object.

**ServiceResourceCapacity**

Represents the maximum number of scheduled hours or number of service appointments that a capacity-based service resource can complete within a specific time period. This object is available in API version 38.0 and later.

**Supported Calls**

create(), delete(), describeLayout(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(), upsert()

**Special Access Rules**

Field Service must be enabled.

<td><strong>Type</strong> reference</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Sort</td>
</tr>
</tbody>
</table>
### Usage

Service resources who are capacity-based can only work a certain number of hours or complete a certain number of service appointments within a specified time period. Contractors tend to be capacity-based. To indicate that a service resource is capacity-based, select **Capacity-Based** on the service resource record, then create a capacity record for the service resource.

You must fill out at least one of these fields: **CapacityInWorkItems** and **CapacityInHours**. If you’re using the Field Service managed package and would like to measure capacity both in hours and in number of work items, enter a value for both. The resource is considered to reach their capacity based on whichever term is met first—hours or number of work items.

**Important:** If you aren’t using the Field Service managed package, capacity serves more as a suggestion than a rule. Resources can still be as scheduled beyond their capacity, and you aren’t notified when a resource exceeds their capacity.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **ServiceResourceCapacityFeed**
  - Feed tracking is available for the object.
- **ServiceResourceCapacityHistory**
  - History is available for tracked fields of the object.

</tr>
</tbody>
</table>
**ServiceResourceCapacityHistory**

Represents the history of changes made to tracked fields on a service resource capacity record. This object is available in API version 38.0 and later.

**Supported Calls**

getDeleted(), getUpdated(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

**Special Access Rules**

Field Service must be enabled in your organization, and field tracking for service resource capacity fields must be configured.

ServiceResourceOwnerSharingRule

Represents the rules for sharing a service resource with user records other than the owner or anyone above the owner in the role hierarchy. This object is available in API version 38.0 and later.

Note: To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The SharingRules Metadata API type is enabled for all orgs.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Type: textarea, Properties: Create, Filter, Nullable, Sort, Update, Description: A description of the sharing rule. Maximum size is 1000 characters.</td>
</tr>
<tr>
<td>DeveloperName</td>
<td>Type: string, Properties: Create, Defaulted on create, Filter, Group, Sort, Update</td>
</tr>
</tbody>
</table>
### Field Details

**Description**

The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization. Corresponds to **Rule Name** in the user interface.

**Note:** When creating large sets of data, always specify a unique **DeveloperName** for each record. If no **DeveloperName** is specified, performance slows down while Salesforce generates one for each record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>GroupId</td>
<td><strong>Type</strong> reference&lt;br&gt;<strong>Properties</strong> Create, Filter, Group, Sort&lt;br&gt;<strong>Description</strong> The ID representing the source group. A service resource owned by a User in the source Group triggers the rule to give access.</td>

<tr>
<td>Name</td>
<td><strong>Type</strong> string&lt;br&gt;<strong>Properties</strong> Create, Filter, Group, Sort, Update&lt;br&gt;<strong>Description</strong> Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to <strong>Label</strong> on the user interface.</td>
</tr>
</tbody>
</table>
| ServiceResourceAccessLevel | **Type** picklist<br>**Properties** Create, Filter, Group, Restricted picklist, Sort, Update<br>**Description** A value that represents the type of access granted to the target Group, or UserRole. The possible values are:  
  - Read  
  - Edit  
  - All |
| UserOrGroupId       | **Type** reference<br>**Properties** Create, Filter, Group, Sort |
ServiceResourcePreference

Represents the service resource scheduling preferences that are considered as a business objective in the scheduling logic engine. This object is available in API version 52.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

The org must have the Workforce Engagement license. To view, create, edit, and delete records, the user must have the Workforce Engagement Agent or Workforce Engagement Planner permission set.

<td><strong>Relationship Type</strong> Lookup</td>
</tr>
</tbody>
</table>

3010
### Usage

You can assign skills to all service resources in your org to indicate their certifications and areas of expertise, and specify each resource’s skill level from 0 to 99.99. For example, you can assign Maria the “Welding” skill, level 50.

If you intend to use the skills feature, determine which skills you want to track and how skill level should be determined. For example, you may want the skill level to reflect years of experience, certification levels, or license classes.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.
ServiceResourceSkillFeed
Feed tracking is available for the object.

ServiceResourceSkillHistory
History is available for tracked fields of the object.

ServiceSetupProvisioning

Represents a task completed by the Service Setup Assistant. This object is available in API version 52.0 and later.

Supported Calls
describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Special Access Rules
ServiceSetupProvisioning is accessible only if the Service Setup Assistant is turned on. Users need the Customize Application permission to access it.

### Usage

If you want to use service territories, determine which territories you need to create. Depending on how your business works, you may decide to create territories based on cities or counties, or on functional categories such as sales versus service. If you plan to build out a hierarchy of service territories, create the highest-level territories first.

For example, you can create a hierarchy of territories to represent the areas where your team works in California. Include a top-level territory named *California*, three child territories named *Northern California*, *Central California*, and *Southern California*, and a series of third-level territories corresponding to California counties. Assign service resources to each county territory to indicate who is available to work in that county.
Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**ServiceTerritoryChangeEvent (API version 48.0)**
- Change events are available for the object.

**ServiceTerritoryFeed**
- Feed tracking is available for the object.

**ServiceTerritoryHistory**
- History is available for tracked fields of the object.

**ServiceTerritoryOwnerSharingRule**
- Sharing rules are available for the object.

**ServiceTerritoryShare**
- Sharing is available for the object.

**ServiceTerritoryLocation**

Represents a location associated with a particular service territory in field service.

**Supported Calls**

- create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

**Special Access Rules**

Field Service must be enabled.

**Fields**

</tr>
</tbody>
</table>

Description
(Read only) Auto-generated number identifying the service territory location.

Associated Objects
This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **ServiceTerritoryLocationFeed**: Feed tracking is available for the object.
- **ServiceTerritoryLocationHistory**: History is available for tracked fields of the object.

ServiceTerritoryMember

Represents a service resource who can be assigned to service appointments in a service territory in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

Supported Calls

- create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(), upsert()

Special Access Rules

Field Service must be enabled.

|                   | Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update |
|                   | **Description**
|                   | Primary, Secondary, or Relocation.
|                   | • The primary territory is typically the territory where the resource works most often—for example, near their home base. Service resources can only have one primary territory. |
Details

- Secondary territories are territories where the resource can be assigned to appointments if needed. Service resources can have multiple secondary territories.
- Relocation territories represent temporary moves for service resources. If you're using the Field Service managed packages with the scheduling optimizer, resources with relocation territories are always assigned to services within their relocation territories during the specified relocation dates; if they don't have a relocation territory, the primary territories are favored over the secondary.

For example, a service resource might have the following territories:

- Primary territory: *West Chicago*
- Secondary territories:
  - *East Chicago*
  - *South Chicago*
- Relocation territory: *Manhattan*, for a three-month period

Usage

If you delete a service territory with members, the service resources who were members no longer have any connection to the territory.

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **ServiceTerritoryMemberChangeEvent** *(API version 48.0)*
  - Change events are available for the object.
- **ServiceTerritoryMemberFeed**
  - Feed tracking is available for the object.
- **ServiceTerritoryMemberHistory**
  - History is available for tracked fields of the object.

ServiceTerritoryWorkType

Represents the relationship between a ServiceTerritory object and a WorkType object for Salesforce Scheduler appointments. This object is available in API version 45.0 and later.

Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

### Field Details

**Properties**
Create, Filter, Group, Sort

**Description**
The ID of the work type that’s related to the service territory indicated in the ServiceTerritoryId field.

This is a relationship field.

**Relationship Name**
WorkType

**Relationship Type**
Lookup

**Refers To**
WorkType

### Associated Objects
This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **ServiceTerritoryWorkTypeFeed**
  Feed tracking is available for the object.

- **ServiceTerritoryWorkTypeHistory**
  History is available for tracked fields of the object.

### SessionPermSetActivation
The SessionPermSetActivation object represents a permission set assignment activated during an individual user session. When a SessionPermSetActivation object is inserted into a permission set, an activation event fires, allowing the permission settings to apply to the user’s specific session. This object is available in API versions 37.0 and later.

### Supported Calls
`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

**Note:** If you include session-based permission sets in a permission set group, the permissions in them do not require session-based activation for users assigned to the group.

### Special Access Rules
As of Summer ’20 and later, only users who have one of these permissions can access this object:

- View Setup and Configuration
- Manage Session Permission Set Activations
## Fields

### Usage

Use SessionPermSetActivation to create a permission set available only for a specified session’s duration. For example, create permission sets that provide access to specific applications only during authenticated sessions.

In the following Apex example, an identified session is activated after session information is submitted via a button. Successful activation results in a confirmation message displayed to the user.

```java
public class SessionPermSetActivationController {
    // id of the session permission set to be activated
    private final String sessionPermSetId = '0PSxx00000004rJ';
    private final String sessionId;

    public SessionPermSetActivationController() {
        // Code goes here
    }
}
```
Map<String, String> sessionManagement = Auth.SessionManagement.getCurrentSession();

sessionId = sessionManagement.get('SessionId');
}

public PageReference activate() {
    // activate the permission set
    SessionPermSetActivation activation = new SessionPermSetActivation();
    activation.AuthSessionId = sessionId;
    activation.PermissionSetId = sessionPermSetId;
    activation.Description = 'created by SessionPermSetActivationController';

    insert activation;
    return null;
}

public boolean getActivated() {
    Integer alreadyActivated = [SELECT count()
        FROM SessionPermSetActivation
        WHERE AuthSessionId = :sessionId
        And PermissionSetId = :sessionPermSetId LIMIT 1];
    return alreadyActivated > 0;
}
}

<apex:page controller="SessionPermSetActivationController">
    <apex:outputPanel rendered="{!!Activated}"
        <h3>Activate Session Permission Set</h3>
        <br />
        <apex:form
            <apex:commandButton action="{!!activate}" value="Activate"
            id="activateButton"/>
        <apex:outputPanel>
            <apex:outputPanel rendered="{!!Activated}"
                <h3>Session Permission Set is already active.</h3>
            </apex:outputPanel>
        </apex:outputPanel>
    </apex:outputPanel>
</apex:page>

SetupAuditTrail

Represents changes you or other admins made in your org's Setup area for at least the last 180 days. This object is available in API version 15.0 and later.

Note: SetupAuditTrail is not a supported standard controller. Using SetupAuditTrail as a standard controller in a Visualforce page results in an error.

Supported Calls

query(), retrieve()
Note: Aggregate queries aren’t supported on this object. For example, `SELECT count() FROM SetupAuditTrail` works but `SELECT count(Id) FROM SetupAuditTrail` fails.

## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The category of the change made in Setup. For example, a value of <code>PermSetCreate</code> indicates that an administrator created a permission set. The <code>Display</code> field contains more specific information.</td>
</tr>
<tr>
<td><strong>CreatedByContext</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The context under which the Setup change was made. For example, if Einstein uses cloud-to-cloud services to make a change in Setup, the value of this field is <code>Einstein</code>. This field is available in API version 48.0 and later.</td>
</tr>
<tr>
<td><strong>CreatedByIssuer</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>string</td>
</tr>
<tr>

<tr>
<td><strong>Properties</strong></td>
<td>Filter, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The Login-As user who executed the action in Setup. If a Login-As user didn't perform the action, this field is blank. This field is available in API version 35.0 and later.</td>
</tr>
<tr>
<td><strong>Display</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Nillable, Sort</td>
</tr>
</tbody>
</table>
Details

Description
The full description of changes made in Setup. For example, if the Action field has a value of PermSetCreate, the Display field has a value like "Created permission set MAD: with user license Salesforce."

Section

Type
string

Properties
Nillable, Sort

Description
The section in the Setup menu where the action occurred. For example, Manage Users or Company Profile.

Note: You can use SOQL joins to get the information you need more quickly. For example, running `SELECT CreatedBy.Name FROM SetupAuditTrail LIMIT 10` returns the first and last names of the last 10 people to make changes in Setup.

SetupEntityAccess

Represents the enabled setup entity access settings (such as for Apex classes) for the parent PermissionSet. This object is available in API version 25.0 and later.

To grant users access to an entity, associate the appropriate SetupEntityAccess record with a PermissionSet that’s assigned to a user.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

As of Spring ’20 and later, only users with "View Setup and Configuration" permission can access this object.

</tr>
<tr>
<td></td>
<td>• In API version 48.0 and later, <strong>CustomEntityDefinition</strong> for Custom Settings and Custom Metadata Types</td>
</tr>
</tbody>
</table>

## Usage

Because SetupEntityAccess is a child of the PermissionSet object, the usage is similar to other PermissionSet child objects like FieldPermissions and ObjectPermissions.

For example, the following code returns all permission sets that grant access to any setup entities for which access is enabled:

```sql
SELECT Id, ParentId, Parent.Name, SetupEntityId
FROM SetupEntityAccess
```
The following code returns permission sets that grant access only to Apex classes:

```
SELECT Id, ParentId, Parent.Name, SetupEntityId
FROM SetupEntityAccess
WHERE SetupEntityType='ApexClass'
```

The following code returns permission sets that grant access to any setup entities, and are not owned by a profile:

```
SELECT Id, ParentId, Parent.Name, SetupEntityId
FROM SetupEntityAccess
WHERE ParentId
IN (SELECT Id
    FROM PermissionSet
    WHERE isOwnedByProfile = false)
```

You may want to return only those permission sets that have access to a specific setup entity. To do this, query the parent object. For example, this code returns all permission sets that grant access to the `helloWorld` Apex class:

```
SELECT Id, Name,
     (SELECT Id, Parent.Name, Parent.Profile.Name
      FROM SetupEntityAccessItems)
FROM ApexClass
WHERE Name = 'helloWorld'
```

While it's possible to return permission sets that have access to a ConnectedApplication, ServiceProvider, or TabSet by SetupEntityId, it's not possible to return permission sets that have access to these SetupEntityType fields by any other AppMenuItem attribute, such as Name or Description. For example, to find out if a user has access to the Recruiting app, you'd run two queries. First, query to get the AppMenuItem ID:

```
SELECT Id, Name, Label
FROM AppMenuItem
WHERE Name = 'Recruiting'
```

Let's say the previous query returned the AppMenuItem ID 02uD0000000GIiMIAW. Using this ID, you can now run a query to find out if a user has access to the Recruiting app:

```
SELECT Id, SetupEntityId, SetupEntityType
FROM SetupEntityAccess
WHERE ParentId
IN
    (SELECT PermissionSetId
     FROM PermissionSetAssignment
     WHERE AssigneeId = '005D0000001QOzF')
AND (SetupEntityId = '02uD0000000GIiMIAW')
```

ShapeRepresentation

Contains information about the shape of an org. The shape of an org includes features, settings, licenses, and limits information. You can easily create scratch orgs based on a source org’s shape. This object is available in API version 50.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Type</td>

<td>Properties</td>
<td></td>
</tr>
<tr>
<td>Description</td>
<td></td>
</tr>
</tbody>
</table>
### LastViewedDate

**Details**
- **Type**: dateTime
- **Properties**: Filter, Nillable, Sort

**Description**
Date when the org shape was last viewed. This field is read-only.

### Name

**Details**
- **Type**: string
- **Properties**: Autonumber, Defaulted on create, Filter, idLookup, Sort

**Description**
The alias for the org shape.

### Settings

**Details**
- **Type**: textarea
- **Properties**: Nillable, Update

**Description**
Settings of the org referred to by this org shape. This field is read-only.

### Status

**Details**
- **Type**: picklist
- **Properties**: Defaulted on create, Filter, Group, Restricted picklist, Sort

**Description**
Status of this org shape. You can use an org shape when it’s Active. This field is read-only.

---

### SharingRecordCollection

Represents a collection of records. This object is available in API version 51.0 and later.
Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(), upsert()

Record collections are limited to 100 items and 100 members for each record collection.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>string</td>
</tr>
<tr>
<td>Properties</td>
<td>Create, Filter, Group, Nillable, Sort, Update</td>

<td>Filter, Nillable, Sort</td>
</tr>
<tr>
<td>Description</td>
<td>The timestamp when the current user last accessed this record, a record related to this record, or a list view.</td>
</tr>
<tr>
<td>LastViewedDate</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>dateTime</td>
</tr>
<tr>
<td>Properties</td>
<td>Filter, Nillable, Sort</td>
</tr>
</tbody>
</table>
**SharingRecordCollectionItem**

Represents a single record in a collection of records. This object is available in API version 51.0 and later.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Record collections are limited to 100 items for each record collection.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| CollectionId | Type  
reference  
Properties 
Create, Filter, Group, Sort  
Description  
The ID of the related record collection. |
| Description | Type  
string  
Properties 
Create, Filter, Group, Nillable, Sort, Update  
Description  
The description of the record collection item. |
| ItemId | Type  
reference  
Properties 
Create, Filter, Group, Nillable, Sort  
Description  
The ID of the record collection item. |
| Name | Type  
string  
Properties 
Create, Filter, Group, idLookup, Sort, Update  
Description  
The name of the record collection item. |

SharingRecordCollectionMember

Represents a user with access to a collection of records. This object is available in API version 51.0 and later.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert() |

Record collections are limited to 100 members for each record collection.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>

<td>The ID of the user or group with access to the record collection.</td>
</tr>
</tbody>
</table>

Shift

Represents a shift for service resource scheduling. Available in API versions 46.0 and later.

Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `upsert()`

Special Access Rules

Field Service must be enabled. Users must have Field Service permission.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **ServiceResourceId** | **Type**  reference  
**Properties**  Create, Filter, Group, Nillable, Sort, Update  
**Description**  The ID of the service resource the shift belongs to. Available in API versions 47.0 and later.  
This is a relationship field.  
**Relationship Name**  ServiceResource  
**Relationship Type**  Lookup  
**Refers To**  ServiceResource |
| **ServiceTerritoryId** | **Type**  reference  
**Properties**  Create, Filter, Group, Nillable, Sort, Update  
**Description**  The ID of the service territory the shift belongs to. Available in API versions 47.0 and later.  
This is a relationship field.  
**Relationship Name**  ServiceTerritory  
**Relationship Type**  Lookup  
**Refers To**  ServiceTerritory |
| **ShiftNumber** | **Type**  string  
**Properties**  Autonumber, Defaulted on create, Filter, idLookup, Sort  
**Description**  The number automatically given to the shift upon creation. |
| **StartTime** | **Type**  dateTime  
**Properties**  Create, Filter, Sort, Update  
**Description**  The date and time that the shift starts. |
### Shift Standard Objects

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Status</strong></td>
<td><strong>Type</strong> picklist</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Describes the status of the shift. Users can create custom values. Default values are:</td>
</tr>
<tr>
<td></td>
<td>• Tentative</td>
</tr>
<tr>
<td></td>
<td>• Published</td>
</tr>
<tr>
<td></td>
<td>• Confirmed</td>
</tr>
</tbody>
</table>

| **StatusCategory** | **Type** picklist |
| **Properties**     | Filter, Group, Nillable, Restricted picklist, Sort |
| **Description**    | Describes the status of the shift using static values. This field is derived from Status using the mapping defined in setup. |
|                    | Possible values are: |
|                    | • Tentative |
|                    | • Published |
|                    | • Confirmed |

| **TimeSlotType**  | **Type** picklist |
| **Properties**    | Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update |
| **Description**   | Type of time slot for the shift. The same setup values as the TimeSlot field in the OperatingHours object. |
|                   | Possible values are: |
|                   | • Normal (default value) |
|                   | • Extended |

### Usage

Scheduling and dispatching service resources using shift data is not supported in API version 46.0, and is a pilot feature in API version 47.0.
**Associated Objects**

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **ShiftFeed**
  Feed tracking is available for the object.

- **ShiftHistory**
  History is available for tracked fields of the object.

- **ShiftOwnerSharingRule**
  Sharing rules are available for the object.

- **ShiftShare**
  Sharing is available for the object.

**ShiftHistory**

Represents the history of changes made to tracked fields on a time sheet. Available in API versions 46.0 and later.

**Supported Calls**

- `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

You can also enable `delete()` in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

**Special Access Rules**

Field Service must be enabled in your organization, and field tracking for shift fields must be configured.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DataType</strong></td>
<td>Type picklist, Properties Filter, Group, Nillable, Restricted picklist, Sort, Description Data type of the field that was changed.</td>
</tr>
<tr>
<td><strong>Field</strong></td>
<td>Type picklist, Properties Filter, Group, Restricted picklist, Sort, Description The name of the field that was changed.</td>
</tr>
</tbody>
</table>
### ShiftOwnerSharingRule

**Usage**

Scheduling and dispatching service resources using shift data is not supported in API version 46.0.

**ShiftOwnerSharingRule**

Represents the rules for sharing a shift with user records other than the owner or anyone above the owner in the role hierarchy. Available in API versions 46.0 and later.

**Supported Calls**

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()
# Special Access Rules

Field Service must be enabled.

**Note:** To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The *SharingRules* Metadata API type is enabled for all orgs.

## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td><strong>Type</strong> textarea</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Nillable, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>A description of the sharing rule. Maximum size is 1000 characters.</td>
</tr>
<tr>
<td><strong>DeveloperName</strong></td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Defaulted on create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization. Corresponds to <em>Rule Name</em> in the user interface.</td>
</tr>
<tr>
<td><strong>Note:</strong> When creating large sets of data, always specify a unique <em>DeveloperName</em> for each record. If no <em>DeveloperName</em> is specified, performance slows down while Salesforce generates one for each record.</td>
<td></td>
</tr>
<tr>
<td><strong>GroupId</strong></td>
<td><strong>Type</strong> reference</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The ID representing the source group. A time sheet owned by a User in the source Group triggers the rule to give access.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td><strong>Type</strong> string</td>
</tr>
</tbody>
</table>
Usage
Scheduling and dispatching service resources using shift data is not supported in API version 46.0.

ShiftPattern
Represents a pattern of templates for creating shifts. This object is available in API version 51.0 and later.

Supported Calls
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules
Field Service must be enabled. Users must have Field Service permission.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **Description** | **Type** textarea  
**Properties** Create, Nillable, Update  
**Description** A short description of the shift pattern to help users identify the pattern. |
| **IsActive** | **Type** boolean  
**Properties** Create, Defaulted on create, Filter, Group, Sort, Update  
**Description** Indicates that the shift pattern can be used to create shifts. The default value is ‘false’. |
| **LastReferencedDate** | **Type** dateTime  
**Properties** Filter, Nillable, Sort  
**Description** The date that the shift pattern was last used. |
| **LastViewedDate** | **Type** dateTime  
**Properties** Filter, Nillable, Sort  
**Description** The date that the shift pattern was last viewed. |
| **Name** | **Type** string  
**Properties** Create, Filter, Group, idLookup, Sort, Update  
**Description** A short, descriptive name of the shift pattern. |
| **OwnerId** | **Type** reference |

<td>Owner</td>
</tr>
<tr>
<td><strong>Relationship Type</strong></td>
<td>Lookup</td>
</tr>
<tr>
<td><strong>Refers To</strong></td>
<td>Group, User</td>
</tr>
</tbody>
</table>

| PatternLength          | Type int                                     |
|                       | **Properties** Create, Filter, Group, Sort, Update |
|                       | **Description** The duration in days of the shift pattern. |

### Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

- **ShiftPatternFeed** [on page 3697](#)  
  Feed tracking is available for the object.

- **ShiftPatternHistory** [on page 3709](#)  
  History is available for tracked fields of the object.

- **ShiftPatternShare** [on page 3719](#)  
  Sharing is available for the object.

SEE ALSO:

- ShiftPatternEntry
- Shift Patterns

### ShiftPatternEntry

ShiftPatternEntry links a shift template to a shift pattern. This object is available in API version 51.0 and later.
Supported Calls
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules
Field Service must be enabled. Users must have Field Service permission.

### ShiftShare

Represents a sharing entry on a field service shift. Available in API versions 46.0 and later.

#### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`
Special Access Rules
Field Service must be enabled.

</tr>
</tbody>
</table>

**Usage**

Scheduling and dispatching service resources using shift data is not supported in API version 46.0.

**ShiftStatus**

Represents a shift, such as Tentative, Published, or Confirmed. Available in API versions 46.0 and later.

**Supported Calls**

describeSObjects(), query(), retrieve()

**Special Access Rules**

Field Service must be enabled.

**Fields**

</table>
| **Description** | Describes the status of the shift using static values. Possible values are:  
  - Tentative  
  - Published  
  - Confirmed |
**Usage**

Scheduling and dispatching service resources using shift data is not supported in API version 46.0.

**ShiftTemplate**

Represents a template for creating shifts. This object is available in API version 51.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

**Special Access Rules**

Field Service or Workforce Engagement must be enabled. For Field Service, users must have Field Service permission. For Workforce Engagement, to create a shift and apply a template, the user needs to have a Workforce Engagement Planner permission set.

</table>
**Field** | **Details**
--- | ---
**Description** | The owner of the shift template. This is a polymorphic relationship field.
**Relationship Name** | Owner
**Relationship Type** | Lookup
**Refers To** | Group, User

**ShiftTemplateDurationType**

**Type** | picklist
**Properties** | Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update
**Description** | The unit of measurement for the shift template duration. Possible values are:
- **H**—Hours
- **M**—Minutes
  The default value is **H**.

**StartTime**

**Type** | time
**Properties** | Create, Filter, Sort, Update
**Description** | The time of day when the shift starts.

**Associated Objects**
This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **ShiftTemplateOwnerSharingRule on page 3714**
  Sharing rules are available for the object.
- **ShiftTemplateShare on page 3719**
  Sharing is available for the object.

**Shipment**

Represents the transport of inventory in field service or a shipment of order items in Order Management.
Supported Calls
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules
This object is only available in Salesforce Order Management orgs or if Field Service is enabled.

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **ShipmentChangeEvent (API version 48.0)**
  - Change events are available for the object.
- **ShipmentFeed**
  - Feed tracking is available for the object.
- **ShipmentHistory**
  - History is available for tracked fields of the object.
- **ShipmentOwnerSharingRule**
  - Sharing rules are available for the object.
- **ShipmentShare**
  - Sharing is available for the object.

**SEE ALSO:**

- ShipmentItem

### ShipmentItem

Represents an order item included in a shipment. This object is available in API version 51.0 and later.

### Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`
### Special Access Rules
This object is only available in Salesforce Order Management orgs or if Field Service is enabled.

**Associated Objects**

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **ShipmentItemFeed**
  - Feed tracking is available for the object.

- **ShipmentItemHistory**
  - History is available for tracked fields of the object.

**SEE ALSO:**
- Shipment
- FulfillmentOrderLineItem

### SignupRequest

Represents a request for a new sign-up. This object is available in API version 27.0 and later.

**Note:** You’re limited to 20 sign-ups per day. To make additional sign-ups, log a support case in the Salesforce Partner Community. For product, specify **Platform**. For topic, specify **AppExchange & Managed Packages**.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete()

</table>
### Field Name: Description
**Details**
The default value is the country of the requesting org. To override the default, enter the two-character, uppercase ISO-3166 country code (Alpha-2 code). A complete list of the codes is located at [https://www.iso.org/obp/ui/#search](https://www.iso.org/obp/ui/#search). The language of the trial org is auto-determined based on the value of this field.

### CreatedOrgId
**Type**
string

**Properties**
Filter, Group, Nillable, Sort

**Description**
The 15-character org ID of the trial org created. The system provides this read-only field after the sign-up request has been processed.

### CreatedOrgInstance
**Type**
string

**Properties**
Filter, Group, Nillable, Sort

**Description**
The server instance of the new trial org, for example, “na8.” This field is available in API version 29.0 and later.

### Edition
**Type**
picklist

**Properties**
Create, Filter, Group, Nillable, Restricted picklist, Sort

**Description**
The Salesforce template that is used to create the trial org. Possible values are Partner Group, Professional, Partner Professional, Sales Enterprise, Professional TSO, Enterprise, Partner Enterprise, Service Professional, Enterprise TSO, Developer, and Partner Developer. This field is available in API version 35.0 and later.

### ErrorCode
**Type**
string

**Properties**
Filter, Group, Nillable, Sort

**Description**
The error code if the sign-up request isn’t successful. The system provides this read-only field for support purposes.

### FirstName
**Type**
string

|                  | **Description**
|                  | The My Domain name for the new trial org used in the org’s login and application URLs. In Developer Edition orgs, your name must contain at least 3 characters and no more than 27 characters. In all other editions, it must be at least 3 characters and no more than 34 characters. It can include letters, numbers, and hyphens, but you can’t start the name with a hyphen. If you don’t choose a My Domain during sign-up, Salesforce assigns one for you based on your company name. If you don’t like the one we set, you can change it. For details, see My Domain in Salesforce Help. |

</tr>
</tbody>
</table>

**Usage**

The Java class uses REST API to create a SignupRequest object. It authenticates to the Trialforce Management Organization (TMO) and then posts a request to the SignupRequest object.

Here are the variables to specify in this example.
• SERVER—The name of the host server for the TMO, for example, yourInstance.salesforce.com.

• USERNAME—The admin username for the TMO.

• PASSWORD—The concatenation of the admin password and the security token for the TMO. To get an email with the security token, from your personal settings in Salesforce, select Reset My Security Token and click Reset Security Token.

• CLIENT_ID—From Setup in Salesforce, in the Quick Find box, enter Apps, and then select Apps. Under Connected Apps, click New. Enter values for the required fields (Callback URL is required, but you can initially set it to any valid URL because it’s not used). Grant full access for the OAuth scopes in the Selected OAuth Scopes selector, and click Save. Then copy the value of Consumer Key and use it for this variable.

• CLIENT_SECRET—On the same page, click Click to reveal. Then copy the value of Consumer Secret and use it for this variable.

```java
public class IsvSignupDriver {
    private static final String SERVER = server_name:port;
    private static final String USERNAME = tmo_username;
    private static final String PASSWORD = tmo_passwordsecurity_token;
    private static final String CLIENT_ID = consumer_key;
    private static final String CLIENT_SECRET = consumer_secret;

    private static SignupRequestInfo signupRequest = null;

    public static String createSignupRequest (SignupRequestInfo sr)
            throws JSONException, IOException {
        JSONObject createResponse = null;
        signupRequest = sr;
        JSONObject loginResponse = login(SERVER, USERNAME, PASSWORD);
        String instanceUrl = loginResponse.getString("instance_url");
        String accessToken = loginResponse.getString("access_token");
        createResponse = create(instanceUrl, accessToken);
        System.out.println("Created SignupRequest object: " + createResponse + "\n");
        return createResponse.toString();
    }

    /* Authenticates to the TMO using the required credentials */

    private static JSONObject login(String server, String username, String password)
            throws ClientProtocolException, IOException, JSONException {
        String authEndPoint = server + "/services/oauth2/token";
        HttpClient httpclient = new DefaultHttpClient();
        try {
           HttpPost post = new HttpPost(authEndPoint);
            List<NameValuePair> params = new ArrayList<NameValuePair>();
            params.add(new BasicNameValuePair("grant_type", "password"));
            params.add(new BasicNameValuePair("client_id", CLIENT_ID));
            params.add(new BasicNameValuePair("client_secret", CLIENT_SECRET));
            params.add(new BasicNameValuePair("username", username));
            params.add(new BasicNameValuePair("password", password));
            post.setEntity(new UrlEncodedFormEntity(params, Consts.UTF_8));

            BasicResponseHandler handler = new BasicResponseHandler();
            String response = httpclient.execute(post, handler);
            return new JSONObject(response);
        } finally {
            httpclient.getConnectionManager().shutdown();
        }
    }
}
```
/* Posts a request to the SignupRequest object */

private static JSONObject create(String instanceUrl, String accessToken)
throws ClientProtocolException, IOException, JSONException {
    HttpClient httpClient = new DefaultHttpClient();
    try {
        HttpPost post = new HttpPost(instanceUrl +
        "/services/data/v27.0/sobjects/SignupRequest/");
        post.setHeader("Authorization", "Bearer " + accessToken);
        post.setHeader("Content-Type", "application/json");
        JSONObject requestBody = new JSONObject();
        requestBody.put("TemplateId", signupRequest.getTemplateID());
        requestBody.put("SignupEmail", signupRequest.getEmail());
        requestBody.put("username", signupRequest.getUsername());
        requestBody.put("Country", "US");
        requestBody.put("Company", signupRequest.getCompanyName());
        requestBody.put("lastName", signupRequest.getLastName());
        StringEntity entity = new StringEntity(requestBody.toString());
        post.setEntity(entity);
        BasicResponseHandler handler = new BasicResponseHandler();
        String response = httpClient.execute(post, handler);
        return new JSONObject(response);
    } finally {
        httpClient.getConnectionManager().shutdown();
    }
}

Error Codes

If the sign-up fails, the system generates an error code that can help you identify the cause. This table shows the most important error codes.

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>C-1007</td>
<td>Duplicate username.</td>
</tr>
<tr>
<td>C-1015</td>
<td>Error while establishing the new org’s My Domain (subdomain) settings. Contact Salesforce support for assistance.</td>
</tr>
<tr>
<td>C-1016</td>
<td>Error while configuring the OAuth connected app for Proxy Signup. Verify that your connected app has a valid consumer key, callback URL, and unexpired certificate (if applicable).</td>
</tr>
<tr>
<td>C-1018</td>
<td>Invalid subdomain value provided during sign-up.</td>
</tr>
<tr>
<td>C-1019</td>
<td>Subdomain in use. Choose a new subdomain value.</td>
</tr>
<tr>
<td>C-1020</td>
<td>Template not found. Either the template doesn’t exist or it was deleted.</td>
</tr>
<tr>
<td>C-1033</td>
<td>Template is the wrong version.</td>

</table>

**Associated Objects**

This object has the following associated objects. Unless noted, they’re available in the same API version as this object.

**SignupRequestFeed**
- Feed tracking is available for the object.

**SignupRequestHistory**
- History is available for tracked fields of the object.

**SignupRequestOwnerSharingRule**
- Sharing rules are available for the object.

**SignupRequestShare**
- Sharing is available for the object.

**Site**

Represents a public website that is integrated with an org. This object is available in API version 16.0 and later.

To access this object, Salesforce Sites, Sites, or Site.com must be enabled for your organization.
Supported Calls
describeSObjects(), query(), retrieve()

Special Access Rules
- Customer Portal users can't access this object.
- To view this object, you must have the “View Setup and Configuration” permission.

<tr>
<td><strong>Description</strong></td>
<td>The subdomain that you registered for your site when you enabled Salesforce Sites or Experience Cloud sites. For example, if your domain is mycompany.force.com, then mycompany is the subdomain.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If enhanced domains are enabled, your site URL is different and uses your My Domain name as the subdomain. For details, see My Domain URL Formats in Salesforce Help.</td>
</tr>
<tr>
<td></td>
<td>If you enabled Salesforce Sites or Digital Experiences after you enabled enhanced domains, this field returns a null value. If you enabled Salesforce Sites or Digital Experiences before you enabled enhanced domains, this field returns this site’s previous subdomain.</td>
</tr>
</tbody>
</table>
TopLevelDomain

**Type**
url

**Properties**
Filter, Nillable

**Description**
The optional branded custom Web address that you registered with a third-party domain name registrar. The custom Web address acts as an alias to your Salesforce address.

Beginning with API version 21.0, TopLevelDomain is no longer available. Instead, use the Domain and DomainSite objects.

UrlPathPrefix

**Type**
string

**Properties**
Filter, Group, Nillable, Sort

**Description**
The unique Salesforce URL that the public uses to access this site.

**Usage**
Use this read-only object to query or retrieve information on your Salesforce site.

**Associated Objects**
This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **SiteFeed**
  Feed tracking is available for the object.

- **SiteHistory**
  History is available for tracked fields of the object.

**SiteDetail**

Represents the details of a Salesforce site or Experience Cloud site. Available in API Version 38.0 and later.

**Supported SOAP Calls**
describeSObjects(), query()
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DurableId</strong></td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong></td>

<tr>
<td></td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td></td>
<td>The URL of the website.</td>
</tr>
</tbody>
</table>

**Note:** SiteDetail fields are exposed in SOAP API version 45.0 and later. You can use Tooling API to query for SiteDetail fields in guest user mode in API version 44.0 and earlier. In API version 45.0 and later, use SOAP API to get this data in guest user mode. SiteDetail is still exposed in Tooling API to User Profiles with the ViewSetup permission.

## SiteDomain

SiteDomain is a read-only object, and a one-to-many replacement for the Site.TopLevelDomain field. This object is available in API version 21.0, and has been deprecated as of API version 26.0. In API version 26.0 and later, use the Domain and DomainSite objects instead.

To access this object, Salesforce Sites, Sites, or Site.com must be enabled for your organization.

### Supported Calls

- `describeSObjects()`
- `query()`
- `retrieve()`

### Special Access Rules

- Customer Portal users can't access this object.
To view this object, you must have the “View Setup and Configuration” permission.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain</td>
<td><strong>Type</strong>&lt;br&gt;url&lt;br&gt;<strong>Properties</strong>&lt;br&gt;Filter, Sort&lt;br&gt;<strong>Description</strong>&lt;br&gt;The branded custom Web address within the global namespace identified by this domain's type. In the Domain Name System (DNS) global namespace, this field is the custom Web address that you registered with a third-party domain name registrar. The custom Web address can be used to access the site of this domain.</td>
</tr>
<tr>
<td>SiteId</td>
<td><strong>Type</strong>&lt;br&gt;reference&lt;br&gt;<strong>Properties</strong>&lt;br&gt;Filter, Group, Sort&lt;br&gt;<strong>Description</strong>&lt;br&gt;The ID of the associated Site.</td>
</tr>
<tr>
<td>DomainType</td>
<td><strong>Type</strong>&lt;br&gt;picklist&lt;br&gt;<strong>Properties</strong>&lt;br&gt;Filter, Group, Sort, Nillable&lt;br&gt;<strong>Description</strong>&lt;br&gt;The global namespace that this custom Web address belongs to. This value is set to DNS for custom Web addresses in the global DNS. This field is available in version 24.0 of the API.</td>
</tr>
</tbody>
</table>

Usage

Use this read-only object to query the custom Web addresses that are associated with each website in your organization.

SiteHistory

Represents the history of changes to the values in the fields of a site. This object is generally available in API version 18.0 and later. To access this object, Salesforce Sites must be enabled for your organization.
Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Special Access Rules

- Customer Portal users can’t access this object.
- To view this object, you must have the “View Setup and Configuration” permission.

</tbody>
</table>
### SiteIframeWhitelistUrl

Represents a list of external domains that you allow to frame your Salesforce site or Experience Cloud site pages. This object is available in API version 44.0 and later.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

#### Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

#### Special Access Rules

- Customer Portal users can’t access this object.
- To view this object, you must have the “View Setup and Configuration” permission.

#### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| SiteId     | **Type**
|            | reference |

**Properties**

Create, Filter, Group, Sort

**Description**

ID of the site to include in the inline frame.

This is a relationship field.
Skill

Represents a category or group that Chat users or field service resources can be assigned to. This object is available in API version 24.0 and later.

Note: For information about WDC skills on a user’s profile, see the ProfileSkill topic.

Supported Calls

create(), describeSObjects(), query(), retrieve(), update(), upsert()

Fields

Field Name | Details
--- | ---
Description | Type
textarea
Properties | Create, Nillable, Update
Description | The description of the skill.

DeveloperName | Type
| string
### Field Name

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| **DeveloperName** | **Properties** Create, Filter, Group, Sort, Update  
**Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization.  
**Note:** When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record. |
| **Language** | **Type** picklist  
**Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update  
**Description** The language of the skill. |
| **LastViewedDate** | **Type** datetime  
**Properties** Filter, Nillable, Sort  
**Description** The timestamp for when the current user last viewed the skill. |
| **MasterLabel** | **Type** string  
**Properties** Create, Filter, Group, idLookup, Sort, Update  
**Description** The name of the skill. |

### Usage

**Chat**  
Use this object to assign Chat users to groups based on their abilities. The skills associated with a LiveChatButton determine which agents receive chat requests that come in through that button.
Field Service

Use this object to track certifications and areas of expertise in your workforce. After you create a skill, you can:

- Assign it to a service resource via the Skills related list on the resource’s detail page. When you assign a skill to a service resource, you can specify their skill level and the duration of the skill.
- Add it as a required skill via the Skill Requirements related list on any work type, work order, or work order line item. When you add a required skill to a work record, you can specify the skill level.

SkillLevelDefinition

Represents a skill which can be acquired by taking myTrailhead learning modules. This object is available in API version 51.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

The org must have a Workforce Engagement license and a myTrailhead license. User must have at least one Workforce Engagement permission set assigned to them: Workforce Engagement Analyst, Workforce Engagement Planner, Workforce Engagement Agent.

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**SkillLevelDefinitionOwnerSharingRule on page 3714**
Sharing rules are available for the object.

**SkillLevelDefinitionShare on page 3719**
Sharing is available for the object.

---

**SkillLevelProgress**

Represents training progress for a given user. This object is available in API version 51.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

**Special Access Rules**

The org must have a Workforce Engagement license and a myTrailhead license. User must have at least one Workforce Engagement permission set assigned to them: Workforce Engagement Analyst, Workforce Engagement Planner, Workforce Engagement Agent.

|                      | SkillLevelDefinition
### Field: SkillMasterLabel

**Type**  
string

**Properties**  
Filter, Group, Nillable, Sort

**Description**  
The master label of the Skill associated with the associated SkillLevelDefinition.

### Field: Status

**Type**  
picklist

**Properties**  
Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**  
Represents the status of the progress.  
Possible values are:  
- A—Approved  
- R—Review  
- S—Started  
The default value is 'S'.

### Field: TotalCount

**Type**  
int

**Properties**  
Create, Filter, Group, Sort, Update

**Description**  
The total number of modules that need to be completed.

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **SkillLevelProgressOwnerSharingRule** on page 3714  
  Sharing rules are available for the object.

- **SkillLevelProgressShare** on page 3719  
  Sharing is available for the object.

### SkillProfile

Represents a join between Skill and Profile. This object is available in API version 24.0 and later.
Supported Calls
create(), delete(), describeSObjects(), query(), update(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| ProfileId  | Type: reference  
Properties: Create, Filter, Group, Nillable, Sort  
Description: The ID of the profile. |
| SkillId    | Type: reference  
Properties: Create, Filter, Group, Sort  
Description: The ID of the skill. |

Usage
Use this object to assign specific skills to specific profiles.

SkillRequirement

Represents a skill that is required to complete a particular task in Field Service and Lightning Scheduler. Skill requirements can be added to work types, work orders, and work order line items in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later. You also can add skill requirements to work items in Omni-Channel skills-based routing using API version 42.0 and later.

Supported Calls
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(), upsert()

Special Access Rules
If you want to use SkillRequirement for Field Service use cases, then Field Service must be enabled.
If you want to use SkillRequirement only for Omni-Channel skills-based routing use cases, then you don't need Field Service to be enabled.
## Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>IsAdditionalSkill</strong></td>
<td><strong>Type</strong> boolean</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Defaulted on create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> Indicates that a skill is additional. After a designated timeout period, a skill marked as additional is dropped from Omni-Channel routing. The case is then routed to the best-matched agent even if they don’t have all the skills.</td>
</tr>
<tr>
<td><strong>LastReferencedDate</strong></td>
<td><strong>Type</strong> dateTime</td>

<tr>
<td><strong>Description</strong></td>
<td>An auto-generated number identifying the skill requirement.</td>
</tr>
<tr>
<td><strong>SkillPriority</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>int</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Aggregatable, Create, Filter, Group, Nillable, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>For additional skills, specify the order in which skills are dropped if after the specified timeout no agent with that skill is available. Higher priority-value skills are dropped first. Lower priority-value skills, for example 0, are dropped last. Skills with the same priority value are dropped as a group. You can set skill priority using skills-based routing rules or Apex code.</td>
</tr>
</tbody>
</table>
Usage

Skill requirements help dispatchers assign work orders to service resources with the proper expertise. You can still assign a work order, work order line item, or related service appointment to a service resource that does not possess the specified skills, so skill requirements serve more as a suggestion than a rule.

Note: If you’re using the Field Service managed package, use matching rules to ensure that appointments are only assigned to service resources who possess the skills listed on the parent work order.

If many of your work orders require the same skills, add skill requirements to work types to save time and keep your processes consistent. When you add a skill requirement to a work type, work orders and work order line items that use that type automatically inherit the skill requirement. For example, if all annual maintenance visits for your Classic Refrigerator product require a Refrigerator Maintenance skill level of at least 50, add that skill requirement to the Annual Maintenance Visit work type. When you create a work order for a customer’s annual fridge maintenance, applying that work type adds the skill requirement as well.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **SkillRequirementFeed**
  Feed tracking is available for the object.

- **SkillRequirementHistory**
  History is available for tracked fields of the object.

SkillUser

Represents a join between Skill and User. This object is available in API version 24.0 and later.

Supported Calls

create(), delete(), describeSObjects(), update(), query(), retrieve()

Fields

<table>
<thead>
<tr>

|            | **Description**
|            | The ID of the skill. |

| UserId     | **Type**
|------------| reference |
Usage

Use this object to assign specific skills to specific users.

SlaProcess

Represents an entitlement process associated with an Entitlement. This object is available in API version 19.0 and later.

An entitlement process is a timeline that includes all the steps (MilestoneType records) that your support team must complete to resolve cases. Each process includes the logic necessary to determine how to enforce the correct service level for your customers.

Supported Calls

describeSObjects(), query(), retrieve(), search(), describeLayout()
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>A description of the entitlement process.</td>
</tr>
<tr>
<td>IsActive</td>
<td>Type: boolean&lt;br /&gt;&lt;br /&gt;Properties: Defaulted on create, Filter&lt;br /&gt;&lt;br /&gt;Description: Indicates whether the entitlement process is active (true) or not (false).</td>
</tr>
<tr>
<td>IsVersionDefault</td>
<td>Type: boolean&lt;br /&gt;&lt;br /&gt;Properties: Defaulted on create, Filter, Group, Sort&lt;br /&gt;&lt;br /&gt;Description: Indicates whether the entitlement process is the default version (true) or not (false).&lt;br /&gt;&lt;br /&gt;This field is available in API version 28.0 and later in organizations that have entitlement versioning enabled.</td>
</tr>
<tr>
<td>LastViewedDate</td>
<td>Type: dateTime&lt;br /&gt;&lt;br /&gt;Properties: Filter, Nullable, Sort&lt;br /&gt;&lt;br /&gt;Description: The date when the SlaProcess was last viewed.</td>
</tr>
<tr>
<td>Name</td>
<td>Type: string&lt;br /&gt;&lt;br /&gt;Properties: Filter, idLookup&lt;br /&gt;&lt;br /&gt;Description: The name of the entitlement process.</td>
</tr>
</tbody>
</table>
| NameNorm            | Type: string<br /><br />Properties: Filter, Group, Sort<br /><br />Description: The read-only value for the unique name of the entitlement process or the entitlement process version. If entitlement versioning is enabled, this value is automatically
Details

Generated for each version of an entitlement process in this form: `process name_v+x`, where `x` is the version number (for example, "gold_support_v2").

If entitlement versioning isn’t enabled, this value is the same as Name.

This field is available in API version 28.0 and later.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| SObjectType | **Type** picklist  
**Properties** Restricted picklist, Filter, Group, Sort  
**Description** The type of records that the entitlement process can run on. Its values are:  
- Case  
- Work Order  
An entitlement process runs only on records that match its type. For example, a Case entitlement process that’s applied to an entitlement runs only on cases associated with the entitlement, not on work orders. As a best practice, therefore, manage customers’ work orders and cases on separate entitlements.  
The field label in the user interface is Entitlement Process Type. |
| StartDateField | **Type** string  
**Properties** Filter, Restricted picklist  
**Description** The criteria for cases to enter the entitlement process. Cases can enter the process based on:  
- The creation date on a case  
- A custom date/time field on a case |
| VersionMaster | **Type** string  
**Properties** Filter, Group, Nillable, Sort  
**Description** Identifies the sequence of versions to which this entitlement process belongs. This field’s contents can be any value as long as it is identical among all versions of the entitlement process.  
This field is available in API version 28.0 and later in organizations that have entitlement versioning enabled. |
### Standard Objects

#### Snippet

**Field** | **Details**
--- | ---
VersionNotes | **Type**
textarea

**Properties**
Filter, Group, Nillable, Sort

**Description**
The description of the entitlement process version.
This field is available in API version 28.0 and later in organizations that have entitlement versioning enabled.

**VersionNumber**

**Type**
int

**Properties**
Filter, Group, Nillable, Sort

**Description**
The version number of the entitlement process. Must be 1 or greater.
This field is available in API version 28.0 and later in organizations that have entitlement versioning enabled.

---

### Usage

Use this object to query entitlement processes on entitlements.

**SEE ALSO:**
- Entitlement
- MilestoneType
- CaseMilestone

### Snippet

Represents a snippet, which is a container for rich text that can be reused across Pardot emails and email templates. This object is available in API version 47.0 and later.

### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), delete(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

### Special Access Rules

Snippets are available in Pardot accounts with the Sales, CRM, or Service permission set license.

### SnippetAssignment

Represents a relationship between a snippet and a campaign. Assignments are required to use snippet content in Pardot emails and email templates. A snippet can be assigned to more than one campaign. This object is available in API version 47.0 and later.

### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

### Special Access Rules

Snippets are available in Pardot accounts with the Sales, CRM, or Service permission set license.

|               | Salesforce product that created the social persona.                    |
| TopicType     | **Type**
|               | string                                                                  |
|               | **Properties**
|               | Create, Filter, Group, Nillable, Sort, Update                          |
|               | **Description**
|               | Type of topic, such as keyword or managed.                             |

**Usage**

The fields on a SocialPersona object don’t provide real-time data. They provide a snapshot of information from the last time Salesforce collected a post from the social persona. Many of the Radian6-related fields are no longer accurate or used.
Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**SocialPersonaHistory (API version 26.0)**

History is available for tracked fields of the object.

SocialPost

Represents a snapshot of a post on a social network such as a Facebook or Twitter. This object is available in API version 23.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

**Usage**

The fields on a SocialPost object don’t provide real-time data. They provide a snapshot of information from the last time Salesforce collected the post from the social network. Many of the Radian6-related fields are no longer accurate or used.
Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**SocialPostChangeEvent (API version 48.0)**
Change events are available for the object.

**SocialPostFeed (API version 26.0)**
Feed tracking is available for the object.

**SocialPostHistory (API version 26.0)**
History is available for tracked fields of the object.

**SocialPostOwnerSharingRule**
Sharing rules are available for the object.

**SocialPostShare**
Sharing is available for the object.

Solution

Represents a detailed description of a customer issue and the resolution of that issue.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

|                  | Create, Filter, Group, idLookup, Sort, Update                           |
|                  | **Description**
|                  | Required. If a client application creates a new Solution and a value for this field is unspecified, a hyphen (-), the default value for this field, is used. Limit: 255 characters. Label is **Title**. |
| SolutionNote     | **Type**
|                  | textarea                                                                |
|                  | **Properties**
|                  | Create, Nillable, Update                                                |
|                  | **Description**
|                  | The details of the Solution record. Limit: 32,000 characters. Label is **Solution Details**. |
|                  | **Note:** If you have HTML Solutions enabled, any HTML tags used in this field are verified before the object is created or updated. If invalid HTML is entered, an error is thrown. Any JavaScript used in this field is removed before the object is created or updated. |
| SolutionNumber   | **Type**
|                  | string                                                                  |
|                  | **Properties**
|                  | Autonumber, Defaulted on create, Filter, Sort                           |
|                  | **Description**
|                  | An identifying number that is assigned automatically when a solution is created. It can't be set directly, and it can't be modified. |
| Status           | **Type**
|                  | picklist                                                                |
|                  | **Properties**
|                  | Create, Defaulted on create, Filter, Group, Sort, Update                |
|                  | **Description**
|                  | Required. The status of the solution. Directly controls the **IsReviewed** value. To obtain the status values in the picklist, a client application can query the SolutionStatus. |
Usage

Use this object to manage your organization’s solutions. Client applications can create, update, delete, and query Attachment records associated with a solution.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**SolutionFeed** *(API version 18.0)*
Feed tracking is available for the object.

**SolutionHistory**
History is available for tracked fields of the object.

SEE ALSO:
- CategoryData
- CategoryNode

SolutionStatus

Represents the status of a Solution, such as Draft, Reviewed, and so on.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

Supported Calls

describeSObjects(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ApiName</td>
<td>Type string</td>
</tr>
<tr>
<td>Field</td>
<td>Details</td>
</tr>
<tr>

</tr>
<tr>
<td>IsReviewed</td>
<td>Type boolean</td>
</tr>
<tr>
<td>MasterLabel</td>
<td>Type string</td>
</tr>
<tr>
<td>SortOrder</td>
<td>Type int</td>
</tr>
</tbody>
</table>

**Usage**

This object represents a value in the solution status picklist. The solution status picklist provides additional information about the status of a Solution, such as whether a given status value represents a reviewed or unreviewed solution. Your client application can query this
object to retrieve the set of values in the solution status picklist, and then use that information while processing Solution objects to
determine more information about a given solution. For example, the application could test whether a given case has been reviewed
or not based on its Status value and the value of the IsReviewed property in the associated SolutionStatus record.

SEE ALSO:
   Solution

SolutionTag

 Associates a word or short phrase with a Solution.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve()

</thead>
</table>

**Properties**

Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**

The language of the deployment.

### MasterLabel

<table>
<thead>
<tr>
<th>Type</th>
<th>string</th>
</tr>
</thead>
</table>

**Properties**

Create, Filter, Group, Sort, Update

**Description**

The name of the deployment.

### OptionsIsBackwardFacingCameraEnabled

<table>
<thead>
<tr>
<th>Type</th>
<th>boolean</th>
</tr>
</thead>
</table>

**Properties**

Create, Filter, Update

**Description**

Determines whether customers can use the backwards-facing camera on their mobile devices to talk to SOS agents.

### OptionsIsEnabled

<table>
<thead>
<tr>
<th>Type</th>
<th>boolean</th>
</tr>
</thead>
</table>

**Properties**

Create, Filter, Update

**Description**

Determines whether the deployment is enabled for customers to request new SOS video calls.

### OptionsIsVoiceOnlyMode

<table>
<thead>
<tr>
<th>Type</th>
<th>boolean</th>
</tr>
</thead>
</table>

Usage

Use this object to query and manage SOS deployments.

SOSSession

This object is automatically created for each SOS session and stores information about the session. This object is available in API versions 34.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

### Field Name

### Details

**Properties**
Create, Filter, Group, Nillable, Sort, Update

**Description**
The version of SOS that was used in your organization’s mobile application when this session occurred.

### StartTime

**Type**
dateTime

**Properties**
Create, Filter, Nillable, Sort, Update

**Description**
The time that the SOS session began.

### SystemInfo

**Type**
string

**Properties**
Create, Filter, Group, Nillable, Sort, Update

**Description**
Information about the customer’s mobile device from which the SOS call originated, such as the device’s operating system.

### WaitDuration

**Type**
int

**Properties**
Filter, Group, Nillable, Sort

**Description**
The amount of time the customer waited before an agent accepted the SOS session and the call began.

### Usage

Use this object to query and manage SOS session records.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**SOSSessionFeed**
Feed tracking is available for the object.

**SOSSessionHistory**
History is available for tracked fields of the object.
SOSSessionOwnerSharingRule
Sharing rules are available for the object.

SOSSessionShare
Sharing is available for the object.

SOSSessionActivity
Captures information about specific events that occur during an SOS video call, such as when an SOS call begins or ends. This object is available in API version 34.0 and later.

Supported Calls
create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActivityTime</td>
<td></td>
</tr>
<tr>

<td>picklist</td>
</tr>
</tbody>
</table>
**Field Name** | **Details**
--- | ---
**Properties** | Create, Filter, Group, Restricted picklist, Sort
**Description** | The kind of activity that occurred.

**Usage**
Use this object to query and manage SOS session activities.

**Stamp**
Represents a User Specialty. This object is available in API version 39.0 and later.
Create User Specialty labels. Specialties can be any term you want, up to 50 characters, including spaces and underscores.

**Supported Calls**
describeSObjects(), query(), retrieve()

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Type: string&lt;br&gt;Properties: Filter, Group, Nillable, Sort&lt;br&gt;Description: Use this field to describe what the user specialty means and how it applies to a user. You have a 255 character maximum including spaces and underscores.</td>
</tr>
<tr>
<td>MasterLabel</td>
<td>Type: string&lt;br&gt;Properties: Filter, Group, Sort&lt;br&gt;Description: The User Specialty label that appears under the user’s profile picture. You can create any label you want as long as it’s within the 50 character maximum, including spaces and underscores.</td>
</tr>
<tr>
<td>ParentId</td>
<td>Type: reference</td>
</tr>
</tbody>
</table>
StampAssignment

Represents assignment of a User Specialty to a user. This object is available in API version 39.0 and later.
Assign a User Specialty to users. This label appears beneath their profile photo.

Supported Calls

describeSObjects(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>StampId</td>
<td>Type: reference</td>
</tr>
<tr>
<td></td>
<td>Properties: Filter, Group, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: The unique id generated when creating a user specialty. This is a relationship field.</td>

<td></td>
<td>Relationship Name: Stamp</td>
</tr>
<tr>
<td></td>
<td>Relationship Type: Lookup</td>
</tr>
<tr>
<td></td>
<td>Refers To: Stamp</td>
</tr>
</tbody>
</table>
**StaticResource**

Represents a static resource that can be used in Visualforce markup.

**Supported Calls**

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(), upsert()

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Body</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>base64</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Nullable, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Required. Encoded file data.</td>
</tr>
<tr>
<td><strong>BodyLength</strong></td>
<td>int</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Size of the file (in bytes).</td>
</tr>
</tbody>
</table>
### CacheControl

**Type**
- picklist

**Properties**
- Create, Filter, Group, Restricted picklist, Sort, Update

**Description**
The sharing policy for the static resource when cached. The cache control can have one of the following values:

- **Private**: specifies that the static resource data cached on the Salesforce server shouldn't be shared with other users. The static resource is stored in cache only for the current user's session.
- **Public**: specifies that the static resource data cached on the Salesforce server be shared with other users in your organization for faster load times. For API users, the resource is accessible to all internet traffic.

### ContentType

**Type**
- string

**Properties**
- Create, Filter, Group, Sort, Update

**Description**
Type of content. Label is **Mime Type**. Limit: 120 characters.

### Description

**Type**
- textarea

**Properties**
- Create, Filter, Group, Nillable, Sort, Update

**Description**
Text description of the static resource. Limit: 255 characters.

### Name

**Type**
- string

**Properties**
- Create, Filter, Group, idLookup, Sort, Update

**Description**
Required. Name of the static resource.

### NamespacePrefix

**Type**
- string

**Properties**
- Filter, Group, Nillable, Sort
The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.
- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

This field can’t be accessed unless the logged-in user has the Customize Application permission.

### Usage

Use static resources to upload content that you can reference in Visualforce markup, including archives (such as .zip and .jar files), images, stylesheets, JavaScript, and other files. Using a static resource is preferable to uploading a file to the Documents tab because:

- You can package a collection of related files into a directory hierarchy and upload that hierarchy as a .zip or .jar archive.
- You can reference a static resource in page markup by name using the `$Resource` global variable instead of hard-coding document IDs.

### Encoded Data

The API sends and receives the binary file data encoded as a base64 data type. Prior to creating a record, clients must encode the binary file data as base64. Upon receiving an API response, clients must decode the base64 data to binary (this conversion is usually handled for you by the SOAP client).

### Maximum Static Resource Size

You can create or update static resources to a maximum size of 5 MB. An organization can have up to 250 MB of static resources, total.

StoreIntegratedService

Represents an association between an integration and a store. This object is available in API version 49.0 and later.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

The StoreIntegratedService object is available only if the B2B Commerce on Lightning Experience license is enabled.

### StreamingChannel

**Represents a channel that is the basis for notifying listeners of generic Streaming API events. This object is available in API version 29.0 and later.**

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

**Special Access Rules**

- This object is available only if Streaming API is enabled for your org.
- Users with the Create permission can create this record.
- You can create a permission set and grant users read and create access to all streaming channels in the org. This access isn’t for a specific channel, like with user sharing.
- You can apply user sharing to StreamingChannel. You can restrict access to receiving or sending events on a channel by sharing channels with specific users or groups. Channels shared with public read-only or read-write access send events only to clients.
subscribed to the channel that also are using a user session associated with the set of shared users or groups. Only users with read-write access to a shared channel can generate events on the channel, or modify the actual StreamingChannel record.

**Dynamic Streaming Channel**

Streaming API generic streaming supports dynamic streaming channel creation, which creates a StreamingChannel when a client first subscribes to the channel. To enable dynamic streaming channels in your org, from Setup, enter User Interface in the Quick Find box, then select User Interface. Enable Enable Dynamic Streaming Channel Creation. You can also enable dynamic channel creation in Metadata API using EventSettings.

</tbody>
</table>
| **NamespacePrefix** | **Type** string  
**Properties** Filter, Group, Nillable, Sort  
**Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation. The namespace prefix can have one of the following values. 
• In Developer Edition orgs, `NamespacePrefix__` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer. 
• In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix. |
| **OwnerId**     | **Type** reference  
**Properties** Filter, Group, Sort  
**Description** The ID of the user who created the survey. |
| **SurveyType**  | **Type** string  
**Properties** Filter, Group, Nillable, Sort  
**Description** Type of the survey. |
| **TotalVersionsCount** | **Type** int  
**Properties** Filter, Group, Nillable, Sort |
### SurveyEmailBranding

Represents the configuration settings for invitation emails sent to survey participants for a particular survey.

#### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), query(), retrieve(), update(), upsert()

#### Special Access Rules

As of Spring '20 and later, only users with the View Setup and Configuration permission can access this object.

#### Fields

<table>

</table>

**MasterLabel**

**Type**

string

**Properties**

Create, Filter, Group, Sort, Update

**Description**

The label for these email configuration settings.

**Subject**

**Type**

string

**Properties**

Create, Filter, Group, Sort, Update

**Description**

The subject of the invitation email.

---

**SurveyEngagementContext**

Represents the context based on which a survey invitation was sent or a survey response was received. This object is available in API version 49.0 and later.

**Supported Calls**

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

### DetailsField Name

**UUID**

**Type** string

**Properties** Filter, Group, Nillable, Sort

**Description** A unique user ID that's added to a survey invitation generated for a contact, lead, or user.

**UserId**

**Type** reference

**Properties** Filter, Group, Nillable, Sort

**Description** ID of the user who received the invitation. This field is available in API v49.0 and later.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **SurveyInvitationOwnerSharingRule**
  - Sharing rules are available for the object.

- **SurveyInvitationShare**
  - Sharing is available for the object.

### SurveyPage

Represents a page, such as the title page or a question page, in a survey.

### Supported Calls

- getDeleted(), getUpdated(), query(), retrieve()

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DeveloperName</td>
<td></td>
</tr>
</tbody>
</table>

**Type** string

**Properties** Filter, Group, Sort
### SurveyPage

Represents a page in a survey.

#### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Details</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td></td>
</tr>
<tr>
<td><strong>SurveyVersionId</strong></td>
<td></td>
</tr>
</tbody>
</table>

#### SurveyVersionId

Type: reference

Properties: Filter, Group, Sort

Description: The version of the survey that the page belongs to.

---

### SurveyQuestion

Represents a question in a survey.

#### Supported Calls

describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

#### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>

### SurveyResponse

Represents information about a participant’s response to a survey, such as the status of the response, the participant’s location, and when the survey was completed.

### Supported Calls

describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete()
## Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| CompletionDateTime          | **Type** `dateTime`
                             **Properties** Filter, Nillable, Sort
                             **Description** The date and time that the participant completed the survey. |
| DataMapperExecutionStatus   | **Type** `picklist`
                             **Properties** Filter, Group, Nillable, Restricted picklist, Sort
                             **Description** Status of all the survey data maps after a response is received. This field is available in API v49.0 and later where Survey Advanced Features permission is enabled. Possible values are:
                             • Pending
                             • InProgress
                             • Success
                             • Error |
| InterviewGuid               | **Type** `string`
                             **Properties** Filter, Group, idLookup, Nillable
                             **Description** An automatically-generated, unique ID for a saved survey response. |
| InterviewId                 | **Type** `reference`
                             **Properties** Filter, Group, Nillable, Sort
                             **Description** The ID of the FlowInterview object that’s associated with this response. |
| InvitationId                | **Type** `reference`
                             **Properties** Filter, Group, Sort |
### Field Name: ID of the SurveyInvitation object that’s associated with this response.

**Type:** string  
**Properties:** Filter, Group, Nillable, Sort  
**Description:** The IP address of the device the participant used to take the survey.

### Field Name: Language

**Type:** picklist  
**Properties:** Filter, Group, Nillable, Restricted picklist, Sort  
**Description:** The language that the participant used to complete the survey. Possible values are:
- `af`—Afrikaans
- `ar`—Arabic
- `ar_AE`—Arabic (United Arab Emirates)
- `ar_BH`—Arabic (Bahrain)
- `ar_DZ`—Arabic (Algeria)
- `ar_EG`—Arabic (Egypt)
- `ar_IQ`—Arabic (Iraq)
- `ar_JO`—Arabic (Jordan)
- `ar_KW`—Arabic (Kuwait)
- `ar_LB`—Arabic (Lebanon)
- `ar_LY`—Arabic (Libya)
- `ar_MA`—Arabic (Morocco)
- `ar_OM`—Arabic (Oman)
- `ar_SA`—Arabic (Saudi Arabia)
- `ar_SD`—Arabic (Sudan)
- `ar_SY`—Arabic (Syria)
- `ar_TN`—Arabic (Tunisia)
- `ar YE`—Arabic (Yemen)
- `bg`—Bulgarian
- `bn`—Bengali
- `bs`—Bosnian

### Field Name: Details

#### Properties
- Filter, Group, Restricted picklist, Sort

#### Description
The status of the survey. Possible values include:
- **Not Started** — The participant hasn’t opened the survey.
- **Started** — The participant has opened the survey.
- **Paused** — The participant has paused the survey. Paused isn’t available for invitations in which either `OptionsAllowParticipantAccessTheirResponse` or `OptionsCollectAnonymousResponse` is true.
- **Completed** — The participant has completed the survey.

---

### Field Name: SubmitterId

#### Type
- reference

#### Properties
- Filter, Group, Nillable, Sort

#### Description
The ID of the Salesforce user or contact who completed the survey.

---

### Field Name: SurveyId

#### Type
- reference

#### Properties
- Filter, Group, Sort

#### Description
The ID of the survey that the participant completed.

---

### Field Name: SurveyVersionId

#### Type
- reference

#### Properties
- Filter, Group, Sort

#### Description
The ID of the version of the survey that the participant completed.

---

### SurveySubject

Represents a relationship between a survey and another object, such as an account or a case.
**Supported Calls**

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

</thead>
</table>
| BrandingSetId   | **Type** reference  
|                 | **Properties** Filter, Group, Nullable, Sort  
|                 | **Description** The ID of the branding set associated with the survey version. |
| Description     | **Type** textarea  
|                 | **Properties** Nullable  
|                 | **Description** The description of this survey version. |
| IsTemplate      | **Type** boolean  
|                 | **Properties** Defaulted on create, Filter, Group, Sort  
|                 | **Description** Indicates whether the survey version is a template. Template surveys are automatically shared with all users in your Salesforce org. |
| LastReferencedDate | **Type** dateTime  
|                 | **Properties** Filter, Nullable, Sort  
|                 | **Description** The date and time that the current user last viewed a record related to the survey version. |
| LastViewedDate  | **Type** dateTime  
|                 | **Properties** Filter, Nullable, Sort  
|                 | **Description** The timestamp for when the current user last viewed the survey version. |
| Name            | **Type** string  

### Field Name | Details
--- | ---

**Properties**  
Filter, Group, Sort  
Filter, Group, Sort  
Filter, Group, idLookup, Sort  

**Description**  
The name of the survey that appears in the UI.

**SurveyId**  

**Type**  
reference  

**Properties**  
Filter, Group, Sort  

**Description**  
The ID of the survey associated with the survey version.

**SurveyStatus**  

**Type**  
picklist  

**Properties**  
Filter, Group, Nillable, Restricted picklist, Sort  

**Description**  
The status of the survey. Possible values include:  
- Active  
- Draft  
- Obsolete  
- InvalidDraft

**SurveyVersion**  

**Type**  
int  

**Properties**  
Filter, Group, Sort  

**Description**  
The version number of the survey.

---

**SurveyVersionAddlInfo**

Represents additional information about a survey version. This information defines the default settings of a survey version. This object is available in API version 49.0 and later.

**Supported Calls**

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Name

Type  
string

Properties  
Filter, Group, idLookup, Sort

Description  
Name of the record.

SurveyQuestionId

Type  
reference

Properties  
Filter, Group, Nillable, Sort

Description  
ID of the survey question embedded in the email template used to send automated survey invitations.

SurveyVersionId

Type  
reference

Properties  
Filter, Group, Sort

Description  
ID of the survey version. This field is unique within your organization.
TabDefinition

Represents a custom tab. Returns only the tabs that the current user has access to. This object is available in API version 43.0 and later.

Supported Calls

describeSObjects(), query(), search()

TagDefinition

Defines the attributes of child Tag objects.

**Supported Calls**

delete(), describeSObjects(), query(), retrieve(), search(), undelete(), update()  

**Special Access Rules**

As of Summer ’20 and later, only authenticated internal and external users can access this object.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Detail</th>
</tr>
</thead>
</table>
| Name         | **Type** string  
|              | **Properties** Filter, Nullable, Update  
|              | **Description** Identifies the tag word or phrase.                        |
| Type         | **Type** picklist  
|              | **Properties** Filter, Nullable, Restricted picklist  
|              | **Description** Defines the visibility of a tag. Possible value are:  
|              | • Public: The tag can be viewed and manipulated between all users in an organization.
Personal: The tag can be viewed or manipulated only by a user with a matching OwnerId.

Usage

When you create a tag for a record, an association is created with to a corresponding TagDefinition:

- If the value in the tag’s Name field is new, a new TagDefinition record is automatically created and becomes the parent of the tag.
- If the value in the tag’s Name field already exists in a TagDefinition, that TagDefinition automatically becomes the parent of the tag.

Each TagDefinition record has a one-to-many relationship with its child tag records.

The following standard objects represent tags for records:

- AccountTag
- AssetTag
- CampaignTag
- CaseTag
- ContactTag
- ContractTag
- DocumentTag
- EventTag
- LeadTag
- NoteTag
- OpportunityTag
- SolutionTag
- TaskTag

Custom objects may also be tagged. Tags for custom objects are identified by a suffix of two underscores immediately followed by the word tag. For example, a custom object named Meeting has a corresponding tag named Meeting__tag in that organization’s WSDL. Meeting__tag is only valid for Meeting objects.

TagDefinition is useful for mass operations on any tag record. For instance, if you want to rename existing tags, you can search for the appropriate TagDefinition object, update it, and the child tag’s Name values are also changed. The following Java example replaces all WC tags with the phrase West Coast:

```java
public void tagDefinitionSample() {
    String soqlQuery = "SELECT Id, Name FROM TagDefinition " + 
    "WHERE Name = 'WC';";
    QueryResult qResult = null;
    try {
        qResult = connection.query(soqlQuery);
        TagDefinition tagDef = (TagDefinition) qResult.getRecords()[0];
        tagDef.setName("West Coast");
        connection.update(new SObject[]{tagDef});
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```
When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

**Task**

Represents a business activity such as making a phone call or other to-do items. In the user interface, Task and Event records are collectively referred to as activities.

Note: Task fields related to calls are exclusive to Salesforce CRM Call Center. Also, `query()`, `delete()`, and `update()` aren't allowed with tasks related to more than one contact in API versions 23.0 and earlier.

**Supported Calls**

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Field Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccountId</td>
<td>reference</td>
</tr>
</tbody>
</table>

- **Type**
  - reference

- **Properties**
  - Filter, Group, Nillable, Sort

- **Description**
  - Represents the ID of the related Account. The `AccountId` is determined as follows.
    - If the value of `WhatId` is any of the following objects, then Salesforce uses that object's `AccountId`.
      - Account
      - Opportunity
      - Contract
      - Custom object that is a child of Account
    - If the value of the `WhatId` field is any other object, and the value of the `WhoId` field is a Contact object, then Salesforce uses that contact's `AccountId`. (If your organization uses Shared Activities, then Salesforce uses the `AccountId` of the primary contact)
    - Otherwise, Salesforce sets the value of the `AccountId` field to null.
  - For information on IDs, see [ID Field Type](#).
  - This is a relationship field.

- **Relationship Name**
  - Account

| CompletedDateTime       | dateTime   | The date and time the task was saved with a Closed status. For insert, if the task is saved with a Closed status the field is set. If the task is saved

-  For insert, if the task is saved with an Open status the field is set to NULL.
-  For update, if the task is saved with a new Closed status, the field is reset. If the task is saved with a new non-closed status, the field is reset to NULL.
-  If the task is saved with the same closed status (that is, unchanged) there is no change to the field.

**Note:** The status is a dynamic enum. If the Closed mapping is changed it won’t cause an update of existing tasks. Only new insert/update operations are affected.

</tr>
</tbody>
</table>

3201
Label is **Repeat This Task**. This field has the following picklist values:

- **None**: The task doesn’t repeat.
- **After due date**: The next repeating task will be due the specified number of days after the current task’s due date.
- **After the task is closed**: The next repeating task will be due the specified number of days after the current task is closed.
- **(Task closed)**: This task, now closed, was opened as part of a repeating series.

**Note**: When tasks in a series are set to repeat after their due date, Salesforce doesn’t create recurrences that would have been due in the past. Instead, Salesforce keeps adding the interval until a repeated task has a due date in the future.

For example, suppose that someone sets a task to repeat three days after it’s due. But, that person doesn’t complete the task (mark it Closed) until five days after it’s due. Instead of creating a task that’s already overdue, Salesforce gives the new task a due date of tomorrow. This due date is equivalent to 6 days after the due date; two intervals of three days each.

If that person completes the repeating task (marks it Closed) before the due date, the next task is still due three days after the due date.

### ReminderDateTime

**Type**
- dateTime

**Properties**
- Create, Filter, Nillable, Sort, Update

**Description**
Represents the time when the reminder is scheduled to fire, if IsReminderSet is set to true. If IsReminderSet is set to false, then the user may have deselected the reminder checkbox in the Salesforce user interface, or the reminder has already fired at the time indicated by the value.

### Status

**Type**
- picklist

**Properties**
- Create, Defaulted on create, Filter, Group, Sort, Update

**Description**
Required. The status of the task, such as In Progress or Completed. Each predefined Status field implies a value for the IsClosed flag. To obtain picklist values, query the TaskStatus object.

**Note:** This field can't be updated for recurring tasks (IsRecurrence is true).

### Subject

**Type**
- combobox

**Properties**
- Create, Filter, Nillable, Sort, Update

**Description**
The subject line of the task, such as “Call” or “Send Quote.” Limit: 255 characters.

### TaskSubtype

**Type**
- picklist

**Properties**
- Create, Filter, Group, Nillable, Restricted picklist, Sort

**Description**
Provides standard subtypes to facilitate creating and searching for specific task subtypes. This field isn’t updateable.

**TaskSubtype values:**
- Task
- Email
- List Email
- Cadence
- Call
<table>

Field | Field Type
--- | ---
Description | The WhoId represents a human such as a lead or a contact. WhoIds are polymorphic. Polymorphic means a WhoId is equivalent to a contact’s ID or a lead’s ID. The label is Name ID.

If Shared Activities is enabled, the value of this field is the ID of the related lead or primary contact. If you add, update, or remove the WhoId field, you might encounter problems with triggers, workflows, and data validation rules that are associated with the record. The label is Name ID.

Beginning in API version 37.0, if the contact or lead ID in the WhoId field is not in the TaskWhoIds list, no error occurs and the ID is added to the TaskWhoIds as the primary WhoId. If WhoId is set to null, an arbitrary ID from the existing TaskWhoIds list is promoted to the primary position.

This is a polymorphic relationship field.

Relationship Type | Lookup
Refers To | Contact, Lead

Usage

Recurring Tasks

- Recurring tasks are available in API version 16.0 and later.
- After a task is created, it can’t be changed from recurring to nonrecurring or vice versa.
- When a user creates a series of recurring tasks, Salesforce creates a main record and subsequent occurrences. For the main record, IsRecurrence is set to true and other fields that define the recurrence pattern are populated. The ID of the main record of the recurring task is saved in the subsequent occurrences, in the RecurrenceActivityId field.
- When you delete a recurring task series through the API, all open and closed task occurrences in the series are removed. However, when you delete a recurring task series through the user interface, only open tasks occurrences (IsClosed is false) in the series are removed.
- If IsRecurrence is true, then RecurrenceStartDateOnly, RecurrenceEndDateOnly, RecurrenceType, and any properties associated with the given recurrence type (see the following table) must be populated.
- When you change the RecurrenceStartDateOnly field or the recurrence pattern, all open tasks occurrences in the series are deleted and new open task occurrences are created based on the new recurrence pattern. The following fields determine the recurrence pattern: RecurrenceType, RecurrenceTimeZoneSidKey, RecurrenceInterval, RecurrenceDayOfWeekMask, RecurrenceDayOfMonth, RecurrenceInstance, and RecurrenceMonthOfYear.
- When you change the value of RecurrenceEndDateOnly to an earlier date (for example, from January 20th to January 10th), all open task occurrences in the series with the ActivityDate value greater than the new end date value are deleted. Other open and closed task occurrences in the series are not affected.
When you change the value of `RecurrenceEndDateOnly` to a later date (for example, from January 10th to January 20th), new task occurrences are created up to the new end date. Existing open and closed tasks in the series are not affected.

This table describes the usage of recurrence fields for Salesforce Classic recurring events. Each recurrence type must have all of its properties set. All unused properties must be set to null.

<table>

<td></td>
</tr>
</tbody>
</table>

**JunctionIdList**

The `JunctionIdList` field is now implemented in the Event and Task objects. With a single API call, it’s easy to create many-to-many relationships between the Event or Task object with contacts, leads, or users.

To create a Task with related Contacts without `JunctionIdList`, you first have to create the task, then use the returned task ID to create the `TaskRelation` records. If the `TaskRelation` save call fails, error handling is your responsibility because the task has already been committed to the database.

```java
public void createTasksOld(Contact[] contacts) {
    Task task = new Task();
    task.setSubject("New Task");
    SaveResult[] results = null;
    try {
        results = connection.create(new Task[] { task });
        if (results[0].isSuccess()) {
            TaskRelation[] relations = new TaskRelation[contacts.size()];
            for (int i = 0; i < contacts.length; i++) {
                relations[i] = new TaskRelation();
                relations[i].setTaskId(results[0].getId());
                relations[i].setRelationId(contacts[i].getId());
            }
            results = connection.create(relations);
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```
To create a task using JunctionIdList, IDs are pulled from the related contacts and both the task and the TaskRelation records are created in one API call. If the TaskRelation fails, the task is rolled back because it’s all done in a single API call.

```java
public void createTaskNew(Contact[] contacts) {
    String[] contactIds = new String[contacts.size()];
    for (int i = 0; i < contacts.size(); i++) {
        contactIds[i] = contacts[i].getID();
    }
    Task task = new Task();
    task.setSubject("New Task");
    task.setTaskWhoIds(contactIds);
    SaveResult[] results = null;
    try {
        results = connection.create(new Task[] { task });
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

**Associated Objects**

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **TaskChangeEvent (API version 44.0)**
  Change events are available for the object.

- **TaskFeed (API version 20.0)**
  Feed tracking is available for the object.

**SEE ALSO:**
- **Object Basics**

**TaskPriority**

Represents the importance or urgency of a Task, such as High, Normal, or Low.

**Supported Calls**

describeSObjects(), query(), retrieve()

**Special Access Rules**

Customer and Partner Portal users can’t access this object.

</tr>
</tbody>
</table>
Usage

This object represents a value in the task priority picklist. The task priority picklist provides additional information about the importance of a Task, such as whether a given priority value represents a high priority. Your client application can query on this object to retrieve the set of values in the task priority picklist, and then use that information while processing Task objects to determine more information about a given task. For example, the application could test whether a given Task is high priority based on its Priority value and the value of the IsHighPriority in the associated TaskPriority object.

SEE ALSO:
Object Basics

TaskRelation

Represents the relationship between a task and a lead, contacts, and other objects related to the task. If Shared Activities is enabled, this object doesn’t support triggers, workflow, or data validation rules. This object is available in API version 24.0 and later.

TaskRelation is only available if you’ve enabled Shared Activities in your organization.

TaskRelation allows the following relationships:
- A task can be related to one lead or up to 50 contacts.
- A task can also be related to one account, asset, campaign, case, contract, opportunity, product, solution, or custom object.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), queryAll(), retrieve()

## Field Name | Details
--- | ---
**Description**<br>Indicates whether a task has been deleted; label is **Deleted**. When a TaskRelation record is deleted, it isn't moved to the Recycle Bin and can't be undeleted, unless the record was cascade-deleted when the parent object was deleted. Don't use the `IsDeleted` field to detect deleted records in SOQL queries or `queryAll()` calls on directly deleted relation records. Instead, use the call `getDeleted()`.<br><br>**IsWhat**<br>Type<br>boolean<br>Properties<br>Create, Defaulted on create, Filter, Group, Sort<br>Description<br>Indicates whether the relation is an Account, Opportunity, Campaign, Case, other standard object, or a custom object. Value is **false** if `RelationId` is a contact or lead and **true** otherwise.<br><br>**RelationId**<br>Type<br>reference<br>Properties<br>Create, Filter, Group, Sort<br>Description<br>Indicates the `WhatId` or `WhoId` in the relationship. For more information, see `Task`. For information on IDs, see ID Field Type.<br><br>**TaskId**<br>Type<br>reference<br>Properties<br>Create, Filter, Group, Sort<br>Description<br>Represents the ID of the associated Task. For information on IDs, see ID Field Type.

### Usage

See contacts associated with a task

```java
public void queryWhosOfTaskSample() {
    String soqlQuery = "SELECT Id, Subject, (SELECT RelationId, Relation.Name, IsWhat from TaskRelations WHERE isWhat = false) FROM Task WHERE Id = '00T x00000050KEN'";
    QueryResult qResult = null;
    try {
        // Code...
    } catch (...) {
        // Error handling...
    }
}
```
```java
qResult = connection.query(soqlQuery);
TaskRelation relation1 = (TaskRelation)qResult.getRecords()[0].getTaskRelations().getRecords()[0];
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
```

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**TaskRelationChangeEvent** (API version 44.0)

Change events are available for the object.

SEE ALSO:

- Task
- TaskWhoRelation

### TaskStatus

Represents the status of a Task, such as Not Started, Completed, or Closed.

### Supported Calls

describeSObjects(), query(), retrieve()

### Special Access Rules

Customer Portal users can’t access this object.

### Fields

<table>
<thead>
<tr>
<th>Field</th>

</tbody>
</table>
### Field Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Defaulted on create, Filter, Group, Sort</td>
<td>Indicates whether this task status value represents a closed Task (true) or not (false). Multiple task status values can represent a closed Task.</td>
</tr>
<tr>
<td><strong>IsDefault</strong></td>
<td>Type: boolean</td>
<td>Indicates whether this is the default task status value (true) or not (false) in the picklist.</td>
</tr>
<tr>
<td><strong>MasterLabel</strong></td>
<td>Type: string</td>
<td>Master label for this task status value. This display value is the internal label that does not get translated. Limit: 255 characters.</td>
</tr>
<tr>
<td><strong>SortOrder</strong></td>
<td>Type: int</td>
<td>Number used to sort this value in the task status picklist. These numbers are not guaranteed to be sequential, as some previous task status values might have been deleted.</td>
</tr>
</tbody>
</table>

### Usage

This object represents a value in the task status picklist. The task status picklist provides additional information about the status of a Task, such as whether a given status value represents an open or closed task. Your client application can query this object to retrieve the set of values in the task status picklist, and then use that information while processing Task records to determine more information about a given task. For example, the application could test whether a given task is open or closed based on the Task Status value and the value of the IsClosed property in the associated TaskStatus record.

**SEE ALSO:**
- [Object Basics](3213)
## TaskTag

Associates a word or short phrase with a Task.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| ItemId             | Type: reference
|                    | Properties: Create, Filter
|                    | Description: ID of the tagged item. |
| Name               | Type: string
|                    | Properties: Create, Filter
|                    | Description: Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically. |
| TagDefinitionId    | Type: reference
|                    | Properties: Filter
|                    | Description: ID of the parent TagDefinition object that owns the tag. |
| Type               | Type: picklist
|                    | Properties: Create, Filter, Restricted picklist
|                    | Description: Defines the visibility of a tag. Valid values:  
|                    | - Public—The tag can be viewed and manipulated by all users in an organization. |
Details

- **Personal**—The tag can be viewed or manipulated only by a user with a matching OwnerId.

Usage

TaskTag stores the relationship between its parent TagDefinition and the Task being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

TaskWhoRelation

Represents the relationship between a task and a lead or contacts. This object is available in API version 29.0 and later.

This derived object is a filtered version of the TaskRelation on page 3210 object; that is, IsParent is `true` and IsWhat is `false`. It doesn't represent relationships to accounts, opportunities, or other objects.

TaskWhoRelation allows a variable number of relationships: one lead or up to 50 contacts. Available only if you've enabled Shared Activities for your organization.

Supported Calls

describeSObjects(), query(), retrieve()

Fields

<table>

</tbody>
</table>

### Usage

**Apex example that queries contacts associated with a task**

```apex
public void queryWhosOfTaskSample() {
    String soqlQuery = "SELECT Id, Subject, (SELECT RelationId, Relation.Name, IsWhat from TaskWhoRelations) FROM Task WHERE Id = '00Tx0000005OKEN'";
    QueryResult qResult = null;
    try {
        qResult = connection.query(soqlQuery);
        TaskWhoRelation relation1 = (TaskWhoRelation)qResult.getRecords()[0].getTaskWhoRelations().getRecords()[0];
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

### SEE ALSO:

- TaskRelation

### TenantSecret

This object stores an encrypted organization-specific key fragment that is used with the master secret to produce organization-specific data encryption keys. This object is available in API version 34.0 and later.

**[other]**: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

You can rotate tenant secrets of the `Data` type once every four hours in a sandbox org or every 24 hours in production orgs. You can rotate tenant secrets of the `SearchIndex` type once every seven days.

**Note:** This information is about Shield Platform Encryption and not Classic Encryption.

### Supported Calls

- `create()`, `query()`, `retrieve()`, `update()`
## Fields

</tr>
</tbody>
</table>

### Version

**Type**

`int`

**Properties**

Filter, Group, idLookup, Sort

**Description**

The version number of this secret. The version number is unique within your org.

---

### Usage

Use this object to create or update an org-specific tenant secret or customer-supplied key material.

**Example 1:** Build an automated tenant secret creation and activation solution similar to the following.

1. Start by creating an Apex class to create the tenant secret. Specify the value of the tenant secret to encrypt data of a particular type.

   ```apex
global class CreateNewSecret implements Schedulable {
    global void execute(SchedulableContext SC) {
        TenantSecret secret = new TenantSecret();
        secret.description = 'Created new secret from scheduled job';
        secret.type = 'SearchIndex';
        insert secret;
    }
}
```

   **Note:** Type is available in API version 39.0 and later. Type is optional; all tenant secrets default to the Data type.

2. Schedule the Apex class to run at the specified interval.

   This Apex code only needs to be run a single time to schedule the job. This code runs the job every 90 days.

   ```apex
   CreateNewSecret secret = new CreateNewSecret();
   String schedule = '0 0 0 1 JAN,APR,JUL,OCT ?';
   String jobID = system.schedule('Automated secret creation and activation', schedule, secret);
   ```

3. Validate that the job is scheduled.

4. Validate that tenant secrets are created after the job is run.

**Example 2:** Upload a customer-supplied tenant secret or customer-supplied data encryption key.

1. Create a certificate that's compatible with customer-supplied key material. See Generate a BYOK- Compatible Certificate in Salesforce Help.
2. Then upload your matching key material and key material hash. Include the unique name of the compatible certificate. The key material is uploaded in encrypted form.

```java
TenantSecret secret = new TenantSecret();
secret.description = 'New uploaded secret';
secret.type = 'Data';
secret.SecretValue = EncodingUtil.base64Decode('...');
secret.SecretValueCertificate = ...
secret.SecretValueHash = EncodingUtil.base64Decode('...');
insert secret;
```

You can use this script to generate a customer-supplied tenant secret and tenant secret hash.

3. Validate that the key material is uploaded.

**Example 3:** Opt out of key derivation on a key-by-key basis when you upload key material. When you upload your key material, specify 'Source':Uploaded and 'KeyDerivationMode':NONE, and set non-null values for the SecretValueCertificate, SecretValue, and SecretValueHash.

**Example 4:** Import a tenant secret of the Data type.

```java
TenantSecret secret = [SELECT Id FROM TenantSecret WHERE Type = 'Data' AND Version = 2];
secret.SecretValue = "<previously_exported_secret_as_a_String>";
update secret;
```

**Example 5:** Export a tenant secret by writing the secret.SecretValue to a file. Here's an example that uses a tenant secret of the SearchIndex type.

```java
TenantSecret secret = [SELECT SecretValue FROM TenantSecret WHERE Type = 'TenantSecret' AND Version = 2];
secret.SecretValue = ...
update secret;
```

**Example 6:** Destroy a tenant secret of the Data type.

⚠️ **Warning:** Your tenant secret is unique to your organization and to the specific data to which it applies. When you destroy a tenant secret, related data isn’t accessible unless you previously exported the key and then import the key back into Salesforce.

```java
TenantSecret secret = [SELECT Id FROM TenantSecret WHERE Type = 'Data' AND Version = 2];
secret.SecretValue = NULL;
secret.Status = Destroyed;
update secret;
```

**Example 7:** Change the Status of a tenant secret from Archived to Destroyed. Include the SecretValue and new tenant secret Status.

```java
TenantSecret secret = [SELECT Id FROM TenantSecret WHERE Type = 'Data' AND Version = 2];
secret.Status = Destroyed;
update secret;
```

Cache-Only Key Service customers can change the Status of cache-only key tenant secrets. For example, reactivate a cache-only key by changing its Status from Destroyed to Active.

**Example 8:** Create a callout connection that fetches a cache-only key tenant secret from a key service outside of Salesforce.

1. Make sure that your org has at least one active Data in Salesforce key, either Salesforce-generated or customer-supplied. Then turn on Allow Cache-Only Keys with BYOK from the Advanced Settings page in Setup.
2. Create a certificate that’s compatible with customer-supplied key material. See Generate a BYOK-Compatible Certificate in Salesforce Help.

3. Create and assemble your key material.

4. Create a named credential to serve as your authenticated callout mechanism. You can define your named credential through Setup or directly with Apex. Specify a BYOK-compatible certificate and an HTTPS endpoint.

5. Configure the connection to your remote key service. This connection uses named credential and its associated certificate to fetch a specified cache-only key tenant secret.

```python
remote_params = { 'Source': 'Remote',
    'RemoteKeyId': ..., 
    'RemoteKeyServiceId': ...,
    'RemoteKeyCertificate': ...}

sf.TenantSecret.create(remote_params)
```

</table>

3224
**Details**

**Description**
The set of features about the API activity that triggered this anomaly event. See the Threat Detection documentation for the list of possible features. Let's say, for example, that a user typically downloads 10 accounts but then they deviate from that pattern and download 1,000 accounts. This event is triggered and the contributing features are captured in this field. Potential features include row count, column count, average row size, the day of week, and the browser's user agent used for the report activity. The data captured in this field also shows how much a particular feature contributed to this anomaly event being triggered, represented as a percentage. The data is in JSON format.

**Summary**

| Field | Type       | Properties
|-------|------------|-------------

### DetailsField

**Properties**
- Nillable

**Description**
UserAgent used in HTTP request, post-processed by the server.

### UserIdentifier

**Type**
- string

**Properties**
- Filter, Group, Nillable, Sort

**Description**
The origin user's unique ID. For example, 00500000000123.

### Username

**Type**
- string

**Properties**
- Filter, Group, idLookup, Nillable, Sort

**Description**
The origin username in the format of user@company.com at the time the event was created.

---

### TenantSecurityConnectedApp

Stores the details for a connected app that was added to or removed from a Security Center tenant. This object is available in API version 53.0 and later.

#### Supported Calls

- `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

#### Fields

<table>

</table>
### TenantSecurityCredentialStuffing

Tracks when a user successfully logs into Salesforce during an identified credential stuffing attack. Credential stuffing refers to large-scale automated login requests using stolen user credentials. This object stores information about Threat Detection events within connected tenants in Security Center. This object is available in API version 53.0 and later.

#### Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()
# Fields

<td><strong>Type</strong> textarea                                                                                      <strong>Properties</strong> Nillable <strong>Description</strong> The set of features about the report activity that triggered this anomaly event. See the Threat Detection documentation for the list of possible features. Let’s say, for example, that a user typically downloads 10 accounts but then they deviate from that pattern and download 1,000 accounts. This event is triggered and the contributing features are captured in this field. Potential features include row count, column count, average row size, the day of week, and the browser’s user agent used for the report activity. The data captured in this field also shows how much a particular feature contributed to this anomaly event being triggered, represented as a percentage. The data is in JSON format.</td>
</tr>
</tbody>
</table>
### TenantSecuritySessionHijacking

Tracks when unauthorized users gain ownership of a Salesforce user’s session with a stolen session identifier. To detect such an event, Salesforce evaluates how significantly a user’s current browser fingerprint diverges from the previously known fingerprint using a probabilistically inferred significance of change. This object stores information about Threat Detection events within connected tenants in Security Center. This object is available in API version 53.0 and later.

DetailsField and PreviousIp) to view the before and after data for the five most interesting browser features that contributed to this anomaly. See the SecurityEventData field for all contributing features in JSON format. Salesforce detects session hijacking by comparing browser fingerprints in a given user session and evaluating how significantly a newly observed fingerprint deviates from the existing one. A large deviation score (6.0 or more) between two intra-session fingerprints indicates that two different browsers are active in the same session. The presence of two active browsers usually means that session hijacking has occurred.

**Field**

**UserEmail**

- **Type**: string
- **Properties**: Filter, Group, idLookup, Nillable, Sort
- **Description**: The email address of the user.

**UserLicense**

- **Type**: string
- **Properties**: Filter, Group, idLookup, Nillable, Sort
- **Description**: The license assigned to the user.

**Username**

- **Type**: string
- **Properties**: Filter, Group, idLookup, Nillable, Sort
- **Description**: The org username of the relevant user.

---

## Territory

 Represents a flexible collection of accounts and users where the users have at least read access to the accounts, regardless of who owns the accounts. Only available if territory management has been enabled for your organization.

**Note**: The original territory management feature is now unavailable. For more information, see [The Original Territory Management Module Will Be Retired in the Summer ’21 Release](#). The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

### Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

### Special Access Rules

As of Spring ’20 and later, only standard and partner users can access this object, and only users with the Manage Territories permission can edit this object.
# Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| AccountAccessLevel | **Type**  
picklist  
**Properties**  
Create, Filter, Group, Sort, Update  
**Description**  
Account access level granted to users assigned to this territory. |
| CaseAccessLevel | **Type**  
picklist  
**Properties**  
Create, Filter, Nillable, Group, Sort, Update  
**Description**  
Case access level granted to users assigned to this territory. |
| ContactAccessLevel | **Type**  
picklist  
**Properties**  
Filter, Group, Nillable, Sort  
**Description**  
A value that represents the type of access granted to the target Group, UserRole, or User for any associated contacts. The possible values are:  
- None  
- Read  
- Edit  
  **Note:** When `DefaultContactAccess` is set to “Controlled by Parent,” you can’t create or update this field. |
| Description | **Type**  
string  
**Properties**  
Create, Filter, Nillable, Sort, Update  
**Description**  
A description of the territory that is 1,000 characters or less. |
| DeveloperName | **Type**  
string  
**Properties**  
Create, Defaulted on create, Filter, Group, Sort, Update |
### Field: Details

**Description**

The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization. Corresponds to **Territory Name** in the user interface.

This field is available in API version 24.0 and later.

- **Note:** When creating large sets of data, always specify a unique **DeveloperName** for each record. If no **DeveloperName** is specified, performance slows down while Salesforce generates one for each record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **ForecastUserId**     | **Type**: reference  
**Properties**: Create, Filter, Group, Nillable, Sort, Update  
**Description**: ID of the Forecast Manager, who is the user to whom forecasts from this territory’s child territories roll up. |
| **MayForecastManagerShare** | **Type**: boolean  
**Properties**: Create, Defaulted on create, Filter, Group, Sort, Update  
**Description**: Indicates whether the forecast manager can manually share their own forecast. |
| **Name**               | **Type**: string  
**Properties**: Create, Filter, Group, Sort, Update  
**Description**: A name for the territory. Limit is 80 characters. Corresponds to **Label** on the user interface. |
| **OpportunityAccessLevel** | **Type**: picklist  
**Properties**: Create, Filter, Group, Sort, Update  
**Description**: Opportunity access level granted to users assigned to this territory. |
### Field Details

</tr>
<tr>
<td></td>
<td><strong>Properties</strong>&lt;br&gt;Create, Defaulted on create, Filter, Update</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong>&lt;br&gt;Indicates whether the opportunities associated with this territory are kept within the bounds of this territory and this territory's children when account assignment rules are run (<strong>true</strong>), or if opportunities associated with this territory can be assigned to other nodes of the territory hierarchy when account assignment rules are run (<strong>false</strong>). Label is <strong>Confine Opportunity Assignment</strong>.</td>
</tr>
</tbody>
</table>

### Usage

Use the Territory object to query your organization's territory hierarchy. Use it to obtain valid territory IDs when querying or modifying records associated with territories.

SEE ALSO:  
- AccountTerritoryAssignmentRule  
- AccountTerritoryAssignmentRuleItem  
- UserTerritory

### Territory2

Represents a sales territory. Available only if Enterprise Territory Management has been enabled for your organization.

### Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Special Access Rules

As of Summer '20 and later, only standard and partner users can access this object. If a territory model is in **Active** state, any standard or partner user can view that model, including its territories and assignment rules. For territories in an active model, any standard or
partner user can view assigned records and assigned users subject to your org’s sharing settings. Users cannot view territory models in other states (such as Planning or Archived).

Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**

The state of the territory model. Values are: Planning, Activating, Activation Failed, Active, Archiving, Archiving Failed, Archived, Deleting, and Deletion Failed.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**Territory2ModelFeed**

Feed tracking is available for the object.
### Territory2ModelHistory

History is available for tracked fields of the object.

**Territory2ModelHistory**

Represents the history of changes to the values in the fields on a territory model. Available only if Enterprise Territory Management has been enabled for your organization.

### Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See [Enable delete of Field History and Field History Archive](#).

### Territory2Type

Represents a category for territories (Territory2). Every Territory2 must have a Territory2Type. Available only if Enterprise Territory Management has been enabled for your organization.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

### Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Special Access Rules

As of Summer ’20 and later, only standard and partner users can access this object.

with the same territory type (and therefore the same priority) assigned to the account, no territory is assigned to the opportunity.

TestSuiteMembership

Associates an Apex class with an ApexTestSuite. This object is available in API version 36.0 and later.

Supported Calls

create(), delete(), describesSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

The `enableApexTestReqViewSetup` field on the ApexSettings metadata type controls the activation of the critical update “Require View Setup permission to access Apex test data”. In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

### ThirdPartyAccountLink

Represents the list of external users who authenticated using an authentication provider. This object is available in API version 32.0 and later.

A list of third-party account links is generated when users of an organization authenticate using an external authentication provider. Use this object to list and revoke a given user’s social sign-on connections (such as Facebook®).

### Supported Calls

describeSObjects(), query()

Usage

Admins (with the Manage Users permission) querying this object can see all the links for all users in the organization. Without the Manage Users permission, users can only retrieve their own links. Users sometimes don't have access to the SsoProvider value (the foreign key). In this case, use the SsoProviderName to render the name of the provider for the associated link.

Use the Apex method Auth.AuthToken.revokeAccess() to revoke a link.

To make the ThirdPartyAccountLink standard object writable for Salesforce admins, contact Salesforce Customer Support. With this feature, you can easily add or delete third-party account links using the API, but you can’t update existing account links.

In API version 34.0 and later, this object was enhanced to help manage high instance counts. A query() call returns up to 500 rows. A queryMore() call returns 500 more, up to 2500 total. No more records are returned after 2500. To make sure that you don’t miss any records, issue a COUNT() query in a SELECT clause for ThirdPartyAccountLink. This query gives you the total number of records. If there are more than 2500 records, divide your query by filtering on fields, like UserId, to return subsets of less than 2500 records.

ThreatDetectionFeedback

Represents feedback provided by a user about a Threat Detection event that occurred in your org. The feedback specifies whether the event was malicious, suspicious, not a threat, or unknown. Each ThreatDetectionFeedback object is associated with one of these Threat Detection storage events: CredentialStuffingEventStore, ReportAnomalyEventStore, or SessionHijackingEventStore. This object is available in API version 49.0 and later.

Supported Calls

create(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), update(), upsert()

### Associated Object

This object has the following associated object. It’s available in the same API version as this object.

**ThreatDetectionFeedbackFeed**

Feed tracking is available for the object.

SEE ALSO:

*Salesforce Help: Threat Detection*

### TimeSheet

Represents a schedule of a service resource’s time in field service. This object is available in API v47.0 and later.

Time sheets are composed of time sheet entries, which typically track individual tasks like travel or asset repair.

#### Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`
**Special Access Rules**
Field Service must be enabled.

### Field Name

**Details**

**Description**
An auto-generated number identifying the time sheet.

---

**TotalDurationInHours**

**Type**
double

**Properties**
Filter, Nillable, Sort

**Description**
Represents the sum total of the duration field of all the time sheet entries related to the time sheet object in hours.

---

**TotalDurationInMinutes**

**Type**
int

**Properties**
Filter, Group, Nillable, Sort

**Description**
Represents the sum total of the duration field of all the time sheet entries related to the time sheet object in minutes.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **TimeSheetChangeEvent** *(API version 48.0)*
  Change events are available for the object.

- **TimeSheetFeed**
  Feed tracking is available for the object.

- **TimeSheetHistory**
  History is available for tracked fields of the object.

- **TimeSheetOwnerSharingRule**
  Sharing rules are available for the object.

- **TimeSheetShare**
  Sharing is available for the object.

### TimeSheetEntry

Represents a span of time that a service resource spends on a field service task. This object is available in API version 47.0 and later. Time sheets are composed of time sheet entries. Time sheet entries typically track individual tasks like travel or asset repair.
Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

Field Service must be enabled.

Subject

**Type**
string

**Properties**
Create, Filter, Group, Nillable, Sort, Update

**Description**
Activity performed; for example, repair, lunch, or travel.

TimeSheetEntryNumber

**Type**
string

**Properties**
Autonumber, Defaulted on create, Filter, Sort

**Description**
An auto-generated number identifying the time sheet entry.

TimeSheetId

**Type**
reference

**Properties**
Create, Filter, Group, Sort

**Description**
The time sheet associated with the time sheet entry.

Type

**Type**
picklist

**Properties**
Create, Defaulted on create, Filter, Group, Nillable, Sort, Update

**Description**
The type of work performed. The picklist includes the following values, which can be customized:

• Direct
• Indirect

WorkOrderId

**Type**
reference

**Properties**
Create, Filter, Group, Nillable, Sort, Update
Details

Field Name | Details
---|---
Description | The work order related to the time sheet entry. Work orders are searchable by their content.

WorkOrderLineItemId

| Type | reference
Properties | Create, Filter, Group, Nillable, Sort, Update
Description | The work order line item related to the time sheet entry. Work order line items are searchable by their content.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**TimeSheetEntryChangeEvent (API version 48.0)**
Change events are available for the object.

**TimeSheetEntryFeed**
Feed tracking is available for the object.

**TimeSheetEntryHistory**
History is available for tracked fields of the object.

**TimeSlot**

Represents a period of time on a specified day of the week during which field service work can be performed in Field Service and Lightning Scheduler. Operating hours consist of one or more time slots. This object is available in API version 38.0 and later.

**Supported Calls**
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

**Fields**

| Field Name | Details |
---|---
DayOfWeek | |
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>The day of the week when the time slot takes place.</td>
</tr>
<tr>
<td><strong>EndTime</strong></td>

</tbody>
</table>
### Field Name | Details
--- | ---
| | This is a relationship field.

**Relationship Name**
- OperatingHours

**Relationship Type**
- Lookup

**Refers To**
- OperatingHours

#### StartTime

**Type**
- time

**Properties**
- Create, Filter, Sort, Update

**Description**
The time when the time slot starts.

#### TimeSlotNumber

**Type**
- string

**Properties**
- Autonumber, Defaulted on create, Filter, idLookup, Sort

**Description**
The name of the time slot. The name is auto-populated to a day and time format—for example, Monday 9:00 AM - 10:00 PM—but you can manually update it if you wish.

#### Type

**Type**
- picklist

**Properties**
- Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update

**Description**
The type of time slot. Possible values are *Normal* and *Extended*. You may choose to use *Extended* to represent overtime shifts.

#### WorkTypeGroupId

**Type**
- reference

**Properties**
- Create, Filter, Group, Nillable, Sort, Update

**Description**
Work type group assigned to the time slot. Available in API version 47.0 and later.

This is a relationship field.

**Relationship Name**
- WorkTypeGroup
Operating hours are composed of time slots, which indicate the hours of operation for a particular day. After you create operating hours, create time slots for each day. For example, if the operating hours should be 8 AM to 5 PM Monday through Friday, create five time slots, one per day. To reflect breaks such as lunch hours, create multiple time slots in a day: for example, Monday 8:00 AM – 12:00 PM and Monday 1:00 PM – 5:00 PM.

Tip: Time slots don’t come with any built-in rules, but you can create Apex triggers that limit time slot settings in your org. For example, you may want to restrict the start and end times on time slots to half-hour increments, or to prohibit end times later than 8 PM.

**TimeSlotHistory**

Represents the history of changes made to tracked fields on a time slot. This object is available in API version 38.0 and later.

**Supported Calls**

getDeleted(), getUpdated(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

**Special Access Rules**

Field Service must be enabled in your organization, and field tracking for time slot fields must be configured.

**Fields**

<table>

<td><strong>Description</strong></td>
<td>Description of the topic.</td>
</tr>
</tbody>
</table>
### Field Name: ManagedTopicType

**Details**

- **Type:** string

- **Properties:** Filter, Group, Nillable, Sort

- **Description:**
  - Type of managed topic. Values are:
    - Content
    - Featured
    - Navigational
  - This field is available in API version 44.0 and later.

### Field Name: Name

- **Type:** string

- **Properties:** Create, Filter, Group, idLookup, Sort, Update

- **Note:** You can change only the spacing and capitalization of a topic name with the update property.

- **Description:**
  - Name of the topic.

### Field Name: NetworkId

- **Type:** reference

- **Properties:** Create, Filter, Nillable, Sort

- **Description:**
  - Identifier of the Experience Cloud site to which the topic belongs. This field is available only if digital experiences is enabled in your org.

### Field Name: TalkingAbout

- **Type:** int

- **Properties:** Filter, Group, Sort

- **Description:**
  - Number of people talking about the topic over the last two months, based on factors such as topic additions and comments on posts with the topic.

### Usage

Use this object to query a specific topic or to get a list of all topics, even those used solely in private groups and on records, and the number of people talking about them.
Use this object to create, edit, or delete topics. To create a topic, you must have the Create Topics permission. To edit a topic, you must have the Edit Topics permission. To delete a topic, you must have the Delete Topics or Modify All Data permission.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**TopicFeed (API version 29.0)**

Feed tracking is available for the object.

**TopicAssignment**

Represents the assignment of a topic to a specific feed item, record, or file. This object is available in API version 28.0 and later.

Administrators must enable topics for objects before users can add topics to records of that object type. Topics for most objects are available in API version 30.0 and later. Topics for ContentDocument are available in API version 37.0 and later.

Supported Calls

- `create()`,
- `describeSObjects()`,
- `delete()`,
- `getDeleted()`,
- `getUpdate()`,
- `query()`,
- `retrieve()`

</tr>
<tr>
<td></td>
<td><strong>Description</strong> Identifier of the topic. This is a relationship field.</td>
</tr>
<tr>
<td></td>
<td><strong>Relationship Name</strong> Topic</td>
</tr>
</tbody>
</table>
Usage

Use this object to query the assignments of topics to feed items, records, or files. To assign or remove topics, you must have the "Assign Topics" permission.

In SOQL SELECT syntax, this object supports nested semi-joins, allowing queries on Knowledge articles assigned to specific topics. For example:

```sql
SELECT parentId FROM KnowledgeArticleViewStat
WHERE parentId in (SELECT KnowledgeArticleId FROM KnowledgeArticleVersion
WHERE publishStatus = 'Online' AND language = 'en_US'
AND Id in (select EntityId from TopicAssignment where TopicId = '0T0xx0000000xxx'))
```

No SOQL limit if logged-in user has "View All Data" permission. If not, do one of the following:

- Specify a LIMIT clause of 1,100 records or fewer.
- Filter on `Id` or `Entity` when using a WHERE clause with "=".

SEE ALSO:

- Topic
- FeedItem

TopicLocalization

Represents the translated version of a topic name. Topic localization applies only to navigational and featured topics in Experience Cloud sites. This object is available in API version 33.0 and later.

Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Users with the Translation Workbench enabled can view topic translations, but the Customize Application, Manage Translation, or Manage Categories permission is required to create or update them.
# Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| Language   | **Type** picklist  
**Properties** Create, Filter, Group, Restricted picklist, Sort  
**Description** The combined language and locale ISO code, which controls the language for labels displayed in an application. (The values in this field are not related to the default locale selection.)  
This picklist contains the following fully-supported languages:  
- Chinese (Simplified): zh_CN  
- Chinese (Traditional): zh_TW  
- Danish: da  
- Dutch: nl_NL  
- English: en_US  
- Finnish: fi  
- French: fr

- Italian: it  
- Japanese: ja  
- Korean: ko  
- Norwegian: no  
- Portuguese (Brazil): pt_BR  
- Russian: ru  
- Spanish: es  
- Spanish (Mexico): es_MX  Spanish (Mexico) defaults to Spanish for customer-defined translations.  
- Swedish: sv  
- Thai: th  The Salesforce user interface is fully translated to Thai, but Help is in English.  
The following end-user only languages are available:  
- Arabic: ar  
- Bulgarian: bg  
- Croatian: hr  
- Czech: cs  
- English (UK): en_GB  
- Greek: el  
- Hebrew: iw |
The following platform languages are available for organizations that use Salesforce exclusively as a platform.

### NamespacePrefix

**Type**

string

**Properties**

Filter, Group, Nillable, Sort

**Description**

The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.
- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

### ParentId

**Type**

reference
**TopicUserEvent**

Represents an action (such as comment, post, like, or share) made by a user on a topic. This object is available in API version 42.0 and later.

**Supported Calls**

del**ete**, undecided**eSObjects**, *query**, *retrieve**

**Special Access Rules**

Only users with the Modify All Data permission can view and delete these data.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>

</tr>
</tbody>
</table>

#### NetworkId

**Type**  
reference

**Properties**  
Filter, Group, Nillable, Sort

**Description**  
ID of the Experience Cloud site where the action was performed.

#### TopicId

**Type**  
reference

**Properties**  
Filter, Group, Sort

**Description**  
Identifier of the topic.

#### UserId

**Type**  
reference

**Properties**  
Filter, Group, Sort

**Description**  
Unique Salesforce user ID.

### Usage

Use the TopicUserEvent object to delete topic-related activities by Experience Cloud site users who would like all their topic-related activities to be removed from a site.

### TransactionSecurityPolicy

Represents a transaction security policy definition.
This object is available in API version 42.0 and later.

**Supported Calls**

create(), delete(), query(), retrieve(), update(), upsert()

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ActionConfig</strong></td>
<td><strong>Type</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong></td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Describes the action to take when the matching Transaction Security policy is triggered. Also indicates the type of notifications selected and the ID of the intended recipient. The recipient must be active and assigned the Modify All Data and View Setup user permissions. Multiple actions can be taken. The actions available depend on the Event Type field.</td>
</tr>
<tr>
<td><strong>ApexPolicyId</strong></td>
<td><strong>Type</strong></td>

<td>Represents the Apex TxnSecurity.PolicyCondition or TxnSecurity.EventCondition interface for this policy.</td>
</tr>
<tr>
<td><strong>BlockMessage</strong></td>
<td><strong>Type</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong></td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The custom message sent to a user when a policy blocks their action. Used in Real-Time Event Monitoring only. Maximum of 1000 characters. This field is null when the default message option is selected in the UI. Available only when EventName is set to ApiEvent, ListViewEvent, BulkApiResultEventStore, or ReportEvent. Available in API version 49.0 and later. Include org- or policy-specific information in your custom message, such as the name of the responsible administrator or the business unit. Be careful about what you include. Too much information on how the policy was designed can aid a malicious user. Two-factor authentication (2FA) isn’t supported in Lightning Experience, so events like ListView and ReportEvent are upgraded to Block in Lightning. Custom messages aren’t translatable.</td>
</tr>
<tr>

</table>
| **Description** | **Type**  
string  
**Properties**  
Create, Filter, Nillable, Sort, Update  
**Description**  
The description entered for this policy.  |
| **DeveloperName** | **Type**  
string  
**Properties**  
Create, Filter, Group, Sort, Update  
**Description**  
The API, or program name, for this policy.  
[Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.  |
| **EventName**   | **Type**  
picklist  
**Properties**  
Create, Filter, Group, Nillable, Restricted picklist, Sort, Update  
**Description**  
Used in Real-Time Event Monitoring only. Indicates the name of the event the policy monitors. Valid values are:  
- **ApiEvent**—Tracks these user-initiated read-only API calls: `query()`, `queryMore()`, and `count()`. Captures API requests through SOAP API, REST API, and Bulk API for the Enterprise and Partner WSDLs. Tooling API calls and API calls originating from a Salesforce mobile app aren’t captured.  
- **ApiAnomalyEventStore**—Tracks anomalies in how users make API calls. `ApiAnomalyEventStore` is an object that stores the event data of `ApiAnomalyEvent`. This object is available in API version 50.0 and later.  
- **BulkApiResultEventStore**—Tracks when a user downloads the results of a Bulk API request. `BulkApiResultEventStore` is a big object that stores the event data of `BulkApiResultEvent`. This object is available in API version 50.0 and later.  
- **CredentialStuffingEventStore**—Tracks when a user successfully logs into Salesforce during an identified credential stuffing attack. Credential stuffing refers to large-scale automated login requests using stolen user credentials. This value is available in API 49.0 and later.  
- **ListViewEvent**—Tracks when users access data with list views using Lightning Experience, Salesforce Classic, or the API. It doesn’t track list views of Setup entities.  
- **LoginEvent**—LoginEvent tracks the login activity of users who log in to Salesforce.  |
### Transaction Security Policy

#### Field Details

- **PermissionSetEventStore (pilot)**—Tracks changes to permission sets and permission set groups.
- **ReportAnomalyEventStore**—Tracks anomalies in how users run or export reports, including unsaved reports. This value is available in API 49.0 and later.
- **ReportEvent**—Tracks when reports are run in your org.
- **SessionHijackingEventStore**—Tracks when unauthorized users gain ownership of a Salesforce user's session with a stolen session identifier. To detect such an event, Salesforce evaluates how significantly a user's current browser fingerprint diverges from the previously known fingerprint using a probabilistically inferred significance of change. This value is available in API 49.0 and later.

#### Event Type

<table>
<thead>
<tr>
<th>Type</th>
<th>Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>picklist</td>
<td>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</td>
</tr>
</tbody>
</table>

**Description**

Used in Legacy Transaction Security only. Indicates the type of event the policy monitors. Valid values are:

- **AccessResource**—Notifies you when the selected resource has been accessed.
- **AuditTrail**—Reserved for future use.
- **DataExport**—Notifies you when any API query is made, such as from the Data Loader API client, or when a Report export occurs.
- **Entity**—Notifies you on use of an object type such as an authentication provider or chatter post.
- **Login**—Notifies you when a user logs in.

#### Execution UserID

<table>
<thead>
<tr>
<th>Type</th>
<th>Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Create, Filter, Group, Nillable, Sort, Update</td>
</tr>
</tbody>
</table>

**Description**

Used in Legacy Transaction Security only. The ID of an active user who is assigned the Modify All Data and View Setup user permissions.

#### MasterLabel

<table>
<thead>
<tr>
<th>Type</th>
<th>Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>Create, Filter, Group, Sort, Update</td>
</tr>
</tbody>
</table>

**Description**

The policy’s name.
### NamespacePrefix

**Type**
- string

**Properties**
- Filter, Group, Nillable, Sort

**Description**
The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values:

- In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.
- In organizations that are not Developer Edition organizations, `NamespacePrefix` is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.

### ResourceName

**Type**
- string

**Properties**
- Create, Filter, Group, Nillable, Sort, Update

**Description**
Used in Legacy Transaction Security only. A resource used to narrow down the conditions under which the policy triggers. For example, with a `DataExport` event, you can select a resource Lead to specifically monitor export activity occurring on your Lead entities. The resources available depend on the `EventType` field.

### State

**Type**
- picklist

**Properties**
- Create, Filter, Group, Restricted picklist, Sort, Update

**Description**
Indicates whether the policy is active. Valid values are:
- Disabled
- Enabled
The type of validation that the policy uses. The valid values are:

- **CustomApexPolicy**— Created with Apex editor.
- **CustomConditionBuilderPolicy**— Created with Condition Builder.

---

**Translation**

The Translation object represents the languages enabled for translation in your Salesforce org. This object is available in API version 47.0 and later.

**Supported Calls**

create(), describeSObjects(), query(), retrieve(), update(), upsert()

**Special Access Rules**

- Your organization must be using Enterprise, Performance, Unlimited, or Developer edition.
- To view this object, you must have the “View Setup and Configuration” permission.
- To use the create(), update(), and upsert() calls, Translation Workbench must be enabled in your org.
- To manage translations, Translation Workbench must be enabled in your org. Specify translators for each language through the Translation Language Settings Setup page.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CanManage</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>boolean</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Defaulted on create, Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Indicates whether the language is available for translation (true) or not (false). Specify translators for each language through the Translation Language Setup page.</td>
</tr>
<tr>
<td><strong>IsActive</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>boolean</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Defaulted on create, Filter, Group, Sort, Update</td>
</tr>
</tbody>
</table>
## TwoFactorInfo

Stores a user’s secret for multi-factor operations. Use this object when customizing multi-factor authentication in your organization. (Note that multi-factor authentication was formerly called two-factor authentication.) This object is available in API version 32.0 and later.

### Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

### Special Access Rules

You need the Manage Multi-Factor Authentication in API permission to create or update this object.

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SharedKey</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Group, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>This field is never read-enabled, though it is write-enabled. A request for this value always returns null. The value must be a base32-encoded string of a 20-byte secret.</td>
</tr>
</tbody>
</table>

SEE ALSO:

Supported Languages
You can use the Apex method `Auth.SessionManagement.getQrCode()` to get a value to write to this field.

**Note:** If you write a secret to this field, in API version 37.0 and later the user gets an email notification that a new identity verification method was added to the user’s account.

<table>

</tr>
</tbody>
</table>

**TwoFactorMethodsInfo**

Stores information about which identity verification methods a user has registered. This object is available in API version 37.0 and later.

**Supported Calls**

describeSObjects(), query()

**Special Access Rules**

You need the Manage Multi-Factor Authentication in API permission to access this object. (Note that multi-factor authentication was formerly called two-factor authentication.)

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>

</table>
TwoFactorTempCode

Stores information about a user’s temporary verification code for confirming their identity when logging in. This object is available in API version 37.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()

Special Access Rules

You need the Manage Multi-Factor Authentication in API permission to access this object. (Note that multi-factor authentication was formerly called two-factor authentication.)

Fields

<table>

</tbody>
</table>
UndecidedEventRelation

Represents event participants (invitees or attendees) with the status Not Responded for a given event. This object is available in API versions 29.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>EventId</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>reference</td>
</tr>
<tr>

<td>---------</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
</tbody>
</table>
| **Description** | Indicates the ID of the event.  
This is a relationship field. |
| **Relationship Name** | Event |
| **Relationship Type** | Lookup |
| **Refers To** | Event |
| **RelationId** | Type  
reference |
| **Properties** | Filter, Group, Nillable, Sort |
| **Description** | Indicates the ID of the invitee.  
This is a polymorphic relationship field. |
| **Relationship Name** | Relation |
| **Relationship Type** | Lookup |
| **Refers To** | Calendar, Contact, Lead, User |
| **RespondedDate** | Type  
dateTime |
| **Properties** | Filter, Nillable, Sort |
| **Description** | This field is always null. |
| **Response** | Type  
string |
| **Properties** | Filter, Group, Nillable, Sort |
| **Description** | Indicates the content of the response field. Label is Comment. |
Field Name: Type

Details:

- **Type**
  - string

- **Properties**
  - Filter, Group, Nillable, Sort

- **Description**
  - Indicates whether the invitee is a user, lead or contact, or resource.

Usage

Query invitees who have not responded to an invitation to an event

```sql
SELECT eventId, type, response FROM UndecidedEventRelation WHERE
eventId='00UTD000000ZH5LA'
```

SEE ALSO:
- AcceptedEventRelation
- DeclinedEventRelation

User

Represents a user in your organization.

Supported Calls

- `create()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

- To create or update a User record, you must have the Manage Internal Users permission. If the user is a Customer Portal user, you must have the Manage Customer Users permission. If the user is a partner portal user, you must have the Manage External Users permission. But the `describeSObjects` call always returns `createable` as `true`.

- If digital experiences is enabled, to create or update external users for Customer Portal, partner portal, or Experience Cloud sites, you must also have the Manage External Users permission.

- Information in hidden fields in a user’s profile isn’t searchable by external users (with a portal profile) in an Experience Cloud site. For example, if a user in a site has a hidden email address and an external user searches for it, the user record isn’t returned in the search results. Hidden field values also aren’t returned when external users perform searches on nonhidden fields. So if an external user searches for a user’s name (can’t be hidden), any hidden field values associated with the user record such as a hidden email address aren’t returned in the search results.

  But internal users belonging to the same Experience Cloud site can search for and view hidden field values in search results.

- When requested by portal users, queries that look up to the User object, such as `owner.name` or `owner.email` sometimes don’t return values when the portal user making the request doesn’t have Read access to the User record being queried.
The behavior depends on the number of domains associated with the lookup field. If the object can look up to more than one domain, `owner.name` returns a value, but other detail fields don’t. For example, Case owner can look up to the User or Queue objects. In this case, portal users can see only the value of `owner.name`. Other User detail fields, such as `owner.email` or `owner.phone` don’t return a value.

If the object can look up to only a single domain, such as Account owner, then no detail fields return values, including `owner.name`.

- To change ownership of a record by updating its `OwnerId` field, you must have both the Transfer Record permission and Read access to the User record of the new record owner.
- To view the `NumberOfFailedLogins` field, you must have the Manage User permission.

</table>
## DelegatedApproverId

**Type**
- reference

**Properties**
- Create, Filter, Group, Nillable, Sort, Update

**Description**
Id of the user who is a delegated approver for this user.

## Department

**Type**
- string

**Properties**
- Create, Filter, Group, Nillable, Sort, Update

**Description**
The company department associated with the user.

## DigestFrequency

**Type**
- picklist

**Properties**
- Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update

**Description**
Required. The send frequency of the user’s Chatter personal email digest. The valid values are:
- D = Daily
- W = Weekly
- N = Never

The default value is D.

## Division

**Type**
- string

**Properties**
- Create, Filter, Group, Nillable, Sort, Update

**Description**
The division associated with this user, similar to Department, and unrelated to DefaultDivision.

## Email

**Type**
- email

| GeocodeAccuracy       | **Type**  
picklist               |
| **Properties**        | Create, Filter, Group, Nillable, Restricted picklist, Sort, Update |
| **Description**       | The level of accuracy of a location’s geographical coordinates compared with its physical address. A geocoding service typically provides this value based on the address’s latitude and longitude coordinates. |
| IndividualId          | **Type**  
reference              |
| **Properties**        | Create, Filter, Group, Nillable, Sort, Update |
| **Description**       | ID of the data privacy record associated with this user. This field is available if Data Protection and Privacy is enabled. This is a relationship field. |
|                       | **Relationship Name** Individual |
|                       | **Relationship Type** Lookup |
|                       | **Refers To** Individual |
| IsActive              | **Type**  
boolean              |
| **Properties**        | Create, Defaulted on create, Filter, Group, Sort, Update |
| **Description**       | Indicates whether the user has access to log in (true) or not (false). You can modify a User’s active status from the user interface or via the API. |
| IsPartner             | **Type**  
boolean              |
<p>| <strong>Properties</strong>        | Defaulted on create, Filter |
| <strong>Description</strong>       | Indicates whether the user is a partner who has access to the partner portal (true) or not (false). This field isn’t available for release 9.0 and later. Instead, use UserType with the value Partner or Power Partner. |</p>
<table>

| IsPortalEnabled     | **Type** boolean  
**Properties** Defaulted on create, Filter, Group, Sort, Update  
**Description** Indicates whether an active, external, user has access to Experience Cloud sites or portals (true) or not (false). This field is only available if one of these conditions is true:  
- Digital experiences is enabled and you have community or portal user licenses  
- Portals are enabled  
**Note:** Users with External Identity licenses can access Experience Cloud sites even if the flag is false. |
| IsPortalSelfRegistered | **Type** boolean  
**Properties** Create, Defaulted on create, Filter, Group, Sort  
**Description** Indicates whether the user is a Customer Portal user who self-registered for your organization's Customer Portal (true) or not (false). This field isn't available for release 9.0 and earlier. |
| IsPrmSuperUser      | **Type** boolean  
**Properties** Create, Defaulted on create, Filter, Group, Sort, Update  
**Description** Available for partner portal users only. Indicates whether the user has super user access in the partner portal (true) or not (false). This field is available in API version 24.0 and later.  
**Note:** This field isn't automatically enabled. Contact Salesforce to enable this field. |
| IsProfilePhotoActive | **Type** boolean  
**Properties** Defaulted on create, Filter, Group, Sort  
**Description** Indicates whether a user has a profile photo (true) or not (false). This field is available in API version 36.0 and later. |

|               | Create, Filter, Group, Nillable, Sort, Update |
|               | **Description**
|               | The user's name suffix. Maximum size is 40 characters. To enable this field, contact Salesforce Customer Support. |
| **TimeZoneSidKey** | **Type**
|               | picklist |
|               | **Properties**
|               | Create, Filter, Group, Restricted picklist, Sort, Update |
|               | **Description**
|               | Required. This field is a restricted picklist field. A User time zone affects the offset used when displaying or entering times in the user interface. But the API doesn't use a User time zone when querying or setting values. Values for this field are named using region and key city, according to ISO standards. You can also manually set one User time zone in the user interface, and then use that value for creating or updating other User records via the API. |
| **Title**     | **Type**
|               | string  |
|               | **Properties**
|               | Create, Filter, Group, Nillable, Sort, Update |
|               | **Description**
|               | The user's business title, such as Vice President. |
| **Username**  | **Type**
|               | string  |
|               | **Properties**
|               | Create, Filter, Group, idLookup, Sort, Update |
|               | **Description**
<p>|               | Required. Contains the name that a user enters to log in to the API or the user interface. The value for this field must be in the form of an email address, using all lowercase characters. It must also be unique across all organizations. If you try to create or update a User with a duplicate value for this field, the operation is rejected. Each inserted User also counts as a license. Every organization has a maximum number of licenses. If you attempt to exceed the maximum number of licenses by inserting User records, the create request is rejected. |</p>

### User.preferences.ShowStreetAddressToGuestUsers

**Type**: boolean

**Properties**: Create, Filter, Update

**Description**: Indicates the visibility of the street address field in the user’s contact information. When `true`, the street address field is visible to guest users. Guest users can access public Site.com and Salesforce sites, and public pages in Experience Cloud sites, via the Guest User license associated with each site.

When `true`, this field overrides the value `false` in `UserPreferences.ShowStreetAddressToExternalUsers`, making the user’s street address visible to guests.

When `false`, this field returns the value `#N/A`. The default value is `false`. This field is available in API version 34.0 and later.

### User.preferences.ShowTitleToExternalUsers

**Type**: boolean

**Properties**: Create, Filter, Update

**Description**: Indicates the visibility of the business title field in the user’s contact information. Title is visible only to internal members of the user’s organization when:

- This field is `false`. When `false`, this field returns the value `#N/A`.

Title is visible to external members in an Experience Cloud site when:

- This field is `true`, or

</tbody>
</table>

**UserPreferencesShowTitleToGuestUsers**

**Type**

boolean

**Properties**

Create, Filter, Update

**Description**

Indicates the visibility of the business title field in the user’s contact information. When true, title is visible to guest users. Guest users can access public Site.com and Salesforce sites, and public pages in Experience Cloud sites, via the Guest User license associated with each site. When false, this field returns the value #N/A.

When true, this field overrides the value false in UserPreferencesShowTitleToExternalUsers, making the user's title visible to external members.

The default value is false. This field is available in API version 28.0 and later.

**UserPreferencesShowWorkPhoneToExternalUsers**

**Type**

boolean

**Properties**

Create, Filter, Update

**Description**

Indicates the visibility of the work phone number field in the user’s contact information. The number is visible only to internal members of the user’s organization when this field is false. The number is visible to external members in an Experience Cloud site when this field is true. External users are users with Community, Customer Portal, or partner portal licenses.

When false, this field returns the value #N/A. The default value is false. This field is available in API version 26.0 and later.

**UserPreferencesUserDebugModePref**

- **Type**: boolean
- **Properties**: Create, Filter, Update
- **Description**: When `true`, the Lightning Component framework executes in debug mode for the user. Corresponds to the `Debug Mode` checkbox on the Advanced User Details page of personal settings in the user interface.

**UserRole**

- **Type**: reference
- **Properties**: Create, Filter, Group, Nullable, Sort, Update
- **Description**: ID of the user's UserRole. Label is **Role ID**. This is a relationship field.

**UserRole**

- **Relationship Name**: UserRole
- **Relationship Type**: Lookup
- **Refers To**: UserRole

**UserType**

- **Type**: picklist
- **Properties**: Filter, Group, Nullable, Sort, Restricted picklist
- **Description**: The category of user license. Each **UserType** is associated with one or more **UserLicense** records. Each **UserLicense** is associated with one or more profiles. In API version 10.0 and later, valid values include:
  - **Standard**: user license. This user type also includes Salesforce Platform and Salesforce Platform One user licenses. Label is **Standard**.
PowerPartner: User whose access is limited because they’re a partner and typically access the application through a partner portal or Experience Cloud site. Label is **Partner**.

CSPLitePortal: user whose access is limited because they’re an org’s customer and access the application through a Customer Portal or Experience Cloud site. Label is **High Volume Portal**.

CustomerSuccess: user whose access is limited because they’re an org’s customer and access the application through a Customer Portal. Label is **Customer Portal User**.

PowerCustomerSuccess: user whose access is limited because they’re an org’s customer and access the application through a Customer Portal. Label is **Customer Portal Manager**.

Users with this license type can view and edit data they directly own or data owned by or shared with users below them in the Customer Portal role hierarchy.

CsnOnly: user whose access to the application is limited to Chatter. This user type includes Chatter Free and Chatter moderator users. Label is **Chatter Free**.

Guest: user whose access is limited because they’re an unauthenticated user without login credentials. Label is **Guest**.

---

### WirelessEmail

**Type**

- email

**Properties**

- Create, Filter, Group, Nillable, Sort, Update

**Description**

Wireless email address associated with this user. For use with Salesforce Wireless Edition. This field is available only if the Wireless and Email permissions are enabled for your organization.

**Note:** As of November 2005, Salesforce Wireless Edition is no longer available for purchase. You can continue to use Wireless Edition through the end of your existing contract term if you are:

- An Enterprise Edition customer who signed or renewed their Salesforce contract before November 7, 2005.

---

### Usage

Use this object to query information about users and to provision and modify users in your organization. Unlike other objects, the records in the User table represent actual users—not data owned by users. Any user can query or describe User records.
For example, the following SOQL code finds users with a particular user role.

```sql
SELECT Id, Username
FROM User
WHERE UserRoleId='00ED0000000xicT'
```

Each portal user is associated with a portal account. A portal account can have a maximum of three portal roles (Executive, Manager, and User). You can select the default number of roles to be created from the user interface. The role hierarchy is maintained when you insert and delete portal roles, and roles are created bottom-up. Deleting the User role causes the Manager role to be renamed to User role. Deleting both the Executive and User roles causes the Manager role to be renamed to User role. Before deleting a role, you must assign users under that role to another role.

**Deactivate Users**

You can’t delete a user in the user interface or the API. You can deactivate a user in the user interface; and you can deactivate or disable a Customer Portal or partner portal user in the user interface or the API. Because users can never be deleted, we recommend that you exercise caution when creating them.

Be aware of the expected behaviors when deactivating users. See Considerations for Deactivating Users. The user interface provides options to auto-remove a user from teams, but the removal isn’t supported in API.

If you deactivate a user, any EntitySubscription where the user is associated with the ParentId or SubscriberId field, meaning all subscriptions both to and from the user, are soft deleted. If the user is reactivated, the subscriptions are restored. However, if you deactivate multiple users at once and these users follow each other, their subscriptions are hard deleted. In this case, the user-to-user EntitySubscription is deleted twice (double deleted). Such subscriptions can’t be restored upon user reactivation.

**Passwords**

For security reasons, you can’t query User passwords via the API or the user interface. But the API allows you to set and reset User passwords using the `setPassword()` and `resetPassword()` calls. The password lockout status and the ability to reset the User locked-out status isn’t available via the API. Check and reset the User password lockout status using the user interface.

**Associated Objects**

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **UserChangeEvent (API version 44.0)**
  Change events are available for the object.

- **UserFeed (API version 18.0)**
  Feed tracking is available for the object.
UserAccountTeamMember

Represents a User on the default account team of another User.

See also OpportunityTeamMember, which represents a User on the opportunity team of an Opportunity.

**Supported Calls**

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

**Special Access Rules**

Customer Portal and Chatter Free users can't access this object.

<td>This field must be set to an access level that is higher than the organization's default access level for opportunities.</td>
</tr>
</tbody>
</table>

**OwnerId**

- **Type**: reference
- **Properties**: Create, Filter
- **Description**: Required. ID of the User who owns the default account team.

**TeamMemberRole**

- **Type**: picklist
- **Properties**: Create, Filter, Nillable, Update
- **Description**: Role that the team member has on opportunities for which the user has added his or her default account team. The valid values are set by the organization's administrator in the Account Team Roles picklist. Label is Team Role.

**UserId**

- **Type**: reference
- **Properties**: Create, Filter
- **Description**: Required. ID of the User who is a member of the default account team. This field cannot be updated.

### Usage

This object is available only in organizations that have enabled the account teams functionality, which can be done using the user interface.

If you attempt to create a record that matches an existing record, the create call updates any modified fields and returns the existing record.

You can set up a User record so the default account team includes the others who typically work with them on accounts.
**UserAppInfo**

Stores the last Lightning app logged in to. This object is available in API version 38.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AppDefinitionId</td>
<td></td>
</tr>
<tr>

</table>

Type  
reference

Properties  
Create, Filter, Group, Nillable, Sort, Update

Description  
The 15-character ID for the application associated with the menu item.  
This is a relationship field.

Relationship Name  
Application

Relationship Type  
Lookup

Refers To  
ConnectedApplication
Field Name | Details
---|---
OwnerId | Type reference
 | Properties Create, Defaulted on create, Filter, Group, Sort, Update
 | Description The ID of the user for these specific settings. This is a polymorphic relationship field.
 | Relationship Name Owner
 | Relationship Type Lookup
 | Refers To Group, User

SortOrder | Type int
 | Properties Create, Filter, Group, Nillable, Sort, Update
 | Description The index value that controls where this item appears in the menu. For example, a menu item with a sort order value of 5 will appear between items with sort order values of 3 and 9.

Usage
See the AppMenuItem object for the organization-wide default settings. This object contains the fields representing any changes the user made to the menu.

Associated Objects
This object has the following associated objects. Unless noted, they are available in the same API version as this object.

UserAppMenuCustomizationOwnerSharingRule
Sharing rules are available for the object.

UserAppMenuCustomizationShare
Sharing is available for the object.

UserAppMenuItem
Represents the organization-wide settings for items in the app menu or App Launcher that the requesting user has access to in Setup. This object is available in API version 35.0 and later.
Supported Calls

describeLayout(), describeSObjects(), query(), search()

<td>The index value that represents where the user set this item in the menu (or App Launcher). For example, an item with a sort order value of 5 will appear between items with sort order values of 3 and 9. This value is separate from SortOrder so you can create logic incorporating both values. For example, if you want the user-sorted items to appear first, followed by the organization order for the rest, use:</td>
</tr>
<tr>
<td><code>SELECT ApplicationId, SortOrder, UserSortOrder FROM AppMenuItem order by userSortOrder NULLS LAST, sortOrder NULLS LAST</code></td>
</tr>
</tbody>
</table>

**Usage**

See the AppMenuItem object for the organization-wide default settings. This object contains the fields the requesting user has permission to see.

**UserAuthCertificate**

Represents a user authentication certificate in your org. A user certificate is a unique PEM-encoded X.509 digital certificate to authenticate individual users to your org. This object is available in API version 45.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

**Special Access Rules**

This object is only available in orgs configured with My Domain and with Let users authenticate with a certificate enabled in Identity Verification. Only users with the Manage Internal Users permission can access this object.

UserConfigTransferButton

Represents the association between a Chat configuration and a live chat button. This association allows users associated with a specific configuration to transfer chats to a button queue.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()  

Special Access Rules

As of Summer '20 and later, only authenticated internal and external users can access this object.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>LiveChatButtonId</td>
<td>Type reference; Properties: Create, Filter, Group, Sort; Description: The ID of the live chat button that agents can transfer chats to.</td>
</tr>
<tr>
<td>LiveChatUserConfigId</td>
<td>Type reference; Properties: Create, Filter, Group, Sort; Description: The ID of the Chat configuration; agents associated with this configuration can transfer chats to the chat button indicated by the LiveChatButtonId.</td>
</tr>
</tbody>
</table>
UserConfigTransferSkill

Represents the association between a Chat configuration and a skill. This association allows users associated with a specific configuration to transfer chats to agents who have that skill.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Fields

Field Name | Details | Description
---|---|---
LiveChatUserConfigId | Type reference | The ID of the Chat configuration; agents associated with this configuration can transfer chats to the chat button indicated by the LiveChatButtonId.
SkillId | Type reference | The ID of the skill group that agents can transfer chats to.

UserCustomBadge

Represents a custom badge for a user. This object is available in API version 38.0 and later.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Fields

Field Name | Details | Description
---|---|---
BadgeType | Type picklist |
### Field Name

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

### UserCustomBadgeLocalization

Represents the translated version of a custom badge for a user. This object is available in API version 38.0 and later.

### Supported Calls

create(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update()

### Special Access Rules

- Translation Workbench must be enabled for your org.
- Users with the "Customize Application" or "Manage Translation" permission can create or update UserCustomBadge translations.
## Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>

<table>
<thead>
<tr>
<th><strong>NamespacePrefix</strong></th>
<th><strong>Details</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the namespacePrefix__componentName notation. The namespace prefix can have one of the following values.</td>
</tr>
</tbody>
</table>
In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.

In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

**ParentId**

- **Type**: reference
- **Properties**: Create, Filter, Group, Sort
- **Description**: ID of the UserCustomBadge.

**Value**

- **Type**: string
- **Properties**: Create, Filter, Sort, Update
- **Description**: The translated text for the UserCustomBadge. Label is `Translation Text`.

---

**UserDevice**

Represents information unique to a device. Available in API version 43.0 and later.

**Supported Calls**

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

**Special Access Rules**

You must have View Devices enabled to see devices.

**Description**  
- This field is system-generated and cannot be changed. |
| **Status** | **Type** picklist  
**Properties**  
- Filter, Group, Nillable, Restricted picklist, Sort  
**Description**  
The activity status of the device application. The picklist options are:  
- Approved  
- Pending Approval  
- Revoked |
| **UserDeviceId** | **Type** reference  
**Properties**  
- Filter, Group, Nillable, Sort  
**Description**  
The unique identifier used to identify a device when tracking events. 'UserDeviceId' is a generated value that's created when the mobile app is initially run after installation. |
| **UserId** | **Type** reference  
**Properties**  
- Filter, Group, Sort  
**Description**  
The ID of the user. |
UserDeviceHistory

Represents tracking information on the UserDevice sObject. This object is available in API version 50.0 and later.

Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

### Field Properties

**Type**

picklist

**Properties**

Filter, Group, Restricted picklist, Sort

**Description**

The field that has changed.

Possible values are:

- BrowserType—Browser
- DeviceNativeUid—Device Native ID
- DeviceType—Device Type
- HashedBrowserFingerPrint—Hashed Browser Fingerprint
- IsVerified—Is Device Verified
- LastLoginHistory—Login History
- Name
- PlatformType—Platform or OS Type
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• PlatformVersion—Platform or OS Version</td>
</tr>
<tr>
<td></td>

<td>• ownerAccepted—Owner (Accepted)</td>
</tr>
<tr>
<td></td>
<td>• ownerAssignment—Owner (Assignment)</td>
</tr>
<tr>
<td></td>
<td>• unlocked—Record unlocked</td>
</tr>
</tbody>
</table>

**NewValue**

- **Type** anyType
- **Properties** Nillable, Sort
- **Description** The value after a change has occurred.

**OldValue**

- **Type** anyType
- **Properties** Nillable, Sort
- **Description** The value before a change has occurred.

**UserDeviceId**

- **Type** reference
- **Properties** Filter, Group, Sort
- **Description** The ID of the UserDevice object.

**UserEmailCalendarSync**

Represents the user assignments of an Einstein Activity Capture configuration. This object is available in API version 49.0 and later.
Supported Calls
create(), describeSObjects(), query(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConfigurationId</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>string</td>
</tr>
<tr>
<td>Properties</td>
<td>Create, Filter, Group, Nullable, Sort, Update</td>
</tr>
<tr>
<td>Description</td>
<td>ID of the Einstein Activity Capture configuration. The configuration is created in Salesforce Setup. After the configuration is created, the autogenerated ID is visible on the Configurations tab. From Setup, in the Quick Find box, enter Einstein Activity Capture, and then select Settings. Click the Configurations tab.</td>
</tr>
</tbody>
</table>

| UserId          |                    |
| Type            | string             |
| Properties      | Create, Filter, Group, Nullable, Sort, Update |
| Description     | ID of the user. Only Einstein Activity users can be added to a configuration. |

Usage

Use UserEmailCalendarSync to add and remove users to an Einstein Activity Capture configuration.

This example adds two users to an Einstein Activity Capture configuration.

```java
// Create a list of UserEmailCalendarSync records
List<UserEmailCalendarSync> usersToAdd = new ArrayList<>();

// Populate the UserEmailCalendarSync record with the ID of
// the user, and with the ID of the Activity Capture configuration you are adding them to
UserEmailCalendarSync user1 = new UserEmailCalendarSync(ConfigurationId = '0063xxxxxxxxxxx', UserId = '005xxxxxxxxxxxx');

UserEmailCalendarSync user2= new UserEmailCalendarSync(ConfigurationId = '0063xxxxxxxxxxx', UserId = '005xxxxxxxxxxxx');

// add the UserEmailCalendarSync users to your list
usersToAdd.add(user1);
usersToAdd.add(user2);

// Insert the list of UserEmailCalendarSync into the database
Database.SaveResult[] results = Database.insertImmediate(usersToAdd);
```
This example removes a user from an Einstein Activity Capture configuration.

To remove a user, call `UserEmailCalendarSync()`, passing in `null` for `ConfigurationId`.

```java
UserEmailCalendarSync user2Remove = new UserEmailCalendarSync(ConfigId = "", UserId = '005xxxxxxxxxxxxx');
Database.SaveResult results = Database.insertImmediate(user2Remove);
```

**UserEmailPreferredPerson**

Represents a mapping for a user’s preferred record for an email address when multiple records match an email field. This object is available in API version 44.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

**Special Access Rules**

As of Summer ’20 and later, only authenticated internal and external users can access this object.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email</td>
<td>Type: email</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Filter, Group, idLookup, Sort, Update</td>
</tr>
<tr>
<td></td>
<td>Description: Required. The unique email the mapping applies to. This field is unique for each user.</td>
</tr>
<tr>
<td>Name</td>
<td>Type: string</td>
</tr>
<tr>
<td></td>
<td>Properties: Autonumber, Defaulted on create, Filter, idLookup, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: Read-only. Auto-generated field.</td>
</tr>
<tr>
<td>OwnerId</td>
<td>Type: reference</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Defaulted on create, Filter, Group, Sort, Update</td>
</tr>
</tbody>
</table>
### Field Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>Required. The userId that owns the record. Each record is only accessible to the owner. This is a polymorphic relationship field.</td>
</tr>
<tr>
<td><strong>Relationship Name</strong></td>
<td>Owner</td>
</tr>
<tr>
<td><strong>Relationship Type</strong></td>

<td>Contact, Lead, User</td>
</tr>
</tbody>
</table>

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**UserEmailPreferredPersonShare**

Sharing is available for the object.

### UserEmailPreferredPersonShare

Represents a sharing entry on a UserEmailPreferredPerson object. Sharing is not customizable for UserEmailPreferredPerson records. This object is available in API version 44.0 and later.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

</tr>
</tbody>
</table>

**Usage**

Users with the “View Setup and Configuration” permission can use the UserLicense object to view the set of currently defined user licenses in your organization.

The UserLicense object is currently used by bulk user creation to determine the user license to which each profile and permission set belongs. For example, if you use the API to create portal users and you want to know which profile belongs to each portal user license, you can query this object for each profile and check the LicenseDefinitionKey to identify the associated user license.

SEE ALSO:

Profile

**UserListView**

Represents the customizations a user made to a list view. This object is available in API version 32.0 and later.
### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Fields

<table>
<thead>
<tr>
<th>Name</th>
<th>Details</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>LastViewedChart</strong></td>
<td>Type  picklist</td>
<td>The last chart a user viewed.</td>

</tr>
</tbody>
</table>
UserListViewCriterion

Represents the criterion for a user’s customized list view. The criterion consists of the filters or sort order a user added to a list view for the Salesforce Mobile app. This object is available in API version 32.0 and later.

Supported Calls

create(), delete(), describesSObjects(), query(), retrieve(), update(), upsert()

Fields

<table>
<thead>
<tr>

<tr>
<td>Value</td>
<td><strong>Type</strong> string&lt;br&gt;&lt;br&gt;<strong>Properties</strong> Create, Filter, Group, Nillable, Sort, Update&lt;br&gt;&lt;br&gt;<strong>Description</strong> The field values used to filter the list view. For example, a value of 94105 if the Field is Billing Zip/Postal Code shows only rows that have a billing ZIP code of 94105.</td>
</tr>
</tbody>
</table>

### UserLogin

Represents the settings that affect a user's ability to log into an organization. To access this object, you need the UserPermissions.ManageUsers permission. This object is available in API version 29.0 and later.

#### Supported Calls

describeSObjects(), query(), retrieve(), update()
Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>IsFrozen</td>
<td>Type: boolean. Properties: Defaulted on create, Filter, Group, Sort, Update. Description: If true, the user account associated with this object is frozen.</td>
</tr>
<tr>
<td>IsPasswordLocked</td>
<td>Type: boolean. Properties: Defaulted on create, Filter, Group, Sort, Update. Description: If true, the user account associated with this object is locked because of too many login failures. From the API, you can set this field to false, but not true.</td>
</tr>
<tr>
<td>UserId</td>
<td>Type: reference. Properties: Filter, Group, Nillable, Sort. Description: ID of the associated user account. This field can’t be updated.</td>
</tr>
</tbody>
</table>

Usage

To query for all frozen users in your organization:

```
SELECT Id, UserId
FROM UserLogin
WHERE IsFrozen = true
```

UserMembershipSharingRule

Represents the rules for sharing user records from a source group to a target group. A user record contains details about a user. Users who are members of the source group can be shared with members of the target group. The source and target groups can be based on roles, portal roles, public groups, or territories. This object is available in API version 26.0 and later.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update()
## Special Access Rules

As of Spring '20 and later, only users with the View Setup and Configuration permission can access this object, and only users with the Manage Sharing permission can edit this object.

## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| Description | **Type**: textarea  
**Properties**: Create, Filter, Nillable, Sort, Update  
**Description**: A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later. |
| DeveloperName | **Type**: string  
**Properties**: Create, Filter, Group, Nillable, Sort, Update  
**Description**: The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface.  
**Note**: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record. |
| GroupId     | **Type**: reference  
**Properties**: Create, Filter, Group, Sort  
**Description**: The ID representing the source group. |
| Name        | **Type**: string  
**Properties**: Create, Filter, Group, idLookup, Sort, Update |
Usage

Use this object to manage sharing rules for user records. Source and target groups can include internal users, portal users, Chatter or Chatter External users.

UserPackageLicense

Represents a license for an installed managed package, assigned to a specific user. This object is available in API version 31.0 and later.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageLicenseId</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>reference</td>
</tr>
<tr>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td></td>
<td>Create, Filter, Group, Sort</td>
</tr>
</tbody>
</table>
UserPermissionAccess

Usage

Use this object, in conjunction with PackageLicense, to provide users access to a managed package installed in your organization.

Supported Calls

describeSObjects(), query()

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LastCacheUpdate</td>
<td>Type</td>
<td>LastCacheUpdate</td>
</tr>
<tr>
<td></td>
<td>dateTime</td>
<td>The last modified date and time of either the user info or org info, whichever is later.</td>
</tr>
</tbody>
</table>
## UserPrioritizedRecord

Represents records that Pipeline Inspection users flag as important for tracking in pipeline views and filters. This object is available in API version 53.0 and later.

### Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrievet()`, `update()`, `upsert()`

### Special Access Rules

To use UserPrioritizedRecord, enable the Pipeline Inspection user permission and the Pipeline Inspection setting.

### Fields

<table>
<thead>
<tr>

#### TargetKeyPrefix

<table>
<thead>
<tr>
<th><strong>Type</strong></th>
<th>string</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, idLookup, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The key prefix of the target object that is marked as important.</td>
</tr>
</tbody>
</table>

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**UserPrioritizedRecordOwnerSharingRule** on page 3714

Sharing rules are available for the object.

**UserPrioritizedRecordShare** on page 3719

Sharing is available for the object.
UserPreference

Represents a functional preference for a specific user in your organization.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

Customer Portal users can't access this object.

Only users with the View All Data or Manage Users permission can access UserPreference records of other users but all users can access their own UserPreference record.

Note: This behavior does not affect other types of user access such as Create or Edit.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preference</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>picklist</td>
</tr>
<tr>
<td>Properties</td>
<td>Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</td>
</tr>
<tr>
<td>Description</td>
<td>The name of the user preference. Supported values are:</td>
</tr>
<tr>
<td></td>
<td>• 57 (Event Reminder Default Lead Time)</td>
</tr>
<tr>
<td></td>
<td>• 58 (Task Reminder Default Time)</td>
</tr>
<tr>
<td></td>
<td>• 91 (Prevent Logs on Load)</td>
</tr>
<tr>
<td></td>
<td>• 92 (Autocomplete Apex After Key Press)</td>
</tr>
<tr>
<td></td>
<td>• 93 (Visualforce Viewstate Inspector)</td>
</tr>
<tr>
<td></td>
<td>• 94 (Forecasting Displayed Type)</td>
</tr>
<tr>
<td></td>
<td>• 96 (Editor Theme)</td>
</tr>
<tr>
<td></td>
<td>• 97 (Editor Font Size)</td>
</tr>
<tr>
<td></td>
<td>• 98 (Pinned Folders)</td>
</tr>
<tr>
<td></td>
<td>• 99 (Enable Query Plan)</td>
</tr>
<tr>
<td></td>
<td>• 100 (Enable New Open Dialog)</td>
</tr>
<tr>
<td></td>
<td>• 101 (Email Transport Type)</td>
</tr>
<tr>
<td></td>
<td>• 102 (Pinned Wave Folders)</td>
</tr>
<tr>
<td></td>
<td>• 108 (Density)</td>
</tr>
</tbody>
</table>

Event Reminder Default Lead Time and Task Reminder Default Time are related to these fields on the User object:
When creating SOQL queries, `tolabel` is required to return accurate results. For example, `select Id, tolabel(Preference), Value, UserId from UserPreference`.

108 (Density) is available in API v44.0 and later.

Usage

Use this object to query the set of currently configured user preferences in your organization. In your client application, you can query the User object to obtain valid User IDs to access the UserPreference object.

All users can invoke the supported calls with this object. Standard users can invoke these calls, but only on their own preferences.

UserProfile

Represents a Chatter user profile.
Note: This object has been deprecated as of API version 32.0. Use the User object to query information about a user in API version 32.0 and later.

Supported Calls

describeLayout(), query(), retrieve()

Special Access Rules

- Information in hidden fields in a user’s profile isn’t searchable by external users (with a portal profile) in an Experience Cloud site. For example, if a user in a site has a hidden email address and an external user searches for it, the user record isn't returned in the search results. Hidden field values also aren't returned when external users perform searches on nonhidden fields. So if an external user searches for a user’s name (can’t be hidden), any hidden field values associated with the user record such as a hidden email address aren’t returned in the search results.

  - internal users belonging to the same Experience Cloud site can search for and view hidden field values in search results.

- Any fields that have been restricted in visibility will be returned empty, whether or not they are, and will not be removed from the field listing.

Fields

<table>
<thead>
<tr>
<th>Field</th>

**UserPreferencesShowStateToGuestUsers**

**Type**

boolean

**Properties**

Filter

**Description**

Indicates the visibility of the state field in the user’s contact information. When true, state is visible to guest users. Guest users can access public Site.com and Salesforce sites, and public pages in Experience Cloud sites, via the Guest User license associated with each site. When false, this field returns the value #N/A.

When true, this field overrides the value false in UserPreferencesShowStateToExternalUsers, making the user’s state visible to external members.

The default value is false. This field is available in API version 28.0 and later.

**UserPreferencesShowStreetAddressToExternalUsers**

**Type**

boolean

**Properties**

Filter

**Description**

Indicates the visibility of the street address field in the user’s contact information. The address is visible only to internal members of the user’s organization when this field is false. The address is visible to external members in an Experience Cloud site when this field is true. External users are users with Community, Customer Portal, or partner portal licenses.

When false, this field returns the value #N/A. The default value is false. This field is available in API version 26.0 and later.
### UserPreferencesShowTitleToExternalUsers

**Type**
boolean

**Properties**
Filter

**Description**
Indicates the visibility of the business title field in the user’s contact information. Title is visible only to internal members of the user’s organization when:
- This field is `false`. When `false`, this field returns the value `#N/A`.

Title is visible to external members in an Experience Cloud site when:
- This field is `true`, or
- This field is `false` but `UserPreferencesShowTitleToGuestUsers` is `true`, which overrides this field’s value.

External users are users with Community, Customer Portal, or partner portal licenses.

The default value is `true`. This field is available in API version 26.0 and later.

---

### UserPreferencesShowTitleToGuestUsers

**Type**
boolean

**Properties**
Filter

**Description**
Indicates the visibility of the business title field in the user’s contact information. When `true`, title is visible to guest users. Guest users can access public Site.com and Salesforce sites, and public pages in Experience Cloud sites, via the Guest User license associated with each site. When `false`, this field returns the value `#N/A`.

When `true`, this field overrides the value `false` in `UserPreferencesShowTitleToExternalUsers`, making the user’s title visible to external members.

The default value is `false`. This field is available in API version 28.0 and later.

---

### UserPreferencesShowWorkPhoneToExternalUsers

**Type**
boolean

**Properties**
Filter
### UserPreferences.TaskRemindersCheckboxDefault

**Type**

boolean

**Properties**

- Filter

**Description**

When true, a reminder popup is automatically set on the user’s tasks. Corresponds to the By default, set reminder on Tasks to... checkbox on the Reminders page in the user interface. This field is related to UserPreference and customizing activity reminders.

---

### Usage

Use this object to query Chatter—related information about the user. While the User object contains all the information about a user and is historically tied to user management, UserProfile is a read-only entity that contains the information that is relevant in a Chatter context.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**UserProfileFeed (API version 18.0–26.0)**

Feed tracking is available for the object.

### UserProvAccount

Represents information that links a Salesforce user account with an account in a third-party (target) system, such as Google, for users of connected apps with Salesforce user provisioning enabled. This object is available in API version 33.0 and later.

### Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

<tr>
<td><strong>Description</strong></td>
<td>Setting the IsKnownLink value to true implies the administrator or another user is managing the relationship between the Salesforce user account and the third-party user account, manually. This field helps Salesforce coordinate updates between the UserProvAccountStaging object and the UserProvAccount object while committing staged accounts. Typically, for a matching user account (the same ExternalUserId for both objects), Salesforce copies the values from the UserProvAccountStaging object to the UserProvAccount object. However, if Salesforce encounters a UserProvAccountStaging object with a matching ExternalUserId but different LinkState and SalesforceUserId values during this process, Salesforce checks the UserProvAccount IsKnownLink value. If the IsKnownLink value is true, Salesforce doesn’t copy the LinkState and SalesforceUserId values from the UserProvAccountStaging object to the UserProvAccount object (all other values are copied). The default is false, meaning Salesforce manages the account relationship.</td>

Lookup

**Refers To**
User
### UserProvAccountStaging

Temporarily stores user account information while a user completes the User Provisioning Wizard. This information that is stored in the UserProvAccount object when you click the button to collect and analyze accounts on the target system.

User provisioning links a Salesforce user account with an account in a third-party (target) system. To configure user provisioning, you use a User Provisioning Wizard that guides you through the setup process. As you enter values about account details in the wizard, these values are stored in this object until you click the button to collect and analyze accounts on the target system. The general user provisioning configuration details are stored in the UserProvisioningConfig object.

---

### Usage

When committing fields from a UserProvAccountStaging to a UserProvAccount object, Salesforce looks up the UserProvAccount record where `UserProvAccountStaging.ExternalUserId = UserProvAccount.ExternalUserId`.

- If an `ExternalUserId` doesn’t match an existing account, Salesforce creates a UserProvAccount record based on the UserProvAccountStaging record.
- If an `ExternalUserId` matches, then Salesforce checks the `UserProvAccount.isKnownLink` value, and does the following.
  - If `UserProvAccount.IsKnownLink = true`, Salesforce copies the UserProvAccountStaging values to the UserProvAccount object, except for the `ExternalUserId` and `LinkState` values.
  - If `UserProvAccount.IsKnownLink = false`, Salesforce copies all of the UserProvAccountStaging values to the UserProvAccount object.

---

### UserProvMockTarget

Represents an entity for testing user data before committing the data to a third-party system for user provisioning.

During the user provisioning process, user account information is sent to a third-party system to create, update or delete a user account on that system. While configuring user provisioning for your organization using a flow or Apex action, you can use this object to confirm the associated flow or Apex code is sending the desired data. After confirming the correct fields and values, you can update the flow or Apex action to send the data to the target system.

#### Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrievel()`, `undelete()`, `update()`, `upsert()`
# Fields

<table>
<thead>

<tr>
<td></td>
<td><strong>Description</strong> The username as stored in the target system for the associated user account.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td><strong>Type</strong> string</td>
</tr>
</tbody>
</table>
### UserProvisioningConfig

Represents information for a flow to use during a user provisioning request process, such as the attributes for an update. This object is available in API version 34.0 and later.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ApprovalRequired</td>
<td>Details</td>
</tr>
<tr>
<td>Type</td>
<td>textarea</td>
</tr>
<tr>
<td>Properties</td>
<td>Create, Nillable, Update</td>
</tr>
<tr>
<td>Description</td>
<td>Denotes whether approvals are required for provisioning users for the associated connected app. If the value is null, no approval is required.</td>
</tr>
<tr>
<td>ConnectedAppId</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>reference</td>
</tr>
<tr>
<td>Properties</td>
<td>Create, Filter, Group, Nillable, Sort, Update</td>
</tr>
<tr>
<td>Description</td>
<td>The unique name for this object.</td>
</tr>
</tbody>
</table>
### Field Name: DeveloperName

**Type:** string

**Properties:**
Create, Filter, Group, Sort, Update

**Description:**
The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package, and the changes are reflected in a subscriber's organization.

**Note:** Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.

### Field Name: Enabled

**Type:** boolean

**Properties:**
Create, Defaulted on create, Filter, Group, Sort, Update

**Description:**
Indicates whether user provisioning is enabled for the associated connected app (true) or not (false).

### Field Name: EnabledOperations

**Type:** textarea

**Properties:**
Create, Nillable, Update

**Description:**
Lists the operations, as comma-separated values, that create a UserProvisioningRequest object for the associated connected app. Allowed values are:
<table>
<thead>
<tr>

<tr>
<td></td>
<td><strong>Properties</strong> Filter, Group, Nillable, Sort</td>
<td></td>
</tr>
</tbody>
</table>
|                  | **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation. The namespace prefix can have one of the following values.  
  - In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.  
  - In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix. |

| Notes            | **Type** textarea                                                       |
|                  | **Properties** Create, Nillable, Update                                 |
|                  | **Description** A utility field for administrators to add any additional information about the configuration. This field is for internal reference only, and is not used by any process. |

| OnUpdateAttributes | **Type** textarea                                                      |
|                   | **Properties** Create, Nillable, Update                                 |
|                   | **Description** Lists the user attributes, as comma-separated values, that generate a UserProvisioningRequest object during an update. |
### UserProvisioningLog

Represents messages generated during the process of provisioning users for third-party applications. This object is available in API version 33.0 and later.

Some messages for this object are generated automatically by Salesforce, and others are created by the developers of the user provisioning plugin. Developers can use this object to log messages from the flow associated with the user provisioning process or the Apex plugin that calls the target system. Administrators can use this object as a log of all user provisioning activity and as a troubleshooting tool if desired behavior is missing. This object is available as a custom report type.

#### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

#### Fields

<table>
<thead>
<tr>

 **Properties** Create, Defaulted on create, Filter, Group, Sort, Update  
 **Description** Salesforce ID of the Group or User who owns this object. |
| **Status** | **Type** string  
 **Properties** Create, Filter, Group, Nillable, Sort, Update  
 **Description** The status of the user provisioning request. Based on the context of the log, it can contain different values, such as an HttpStatusCode. |
| **UserId** | **Type** reference |
### UserProvisioningRequest

Represents an individual provisioning request to create, update, or delete a single user account in a third-party service system (or another Salesforce organization). This object is available in API version 33.0 and later.

A UserProvisioningRequest (UPR) record is created for each provisioning action for each user, and for each connected app available to the user. For example, if a user has two connected apps, and a provisioning request is sent to two different services to create an account for the user, Salesforce creates two UPR objects. Provisioning actions include creating, updating, or deleting a user account.

#### Supported Calls

- create()
- delete()
- describeLayout()
- describeSObjects()
- getDeleted()
- getUpdated()
- query()
- retrieve()
- undelete()
- update()
- upsert()
## Fields

### Field Details

- Analyzed
- Committing
- Retried
- Manually Completed

The State goes from New to Requested to Completed or Failed, unless a reconciliation process is occurring. For details about the reconciliation process State value changes, see Usage.

The State goes from Failed to Retried or Manually Completed when troubleshooting UPR failures. For details about handling failures, see State Values for Managing Provisioning Failures.

</tbody>
</table>
Usage

The State value changes during a reconciliation process (Operation = Reconcile) to gather and compare users on the third-party system to Salesforce users. Typically, when a UPR entry is first created, it has a State value of New. When a collection process is triggered, the State transitions to Collecting until that process is finished and the State is Collected. When an analyze process is triggered, the State transitions to Analyzing until that process is finished and the State is Analyzed. If a process commits the request, the State then transitions to Committing, and the properties move from the UserProvAccountStaging object to the UserProvAccount object. When those properties are saved in the UserProvAccount object, the State transitions to Completed.

However, the State does not necessarily start at New. For example, UserProvAccountStaging entries can be inserted programmatically. If a process is initiated that triggers linking these rows to accounts on the third-party service, a UPR entry could start with the Analyzing State.

Also, the State cannot go backwards from an active task. For example, a successful Analyzing State must progress to Analyzed; unless the active process fails, and then the State must change to Failed. Certain State transitions cannot be made programmatically and must be triggered by Salesforce.

The following table shows the State transitions that can occur for each State value. Each row corresponds to a current State value and each column corresponds to a new State after a potential transition.

- 🚫 — the transition to this value is not allowed.
- ✅ — the transition to this value is allowed.
- 🚷 — only Salesforce can transition the State to this value.

State Values for Managing Provisioning Failures

The state value changes to Failed for several reasons, such as network outages, session timeouts, permissions issues, and record locks. The Failed state can transition to either Retried or Manually Completed to indicate what action was taken to address the failure. Actions can include correcting the root cause of the failure and requesting that the provisioning engine retry the UPR. Or, it can be completing the action against the target manually. Each UPR is an independent transaction and it’s possible the retry causes a failure with a different root cause. So it’s hard to distinguish failed events that you addressed from the ones that require more action.

If you tried to correct the cause of the failure and requested the provisioning engine to retry the UPR, you can mark the failed UPR Retried. Or, if the action against the target was completed manually, you can mark it Manually Completed.

When a retry event is created, the failed UPR is cloned, and resubmitted. The ParentID field contains a lookup to the failed UPR to use to clone the new UPR. The Retry Count field contains the number of retry attempts that were performed on a UPR. With the Retry Count field, you can add custom business logic like "Retry 5 times then stop and notify your admin."

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **UserProvisioningRequestOwnerSharingRule (API version 34.0)**
  - Sharing rules are available for the object.

- **UserProvisioningRequestShare (API version 34.0)**
  - Sharing is available for the object.

UserRecordAccess

Represents a user’s access to a set of records. This object is read only and is available in API version 24.0 and later.

Supported Calls

describeSObjects(), query()

### Standard Objects

#### UserRecordAccess

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>RecordId</td>
<td><strong>Type</strong> picklist</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Filter, Group, Restricted picklist, Sort</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> ID of the record.</td>
</tr>
<tr>
<td>UserId</td>
<td><strong>Type</strong> reference</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Filter, Group</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> ID of the user.</td>
</tr>
</tbody>
</table>

### Usage

Use this object to query a user's access to records. You can only query records of objects listed on the Sharing Settings Setup page. You can’t create, delete, or update any records using this object.

Up to 200 record IDs can be queried. You can include an `ORDER BY` clause for any field that is being selected in the query.

The following sample query returns the records, whether the queried user has read and transfer access to each record, and the user’s maximum access level to each record.

```sql
SELECT RecordId, HasReadAccess, HasTransferAccess, MaxAccessLevel
FROM UserRecordAccess
WHERE UserId = [single ID]
AND RecordId = [single ID]  //or Record IN [list of IDs]
```

The following query returns the records to which a queried user has read access.

```sql
SELECT RecordId
FROM UserRecordAccess
WHERE UserId = [single ID]
AND RecordId = [single ID]  //or Record IN [list of IDs]
AND HasReadAccess = true
```

Using API version 30.0 and later, UserRecordAccess is a foreign key on the records. You can’t filter by or provide the `UserId` or `RecordId` fields when using this object as a lookup or foreign key. The previous sample queries can be run as:

```sql
SELECT Id, Name, UserRecordAccess.HasReadAccess, UserRecordAccess.HasTransferAccess,
UserRecordAccess.MaxAccessLevel
FROM Account

SELECT Id, Name, UserRecordAccess.HasReadAccess
FROM Account
```

SOQL restrictions:
When the running user is querying a user’s access to a set of records, records that the running user does not have read access to are filtered out of the results.

When filtering by UserId and RecordId only, you must use SELECT RecordId and optionally one or more of the access level fields: HasReadAccess, HasEditAccess, HasDeleteAccess, HasTransferAccess, and HasAllAccess. You may include MaxAccessLevel.

When filtering by UserId, RecordId, and an access level field, you must use SELECT RecordId only.

UserRole

Represents a user role in your organization.

Note: This object was called “Role” in previous versions of the API documentation.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(), upsert()

Special Access Rules

As of Summer ’20 and later, only users with the View Roles and Role Hierarchy permission can access this object, and only users with the Manage Roles permission can edit this object.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>CaseAccessForAccountOwner</td>
<td>Type: picklist</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</td>
</tr>
<tr>
<td></td>
<td>Description: The case access level for the account owner.</td>
</tr>
<tr>
<td>ContactAccessForAccountOwner</td>
<td>Type: picklist</td>
</tr>
<tr>
<td></td>
<td>Properties: Filter, Group, Nillable, Restricted picklist, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: The contact access level for the account owner.</td>
</tr>
</tbody>
</table>

Note: When DefaultContactAccess is set to Controlled by Parent, you can't create or update this field.
### DeveloperName

**Type**
- string

**Properties**
- Create, Filter, Group, Nillable, Sort, Update

**Description**

The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization. Corresponds to **Role Name** in the user interface.

This field is available in API version 24.0 and later.

**Note:** When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record.

### ForecastUserId

**Type**
- reference

**Properties**
- Create, Filter, Group, Nillable, Sort, Update

**Description**

The ID of the forecast manager associated with this role. Label is **User ID**.

### IsPartner

**Type**
- boolean

**Properties**
- Defaulted on create, Filter

**Description**

Indicates whether the user role is a partner who has access to the partner portal (true) or not (false). This field is not available for release 9.0 and later. Instead, use PortalType with the value Partner.

### MayForecastManagerShare

**Type**
- boolean

**Properties**
- Defaulted on create, Filter, Group, Sort

**Description**

Indicates whether the forecast manager can manually share their own forecast.
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| Name                              | **Type** string  
**Properties** Create, Filter, Group, idLookup, Sort, Update  
**Description** Required. Name of the role. Corresponds to Label on the user interface. |
| OpportunityAccessForAccountOwner  | **Type** picklist  
**Properties** Create, Filter, Group, Restricted picklist, Sort, Update  
**Description** Required. The opportunity access level for the account owner. Note that you can’t set a user role with an opportunity access less than that specified in organization-wide defaults. |
| ParentRoleId                       | **Type** reference  
**Properties** Create, Filter, Group, Nillable, Sort, Update  
**Description** The ID of the parent role. |
| PortalAccountId                    | **Type** reference  
**Properties** Create, Filter, Group, Nillable, Sort  
**Description** The ID of the role's associated portal account. This field is read-only. |
| PortalAccountOwnerId               | **Type** reference  
**Properties** Filter, Group, Nillable, Sort  
**Description** The ID of the role's associated portal account's owner. This field is read-only. |
| PortalRole                         | **Type** picklist  
**Properties** Filter, Group, Nillable, Restricted picklist, Sort |
### Portal Type

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **PortalType** | **Type**  
picklist  

**Properties**
Create, Filter, Group, Nillable, Restricted picklist, Sort

**Description**
This value indicates the type of portal for the role:
- None: Salesforce application role.
- Partner: partner portal role. The field `IsPartner` used in release 8.0 will map to this value.

This field replaces `IsPartner` beginning with release 9.0.

### Rollup Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **RollupDescription** | **Type**  
string  

**Properties**
Create, Filter, Group, Nillable, Sort, Update

**Description**
Description of the forecast rollup. Label is `Description`.

---

### Usage

Use this object to query the set of currently configured user roles in your organization. Use it in your client application to obtain valid UserRole IDs to use when querying or modifying a User record.

Users with the View Roles and Role Hierarchy permission can query or describe this object. If your client application logs in with the “Manage Users” permission, it can query, create, update, or delete UserRole records.

**Note:** You can’t update any field for a portal role.

For example, the following code finds all roles that are not assigned to any users.

```sql
SELECT Id, Name, DeveloperName
FROM UserRole
WHERE Id NOT IN (SELECT UserRoleId
FROM User
WHERE UserRoleId !='000000000000000')
```

SEE ALSO:
- Object Basics
UserServicePresence

Represents a presence user's real-time presence status. This object is available in API version 32.0 and later.

Supported Calls

delete(), query(), getDeleted(), getUpdated(), retrieve(), undelete()

Special Access Rules

To access this object, Omni-Channel must be enabled.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConfiguredCapacity</td>
<td><strong>Type</strong> int&lt;br&gt;<strong>Properties</strong> Filter, Group, Nillable, Sort&lt;br&gt;<strong>Description</strong> The user's total configured capacity.</td>
</tr>
<tr>
<td>IsAway</td>
<td><strong>Type</strong> boolean&lt;br&gt;<strong>Properties</strong> Defaulted on create, Filter, Group, Sort&lt;br&gt;<strong>Description</strong> Indicates whether the user's status is Away.</td>
</tr>
<tr>
<td>Name</td>
<td><strong>Type</strong> string&lt;br&gt;<strong>Properties</strong> Create, Filter, Nillable, Sort, Update&lt;br&gt;<strong>Description</strong> An automatically generated ID number that identifies the record.</td>
</tr>
<tr>
<td>OwnerId</td>
<td><strong>Type</strong> reference&lt;br&gt;<strong>Properties</strong> Filter, Group, Sort</td>
</tr>
</tbody>
</table>
### Field: ServicePresenceStatusId

**Type**: reference

**Properties**: Create, Filter, Nillable, Sort, Update

**Description**: The ID of the presence status that's associated with the presence user that's specified by the UserId.

### Field: UserId

**Type**: string

**Properties**: Create, Filter, Group, Sort, Update

**Description**: The ID of the Omni-Channel user.

### Usage

Apex triggers aren't supported with UserServicePresence.

Sharing rules aren't supported with UserServicePresence even if the OwnerId field is enabled.

In API version 41.0 or later, UserServicePresence records can be deleted programmatically. The “Customize Application” permission is required.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **UserServicePresenceOwnerSharingRule**: Sharing rules are available for the object.
- **UserServicePresenceShare**: Sharing is available for the object.

### UserShare

Represents a sharing entry on a user record. This object is available in API version 26.0 and later.
Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

As of Summer '20 and later, only standard users or users with the Customize Application permission can access this object.

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| IsActive         | Type: boolean  
                    Properties: Defaulted on create, Filter, Group, Sort  
                    Description: Read-only. Indicates whether the User has access to log in (true) or not (false). You can modify a User's active status from the user interface or via the API. |
| RowCause         | Type: picklist  
                    Properties: Create, Filter, Group, Nillable, Restricted picklist, Sort  
                    Description: Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to Manual (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings. Possible values include:  
                    • Manual—The User or Group has access to the user record because a User with “All” access manually shared the User with them.  
                    • Rule—The User or Group has access to the user record via a User sharing rule.  
                    • GuestRule—The User or Group has access via a User guest user sharing rule.  
                    • LpuImplicit—The User has access to records owned by high-volume Experience Cloud site users via a share group. |
| UserAccessLevel  | Type: picklist  
                    Properties: Create, Filter, Group, Restricted picklist, Sort, Update |
### Description
Level of access that the User or Group has to the specified user. The specified user is denoted by the UserId. The possible values are:

- Read
- Edit

This field must be set to an access level that is at least equal to the organization’s default UserAccessLevel.

UserAccessLevel can be updated only if RowCause is set to Manual Sharing.

<table>

</tbody>
</table>

| **UserOrGroupId** |         |
| **Type**         | reference |
| **Properties**   | Create, Filter, Group, Sort |
| **Description**  | ID of the User or Group that has been given access to the User. This field can’t be updated. This is a polymorphic relationship field. |
| **Relationship Name** | UserOrGroup |
| **Relationship Type** | Lookup |
| **Refers To**    | Group, User |
Usage
This object allows you to determine which users and groups can view or edit User records owned by other users.

UserTeamMember

Represents a single User on the default opportunity team of another User.

Supported Calls
create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules
- This object is available only in organizations that have enabled the team selling functionality.
- Customer Portal users can’t access this object.

Fields

<table>
<thead>

</tbody>
</table>
### User Territory

Represents a User who has been assigned to a Territory.

**Note:** The original territory management feature is now unavailable. For more information, see [The Original Territory Management Module Will Be Retired in the Summer '21 Release](#). The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

#### Supported Calls

- `create()`
- `delete()`
- `describeSObjects()`
- `getDeleted()`
- `getUpdated()`
- `query()`
- `retrieve()`

#### Special Access Rules

- Only available if territory management has been enabled for your organization.
- As of Spring '20 and later, only users with the View Setup and Configuration permission can access this object, and only users with the Manage Territories permission can edit this object.
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| IsActive | **Type**
  boolean  

**Properties**
Defaulted on create, Filter

**Description**
Indicates whether the user is active in the given territory (true), or inactive in the given territory (false):

- Users who are active in a territory are explicitly assigned to the territory and can have open opportunities, closed opportunities, or no opportunities associated with that territory.
- Users who are inactive in a territory are not explicitly assigned to the territory, but own an open or closed opportunity that is associated with the territory. For example, a user may have been transferred out of a territory, but still own opportunities in his or her old territory.

Until a user is deleted from a territory (not simply removed from the territory), the record is not returned in a `getDeleted()` call.

| IsDeleted | **Type**
  boolean  

**Properties**
Defaulted on create, Filter

**Description**
Indicates whether the object has been moved to the Recycle Bin (true) or not (false). Label is **Deleted**.

| TerritoryId | **Type**
  reference  

**Properties**
Create, Filter

**Description**
ID of the Territory to which the user has been assigned. This field is required when creating a record in API version 20.0 and later.

| UserId | **Type**
  reference  

**Properties**
Create, Filter

**Description**
ID of the user. This field is required when creating a record.
Usage

If a user is inactive in a territory, and the opportunities they own that are associated with the territory are all closed, the user is not returned in the Territories related list on the User page in Setup. Regardless of whether the user is inactive or the opportunities are closed, the user is returned in the Quotas related list.

SEE ALSO:
- Territory
- AccountTerritoryAssignmentRule
- AccountTerritoryAssignmentRuleItem

UserTerritory2Association

Represents an association (by assignment) between a territory and a user record. Available only if Enterprise Territory Management has been enabled for your organization.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve()

Special Access Rules

As of Summer ’20 and later, only standard and partner users can access this object. If a territory model is in Active state, any standard or partner user can view that model, including its territories and assignment rules. For territories in an active model, any standard or partner user can view assigned records and assigned users subject to your org’s sharing settings. Users cannot view territory models in other states (such as Planning or Archived).

Fields

<table>
<thead>
<tr>
<th>Field Name</th>

### UserWorkList

Represents a list of work items in the My Feed tab for High Velocity Sales users.

#### Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

#### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>IsActive</td>
<td>Type</td>

<td>Type</td>
</tr>
<tr>
<td></td>
<td>picklist</td>
</tr>
</tbody>
</table>
### Properties

**DetailsField**
- **Properties**: Create, Filter, Group, Nillable, Restricted picklist, Sort, Update
- **Description**: The type of list, such as a call or email.

**Name**
- **Type**: string
- **Properties**: Create, Filter, Group, idLookup, Sort, Update
- **Description**: The name of the work list.

**OwnerId**
- **Type**: reference
- **Properties**: Create, Defaulted on create, Filter, Group, Sort, Update
- **Description**: The owner of the list.

### UserWorkListItem

Represents an individual work item in the My Feed tab for High Velocity Sales users.

### Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

### Fields

#### PriorityOrder
- **Type**: int
- **Properties**: Filter, Group, Nillable, Sort
- **Description**: The order of the item in the list.
**VerificationHistory**

Represents the past six months of your org users’ attempts to verify their identity. This object is available in API version 36.0 and later.

**Supported Calls**

describeSObjects(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

**Special Access Rules**

Only users with Manage Users permission can access this object.

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| **Activity** | Type: picklist  
*Properties*: Filter, Group, Restricted picklist, Sort  
*Description*: The action the user attempted that requires identity verification. The label is User Activity. Available values are:  
- **AccessReports**—The user attempted to access reports or dashboards. |
### Standard Objects

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Apex</td>
<td>The user attempted to access a Salesforce resource with a verification Apex method.</td>
</tr>
<tr>
<td>• ChangeEmail</td>
<td>The user attempted to change an email address.</td>
</tr>
<tr>
<td>• ConnectSms</td>
<td>The user attempted to connect a phone number.</td>
</tr>
<tr>
<td>• ConnectToopher</td>
<td>The user attempted to connect Salesforce Authenticator.</td>
</tr>
<tr>
<td>• ConnectTotp</td>
<td>The user attempted to connect a one-time password generator.</td>
</tr>
<tr>
<td>• ConnectU2F</td>
<td>The user attempted to register a U2F security key.</td>
</tr>
<tr>
<td>• ConnectWebAuth</td>
<td>The user attempted to register a built-in authenticator.</td>
</tr>
<tr>
<td>• ConnectedApp</td>
<td>The user attempted to access a connected app.</td>
</tr>
<tr>
<td>• EnableLL</td>
<td>The user attempted to enroll in Lightning Login.</td>
</tr>
<tr>
<td>• ExportPrintReports</td>
<td>The user attempted to export or print reports or dashboards.</td>
</tr>
<tr>
<td>• ExtraVerification</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>• ListView</td>
<td>The user attempted to access a list view.</td>
</tr>
<tr>
<td>• Login</td>
<td>The user attempted to log in.</td>
</tr>
<tr>
<td>• Registration</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>• TempCode</td>
<td>The user attempted to generate a temporary verification code.</td>
</tr>
</tbody>
</table>

#### EventGroup

<table>
<thead>
<tr>
<th>Type</th>
<th>int</th>
</tr>
</thead>
</table>

#### Properties

Filter, Group, Sort

#### Description

ID of the verification attempt. Verification can involve several attempts and use different verification methods. For example, in a user’s session, a user enters an invalid verification code (first attempt). The user then enters the correct code and successfully verifies identity (second attempt). Both attempts are part of a single verification and, therefore, have the same ID. The label is Verification Attempt.

#### LoginGeoId

<table>
<thead>
<tr>
<th>Type</th>
<th>reference</th>
</tr>
</thead>
</table>

#### Properties

Filter, Group, Nillable, Sort

#### Description

The 18-character ID for the record of the geographic location of the user for a successful or unsuccessful identity verification attempt. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) can vary.

This is a relationship field.
### LoginHistoryId

**Type**
- reference

**Properties**
- Filter, Group, Sort

**Description**
The ID for the record of the user's successful or unsuccessful login attempt. This is a relationship field.

### Policy

**Type**
- picklist

**Properties**
- Filter, Group, Restricted picklist, Sort

**Description**
The identity verification security policy or setting. The label is Triggered By. Available values are:

- **CustomApex** — Identity verification made by a verification Apex method.
- **DeviceActivation** — Identity verification required for users logging in from an unrecognized device or new IP address. This verification is part of Salesforce's risk-based authentication.
- **EnableLightningLogin** — Identity verification required for users enrolling in Lightning Login. This verification is triggered when the user attempts to enroll. Users are eligible to enroll if they have the Lightning Login User user permission and the org has enabled Allow Lightning Login in Session Settings.
- **ExtraVerification** — Reserved for future use.
- **HighAssurance** — High assurance session required for resource access. This verification is triggered when the user tries to access a resource, such as a connected app, report, or dashboard, that requires a high-assurance session level.
• **LightningLogin**—Identity verification required for internal users logging in via Lightning Login. This verification is triggered when the enrolled user attempts to log in. Users are eligible to log in if they have the Lightning Login User user permission and have successfully enrolled in Lightning Login. Also, from Session Settings in Setup, Allow Lightning Login must be enabled.

• **PageAccess**—Identity verification required for users attempting to perform an action, such as changing an email address or adding a verification method for multi-factor authentication (MFA).

• **PasswordlessLogin**—Identity verification required for customers attempting to log in to an Experience Cloud site that is set up for passwordless login. The admin controls which registered verification methods can be used, for example, email, SMS, Salesforce Authenticator, or TOTP.

• **ProfilePolicy**—Session security level required at login. This verification is triggered by the Session security level required at login setting on the user’s profile.

• **TwoFactorAuthentication**—Multi-factor authentication (formerly called two-factor authentication) required at login. This verification is triggered by the Multi-Factor Authentication for User Interface Logins user permission assigned to a custom profile. Or the user permission is included in a permission set that is assigned to a user.

---

### Remarks

**Type**
string

**Properties**
Filter, Group, Nillable, Sort

**Description**
The text the user sees on the page or in Salesforce Authenticator when prompted to verify identity. For example, if identity verification is required for a user’s login, the user sees “You’re trying to Log In to Salesforce.” In this case, the Remarks value is “Log In to Salesforce.” But if the Activity value is Apex, the Remarks value is a custom description passed by an Apex method. If the user is verifying identity using Salesforce Authenticator, the custom description also appears in the app. If the custom description isn’t specified, the value is the name of the Apex method. The label is Activity Message.

---

### ResourceId

**Type**
reference

**Properties**
Filter, Group, Nillable, Sort

**Description**
If the Activity value is ConnectedApp, the ResourceId value is the ID of the connected app. The label is Connected App ID.

This is a relationship field.
**Field Name** | **Details**
--- | ---
**SourceIp** | **Type**
string

**Properties**
Filter, Group, Sort

**Description**
The IP address of the machine from which the user attempted the action that requires identity verification. For example, the IP address of the machine from where the user tried to log in or access reports. If it’s a non-login action that required verification, the IP address can be different from the address from where the user logged in. This address can be an IPv4 or IPv6 address.

**Status** | **Type**
picklist

**Properties**
Filter, Group, Restricted picklist, Sort

**Description**
The status of the identity verification attempt. Available values are:
- **AutomatedSuccess**—Salesforce Authenticator approved the request for access because the request came from a trusted location. After users enable location services in Salesforce Authenticator, they can designate trusted locations. When a user trusts a location for a particular activity, such as logging in from a recognized device, that activity is approved from the trusted location for as long as the location is trusted.
- **Denied**—The user denied the approval request in the authenticator app, such as Salesforce Authenticator.
- **FailedGeneralError**—An error caused by something other than an invalid verification code, too many verification attempts, or authenticator app connectivity.
- **FailedInvalidCode**—The user entered an invalid verification code.
- **FailedInvalidPassword**—The user entered an invalid password.
- **FailedPasswordLockout**—The user attempted to enter a password too many times.
- **FailedTooManyAttempts**—The user attempted to verify identity too many times. For example, the user entered an invalid verification code repeatedly.
• **Initiated**—Salesforce initiated identity verification but hasn’t yet challenged the user.

• **InProgress**—Salesforce challenged the user to verify identity and is waiting for the user to respond or for Salesforce Authenticator to send an automated response.

• **RecoverableError**—Salesforce can’t reach the authenticator app to verify identity, but it continues to retry.

• **ReportedDenied**—The user denied the approval request in the authenticator app, such as Salesforce Authenticator, and also flagged the approval request to report to an administrator.

• **Succeeded**—The user’s identity was verified.

</tr>
</thead>
<tbody>
<tr>
<td><strong>Initiated</strong></td>
<td>Salesforce initiated identity verification but hasn’t yet challenged the user.</td>
</tr>
<tr>
<td><strong>InProgress</strong></td>
<td>Salesforce challenged the user to verify identity and is waiting for the user to respond or for Salesforce Authenticator to send an automated response.</td>
</tr>
<tr>
<td><strong>RecoverableError</strong></td>
<td>Salesforce can’t reach the authenticator app to verify identity, but it continues to retry.</td>
</tr>
<tr>
<td><strong>ReportedDenied</strong></td>
<td>The user denied the approval request in the authenticator app, such as Salesforce Authenticator, and also flagged the approval request to report to an administrator.</td>
</tr>
<tr>
<td><strong>Succeeded</strong></td>
<td>The user’s identity was verified.</td>
</tr>
</tbody>
</table>

### Type Reference

**UserId**

- **Type**: reference

**Properties**

Filter, Group, Sort

**Description**

ID of the user verifying identity.

This is a relationship field.

**Relationship Name**

User

**Relationship Type**

Lookup

**Refers To**

User

**VerificationMethod**

- **Type**: picklist

**Properties**

Filter, Group, Nillable, Restricted picklist, Sort

**Description**

The method by which the user attempted to verify identity in the verification event. The label is Method. Available values are:

- **BuiltInAuthenticator**—A built-in authenticator set up on the user’s device, such as Touch ID or Windows Hello, generated the required credentials. This value is available in API version 53.0 and later.

- **Email**—Salesforce sent an email with a verification code to the address associated with the user’s account.

- **EnableLL**—Salesforce Authenticator sent a notification to the user’s mobile device to enroll in Lightning Login. This value is available in API version 38.0 and later.
### Details

- **LL**—Salesforce Authenticator sent a notification to the user’s mobile device to approve login via Lightning Login. This value is available in API version 38.0 and later.
- **SalesforceAuthenticator**—Salesforce Authenticator sent a notification to the user’s mobile device to verify account activity.
- **Sms**—Salesforce sent a text message with a verification code to the user’s mobile device. SMS messaging requires a Salesforce add-on license for Identity Verification Credits.
- **TempCode**—A Salesforce admin or a user with the Manage Multi-Factor Authentication in User Interface permission generated a temporary verification code for the user. This value is available in API version 37.0 and later.
- **Totp**—An authenticator app generated a time-based, one-time password (TOTP) on the user’s mobile device.
- **U2F**—A U2F security key generated required credentials for the user. This value is available in API version 38.0 and later.

### VerificationTime

**Type**

dateTime

**Properties**

- Filter, Sort

**Description**

The date and time of the identity verification attempt, for example, 7/19/2025, 3:19:13 PM PDT. The time zone is based on GMT. The label is Time.

### Usage

Here are two examples of the types of API queries you can perform.

<table>
<thead>
<tr>
<th>Query</th>
<th>String</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show verification history for a user’s login record</td>
<td>SELECT Activity, EventGroup, Policy, Remarks, Status, UserId, VerificationMethod, VerificationTime FROM VerificationHistory WHERE LoginHistoryId = '0YaD000#########'</td>
</tr>
<tr>
<td>Get detailed geographic location information for a user's verification attempt</td>
<td>SELECT City, CountryIso, Latitude, Longitude, PostalCode FROM LoginGeo WHERE LoginGeoId = '0LE####################################################'</td>
</tr>
</tbody>
</table>

### VisualforceAccessMetrics

Represents summary statistics for Visualforce pages.
Supported Calls

count(), describeSObjects(), query(), retrieve()

Special Access Rules

As of Spring '20 and later, to access VisualforceAccessMetrics, users must have the Customize Application permission.

Fields

3468
Details

Field | Details
--- | ---

**Properties**
Aggregate, Filter, Group, Nillable, Sort

**Description**
The number of views received by the specified Visualforce page.

**MetricsDate**

**Type**
date

**Properties**
Aggregate, Filter, Group, Sort

**Description**
The date the metrics are queried.

**LogDate**

**Type**
date

**Properties**
Aggregate, Filter, Group, Nillable, Sort

**Description**
The most recent page access date.

Usage

Use this object to query information on the Visualforce pages in your org.

```
SELECT ApexPageId, DailyPageViewCount, Id, ProfileId, MetricsDate, LogDate FROM VisualforceAccessMetrics
```

VideoCall

Represents a video call.

One VideoCall record can be related to several VideoCallRecording records — for example, a video call can have several video recordings and a transcript. As well, one video call record can be associated with several video call participant records.

This object is available in API version 51.0 and later.

Supported Calls

delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update()
### Fields

</tbody>
</table>
Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

*VideoCallChangeEvent (API version 51.0)*

Change events are available for the object.

SEE ALSO:

- VideoCallParticipant
- VideoCallRecording

VideoCallParticipant

Represents a participant in a video call.

Participant information can come from the video call provider (for example, Zoom), or Salesforce.

This object is available in API version 51.0 and later.

Supported Calls

delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete()
<table>

|                           | Description | The status of a phone call. For Dialer, this field is used to determine whether a phone call is in progress, busy, or failed. For Service Cloud Voice, the following status values are possible:  
  • new—Indicates that the VoiceCall record has been created.  
  • in-progress—Indicates that the call has been accepted (or, for outbound messages, initiated) by an agent.  
  • completed—Indicates that the call has ended, which includes calls that are transferred. (If a call is transferred, another VoiceCall record is created to track the state of the transferred call.) If After Conversation Work (ACW) is enabled, that work begins after the call has completed. |

- Filter, Group, Nillable, Restricted picklist, Sort

**Description**
- The number displayed for outbound calls. The possible values are:
  - VendorLine
  - CompanyNumber
  - LocalPresence
  - CustomCallerId

#### CallQueuedDateTime

**Type**
- dateTime

**Properties**
- Filter, Nillable, Sort

**Description**
- The date and time when a call is added to a queue to be routed to an agent. Available only if Service Cloud Voice is enabled. Available in API version 49.0 and later.

#### CallRecordingId

**Type**
- reference

**Properties**
- Filter, Group, Nillable, Sort

**Description**
- The ID of the related call recording. Removed in API version 48.0 and later.
  - This is a relationship field.

**Relationship Name**
- CallRecording

**Relationship Type**
- Lookup

**Refers To**
- VoiceCallRecording

#### CallResolution

**Type**
- picklist

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **VoiceCallChangeEvent** *(API version 48.0)*
  - Change events are available for the object.

- **VoiceCallFeed** *(Available in API version 50.0 and later.)*
  - Feed tracking is available for the object.

- **VoiceCallOwnerSharingRule**
  - Sharing rules are available for the object.

- **VoiceCallShare**
  - Sharing is available for the object.

### VoiceCallList

Represents a prioritized list of numbers to call.
Supported Calls
create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules
As of Spring ’20 and later, only your Salesforce org’s internal users can access this object.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| IsActive   | Type: boolean  
Properties: Create, Defaulted on create, Filter, Group, Sort, Update  
Description: Whether the call list is active or not. |
| Name       | Type: string  
Properties: Create, Filter, Group, idLookup, Sort, Update  
Description: The name of the call list. |
| OwnerId    | Type: reference  
Properties: Create, Defaulted on create, Filter, Group, Sort, Update  
Description: The ID of the call list owner. |

Associated Objects
This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**VoiceCallListOwnerSharingRule**
Sharing rules are available for the object.

**VoiceCallListShare**
Sharing is available for the object.
VoiceCallListItem

Represents a single phone number in a prioritized call list.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

As of Spring ’20 and later, only your Salesforce org’s internal users can access this object.

</tbody>
</table>
Associated Objects
This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**VoiceCallQualityFeedbackOwnerSharingRule**
- Sharing rules are available for the object.

**VoiceCallQualityFeedbackShare**
- Sharing is available for the object.

**VoiceCallRecording**
Represents a call recording in Service Cloud Voice and Sales Dialer. Call recordings for Service Cloud Voice with Amazon Connect and for Service Cloud Voice with Partner Telephony from Amazon Connect are stored in S3 buckets on your Amazon Web Services (AWS) account and can be accessed via AWS. Call recordings for Sales Dialer are saved as files in Salesforce.

**Supported Calls**
create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

**Special Access Rules**
As of Spring '20 and later, only your Salesforce org's internal users can access this object.
