
SOAP API Developer Guide

Version 54.0, Spring '22

CONTENTS

GETTING STARTED	1
Chapter 1: Introducing SOAP API	1
Customize, Integrate, and Extend Your Salesforce Solutions	2
Supported Salesforce Editions	2
Standards Compliance	2
Development Platforms	2
SOAP API Support Policy	3
API End-of-Life	3
Choosing a WSDL	4
Related Resources	4
Quick Start	4
Step 1: Sign up for Salesforce Developer Edition	4
Step 2: Generate or Obtain the Web Service WSDL	5
Step 3: Import the WSDL File Into Your Development Platform	5
Step 4: Walk Through the Sample Code	7
Chapter 2: Object Basics	29
Primitive Data Types	30
Field Types	32
Compound Fields	38
Address Compound Fields	39
Geolocation Compound Field	41
Compound Field Considerations and Limitations	42
API Data Types and Salesforce Field Types	44
Core Data Types Used in API Calls	45
sObject	45
API Fault Element	45
ExceptionCode	46
Error	51
StatusCode	51
ExtendedErrorDetails	61
ExtendedErrorCode	61
Duplicate Management Data Types	62
System Fields	70
Required Fields	71
Frequently-Occurring Fields	71
API Field Properties	72
Relationships Among Objects	73

Contents

Relabeling Fields and Tabs and the API	74
Tooling API Objects in the Enterprise WSDL	74
Salesforce AppExchange Object Prefixes and the API	75
Custom Object Behavior	75
External Objects	78
Chapter 3: Call Basics	81
Characteristics of API Calls	82
Factors that Affect Data Access	82
Package Version Settings	84
Chapter 4: Error Handling	86
Error Handling for Session Expiration	87
More About Error Handling	87
Chapter 5: Security	88
User Authentication	89
User Profile and Permission Sets Configuration	89
Security Token	89
Sharing	90
Implicit Restrictions for Objects and Fields	91
API Access in Salesforce AppExchange Packages	91
Outbound Port Restrictions	93
Chapter 6: Using the Partner WSDL	94
Obtaining the Partner WSDL File	95
Calls and the Partner WSDL	95
Objects, Fields, and Field Data and the Partner WSDL	96
Queries and the Partner WSDL	96
Namespaces in the Partner WSDL	97
Package Versions and the Partner WSDL	97
User Interface Themes	98
Examples Using the Partner WSDL	98
Sample query and queryMore Calls	102
Sample search Call	104
Sample create Call	107
Sample update Call	110
REFERENCE	113
Chapter 7: Data Model	113
Sales Objects	114
Task and Event Objects	114
Service Cloud Objects	114
Document, Note, and Attachment Objects	115

Contents

User, Sharing, and Permission Objects	116
User Email Objects	117
Profile and Permission Objects	118
Record Type Objects	120
Product and Price Book Objects	120
Sharing and Team Selling Objects	121
Forecasts Objects	121
Territory Management 2.0 Objects	122
Original Territory Management	123
Process Objects	125
Content Objects	126
ContentNote Objects	126
Chatter Objects	127
Chatter Feed Objects	129
Salesforce Knowledge Objects	129
Consent Management Objects	132
WDC Badge and Reward Objects	133
WDC Feedback and Performance Cycle Objects	134
Chapter 8: Standard Objects	135

GETTING STARTED

CHAPTER 1 Introducing SOAP API

In this chapter ...

- [Customize, Integrate, and Extend Your Salesforce Solutions](#)
- [Supported Salesforce Editions](#)
- [Standards Compliance](#)
- [Development Platforms](#)
- [SOAP API Support Policy](#)
- [API End-of-Life](#)
- [Choosing a WSDL](#)
- [Related Resources](#)
- [Quick Start](#)

Salesforce provides programmatic access to your org's information using simple, powerful, and secure application programming interfaces. To use this document, you should have a basic familiarity with software development, web services, and the Salesforce user interface.

Any functionality described in this guide is available if your org has the API feature enabled. This feature is enabled by default for Performance, Unlimited, Enterprise, and Developer Editions. Some Professional Edition orgs have the API enabled. If you can't access the features you see in this guide, contact Salesforce.

Salesforce offers several APIs in addition to SOAP API. If you're wondering whether SOAP API is the right tool to use, check out [Which API Do I Use?](#) in *Salesforce Help*.

Note: Salesforce Education Services offers a suite of training courses to enable developers to design, create, integrate, and extend applications built on the Lightning platform. Be sure to visit <https://trailhead.salesforce.com/> to learn more.

Customize, Integrate, and Extend Your Salesforce Solutions

The Lightning Platform allows you to customize, integrate, and extend your Salesforce organization using the language and platform of your choice:

- **Customize Salesforce** with custom fields, links, objects, page layouts, buttons, record types, s-controls, and tabs to meet specific business requirements.
- **Integrate Salesforce** with your org's ERP and finance systems. Deliver real-time sales and support information to company portals and populate critical business systems with customer information.
- **Extend Salesforce** in presentation, business logic, and data services with new functionality that reflects the business requirements of your org.

For more information about Lightning Platform solutions and developer resources, go to [Salesforce Developers](#).

Supported Salesforce Editions

To use SOAP API, your org must use Enterprise Edition, Performance Edition, Unlimited Edition, or Developer Edition. If you're an existing Salesforce customer and want to upgrade to Enterprise, Unlimited, or Performance Edition, contact your account representative.

It is recommended that you use Developer Sandbox to develop Web service client applications. Developer Sandbox is an exact replica of your Salesforce deployment, including all customization and data. For more information, see [Deploy Enhancements from Sandboxes](#).

Developer Edition provides access to all features available with Enterprise Edition. Developer Edition is constrained only by the number of users and the amount of storage space. Developer Edition provides a development context that allows you to build and test your solutions without affecting your org's live data. Developer Edition accounts are available for free at developer.salesforce.com/gettingstarted.

Standards Compliance

SOAP API is implemented to comply with the following specifications:

Standard Name	Website
Simple Object Access Protocol (SOAP) 1.1	https://www.w3.org/TR/2000/NOTE-SOAP-20000508/
Web Service Description Language (WSDL) 1.1	http://www.w3.org/TR/2001/NOTE-wsdl-20010315
WS-I Basic Profile 1.1	http://www.ws-i.org/Profiles/BasicProfile-1.1-2004-08-24.html

Development Platforms

SOAP API works with current SOAP development environments, including, but not limited to, Visual Studio .NET 2005. In this document, we provide examples in Java and C# (.NET). The Java examples are based on WSC 20.0 (WSC) and JDK 6 (Java Platform Standard Edition Development Kit 6). Other versions of WSC are available at <https://github.com/forcedotcom/wsc> and <http://mvnrepository.com/artifact/com.force.api/force-wsc>. To see a complete list of compatible development platforms and more sample code, go to developer.salesforce.com.

-  **Note:** Development platforms vary in their SOAP implementations. Implementation differences in certain development platforms might prevent access to some or all features of the API. If you are using Visual Studio for .NET development, we recommend that you use Visual Studio 2003 or higher.

SOAP API Support Policy

Salesforce recommends that your new client applications use the most recent version of the Lightning Platform WSDL file to fully exploit the benefits of richer features and greater efficiency. You can navigate to the most recent WSDL for your organization from Setup by entering *API* in the Quick Find box, then selecting **API**. When a new version is released, use the following steps in [Quick Start](#) to update your WSDL:

- Regenerate the WSDL file (see [Step 2: Generate or Obtain the Web Service WSDL](#))
- Import it into your environment (see [Step 3: Import the WSDL File Into Your Development Platform](#))

Backward Compatibility

Salesforce strives to make backward compatibility easy when using the Lightning platform.

Each new Salesforce release consists of two components:

- A new release of platform software that resides on Salesforce systems
- A new version of SOAP API

For example, the Winter '07 release included SOAP API version 9.0 and the Summer '07 release included SOAP API version 10.0.

We maintain support for each SOAP API version across releases of the platform software. SOAP API is backward compatible in that an application created to work with a given SOAP API version will continue to work with that same SOAP API version in future platform software releases.

Salesforce does not guarantee that an application written against one SOAP API version will work with future SOAP API versions: Changes in method signatures and data representations are often required as we continue to enhance SOAP API. However, we strive to keep SOAP API consistent from version to version with minimal, if any, changes required to port applications to newer SOAP API versions.

For example, an application written using SOAP API version 9.0 which shipped with the Winter '07 release will continue to work with SOAP API version 9.0 on the Summer '07 release and on future releases beyond that. However, that same application may not work with SOAP API version 10 without modifications to the application.

API End-of-Life

Salesforce is committed to supporting each API version for a minimum of three years from the date of first release. In order to mature and improve the quality and performance of the API, versions that are more than three years old might cease to be supported.

When an API version is to be deprecated, advance notice is given at least one year before support ends. Salesforce will directly notify customers using API versions planned for deprecation.

-  **Note:** Versions 7.0 through 20.0 of SOAP API have now been deprecated and are no longer supported. You can continue to access these legacy API versions until Summer '22 is released, at which point these legacy versions will be retired and will become unavailable. For more information, see this Knowledge Article: [Salesforce Platform API Versions 7.0 through 20.0 Retirement](#).
-  **Note:** Versions 21.0 through 30.0 of SOAP API will be deprecated in the Summer '22 release. For more information, see this Knowledge Article: [Salesforce Platform API Versions 21.0 through 30.0 Retirement](#).

Choosing a WSDL

There are two Lightning Platform Web services for which you can obtain WSDL files for API access:

- **Lightning Platform Enterprise WSDL**—This API is for most enterprise users who are developing client applications for their org. The enterprise WSDL file is a strongly typed representation of your org's data. It provides information about your schema, data types, and fields to your development environment, allowing for a tighter integration between it and the Lightning Platform Web service. This WSDL changes if custom fields or custom objects are added to, renamed, or removed from, your org's Salesforce configuration. If you are downloading an enterprise WSDL and you have managed packages installed in your organization, you need to take an extra step to select the version of each installed package to include in the generated WSDL.

Note the following when generating the enterprise WSDL:

- If new custom fields or objects are added to, renamed, or removed from your org's information, you must regenerate the WSDL file to access them.
 - The generated WSDL contains the objects and fields in your org, including those available in the selected versions of each installed package. If a field or object is added in a later package version, you must generate the enterprise WSDL with that package version to work with the object or field in your API integration.
- **Lightning Platform Partner WSDL**—This API is for Salesforce partners who are developing client applications for multiple orgs. As a loosely-typed representation of the Salesforce object model, the [partner WSDL](#) can be used to access data within any org.

Related Resources

The Salesforce developer website provides a full suite of developer toolkits, sample code, sample SOAP messages, community-based support, and other resources to help you with your development projects. Be sure to visit developer.salesforce.com for more information, or visit developer.salesforce.com/signup to sign up for a free Developer Edition account.

You can visit these websites to find out more about Salesforce applications:

- [Salesforce](#) for information about the Salesforce application.
- [Salesforce AppExchange](#) for access to apps created for Salesforce.
- [Trailblazer Community](#) for services to ensure Salesforce customer success.

Quick Start

Use this quick start to create a sample application in your development environment.

-  **Note:** Before you begin building an integration or other client application:
 - Install your development platform according to its product documentation.
 - Read through all the steps before beginning this quick start. You may also wish to review the rest of this document to familiarize yourself with terms and concepts.

Step 1: Sign up for Salesforce Developer Edition

Use Salesforce Developer Edition to develop, stage, and test your API code against sample data.

Using a separate org to develop your applications protects your live data during testing. This recommendation is especially true for applications that insert, update, or delete data (as opposed to simply reading data). After you've tested your code, you can implement it in an edition with API access.

To create a Developer Edition org, go to developer.salesforce.com/signup and follow the instructions for signing up for a Developer Edition organization.

If you already have a Developer Edition organization, verify that your user profile has the API Enabled permission. This permission is enabled by default, but may have been changed by an administrator. For more information, see Salesforce Help.

Step 2: Generate or Obtain the Web Service WSDL

To access the Lightning Platform Web service, you need a Web Service Description Language (WSDL) file. The WSDL file defines the Web service that is available to you. Your development platform uses this WSDL to generate an API to access the Lightning Platform Web service it defines. You can either obtain the WSDL file from your organization's Salesforce administrator or you can generate it yourself if you have access to the WSDL download page in the Salesforce user interface. You can navigate to the most recent WSDL for your organization from Setup by entering *API* in the Quick Find box, then selecting **API**.

For more information about WSDL, see <http://www.w3.org/TR/wsdl>.

Generating the WSDL File for Your Organization

Any user with the Modify All Data permission can download the Web Services Description Language (WSDL) file to integrate and extend Salesforce using the API. (The System Administrator profile has this permission.)

The WSDL file is dynamically generated based on which type of WSDL file (enterprise or partner) you download. The generated WSDL defines all of the API calls, objects (including standard and custom objects), and fields that are available for API access for your organization.

To generate the WSDL file for your organization:

1. Log in to your Enterprise, Unlimited, Performance, or Developer Edition Salesforce account. You must log in as an administrator or as a user who has the "Modify All Data" permission. Logins are checked to ensure they are from a known IP address. For more information, see [Security and the API](#).
2. From Setup, enter *API* in the Quick Find box, then select **API** to display the WSDL download page.
3. Download the [appropriate WSDL](#):
 - If you're downloading an enterprise WSDL and you have managed packages installed in your org, click **Generate Enterprise WSDL**. Select the version of each installed package to include in the generated WSDL. By default, it is set to the latest installed versions of the packages.
 - Otherwise, right-click the link for the appropriate WSDL document to save it to a local directory. In the menu, Internet Explorer users can choose **Save Target As**, while Google Chrome and Mozilla Firefox users can choose **Save Link As**.

Step 3: Import the WSDL File Into Your Development Platform

Once you have the WSDL file, you need to import it into your development platform so that your development environment can generate the necessary objects for use in building client Web service applications in that environment. This section provides sample instructions for WSC and Microsoft Visual Studio. For instructions about other development platforms, see your platform's product documentation.

 **Note:** The process for importing WSDL files is identical for the enterprise and partner WSDL files.

Instructions for Java Environments (WSC)

Java environments access the API through Java objects that serve as proxies for their server-side counterparts. Before using the API, you must first generate these objects from your organization's WSDL file.

Each SOAP client has its own tool for this process. For WSC, use the `wSDLc` utility.

 **Note:** Before you run `wsdlc`, you must have the WSC JAR file installed on your system and referenced in your classpath.

The basic syntax for `wsdlc` is:

```
java -classpath pathToJAR/wsc-22.jar com.sforce.ws.tools.wsdlc pathToWsdL/WsdLFilename
pathToOutputJar/OutputJarFilename
```

This command generates an output jar file based on the specified WSDL file. After the output jar file is created, reference it along with the wsc jar file (for example, `wsc-22.jar`) in your Java program to create a client application.

Instructions for Microsoft Visual Studio

Visual Studio languages access the API through objects that serve as proxies for their server-side counterparts. Before using the API, you must first generate these objects from your organization's WSDL file.

Once you have the proxy classes for the server-side objects, you need to ensure that you specify whether you have set any values on non-string fields. For more information, see [Implementation Considerations](#).

Visual Studio provides two approaches for importing your WSDL file and generating an XML Web service client: an IDE-based approach and a command line approach. This walkthrough describes how to import your WSDL file through the IDE.

 **Note:** Before you begin, the first step is to create a new application or open an existing application in Visual Studio. In addition, you need to have generated the WSDL file, as described in [Generating the WSDL File for Your Organization](#).

An XML Web service client is any component or application that references and uses an XML Web service. This does not necessarily need to be a client-based application. In fact, in many cases, your XML Web service clients might be other Web applications, such as Web Forms or even other XML Web services. When accessing XML Web services in managed code, a proxy class and the .NET Framework handle all of the infrastructure coding.

To access an XML Web service from managed code:

1. Name your project `walkthrough` or change the `using` directive in the following sample to `your_project_name.web_reference_name`. Then, add a Web reference to your project for the XML Web service that you want to access. The Web reference creates a proxy class with methods that serve as proxies for each exposed method of the XML Web service.
2. Add the namespace for the Web reference.
3. Create an instance of the proxy class and then access the methods of that class as you would the methods of any other class.

You can add either a .NET 2.0 style Web reference, or a .NET 3.0 style Service reference, depending on your version of Visual Studio and preferred developer environment. A .NET 3.0 style reference uses services like `SoapClient` instead of `SforceService`.

To add a Web reference:

 **Note:** These steps may be different depending on the version of Visual Studio that you're using. For more information, see "Adding and Removing Web References" in the Visual Studio documentation.

1. If you are using Visual Studio 2010 or earlier, on the Project menu, choose **Add Web Reference**. For later versions of Visual Studio, on the Project menu, choose **Add Service Reference**, select **Advanced** and then select **Add Web Reference**.
2. In the URL box of the Add Web Reference dialog box, type the URL to obtain the service description of the XML Web service you want to access, such as:

```
c:\WSDLFiles\enterprise.wsdl
```
3. Click **Go** to retrieve information about the XML Web service.
4. In the Web reference name box, rename the Web reference to `sforce`, which is the name you will use for this Web reference.

5. Click **Add Reference** to add a Web reference for the target XML Web service.
6. Visual Studio retrieves the service description and generates a proxy class to interface between your application and the XML Web service.

 **Note:** If you are using Visual Basic .Net 1.1 and the enterprise WSDL, you will need to modify the generated Web service client to overcome a bug in Visual Studio's client generation utility. The API exposes two objects ([Case](#) and [Event](#)) whose names conflict with Visual Basic keywords. When the classes that represent these objects are created, Visual Studio wraps the class names with brackets (`[Case]` and `[Event]`). This is the method by which you can reuse keywords.

Unfortunately, in the definition of the `SObject` class, Visual Studio does not wrap `Case` and `Event` to class references in the `System.Xml.Serialization.XmlIncludeAttribute` that are part of the `SObject` definition. To work around this problem in Visual Studio, you need to edit the `XmlIncludeAttribute` settings for `Case` and `Event` as shown below. This does not apply to C# and only applies when using the enterprise version of the WSDL.

```
System.Xml.Serialization.XmlIncludeAttribute(GetType([Event])), _
System.Xml.Serialization.XmlIncludeAttribute(GetType([Case])), _
```

Step 4: Walk Through the Sample Code

Once you have imported your WSDL file, you can begin building client applications that use the API. Use the following samples to create a basic client application. Comments embedded in the sample explain each section of code.

Java Sample Code

This section walks through a sample Java client application that uses the WSC SOAP client. The purpose of this sample application is to show the required steps for logging into the login server and to demonstrate the invocation and subsequent handling of several API calls.

To run this sample, you must pass the authentication endpoint URL as an argument for your program. You can obtain this URL from the WSDL file. This sample application performs the following main tasks:

1. Prompts the user for their Salesforce username and password.
2. Calls `login()` to log in to the single login server and, if the login succeeds, retrieves user information and writes it to the console along with session information.
3. Calls `describeGlobal()` to retrieve a list of all available objects for the organization's data. The `describeGlobal` method determines [the objects that are available to the logged in user](#). This call should not be made more than once per session, since the data returned from the call is not likely to change frequently. The `DescribeGlobalResult` is echoed to the console.
4. Calls `describeSObjects()` to retrieve metadata (field list and object properties) for a specified object. The `describeSObject` method illustrates the type of metadata information that can be obtained for each object available to the user. The sample client application executes a `describeSObjects()` call on the object that the user specifies and then echoes the returned metadata information to the console. Object metadata information includes permissions, field types and lengths, and available values for picklist fields and types for `referenceTo` fields.
5. Calls `query()`, passing a simple query string (`"SELECT FirstName, LastName FROM Contact"`), and iterating through the returned `QueryResult`.
6. Calls `logout()` to log the user out.

The following sample code uses try/catch blocks to handle exceptions that might be thrown by the API calls.

```
package com.example.samples;

import java.io.BufferedReader;
import java.io.FileNotFoundException;
import java.io.InputStreamReader;
import java.io.IOException;
import com.sforce.soap.enterprise.DeleteResult;

    }
}
}
}

```

C# Sample Code

This section walks through a sample C# client application. The purpose of this sample application is to show the required steps for logging in and to demonstrate the invocation and subsequent handling of several API calls.

This sample application performs the following main tasks:

1. Prompts the user for their Salesforce username and password.
2. Calls `login()` to log in to the single login server and, if the login succeeds:
 - Sets the returned `sessionId` into the session header, which is required for session authentication on subsequent API calls.
 - Resets the Lightning Platform endpoint to the returned `serverUrl`, which is the target of subsequent API calls.

All client applications that access the API must complete the tasks in this step before attempting any subsequent API calls.

 - Retrieves user information and writes it to the console along with session information.
3. Calls `describeGlobal()` to retrieve a list of all available objects for the organization's data. The `describeGlobal` method determines [the objects that are available to the logged in user](#). This call should not be made more than once per session, since the data returned from the call is not likely to change frequently. The `DescribeGlobalResult` is echoed to the console.
4. Calls `describeSObjects()` to retrieve metadata (field list and object properties) for a specified object. The `describeSObject` method illustrates the type of metadata information that can be obtained for each object available to the user. The sample client application executes a `describeSObjects()` call on the object that the user specifies and then echoes the returned metadata information to the console. Object metadata information includes permissions, field types and lengths, and available values for picklist fields and types for `referenceTo` fields.
5. Calls `query()`, passing a simple query string (`"SELECT FirstName, LastName FROM Contact"`), and iterating through the returned `QueryResult`.
6. Calls `logout()` to log the user out.

The following sample code uses try/catch blocks to handle exceptions that might be thrown by the API calls.

The following code begins the sample C# client application.

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Web.Services.Protocols;

- [Relabeling Fields and Tabs and the API](#)
- [Tooling API Objects in the Enterprise WSDL](#)
- [Salesforce AppExchange Object Prefixes and the API](#)
- [Custom Object Behavior](#)
- [External Objects](#)

Generally speaking, API objects represent database tables that contain your organization's information. For example, the central object in the Salesforce data model represents accounts—companies and organizations involved with your business, such as customers, partners, and competitors.

The term “record” describes a particular occurrence of an object (such as a specific account like “IBM” or “United Airlines” that is represented by an Account object). A record is analogous to a row in a database table.

Objects already created for you by Salesforce are called standard objects. Objects that you create in your organization with the user interface or with the Metadata API are called custom objects. Objects you create that map to data stored outside your organization are called external objects.

While this document describes all of the objects available in the API, your applications work with only the objects that you are authorized to access. Programmatic access to objects is determined by the objects defined in your organization, your organization configuration, your user permissions and access settings (which are configured by your organization's system administrator), your data sharing model, and other factors related specifically to the object.

Most of the objects accessible through the API are read-write objects. However, there are a few objects that are read-only. This fact is noted in the description for the object.

For details about the data types and size restrictions for each object's fields, see the [Salesforce Field Reference Guide](#).

Primitive Data Types

The API uses the following primitive data types:

Value	Details
base64	Base 64-encoded binary data. Fields of this type are used for storing binary files in Attachment records, Document records, and Scontrol records. In these objects, the <code>Body</code> or <code>Binary</code> field contains the (base64 encoded) data, while the <code>BodyLength</code> field defines the length of the data in the <code>Body</code> or <code>Binary</code> field. In the Document object, you can specify a URL to the document instead of storing the document directly in the record.
boolean	Boolean fields have one of these values: <code>true</code> (or 1), or <code>false</code> (or 0).
byte	A set of bits.
date	Date data. Fields of this type contain date values, such as <code>ActivityDate</code> in the Event object. Unlike <code>dateTime</code> fields, date fields contain no time value—the time portion of a date field is not relevant and is always set to midnight in the Coordinated Universal Time (UTC) time zone. If you specify a date value in a query, you can filter on date fields only.
dateTime	Date/time values (timestamps). Fields of this type handle date/time values (timestamps), such as <code>ActivityDateTime</code> in the Event object or the <code>CreatedDate</code> , <code>LastModifiedDate</code> , or <code>SystemModstamp</code> in many objects. Regular <code>dateTime</code> fields are full timestamps with a precision of one second. They are always transferred in the Coordinated Universal Time (UTC) time zone. In your client application, you might need to translate the timestamp to or from a local time zone. If you specify a <code>dateTime</code> value in a query, you can filter on <code>dateTime</code> fields only. Development tools differ in the way that they handle time data. Some development tools report the local time, while others report only the Coordinated Universal Time (UTC) time zone. To determine how your development tool handles time values, refer to its documentation.  Note: The Event object has a <code>DurationInMinutes</code> field that specifies the number of minutes for an event. Even though this is a temporal value, it is an integer type—not a <code>dateTime</code> type.
double	Double values. Fields of this type can contain fractional portions (digits to the right of the decimal place), such as <code>ConversionRate</code> in <code>CurrencyType</code> . In the API, all non-integer values (such as Currency Field Type and Percent Field Type) contain values of type double. Some restrictions may be applied to double values: <ul style="list-style-type: none"> • <code>scale</code>: Maximum number of digits to the right of the decimal place. • <code>precision</code>: Total number of digits, including those to the left and the right of the decimal place The maximum number of digits to the left of the decimal place is equal to <code>precision</code> minus <code>scale</code> . In the Salesforce user interface, precision is defined differently—it is the maximum number of digits allowed to the left of the decimal place. Values can be stored in scientific notation if the number is large enough (or, for negative numbers, small enough), as indicated by the W3C XML Schema Part 2: Datatypes Second Edition specification .  Warning: When the user sets the precision in custom fields in the Salesforce application, it displays the precision set by the user, even if the user enters a more precise value than defined for those

Value	Details
	fields. However, when you set the precision in custom fields using the API, no rounding occurs when the user retrieves the number field.
int	Fields of this type contain numbers with no fractional portion (digits to the right of a decimal place), such as the <code>NumberOfEmployees</code> in an <code>Account</code> . For integer fields, <code>digits</code> specifies the maximum number of digits that an int can have.
long	Large integers. They are similar to the int type but can hold a wider range of numbers. The smallest possible value for long is -9223372036854775808 and the largest possible value is 9223372036854775807. For long fields, <code>digits</code> specifies the maximum number of digits that the number can have.
string	<p>Character strings. Fields that are of data type <code>string</code> contain text and some have length restrictions depending on the data being stored. For example, in the <code>Contact</code> object, the <code>FirstName</code> field is 40 characters, the <code>LastName</code> field is 80 characters, the <code>MailingStreet</code> is 255 characters.</p> <p> Note: For fields that contain strings, behavior is different beginning with API version 15.0. In API versions previous to 15.0, if you specify a value for a field, and that value is too large, the value is truncated. For API version 15.0 and later, if a value is specified that is too large, the operation fails and the fault code <code>STRING_TOO_LONG</code> is returned. <code>AllowFieldTruncationHeader</code> allows you to specify that the previous behavior, truncation, be used instead of the new behavior in API versions 15.0 and later. This header has no effect in versions 14.0 and earlier. The affected fields are: <code>anyType</code>, <code>email</code>, <code>encryptedstring</code>, <code>multipicklist</code>, <code>phone</code>, <code>picklist</code>, <code>string</code>, and <code>textarea</code>.</p>
time	<p>Time values. Fields of this type handle time values, such as <code>FridayEndTime</code> in the <code>BusinessHours</code> object, with a precision of one millisecond.</p> <p>Development tools differ in the way that they handle time data. Some development tools report the local time, while others report only the Coordinated Universal Time (UTC) time zone. To determine how your development tool handles time values, refer to its documentation.</p>

These data types are used in the SOAP messages that are exchanged between your client application and the API. When writing your client application, follow the data typing rules defined for your programming language and development environment. Your development tool handles the mapping of typed data in your programming language with these SOAP data types.

The primitive data types are:

- specified in the World Wide Web Consortium's publication *XML Schema Part 2: Data Types* at the following URL: <http://www.w3.org/TR/xmlschema-2/>.
- enumerated in the `SOAPType` field of the `Field` type, which is described in the `fields` property of the `DescribeObjectResult`.

Primitive types are used as a standardized way to define, send, receive, and interpret basic data types in the SOAP messages exchanged between client applications and the API. In addition, primitive data types are interpreted in a Salesforce-specific way, which is useful for display formatting and for numeric conversion (adding values of different currencies).

For example, Salesforce chooses to interpret a double value passed via SOAP as a `double` in a number of possible ways, depending on the field definition. If the field type for that data is currency, Salesforce handles the display of the data by prepending it with a currency symbol and inserting a decimal for precision. Similarly, if the field type is percent, Salesforce handles the display of the data by appending a percent sign (%). Regardless of the field type, however, the value is sent in the SOAP message as a double.

The API uses data types called field types that are defined in the WSDLs. For more information, see [Field Types](#).

Field Types

 **[other]:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

In addition to the primitive data types, the API defines the following data types for fields:

 **Note:** For fields that contain strings, behavior is different beginning with API version 15.0. In API versions previous to 15.0, if you specify a value for a field, and that value is too large, the value is truncated. For API version 15.0 and later, if a value is specified that is too large, the operation fails and the fault code `STRING_TOO_LONG` is returned. `AllowFieldTruncationHeader` allows you to specify that the previous behavior, truncation, be used instead of the new behavior in API versions 15.0 and later. This header has no effect in versions 14.0 and earlier. The affected fields are: `anyType`, `email`, `encryptedstring`, `multipicklist`, `phone`, `picklist`, `string`, and `textarea`.

Field Type	What the Field Contains
address	A compound data type that contains address field data. See Address Compound Fields .
anyType	Polymorphic data type that returns string, picklist, reference, Boolean, currency, int, double, percent, ID, date, datetime, url, or email data depending on the kind of field involved. See AnyType Field Type .
calculated	Fields that are defined by a formula. See Calculated Field Type .
combobox	A combobox, which includes a set of enumerated values and allows the user to specify a value not in the list. See ComboBox Field Type .
currency	Currency values. See Currency Field Type .
DataCategoryGroupReference	Reference to a data category group or a category unique name. See DataCategoryGroupReference Field Type .
email	Email addresses. See Email Field Type .
encryptedstring	Encrypted text fields contain any combination of letters, numbers, or symbols that are stored in encrypted form. You can set a maximum length of up to 175 characters. Available in API versions 11.0 and later.
ID	<p>Primary key field for the object. See ID Field Type.</p> <p> Note: Most Web services tools, including .NET and WSC, map the ID simple type defined in the API WSDL (Enterprise or Partner) to a string. However, other tools generate a specific ID class to represent the ID simple type. Consult your Web services toolkit documentation for more information.</p>
JunctionIdList	<p>A string array of referenced ID values that represent the many-to-many relationship of an underlying junction entity. Query and manipulate the string array to query and manipulate the underlying junction entities in a single API call. See: JunctionIdList Field Type</p> <p> Warning: Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.</p>
location	A compound data type that contains latitude and longitude values for geolocation fields. See Geolocation Compound Field .

Field Type	What the Field Contains
masterrecord	When records are merged, the ID of the record that is saved (the other records are deleted).
multipicklist	Multi-select picklists, which include a set of enumerated values from which multiple values can be selected. See Multi-Select Picklist Field Type .
percent	Percentage values. See Percent Field Type .
phone	Phone numbers. Values can include alphabetic characters. Client applications are responsible for phone number formatting. See Phone Field Type .
picklist	Picklists, which include a set of enumerated values from which one value can be selected. See Picklist Field Type .
reference	Cross-references to a different object. Analogous to a foreign key field in SQL. See Reference Field Type .
textarea	String that is displayed as a multiline text field. See Textarea Field Type .
url	URL values. Client applications commonly display URLs as hyperlinks. See URL Field Type .

These field types extend [primitive data types](#). Many of these field types follow common data typing conventions that are made explicit in their metadata. However, certain field types have unique characteristics that you must understand before using them in your client application.

These field types apply to both standard and custom fields. They are enumerated in the `type` field of the [Field Types](#) type, which is described in the `fields` property of the `DescribeSObjectResult`.

 **Note:** Some numeric fields have precision and scale limits. In addition, certain text fields have length restrictions. These restrictions are enforced when you `create()` or `update()` objects. However, the API can return data that does not meet these restrictions.

AnyType Field Type

The `anyType` field type is dynamic and returns `string`, `date`, `number`, or `boolean` data depending on the kind of field involved. For example, the element in a SOAP message has an `xsi:type="xsd:string"` attribute if the field is of type `string`. This field type is used in history objects for the `NewValue` and `OldValue` fields. It is also a valid field type for `fieldType` and `soapType`.

 **Note:** Most SOAP toolkits automatically deserialize this element into the correct native type.

Calculated Field Type

Calculated fields are read-only fields in the API. These fields are defined by a formula, which is an algorithm that derives its value from other fields, expressions, or values. You can filter on these fields in SOQL, but you don't replicate these fields. The length of text calculated fields is 3900 characters or less—anything longer is truncated.

Calculated fields are called formula fields in the Salesforce user interface.

ComboBox Field Type

A combobox is a picklist that also allows users to type a value that is not already specified in the list. A combobox is defined as a string value.

Currency Field Type

Currency fields contain currency values, such as the `ExpectedRevenue` field in a Campaign, and are defined as type `double`.

For organizations that have the multicurrency option enabled, the `CurrencyIsoCode` field is defined for any object that can have currency fields. The `CurrencyIsoCode` field and currency fields are linked in a special way. On any specific record, the `CurrencyIsoCode` field defines the currency of that record. Therefore, the values of all currency fields on that record are expressed in that currency.

For most cases, clients do not need to consider the linking of the `CurrencyIsoCode` field and the currency fields on an object. However, consider the following:

- The `CurrencyIsoCode` field exists only for those organizations that have enabled multicurrency support.
- When displaying the currency values in a user interface, it is preferred to prepend each currency value with its `CurrencyIsoCode` value and a space separator.
- The `CurrencyIsoCode` field is a restricted picklist field. The set of allowable values, defined in the `CurrencyType` object, can vary from organization to organization. Attempting to set it to a value that is not defined for an organization causes the operation to be rejected.
- If you update the `CurrencyIsoCode` field on an object, it implicitly converts all currency values on that object to the new currency code. The field uses the conversion rates that are defined for that organization in the Salesforce user interface. If you specify currency values in that same `update()` call, the new currency values you specify are interpreted in the new `CurrencyIsoCode` field value, without conversion.
- The picklist values in a `CurrencyIsoCode` field do not exactly match the labels displayed in Salesforce.

To perform currency conversions, client applications can look up the `CurrencyIsoCode` in the `CurrencyType` object.

DataCategoryGroupReference Field Type

A data category group has categories that classify articles in Salesforce Knowledge and questions in the Answers feature. Every article and question object has two fields of type `DataCategoryGroupReference` which contain the category group and category unique name. You can use the `describeDataCategoryGroups()` and `describeDataCategoryGroupStructures()` calls to retrieve the category groups and categories associated to these objects.

Email Field Type

Email fields contain email addresses. Client applications are responsible for specifying valid and properly formatted email addresses in `create()` and `update()` calls.

ID Field Type

With rare exceptions, all objects in the API have a field of type ID. The field is named `Id` and contains a unique identifier for each record in the object. It is analogous to a primary key in relational databases. When you `create()` a new record, the Web service generates an ID value for the record, ensuring that it is unique within your organization's data. You cannot use the `update()` call on ID fields. Because the ID value stays constant over the lifetime of the record, you can refer to the record by its ID value in subsequent API calls. Also, the ID value contains a three-character code that identifies the object type, which client applications can retrieve via the `describeSObjects()` call.

In addition, certain objects, including custom objects, have one or more fields of type `reference` that contain the ID value for a related record. These fields have names that end in the suffix "Id", for example, `OwnerId` in the account object. `OwnerId` contains

the ID of the user who owns that object. Unlike the field named `Id`, `reference` fields are analogous to foreign keys and can be changed via the `update()` call. For more information, see [Reference Field Type](#).

Some API calls, such as `retrieve()` and `delete()`, accept an array of IDs as parameters—each array element uniquely identifies the row to retrieve or delete. Similarly, the `update()` call accepts an array of `sObject` records—each `sObject` contains an `Id` field that uniquely identifies the `sObject`.

 **Note:** Most Web services tools, including .NET and WSC, map the ID simple type defined in the API WSDL (Enterprise or Partner) to a string. However, other tools generate a specific ID class to represent the ID simple type. Consult your web services toolkit documentation for more information.

15-Character and 18-Character IDs, and Case Sensitivity

Salesforce IDs are often represented by 15-character, base-62, strings. Each of the 15 characters can be a numeric digit (0-9), a lowercase letter (a-z), or an uppercase letter (A-Z). These 15-character IDs are *case-sensitive*. To Salesforce, `000000000000Abc` is not the same as `000000000000aBC`.

Don't use 15-character IDs in case-insensitive applications like Microsoft Access™. These applications incorrectly consider `000000000000Abc` to be the same as `000000000000aBC`.

To avoid these issues, all API calls return 18-character IDs that are *case-safe*, meaning that they will be compared correctly by case-insensitive applications. The extra 3 characters at the end of the ID encode the case of the preceding 15 characters. Use 18-character IDs in all API calls when creating, editing, or deleting data.

 **Note:** 18-character IDs are *case-safe*, but not *case-insensitive*. In other words, if you manually change the case of an 18-character ID, Salesforce detects that the three extra characters do not match the case of the preceding characters and returns an error.

Multi-Select Picklist Field Type

Multi-select picklist fields contain a list of one or more items from which a user can choose multiple items. One of the items can be configured as the default item. Selections are maintained as a string containing a series of attributes delimited by semicolons. For example, a query can return the values of a multivalued picklist as “first value; second value; third value”. For information on querying multi-select picklists, see Querying Multi-Select Picklists in the [Salesforce SOQL and SOSL Reference Guide](#).

Percent Field Type

Percent fields contain percent values. Percent fields are defined as type double.

Phone Field Type

Phone fields contain phone numbers, which can include alphabetic characters. Client applications are responsible for phone number formatting.

Picklist Field Type

Picklist fields contain a list of one or more items from which a user chooses a single item. They display as dropdown lists in the Salesforce user interface. One of the items can be configured as the default item.

In the Field object associated with the DescribeSObjectResult, the `restrictedPicklist` field defines whether the field is a restricted picklist or not. The API does not enforce the list of values for advisory (unrestricted) picklist fields on `create()` or `update()`. When inserting an unrestricted picklist field that does not have a PicklistEntry, the system creates an “inactive” picklist value. This value can be promoted to an “active” picklist value by adding the picklist value in the Salesforce user interface.

When creating new, inactive picklists, the API checks to see if there is a match. This check is case-insensitive.

In the Field object associated with the DescribeSObjectResult, the `picklistValues` field contains an array of items (PicklistEntry objects). Each PicklistEntry defines the item’s label, value, and whether it is the default item in the picklist (a picklist has no more than one default value).

Enumerated fields support localization of the labels to the language of the user. For example, for the `Industry` field on an Account, the value “Agriculture” can be translated to various languages. The enumerated field values are fixed and do not change with a user’s language. However, each value may have a specified “label” field that provides the localized label for that value. Always use the value when inserting or updating a field. The `query()` call always returns the value, not the label. Use the corresponding label for a value in the describeSObjectResult when displaying the value to the user in any user interface.

The API supports the retrieval of the certain picklists in the following objects: CaseStatus, ContractStatus, LeadStatus, OpportunityStage, PartnerRole, SolutionStatus, TaskPriority, and TaskStatus. Each object represents a value in the respective picklist. These picklist entries always specify some other piece of information, such as whether the status is converted. Your client application can invoke the `query()` call on any of these objects (such as CaseStatus) to retrieve the set of values in the picklist. The application can then use that information while processing other objects (such as Case objects) to find more information about those objects (such as a given case). These objects are read-only via the API. To modify items in picklists, you must use the Salesforce user interface.

Reference Field Type

A reference field contains an `Id` value that points to a unique record (usually the parent record) on another object. A reference field is analogous to the concept of a foreign key in relational databases. The name of a reference field ends, by convention, with the letters `Id` (such as `CaseId` or `OpportunityId`). For example, in the OpportunityCompetitor object, the `OpportunityId` field is a reference field that points to the Opportunity object. It contains an ID value that uniquely identifies an Opportunity record.

Sometimes, an object can refer to another object of its same type. For example, an Account can have a parent link that points to another Account.

The Event and Task objects both have `whoId` and `whatId` cross-reference ID fields. Each of these cross-reference fields can point to one of several other objects. The `whoId` field can point to a Contact or Lead, and the `whatId` field can point to an Account, Opportunity, Campaign, or Case. In addition, if the `whoId` field refers to a Lead, then the `whatId` field must be empty.

You can describe and query each cross-referenced object. When you query a cross-reference ID field, it returns an object ID of the appropriate type. You can then query that ID to get additional information about the object, using the ID in the `id` field for that query.

The cross-reference ID field value is either:

- a valid record in your organization, or
- an empty value, which indicates an empty reference

The cross-reference ID field value, if non-`null`, is guaranteed to be an object in your organization. However, it is not guaranteed that you can query that object. Users with the “View All Data” permission can always query that object. Other users can be restricted from viewing or editing the referenced object.

When specifying a value for a cross-reference ID field in a `create()` or `update()` call, the value must be a valid value of type ID, and the user must have appropriate access to that object. The exact requirements vary from field to field.

Textarea Field Type

Textarea fields contain text that can be longer than 4000 bytes. Unlike string fields, textarea fields cannot be specified in the WHERE clause of a `queryString` of a `query()` call. To filter records on this field, you must do so while processing records in the `QueryResult`. For fields with this restriction, its `filterable` field in the Field type (described in the `fields` property of the `DescribeObjectResult`) is `false`.

URL Field Type

URL fields contain URLs. Client applications are responsible for specifying valid and properly formatted URLs in `create()` and `update()` calls.

Compound Fields

Compound fields group together multiple elements of primitive data types, such as numbers or strings, to represent complex data types, such as a location or an address. Compound fields are an abstraction that can simplify application code that handles the values, leading to more concise, understandable code.

Address compound fields are available in the SOAP and REST APIs in API version 30.0 and later. Geolocation fields are available in the SOAP and REST APIs in API version 26.0 and later, with some limitations on SOAP for API versions below 30.0.

Compound fields are accessible as a single, structured field, or as individual component fields. The values contained within the compound field and the values in individual fields both map to the same underlying data stored in Salesforce; they always have identical values. Code that references individual component fields is unaffected by the new compound fields.

Compound fields are read-only. Changes are performed by writing to the individual component fields. This maintains a single, consistent method for performing updates, and avoids the possibility of conflicts. For example, if both the `BillingAddress` compound field and `BillingCity` individual component field were updated in the same API call, it would be unclear which value should be saved.

Compound fields are available only through the SOAP and REST APIs. Compound fields are described in both the Enterprise and Partner WSDLs. Update your WSDL to at least API 30.0 to access the new compound data types.

Address Compound Fields

Standard addresses—addresses built into standard objects in Salesforce—are accessible in the SOAP and REST APIs as an `Address`, a structured compound data type, as well as individual address elements.

The `Address` type extends the `Location` type, the data type used for compound geolocation fields. Using API 30.0 and later, standard addresses are available in the SOAP and REST APIs as a compound field of type `Address`, a structured data type that combines the following fields.

Field	Type	Description
<code>Accuracy</code>	picklist	Accuracy level of the geocode for the address. For example, this field is known as <code>MailingGeocodeAccuracy</code> on <code>Contact</code> .
<code>City</code>	string	The city detail for the address. For example, this field is known as <code>MailingCity</code> on <code>Contact</code> .
<code>Country</code>	string	The country detail for the address. For example, this field is known as <code>MailingCountry</code> on <code>Contact</code> .
<code>CountryCode</code>	picklist	The ISO country code for the address. For example, this field is known as <code>MailingCountryCode</code> on <code>Contact</code> . <code>CountryCode</code> is always available on compound address fields, whether or not state and country/territory picklists are enabled in your organization.
<code>Latitude</code>	double	Used with <code>Longitude</code> to specify the precise geolocation of the address. For example, this field is known as <code>MailingLatitude</code> on <code>Contact</code> .
<code>Longitude</code>	double	Used with <code>Latitude</code> to specify the precise geolocation of the address. For example, this field is known as <code>MailingLongitude</code> on <code>Contact</code> .
<code>PostalCode</code>	string	The postal code for the address. For example, this field is known as <code>MailingPostalCode</code> on <code>Contact</code> .
<code>State</code>	string	The state detail for the address. For example, this field is known as <code>MailingState</code> on <code>Contact</code> .
<code>StateCode</code>	picklist	The ISO state code for the address. For example, this field is known as <code>MailingStateCode</code> on <code>Contact</code> . <code>StateCode</code> is always available on compound address fields, whether or not state and country/territory picklists are enabled in your organization.
<code>Street</code>	textarea	The street detail for the address. For example, this field is known as <code>MailingStreet</code> on <code>Contact</code> .

Address fields are provided on many standard objects, such as `Account`, `Contact`, `Quote`, and `User`. Some objects provide fields for multiple addresses. For example, `Account` provides for four different addresses. In this case, address field names are prefixed with the type of address, for example, `BillingAddress`, `ShippingAddress`, and so on.

 **Note:** Standard address compound fields are read-only, and are only accessible using the SOAP and REST APIs. See [Compound Field Considerations and Limitations](#) on page 42 for additional details of the restrictions this imposes.

When an address is geocoded, its latitude and longitude fields are populated with coordinates. A related geolocation field is also populated. Typically, geocoding service providers geocode addresses, and rate the accuracy of the geocodes.

The accuracy subfield `GeocodeAccuracy` stores the accuracy data for a geocoded location. External geolocation apps can get the accuracy level of a geocoded address via the API. When you retrieve an address via the API, any accuracy data is included. You can also retrieve the accuracy information by itself, if needed.

Like its parent, the compound `Address` field, the `GeocodeAccuracy` field is only available for standard address fields on standard objects.

Retrieving Compound Address Fields

Using compound fields can simplify code that works with addresses, especially for SOQL queries. SOQL `SELECT` clauses can reference addresses directly, instead of all of the individual component fields.

```
SELECT Name, BillingAddress
FROM Account
```

To write code that's compatible with API versions before 30.0, as well as API 30.0 and above, use the individual fields:

```
SELECT Name, BillingStreet, BillingCity, BillingState, BillingPostalCode,
       BillingCountry, BillingLatitude, BillingLongitude
FROM Account
```

Compound address field values are returned as a structured data type, `Address`. Code that works with compound address fields needs to reference the individual components of the returned value. See the code sample below.

Example: Retrieve a Standard Address Compound Field with the SOAP API

The following Java method uses the Salesforce SOAP API to retrieve and display the Mailing Address for a list of contacts.

```
// Modified version of code in the SOAP API QuickStart
private void querySample() {
    String soqlQuery = "SELECT FirstName, LastName, MailingAddress FROM Contact";
    try {
        QueryResult qr = connection.query(soqlQuery);
        boolean done = false;

        if (qr.getSize() > 0) {
            System.out.println("\nLogged-in user can see "
                + qr.getRecords().length + " contact records.");

            while (!done) {
                System.out.println("");
                Object[] records = qr.getRecords();
                for (int i = 0; i < records.length; ++i) {
                    Contact con = (Contact) records[i];
                    String fName = con.getFirstName();
                    String lName = con.getLastName();

                    // Access the compound address field MailingAddress
                    Address addr = (Address) con.getMailingAddress();
                    String streetAddr = "";
                    if (null != addr) streetAddr = addr.getStreet();

                    if (fName == null) {
                        System.out.println("Contact " + (i + 1) + ": " + lName +
                            " -- " + streetAddr);
                    } else {

```

```

        System.out.println("Contact " + (i + 1) + ": " + fName +
            " " + lName +
            " -- " + streetAddr);
    }
}

if (qr.isDone()) {
    done = true;
} else {
    qr = connection.queryMore(qr.getQueryLocator());
}
} else {
    System.out.println("No records found.");
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}
}

```

Using Compound Address Fields as Locations

Compound address fields include latitude and longitude fields. Address fields can be used as locations in SOQL `WHERE` and `ORDER BY` clauses. For example, here's a SOQL query that uses the `GEOLOCATION` function to retrieve the 10 accounts closest to San Francisco.

```

SELECT Id, Name, BillingAddress
FROM Account
WHERE DISTANCE(BillingAddress, GEOLOCATION(37.775,-122.418), 'mi') < 20
ORDER BY DISTANCE(BillingAddress, GEOLOCATION(37.775,-122.418), 'mi')
LIMIT 10

```

 **Note:** In Developer, Professional, Enterprise, Unlimited, and Performance editions, Salesforce can automatically add or update geolocation fields for Account, Contact, Lead, and WorkOrder records. To use this feature, your administrator must enable the geo data integration rule for each object. For all other objects and editions, set values for latitude and longitude by using SOQL, Workbench, SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. To find geocoding services, search AppExchange.

Geolocation Compound Field

Geolocation fields are accessible in the SOAP and REST APIs as a `Location`—a structured compound data type—or as individual latitude and longitude elements.

In API versions 26.0 and later, geolocation fields are available in the SOAP and REST APIs as a compound field of type `Location`. This structured data type contains the following fields.

- latitude
- longitude

 **Note:** SOAP calls that use API versions earlier than 30.0 return geolocation compound values as strings. See “Returned Geolocation Data Types” later in this topic.

Geolocation fields are provided on many standard objects, such as Account, Contact, Quote, and User, as part of their address field or fields. Geolocation fields can also be added as custom fields to standard or custom objects.

 **Note:**

- A geolocation compound field is read-only, although its `latitude` and `longitude` subfields are editable. You can only access compound fields using the SOAP or REST API. For more information about working with compound fields and their subfields, see [Compound Field Considerations and Limitations](#) on page 42.
- Although geolocation fields appear as a single field in the user interface, custom geolocation fields count as *three* custom fields towards your organization's limits: one for latitude, one for longitude, and one for internal use.

Retrieving Compound Geolocation Fields

Using compound fields can simplify code that works with geolocations, especially for SOQL queries. SOQL `SELECT` clauses can reference geolocations directly, instead of the individual component fields.

```
SELECT location__c
FROM Warehouse__c
```

To write code that's compatible with API versions earlier than 26.0 and with API versions 26.0 and later, use the individual latitude and longitude fields.

```
SELECT location__latitude__s, location__longitude__s
FROM Warehouse__c
```

Returned Geolocation Data Types

A compound geolocation field value is returned as the structured data type `Location`. Code that works with compound geolocation fields must reference the individual components of the returned value. See the sample code in [Address Compound Fields](#) on page 40.

In API versions earlier than 30.0, SOAP calls return compound geolocation field values as strings, instead of as a structured data type, for backward compatibility. If you plan to display your latitude and longitude values or pass them to a service that expects strings, use the values that are returned. If you plan to use the values in mathematical calculations or pass them to a map service that expects numbers, cast the results to numbers.

The string value format is:

```
API location: [latitudeValue longitudeValue]
```

An example of a regular expression to parse out the latitude and longitude values is:

```
API location: \[([+-]?\d{1,2}(\.|\d+)?) ([+-]?\d{1,3}(\.|\d+)?)\]
```

The first capture is the latitude, and the third is the longitude.

Compound Field Considerations and Limitations

Address and geolocation compound fields are convenient and result in more concise, clear code. Here are some things to consider when using them in your apps.

Both address and geolocation compound fields have the following limitations.

- Compound fields are read-only. To update field values, modify the individual field components.
- Compound fields are accessible only through the SOAP API, REST API, and Apex. The compound versions of fields aren't accessible anywhere in the Salesforce user interface.

- Although compound fields can be queried with the `Location` and `Address` Apex classes, they're editable only as components of the actual field. Read and set geolocation field components by appending “`__latitude__s`” or “`__longitude__s`” to the field name, instead of the usual “`__c`.” For example:

```
Double theLatitude = myObject__c.aLocation__latitude__s;
myObject__c.aLocation__longitude__s = theLongitude;
```

You can't access or set the compound value.

- You can't use compound fields in Visualforce—for example, in an `<apex:outputField>`. To access or update field values, use the individual field components.
- If you select compound fields for export in the Data Loader, they cause error messages. To export values, use individual field components.
- Custom geolocation and location fields on standard addresses aren't supported with email templates.
- You can't use compound fields in lookup filters, except to filter distances that are within or not within given ranges. You can use distance lookup filters only in the Metadata API.
- The only formula functions that you can use with compound fields are `ISBLANK`, `ISCHANGED`, and `ISNULL`. You can't use `BLANKVALUE`, `CASE`, `NULLVALUE`, `PRIORVALUE`, or the equality and comparison operators with compound fields. The equality and comparison operators include `=` and `==` (equal), `<>` and `!=` (not equal), `<` (less than), `>` (greater than), `<=` (less than or equal), `>=` (greater than or equal), `&&` (AND), and `||` (OR).

Address compound fields have the following limitations.

- Compound address fields are available only for address fields that exist as part of the standard objects included in Salesforce. You can't create custom compound address fields.
- In Developer, Professional, Enterprise, Unlimited, and Performance editions, Salesforce can automatically add or update geolocation fields for Account, Contact, Lead, and WorkOrder records. To use this feature, your administrator must enable the geo data integration rule for each object. For all other objects and editions, set values for latitude and longitude by using Salesforce CLI, SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. To find geocoding services, search AppExchange.
- The accuracy subfield of address fields is populated only when an address is geocoded. Typically, geocoding service providers provide accuracy data for an address's latitude and longitude coordinates.
- Address fields can't be used in `WHERE` statements in SOQL. Address fields aren't filterable, but the `isFilterable()` method of the `DescribeFieldResult` Apex class erroneously returns `true` for address fields.

Geolocation compound fields have the following limitations.

- Geolocation fields aren't supported in custom settings.
- Geolocation fields aren't available in dashboards or Schema Builder.
- Geolocation fields are available in Visual Workflow and in formula-based workflow and approvals, but they can't be used in filter-based workflow updates and approvals.
- `DISTANCE` formulas are supported in:
 - Entry criteria for workflow rules and approval processes
 - Field update actions in workflow rules and approval processes
 - Custom validation rules
 - Lookup filters (in the Metadata API only)
- Geolocation fields and latitude and longitude on standard addresses aren't supported in Salesforce to Salesforce.
- In Developer, Professional, Enterprise, Unlimited, and Performance editions, Salesforce can automatically add or update geolocation fields for Account, Contact, Lead, and WorkOrder records. To use this feature, your administrator must enable the geo data integration

rule for each object. For all other objects and editions, set values for latitude and longitude by using SOQL, Workbench, SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. To find geocoding services, search AppExchange.

- Geolocation fields are supported in SOQL with the following limitations.
 - `DISTANCE` and `GEOLOCATION` are supported in `WHERE` and `ORDER BY` clauses in SOQL, but not in `GROUP BY`. `DISTANCE` is supported in `SELECT` clauses.
 - `DISTANCE` supports only the logical operators `>` and `<`, returning values within (`<`) or beyond (`>`) a specified radius.
 - When using the `GEOLOCATION` function in SOQL queries, the geolocation field must precede the latitude and longitude coordinates. For example, `DISTANCE(warehouse_location__c, GEOLOCATION(37.775,-122.418), 'km')` works but `DISTANCE(GEOLOCATION(37.775,-122.418), warehouse_location__c, 'km')` doesn't work.
 - Apex bind variables aren't supported for the units parameter in the `DISTANCE` function. This query doesn't work.

```
String units = 'mi';
List<Account> accountList =
    [SELECT ID, Name, BillingLatitude, BillingLongitude
     FROM Account
     WHERE DISTANCE(My_Location_Field__c, GEOLOCATION(10,10), :units) < 10];
```

For more information and examples, see the [SOQL and SOSL Reference](#).

API Data Types and Salesforce Field Types

- 💡 **[other]:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Generally, API data types and field types in the user interface have the same names. For example, a date field is represented by a date data type in the API. However, some field types are represented differently depending on whether you are inspecting an object via the API or the user interface. The following table contains the mapping for field types and data types that are different:

API Data Type	Corresponding Field Types in the User Interface
ID	Lookup relationship, master-detail relationship
string	Auto number, email, phone, picklist, multi-select picklist, text, text area, long text area, rich text area, data category group reference and URL. Different maximum lengths are specified in the WSDL for text, text area, and long text area.
boolean	Checkbox
double	Currency, formula, number, percent, and roll-up summary
Varies by type	When formula fields are created in the user interface, a type must be specified. This type corresponds to the API data type of the same name: currency, date, date/time, number, percent, or text.

All other fields that you can create in the user interface fall into one of the following categories:

- The field is not available in both the user interface and the API. For example, the `BusinessHours` object has fields of API data type `time`, but you cannot create a custom field of this type.
- Field types are the same as their corresponding API data type. For example, if you create a date field in the user interface, that field is the `date` data type in the API.

For more information about API data types, see [Primitive Data Types](#) and [Field Types](#).

Core Data Types Used in API Calls

Many calls in the API use the following data types:

- [sObject](#)
- ID (String). See [ID Field Type](#).

The API also uses several error handling objects. If an error occurs during a SOAP request, the API returns a SOAP fault message. The message contains different content, depending on the type of error:

- If an error affects the entire request, an [API Fault Element](#), is returned, containing an [ExceptionCode](#) and the associated error message text.
- If the error affects some records and not others, an [Error](#) is returned, containing a [StatusCode](#). These errors typically occur during bulk operations, such as creating, updating, or deleting multiple records with a single call.

You can see the list of exception codes, status codes, and extended error codes in the WSDL file for your org. Some codes don't appear in your WSDL, depending on the features enabled. See [Generating the WSDL File for Your Organization](#).

sObject

An sObject represents an object, such as an [Account](#) or [Campaign](#). For a list of standard objects, see [Standard Objects](#).

An sObject has the following properties:

Name	Type	Description
<code>fieldsToNull</code>	<code>string[]</code>	<p>Array of one or more field names whose value you want to explicitly set to <code>null</code>.</p> <p>When used with <code>update()</code> or <code>upsert()</code>, you can specify only those fields that you can update and that have the <code>nullable</code> property. When used with <code>create()</code>, you can specify only those fields that you can create and that have the <code>nullable</code> or the <code>default on create</code> property.</p> <p>For example, if specifying an ID field or required field results in a runtime error, you can specify that field name in <code>fieldsToNull</code>. Similarly, if a picklist field has a default value and you want to set the value to <code>null</code> instead, specify the field in <code>fieldsToNull</code>.</p>
<code>ID</code>	<code>ID</code>	<p>Unique ID for this individual object. For the <code>create()</code> call, this value is null. For all other API calls, this value must be specified.</p>

API Fault Element

An `ApiFault` element contains information about a fault that occurs when processing a service request. The `ApiFault` element has the following properties.

Name	Type	Description
<code>exceptionCode</code>	ExceptionCode	A code that characterizes the exception.
<code>exceptionMessage</code>	<code>string</code>	Exception message text.

Name	Type	Description
<code>extendedErrorDetails</code>	ExtendedErrorDetails	Additional details about the exception, including an extended error code and extra error properties, when available.

The following table lists the API fault elements that represent all the API faults that can occur.

Fault	Description
<code>ApiQueryFault</code>	The row and column numbers where the problem occurred.
<code>LoginFault</code>	An error occurred during the <code>login()</code> call.
<code>InvalidSObjectFault</code>	An invalid <code>sObject</code> in a <code>describeSObject()</code> , <code>describeSObjects()</code> , <code>describeLayout()</code> , <code>describeDataCategoryGroups()</code> , <code>describeDataCategoryGroupStructures()</code> , <code>create()</code> , <code>update()</code> , <code>retrieve()</code> , or <code>query()</code> call.
<code>InvalidFieldFault</code>	An invalid field in a <code>retrieve()</code> or <code>query()</code> call.
<code>InvalidOrNullForRestrictedPicklist</code>	An invalid <code>appMenuItem</code> in a <code>describeAppMenu()</code> call.
<code>MalformedQueryFault</code>	A problem in the <code>queryString</code> passed in a <code>query()</code> call.
<code>InvalidQueryLocatorFault</code>	A problem in the <code>queryLocator</code> passed in a <code>queryMore()</code> call.
<code>MalformedSearchFault</code>	A problem in the <code>search</code> passed in a <code>search()</code> call.
<code>InvalidIdFault</code>	A specified ID was invalid in a <code>setPassword()</code> or <code>resetPassword()</code> call.
<code>UnexpectedErrorFault</code>	An unexpected error occurred. The error isn't associated with any other API fault.

ExceptionCode

The following exception codes can be returned with an error.

APEX_REST_SERVICES_DISABLED

Apex REST Services permission hasn't been enabled for the user. Enable the user permission to access Apex classes and methods as REST web services.

API_CURRENTLY_DISABLED

Because of a system problem, API functionality is temporarily unavailable.

API_DISABLED_FOR_ORG

API access hasn't been enabled for the org. Contact Salesforce to enable API access.

CANT_ADD_STANDARD_PORTAL_USER_TO_TERRITORY

A user with a standard portal license can't be added to a territory.

CIRCULAR_OBJECT_GRAPH

The request failed because it contained a circular object reference.

CLIENT_NOT_ACCESSIBLE_FOR_USER

The current user doesn't have permission to access the specified client.

CLIENT_REQUIRE_UPDATE_FOR_USER

The current user is required to use a newer version of the specified client and doesn't have access until the client is updated.

CLONE_NOT_SUPPORTED

This entity doesn't support the clone operation.

CLONE_FIELD_INTEGRITY_EXCEPTION

A field integrity exception occurred during the clone operation.

DELETE_REQUIRED_ON_CASCADE

The delete operation triggers a cascade delete on a record, but the logged-in user doesn't have delete permission on that related object.

DUPLICATE_COMM_NICKNAME

You can't create a user with the same nickname as another user.

DUPLICATE_VALUE

You can't supply a duplicate value for a field that must be unique. For example, you can't submit two copies of the same session ID in a `invalidateSessions()` call.

EMAIL_BATCH_SIZE_LIMIT_EXCEEDED

A method tried to process more email records than the maximum batch size.

EMAIL_TO_CASE_INVALID_ROUTING

An Email-to-Case record has been submitted for processing but the feature isn't enabled.

EMAIL_TO_CASE_LIMIT_EXCEEDED

The daily converted email limit for the Email-to-Case feature has been exceeded.

EMAIL_TO_CASE_NOT_ENABLED

The Email-to-Case feature hasn't been enabled.

EXCEEDED_ID_LIMIT

Too many IDs were specified in a call. For example, more than 2000 IDs were requested in a `retrieve()` call, or more than 200 session IDs were specified in a `logout()` call.

EXCEEDED_LEAD_CONVERT_LIMIT

Too many IDs were sent to a `convertLead()` call.

EXCEEDED_MAX_SIZE_REQUEST

The size of the message sent to the API exceeded 50 MB.

EXCEEDED_MAX_TYPES_LIMIT

The number of object types to describe is too large.

EXCEEDED_QUOTA

The size limit for org data storage was exceeded during a `create()` call.

FUNCTIONALITY_NOT_ENABLED

Functionality has been temporarily disabled. Other calls continue to work.

INACTIVE_OWNER_OR_USER

The user or record owner isn't active.

INACTIVE_PORTAL

The referenced portal is inactive.

INSUFFICIENT_ACCESS

The user doesn't have sufficient access to perform the operation.

INVALID_ASSIGNMENT_RULE

An invalid [AssignmentRuleHeader](#) value was specified.

INVALID_BATCH_SIZE

The query options have an invalid batch size value.

INVALID_CLIENT

The client is invalid.

INVALID_CROSS_REFERENCE_KEY

An invalid foreign key can't be set on a field. For example, an object share, such as AccountShare, can't be deleted because the share row is a result of a sharing rule.

INVALID_FIELD

The specified field name is invalid.

INVALID_FILTER_LANGUAGE

The specified language can't be used as a filter.

INVALID_FILTER_VALUE

A SOQL query with `LIKE` specified an invalid character, for example, an incorrectly placed asterisk (*). Correct the query and resubmit.

INVALID_ID_FIELD

The specified ID is correctly formatted but isn't valid. For example, the ID is of the wrong type, or the object it identifies no longer exists.

INVALID_GOOGLE_DOCS_URL

An invalid Salesforce record URL was used when trying to associate a Google Doc to that record. Correct the URL before trying the operation again.

INVALID_LOCATOR

The locator is invalid.

INVALID_LOGIN

The `login()` credentials aren't valid, or the maximum number of logins have been exceeded. Contact your administrator for more information.

INVALID_NEW_PASSWORD

The new password doesn't conform with the password policies of the org.

INVALID_OPERATION

The client application tried to modify a record that is locked by an approval process.

INVALID_OPERATION_WITH_EXPIRED_PASSWORD

Due to password expiration, a valid password must be set using `setPassword()` before the call can be invoked.

INVALID_QUERY_FILTER_OPERATOR

An invalid operator was used in the `query()` filter clause, at least for that field.

INVALID_QUERY_LOCATOR

An invalid `queryLocator` parameter was specified in a `queryMore()` call. It's also possible that you've exceeded the maximum number of calls, which is 10 per user for the API, and 5 for Apex and Visualforce.

INVALID_QUERY_SCOPE

The specified search scope is invalid.

INVALID_REPLICATION_DATE

The date for replication is out of the allowed range, such as before the org was created.

INVALID_SETUP_OWNER

The setup owner must be an Organization, Profile, or User.

INVALID_SEARCH

The `search()` call has invalid syntax or grammar. For more information, see the [Salesforce SOQL and SOSL Reference Guide](#).

INVALID_SEARCH_SCOPE

The specified search scope is invalid.

INVALID_SESSION_ID

The specified `sessionId` is malformed (incorrect length or format) or has expired. Log in again to start a new session.

INVALID_SOAP_HEADER

There's an error in the SOAP header. If you're migrating from an earlier version of the API, be advised that the `SaveOptions` header can't be used with API version 6.0 or later. Use [AssignmentRuleHeader](#) instead.

INVALID_SSO_GATEWAY_URL

The URL provided to configure the Single Sign-On gateway wasn't a valid URL.

INVALID_TYPE

The specified `sObject` type invalid.

INVALID_TYPE_FOR_OPERATION

The specified `sObject` type is invalid for the specified operation.

LIMIT_EXCEEDED

An array is too long. For example, there are too many BCC addresses, targets, or email messages.

LOGIN_DURING_RESTRICTED_DOMAIN

The user isn't allowed to log in from this IP address.

LOGIN_DURING_RESTRICTED_TIME

The user isn't allowed to log in during this time period.

MALFORMED_ID

An invalid ID string was specified. For information about IDs, see [ID Field Type](#).

MALFORMED_QUERY

An invalid query string was specified. For example, the query string was longer than 100,000 characters.

MALFORMED_SEARCH

An invalid search string was specified. For example, the search string was longer than 100,000 characters.

MISSING_ARGUMENT

A required argument is missing.

MIXED_DML_OPERATION

There are limits on what kinds of DML operations can be performed in the same transaction. For more information, see [Data Manipulation Language](#) in the *Apex Developer Guide*.

NOT_MODIFIED

The describe call response hasn't changed since the specified date.

NO_SOFTPHONE_LAYOUT

If an org has the CTI feature enabled, but no softphone layout has been defined, this exception is returned if a describe call is issued. This exception is most often caused because no call center has been defined. A default softphone layout is created during call center definition.

If an org doesn't have the CTI feature enabled, `FUNCTIONALITY_NOT_ENABLED` is returned instead.

NUMBER_OUTSIDE_VALID_RANGE

The number specified is outside the valid range for the field.

OPERATION_TOO_LARGE

The query has returned too many results. If certain queries are run by a user without the “View All Data” permission and many records are returned, the queries require sharing rule checking. For example, consider queries that are run on objects, such as [Task](#), that use a polymorphic foreign key. These queries return this exception because the operation requires too many resources. To correct, add filters to the query to narrow the scope, or use filters such as date ranges to break the query up into a series of smaller queries.

ORDER_MANAGEMENT_ACTION_NOT_ALLOWED

The requested action isn’t allowed.

ORG_LOCKED

The org has been locked. Contact Salesforce to unlock the org.

ORG_NOT_OWNED_BY_INSTANCE

The user tried to log in to the wrong server instance. Choose another server instance, use your org’s My Domain login URL, or log in at <https://login.salesforce.com>.

PASSWORD_LOCKOUT

The user has exceeded the allowed number of login attempts. The user must contact an administrator to regain login access.

PORTAL_NO_ACCESS

Access to the specified portal isn’t available.

QUERY_TIMEOUT

The query has timed out. For more information, see the [Salesforce SOQL and SOSL Reference Guide](#).

QUERY_TOO_COMPLICATED

SOQL query is either selecting too many fields or there are too many filter conditions. Try reducing the number of formula fields referenced in the query.

REQUEST_LIMIT_EXCEEDED

Exceeded either the concurrent request limit or the request rate limit for your org. For details on API request limits, see [API Usage Metering](#).

REQUEST_RUNNING_TOO_LONG

A request has taken too long to be processed.

SERVER_UNAVAILABLE

A server that is necessary for this call is unavailable. Other types of requests could still work.

SSO_SERVICE_DOWN

The service was unavailable, and an authentication call to the org’s specified Single Sign-On server failed.

TOO_MANY_APEX_REQUESTS

Too many Apex requests have been issued. If this exception persists, contact Salesforce Customer Support.

TRIAL_EXPIRED

The trial period for the org has expired. A representative from the company must contact Salesforce to re-enable the org.

UNSUPPORTED_API_VERSION

A method call was made that doesn’t exist in the accessed API version, for example, trying to use `upsert()` (new in 8.0) against version 5.0.

UNSUPPORTED_CLIENT

This version of the client is no longer supported.

Error

An `Error` contains information about an error that occurred during a `create()`, `merge()`, `process()`, `update()`, `upsert()`, `delete()`, or `undelete()` call. For more information, see [Error Handling](#). An `Error` has the following properties:

Name	Type	Description
<code>statusCode</code>	StatusCode	A code that describes the error.
<code>message</code>	string	Error message text.
<code>fields</code>	string[]	Array of one or more field names. Identifies which fields in the object, if any, affected the error condition.
<code>extendedErrorDetails</code>	ExtendedErrorDetails	More details about the error, including an extended error code and extra error properties, when available.

 **Note:** If your org has active duplicate rules and a duplicate is detected, the `SaveResult` includes an error with a data type of [DuplicateError](#).

StatusCode

An error can return any of these API status codes.

ALL_OR_NONE_OPERATION_ROLLED_BACK

The bulk operation was rolled back because one of the records wasn't processed successfully. See [AllOrNoneHeader](#).

ALREADY_IN_PROCESS

You can't submit a record that is already in an approval process. Wait for the previous approval process to complete before resubmitting a request with this record.

ASSIGNEE_TYPE_REQUIRED

Designate an assignee for the approval request (`ProcessInstanceStep` or `ProcessInstanceWorkitem`).

BAD_CUSTOM_ENTITY_PARENT_DOMAIN

The changes you're trying to make can't be completed because changes to the associated master-detail relationship can't be made.

BCC_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED

Your client application blind carbon-copied an email address even though the org's Compliance BCC Email option is enabled. This option specifies a particular email address that automatically receives a copy of all outgoing email. When this option is enabled, you can't BCC any other email address. To disable the option, log in to the user interface and from Setup, enter *Compliance BCC Email* in the `Quick Find` box, then select **Compliance BCC Email**.

BCC_SELF_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED

Your client application blind carbon-copied the logged-in user's email address even though the org's BCC COMPLIANCE option is set to true. This option specifies a particular email address that automatically receives a copy of all outgoing email. When this option is enabled, you can't BCC any other email address. To disable the option, log in to the user interface and from Setup, enter *Compliance BCC Email* in the `Quick Find` box, then select **Compliance BCC Email**.

CANNOT_CASCADE_PRODUCT_ACTIVE

An update to a product caused by a cascade can't be done because the associated product is active.

CANNOT_CHANGE_FIELD_TYPE_OF_APEX_REFERENCED_FIELD

You can't change the type of a field that is referenced in an Apex script.

CANNOT_CREATE_ANOTHER_MANAGED_PACKAGE

You can create only one managed package in an org.

CANNOT_DEACTIVATE_DIVISION

You can't deactivate Divisions if an assignment rule references divisions or if the `DefaultDivision` field on a user record isn't set to null.

CANNOT_DELETE_LAST_DATED_CONVERSION_RATE

If dated conversions are enabled, you must have at least one `DatedConversionRate` record.

CANNOT_DELETE_MANAGED_OBJECT

You can't modify components that are included in a managed package.

CANNOT_DISABLE_LAST_ADMIN

You must have at least one active administrator user.

CANNOT_ENABLE_IP_RESTRICT_REQUESTS

If you exceed the limit of five IP ranges specified in a profile, you can't enable restriction of login by IP addresses. Reduce the number of specified ranges in the profile and try the request again.

CANNOT_INSERT_UPDATE_ACTIVATE_ENTITY

You don't have permission to create, update, or activate the specified record.

CANNOT_MODIFY_MANAGED_OBJECT

You can't modify components that are included in a managed package.

CANNOT_RENAME_APEX_REFERENCED_FIELD

You can't rename a field that is referenced in an Apex script.

CANNOT_RENAME_APEX_REFERENCED_OBJECT

You can't rename an object that is referenced in an Apex script.

CANNOT_REPARENT_RECORD

You can't define a new parent record for the specified record.

CANNOT_RESOLVE_NAME

A `sendEmail()` call couldn't resolve an object name.

CANNOT_UPDATE_CONVERTED_LEAD

A converted lead couldn't be updated.

CANT_DISABLE_CORP_CURRENCY

You can't disable the corporate currency for an org. To disable a currency that is set as the corporate currency, first use the user interface to change the corporate currency to a different currency. Then disable the original currency.

CANT_UNSET_CORP_CURRENCY

You can't change the corporate currency for an org from the API. Use the user interface to change the corporate currency.

CHILD_SHARE_FAILS_PARENT

If you don't have appropriate permissions on a parent record, you can't change the owner of or define sharing rules for a child record. For example, you can't change the owner of a contact record if you can't edit its parent account record.

CIRCULAR_DEPENDENCY

You can't create a circular dependency between metadata objects in your org. For example, public group A can't include public group B, if public group B already includes public group A.

COMMUNITY_NOT_ACCESSIBLE

You don't have permission to access the Experience Cloud site that this entity belongs to. You must be given permission to access the site before you can access this entity.

CUSTOM_CLOB_FIELD_LIMIT_EXCEEDED

You can't exceed the maximum size for a CLOB field.

CUSTOM_ENTITY_OR_FIELD_LIMIT

You've reached the maximum number of custom objects or custom fields for your org.

CUSTOM_FIELD_INDEX_LIMIT_EXCEEDED

You've reached the maximum number of indexes on a field for your org.

CUSTOM_INDEX_EXISTS

You can create only one custom index per field.

CUSTOM_LINK_LIMIT_EXCEEDED

You've reached the maximum number of custom links for your org.

CUSTOM_METADATA_LIMIT_EXCEEDED

Your org has reached its custom metadata maximum limit.

CUSTOM_SETTINGS_LIMIT_EXCEEDED

Your org has reached its custom settings maximum limit.

CUSTOM_TAB_LIMIT_EXCEEDED

You've reached the maximum number of custom tabs for your org.

DELETE_FAILED

You can't delete a record because it is in use by another object.

DEPENDENCY_EXISTS

You can't perform the requested operation because of an existing dependency on the specified object or field.

DUPLICATE_CASE_SOLUTION

You can't create a relationship between the specified case and solution because it already exists.

DUPLICATE_CUSTOM_ENTITY_DEFINITION

Custom object or custom field IDs must be unique.

DUPLICATE_CUSTOM_TAB_MOTIF

You can't create a custom object or custom field with a duplicate master name.

DUPLICATE_DEVELOPER_NAME

You can't create a custom object or custom field with a duplicate developer name.

DUPLICATES_DETECTED

Duplicate records have been detected. Used for an Error object with a data type of [DuplicateError](#).

DUPLICATE_EXTERNAL_ID

A user-specified external ID matches more than one record during an upsert.

DUPLICATE_MASTER_LABEL

You can't create a custom object or custom field with a duplicate master name.

DUPLICATE_SENDER_DISPLAY_NAME

A `sendEmail()` call couldn't choose between `OrgWideEmailAddress.DisplayName` or `senderDisplayName`. Define only one of the two fields.

DUPLICATE_USERNAME

A create, update, or upsert failed because of a duplicate username.

DUPLICATE_VALUE

You can't supply a duplicate value for a field that must be unique. For example, you can't submit two copies of the same session ID in a `invalidateSessions()` call.

EMAIL_ADDRESS_BOUNCED

Emails to one or more recipients have bounced. Check the email addresses to make sure that they're valid.

EMAIL_NOT_PROCESSED_DUE_TO_PRIOR_ERROR

Because of an error earlier in the call, the current email wasn't processed.

EMAIL_OPTED_OUT

A single email message was sent with the REJECT setting in the `optOutPolicy` field to recipients that have opted out from receiving email. To avoid this error, set the `optOutPolicy` field to another value.

EMAIL_TEMPLATE_FORMULA_ERROR

The email template is invalid and can't be rendered. Check the template for incorrectly specified merge fields.

EMAIL_TEMPLATE_MERGEFIELD_ACCESS_ERROR

You don't have access to one or more merge fields in this template. To request access, contact your Salesforce administrator.

EMAIL_TEMPLATE_MERGEFIELD_ERROR

One or more merge fields don't exist. Check the spelling of field names.

EMAIL_TEMPLATE_MERGEFIELD_VALUE_ERROR

One or more merge fields have no value. To provide values, update the records before sending the email.

EMAIL_TEMPLATE_PROCESSING_ERROR

The merge fields in this email template can't be processed. Ensure that your template body is valid.

EMPTY_SCONTROL_FILE_NAME

The Scontrol file name was empty, but the binary wasn't empty.

ENTITY_FAILED_IFLASTMODIFIED_ON_UPDATE

If the value in a record's `LastModifiedDate` field is later than the current date, you can't update the record.

ENTITY_IS_ARCHIVED

If a record has been archived, you can't access it.

ENTITY_IS_DELETED

You can't reference an object that has been deleted. This status code occurs only in API version 10.0 and later. Previous releases of the API use `INVALID_ID_FIELD` for this error.

ENTITY_IS_LOCKED

You can't edit a record that is locked by an approval process.

ENVIRONMENT_HUB_MEMBERSHIP_CONFLICT

You can't add an org to more than one Environment Hub.

ERROR_IN_MAILER

An email address is invalid, or another error occurred during an email-related transaction.

FAILED_ACTIVATION

The activation of a Contract failed.

FIELD_CUSTOM_VALIDATION_EXCEPTION

You can't define a custom validation formula that violates a field integrity rule.

FIELD_FILTER_VALIDATION_EXCEPTION

You can't violate field integrity rules.

FILTERED_LOOKUP_LIMIT_EXCEEDED

The creation of the lookup filter failed because it exceeds the maximum number of lookup filters allowed per object.

HTML_FILE_UPLOAD_NOT_ALLOWED

Your attempt to upload an HTML file failed. HTML attachments and documents, including HTML attachments to a [Solution](#), can't be uploaded if the `Disallow HTML documents and attachments` checkbox is selected on the HTML Documents and Attachments Settings page.

IMAGE_TOO_LARGE

The image exceeds the maximum width, height, and file size.

INACTIVE_OWNER_OR_USER

The owner of the specified item is an inactive user. To reference this item, either reactivate the owner or reassign ownership to another active user.

INSERT_UPDATE_DELETE_NOT_ALLOWED_DURING_MAINTENANCE

Starting with version 32.0, you can't create, update, or delete data while the instance where your org resides is being upgraded to the latest release. Try again after the release has completed. For release schedules, see trust.salesforce.com. Before version 32.0, the code is `INVALID_READ_ONLY_USER_DML`.

INSUFFICIENT_ACCESS_ON_CROSS_REFERENCE_ENTITY

An operation affects an object that is cross-referenced by the specified object, but the logged-in user doesn't have sufficient permissions on the cross-referenced object. For example, a logged-in user attempts to modify an account record, and the update creates a `ProcessInstanceWorkitem`. If the user doesn't have permission to approve, reject, or reassign the `ProcessInstanceWorkitem`, this exception occurs.

INSUFFICIENT_ACCESS_OR_READONLY

You can't perform the specified action because you don't have sufficient permissions.

INVALID_ACCESS_LEVEL

You can't define a new sharing rule that provides less access than the specified org-wide default.

INVALID_ARGUMENT_TYPE

You supplied an argument that is of the wrong type for the operation being attempted.

INVALID ASSIGNEE TYPE

You specified an assignee type that isn't a valid integer between one and six.

INVALID_ASSIGNMENT_RULE

You specified an assignment rule that is invalid or that isn't defined in the org.

INVALID_BATCH_OPERATION

The specified batch operation is invalid.

INVALID_CONTENT_TYPE

The outgoing email has an `EmailFileAttachment` with an invalid `contentType` property. See [RFC2045 - Internet Message Format](#).

INVALID_CREDIT_CARD_INFO

The specified credit card information isn't valid.

INVALID_CROSS_REFERENCE_KEY

The specified value in a relationship field is not valid, or data is the expected type.

INVALID_CROSS_REFERENCE_TYPE_FOR_FIELD

The specified cross-reference type isn't valid for the specified field.

INVALID_CURRENCY_CONV_RATE

Specify a positive, non-zero value for the currency conversion rate.

INVALID_CURRENCY_CORP_RATE

You can't modify the corporate currency conversion rate.

INVALID_CURRENCY_ISO

The specified [currency ISO code](#) isn't valid.

INVALID_EMAIL_ADDRESS

A specified email address is invalid.

INVALID_EMPTY_KEY_OWNER

You can't set the value for `owner` to null.

INVALID_EVENT_SUBSCRIPTION

Invalid parameters were specified when subscribing to an event.

INVALID_FIELD

You specified an invalid field name when trying to update or upsert a record.

INVALID_FIELD_FOR_INSERT_UPDATE

You can't combine a person account record type change with any other field update.

INVALID_FIELD_WHEN_USING_TEMPLATE

You can't use an email template with an invalid field name.

INVALID_FILTER_ACTION

The specified filter action can't be used with the specified object. For example, an alert isn't a valid filter action for a Task.

INVALID_ID_FIELD

The specified ID field (`ID`, `ownerId`), or cross-reference field is invalid.

INVALID_INET_ADDRESS

A specified Inet address isn't valid.

INVALID_LINEITEM_CLONE_STATE

You can't clone a Pricebook2 or PricebookEntry record that isn't active.

INVALID_MASTER_OR_TRANSLATED_SOLUTION

The solution is invalid. For example, this exception occurs if you try to associate a translated solution with a master solution that's associated with another translated solution.

INVALID_MESSAGE_ID_REFERENCE

The outgoing email's References or In-Reply-To fields are invalid. These fields must contain valid Message-IDs. See [RFC2822 - Internet Message Format](#).

INVALID_OPERATION

There's no applicable approval process for the specified object.

INVALID_OPERATOR

The specified operator isn't applicable for the field type when used as a workflow filter.

INVALID_OR_NULL_FOR_RESTRICTED_PICKLIST

You specified an invalid or null value for a restricted picklist.

INVALID_PARTNER_NETWORK_STATUS

The specified partner network status is invalid for the specified template field.

INVALID_PERSON_ACCOUNT_OPERATION

You can't delete a person account.

INVALID_READ_ONLY_USER_DML

Version 31.0 and earlier: You can't create, update, or delete data while the instance where your org resides is being upgraded to the latest release. Try again after the release has completed. For release schedules, see trust.salesforce.com. After version 31.0, the code is `INSERT_UPDATE_DELETE_NOT_ALLOWED_DURING_MAINTENANCE`.

INVALID_SAVE_AS_ACTIVITY_FLAG

Specify `true` or `false` for the `saveAsActivity` flag.

INVALID_SESSION_ID

The specified `sessionId` is malformed (incorrect length or format) or has expired. Log in again to start a new session.

INVALID_STATUS

The specified org status change isn't valid.

INVALID_TYPE

The specified type isn't valid for the specified object.

INVALID_TYPE_FOR_OPERATION

The specified type isn't valid for the specified operation.

INVALID_TYPE_ON_FIELD_IN_RECORD

The specified value isn't valid for the specified field's type.

IP_RANGE_LIMIT_EXCEEDED

The specified IP address is outside the IP range specified for the org.

JIGSAW_IMPORT_LIMIT_EXCEEDED

The number of records you attempted to purchase from Data.com exceeds your available record addition limit.

LICENSE_LIMIT_EXCEEDED

You've exceeded the number of licenses assigned to your org.

LIGHT_PORTAL_USER_EXCEPTION

You attempted an action with a customer portal that's not allowed. For example, trying to add the user to a case team.

LIMIT_EXCEEDED

You've exceeded a limit on a field size or value, license, platform event publishing, or other component.

LOGIN_CHALLENGE_ISSUED

An email containing a security token was sent to the user's email address because the user logged in from an untrusted IP address.

The user can't log in until the security token is added to the end of the password.

LOGIN_CHALLENGE_PENDING

The user logged in from an untrusted IP address, but a security token hasn't yet been issued.

LOGIN_MUST_USE_SECURITY_TOKEN

The user must add a security token to the end of the password to log in.

MALFORMED_ID

An ID must be either 15 characters, or 18 characters with a valid case-insensitive extension. There's also an exception code of the same name.

MANAGER_NOT_DEFINED

A manager hasn't been defined for the specified approval process.

MASSMAIL_RETRY_LIMIT_EXCEEDED

A mass mail retry failed because your org has exceeded its mass mail retry limit.

MASS_MAIL_LIMIT_EXCEEDED

The org has exceeded its daily limit for mass email. Mass email messages can't be sent again until the next day.

MAXIMUM_CCEMAILS_EXCEEDED

You've exceeded the maximum number of specified CC addresses in a workflow email alert.

MAXIMUM_DASHBOARD_COMPONENTS_EXCEEDED

You've exceeded the document size limit for a dashboard.

MAXIMUM_HIERARCHY_LEVELS_REACHED

You've reached the maximum number of levels in a hierarchy.

MAXIMUM_SIZE_OF_ATTACHMENT

You've exceeded the maximum size of an attachment.

MAXIMUM_SIZE_OF_DOCUMENT

You've exceeded the maximum size of a document.

MAX_ACTIONS_PER_RULE_EXCEEDED

You've exceeded the maximum number of actions per rule.

MAX_ACTIVE_RULES_EXCEEDED

You've exceeded the maximum number of active rules.

MAX_APPROVAL_STEPS_EXCEEDED

You've exceeded the maximum number of approval steps for an approval process.

MAX_FORMULAS_PER_RULE_EXCEEDED

You've exceeded the maximum number of formulas per rule.

MAX_RULES_EXCEEDED

You've exceeded the maximum number of rules for an object.

MAX_RULE_ENTRIES_EXCEEDED

You've exceeded the maximum number of entries for a rule.

MAX_TASK_DESCRIPTION_EXCEEDED

The task description is too long.

MAX_TM_RULES_EXCEEDED

You've exceeded the maximum number of rules per Territory.

MAX_TM_RULE_ITEMS_EXCEEDED

You've exceeded the maximum number of rule criteria per rule for a Territory.

MERGE_FAILED

A merge operation failed.

MISSING_ARGUMENT

You didn't specify a required argument.

NONUNIQUE_SHIPPING_ADDRESS

You can't insert a reduction order item if the original order shipping address is different from the shipping address of other items in the reduction order.

NO_APPLICABLE_PROCESS

A `process()` request failed because the record submitted doesn't satisfy the entry criteria of any active approval processes for which the user has permission.

NO_ATTACHMENT_PERMISSION

Your org doesn't permit email attachments.

NO_INACTIVE_DIVISION_MEMBERS

You can't add members to an inactive Division.

NO_MASS_MAIL_PERMISSION

You don't have permission to send the email. You must have "Mass Email" to send mass mail or "Send Email" to send individual email.

NUMBER_OUTSIDE_VALID_RANGE

The number specified is outside the valid range of values.

NUM_HISTORY_FIELDS_BY_SUBJECT_EXCEEDED

The number of history fields specified for the sObject exceeds the allowed limit.

OP_WITH_INVALID_USER_TYPE_EXCEPTION

The operation you attempted can't be performed for one or more users. For example, you can't add high-volume portal users to a group.

OPTED_OUT_OF_MASS_MAIL

An email can't be sent because the specified User has opted out of mass mail.

ORDER_MANAGEMENT_ACTION_NOT_ALLOWED

The requested action isn't allowed.

ORDER_MANAGEMENT_RECORD_EXISTS

You can't create the record because it already exists.

ORDER_MANAGEMENT_RECORD_NOT_FOUND

We couldn't find the requested record.

PACKAGE_LICENSE_REQUIRED

The logged-in user can't access an object that is in a licensed package without a license for the package.

PLATFORM_EVENT_ENCRYPTION_ERROR

The platform event messages couldn't be published due to a problem with encryption. A misconfiguration in your Salesforce org or a general encryption service error can cause this problem.

PLATFORM_EVENT_PUBLISHING_UNAVAILABLE

Publishing platform event messages failed due to a service being temporarily unavailable. Try again later.

PLATFORM_EVENT_PUBLISH_FAILED

The platform event message couldn't be published after one or more attempts because of a system error. Try again later.

PORTAL_USER_ALREADY_EXISTS_FOR_CONTACT

A create [User](#) operation failed because you can't create a second portal user under a Contact.

PRIVATE_CONTACT_ON_ASSET

You can't have a private contact on an asset.

RECORD_IN_USE_BY_WORKFLOW

You can't access a record that's in use by a workflow or approval process.

REQUEST_RUNNING_TOO_LONG

A request that has been running too long is canceled.

REQUIRED_FIELD_MISSING

A call requires a field that wasn't specified.

SELF_REFERENCE_FROM_TRIGGER

You can't recursively update or delete the same object from an Apex trigger. This error often occurs when:

- You try to update or delete an object from within its before trigger.
- You try to delete an object from within its after trigger.

This error occurs with both direct and indirect operations. The following is an example of an indirect operation:

1. A request is submitted to update Object A.
2. A `before update` trigger on object A creates an object B.

- Object A is updated.
- An `after insert` trigger on object B queries object A and updates it. This update is an indirect update of object A because of the before trigger of object A, so an error is generated.

SHARE_NEEDED_FOR_CHILD_OWNER

If a parent record has a child record that needs a sharing rule, you can't delete the sharing rule for the parent record.

SINGLE_EMAIL_LIMIT_EXCEEDED

(API version 18.0 and later) The org has exceeded its daily limit for individual emails. Individual email messages can't be sent again until the next day.

STANDARD_PRICE_NOT_DEFINED

Custom prices can't be defined without corresponding standard prices.

STORAGE_LIMIT_EXCEEDED

You've exceeded your org's storage limit.

STRING_TOO_LONG

The specified string exceeds the maximum allowed length.

TABSET_LIMIT_EXCEEDED

You've exceeded the number of tabs allowed for a tabset.

TEMPLATE_NOT_ACTIVE

The template specified is unavailable. Specify another template or make the template available for use.

TERRITORY_REALIGN_IN_PROGRESS

An operation can't be performed because a territory realignment is in progress.

TEXT_DATA_OUTSIDE_SUPPORTED_CHARSET

The specified text uses a character set that isn't supported.

TOO_MANY_APEX_REQUESTS

Too many Apex requests have been sent. This error is transient. Resend your request after a short wait.

TOO_MANY_ENUM_VALUE

A request failed because too many values were passed in for a multi-select picklist. You can select a maximum of 100 values for a multi-select picklist.

TRANSFER_REQUIRES_READ

You can't assign the record to the specified User because the user doesn't have read permission.

UNABLE_TO_LOCK_ROW

A deadlock or timeout condition has been detected.

- A deadlock involves at least two transactions that are attempting to update overlapping sets of objects. If the transaction involves a summary field, the parent objects are locked, making these transactions especially prone to deadlocks. To debug, check your code for deadlocks and correct. Deadlocks are generally not the result of an issue with Salesforce operations.
- A timeout occurs when a transaction takes too long to complete, for example, when replacing a value in a picklist or changing a custom field definition. The timeout state is temporary. No corrective action is needed.

If an object in a batch can't be locked, the entire batch fails with this error. Errors with this status code contain the IDs of the records that couldn't be locked, when available, in the error message.

UNAVAILABLE_RECORDTYPE_EXCEPTION

The appropriate default record type couldn't be found.

UNDELETE_FAILED

An object couldn't not be undeleted because it doesn't exist or hasn't been deleted.

UNKNOWN_EXCEPTION

The system encountered an internal error. Report this problem to Salesforce.

Note: Don't report this exception code to Salesforce if it results from a `sendEmail()` call. The `sendEmail()` call returns this exception code when it is used to send an email to one or more recipients who have the **Email Opt Out** option selected.

UNSPECIFIED_EMAIL_ADDRESS

The specified user doesn't have an email address.

UNSUPPORTED_APEX_TRIGGER_OPERATION

You can't save recurring events with an Apex trigger.

UNVERIFIED_SENDER_ADDRESS

A `sendEmail()` call attempted to use an unverified email address defined in the `OrgWideEmailAddress` object.

WEBLINK_SIZE_LIMIT_EXCEEDED

The size of a WebLink URL or JavaScript code exceeds the limit.

WEBLINK_URL_INVALID

The WebLink URL has failed the URL string validation check.

WRONG_CONTROLLER_TYPE

The controller type for your Visualforce email template doesn't match the object type being used.

If you receive a status code not listed in the previous table, contact Customer Support.

ExtendedErrorDetails

An `ExtendedErrorDetails` element contains additional information about an error. The `ExtendedErrorDetails` element can include the following properties.

Name	Type	Description
<code>extendedErrorCode</code>	<code>ExtendedErrorCode</code>	A code that characterizes the extended error details.
<code>extended error property</code>	Varies	An extended error property that contains more information about the error. The property name and value vary based on the extended error code. For example, in a limits-related error, the property <code>limit</code> contains the value of a limit and <code>input</code> contains the submitted value that reaches or exceeds the <code>limit</code> .

ExtendedErrorCode

Each `ExtendedErrorDetails` contains an error code and its related properties. The codes and descriptions included here are examples of extended errors. You might see other extended error codes, depending on the error you encounter.

MAX_STATEMENT_SIZE

The query exceeds the character limit. See [SOQL SELECT Syntax](#).

MAX_XDS_IMPLICIT_SUBQUERIES

The query exceeds the number of joins allowed across external objects. [Understanding Relationship Query Limitations](#).

Duplicate Management Data Types

DuplicateError

Contains information about an error that occurred when an attempt was made to save a duplicate record. Use if your organization has set up duplicate rules, which are part of the Duplicate Management feature.

Fields

Field	Details
<code>duplicateResult</code>	<p>Type DuplicateResult</p> <p>Description The details of a duplicate rule and duplicate records found by the duplicate rule.</p>
<code>fields</code>	<p>Type string[]</p> <p>Description Array of one or more field names. Identifies which fields in the object, if any, affected the error condition.</p>
<code>message</code>	<p>Type string</p> <p>Description Error message text.</p>
<code>statusCode</code>	<p>Type StatusCode</p> <p>Description A code that characterizes the error. The full list of status codes is available in the WSDL file for your organization (see Generating the WSDL File for Your Organization).</p>

Usage

DuplicateError and its constituent objects are available to organizations that use duplicate rules.

DuplicateError is a data type of Error.

To process duplicates, loop through all the Error objects in the `errors` field on SaveResult. An Error object with a data type of DuplicateError contains information about an error that occurred when an attempt was made to save a duplicate record. To access information about the duplicates, use the `duplicateResult` field.

Java Sample

Here is a sample that shows how to see if there are any errors on the saveResult with a data type of DuplicateError. If so, duplicates were detected. See [DuplicateResult](#) for a full code sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```

if (!saveResult.isSuccess()) {
    for (Error e : saveResult.getErrors()) {
        if (e instanceof DuplicateError) {
            System.out.println("Duplicate(s) Detected for lead with ID: " +
leads[i].getId());
            System.out.println("ERROR MESSAGE: " + e.getMessage());
            System.out.println("STATUS CODE: " + e.getStatusCode());
            DuplicateResult dupeResult = ((DuplicateError)e).getDuplicateResult();
            System.out.println("Found the following duplicates...");
            for (MatchResult m : dupeResult.getMatchResults()) {
                if (m.isSuccess()) {
                    System.out.println("The match rule that was triggered was " +
m.getRule());
                    for (MatchRecord mr : m.getMatchRecords()) {
                        System.out.println("Your record matched " + mr.getRecord().getId()
+ " of type "
+ mr.getRecord().getType());
                        System.out.println("The match confidence is " +
mr.getMatchConfidence());
                    }
                }
            }
        }
    }
}

```

DuplicateResult

Represents the details of a duplicate rule that detected duplicate records and information about those duplicate records.

Fields

Field	Details
allowSave	<p>Type boolean</p> <p>Description true if duplicates are allowed to be saved. false if duplicates are not allowed to be saved.</p>
duplicateRule	<p>Type string</p> <p>Description The name of the duplicate rule that detected duplicate records.</p>

Field	Details
duplicateRuleEntityType	<p>Type string</p> <p>Description The name of the duplicate rule that detected duplicate records.</p>
errorMessage	<p>Type string</p> <p>Description The error message configured by the administrator to warn users they are potentially creating duplicate records. This message is associated with a duplicate rule.</p>
matchResults	<p>Type MatchResult</p> <p>Description The duplicate records and related match information.</p>

Usage

DuplicateResult and its constituent objects are available to organizations that use duplicate rules.

Java Sample

Here is a sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```
package com.doc.example;

import java.io.FileNotFoundException;

import com.sforce.soap.partner.*;
import com.sforce.soap.partner.Error;
import com.sforce.soap.partner.sobject.SObject;
import com.sforce.ws.ConnectionException;
import com.sforce.ws.ConnectorConfig;

public class SaveResultsWithDupeHeader {

    private PartnerConnection partnerConnection = null;
    static SaveResultsWithDupeHeader tester;

    public static void main(String[] args) {
        tester = new SaveResultsWithDupeHeader();
        try {
            tester.demoDuplicateRuleHeader();
        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

```

    /*
     * Make sure that you have an active lead duplicate rule linked to an active matching
     rule. This method tries to save
     * an array of leads and inspects whether any duplicates were detected
     */
    public void demoDuplicateRuleHeader() throws FileNotFoundException, ConnectionException
    {
        // Create the configuration for the partner connection
        ConnectorConfig config = new ConnectorConfig();
        config.setUsername("user@domain.com");
        config.setPassword("secret");
        config.setAuthEndpoint("authEndPoint");
        config.setTraceFile("traceLogs.txt");
        config.setTraceMessage(true);
        config.setPrettyPrintXml(true);

        // Initialize the connection
        partnerConnection = new PartnerConnection(config);

        // Get the leads that have to be saved
        SObject[] leads = getLeadsForInsertOrUpdate();

        /* Set a duplicate rule header to return a result if duplicates are detected
         * This sets the allowSave, includeRecordDetails, and runAsCurrentUser flags to
true
         */
        partnerConnection.setDuplicateRuleHeader(true, true, true);

        // Save the leads
        SaveResult[] saveResults = partnerConnection.create(leads);

        // Check the results to see if duplicates were detected
        for (int i = 0; i < leads.length; i++) {
            SaveResult saveResult = saveResults[i];
            if (!saveResult.isSuccess()) {
                for (Error e : saveResult.getErrors()) {
DuplicateError
                    // See if there are any errors on the saveResult with a data type of
DuplicateError
                    if (e instanceof DuplicateError) {
                        System.out.println("Duplicate(s) Detected for lead with ID: " +
leads[i].getId());
                        System.out.println("ERROR MESSAGE: " + e.getMessage());
                        System.out.println("STATUS CODE: " + e.getStatusCode());
                        DuplicateResult dupeResult =
((DuplicateError)e).getDuplicateResult();
                        System.out.println("Found the following duplicates...");
                        for (MatchResult m : dupeResult.getMatchResults()) {
                            if (m.isSuccess()) {
                                System.out.println("The match rule that was triggered was
" + m.getRule());
                                for (MatchRecord mr : m.getMatchRecords()) {
                                    System.out.println("Your record matched " +
mr.getRecord().getId() + " of type "

```

```

        + mr.getRecord().getType());
        System.out.println("The match confidence is " +
mr.getMatchConfidence());

        for (FieldDiff f : mr.getFieldDiffs()) {
            System.out.println("For field " + f.getName() + "
                + f.getDifference().name());
        }
    }
}

// Clear the duplicate rule header
partnerConnection.clearDuplicateRuleHeader();
}

/**
 * The assumption here is that this method is retrieving leads from either UI, a data
 source, etc
 */
private SObject[] getLeadsForInsertOrUpdate() {
    return new SObject[0];
}
}

```

MatchResult

Represents the duplicate results for a matching rule.

Fields

Field	Details
errors	<p>Type Error[]</p> <p>Description Errors that occurred during matching for the matching rule.</p>
entityType	<p>Type string</p> <p>Description The entity type of the matching rule.</p>
matchEngine	<p>Type string</p>

Field	Details
	<p>Description</p> <p>The match engine for the matching rule.</p>
matchRecords	<p>Type</p> <p>MatchRecord[]</p> <p>Description</p> <p>Information about the duplicates detected by the matching rule.</p>
rule	<p>Type</p> <p>string</p> <p>Description</p> <p>The developer name of the matching rule that detected duplicates.</p>
size	<p>Type</p> <p>int</p> <p>Description</p> <p>The number of duplicates detected by the matching rule.</p>
success	<p>Type</p> <p>boolean</p> <p>Description</p> <p><code>true</code> if the matching rule successfully ran. <code>false</code> if there's an error with the matching rule.</p>

Usage

MatchResult and its constituent objects are available to organizations that use duplicate rules.

There is 1 MatchResult for each saved record that has duplicates. The MatchResult contains all duplicates for that saved record.

Java Sample

Here is a sample that shows how to display the ID and type of all duplicates detected when leads are saved. See [DuplicateResult](#) for a full code sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```
for (MatchResult m : dupeResult.getMatchResults()) {
    if (m.isSuccess()) {
        System.out.println("The match rule that was triggered was " + m.getRule());
        for (MatchRecord mr : m.getMatchRecords()) {
            System.out.println("Your record matched " + mr.getRecord().getId() + " of type "
                + mr.getRecord().getType());
            System.out.println("The match confidence is " + mr.getMatchConfidence());
        }
    }
}
```

MatchRecord

Represents a duplicate record detected by a matching rule.

Fields

Field	Details
<code>additionalInformation</code>	<p>Type AdditionalInformationMap</p> <p>Description Other information about matched records.</p>
<code>fieldDiffs</code>	<p>Type FieldDiff[]</p> <p>Description Matching rule fields and how each field value compares for the duplicate and its matching record.</p>
<code>matchConfidence</code>	<p>Type double</p> <p>Description The ranking of how similar a matched record's data is to the data in your request. Must be equal to or greater than the value of the <code>minMatchConfidence</code> specified in your request. Returns <code>-1</code> if unused.</p>
<code>record</code>	<p>Type <code>sObject</code></p> <p>Description The fields and field values for the duplicate record.</p>

Usage

`MatchRecord` and its constituent objects are available to organizations that use duplicate rules.

Each `MatchRecord` represents a duplicate detected when a record is saved. There can be multiple `MatchRecord` objects for a saved record if multiple duplicates are detected.

Java Sample

Here is a sample that shows how to display the ID and type of all duplicates detected when a lead is saved. See [DuplicateResult](#) for a full code sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```
for (MatchRecord mr : m.getMatchRecords()) {
    System.out.println("Your record matched " + mr.getRecord().getId() + " of type "
        + mr.getRecord().getType());
}
```

```
System.out.println("The match confidence is " + mr.getMatchConfidence());
}
```

FieldDiff

Represents the name of a matching rule field and how the values of the field compare for the duplicate and its matching record.

Fields

Field	Details
difference	<p>Type differenceType</p> <p>Description How the values of the matching rule field compare for the duplicate and its matching record. Possible values include:</p> <ul style="list-style-type: none"> • Same: Indicates the field values match exactly. • Different: Indicates that the field values do not match. • Null: Indicates that the field values are a match because both values are blank.
name	<p>Type string</p> <p>Description The name of a field on a matching rule that detected duplicates.</p>

Java Sample

Here is a sample that shows how to display the matching rule field differences when a duplicate is detected. See [DuplicateResult](#) for a full code sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```
for (FieldDiff f : mr.getFieldDiffs()) {
    System.out.println("For field " + f.getName() + " field difference is "
        + f.getDifference().name());
}
```

AdditionalInformationMap

Represents other information, if any, about matched records.

Fields

Field	Details
name	<p>Type string</p>

Field	Details
	<p>Description The name of the element.</p>
value	<p>Type string</p> <p>Description The value of the element.</p>

System Fields

The following fields are read-only fields found on most objects. These fields are automatically updated during API operations. For example, the ID field is automatically generated during a create operation and the LastModifiedDate is automatically updated when a user modifies a record.

Field	Field Type	Description
Id	ID	Globally unique string that identifies a record. For information on IDs, see ID Field Type . Because this field exists in every object, it is not listed in the field table for each object. Id fields have Defaulted on create and Filter access.
IsDeleted	boolean	Indicates whether the record has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Because this field does not appear in all objects, it is listed in the field table for each object.
Audit Fields		
CreatedById	reference	ID of the User who created this record. CreatedById fields have Defaulted on create and Filter access.
CreatedDate	dateTime	Date and time when this record was created. CreatedDate fields have Defaulted on create and Filter access.
LastModifiedById	reference	ID of the User who last updated this record. LastModifiedById fields have Defaulted on create and Filter access.
LastModifiedDate	dateTime	Date and time when a user last modified this record. LastModifiedDate fields have Defaulted on create and Filter access.
SystemModstamp	dateTime	Date and time when a user or automated process (such as a trigger) last modified this record. In this context, "trigger" refers to Salesforce code that runs to implement standard functionality, and not an Apex trigger. SystemModstamp fields have Defaulted on create and Filter access.

 **Note:** Audit Fields with the dateTime field type have a certain range of valid dates. Unlike other dateTime fields, the earliest valid date is 1970-01-01T00:00:00Z GMT, or just after midnight on January 1, 1970. The latest valid date is 4000-12-31T00:00:00Z GMT, or just after midnight on December 31, 4000. These values are offset by your time zone. For example, in the Pacific time zone, the earliest valid date is 1969-12-31T16:00:00, or 4:00 PM on December 31, 1969.

If you import data into Salesforce and want to retain the audit field values of the source system, you can set the values for audit fields on the following objects: Account, ArticleVersion, Attachment, CampaignMember, Case, CaseComment, Contact, ContentVersion, Contract, Event, Idea, IdeaComment, Lead, Opportunity, Question, Task, Vote, and custom objects. The only audit field you cannot set a value for is `systemModstamp`.

1. From Setup, enter *User Interface* in the *Quick Find* box, then select **User Interface** under *Customize*.
2. Under Setup, select **Enable “Set Audit Fields upon Record Creation” and “Update Records with Inactive Owners” User Permissions**.
3. In the permission set or profile that you want to set audit fields with, enable the permission **Set Audit Fields upon Record Creation**.
4. Using the API, create a record and set its audit fields.

Not all standard objects have all audit fields. Check the Enterprise WSDL to verify which audit fields are available for a given object.

Parent Reference Fields

If an object has a relationship to a parent object, two fields are added.

- `Parent_Name` contains the object name of the parent. For example, Case has a `Contact` field that contains a reference to the contact parent of the case.
- `Parent_NameId` contains the ID of the parent. For example, Case has a `ContactId` field that refers to the contact parent of the case. This field is used in SOQL relationship queries such as the following:

```
SELECT Case.ContactId, Case.Contact.Name FROM Case
```

Even if the object can parent itself, these fields occur. For example, the Campaign object has a `Campaign` and `CampaignId` field for referencing the parent Campaign.

Required Fields

Required fields must have a non-`null` value. This rule affects the create and update calls:

- In a create call, the system automatically populates the data for certain required fields (such as system fields and the object ID fields). Similarly, if a required field has a default value (its `defaultedOnCreate` attribute is set to `true`, then the system implicitly assigns a value for this field when the object is created, even if a value for this field is not explicitly passed in on the create call. For all other required fields, such as ID fields that are analogous to foreign keys in SQL, a client application must explicitly assign a value when the object is created (it cannot be `null`).
- In updates, a required field cannot be set to `null`, and many required fields can't be changed.

Any field not specified as required in the object description is optional, that is, it can be `null` when updated or created.

Some required fields for some objects require special handling.

Frequently-Occurring Fields

In addition to system fields, these fields are found on many objects.

- `OwnerId`
- `RecordTypeId`
- `CurrencyIsoCode`

OwnerId

Objects have an `OwnerId` field that is a reference to the user who owns that object. Ownership is an important concept that affects the security model and has other implications throughout the system. Any user can query the owner field for any record they can access. However, setting the `OwnerId` field has the following limitations:

- For most users and most objects, this field can't be set directly upon insert. It is implicitly set to the current user when inserting an object.
- When creating or updating a Case or Lead, a client application (that is logged in with sufficient permissions to transfer a record) can set this field to any valid User in the organization or to any valid queue of the appropriate type in the organization.
- Updating this field via the API changes only the owner of that record. The change of ownership does not cascade to associated records as it does when you transfer record ownership in the Salesforce user interface.
- Updating this field on an account deletes the existing sharing information and reapplies the organization-wide sharing defaults and sharing rules.
- To update the `OwnerId` field, the user must have the "Transfer Record" permission and Read access to the new owner.

In API version 12.0 and later, if your organization has set up opportunity teams, `OwnerId` fields behave the same for Account and Opportunity objects as for other objects. That is, if you update the `OwnerId` field in either object, any AccountShare or OpportunityShare records with `RowCause` set to Sales Team are kept. In API version 11.0 and earlier, the sharing records are deleted.

RecordTypeId

Record types are used to offer different business processes and subsets of picklist values to different User records based on their Profile settings. (In addition, person accounts use record types to manage a number of additional elements.)

Record types are configured in the user interface or by creating, editing, or deleting the RecordType object in the API. Retrieve the list of valid record type IDs (String) for an object by querying the RecordType object.

The `RecordTypeId` field in an object contains the ID of the RecordType record that is associated with a standard or custom object. You can create or update this field.

 **Note:** You can't create or update the `RecordTypeId` field on the CampaignMember records. Set the CampaignMember record type using the `CampaignMemberRecordTypeId` field on Campaign.

When specified in a create or update call, the record type ID (String) must refer to a valid record type for that object.

 **Note:** The `RecordTypeId` field is in your organization's WSDL only if at least one record type is configured for your organization in the Salesforce user interface.

CurrencyIsoCode

For organizations that have multicurrency enabled, the `CurrencyIsoCode` field contains the string representation of the currency ISO code associated with currency values in the object. Note that the User object also has a `DefaultCurrencyIsoCode` field, which is the default currency for that user. For example, a user in France could have a `DefaultCurrencyIsoCode` set to Euros, and that would be their default currency in the application. However, the User object could have currency custom fields stored in a different currency, that will correspond to the organization currency at the time the user record is created.

API Field Properties

Fields on objects represent the details of each object and are analogous to columns in a database table. Each field on each object has one or more of the following properties:

Property	Description
Aggregatable	Can be used by one of the SOQL aggregate functions.
Autonumber	The API creates an autonumber.
Create	Value for the field can be specified during create using the API.
Defaulted on create	If no other value is specified when created, a default value is supplied.
Delete	Value for the field can be deleted using the API.
Filter	Can be used as filter criteria in a SOQL query FROM or WHERE clause.
Group	Can be included in the GROUP BY clause of a SOQL query (<code>true</code>) or not (<code>false</code>). Available in API version 18.0 and later.
idLookup	Can be used to specify a record in an upsert call. The <code>Id</code> field of each object has this property and some <code>Name</code> fields. There are exceptions, so check for the property in any object you wish to upsert.
Namepointing	Indicates whether the field's value is the Name of the parent of this object (<code>true</code>) or not (<code>false</code>). Used for objects whose parents can be more than one type of object. For example, a task can have an account or a contact as a parent.
Nullable	The field can contain a null value.
Query	The field can be queried with SOQL using the API.
Restricted picklist	A picklist whose values are restricted to those values defined by a Salesforce admin. Users can't load unapproved values through the API.
Retrieve	Value of the field can be retrieved using the API.
Sort	Indicates whether a query can sort on this field (<code>true</code>) or not (<code>false</code>).
Update	Can be updated using the API.

Relationships Among Objects

 **[other]:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Relationships associate objects with other objects. For example, a relationship can link a custom object to standard object in a related list, such as linking a custom object called Bugs to cases to track product defects associated with customer cases. To view the parent and child relationships among standard objects, see the ERD diagrams in [Data Model](#).

 **Note:**

- You can use parent-child relationships in SOQL queries. For more information, see Relationship Queries in the [Salesforce SOQL and SOSL Reference Guide](#).
- Only lookup, external lookup, and indirect lookup relationships are available for external objects. No other relationship types are supported. See “External Object Relationships” in the Salesforce Help.

You can define different types of relationships by creating custom relationship fields on an object. The differences between relationship types include how they handle data deletion, record ownership, security, and required fields in page layouts:

- **Master-Detail (1:n)** — A parent-child relationship in which the master object controls certain behaviors of the detail object:
 - When a record of the master object is deleted, its related detail records are also deleted.
 - The `Owner` field on the detail object is not available and is automatically set to the owner of its associated master record. Custom objects on the detail side of a master-detail relationship cannot have sharing rules, manual sharing, or queues, as these require the `Owner` field.
 - The detail record inherits the sharing and security settings of its master record.
 - The master-detail relationship field is required on the page layout of the detail record.
 - By default, records can't be reparented in master-detail relationships. Administrators can, however, allow child records in master-detail relationships on custom objects to be reparented to different parent records by selecting the `Allow reparenting` option in the master-detail relationship definition.

You can define master-detail relationships between custom objects or between a custom object and a standard object. However, the standard object cannot be on the detail side of a relationship with a custom object. In addition, you cannot create a master-detail relationship in which the User or Lead objects are the master.

When you define a master-detail relationship, the custom object on which you are working is the detail side. Its data can appear as a custom related list on page layouts for the other object.

- **Many-to-many** — You can use master-detail relationships to model *many-to-many* relationships between any two objects. A many-to-many relationship allows each record of one object to be linked to multiple records from another object and vice versa. For example, you create a custom object called Bug that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs. To create a many-to-many relationship, simply create a custom junction object with two master-detail relationship fields, each linking to the objects you want to relate. See the Salesforce online help for details.

Custom objects with two master-detail relationships are supported in API version 11 and later.

Starting in API version 34.0, the `JunctionIdList` field type lets you manipulate the many-to-many relationship of an entity directly. You no longer need to manipulate underlying junction entity records. `JunctionIdList` fields can be queried and updated like any other field on the entity. Queries or updates to `JunctionIdList` fields act as queries or updates to the underlying junction entity records. Fields of type `JunctionIdList` appear in the WSDL as an unbounded array of type ID. `JunctionIdList` is implemented in the `Task` and `Event` objects.

- **Lookup (1:n)** — This type of relationship links two objects together, but has no effect on deletion or security. Unlike master-detail fields, lookup fields are not automatically required. When you define a lookup relationship, data from one object can appear as a custom related list on page layouts for the other object. See the Salesforce online help for details.

To create relationships, use the user interface or Salesforce Metadata API.

Relabeling Fields and Tabs and the API

The user interface allows you to change the labels on some fields and tabs. Although you cannot relabel fields or tabs using the API, you can retrieve the current values. To do so, issue a `describeSObjects()` call and inspect the label field of the returned `DescribeSObjectResult`.

Tooling API Objects in the Enterprise WSDL

Some objects used by the Tooling API are included in the Enterprise and Partner WSDL. Use the objects from these WSDLs instead of the Tooling WSDL if you need field-level security.

The following Tooling API objects are exposed in the Enterprise and Partner WSDL.

- BriefcaseDefinition
- DataType
- EntityDefinition
- EntityParticle
- FieldDefinition
- PicklistValueInfo
- Publisher
- SearchLayout
- Service
- ServiceDataType (Reserved for future use.)
- ServiceFieldDataType (Unavailable in version 35.0 and later. Do not use.)
- RelationshipDomain
- RelationshipInfo
- UserEntityAccess
- UserFieldAccess
- WsdldataType (Reserved for future use.)
- XmlSchema (Reserved for future use.)

For more information, use the *Tooling API Developer's Guide*.

Salesforce AppExchange Object Prefixes and the API

If you have an unmanaged package and a managed package version becomes available, the API names of custom fields, custom objects, and Scontrol objects in the package change. A namespace prefix is added to each component to make it unique: `name__c` becomes `prefix__name__c`. To move from an unmanaged package to a managed package version of the same application, export your data, uninstall the old package, and install the new package. Then review the name changes and import your data with the relevant mapping. For details, see the *ISVforce Guide*.

Custom Object Behavior

In the user interface, you can extend your org's data by defining custom objects. Custom objects are custom database tables that allow you to store information unique to your organization. For custom objects, the `custom` flag—a Boolean field in the describe results—is `true`.

 **[other]:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Client applications with sufficient permissions can invoke API calls on existing custom objects. You can create custom objects with the user interface, or by using the metadata WSDL with a client application or using the Salesforce Extensions for Visual Studio Code. For more information about using the metadata WSDL to create custom objects, see the *Lightning Platform Metadata API Developer's Guide*. For more information about Visual Studio Code, see *Salesforce Extensions for Visual Studio Code*.

Use the following topics to understand how the API interacts with custom objects and fields:

- [Naming Conventions for Custom Objects](#)
- [Relationships Among Custom Objects](#)

- [Audit Fields for Custom Objects](#)
- [Sharing and Custom Objects](#)
- [Tags and Custom Objects](#)
- [Standard Fields for Custom Objects](#)
- [Required Fields in Custom Objects](#)
- [Managed Packages and API Names](#)

Naming Conventions for Custom Objects

Your Salesforce administrator defines an associated name field for each custom object during setup. Custom objects must have unique names within your organization.

In the API, the names of custom objects include a suffix of two underscores followed by a lowercase “c”. For example, a custom object labeled “Issue” in the Salesforce user interface is `Issue__c` in that organization’s WSDL.

Relationships change the naming convention. See [Relationships Among Custom Objects](#) for more information.

For a custom object record to appear in the Salesforce user interface, its name field must be populated. If you use the API to create a custom object record that doesn’t have a name, the record’s ID is used as its name.

Relationships Among Custom Objects

Custom objects behave and relate to other objects just like standard objects do, as described in [Relationships Among Objects](#). For example, cascading deletes are supported in custom objects in a Master-Detail relationship.

Custom objects can also have many-to-many relationships with other custom objects or standard objects. A many-to-many relationship allows each record of one object to be linked to multiple records from another object and vice versa. For more information, see [Relationships Among Objects](#).

Custom objects require special treatment so that they can participate in Relationship Queries. For the relationship field name of a custom object, `__r` is appended to the name to create the ID. Also, `__c` is appended to the name to create the parent object pointer. For example, if the relationship field name is `MyRel`, the name of the ID becomes `MyRelId__r`, the parent object pointer becomes `MyRel__c`, and the relationship name is `MyRel__r`. For more information, see [Understanding Relationship Names, Custom Objects, and Custom Fields in the *Salesforce SOQL and SOSL Reference Guide*](#).

This table summarizes whether a standard object can be:

- The master in a master-detail relationship with a custom object. Master-detail relationships involve cascading deletes and sharing rules that the parent controls.
- The lookup in a lookup relationship on a custom object. In other words, whether a custom object can have a lookup to the standard object.
- Extended with custom fields.

Standard Object	Master-Detail	Lookup	Custom Fields
Account	Yes	Yes	Yes
Campaign	Yes	Yes	Yes
Case	Yes	Yes	Yes
Contact	Yes	Yes	Yes
Contract	Yes	Yes	Yes

Standard Object	Master-Detail	Lookup	Custom Fields
Event	No	No	Yes
Lead	No	No	Yes
Opportunity	Yes	Yes	Yes
Product2	No	Yes	Yes
Solution	Yes	Yes	Yes
Task	No	No	Yes
User	No	Yes	Yes

Audit Fields for Custom Objects

Custom objects can have the same audit fields as standard objects. When you create a custom object, the four audit fields, `CreatedById`, `CreatedDate`, `LastModifiedById`, and `LastModifiedDate`, are created and populated for the object. These fields are read only. If you import data into Salesforce custom objects and want to retain the audit field values from the source system, you can set the values when you create the custom objects. The only audit field you cannot set a value for is `SystemModstamp`. Your organization must be API enabled, and you must have the “Modify All Data” permission.

1. From Setup, enter *User Interface* in the **Quick Find** box, then select **User Interface** under Customize.
2. Under Setup, select **Enable “Set Audit Fields upon Record Creation” and “Update Records with Inactive Owners” User Permissions**.
3. In the permission set or profile that you want to set audit fields with, enable the permission **Set Audit Fields upon Record Creation**.
4. Using the API, create a record and set its audit fields.

Note these restrictions:

- `CreatedDate` can't be greater than the `LastModifiedDate`.
- You can't set any date field to be greater than the current time.

For more information about audit fields, see [System Fields](#).

Sharing and Custom Objects

A sharing rule object is created for each custom object that does not have a master-detail relationship to another object. They are similar to standard object sharing rules, for example `AccountOwnerSharingRule`. If the user creating the custom object has the “Manage Sharing” permission, a sharing rule object is automatically created for it.

Apex sharing reasons can be retrieved describing the custom object's sharing object, and examining the information in the `rowCause` field. The name of a sharing object for each custom object is of the form: `MyObjectName__Share`, similar to `AccountShare` and other standard object sharing objects.

Tags and Custom Objects

When a custom object is created, a Tag object related to it is also created. These object names are of the form: `MyObjectName__Tag`, similar to `AccountTag` and other standard object tag objects.

Standard Fields for Custom Objects

When a custom object is created, Salesforce assigns some standard fields to the object or entity. For details, see [Custom Objects](#).

Required Fields in Custom Objects

In the user interface, you can mark a custom field as required, and this rule is also enforced in the API. Each custom field has a `nullable` attribute, with a data type boolean. The default value is `false`. If set to `true`, each request supplies a value (or leaves the current value) to this field. Otherwise, the request fails. When the value is set to `true`, the next time the field is edited or created, the validation applies. If no value is supplied or default value specified, the request fails.

To edit the `nullable` attribute, you must log in as a user with the “Customize Application” permission.

If you change a custom object field to be required in an existing client application or integration, be sure that a value is supplied for that field. For example, if the custom picklist field `Education Level` on the contact object is required, supply a default value for that custom field. If a required field does not have a specified or default value, an error with the status code `REQUIRED_FIELD_MISSING` is returned.

Managed Packages and API Names

If you have an unmanaged package and a managed package version becomes available, the API names of custom fields, custom objects, and Scontrol objects in the package change. A namespace prefix is added to each component to make it unique: `name__c` becomes `prefix_name__c`. To move from an unmanaged package to a managed package version of the same application, export your data, uninstall the old package, and install the new package. Then review the name changes and import your data with the relevant mapping. For details, see the [ISVforce Guide](#).

SEE ALSO:

[Custom Objects](#)

External Objects

External objects are supported in API version 32.0 and later. External objects are similar to custom objects, but external object record data is stored outside your Salesforce organization. For example, perhaps you have data that's stored on premises in an enterprise resource planning (ERP) system. Instead of copying the data into your org, you can use external objects to access the data in real time via web service callouts.

External objects are available with Salesforce Connect and Files Connect. Each external object is associated with an external data source definition in your Salesforce organization.

An external data source specifies how to access an external system. Salesforce Connect uses external data sources to access data that's stored outside your Salesforce organization. Files Connect uses external data sources to access third-party content systems. External data sources have associated external objects, which your users and the Lightning Platform use to interact with the external data and content.

By accessing record data on demand, external objects always reflect the current state of the external data. You don't have to manage a copy of that data in Salesforce, so you're not wasting storage and resources keeping data in sync.

External objects are best used when you have a large amount of data that you can't or don't want to store in your Salesforce organization, and you need to use only a small amount of data at any one time.

See “Define External Objects” in the Salesforce Help for how to create and modify external objects.

Naming Conventions for External Objects

Object names must be unique across all standard, custom, and external objects in the org.

In the API, the names of external objects are identified by a suffix of two underscores immediately followed by a lowercase “x” character. For example, an external object named “ExtraLogInfo” in the Salesforce user interface is seen as `ExtraLogInfo__x` in that organization's WSDL.

We recommend that you make object labels unique across all standard, custom, and external objects in the org.

External Object Relationships

External objects support standard lookup relationships, which use the 18-character Salesforce record IDs to associate related records with each other. However, data that’s stored outside your Salesforce org often doesn’t contain those record IDs. Therefore, two special types of lookup relationships are available for external objects: external lookups and indirect lookups. See “External Object Relationships” in the Salesforce Help for details.

Feature Support for External Objects

Most of the Salesforce features that support custom objects also support external objects. However, there are exceptions, and some features have special limitations and considerations for external objects. See the following topics in the Salesforce Help.

- External Objects in Salesforce Connect
- Salesforce Platform Features Supported by Salesforce Connect

Salesforce Connect Adapters

Salesforce Connect uses a protocol-specific adapter to connect to an external system and access its data. This table describes the available adapters.

Salesforce Connect Adapter	Description	When to Use
Cross-org	Uses the Lightning Platform REST API to access data that’s stored in other Salesforce orgs.	To seamlessly connect data between your Salesforce orgs. For example, provide your service representatives a unified view of customer transactions by integrating data from different Salesforce orgs.
OData 2.0 OData 4.0	Uses Open Data Protocol to access data that’s stored outside Salesforce. The external data must be exposed via OData producers.	To integrate external data sources into your org that support the ODATA protocol and publish an OData provider. For example, give your account executives a unified data view by pulling data from legacy systems such as SAP, Microsoft, and Oracle in real time.
Custom adapter created via Apex	You use the Apex Connector Framework to develop your own custom adapter when the other available adapters aren’t suitable for your needs. A custom adapter can obtain data from anywhere. For example, some data can be retrieved from anywhere in	To develop your own adapter with the Apex Connector Framework when the other available adapters aren’t suitable for your needs. For example, when you want to retrieve data via callouts from a REST API.

Salesforce Connect Adapter	Description	When to Use
<hr/> <p data-bbox="349 317 852 384">the Internet via callouts, while other data can be manipulated or even generated programmatically.</p> <hr/>		

Files Connect Adapters

Several Files Connect adapters are also available:

- Google Drive
- Box
- SharePoint Online
- OneDrive for Business

For more information about setting up Files Connect adapters see, [The Files Connect Process](#).

For more information about Salesforce Connect, see “Salesforce Connect” in the Salesforce Help.

For details on using the Apex Connector Framework, see “Salesforce Connect” and “DataSource Namespace” in the [Apex Code Developer’s Guide](#).

CHAPTER 3 API Call Basics

In this chapter ...

- [Characteristics of API Calls](#)
- [Factors that Affect Data Access](#)
- [Package Version Settings](#)

API calls represent specific operations that your client applications can invoke at runtime to perform tasks, for example:

- Query data in your organization.
- Add, update, and delete data.
- Obtain metadata about your data.
- Run utilities to perform administration tasks.

Using your development environment, you can construct Web service client applications that use standard Web service protocols to programmatically:

- Log in to the login server (`login()`) and receive authentication information to be used for subsequent calls
- Query your organization's information (`query()`, `queryAll()`, `queryMore()`, and `retrieve()` calls)
- Perform text searches across your organization's information (`search()` call)
- Create, update, and delete data (`create()`, `merge()`, `update()`, `upsert()`, `delete()`, and `undelete()` calls)
- Perform administrative tasks, such as retrieving user information (`getUserInfo()` call), changing passwords (`setPassword()` and `resetPassword()` calls), and getting the system time (`getServerTimestamp()` call)
- Replicate data locally (`getDeleted()` and `getUpdated()` calls)
- Obtain and navigate metadata about your organization's data (`describeGlobal()`, `describeSubject()`, `describeSubjects()`, `describeLayout()`, and `describeTabs()` calls)
- Work with approval processes (`process()`)
- Return category groups and categories from your organization (`describeDataCategoryGroups()` and `describeDataCategoryGroupStructures()`).

See [Core Calls](#), [Describe Calls](#), and [Utility Calls](#) for complete details about each call.

SEE ALSO:

[User Permissions](#)

Characteristics of API Calls

All API calls are:

- **Service Requests and Responses**—Your client application prepares and submits a service request to the Lightning Platform Web Service via the API, the Lightning Platform Web Service processes the request and returns a response, and the client application handles the response.
- **Synchronous**—Once the API call is invoked, your client application waits until it receives a response from the service. Asynchronous calls are not supported.
- **Committed Automatically Versus Rollback on Error**—By default, every operation that writes to a Salesforce object is committed automatically. This is analogous to the AUTOCOMMIT setting in SQL. For `create()`, `update()`, and `delete()` calls that attempt to write to multiple records for an object, the write operation for each record is treated as a separate transaction. For example, if a client application attempts to create two new accounts, they're created using mutually exclusive insert operations that succeed or fail individually, not as a group.

For API version 20.0 and later, there is an `AllOrNoneHeader` header that allows a call to roll back all changes unless all records are processed successfully. This header is supported by the `create()`, `delete()`, `undelete()`, `update()`, and `upsert()` calls.

- **Note:** The default behavior means that client applications may need to handle some failures: for example, if you create an opportunity that has shipments (a custom object), and the opportunity line item gets created but the shipment creation fails, if your business rules required all opportunities be created with shipment, your client application would need to roll back the opportunity creation. The easiest way to do this is to use `AllOrNoneHeader`.

Factors that Affect Data Access

When using the API, the following factors affect access to your organization's data:

Access

Your organization must be enabled for API access.

Objects may not be available until you contact Salesforce and request access. For example, Territory2 is visible only if Enterprise Territory Management has been enabled in the application. Such requirements are in the "Usage" section for each object.

Sometimes a feature must be used once before objects related to it can be accessed with the API. For example, the `recordTypeId`s is available only after at least one record type has been created for your organization in the user interface.

To investigate data access issues, you can start by inspecting the WSDL:

- **Enterprise WSDL:** The generated enterprise WSDL file contains all of the objects that are available to your organization. By using the API, a client application can access objects that are defined in your enterprise WSDL file.
- **Partner WSDL:** When using the generated partner WSDL file, a client application can access objects that are returned in the `describeGlobal()` call.

Object-Level and Field-Level Security

The API respects object-level and field-level security configured in the user interface. You can access objects and fields only if the logged-in user's permissions and access settings allow such access. For example, fields that are not visible to a given user are not returned in a `query()` or `describeObjects()` call. Similarly, read-only fields can't be updated.

User Permissions

A user attempting to access the API must have the permission "API Enabled" selected. It's selected by default.

Your client application logs in as a user called a *logged-in* user. The logged-in user's permissions grant or deny access to specific objects and fields in your organization:

- **Read**—Users can only view objects of this type.
- **Create**—Users can read and create objects of this type.
- **Edit**—Users can read and update objects of this type.
- **Delete**—Users can read, edit, and delete objects of this type.

User permissions do not affect field-level security. If field-level security specifies that a field is hidden, users with “Read” on that object can view only those fields that are not hidden on the record. In addition, users with “Read” on an object can view only those records that sharing settings allow. The one exception is the “Edit Read Only Fields” permission, which gives users the ability to edit fields marked as read only via field-level security.

Sharing

For most API calls, data that is outside of the logged-in user’s sharing model is not returned. Users are granted the most permissive access that is available to them, either through organization-wide defaults or manual record sharing, just as in the application.

User Permissions that Override Sharing

- **View All**—Users can view all records associated with this object, regardless of sharing settings.
- **Modify All**—Users can read, edit, delete, transfer, and approve all records associated with this object, regardless of sharing settings.
- **Modify All Data**—users can read, edit, delete, transfer, and approve all records regardless of sharing settings. This permission is not an object-level permission, unlike “View All” and “Modify All.”

To protect the security of your data, give the logged-in user only the permissions needed to successfully execute all the calls made by the application. For large integration applications, “Modify All Data” may speed up call response times. If you are loading a large number of records, use [Bulk API 2.0](#) instead.

Related Objects

Some objects depend on other objects for permission. For example, AccountTeamMember follows sharing on the associated permission-assigned object such as the Account record. Similarly, a Partner depends on the permissions in the associated .

Ownership changes to a record do not automatically cascade to related records. For example, if ownership changes for a given Account, ownership does not then automatically change for any Contract associated with that Account—each ownership change must be made separately and explicitly by the client application.

Object Properties

To create an object with the `create()` call, the object’s `createable` attribute must be set to `true`. To determine what operations are allowed on a given object, your client application can invoke the `describeSObjects()` call on the object and inspect the properties in the `DescribeSObjectResult`.

 **Note:** `replicable` allows `getUpdated()` and `getDeleted()` calls.

Page Layouts and Record Types

Requirements defined in the Salesforce user interface for page layouts and record types are not enforced by the API:

- Page layouts can specify whether a given field is required, but the API does not enforce such layout-specific field restrictions or validations in `create()` and `update()` calls. It’s up to the client application to enforce any such constraints, if applicable.
- Record types can control which picklist values can be chosen in a given record and which page layouts users with different profiles can see. However, such rules that are configured and enforced in the user interface are not enforced in the API. For example, the API does not validate whether the value in a picklist field is allowed per any record type restrictions associated with the profile of the logged-in user. Similarly, the API does not prevent a client application from adding data to a particular field simply because that field does not appear in a layout associated with the profile of the logged-in user.

Referential Integrity

To ensure referential integrity, the API forces or prevents certain behaviors:

- ID values in [reference fields](#) are validated in `create()` and `update()` calls.

- If a client application deletes a record, then its children are automatically deleted as part of the call if the `cascadeDelete` property on `ChildRelationship` for that child has a value of `true`. For example, if a client application deletes an `Opportunity`, then any associated `OpportunityLineItem` records are also deleted. However, if an `OpportunityLineItem` is not deletable or is currently being used, then deletion of the parent `Opportunity` fails. For example, if a client application deletes an `Invoice_Statement`, then any associated `Line_Item` records are also deleted. However, if a `Line_Item` is not deletable or is currently being used, then deletion of the parent `Invoice_Statement` fails. Use `DescribeObjectResult` to view the `ChildRelationship` value if you want to be sure what will be deleted.

There are certain exceptions that prevent the execution of a `cascadeDelete`. For example, you can't delete an account if it has associated cases, if it has related opportunities that are owned by other users, or if associated contacts are enabled for the Customer Portal. In addition, if you attempt to delete an account that has closed/won opportunities owned by you or has active contracts, then the delete request for that record will fail.

Package Version Settings

When your API client is referencing components in managed packages, you can specify the version of each installed package that you want to reference for your integration. This allows your API client to continue to function with specific, known behavior even when you install subsequent versions of a package. You can use the `PackageVersionHeader` SOAP header to set different package versions for different calls, if necessary.

A package version is a number that identifies the set of components uploaded in a package. The version number has the format `majorNumber.minorNumber.patchNumber` (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The `patchNumber` is generated and updated only for a patch release. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package.

Default package versions for API calls provide fallback settings if package versions are not provided by an API call. Many API clients do not include package version information, so the default settings maintain existing behavior for these clients.

You can specify the default package versions for enterprise API and partner API calls. The enterprise WSDL is for customers who want to build an integration with their Salesforce organization only. It is strongly typed, which means that calls operate on objects and fields with specific data types, such as `int` and `string`. The partner WSDL is for customers, partners, and ISVs who want to build an integration that can work across multiple Salesforce organizations, regardless of their custom objects or fields. It is loosely typed, which means that calls operate on name-value pairs of field names and values instead of specific data types.

You must associate the enterprise WSDL with specific package versions to maintain existing behavior for clients. There are options for setting the package version bindings for an API call from client applications using either the enterprise or partner WSDL. The package version information for API calls issued from a client application based on the enterprise WSDL is determined by the first match in the following settings.

1. The `PackageVersionHeader` SOAP header.
2. The SOAP endpoint contains a URL with a format of `serverName/services/Soap/c/api_version/ID` where `api_version` is the version of the API, such as 54.0, and `ID` encodes your package version selections when the enterprise WSDL was generated.
3. The default enterprise package version settings.

The partner WSDL is more flexible as it is used for integration with multiple organizations. If you choose the Not Specified option for a package version when configuring the default partner package versions, the behavior is defined by the latest installed package version. This means that behavior of package components, such as an Apex trigger, could change when a package is upgraded and that change would immediately impact the integration. Subscribers may want to select a specific version for an installed package for all partner API calls from client applications to ensure that subsequent installations of package versions do not affect their existing integrations.

The package version information for partner API calls is determined by the first match in the following settings.

1. The PackageVersionHeader SOAP header.
2. An API call from a Visualforce page uses the package versions set for the Visualforce page.
3. The default partner package version settings.

To configure default package versions for API calls:

1. From Setup, enter *API* in the *Quick Find* box, then select **API**.
2. Click **Configure Enterprise Package Version Settings** or **Configure Partner Package Version Settings**. These links are only available if you have at least one managed package installed in your organization.
3. Select a *Package Version* for each of your installed managed packages. If you are unsure which package version to select, you should leave the default selection.
4. Click **Save**.

Note: Installing a new version of a package in your organization does not affect the current default settings.

CHAPTER 4 Error Handling

In this chapter ...

- [Error Handling for Session Expiration](#)
- [More About Error Handling](#)

The API calls return error data that your client application can use to identify and resolve runtime errors. If an error occurs during the invocation of most API calls, then the API provides the following types of error handling:

- For errors resulting from badly formed messages, failed authentication, or similar problems, the API returns a SOAP fault message with an associated [ExceptionCode](#).
- For most calls, if the error occurs because of a problem specific to the query, the API returns an [Error](#). For example, if a `create()` request contains more than 200 objects.

Error Handling for Session Expiration

When you sign on via the `login()` call, a new client session begins and a corresponding unique session ID is generated. Sessions expire automatically after a predetermined length of inactivity, which can be configured in Salesforce from Setup by clicking **Security Controls**. The default is 120 minutes (two hours). If you make an API call, the inactivity timer is reset to zero.

When your session expires, the exception code `INVALID_SESSION_ID` is returned. If this happens, you must invoke the `login()` call again.

More About Error Handling

For more information about errors, see the following topics:

- [API Fault Element](#)
- [ExceptionCode](#)
- [Error](#)

CHAPTER 5 Security and the API

In this chapter ...

- [User Authentication](#)
- [User Profile and Permission Sets Configuration](#)
- [Security Token](#)
- [Sharing](#)
- [Implicit Restrictions for Objects and Fields](#)
- [API Access in Salesforce AppExchange Packages](#)
- [Outbound Port Restrictions](#)

Client apps that access your Salesforce data are subject to the same security protections that are used in the Salesforce user interface. Additional protection is available for orgs that install AppExchange managed packages if those packages contain components that access Salesforce via the API.

User Authentication

Client apps must log in using valid credentials. After validating, the server provides the client app with a:

- `sessionId` that is set into the session header so that all subsequent calls to the Web service are authenticated
- URL address (`serverUrl`) for the client app's web service requests

Salesforce supports only the Transport Layer Security (TLS) protocol and `frontdoor.jsp`. Ciphers must have a key length of at least 128 bits.

User Profile and Permission Sets Configuration

As an org's Salesforce admin, you control which features and views are available to users by configuring profiles and permission sets and assigning users to them. To access the API to issue calls and receive the call results, a user must have the API Enabled permission. Client apps can query or update only those objects and fields to which they have access via the permissions of the logged-in user.

To create, edit, or delete a profile, from Setup, enter *Profiles* in the Quick Find box, then select **Profiles**. To create, edit, or delete a permission set, from Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets**.

 **Note:** The web services WSDL files return all available objects and fields for an org.

Security Token

When users log in to Salesforce via the user interface, the API, or a desktop client such as Salesforce for Outlook, Connect Offline, Connect for Office, or the Data Loader, Salesforce authorizes the login as follows.

1. Salesforce checks whether the user's profile has login-hour restrictions. If the user's profile specifies login-hour restrictions, login attempts outside the specified hours are denied.
2. If the user has the Multi-Factor Authentication for User Interface Logins permission, the Salesforce login process prompts the user for an identity verification method in addition to their username and password. If the user's account isn't already connected to a verification method, such as the Salesforce Authenticator mobile app, Salesforce prompts the user to register a method.
3. If the user has the Multi-Factor Authentication for API Logins permission and connected an authenticator app to the account, the user must enter a verification code (TOTP) generated by the authenticator app. If the user uses the standard security token, Salesforce returns an error.
4. Salesforce then checks whether the user's profile defines IP address range restrictions. If so, logins from outside the IP address range are denied. If the **Enforce login IP ranges on every request** session setting is enabled, the IP address restrictions are enforced for each page request, including requests from client apps.
5. If profile-based IP address restrictions aren't set, Salesforce checks whether the user is logging in from a device that was previously used to access Salesforce.
 - If the user is logging in from a device and browser that Salesforce recognizes, the login is allowed.
 - If the user is logging in from an IP address on your org's trusted IP address list, the login is allowed.
 - If the user isn't logging in from a trusted IP address, device, or browser that Salesforce recognizes, the login is blocked.

Whenever a login is blocked or returns an API login fault, Salesforce verifies the user's identity.

- For access via the user interface, the user is prompted to verify using Salesforce Authenticator (version 2 or later) or enter a verification code.

 **Note:** Users aren't asked for a verification code the first time they log in to Salesforce.

- For access via the API or client app, if the Multi-Factor Authentication on API Logins permission is set on the user profile, users enter a TOTP verification code generated by an authenticator app.

If the permission isn't set, users must add their security token to the end of their password to log in. A security token is a generated key from Salesforce. For example, if a user's password is *mypassword* and the security token is *XXXXXXXXXX*, the user enters *mypasswordXXXXXXXXXX* to log in. Some client apps have a separate field for the security token.

Users can get their security token by changing their password or resetting their security token via the Salesforce user interface. When a user changes a password or resets a security token, Salesforce sends a new security token to the email address on the user's Salesforce record. The security token is valid until the user resets the security token, changes a password, or has a password reset.

 **Note:** Before you access Salesforce from a new IP address, we recommend that you get your security token from a trusted network using Reset My Security Token.

For more information about tokens, see [Reset Your Security Token](#) in Salesforce Help.

When a user's password is changed, the user's security token is automatically reset. To log in after the reset, the user adds the generated security token to the end of the password. Or the user enters the new password after you add the user's IP address to the org's list of trusted IP addresses.

If you reset the password of a user with the API only user permission, the user doesn't receive a security token reset email. If you want API only users to receive a security token reset email when you reset their password, take these steps.

- Temporarily assign the user to a profile that doesn't have the API only user permission. For more information on user profiles and permissions, see [User Permissions and Access](#).
- Ask the user to [manually reset their security token](#).
- Reassign the user to a profile with the API only user permission.

If single sign-on (SSO) is enabled, users who access the API or a desktop client can't log in unless their IP address is included on your org's list of trusted IP addresses or on their profile, if their profile has IP address restrictions set. The delegated authentication authority usually handles login lockout policies for users with the Uses Single Sign-On permission. However, if the security token is enabled, your login lockout settings determine how many times a user can try to log in with an invalid security token before getting locked out. For more information, see [Setting Login Restrictions and Setting Password Policies](#) in Salesforce Help.

Sharing

Sharing refers to the act of granting read or write access to a user or group so that they can view or edit a record owned by other users, if the default access levels don't permit such access. All API calls respect the sharing model.

The following table describes the types of access levels.

API Value	Salesforce User Interface Label	API Picklist Label	Description
None	Private	Private	Only the record owner and Users above that role in the hierarchy can view and edit the record.
Read	Read Only	Read Only	All Users and Groups can view the record but not edit it. Only the owner and users above that role in the hierarchy can edit the record.
Edit	Read/Write	Read/Write	All Users and Groups can view and edit the record.

API Value	Salesforce User Interface Label	API Picklist Label	Description
ReadEditTransfer	Read/Write/Transfer	Read/Write/Transfer	All Users and Groups can view, edit, delete, and transfer the record. (Only available for cases and leads as an org-wide default setting.)
All	Full Access	Owner	All Users and Groups can view, edit, transfer, delete, and share the record. (Only available for campaigns as an org-wide default setting.)
ControlledByParent	Controlled by Parent	Controlled By Parent	(Contacts only.) All Users and Groups can perform an action (such as view, edit, or delete) on the contact based on whether he or she can perform that same action on the record associated with it.

Not all access levels are available for every object. See the Fields table for each object to learn which access levels are available, as well as other sharing details specific to that object.

For more information about sharing in general, see [Salesforce Help](#).

Note: In the API, you can create and update objects such as [AccountShare](#) and [OpportunityShare](#) that define sharing entries for records.

Implicit Restrictions for Objects and Fields

Certain objects can be created or deleted only in the Salesforce user interface. Other objects are read-only—client apps cannot create(), delete(), or update() such objects. Similarly, certain fields within some objects can be specified on create() but not on update(). Other fields are read-only—client apps cannot specify field values in create() or update() calls. For more information, see the respective object descriptions in [Object Basics](#).

API Access in Salesforce AppExchange Packages

The API allows access to objects and calls based on the permissions of the user who logs into the API. To prevent security issues from arising when installed packages have components that access data via the API, Salesforce provides additional security:

- When a developer creates an AppExchange package with components that access the API, the developer can restrict the API access for those components.
- When an administrator installs an AppExchange package, the administrator can accept or reject the access. Rejecting the access cancels the installation.
- After an administrator installs a package, the administrator can restrict the API access of components in the package that access the API.

Editing API access for a package is done in the Salesforce user interface. For more information, see [Manage API and Dynamic Apex Access in Packages](#) in [Salesforce Help](#).

API access for a package affects the API requests originating from components within the package; it determines the objects that the API requests can access. If the API access for a package is not defined, then the objects that the API requests have access to are determined by the user's permissions.

The API access for a package never allows users to do more than the permissions granted to the user. API access in a package only reduces what the user's permissions allow.

Choosing `Restricted` for the `API Access` setting in a package affects the following:

- API access in a package overrides the following user permissions:
 - Author Apex
 - Customize Application
 - Edit HTML Templates
 - Edit Read Only Fields
 - Manage Billing
 - Manage Call Centers
 - Manage Categories
 - Manage Custom Report Types
 - Manage Dashboards
 - Manage Letterheads
 - Manage Package Licenses
 - Manage Public Documents
 - Manage Public List Views
 - Manage Public Reports
 - Manage Public Templates
 - Manage Users
 - Transfer Record
 - Use Team Reassignment Wizards
 - View Setup and Configuration
 - Weekly Export Data
- If `Read`, `Create`, `Edit`, and `Delete` access are not selected in the API access setting for objects, users do not have access to those objects from the package components, even if the user has the “Modify All Data” and “View All Data” permissions.
- A package with `Restricted` API access can't create new users.
- Salesforce denies access to Web service and `executeanonymous` requests from an AppExchange package that has `Restricted` access.

The following considerations also apply to API access in packages:

- Workflow rules and Apex triggers fire regardless of API access in a package.
- If a component is in more than one package in an organization, API access is unrestricted for that component in all packages in the organization regardless of the access setting.
- If Salesforce introduces a new standard object after you select restricted access for a package, access to the new standard object is not granted by default. You must modify the restricted access setting to include the new standard object.
- When you upgrade a package, changes to the API access are ignored even if the developer specified them. This ensures that the administrator installing the upgrade has full control. Installers should carefully examine the changes in package access in each upgrade during installation and note all acceptable changes. Then, because those changes are ignored, the administrator should manually apply any acceptable changes after installing an upgrade.

- S-controls are served by Salesforce and rendered inline in Salesforce. Because of this tight integration, there are several means by which an s-control in an installed package could escalate its privileges to the user's full privileges. In order to protect the security of organizations that install packages, s-controls have the following limitations:
 - For packages you are developing (that is, not installed from AppExchange), you can only add s-controls to packages with the default `Unrestricted` API access. Once a package has an s-control, you cannot enable `Restricted` API access.
 - For packages you have installed, you can enable access restrictions even if the package contains s-controls. However, access restrictions provide only limited protection for s-controls. Salesforce recommends that you understand the JavaScript in an s-control before relying on access restriction for s-control security.
 - If an installed package has `Restricted` API access, upgrades will be successful only if the upgraded version does not contain any s-controls. If s-controls are present in the upgraded version, you must change the currently installed package to `Unrestricted` API access.

To manage API access to packages, see “Manage API and Dynamic Apex Access in Packages” in Salesforce Help.

 **Note:** XML-RPC requests that originate from restricted packages are denied access.

Outbound Port Restrictions

For security reasons, Salesforce restricts the outbound ports you can specify to one of the following:

- 80: This port only accepts HTTP connections.
- 443: This port only accepts HTTPS connections.
- 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

The port restriction applies to any feature where a port is specified, for example outbound messages, AJAX proxy, or single-sign on.

CHAPTER 6 Using the Partner WSDL

In this chapter ...

- [Obtaining the Partner WSDL File](#)
- [Calls and the Partner WSDL](#)
- [Objects, Fields, and Field Data and the Partner WSDL](#)
- [Queries and the Partner WSDL](#)
- [Namespaces in the Partner WSDL](#)
- [Package Versions and the Partner WSDL](#)
- [User Interface Themes](#)
- [Examples Using the Partner WSDL](#)

The API provides two WSDLs to choose from:

- **Enterprise Web Services WSDL**—Used by enterprise developers to build client applications for a single Salesforce organization. The enterprise WSDL is strongly typed, which means that it contains objects and fields with specific data types, such as `int` and `string`. Customers who use the enterprise WSDL document must download and re-consume it when changes are made to the custom objects or fields in their org or when they want to use a different version of the API. To access the current WSDL for your organization, log in to your Salesforce organization and from Setup, enter `API` in the `Quick Find` box. Then, on the API page, select **Generate Enterprise WSDL**.
- **Partner Web Services WSDL**—Used for client applications that are metadata-driven and dynamic in nature. It is particularly—but not exclusively—useful to Salesforce partners who are building client applications for multiple organizations. As a loosely typed representation of the Salesforce data model that works with name-value pairs of field names and values instead of specific data types, it can be used to access data within any organization. This WSDL is most appropriate for developers of clients that can issue a query call to get information about an object before the client acts on the object. The partner WSDL document needs to be downloaded and consumed only once per version of the API. To access the current WSDL for your organization, log in to your Salesforce organization and from Setup, enter `API` in the `Quick Find` box. Then, on the API page, select **Generate Partner WSDL**.

In general, the enterprise WSDL is more straightforward to use, while the partner WSDL is more flexible and dynamically adaptable to different organizations, allowing you to write a single application that can be used for multiple users and multiple organizations.

High Precision Versions

If you require higher precision than the regular WSDLs provide, ask your account team about the “High Precision API” feature. When this feature is enabled, the WSDLs that you download (both Enterprise and Partner) use higher precision data types. For example, this feature is useful if your organization uses complex numerical formulas that are prone to rounding errors.

 **Note:** This feature is a limited pilot and is not currently a generally available feature.

If you have been using the regular version of the WSDL and change to the high precision version, perform the following checks:

1. Download the new WSDL.
2. Regenerate the stub code. (See [Setting Up Your Java Developer Environment](#).)
3. Verify that the type of variables used to store numeric values in your code can accommodate the new types.

Obtaining the Partner WSDL File

To use the partner WSDL, download a copy of the file using either of the following methods:

- Obtain it from your organization's Salesforce administrator, or
- Generate from Setup in Salesforce (enter *API* in the *Quick Find* box, then select **API**) according to the instructions in [Step 2: Generate or Obtain the Web Service WSDL](#).

While the enterprise WSDL file needs to be regenerated whenever custom fields or custom objects are added to an organization's Salesforce information, the partner WSDL file remains the same regardless of underlying changes in the organization's Salesforce data.

Calls and the Partner WSDL

The partner WSDL file defines exactly the same API calls found in the enterprise WSDL file. A client application using the partner WSDL will likely use the following API calls to determine an organization's metadata:

Task / Call	Description
<code>describeGlobal()</code>	Retrieves a list of available objects for your organization's data.
<code>describeLayout()</code>	Retrieves metadata about page layouts for the specified object type.
<code>describeSObject()</code>	<code>describeSObject()</code> has been superseded by <code>describeSObjects()</code> .
<code>describeSObjects()</code>	Use to obtain metadata for a given object. You can first call to retrieve a list of all objects for your organization, then iterate through the list and use to obtain metadata about individual objects.
<code>describeTabs()</code>	In the user interface, users have access to standard apps (and may also have access to custom apps) as listed in the Lightning Platform app menu at the top of the page. Selecting a standard app or custom app in the user interface allows the user to switch between the listed apps at any time.

To explore an organization's metadata, a client application can:

1. Call `describeGlobal()` to obtain a list of available objects.
2. In the returned `DescribeGlobalResult` object, retrieve an array of `DescribeGlobalSObjectResult` objects by calling `subjects`.
3. Get the `sObject` type name for each returned `sObject` by calling `name` on the `DescribeGlobalSObjectResult` objects.
4. The `DescribeGlobalSObjectResult` object provides some metadata about the `sObject`, such as whether the `sObject` is createable or updateable. If you want to get more information about particular `sObjects`, like their fields and child relationships, call `describeSObjects()` by passing it an array of the `sObject` type names that you're interested in obtaining more information about.

sObject Reference Reuse

An `sObject` reference can't be reused within a single operation.

Use a different reference. For example, the following code snippet creates an account and contact with a custom field and an event using two different references:

```
SObject account = new com.sforce.soap.partner.sobject.wsc.SObject();
account.setType("Account");
```

```

account.setField("Name", "myAccount");
account.setField("XID1__c", "1");
SObject refAcc1 = new com.sforce.soap.partner.object.wsc.SObject();
refAcc1.setType("Account");
refAcc1.setField("XID1__c", "1");
SObject refAcc2 = new com.sforce.soap.partner.object.wsc.SObject();
refAcc2.setType("Account");
refAcc2.setField("XID1__c", "1");

SObject contact = new com.sforce.soap.partner.object.wsc.SObject();
contact.setType("Contact");
contact.setField("LastName", "LName");
contact.setField("XID2__c", "2");
contact.setField("Account", refAcc1);
SObject refCon = new com.sforce.soap.partner.object.wsc.SObject();
contact.setType("Contact");
contact.setField("XID2__c", "2");

SObject event = new com.sforce.soap.partner.object.wsc.SObject();
contact.setType("Event");
contact.setField("Subject", "myEvent");
contact.setField("ActivityDateTime", Calendar.getInstance());
contact.setField("DurationInMinutes", 60);
contact.setField("Who", refCon);
contact.setField("What", refAcc2);

client.create(new SObject[] { account, contact, event}); // exception thrown here

```

Any call that takes a parameter of the form `sObject[] sObjects` is subject to this limitation.

Objects, Fields, and Field Data and the Partner WSDL

The enterprise WSDL file defines all the specific objects (such as Account and Contact) in a Salesforce org. In contrast, the partner WSDL file defines a single, generic object (`sObject`) that represents all the objects. For a particular object, its type is defined in the `name` field in the returned `DescribeSObjectResult`.

With the partner WSDL, your client application code handles fields as arrays of name-value pairs that represent the field data. When referring to the name of an individual field, use the value in its `name` field of the `Field` type in the `DescribeSObjectResult`.

Languages vary in the way they handle name-value pairs and map typed values to the primitive XML data types defined in SOAP messages. With the enterprise WSDL, the mapping is handled implicitly. With the partner WSDL, however, you manually manage values and data types when building client applications. Specify the object type before you assign field values. When specifying the value of a particular field, use a value that is valid for the field (range, format, and data type). Make sure that you understand the mapping between data types in your programming language and XML primitive data types. See [SOAPType](#) for more information.

Queries and the Partner WSDL

When using the `query()` call with the partner WSDL, consider the following guidelines:

- The `queryString` parameter is case-insensitive. The API will accept field names in the `fieldList` using any combination of uppercase and lowercase letters. However, in the [QueryResult](#), the case of field names (both predefined and custom fields) will match exactly

the value in the `name` field of the `Field` type in the [DescribeObjectResult](#). It is recommended that you use the proper case when specifying fields in the `fieldList`.

- For the partner WSDL, the ordering of fields in the [QueryResult](#) is determined by the field order in the `fieldList`, not the field order in the WSDL file.
- The `fieldList` cannot contain duplicate field names. For example:
 - Invalid (returns an error): `"SELECT Firstname, Lastname, Firstname FROM User"`
 - Valid: `"SELECT Firstname, Lastname FROM User"`
- The [QueryResult](#) always contains all of the fields specified in the `fieldList`, even if some of the fields contain no data (`null`). Although SOAP allows you to omit fields that contain no values in the result set, the API always returns an array containing all fields.
- If you use the partner WSDL, a query that includes ID will return the ID field twice in the SOAP XML response data. Similarly, a query that does not include ID will return a single null ID field in the SOAP XML response data. For example, a query for `SELECT ID, FirstName, LastName FROM Contact` might return a SOAP XML response with records like:

```
<records xsi:type="sf:sObject" xmlns="urn:partner.soap.sforce.com">
  <sf:type>Contact</sf:type>
  <sf:Id>0038000000Frj0BQRW</sf:Id>
  <sf:Id>0038000000Frj0BQRW</sf:Id>
  <sf:FirstName>John</sf:FirstName>
  <sf:LastName>Smith</sf:LastName>
</records>
```

This is expected behavior and something to be aware of if you are accessing the full SOAP XML response data and not using WSC to access the web service response.

Namespaces in the Partner WSDL

In XML, every tag has a defined namespace. In the `enterprise.wsdl`, namespaces are handled implicitly. When using API calls with the partner WSDL, however, you need to explicitly specify the correct namespaces for API calls, objects, and fields, and faults. This rule applies to predefined and custom objects and fields.

For	Namespace
API Calls	<code>urn:partner.soap.sforce.com</code>
sObjects	<code>urn:object.partner.soap.sforce.com</code>
Fields	<code>urn:object.partner.soap.sforce.com</code>
Faults	<code>urn:fault.partner.soap.sforce.com</code>

Package Versions and the Partner WSDL

The partner WSDL is loosely typed. This makes it more flexible for partners who want to integrate with multiple organizations. Default package versions for API calls provide fallback settings if package versions are not provided by an API call.

The behavior of a package in partner API calls is defined by the latest installed package version if the default value (`Not Specified`) is selected for the installed package. This means that behavior of package components, such as an Apex trigger, could change when a package is upgraded and that change would immediately impact the integration. Subscribers may want to select a specific version for

an installed package for all partner API calls from client applications to ensure that subsequent installations of package versions do not affect their existing integrations.

An API client developer should communicate with the administrator of the default partner package version settings if these are two different roles in your organization and the developer recommends changing the settings. Alternatively, an API client developer can set the package versions in the [PackageVersionHeader](#) SOAP header for the client.

A partner that is developing a package that references another package should always supply version information for the base package in their partner API calls. This ensures that the extension package is not affected by a component being deprecated in the base package.

The package version information for partner API calls is determined by the first match in the following settings.

1. The [PackageVersionHeader](#) SOAP header.
2. An API call from a Visualforce page uses the package versions set for the Visualforce page.
3. The default partner package version settings.

To configure default package versions for API calls with the partner WSDL, see [Package Version Settings](#).

User Interface Themes

Back in the Winter '06 release, Salesforce started supporting multiple user interface themes, allowing you to use different sets of icons and colors for the user interface. But these user interface themes do not apply when your org is using Lightning Experience.

Two user interface themes match the earlier iterations of Salesforce.

- Theme3—The “Salesforce Classic 2010 user interface theme.” This interface was previously referred to as “Salesforce” or “new user interface theme.” You might also be familiar with it as the Salesforce *Aloha* interface.
- Theme2—The “Salesforce Classic 2005 user interface theme.” This interface was previously referred to as “Salesforce Classic” or the “classic user interface theme.”

The [getUserInfo\(\)](#) call returns a [getUserInfoResult](#) object, which includes the [userUiSkin](#) property. This property informs you of the user’s current user interface theme.

Use the [describeQuickActions\(\)](#), [describeTabs\(\)](#), and [describeTheme\(\)](#) calls and their return types to get information on theme icons and colors.

Style sheets are available to mimic the look and feel of the older user interfaces. For more information, see [Styling Visualforce Pages](#) in the *Visualforce Developer’s Guide*. But if you’re planning to switch to Lightning Experience, consider the Lightning Component framework, our new UI framework. See the “[Lightning Components](#)” module in the [Develop for Lightning Experience](#) Trailhead trail to learn more.

Examples Using the Partner WSDL

This section includes examples in Java and C# for making API calls using the partner WSDL. Before running these samples, perform the following steps in the quick start tutorial to get the partner WSDL file and generate the proxy client code for your development environment.

- [Step 2: Generate or Obtain the Web Service WSDL](#)
- [Step 3: Import the WSDL File Into Your Development Platform](#)

After you generate the proxy client code and set up your development environment, you can start writing your client application. First, your application needs to log into the Salesforce service using the partner authentication endpoint. After a successful login, you can execute the sample methods.

For your convenience, template classes are provided, one in Java and one in C#, that make a login call. You can use them to execute the sample methods provided later in this section.

Sample template class for Java: This sample prompts the user to enter the username, password, and authentication endpoint. Next, it logs the user in. For the authentication endpoint URL, pass in the endpoint found in the partner WSDL file.

```

    PartnerConnection partnerConnection = null;
    private static BufferedReader reader =
        new BufferedReader(new InputStreamReader(System.in));

    public static void main(String[] args) {
        PartnerSamples samples = new PartnerSamples();
        if (samples.login()) {
            // Add calls to the methods in this class.
            // For example:
            // samples.querySample();
        }
    }

    private String getUserInput(String prompt) {
        String result = "";
        try {
            System.out.print(prompt);
            result = reader.readLine();
        } catch (IOException ioe) {
            ioe.printStackTrace();
        }
        return result;
    }

    private boolean login() {
        boolean success = false;
        String username = getUserInput("Enter username: ");
        String password = getUserInput("Enter password: ");
        String authEndPoint = getUserInput("Enter auth end point: ");

        try {
            ConnectorConfig config = new ConnectorConfig();
            config.setUsername(username);
            config.setPassword(password);

            config.setAuthEndpoint(authEndPoint);
```

```

        config.setTraceFile("traceLogs.txt");
        config.setTraceMessage(true);
        config.setPrettyPrintXml(true);

        partnerConnection = new PartnerConnection(config);

        success = true;
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    } catch (FileNotFoundException fnfe) {
        fnfe.printStackTrace();
    }

    return success;
}

//
// Add your methods here.
//
}

```

Sample template class for C#: This sample prompts the user to enter the username and password. Next, it logs the user in. The project name for this sample is assumed to be *TemplatePartner* and the Web reference name *sforce*. If these values are different for your project, make sure to change the using directive to appropriate values for your project: `using your_project_name.web_reference_name;`

```

- [Sample query and queryMore Calls](#)
- [Sample search Call](#)
- [Sample create Call](#)
- [Sample update Call](#)

Sample query and queryMore Calls

The following Java and C# examples show usage of the `query()` and `queryMore()` calls for the partner WSDL. Each example sets the batch size of the query to 250 items returned. It then performs a query call to get the first name and last name of all contacts and iterates through the contact records returned. For each contact, it writes the contact's first name and last name to the output, or only the last name if the first name is null. Finally, if there are more items to be returned by the query, as indicated by a `QueryResult.done` property value of `false`, it calls `queryMore()` to get the next batch of items, and repeats the process until no more records are returned.

To execute the sample method, you can use the corresponding Java or C# template class provided in [Examples Using the Partner WSDL](#).

Java Example

```

public void querySample() {
    try {
        // Set query batch size
        partnerConnection.setQueryOptions(250);

        // SQL query to use
        String sqlQuery = "SELECT FirstName, LastName FROM Contact";
        // Make the query call and get the query results
        QueryResult qr = partnerConnection.query(sqlQuery);

        boolean done = false;
        int loopCount = 0;
        // Loop through the batches of returned results
        while (!done) {
            System.out.println("Records in results set " + loopCount++
                + " - ");
            SObject[] records = qr.getRecords();
            // Process the query results
            for (int i = 0; i < records.length; i++) {
                SObject contact = records[i];
                Object firstName = contact.getField("FirstName");
                Object lastName = contact.getField("LastName");
                if (firstName == null) {
                    System.out.println("Contact " + (i + 1) +

```

```

                ": " + lastName
            );
        } else {
            System.out.println("Contact " + (i + 1) + ": " +
                firstName + " " + lastName);
        }
    }
    if (qr.isDone()) {
        done = true;
    } else {
        qr = partnerConnection.queryMore(qr.getQueryLocator());
    }
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
System.out.println("\nQuery execution completed.");
}

```

C# Example

```

public void querySample()
{
    try
    {
        QueryResult qr = null;
        binding.QueryOptionsValue = new sforce.QueryOptions();
        binding.QueryOptionsValue.batchSize = 250;
        binding.QueryOptionsValue.batchSizeSpecified = true;

        qr = binding.query("SELECT FirstName, LastName FROM Contact");

        bool done = false;
        int loopCount = 0;
        while (!done)
        {
            Console.WriteLine("\nRecords in results set " +
                Convert.ToString(loopCount++)
                + " - ");
            // Process the query results
            for (int i = 0; i < qr.records.Length; i++)
            {
                sforce.sObject con = qr.records[i];
                string fName = con.Any[0].InnerText;
                string lName = con.Any[1].InnerText;
                if (fName == null)
                    Console.WriteLine("Contact " + (i + 1) + ": " + lName);
                else
                    Console.WriteLine("Contact " + (i + 1) + ": " + fName
                        + " " + lName);
            }

            if (qr.done)

```

```

        done = true;
    else
        qr = binding.queryMore(qr.queryLocator);
    }
}
catch (SoapException e)
{
    Console.WriteLine("An unexpected error has occurred: " + e.Message +
        " Stack trace: " + e.StackTrace);
}
Console.WriteLine("\nQuery execution completed.");
}

```

Sample search Call

The following Java and C# examples show how to use the `search()` call for the partner WSDL. Each example accepts a phone number string value that is used in the SOQL query. The search call looks for phone fields that match the passed in phone value in all contacts, leads, and accounts. Next, the example iterates through the returned search results that contain the matching records, adds them to arrays, and writes their field values to the console. The record fields returned correspond to the fields specified in the SOQL query for each record type.

To execute the sample method, you can use the corresponding Java or C# template class provided in [Examples Using the Partner WSDL](#).

Java Example

```

public void searchSample(String phoneNumber) {
    try {
        // Example of phoneNumber format: 4155551212
        String soslQuery =
            "FIND {" + phoneNumber + "} IN Phone FIELDS " +
            "RETURNING " +
            "Contact(Id, Phone, FirstName, LastName), " +
            "Lead(Id, Phone, FirstName, LastName)," +
            "Account(Id, Phone, Name)";
        // Perform SOSL query
        SearchResult sResult = partnerConnection.search(soslQuery);
        // Get the records returned by the search result
        SearchRecord[] records = sResult.getSearchRecords();
        // Create lists of objects to hold search result records
        List<SObject> contacts = new ArrayList<SObject>();
        List<SObject> leads = new ArrayList<SObject>();
        List<SObject> accounts = new ArrayList<SObject>();

        // Iterate through the search result records
        // and store the records in their corresponding lists
        // based on record type.
        if (records != null && records.length > 0) {
            for (int i = 0; i < records.length; i++){
                SObject record = records[i].getRecord();
                if (record.getType().toLowerCase().equals("contact")) {
                    contacts.add(record);
                } else if (record.getType().toLowerCase().equals("lead")){

```

```

        leads.add(record);
    } else if (record.getType().toLowerCase().equals("account")) {
        accounts.add(record);
    }
}
// Display the contacts that the search returned
if (contacts.size() > 0) {
    System.out.println("Found " + contacts.size() +
        " contact(s):");
    for (SObject contact : contacts) {
        System.out.println(contact.getId() + " - " +
            contact.getField("FirstName") + " " +
            contact.getField("LastName") + " - " +
            contact.getField("Phone")
        );
    }
}
// Display the leads that the search returned
if (leads.size() > 0) {
    System.out.println("Found " + leads.size() +
        " lead(s):");
    for (SObject lead : leads) {
        System.out.println(lead.getId() + " - " +
            lead.getField("FirstName") + " " +
            lead.getField("LastName") + " - " +
            lead.getField("Phone")
        );
    }
}
// Display the accounts that the search returned
if (accounts.size() > 0) {
    System.out.println("Found " +
        accounts.size() + " account(s):");
    for (SObject account : accounts) {
        System.out.println(account.getId() + " - " +
            account.getField("Name") + " - " +
            account.getField("Phone")
        );
    }
}
} else {
    // The search returned no records
    System.out.println("No records were found for the search.");
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}
}

```

C# Example

```

public void searchSample(String phoneNumber)
{

```

```

try
{
    // Example of phoneNumber format: 4155551212
    String soslQuery =
        "FIND {" + phoneNumber + "} IN Phone FIELDS " +
        "RETURNING " +
        "Contact(Id, Phone, FirstName, LastName), " +
        "Lead(Id, Phone, FirstName, LastName)," +
        "Account(Id, Phone, Name)";
    // Perform SOSL query
    SearchResult sResult = binding.search(soslQuery);
    // Get the records returned by the search result
    SearchRecord[] records = sResult.searchRecords;
    // Create lists of objects to hold search result records
    ArrayList contacts = new System.Collections.ArrayList();
    ArrayList leads = new System.Collections.ArrayList();
    ArrayList accounts = new System.Collections.ArrayList();

    // Iterate through the search result records
    // and store the records in their corresponding lists
    // based on record type.
    if ((records != null) && (records.Length > 0))
    {
        for (int i = 0; i < records.Length; i++)
        {
            sObject record = records[i].record;

            if (record.type.ToLower().Equals("contact"))
            {
                contacts.Add(record);
            }
            else if (record.type.ToLower().Equals("lead"))
            {
                leads.Add(record);
            }
            else if (record.type.ToLower().Equals("account"))
            {
                accounts.Add(record);
            }
        }
    }
    // Display the contacts that the search returned
    if (contacts.Count > 0)
    {
        Console.WriteLine("Found " + contacts.Count + " contact(s):");
        for (int i = 0; i < contacts.Count; i++)
        {
            sObject c = (sObject)contacts[i];
            Console.WriteLine(c.Any[0].InnerText + " - " +
                c.Any[2].InnerText + " " +
                c.Any[3].InnerText + " - " + c.Any[1].InnerText);
        }
    }
    // Display the leads that the search returned
    if (leads.Count > 0)

```

```

    {
        Console.WriteLine("Found " + leads.Count + " lead(s):");
        for (int i = 0; i < leads.Count; i++)
        {
            sObject l = (sObject)leads[i];
            Console.WriteLine(l.Any[0].InnerText + " - " +
                l.Any[2].InnerText + " " +
                l.Any[3].InnerText + " - " + l.Any[1].InnerText);
        }
    }
    // Display the accounts that the search returned
    if (accounts.Count > 0)
    {
        Console.WriteLine("Found " + accounts.Count + " account(s):");
        for (int i = 0; i < accounts.Count; i++)
        {
            sObject a = (sObject)accounts[i];
            Console.WriteLine(a.Any[0].InnerText + " - " +
                a.Any[2].InnerText + " - " +
                a.Any[1].InnerText);
        }
    }
}
else
{
    // The search returned no records
    Console.WriteLine("No records were found for the search.");
}
}
catch (SoapException e)
{
    Console.WriteLine("An unexpected error has occurred: " + e.Message +
        " Stack trace: " + e.StackTrace);
}
}

```

Sample create Call

The following Java and C# examples show how to use the `create()` call for the partner WSDL. Each example creates a contact record with several fields. It iterates through the results of the create call and checks whether the operation was successful or not. If the create operation was successful, it writes the ID of the contact created to the console. Otherwise, it iterates through the errors and writes details of each error to the console. In this case, the output of the example is the ID of the new contact.

To execute the sample method, you can use the corresponding Java or C# template class provided in [Examples Using the Partner WSDL](#).

Java Example

```

public String createSample() {
    String result = null;
    try {
        // Create a new sObject of type Contact
        // and fill out its fields.
        SObject contact = new SObject();
    }
}

```

```

contact.setType("Contact");
contact.setField("FirstName", "Otto");
contact.setField("LastName", "Jespersen");
contact.setField("Salutation", "Professor");
contact.setField("Phone", "(999) 555-1234");
contact.setField("Title", "Philologist");

// Add this sObject to an array
SObject[] contacts = new SObject[1];
contacts[0] = contact;
// Make a create call and pass it the array of sObjects
SaveResult[] results = partnerConnection.create(contacts);

// Iterate through the results list
// and write the ID of the new sObject
// or the errors if the object creation failed.
// In this case, we only have one result
// since we created one contact.
for (int j = 0; j < results.length; j++) {
    if (results[j].isSuccess()) {
        result = results[j].getId();
        System.out.println(
            "\nA contact was created with an ID of: " + result
        );
    } else {
        // There were errors during the create call,
        // go through the errors array and write
        // them to the console
        for (int i = 0; i < results[j].getErrors().length; i++) {
            Error err = results[j].getErrors()[i];
            System.out.println("Errors were found on item " + j);
            System.out.println("Error code: " +
                err.getStatusCode().toString());
            System.out.println("Error message: " + err.getMessage());
        }
    }
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
return result;
}

```

C# Example

```

public void createSample()
{
    try
    {
        // Create a new sObject of type Contact
        // and fill out its fields.
        sObject contact = new sforce.sObject();
        System.Xml.XmlElement[] contactFields = new System.Xml.XmlElement[6];
    }
}

```

```

// Create the contact's fields
System.Xml.XmlDocument doc = new System.Xml.XmlDocument();
contactFields[0] = doc.CreateElement("FirstName");
contactFields[0].InnerText = "Otto";
contactFields[1] = doc.CreateElement("LastName");
contactFields[1].InnerText = "Jespersen";
contactFields[2] = doc.CreateElement("Salutation");
contactFields[2].InnerText = "Professor";
contactFields[3] = doc.CreateElement("Phone");
contactFields[3].InnerText = "(999) 555-1234";
contactFields[4] = doc.CreateElement("Title");
contactFields[4].InnerText = "Philologist";

contact.type = "Contact";
contact.Any = contactFields;

// Add this sObject to an array
sObject[] contactList = new sObject[1];
contactList[0] = contact;

// Make a create call and pass it the array of sObjects
SaveResult[] results = binding.create(contactList);
// Iterate through the results list
// and write the ID of the new sObject
// or the errors if the object creation failed.
// In this case, we only have one result
// since we created one contact.
for (int j = 0; j < results.Length; j++)
{
    if (results[j].success)
    {
        Console.WriteLine("\nA contact was created with an ID of: "
            + results[j].id);
    }
    else
    {
        // There were errors during the create call,
        // go through the errors array and write
        // them to the console
        for (int i = 0; i < results[j].errors.Length; i++)
        {
            Error err = results[j].errors[i];
            Console.WriteLine("Errors were found on item " + j.ToString());
            Console.WriteLine("Error code is: " + err.statusCode.ToString());
            Console.WriteLine("Error message: " + err.message);
        }
    }
}
}
catch (SoapException e)
{
    Console.WriteLine("An unexpected error has occurred: " + e.Message +
        " Stack trace: " + e.StackTrace);
}

```

```

    }
}

```

Sample update Call

The following Java and C# examples show how to use the `update()` call for the Partner WSDL. Each example takes the ID of the contact to update as an argument. It creates two `sObject` records of type `Contact`—one to hold the valid passed in ID and the other has an invalid ID. Next, it sets a new phone number for the valid contact and `null` for the last name of the invalid contact. It then makes the update call and iterates through the results. For a successful update operation, it writes the ID of the contact that got updated. For a failed update operation, it writes the details of all returned errors to the console. In this case, the output is the ID of the contact that was successfully updated and an error for the invalid contact update.

To execute the sample method, you can use the corresponding Java or C# template class provided in [Examples Using the Partner WSDL](#).

Java Example

```

public void updateSample(String id) {
    try {
        // Create an sObject of type contact
        SObject updateContact = new SObject();
        updateContact.setType("Contact");

        // Set the ID of the contact to update
        updateContact.setId(id);
        // Set the Phone field with a new value
        updateContact.setField("Phone", "(415) 555-1212");

        // Create another contact that will cause an error
        // because it has an invalid ID.
        SObject errorContact = new SObject();
        errorContact.setType("Contact");
        // Set an invalid ID on purpose
        errorContact.setId("SLFKJLFKJ");
        // Set the value of LastName to null
        errorContact.setFieldsToNull(new String[] {"LastName"});

        // Make the update call by passing an array containing
        // the two objects.
        SaveResult[] saveResults = partnerConnection.update(
            new SObject[] {updateContact, errorContact}
        );
        // Iterate through the results and write the ID of
        // the updated contacts to the console, in this case one contact.
        // If the result is not successful, write the errors
        // to the console. In this case, one item failed to update.
        for (int j = 0; j < saveResults.length; j++) {
            System.out.println("\nItem: " + j);
            if (saveResults[j].isSuccess()) {
                System.out.println("Contact with an ID of " +
                    saveResults[j].getId() + " was updated.");
            }
            else {

```

```

        // There were errors during the update call,
        // go through the errors array and write
        // them to the console.
        for (int i = 0; i < saveResults[j].getErrors().length; i++) {
            Error err = saveResults[j].getErrors()[i];
            System.out.println("Errors were found on item " + j);
            System.out.println("Error code: " +
                err.getStatusCode().toString());
            System.out.println("Error message: " + err.getMessage());
        }
    }
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}
}

```

For more information about `setFieldsToNull` (or its equivalent in client tools other than WSC), see [fieldsToNull](#) and [Resetting Values to null](#).

C# Example

```

public void updateSample(String id) {
    try
    {
        // Create an sObject of type contact
        sObject updateContact = new sObject();
        updateContact.type = "Contact";

        // Set the ID of the contact to update
        updateContact.Id = id;
        // Set the Phone field to a new value.
        // The Phone field needs to be created as an XML element.
        System.Xml.XmlDocument doc = new System.Xml.XmlDocument();
        System.Xml.XmlElement phoneField = doc.CreateElement("Phone");
        phoneField.InnerText = "(415) 555-1212";

        // Add the Phone field to the contact
        updateContact.Any = new System.Xml.XmlElement[] {phoneField};

        // Create another contact that will cause an error
        // because it has an invalid ID.
        sObject errorContact = new sObject();
        errorContact.type = "Contact";
        // Set an invalid ID on purpose
        errorContact.Id = "SLFKJLFKJ";
        // Set the value of LastName to null
        errorContact.fieldsToNull = new String[] { "LastName" };

        // Make the update call by passing an array containing
        // the two objects.
        SaveResult[] saveResults = binding.update(
            new sObject[] {updateContact, errorContact});
        // Iterate through the results and write the ID of
    }
}

```

```
// the updated contacts to the console, in this case one contact.
// If the result is not successful, write the errors
// to the console. In this case, one item failed to update.
for (int j = 0; j < saveResults.Length; j++) {
    Console.WriteLine("\nItem: " + j);
    if (saveResults[j].success)
    {
        Console.WriteLine("Contact with an ID of " +
            saveResults[j].id + " was updated.");
    }
    else
    {
        // There were errors during the update call,
        // go through the errors array and write
        // them to the console.
        for (int i = 0; i < saveResults[j].errors.Length; i++) {
            Error err = saveResults[j].errors[i];
            Console.WriteLine("Errors were found on item " + j.ToString());
            Console.WriteLine("Error code: " +
                err.statusCode.ToString());
            Console.WriteLine("Error message: " + err.message);
        }
    }
}
}
}
catch (SoapException e)
{
    Console.WriteLine("An unexpected error has occurred: " + e.Message +
        " Stack trace: " + e.StackTrace);
}
}
```

REFERENCE

CHAPTER 7 Data Model

The entity relationship diagrams (ERDs) for standard Salesforce objects in this section illustrate important relationships between objects. Salesforce ERDs use crow's foot notation. The following ERDs are available.

 **[other]:** We're updating our data models, one at a time, and moving all diagrams to [Salesforce Architects](#). We'll share a direct link to the new version of each diagram as they become available, and retire this page when all data models have been updated and moved.

- [Sales Objects](#)—includes accounts, contacts, opportunities, leads, campaigns, and other related objects
- [Task and Event Objects](#)—includes tasks and events and their related objects
- [Support Objects](#)—includes cases and solutions and their related objects
- [Salesforce Knowledge Objects](#)—includes view and vote statistics, article versions, and other related objects
- [Document, Note, and Attachment Objects](#)—includes documents, notes, and attachments and their related objects
- [User, Sharing, and Permission Objects](#)—includes users, profiles, and roles
- [User Email Objects](#)
- [Profile and Permission Objects](#)—includes users, profiles, permission sets, and related permission objects
- [Record Type Objects](#)—includes record types and business processes and their related objects
- [Product and Schedule Objects](#)—includes opportunities, products, and schedules
- [Sharing and Team Selling Objects](#)—includes account teams, opportunity teams, and sharing objects
- [Forecasts Objects](#)—includes objects for Collaborative Forecasts.
- [Territory Management 2.0 Objects](#)—includes territories and related objects associated with Territory Management 2.0
- [Original Territory Management](#)—includes territories and related objects
- [Process Objects](#)—includes approval processes and related objects
- [Content Objects](#)—includes content and libraries and their related objects
- [Chatter Feed Objects](#)—includes objects related to feeds
- [Consent Management Objects](#)—includes consent, authorization form, and communication subscription objects
- [WDC Badge and Reward Objects](#)—includes badge and reward objects
- [WDC Feedback and Performance Cycle Objects](#)—includes feedback and performance cycle objects

Each ERD includes links to the topics that describe the fields in objects related to the diagram. The data model for your custom objects depends on what you create.

Chatter Objects

Diagram showing the relationships between the Chatter objects

The following diagram shows the relationships between the major Chatter objects.

- A feed item is an entry in the feed, such as a change to a record that's being followed, an updated post, or a user status change.
- All feed items have a `ParentId`, which is either:
 - a record
 - a user
 - a group

CHAPTER 8 Standard Objects

This section provides a list of standard objects and their standard fields.

Some fields may not be listed for some objects. To see the system fields for each object, see [System Fields](#).

To verify the complete list of fields for an object, you can use a describe call from the API, or inspect with an appropriate tool, for example, inspecting the WSDL or using a schema viewer.

[AcceptedEventRelation](#)

Represents event participants (invitees or attendees) with the status `Accepted` for a given event.

[Account](#)

Represents an individual account, which is an organization or person involved with your business (such as customers, competitors, and partners).

[AccountBrand](#)

Represents the brand details of a Partner Account. This object is available in API version 43.0 and later.

[AccountContactRelation](#)

Represents a relationship between a contact and one or more accounts.

[AccountCleanInfo](#)

Stores the metadata Data.com Clean uses to determine an account record's clean status. `AccountCleanInfo` helps you automate the cleaning or related processing of account records.

[AccountContactRole](#)

Represents the role that a `Contact` plays on an `Account`.

[AccountInsight](#)

Represents an individual insight (a key business development) related to an account record.

[AccountOwnerSharingRule](#)

Represents the rules for sharing an account with a `User` other than the owner.

[AccountPartner](#)

This object represents a partner relationship between two `Account` records. An `AccountPartner` record is created automatically when a `Partner` record is created for a partner relationship between two accounts.

[AccountRelationship](#)

Represents a relationship of a given type between two accounts. This object is available in API version 45.0 and later.

[AccountRelationshipShareRule](#)

Represents the rule that determines which object records are shared, how they are shared, the account relationship type that shares the records, and the level of access granted to the records. This object is available in API version 45.0 and later.

[AccountShare](#)

Represents a sharing entry on an `Account`.

Standard Objects

[AccountTag](#)

Associates a word or short phrase with an Account.

[AccountTeamMember](#)

Represents a User who is a member of an Account team.

[AccountTerritoryAssignmentRule](#)

An account assignment rule that assigns accounts to territories based on account fields. Only available if territory management has been enabled for your organization.

[AccountTerritoryAssignmentRuleItem](#)

A row of selection criteria for an AccountTerritoryAssignmentRule object. Only available if territory management has been enabled for your organization.

[AccountTerritorySharingRule](#)

Represents the rules for sharing an Account within a Territory.

[AccountUserTerritory2View](#)

Represents the view of the Users in Assigned Territories related list in Lightning Experience. Available in API version 42.0 and later.

[ActionCadence](#)

Represents the definition of a 1 cadence. This object is available in API version 45.0 and later.

[ActionCadenceRule](#)

Represents the logic that a branch step uses to determine which branch an action cadence tracker follows in an action cadence. Use ActionCadenceRule to learn about a branch step, including its logic and what the next step is. This object is available in API version 48.0 and later.

[ActionCadenceRuleCondition](#)

Represents the logic for a branch step. This object is available in API version 48.0 and later.

[ActionCadenceStep](#)

Represents a step in a sales cadence. Use ActionCadenceStep to learn which steps belong to a sales cadence, and how the steps are connected to each other. This object is available in API version 48.0 and later.

[ActionCadenceStepTracker](#)

Represents a step in an active sales cadence for a specific sales cadence target. This object is available in API version 48.0 and later.

[ActionCadenceStepVariant](#)

Represents an email template or call script variant associated with an action cadence step. Email and call steps can have up to 3 variants associated so sales teams can compare the engagement results. This object is available in API version 53.0 and later.

[ActionCadenceTracker](#)

Represents an active sales cadence target. This object is available in API version 45.0 and later.

[ActionCdncStpMonthlyMetric](#)

Represents the monthly engagement metrics for an action cadence step. This object is available in API version 52.0 and later.

[ActionLinkGroupTemplate](#)

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking on an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. Every action link belongs to an action link group and action links within the group are mutually exclusive. This object is available in API version 33.0 and later.

Standard Objects

[ActionLinkTemplate](#)

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. This object is available in API version 33.0 and later.

[ActionPlan](#)

Represents the instance of an action plan, a set of tasks created from an action plan template. This object is used by more than one cloud in Industries.

[ActionPlanItem](#)

Represents the instance of an action plan item. This object is used by more than one cloud in Industries.

[ActionPlanTemplate](#)

Represents the instance of an action plan template. This object is used by more than one cloud in Industries.

[ActionPlanTemplateItem](#)

Represents the instance of an item on an action plan template version. This object is used by more than one cloud in Industries.

[ActionPlanTemplateItemValue](#)

Represents the value associated with an action plan template item. This object is used by more than one cloud in Industries.

[ActionPlanTemplateVersion](#)

Represents the version of an action plan template. This object is used by more than one cloud in Industries.

[ActiveFeatureLicenseMetric](#)

Represents the number of active, assigned, and purchased feature licenses in the org. This object is available in API version 52.0 and later.

[ActivePermSetLicenseMetric](#)

Represents the number of active, assigned, and purchased permission set licenses in the org. This object is available in API version 52.0 and later.

[ActiveProfileMetric](#)

Represents the profile associated with the active, assigned, and purchased user licenses. This object is available in API version 52.0 and later.

[ActiveScratchOrg](#)

Represents an active scratch org. This object is available in API version 41.0 and later.

[ActivityHistory](#)

This read-only object is displayed in a related list of closed activities—past events and closed tasks—related to an object. It includes activities for all contacts related to the object. ActivityHistory fields for phone calls are only available if your organization uses Salesforce CRM Call Center.

[ActivityMetric](#)

Represents activities that were added to Salesforce automatically by Einstein Activity Capture and manually by users.

[ActivityUsrConnectionStatus](#)

Represents the status of the email connections for Einstein Activity Capture users. You can also see whether users accepted the required terms of service to capture emails. This object is available in API version 54.0 and later.

[AdCreativeSizeType](#)

Defines the size of the Ad Creative. Example: 728 x 90 pixels. This object is available in API version 54.0 and later.

[AdditionalNumber](#)

Represents an optional additional number for a call center. This additional number is visible in the call center's phone directory.

Standard Objects

[Address](#)

Represents a mailing, billing, or home address.

[AdOrderItem](#)

An extension to the Order LineItem and captures the details specific to an Ad Placement. This object is available in API version 54.0 and later.

[AdQuote](#)

An extension to Quote and captures quote attributes specific to Advertising Sales Management. This object is available in API version 54.0 and later.

[AdQuoteLine](#)

An extension to the Quote LineItem and captures the details specific to an Ad Placement. This object is available in API version 54.0 and later.

[AdServer](#)

Stores and delivers advertising content onto various platforms. This object is available in API version 54.0 and later.

[AdServerAccount](#)

Captures the mapping of an Account with an Ad Server. This object is available in API version 54.0 and later.

[AdServerUser](#)

Captures the mapping of a User with an Ad Server. This object is available in API version 54.0 and later.

[AdSpaceCreativeSizeType](#)

Each Ad Space Creative Size Type defines the compatibility of an Ad Space with an Ad Creative Size Type. This object is available in API version 54.0 and later.

[AdSpaceGroupMember](#)

Defines the association of an Ad Space Specification record with an Ad Space Group record. This object is available in API version 54.0 and later.

[AdSpaceSpecification](#)

Defines a specific place or a group of places where an Ad Creative may be served. This object is available in API version 54.0 and later.

[AgentWork](#)

Represents a work assignment that's been routed to an agent. This object is available in API version 32.0 and later.

[AgentWorkSkill](#)

Represents a skill used to route a work assignment to an agent. AgentWorkSkill is used for reporting and represents the result of a routing decision. This object is available in API version 42.0 and later.

[AIApplication](#)

Represents an AI application such as Einstein Prediction Builder. This object is available in API version 50.0 and later.

[AIApplicationConfig](#)

Additional prediction information related to an AI application. This object is available in API version 50.0 and later.

[AllInsightAction](#)

Represents an Einstein prediction insight action. This object is available in API version 47.0 and later.

[AllInsightFeedback](#)

Represents an Einstein prediction insight feedback. This object is available in API version 47.0 and later.

[AllInsightReason](#)

Represents an Einstein prediction insight reason. This object is available in API version 47.0 and later.

Standard Objects

[AllInsightValue](#)

Represents an Einstein prediction insight value. This object is available in API version 47.0 and later.

[AIRecordInsight](#)

Represents an Einstein prediction insight. This object is available in API version 47.0 and later.

[AllowedEmailDomain](#)

Represents an allowed email domain for users in your organization. You can define an allowlist to restrict the email domains allowed in a user's `Email` field. This object is available in API version 29.0 and later.

[AlternativePaymentMethod](#)

Represents a payment method that doesn't have a defined Commerce Orders entity such as [CardPaymentMethod](#) on page 753 or [DigitalWallet](#) on page 1268. Common examples of alternative payment methods for Commerce Orders include CashOnDeliver, Klarna, and Direct Debit. `AlternativePaymentMethod` functions the same as any other type of payment method for processing transactions in the payment gateway. This object is available in API version 51.0 and later.

[AnalyticsLicensedAsset](#)

Represents a licensed Analytics asset. In this context, Analytics is Tableau CRM or Sonic. Available in API version 52.0 and later.

[Announcement](#)

Represents a Chatter group announcement. This object is available in API version 30.0 and later.

[ApexClass](#)

Represents an Apex class.

[ApexComponent](#)

Represents a definition for a custom component that can be used in a Visualforce page alongside standard components such as `<apex:relatedList>` and `<apex:dataTable>`.

[ApexLog](#)

Represents a debug log containing information about a transaction, including information about Apex, Visualforce, and workflow and validation rules. This object is available in API version 19.0 and later.

[ApexPage](#)

Represents a single Visualforce page.

[ApexPageInfo](#)

Represents metadata about a single Visualforce page. This object is available in API version 48.0 and later.

[ApexTestQueueItem](#)

Represents a single Apex class in the Apex job queue. This object is available in API version 23.0 and later.

[ApexTestResult](#)

Represents the result of an Apex test method execution. This object is available in API version 23.0 and later.

[ApexTestResultLimits](#)

Captures the Apex test limits used for a particular test method execution. An instance of this object is associated with each `ApexTestResult` record. This object is available in API version 37.0 and later.

[ApexTestRunResult](#)

Contains summary information about all the test methods that were run in a particular Apex job. This object is available in API version 37.0 and later.

[ApexTestSuite](#)

Represents a suite of Apex classes to include in a test run. A `TestSuiteMembership` object associates each class with the suite. This object is available in API version 36.0 and later.

Standard Objects

[ApexTrigger](#)

Represents an Apex trigger.

[ApexTypeImplementor \(Beta\)](#)

Represents Apex classes that directly or indirectly implement an interface. Using a SOQL query this object gets information about public or global classes and only global classes for installed managed packages. This object is available in API version 54.0 and later.

[AppAnalyticsQueryRequest](#)

Represents a request for AppExchange App Analytics data.

[AppDefinition](#)

Represents the metadata of an app and its navigation items. Metadata is returned only for apps that the current user can access. This object is available in API version 43.0 and later.

[AppExtension](#)

Represents a connection between the Field Service mobile app and another app, typically for passing record data to the Salesforce mobile app or other apps. This object is available in API version 41.0 and later.

[AppMenuItem](#)

Represents the organization's default settings for items in the app menu or App Launcher.

[AppointmentAssignmentPolicy](#)

Stores information about resource assignment rules. This object is available in API version 52.0 and later.

[AppointmentScheduleAggr](#)

Records the utilization of a service resource, by date, for the Load Balancing appointment assignment policy. This object is available in API version 52.0 and later.

[AppointmentScheduleLog](#)

Stores service appointments of each service Resource. This object is used to calculate the utilization of a service resource for the AppointmentScheduleAggr object. This object is available in API version 52.0 and later.

[AppointmentSchedulingPolicy](#)

Represents a set of rules for scheduling appointments using Salesforce Scheduler. This object is available in API version 45.0 and later.

[AppointmentTopicTimeSlot](#)

Junction object that is a lookup to a work type or a work type group for a time slot. This object is available in API version 52.0 and later.

[Approval](#)

Represents an approval request for a Contract.

[AppTabMember](#)

Represents the list of tabs for each of the available apps. This object is available in API version 43.0 and later.

[ApptBundleAggrDurDnscale](#)

Sums the duration of the bundle members, reduced by a predefined percentage. This object is available in API version 54.0 and later.

[ApptBundleAggrPolicy](#)

Policy that defines how the property values of the bundle members are aggregated and assigned to the bundle. This object is available in API version 54.0 and later.

[ApptBundleConfig](#)

Represents the general parameters that define the behavior of the bundle. This object is available in API version 54.0 and later.

Standard Objects

[ApptBundlePolicy](#)

Policy that defines how the bundling of service appointments should be handled. This object is available in API version 54.0 and later.

[ApptBundlePolicySvcTerr](#)

Represents a link between the BundlePolicy and the ServiceTerritory. This object is available in API version 54.0 and later.

[ApptBundleRestrictPolicy](#)

Policy that defines the restrictions that are considered while forming a bundle. This object is available in API version 54.0 and later.

[ApptBundleSortPolicy](#)

Policy that defines the properties by which the bundle members are sorted within the bundle. Can also be used in the automatic mode for determining the order of the automatic selection of bundle members. This object is available in API version 54.0 and later.

[AppUsageAssignment](#)

The AppUsageAssignment object defines the type of application that consumes information from a certain record. When an application attempts an application-specific action on the record, the application first evaluates that the object has the correct AppUsageAssignment for that application. If the assignment is correct, the action proceeds normally. If the assignment is incorrect or doesn't exist, the application may return an error. Each AppUsageAssignment has an AppUsageType metadata type that contains the actual application definition. This way, the AppUsageAssignment acts as a junction object for assigning a certain AppUsageType across multiple objects. This object is available in API version 50.0 and later.

[Article Type__DataCategorySelection](#)

A data category selection represents a data category that classifies an article. This object is available in API version 19.0 and later.

[Asset](#)

Represents an item of commercial value, such as a product sold by your company or a competitor, that a customer has purchased.

[AssetAction](#)

Represents a change made to a lifecycle-managed asset. The fields can't be edited. This object is available in API version 50.0 and later.

[AssetActionSource](#)

Represents an optional way to record what transactions caused changes to lifecycle-managed assets. Use it to trace financial and other information about asset actions. This object supports Salesforce order products and work order line items, and transaction IDs from other systems. The fields can't be edited. This object is available in API version 50.0 and later.

[AssetDowntimePeriod](#)

Represents a period during which an asset is not able to perform as expected. Downtime periods include planned activities, such as maintenance, and unplanned events, such as mechanical breakdown. This object is available in API version 49.0 and later.

[AssetOwnerSharingRule](#)

Represents the rules for sharing an Asset with users other than the owner. This object is available in API version 33.0 and later.

[AssetRelationship](#)

Represents a non-hierarchical relationship between assets due to replacement, upgrade, or other circumstances.

[AssetShare](#)

Represents a sharing entry on an Asset. This object is available in API version 33.0 and later.

[AssetStatePeriod](#)

Represents a time span when an asset has the same quantity, amount, and monthly recurring revenue (MRR). An asset has as many asset state periods as there are changes to it (asset actions) during its lifecycle. The dashboard and related pages show the current asset state period. The fields can't be edited. This object is available in API version 50.0 and later.

[AssetTag](#)

Associates a word or short phrase with an Asset.

Standard Objects

[AssetTokenEvent](#)

The documentation has moved to [AssetTokenEvent](#) in the *Platform Events Developer Guide*.

[AssetWarranty](#)

Defines the warranty terms applicable to an asset along with any exclusions and extensions. This object is available in API version 50.0 and later.

[AssignedResource](#)

Represents a service resource who is assigned to a service appointment in Field Service and Lightning Scheduler. Assigned resources appear in the Assigned Resources related list on service appointments. This object is available in API version 38.0 and later.

[AssignmentRule](#)

Represents an assignment rule associated with a Case or Lead.

[AssociatedLocation](#)

Represents a link between an account and a location in Field Service. You can associate multiple accounts with one location. For example, a shopping center location may have multiple customer accounts.

[AsyncApexJob](#)

Represents an individual Apex sharing recalculation job, a batch Apex job, a method with the `future` annotation, or a job that implements `Queueable`. Use this object to query Apex batch jobs in your organization.

[AsyncOperationLog](#)

Represents an async operations log containing progress and status information about external synchronizations to the Omnichannel Inventory service. This object is available in API version 51.0 and later.

[AttachedContentDocument](#)

This read-only object contains all `ContentDocument` objects associated with an object.

[AttachedContentNote](#)

This read-only object contains all `ContentNote` objects associated with an object. This object is available in API version 35.0 and later.

[Attachment](#)

Represents a file that a User has uploaded and attached to a parent object.

[Audience](#)

Represents an audience that is defined by criteria and can be assigned and used for targeting in an Experience Cloud site. This object is available in API version 44.0 and later.

[AuraDefinition](#)

Represents an Aura component definition, such as component markup, a client-side controller, or an event. This object is available in API version 32.0 and later.

[AuraDefinitionBundle](#)

Represents a Lightning Aura component definition bundle, such as a component or application bundle. A bundle contains a Lightning Aura component definition and all its related resources. This object is available in API version 32.0 and later.

[AuraDefinitionBundleInfo](#)

For internal use only.

[AuraDefinitionInfo](#)

For internal use only.

[AuthConfig](#)

Represents authentication options for an org with a My Domain configured, an Experience Cloud site, or a custom domain. This object is available in API version 32.0 and later.

Standard Objects

[AuthConfigProviders](#)

Represents an authentication provider that's configured in an organization. This object is a child of the AuthConfig object. This object is available in API version 32.0 and later.

[AuthorizationForm](#)

Represents the specific version and effective dates of a form that is associated with consent, such as a privacy policy or terms and conditions. This object is available in API version 46.0 and later.

[AuthorizationFormConsent](#)

Represents the date and way in which a user consented to an authorization form. This object is available in API version 46.0 and later.

[AuthorizationFormDataUse](#)

Represents the data use consented to in an authorization form. This object is available in API version 46.0 and later.

[AuthorizationFormText](#)

Represents an authorization form's text and language settings. This object is available in API version 46.0 and later.

[AuthProvider](#)

Represents an authentication provider (auth provider). An auth provider lets users log in to your Salesforce org from an external service provider, such as Facebook, Google, or GitHub.

[AuthSession](#)

The AuthSession object represents an individual user session in your organization. This object is available in versions 29.0 and later.

[BackgroundOperation](#)

Represents a background operation in an asynchronous job queue. This object is available in API version 35.0 and later.

[BackgroundOperationResult](#)

Stores error messages generated when running Async SOQL queries or importing data into big objects using Bulk API. This is a big object, available in API version 37.0 and later.

[BatchApexErrorEvent](#)

The documentation has moved to [BatchApexErrorEvent](#) in the *Platform Events Developer Guide*.

[Bookmark](#)

Represents a link between opportunities that share common information.

[BrandTemplate](#)

Letterhead for HTML EmailTemplate.

[BriefcaseAssignment](#)

Represents the assignment of a briefcase definition to selected users and user groups. This object is available in API version 50.0 and later.

[BriefcaseDefinition](#)

Represents a briefcase definition. A briefcase makes selected records available for users to view when they're offline in the Salesforce Field Service mobile app for iOS and Android. This object is available in API version 50.0 and later.

[BriefcaseRule](#)

Represents a rule that specifies records for a briefcase definition. This object is available in API version 50.0 and later.

[BriefcaseRuleFilter](#)

Represents a filter criteria for a briefcase rule. This object is available in API version 50.0 and later.

[Budget](#)

Tracks an estimate of future revenue or expenses during a specific time period. This object is available in API version 53.0 and later.

Standard Objects

[BudgetAllocation](#)

Represents a subsection of a Budget that shows where allocated resources are being applied. This object is available in API version 53.0 and later.

[BusinessBrand](#)

Represents a unique brand for a business that belongs to a parent entity. This object is available in API version 53.0 and later.

[BusinessHours](#)

Specifies the business hours of your support organization. Escalation rules are run only during these hours.

[BusinessProcess](#)

Represents a business process.

[BusinessProcessDefinition](#)

Setup object that stores information about stages in a customer lifecycle map. The stages are associated with surveys and questions created using Salesforce Surveys. This object is reserved for internal use, and is available in API version 49.0 and later.

[BusinessProcessFeedback](#)

Setup object that stores information about the survey and the question associated with each stage in a customer lifecycle map. Customer lifecycle maps are used to track the scores provided by customers across their lifecycle using Salesforce Surveys. This object is reserved for internal use, and is available in API version 49.0 and later.

[BusinessProcessGroup](#)

Setup object that stores information about customer lifecycle maps. Customer lifecycle maps are used to track the scores provided by customers across their lifecycle using Salesforce Surveys. This object is reserved for internal use, and is available in API version 49.0 and later.

[BuyerAccount](#)

Represents an account that is enabled as a buyer for Lightning B2B Commerce. This object is available in API version 48.0 and later.

[BuyerGroupPricebook](#)

Represents a buyer group price book used in Lightning B2B Commerce. This object is available in API version 48.0 and later.

[CalcProcStepRelationship](#)

Defines a parent-child relationship between two Expression Set Steps in an Expression Set Version. The label for this object is Expression Set Step Relationship. This object is available in API version 53.0 and later.

[CalculationMatrix](#)

Matches input values to a table row and returns the row's output values. The label for this object is Decision Matrix. This object is available in API version 53.0 and later.

[CalculationMatrixColumn](#)

Defines a column in a Decision Matrix. The label for this object is Decision Matrix Column. This object is available in API version 53.0 and later.

[CalculationMatrixRow](#)

Defines a row in a Decision Matrix. The label for this object is Decision Matrix Row. This object is available in API version 53.0 and later.

[CalculationMatrixVersion](#)

Defines a version of a Decision Matrix. The label for this object is Decision Matrix Version. This object is available in API version 53.0 and later.

[CalculationProcedure](#)

Performs a series of calculations using matrix lookups and user-defined variables and constants. The label for this object is Expression Set. This object is available in API version 53.0 and later.

Standard Objects

[CalculationProcedureStep](#)

Defines a step in an Expression Set. The label for this object is Expression Set Step. This object is available in API version 53.0 and later.

[CalculationProcedureVariable](#)

Defines a variable in an Expression Set. The label for this object is Expression Set Variable. This object is available in API version 53.0 and later.

[CalculationProcedureVersion](#)

Defines a version of an Expression Set. The label for this object is Expression Set Version. This object is available in API version 53.0 and later.

[Calendar](#)

Represents a calendar. This can be a default user calendar, public calendar, resource calendar, or holiday calendar. This object is available in API version 45.0 and later.

[CalendarView](#)

These calendars can be created and assigned to users other than the creator. Available calendars include object, shared, public, resource, and user list calendars. Object calendars represent a calendar based on a Salesforce object, either standard or custom. This object is available in API version 51.0 and later.

[CallCenter](#)

Represents a call center, which is a logical representation of a single computer-telephony integration (CTI) system instance in an organization.

[CallCenterRoutingMap](#)

Stores a mapping between a user or queue in a Salesforce org to a user or queue in an external system's call center. This object is available in API version 53.0 and later.

[CallCoachConfigModifyEvent](#)

Represents a Conversation Insights configuration change. This object is available in API version 49.0 and later.

[CallCoachingMediaProvider](#)

Represents the media provider for call recordings. This object is available in API version 49.0 and later.

[CallDisposition](#)

Represents a call result value that sales reps select when logging a call. This object is available in API version 47.0 and later.

[CallDispositionCategory](#)

Represents the call outcome of a phone call that is used in reports and branching criteria for sales cadences. This object is available in API version 47.0 and later.

[CallTemplate](#)

Represents a call script for users to read when making calls.

[Campaign](#)

Represents and tracks a marketing campaign, such as a direct mail promotion, webinar, or trade show.

[CampaignInfluence](#)

Represents the association between a campaign and an opportunity in Customizable Campaign Influence. This object is available in API version 37.0 and later.

[CampaignInfluenceModel](#)

This read-only object represents a campaign influence model in Customizable Campaign Influence. Use campaign influence models to group `CampaignInfluence` records created by a specific set of triggers and workflows that you define. The Primary Campaign Source influence model is the default model. This object is available in API version 37.0 and later.

Standard Objects

[CampaignMember](#)

Represents the association between a campaign and either a lead or a contact.

[CampaignMemberStatus](#)

One or more member status values defined for a campaign.

[CampaignOwnerSharingRule](#)

Represents the rules for sharing a campaign with User records other than the owner or anyone above the owner in the role hierarchy.

[CampaignShare](#)

Represents a sharing entry on a Campaign.

[CampaignTag](#)

Associates a word or short phrase with a Campaign.

[CardPaymentMethod](#)

References a credit card or debit card payment method. This entity implements the PaymentMethod entity interface. This object is available in API version 48.0 and later.

[CartCheckoutSession](#)

Represents a checkout session used in Lightning B2B Commerce checkout. This object is available in API version 48.0 and later.

[CartDeliveryGroup](#)

Represents shipping information for the delivery of items in an order against a store built with B2B Commerce on Lightning Experience. This object is available in API version 49.0 and later.

[CartDeliveryGroupMethod](#)

Represents the selected delivery method for a cart delivery group used in Lightning B2B Commerce checkout. This object is available in API version 49.0 and later.

[CartItem](#)

Represents an item in a `WebCart` that's active in a store built with B2B Commerce on Lightning Experience. Cart item can be of type `Product` or `Charge`. This object is available in API version 49.0 and later.

[CartItemPriceAdjustment](#)

Price adjustment for a cart item. This object is available in API version 52.0 and later.

[CartTax](#)

Represents taxes for a line item in a `WebCart` that's active in a store built with B2B Commerce on Lightning Experience. This object is available in API version 49.0 and later.

[CartValidationOutput](#)

Associate errors to cart entities, such as cart line items, delivery groups, and the like, in a store built with B2B Commerce on Lightning Experience. An example error is "Out of stock." Available in API version 49.0 and later.

[Case](#)

Represents a case, which is a customer issue or problem.

[CaseArticle](#)

Represents the association between a Case and a KnowledgeArticle. This object is available in API version 20.0 and later.

[CaseComment](#)

Represents a comment that provides additional information about the associated Case.

[CaseContactRole](#)

Represents the role that a given Contact plays on a Case.

Standard Objects

[CaseHistory](#)

Represents historical information about changes that have been made to the associated Case.

[CaseMilestone](#)

Represents a milestone (required step in a customer support process) on a Case. This object is available in API version 18.0 and later.

[CaseOwnerSharingRule](#)

Represents the rules for sharing a case with users other than the owner.

[CaseRelatedIssue](#)

This object acts as a junction between a customer issue (Case) and the Incident or Problem that represents an associated service failure. This object is available in API version 53.0 and later.

[CaseShare](#)

Represents a sharing entry on a Case.

[CaseSolution](#)

Represents the association between a Case and a Solution.

[CaseStatus](#)

Represents the status of a Case, such as New, On Hold, or In Process.

[CaseSubjectParticle](#)

Represents the Social Business Rules custom format for the **Case Subject** field on cases created from inbound social posts. This object is available in API version 41.0 and later.

[CaseTag](#)

Associates a word or short phrase with a Case

[CaseTeamMember](#)

Represents a case team member, who works with a team of other users to help resolve a case.

[CaseTeamRole](#)

Represents a case team role. Every case team member has a role on a case, such as "Customer Contact" or "Case Manager."

[CaseTeamTemplate](#)

Represents a predefined case team, which is a group of users that helps resolve a case.

[CaseTeamTemplateMember](#)

Represents a member on a predefined case team, which is a group of users that helps resolve cases.

[CaseTeamTemplateRecord](#)

The CaseTeamTemplateRecord object is a linking object between the Case and CaseTeamTemplate objects. To assign a predefined case team to a case (customer inquiry), create a CaseTeamTemplateRecord record and point the `ParentId` to the case and the `TeamTemplateId` to the predefined case team.

[CategoryData](#)

Represents a logical grouping of Solution records.

[CategoryNode](#)

Represents a tree of Solution categories.

[CategoryNodeLocalization](#)

When the Translation Workbench is enabled for your organization, the CategoryNodeLocalization object provides the translation of the label of a solution category.

[ChangeRequest](#)

Represents a decision to implement a formal request for a change (RFC). This object is available in API version 53.0 and later.

Standard Objects

[ChangeRequestRelatedIssue](#)

This object acts as a junction between a Change Request and an Incident or a Problem that represents a service failure. This object is available in API version 53.0 and later.

[ChannelObjectLinkingRule](#)

Represents a rule for linking a channel interaction with an object (such as Lead or Contact). This object is available in API version 47.0 and later.

[ChannelProgram](#)

Represents a channel program that vendors use to market and sell their products through channel partners. This object is available in API version 41.0 and later.

[ChannelProgramLevel](#)

Represents a level, based on member experience, in a channel program. This object is available in API version 41.0 and later.

[ChannelProgramMember](#)

Represents a partner who is a member of a channel program. This object is available in API version 41.0 and later.

[ChatterActivity](#)

ChatterActivity represents the number of posts and comments made by a user and the number of comments and likes on posts and comments received by the same user. This object is available in API version 23.0 and later.

[ChatterAnswersActivity](#)

Represents the reputation of a User in Chatter Answers zones. This object is available in API version 25.0 and later.

[ChatterAnswersReputationLevel](#)

Represents a reputation level within a Chatter Answers zone. This object is available in API version 26.0 and later.

[ChatterConversation](#)

Represents a private conversation in Chatter, consisting of messages that conversation members have sent or received. This object is available in API version 23.0 and later.

[ChatterConversationMember](#)

Represents a member of a private conversation in Chatter. A member has either sent messages to or received messages from other conversation participants. This object is available in API version 23.0 and later.

[ChatterExtension](#)

Represents a Rich Publisher App that's integrated with the Chatter publisher. This object is available in API version 41.0 and later.

[ChatterExtensionConfig](#)

Configuration for the Chatter extension for Experience Cloud sites. This object is available in API version 41.0 and later.

[ChatterMessage](#)

Represents a message sent as part of a private conversation in Chatter. This object is available in API version 23.0 and later.

[ClaimRecovery](#)

Represents a recovery of funds on an insurance claim through subrogation and salvage activities. Recovered amounts can come from a salvage company or through legal litigation or arbitration. Master-detail child object of Claim. This object is available in API version 54.0 and later.

[ClientBrowser](#)

Represents a cookie added to the browser upon login, and also includes information about the browser application where the cookie was inserted. This object is available in version 28.0 and later.

[CollaborationGroup](#)

Represents a Chatter group. This object is available in API version 19.0 and later.

Standard Objects

[CollaborationGroupMember](#)

Represents a member of a Chatter group. This object is available in API version 19.0 and later.

[CollaborationGroupMemberRequest](#)

Represents a request to join a private Chatter group. This object is available in API version 21.0 and later.

[CollaborationGroupRecord](#)

Represents the records associated with Chatter groups.

[CollaborationInvitation](#)

Represents an invitation to join Chatter, either directly or through a group. This object is available in API version 21.0 and later.

[CollabDocumentMetric](#)

Represents the engagement metrics for a Quip thread (document or spreadsheet) that's linked to a Salesforce record. This object is available in API version 50.0 and later.

[CollabDocumentMetricRecord](#)

Represents an association between a CollabDocumentMetric and a Salesforce record. It tracks which Salesforce record, such as an Account or Contact, is linked to a Quip thread for which metrics were gathered using CollabDocumentMetric. CollabDocumentMetricRecord is available in API version 50.0 and later.

[CollabTemplateMetric](#)

Represents the engagement metrics for a Quip template. This object is available in API version 50.0 and later.

[CollabTemplateMetricRecord](#)

Represents an association between a CollabTemplateMetric and a Salesforce record. It tracks which Salesforce record, such as an Account or Contact, is linked to a Quip template for which metrics were gathered using CollabTemplateMetric. CollabTemplateMetricRecord is available in API version 50.0 and later.

[CollabUserEngagementMetric](#)

Represents the user engagement metrics for a Quip thread in a Quip template or document. This object is available in API version 50.0 and later.

[CollabUserEngmtRecordLink](#)

Represents an association between a CollabUserEngagementMetric and a Salesforce record. It tracks which Salesforce record, such as an Account or Contact, is associated with the user engagement metric. This object is available in API version 50.0 and later.

[ColorDefinition](#)

Represents the color-related metadata for a custom tab. This object is available in API version 43.0 and later.

[CombinedAttachment](#)

This read-only object contains all notes, attachments, Google Docs, documents uploaded to libraries in Salesforce CRM Content, and files added to Chatter that are associated with a record.

[CommerceEntitlementBuyerGroup](#)

Represents the entitlement policy for a buyer group. This object is available in API version 49.0 and later.

[CommerceEntitlementPolicy](#)

Represents an entitlement policy, which determines what products and prices a user can see. This object is available in API version 49.0 and later.

[CommerceEntitlementPolicyShare](#)

Represents the entitlement rule for sharing products and prices with users other than the owner. This object is available in API version 49.0 and later.

[CommerceEntitlementProduct](#)

Represents the entitlement policy for a product. This object is available in API version 49.0 and later.

Standard Objects

[CommissionSchedule](#)

Represents a commission calculation and rate definition. Calculates commission values for a commissionable event.

[CommissionScheduleAssignment](#)

Represents the commission calculation applicable to a specific product or producer for one or multiple commissionable events.

[CommSubscription](#)

Represents a customer's subscription preferences for a specific communication. This object is available in API version 48.0 and later.

[CommSubscriptionChannelType](#)

Represents the engagement channel through which you can reach a customer for a communication subscription. This object is available in API version 48.0 and later.

[CommSubscriptionConsent](#)

Represents a customer's consent to a communication subscription. This object is available in API version 48.0 and later.

[CommSubscriptionTiming](#)

Represents a customer's timing preferences for receiving a communication subscription. This object is available in API version 48.0 and later.

[Community \(Zone\)](#)

Represents a zone that contains Idea or Question objects.

[ConnectedApplication](#)

Represents a connected app and its details; all fields are read-only.

[Consumption Rate](#)

Consumption rates describe the billing rate for a range of usage within a consumption schedule. All consumption schedules require at least one consumption rate in order to rate usage on a usage product. This object is available in API version 45.0 and later.

[Consumption Schedule](#)

A consumption schedule organizes a set of consumption rates by which usage-based products are quoted and billed. This object is available in API version 45.0 and later.

[Contact](#)

Represents a contact, which is a person associated with an account.

[ContactCleanInfo](#)

Stores the metadata Data.com Clean uses to determine a contact record's clean status. Helps you automate the cleaning or related processing of contact records. ContactCleanInfo includes a number of bit vector fields.

[ContactDailyMetric](#)

Represents the daily engagement metrics for a contact. This object is available in API version 52.0 and later.

[ContactMonthlyMetric](#)

Represents the monthly engagement metrics for a contact. This object is available in API version 52.0 and later.

[ContactPointAddress](#)

Represents a contact's billing or shipping address, which is associated with an individual or person account. This object is available in API version 49.0 and later.

[ContactPointConsent](#)

Represents a customer's consent to be contacted via a specific contact point, such as an email address or phone number. This object is available in API version 48.0 and later.

[ContactPointEmail](#)

Represents a contact's email, which is associated with an individual or person account. This object is available in API version 48.0 and later.

Standard Objects

[ContactPointPhone](#)

Represents a contact's phone number, which is associated with an individual or person account. This object is available in API version 48.0 and later.

[ContactPointTypeConsent](#)

Represents consent for a contact point type, such as email or phone. This object is available in API version 45.0 and later.

[ContactOwnerSharingRule](#)

Represents the rules for sharing a contact with a User other than the owner.

[ContactRequest](#)

Represents a customer's request for support to get back to them about an issue. This object is available in API version 45.0 and later.

[ContactRequestShare](#)

Represents a list of access levels to a ContactRequest with an explanation of the access level. This object is available in API version 45.0 and later.

[ContactShare](#)

Represents a list of access levels to a Contact along with an explanation of the access level. For example, if you have access to a record because you own it, the `ContactAccessLevel` is `All` and `RowCause` is `Owner`.

[ContactSuggestionInsight](#)

Represents a suggestion for a new contact record. Available in API versions 45.0 and later.

[ContactTag](#)

Associates a word or short phrase with a Contact.

[ContentAsset](#)

Represents a Salesforce file that has been converted to an asset file in a custom app in Lightning Experience. Use asset files for org setup and configuration. Asset files can be packaged and referenced by other components. This object is available in API version 38.0 and later.

[ContentBody](#)

Represents the body of a file in Salesforce CRM Content or Salesforce Files. This object is available in API version 40.0 and later.

[ContentDistribution](#)

Represents information about sharing a document externally. This object is available in API version 32.0 and later.

[ContentDistributionView](#)

Represents information about views of a shared document. This read-only object is available in API version 32.0 and later.

[ContentDocument](#)

Represents a document that has been uploaded to a library in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content. This object is available in API version 21.0 and later for Salesforce Files.

[ContentDocumentHistory](#)

Represents the history of a document. This object is available in versions 17.0 and later.

[ContentDocumentLink](#)

Represents the link between a Salesforce CRM Content document, Salesforce file, or ContentNote and where it's shared. A file can be shared with other users, groups, records, and Salesforce CRM Content libraries. This object is available in versions 21.0 and later for Salesforce CRM Content documents and Salesforce Files.

[ContentDocumentListViewMapping](#)

Represents an association between a ListView and a Quip ContentDocument. Applies to Quip file types only. Maintains the mapping between a list view and Quip document when the list view is exported to a newly created Quip document. This object is available in API version 44.0 and later.

Standard Objects

[ContentDocumentSubscription](#)

Represents a subscription for a user following or commenting on a file in a library. This object is available in API version 42.0 and later.

[ContentFolder](#)

Represents a folder in a content library for adding files. This object is available in API version 34.0 and later.

[ContentFolderItem](#)

Represents a file (ContentDocument) or folder (ContentFolder) that resides in a ContentFolder in a ContentWorkspace. This object is available in API version 35.0 and later.

[ContentFolderLink](#)

Defines the association between a library and its root folder. This object is available in API version 34.0 and later.

[ContentFolderMember](#)

Defines the association between a file and a folder. This object is available in API version 34.0 and later.

[ContentHubItem](#)

Represents a file or folder in a Files Connect external data source, such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

[ContentHubRepository](#)

Represents a Files Connect external data source such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

[ContentNote](#)

Represents a note created with the enhanced note taking tool, released in Winter '16. This object is available in API version 32.0 and later.

[ContentNotification](#)

Represents a notification for a file. This object is available in API version 42.0 and later.

[ContentTagSubscription](#)

Represents a subscription for a user following a tag on a file. This object is available in API version 42.0 and later.

[ContentUserSubscription](#)

Represents a subscription for a user following another user. This object is available in API version 42.0 and later.

[ContentVersion](#)

Represents a specific version of a document in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content documents. This object is available in versions 20.0 and later for Salesforce Files.

[ContentVersionComment](#)

Represents a comment on a version of a file. This object is available in API version 42.0 and later.

[ContentVersionHistory](#)

Represents the history of a specific version of a document. This object is available in version 17.0 and later.

[ContentVersionRating](#)

Represents a rating on a version of a file. This object is available in API version 42.0 and later.

[ContentWorkspace](#)

Represents a content library. This object is available in versions 17.0 and later.

[ContentWorkspaceDoc](#)

Represents a link between a document and a public library in Salesforce CRM Content. This object is available in versions 17.0 and later.

Standard Objects

[ContentWorkspaceMember](#)

Represents a member of a content library. This object is available in API version 40.0 and later.

[ContentWorkspacePermission](#)

Represents a library permission. This object is available in API version 40.0 and later.

[ContentWorkspaceSubscription](#)

Represents a subscription for a user following a library. This object is available in API version 42.0 and later.

[Contract](#)

Represents a contract (a business agreement) associated with an Account.

[ContractContactRole](#)

Represents the role that a given Contact plays on a Contract.

[ContractLineItem](#)

Represents a product covered by a service contract (customer support agreement). This object is available in API version 18.0 and later.

[ContractStatus](#)

Represents the status of a Contract, such as Draft, InApproval, Activated, Terminated, or Expired.

[ContractTag](#)

Associates a word or short phrase with a Contract.

[Conversation](#)

Represents a conversation between an end user and an agent. Available in API version 49.0 and later.

[ConversationContextEntry](#)

Represents the context of a message or an event in the chat history between an agent and a messaging user. This object is available in API version 47.0 and later.

[ConversationEntry](#)

Represents a message or an event in the chat history between an agent and a messaging user. This object is available in API version 43.0 and later.

[ConversationParticipant](#)

Represents an active participant in a conversation. A new ConversationParticipant record is created each time a participant joins a conversation. This object is available in API version 49.0 and later.

[CorsWhitelistEntry](#)

Represents an entry in the cross-origin resource sharing (CORS) allowlist. Origins included in the allowlist can request REST resources from that Salesforce org.

[Coupon](#)

A coupon associated with a promotion. This object is available in API version 54.0 and later.

[CreditMemo](#)

Represents a document that is used to adjust or rectify errors made in an invoice. The invoice has already been processed and sent to a customer. This object is available in API version 48.0 and later.

[CreditMemoLine](#)

Represents a partial or full application of a credit memo's balance against an invoice or invoice line. This object is available in API version 48.0 and later.

Standard Objects

[Crisis](#)

Represents a major crisis event that affects an Employee in an InternalOrganizationUnit. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

[CronJobDetail](#)

Contains details about the associated scheduled job, such as the job's name and type. This object is available in API version 29.0 and later.

[CronTrigger](#)

Contains schedule information for a scheduled job. CronTrigger is similar to a cron job on UNIX systems. This object is available in API version 17.0 and later.

[CspTrustedSite](#)

Represents a CSP Trusted Site. The Lightning Component framework uses Content Security Policy (CSP) to impose restrictions on content. The main objective is to help prevent cross-site scripting (XSS) and other code injection attacks. To use third-party APIs that make requests to an external (non-Salesforce) server or to use a WebSocket connection, add a CSP Trusted Site. This object is available in API version 48.0 and later.

[CurrencyType](#)

Represents the currencies used by an organization for which the multicurrency feature is enabled.

[CustomBrand](#)

Represents a custom branding and color scheme. This object is available in API version 28.0 and later.

[CustomBrandAsset](#)

Represents a branding element in a custom branding scheme. For example, a color, logo image, header image, or footer text. A CustomBrandAsset can apply to an Experience Cloud site or to an org using the Salesforce mobile app. This object is available in API version 28.0 and later.

[CustomHelpMenuItem](#)

Represents the items within a section of the Lightning Experience help menu that the admin added to display custom, org-specific help resources. This object is available in API version 44.0 and later.

[CustomHelpMenuSection](#)

Represents a section of the Lightning Experience help menu that the admin added to display custom, org-specific help resources. This object is available in API version 44.0 and later.

[CustomHTTPHeader](#)

Represents a custom HTTP header that provides context information from Salesforce such as region, org details, or the role of the person viewing the external object. This object is available in API version 43.0 and later.

[CustomNotificationType](#)

Stores information about custom notification types. This object is available in API version 47.0 and later.

[CustomPermission](#)

Represents a permission created to control access to a custom process or app, such as sending email. This object is available in API version 31.0 and later.

[CustomPermissionDependency](#)

Represents the dependency between two custom permissions when one custom permission requires that you enable another custom permission. This object is available in API version 32.0 and later.

[Customer](#)

Represents the customer role of an individual with respect to a particular company or organization. This object is available in API version 53.0 and later.

Standard Objects

[DandBCompany](#)

Represents a Dun & Bradstreet® company record, which is associated with an account added from Data.com. This object is available in API version 25.0 and later.

[Dashboard](#)

Represents a dashboard, which shows data from custom reports as visual components. Access is read-only. This object is available in API version 20.0 and later.

[DashboardComponent](#)

Represents a dashboard component, which can be a chart, metric, table, or gauge on a dashboard. Access is read-only. This object is available in API version 21.0 and later.

[DashboardTag](#)

Associates a word or short phrase with a Dashboard. This object is available in API version 20.0 and later.

[DataAssessmentFieldMetric](#)

Represents summary statistics for matched, blank, and differing fields in account records of an org compared to records in Data.com. This object is available in API version 37.0 and later.

[DataAssessmentMetric](#)

Represents a summary of statistics for fields matched and unmatched in your account records with Data.com account records. This object is available in API version 37.0 and later.

[DataAssessmentValueMetric](#)

Summarizes the number of fields matched for your account records with Data.com account records. This object is available in API version 37.0 and later.

[DatacloudCompany](#)

Represents the fields for Data.com company records. This object is available in API version 30.0 or later.

[DatacloudContact](#)

The fields and properties for Data.com contact records. This object is available in API version 30.0 or later.

[DatacloudDandBCompany](#)

Represents a set of read-only fields that are used to return D&B company data from Data.com API calls. This object is available in API version 30.0 or later.

[DatacloudOwnedEntity](#)

Represents fields in the DatacloudOwnedEntity object. The DatacloudOwnedEntity object tracks user-purchased records. This object is available in API version 30.0 or later.

[DatacloudPurchaseUsage](#)

Represents an object used to identify and track Data.com record purchases. This object is available in API version 30.0 or later.

[DataIntegrationRecordPurchasePermission](#)

Indicates Lightning Data purchase credits that a Salesforce admin has granted to users.

[DatasetExport](#)

Represents a dataset exported from Tableau CRM. When a dataset is exported, the data is converted into a .csv file and the schema is stored in a separate JSON file. These files are stored in two objects: DatasetExport and DatasetExportPart. DatasetExport acts as the header and includes the JSON schema.

[DatasetExportPart](#)

Represents a dataset exported from Tableau CRM. When a dataset is exported, the data is converted into a .csv file and the schema is stored in a separate JSON file. These files are stored in two objects: DatasetExport and DatasetExportPart. DatasetExportPart contains parts of the .csv file.

Standard Objects

[DataUseLegalBasis](#)

Represents the legal basis for contacting a customer, such as billing or contract. This object is available in API version 45.0 and later.

[DataUsePurpose](#)

Represents the reason for contacting a prospect or customer, such as for billing, marketing, or surveys. This object is available in API version 45.0 and later.

[DatedConversionRate](#)

Represents the dated exchange rates used by an organization for which the multicurrency and the effective dated currency features are enabled.

[DeclinedEventRelation](#)

Represents event participants (invitees or attendees) with the status `Declined` for a given event. This object is available in API versions 29.0 and later.

[DelegatedAccount](#)

Represents the external managed account. This object is available in API version 49.0 and later.

[DeleteEvent](#)

Represents a record that has been soft deleted. Search on this object was available in API version 48.0, then removed in API version 50.0.

[DigitalSignature](#)

Represents a signature captured on a service report in field service.

[DigitalWallet](#)

The digital wallet entity represents a customer's digital wallet service. Commerce Payments can use a digital wallet as a payment source when processing payments through a payment gateway. This object is available in API version 48.0 and later.

[DirectMessage](#)

Represents a direct message conversation between multiple users in Chatter. This object is available in API version 38.0 and later.

[Division](#)

A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.

[DivisionLocalization](#)

When the Translation Workbench is enabled for your organization, the DivisionLocalization object provides the translation of the label for a division.

[Document](#)

Represents a file that a user has uploaded. Unlike Attachment records, documents are not attached to a parent object.

[DocumentAttachmentMap](#)

Maps the relationship between an EmailTemplate and its attachment, which is stored as a Document.

[DocumentTag](#)

Associates a word or short phrase with a Document.

[Domain](#)

Read-only object that represents a custom Web address assigned to a site in your organization. This object is available in API version 26.0 and later.

[DomainSite](#)

Read-only junction object that joins together the Site and Domain objects. This object is available in API version 26.0 and later.

Standard Objects

[DsarPolicy](#)

Represents a Data Subject Access Request (DSAR) policy created in the Privacy Center managed package. DSAR policies anonymize or transfer personal data from your org at your customer's request. This object is available in API version 50.0 and later.

[DsarPolicyLog](#)

Represents the history of Data Subject Access Request (DSAR) policy execution requests. This log records the status and results of executed DSAR policies for a customer. This object is available in API version 50.0 and later.

[DuplicateJob](#)

Represents an instance of a job that identifies duplicates among existing records in the system.

[DuplicateJobDefinition](#)

Setup object defining a job that identifies duplicate record items globally.

[DuplicateJobMatchingRule](#)

Represents a MatchingRule to be used with a DuplicateJob sharing the corresponding DuplicateJobMatchingRuleDefinition.

[DuplicateJobMatchingRuleDefinition](#)

Setup object specifying a MatchingRule to use with DuplicateJob instances that share a DuplicateJobDefinition.

[DuplicateRecordItem](#)

Represents an individual record that's part of a duplicate record set. Use this object to create custom report types.

[DuplicateRecordSet](#)

Represents a group of records that have been identified as duplicates. Each duplicate record set contains one or more duplicate record items. Use this object to create custom report types and view the results of duplicate jobs.

[DuplicateRule](#)

Represents a duplicate rule for detecting duplicate records.

[ElectronicMediaGroup](#)

Represents the type of media that you can associate with a product or category. This object is available in API version 49.0 and later.

[ElectronicMediaUse](#)

Represents the usage of media. This object is available in API version 49.0 and later.

[EmailContent](#)

Represents a marketing email asset for use with Pardot. This object is available in API version 50.0 and later.

[EmailDomainFilter](#)

Represents a filter that determines whether an email relay is restricted to a specific list of domains. This object is available in API version 43.0 and later.

[EmailDomainKey](#)

Represents a domain key for an organization's domain, used to authenticate outbound email that Salesforce sends on the organization's behalf. This object is available in API version 28.0 and later.

[EmailMessage](#)

Represents an email in Salesforce.

[EmailMessageRelation](#)

Represents the relationship between an email and contacts, leads, and users. This object is available in API version 37.0 and later.

[EmailRelay](#)

Represents the configuration for sending an email relay. An email relay routes email sent from Salesforce through your company's email servers. This object is available in API version 43.0 and later.

Standard Objects

[EmailServicesAddress](#)

An email service address.

[EmailServicesFunction](#)

An email service.

[EmailStatus](#)

Represents the status of email sent.

[EmailTemplate](#)

Represents a template for an email, mass email, list email, or HVS email.

[EmailTemplateMonthlyMetric](#)

Represents the monthly engagement metrics for an email template. This object is available in API version 53.0 and later.

[EmbeddedServiceDetail](#)

Represents a metadata catalog object that exposes fields from the underlying Embedded Service setup objects defined in each EmbeddedServiceConfig deployment for guest users. Guest users don't have direct access to the Embedded Service setup objects. Available in API version 39.0 and later.

[EmbeddedServiceLabel](#)

Represents a customized label in Embedded Chat or embedded Appointment Management. This object is available in API version 44.0 and later.

[Employee](#)

Represents an employee within a company or organization. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

[EmployeeCrisisAssessment](#)

Represents a crisis assessment of an Employee. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

[EmpUserProvisioningProcess](#)

Represents an employee-user provisioning process. This object is available in API version 52.0 and later.

[EmpUserProvisionProcessErr](#)

Represents an employee-user provisioning process error. This object is available in API version 52.0 and later.

[EngagementChannelType](#)

Represents a channel through which a customer can be reached for communication. This object is available in API version 48.0 and later.

[EnhancedLetterhead](#)

Represents an enhanced letterhead that can be associated with a Lightning email template that doesn't use the Salesforce Merge Language (SML). This object is available in API version 46.0 and later.

[Entitlement](#)

Represents the customer support an account or contact is eligible to receive. This object is available in API version 18.0 and later. Entitlements may be based on an asset, product, or service contract.

[EntitlementContact](#)

Represents a Contact eligible to receive customer support via an Entitlement. This object is available in API version 18.0 and later.

[EntitlementTemplate](#)

Represents predefined terms of customer support for a product (Product2). This object is available in API version 18.0 and later.

Standard Objects

[EntityHistory](#)

Represents historical information about an object's changed field values. This object is only available to users with the "View All Data" permission. This object is unavailable beginning with API version 8.0. Use the object-specific [History](#) objects instead.

[EntityMilestone](#)

Represents a required step in a customer support process on a work order. The Salesforce user interface uses the term "object milestone." This object is available in API version 37.0 and later.

[EntitySubscription](#)

Represents a subscription for a user following a record or another user. This object is available in API version 34.0 and later.

[EnvironmentHubMember](#)

Represents a member organization in the Environment Hub. This object is available in API version 29.0 and later.

[Event](#)

Represents an event in the calendar. In the user interface, event and task records are collectively referred to as activities.

[EventLogFile](#)

Represents event log files for event monitoring. The event monitoring product gathers information about your Salesforce org's operational events, which you can use to analyze usage trends and user behavior. This object is available in API version 32.0 and later. The `Interval` and `Sequence` fields are available only in API version 37.0 and later.

[EventRelation](#)

Represents a person (a user, lead, or contact) or a resource (such as a conference room) invited to an event. This object lets you add or remove invitees from an event and use the API to manage invitees' responses to invitations. If Shared Activities is enabled, `EventRelation` can also represent other objects that are related to an event. `EventRelation` does not support triggers, workflow, or data validation rules.

[EventBusSubscriber](#)

Represents a trigger, process, or flow that's subscribed to a platform event or a change data capture event. Doesn't include CometD subscribers.

[EventTag](#)

Associates a word or short phrase with an Event.

[EventWhoRelation](#)

Represents the relationship between an event and a lead or contacts. This derived object is a filtered version of the [EventRelation](#) on page 1701 object; that is, `IsParent` is `true` and `IsWhat` is `false`. It doesn't represent relationships to invitees or to accounts, opportunities, or other objects. This object is available in API versions 29.0 and later.

[Expense](#)

Represents an expense linked to a work order. Service resource technicians can log expenses, such as tools or travel costs. This object is available in API version 49.0 and later.

[ExpenseReport](#)

Represents a report that summarizes expenses. This object is available in API version 50.0 and later.

[ExpenseReportEntry](#)

Represents an entry in an expense report. This object is available in API version 50.0 and later.

[ExpressionFilter](#)

Represents a logical expression that's used to control the execution of macro instructions. This object is available in API version 46.0 and later.

[ExpressionFilterCriteria](#)

Represents a condition in an expression that's used to control the execution of macro instructions. This object is available in API version 46.0 and later.

Standard Objects

[ExternalAccountHierarchy](#)

Represents the external account hierarchy, which works like a role-based hierarchy. Use `ExternalAccountHierarchy` to allow partner and customer users to share data with other external accounts in their hierarchy. This object is available in API version 49.0 and later.

[ExternalAccountHierarchyHistory](#)

Represents the history of changes to values in the fields of an external account hierarchy. This object is available in API version 50.0 and later.

[ExternalDataSource](#)

Represents an external data source, which defines connection details for integration with data and content that are stored outside the Salesforce org. This object is available in API version 27.0 and later.

[ExternalDataUserAuth](#)

Stores authentication settings for a Salesforce user to access an external system. The external system must be defined in an external data source or a named credential that's configured to use per-user authentication. This object is available in API version 27.0 and later.

[ExternalSocialAccount](#)

Represents a managed social media account on a social network such as Facebook or Twitter. This object is available in API version 29.0 and later.

[FeedAttachment](#)

Represents an attachment to a feed item, such as a file attachment or a link. Use `FeedAttachment` to add various attachments to one feed item. This object is available in API version 36.0 and later.

[FeedComment](#)

Represents a comment added to a feed by a user. This object is available in API version 18.0 and later.

[FeedItem](#)

`FeedItem` represents an entry in the feed, such as changes in a record feed, including text posts, link posts, and content posts. This object is available in API version 21.0 and later. This object replaces `FeedPost`.

[FeedLike](#)

Indicates that a user has liked a feed item. This object is available in API version 21.0 and later.

[FeedPollChoice](#)

Shows the choices for a poll posted in the feed. This object is available in API version 29.0 and later.

[FeedPollVote](#)

Shows how users voted on a poll posted in the feed. This object is available in API version 29.0 and later.

[FeedPost](#)

`FeedPost` represents the following types of changes in a record feed, such as `AccountFeed`: text posts, link posts, and content posts. This object is available in API version 18.0 through 21.0. `FeedPost` is no longer available in later versions. Starting with API version 21.0, use `FeedItem` to represent text posts, link posts, and content posts in feeds.

[FeedRevision](#)

Holds the revision history of a specific feed item or comment, including a list of attributes that changed for each revision. This object is available in API version 34.0 and later.

[feedSignal](#)

Attach feed signals, like `UpDownVote`, `UserVerified`, and `Verified`, to a feed post or comment. This object is available in API version 41.0 and later.

[FeedTrackedChange](#)

Represents an individual field change or set of field changes. A `FeedTrackedChange` is a child object of a record feed, such as `AccountFeed`. This object is available in API version 18.0 and later.

Standard Objects

[FieldHistoryArchive](#)

Represents field history values for all objects that retain field history. `FieldHistoryArchive` is a big object, available only to users with the “Retain Field History” permission. This object is available in API version 29.0 and later.

[FieldChangeSnapshot](#)

Use this virtual object to learn which opportunities' close dates changed during the specified time period. This object is available in API version 52.0 and later.

[FieldPermissions](#)

Represents the enabled field permissions for the parent `PermissionSet`. This object is available in API version 24.0 and later.

[FieldSecurityClassification](#)

Represents a field's data sensitivity value selected from the `SecurityClassification` picklist. This object is available in API version 46.0 and later.

[FieldServiceMobileSettings](#)

Represents a configuration of settings that control the Field Service iOS and Android mobile app experience. This object is available in API version 38.0 and later.

[FieldServiceOrgSettings](#)

Represents the org settings for Field Service, such as Appointment Assistant settings. If Field Service is enabled, the org contains one read-only record of this object. This object is available in API version 51.0 and later.

[FiscalYearSettings](#)

Settings to define a custom or standard fiscal year for your organization. This object has a parent-child relationship with the `Period` object.

[FlexQueueItem](#)

Represents an asynchronous Apex job in the Apex flex queue. Provides information about the job type and flex queue position of the `AsyncApexJob`. This object is available in API version 36.0 and later.

[FlowDefinitionView](#)

Represents the description of a flow definition. This object is available in API version 46.0 and later.

[FlowInterview](#)

Represents a flow interview. A *flow interview* is a running instance of a flow.

[FlowInterviewOwnerSharingRule](#)

Represents the rules for sharing a `FlowInterview` with users other than the owner. This object is available in API version 33.0 and later.

[FlowInterviewShare](#)

Represents a sharing entry on a `FlowInterview`. This object is available in API version 33.0 and later.

[FlowRecordRelation](#)

Represents a relationship between a record and a flow interview. When a flow interview is paused, Salesforce uses the `$Flow.CurrentRecord` global variable in the flow to associate the interview with a record. Available in API version 42.0 and later.

[FlowStageRelation](#)

Represents a relationship between a paused flow interview and its stages. When a flow interview is paused, Salesforce creates a `FlowStageRelation` record for each stage that's set to the `$Flow.CurrentStage` or `$Flow.ActiveStages` global variable. Available in API version 43.0 and later.

[FlowVariableView](#)

Represents a variable within the flow version. This object is available in API version 46.0 and later.

Standard Objects

[FlowVersionView](#)

Represents the version of a flow definition. This object is available in API version 46.0 and later.

[Folder](#)

Represents a repository for a Dashboard, Document, EmailTemplate, Macro, QuickText, or Report. Only one type of item can be contained in a folder.

[FolderedContentDocument](#)

Represents the relationship between a parent and child ContentFolderItem in a ContentWorkspace.

[ForecastingAdjustment](#)

This object represents an individual forecast manager's adjustment for a subordinate's or child territory's forecast via a ForecastingItem. Available in API versions 26 and greater. This object is separate from the ForecastingOwnerAdjustment object, which represents forecast users' adjustments of their *own* forecasts, including territory forecasts they own.

[ForecastingDisplayedFamily](#)

Represents the table in Forecasts Settings where an admin selects the product families that users can forecast on in Lightning Experience. This object is available in API version 40.0 and later.

[ForecastingFact](#)

This is a read-only object linking a ForecastingItem with its opportunities, such as opportunities that share the same owner or forecast category and have a closing date within the period of the forecasting item. Available in API versions 26 and greater.

[ForecastingFilter](#)

Represents the custom filter for including or excluding recordtype data from opportunity forecasts. This object is available in API version 54.0 and later.

[ForecastingFilterCondition](#)

Represents the custom filter condition logic for including or excluding recordtype data from opportunity forecasts. This object is available in API version 54.0 and later.

[ForecastingItem](#)

This is a read-only object used for individual forecast amounts. Users see amounts based on their perspectives and forecast roles. The amounts users see include one of the following when forecasting in revenue: `AmountWithoutAdjustments`, `AmountWithoutManagerAdjustment`, `ForecastAmount`, `OwnerOnlyAmount`. The amounts users see include one of the following when forecasting in quantity: `QuantityWithoutAdjustments`, `QuantityWithoutManagerAdjustment`, `ForecastQuantity`, `OwnerOnlyQuantity`. Available in API versions 26 and greater.

[ForecastingOwnerAdjustment](#)

This object represents an individual forecast user's adjustment of their *own* forecast, including territory forecasts they own, via a ForecastingItem. Available in API versions 33 and greater. This object is separate from the ForecastingAdjustment object, which represents managers' adjustments of *subordinates'* and child territories' forecasts.

[ForecastingQuota](#)

This object represents an individual user's or territory's quota for a specified time period. The "Manage Quotas" user permission is required for creating, updating, or deleting quotas. (Users can only edit their subordinates' or child territories' quotas, not their own.) The "View All Forecasts" permission is required to View any user's forecast, regardless of the forecast hierarchy. Available in API versions 25 and greater. Forecast managers can view the forecasts of subordinates and territories below them in the forecast hierarchy.

[ForecastingShare](#)

Represents forecasts shared between a forecast manager and a user. Available in API version 44.0 and later.

[ForecastingSourceDefinition](#)

Represents the object, measure, date type, and hierarchy that a forecast uses to project sales. This object is available in API version 52.0 and later.

Standard Objects

[ForecastingType](#)

This object is used to identify the forecast type associated with `ForecastingAdjustment`, `ForecastingOwnerAdjustment`, `ForecastingQuota`, `ForecastingFact`, and `ForecastingItem` objects. Available in API versions 30.0 and greater.

[ForecastingTypeSource](#)

Maps a forecasting source definition to a forecast type. This object is available in API version 52.0 and later.

[ForecastingUserPreference](#)

Represents the forecasting selections that a user has made, such as display options, date range, forecasting type, and currency.

[FormulaFunction](#)

Represents a function used when building a formula, including examples and uses. This object is available in API version 47.0 and later.

[FormulaFunctionAllowedType](#)

Represents the functions that are supported in the given formula context. This object is available in API version 48.0 and later.

[FormulaFunctionCategory](#)

Represents the category to which a formula belongs when building a formula. This object is available in API version 47.0 and later.

[FulfillmentOrder](#)

Represents a group of products and delivery charges on a single order that share the same fulfillment location, delivery method, and recipient. The `FulfillmentOrderLineItems` belonging to a `FulfillmentOrder` are associated with `OrderItemSummary` objects belonging to a single `OrderSummary`. This object is available in API version 48.0 and later.

[FulfillmentOrderItemAdjustment](#)

Represents a price adjustment on a `FulfillmentOrderLineItem`. Corresponds to an `OrderItemAdjustmentLineSummary` associated with the corresponding `OrderItemSummary`. This object is available in API version 48.0 and later.

[FulfillmentOrderItemTax](#)

Represents the tax on a `FulfillmentOrderLineItem` or `FulfillmentOrderItemAdjustment`. Corresponds to an `OrderItemTaxLineItemSummary`. This object is available in API version 48.0 and later.

[FulfillmentOrderLineItem](#)

Represents a product or delivery charge belonging to a `FulfillmentOrder`. Corresponds to an `OrderItemSummary`. This object is available in API version 48.0 and later.

[FunctionConnection](#)

Represents a connection between an org and Salesforce Functions. This object is available in API version 52.0 and later.

[FunctionInvocationRequest](#)

Represents invocation information for a Salesforce Function. This object is available in API version 51.0 and later.

[FunctionReference](#)

Represents a deployed Salesforce Function associated with an org. This object is available in API version 52.0 and later.

[GtwyProvPaymentMethodType](#)

The gateway provider payment method type allows integrators and payment providers to choose an active payment to receive an order's payment data rather than allowing the Salesforce Order Management platform to select a default payment method. This object is available in API version 50.0 and later.

[Goal](#)

The Goal object represents the components of a goal such as its name, description, and status.

Standard Objects

[GoalLink](#)

Represents the relationship between two goals. This is a many-to-many relationship, meaning that each goal can link to many other goals.

[GoogleDoc](#)

Represents a link to a Google Document. This object is available in API version 14.0 and later.

[Group](#)

A set of User records.

[GroupMember](#)

Represents a User or Group that is a member of a public group.

[GuestBuyerProfile](#)

Represents a store's guest buyer profile, which allows unauthenticated buyers to browse the store. This object is available in API version 51.0 and later.

[HashtagDefinition](#)

HashtagDefinition represents hashtag (#) topics in public Chatter posts and comments. Public posts and comments include those on profiles and in public groups, but not those on records or in private groups. This object is available in API version 26.0 and later.

[HealthCareDiagnosis](#)

Represents information related to industry-standard healthcare diagnosis codes.

[HealthCareProcedure](#)

Represents information related to industry-standard healthcare procedure codes.

[Holiday](#)

Represents a period of time during which your customer support team is unavailable. Business hours and escalation rules associated with business hours are suspended during any holidays with which they are affiliated.

[IconDefinition](#)

Represents the icon-related metadata for a custom tab. This object is available in API version 43.0 and later.

[Idea](#)

Represents an idea on which users are allowed to comment and vote, for example, a suggestion for an enhancement to an existing product or process. This object is available in API version 12 and later.

[IdeaComment](#)

Represents a comment that a user has submitted in response to an idea.

[IdeaReputation](#)

Represents a collection of statistics and scores derived from a user's activity within an Ideas zone or internal organization. This object is available in API version 28.0 and later.

[IdeaReputationLevel](#)

Represents a reputation level within an Ideas zone or internal organization and is used by the system to calculate reputation. You can create up to 25 levels per zone or internal organization. This object is available in API version 28.0 and later.

[IdeaTheme](#)

Represents an invitation to zone members to submit ideas that are focused on a specific topic. This object is available in API version 26 and later.

[IdpEventLog](#)

Represents the Identity Provider Event Log. This log records both problems and successes with inbound SAML or OpenID Connect authentication requests from another app provider. It also records outbound SAML responses when Salesforce is acting as an identity provider. This object is available in API version 39.0 and later.

Standard Objects

[IframeWhiteListUrl](#)

Represents a list of trusted external domains that you allow to frame your Embedded Service, Surveys, and Visualforce pages. This object is available in API version 45.0 and later.

[Image](#)

Represents the details of an image. This object is available in API version 47.0 and later.

[Incident](#)

An Incident is any unplanned business interruption that has wide-sweeping impacts and requires an urgent fix. This object contains the details of the incident, documenting the history of the incident from registration to closure. This object is available in API version 53.0 and later.

[Individual](#)

Represents a customer's data privacy and protection preferences. Data privacy records based on the Individual object store your customers' preferences. Data privacy records are associated with related leads, contacts, person accounts, and users. This object is available in API version 42.0 and later.

[IndividualHistory](#)

Represents the history of changes to values in the fields of a data privacy record, based on the Individual object. This object is available in versions 42.0 and later.

[IndividualShare](#)

Represents a list of access levels to a data privacy record along with an explanation of the access level. For example, if you have access to a record because you own it, the `IndividualAccessLevel` is `All` and `RowCause` is `Owner`. This object is available in API version 42.0 and later.

[InternalOrganizationUnit](#)

Represents an organization that an Employee belongs to. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

[Invoice](#)

Represents a financial document describing the total amount a buyer must pay for goods or services provided. This object is available in API version 48.0 and later.

[InvoiceLine](#)

Represents the amount that a buyer must pay for a product, service, or fee. Invoice lines are created based on the amount of an order line. This object is available in API version 48.0 and later.

[JobProfile](#)

Represents a job profile used for shift scheduling. This object is available in API versions 47.0 and later.

[JobProfileQueueGroup](#)

`JobProfileQueueGroup` defines the mapping between `Queue` and `JobProfile`, and configurations for Omni-Channel Planning. This object is available in API version 53.0 and later.

[Knowledge__Feed](#)

Represents the feed for a knowledge article. This object is available in API version 39.0 and later.

[Knowledge__ka](#)

Provides access to the concrete object that represents a Knowledge article, the parent object for article versions. This object is available in API version 39.0 and later.

[Knowledge__kav](#)

Provides access to the concrete object that represents a Knowledge article version. This object is available in API version 39.0 and later.

Standard Objects

[Knowledge__DataCategorySelection](#)

Represents a data category that classifies an article. This object is available in API version 39.0 and later.

[KnowledgeableUser](#)

Represents a user identified as knowledgeable about a specific topic, and ranks them relative to other knowledgeable users. This object is available in API version 31.0 and later.

[KnowledgeArticle](#)

Provides read-only access to an article and the ability to delete the master article. This object is available in API version 19.0 and later.

[KnowledgeArticleVersion](#)

Provides a global view of standard article fields across all types of articles depending on their version. This object is available in API version 18.0 and later.

[KnowledgeArticleVersionHistory](#)

Enables read-only access to the full history of an article. This object is available in API version 25.0 and later.

[KnowledgeArticleViewStat](#)

Provides statistics on the number of views for the specified article across all article types. This object is read-only and available in API version 20.0 and later.

[KnowledgeArticleVoteStat](#)

Provides the weighted rating for the specified article on a scale of 1 to 5 across all article types. This object is read-only and available in API version 20.0 and later.

[LandingPage](#)

Represents a Pardot landing page. A landing page is a web page that a visitor reaches after clicking a link or advertisement. Landing pages can be created in Pardot Classic and synced to Salesforce or created on the Landing Page object in Pardot Lightning App. This object is available in API version 42.0 and later.

[Lead](#)

Represents a prospect or lead.

[LeadCleanInfo](#)

Stores the metadata Data.com Clean uses to determine a lead record's clean status. Helps you automate the cleaning or related processing of lead records.

[LeadDailyMetric](#)

Represents the daily engagement metrics for a lead. This object is available in API version 52.0 and later.

[LeadMonthlyMetric](#)

Represents the monthly engagement metrics for a lead. This object is available in API version 52.0 and later.

[LeadOwnerSharingRule](#)

Represents the rules for sharing a lead with users other than the owner.

[LeadShare](#)

Represents a sharing entry on a Lead.

[LeadStatus](#)

Represents the status of a Lead, such as Open, Qualified, or Converted.

[LeadTag](#)

Associates a word or short phrase with a Lead.

[LearningContent](#)

Represents a Trailhead or Sales Enablement (myTrailhead) module assigned to a user. This object is available in API version 54.0 and later.

Standard Objects

[LegalEntity](#)

Represents the way an organization is structured. An organization can be a single legal entity or it can comprise more than one legal entity. This object is available in API version 48.0 and later.

[LicenseDefinitionCustomPermission \(Developer Preview\)](#)

Represents a licensed custom permission that controls access to a license's features when included in a custom permission set license definition. This object is available in API version 54.0 and later.

[LightningExperienceTheme](#)

Represents information for a theme in Lightning Experience. This object is available in API Version 42.0 and later.

[LightningOnboardingConfig](#)

Represents the feedback provided when users switch from Lightning Experience to Salesforce Classic. Admins can customize the question, how frequently the form appears, and where the feedback is stored in Chatter from the Adoption Assistance page in Lightning Experience Setup. Available in API version 47.0 and later.

[LightningToggleMetrics](#)

Represents users who switched from Lightning Experience back to Salesforce Classic. This object is available in API version 43.0 and later.

[LightningUsageByAppTypeMetrics](#)

Represents number of users on Lightning Experience and Salesforce Mobile. This object is available in API version 43.0 and later.

[LightningUsageByBrowserMetrics](#)

Represents Lightning Experience usage grouped by user's browser. This object is available in API version 43.0 and later.

[LightningUsageByPageMetrics](#)

Represents standard pages users viewed most frequently in Lightning Experience. This object is available in API version 43.0 and later.

[LightningUsageByFlexiPageMetrics](#)

Represents custom pages users viewed most frequently in Lightning Experience. This object is available in API version 43.0 and later.

[LightningExitByPageMetrics](#)

Represents standard pages users switched from Lightning Experience to Salesforce most frequently. This object is available in API version 44.0 and later.

[LinkedArticle](#)

Represents a knowledge article that is attached to a work order, work order line item, or work type. This object is available in API version 37.0 and later.

[LinkedArticleFeed](#)

Represents the comment feed on a linked article. This object is available in API version 39.0 and later.

[LinkedArticleHistory](#)

Represents the history of changes made to tracked fields on a linked article. This object is available in API version 37.0 and later.

[ListEmail](#)

Represents a list email sent from Salesforce, or sent from Pardot and synced to Salesforce. When the list email is sent, the recipients are generated by combining recipients in ListEmailIndividualRecipients and ListEmailRecipientSource. Duplicate and other invalid recipients are removed. The result is the recipients who are sent any given list email. Has a one-to-many relationship with ListEmailRecipientSource and ListEmailIndividualRecipient. This object is available in API version 41.0 and later.

[ListEmailIndividualRecipient](#)

For a list email in Salesforce, represents a recipient. Each record represents a link from a list email to exactly one recipient for that list email. Recipients can be contacts, leads, or campaign members. Has a one-to-many relationship with ListEmail. This object is available in API version 44.0 and later.

Standard Objects

[ListEmailRecipientSource](#)

For a list email in Salesforce, represents the dynamically defined sources of recipient email addresses. Each record represents a link to a single list view or campaign that is examined when the list email is sent. Has a one-to-many relationship with ListEmail. This object is available in API version 41.0 and later.

[ListView](#)

Represents a list view. A list view specifies a set of records for an object, based on specific criteria. This object is available in API version 32.0 and later.

[ListViewChart](#)

Represents a graphical chart that's displayed on Salesforce for Android, iOS, and mobile web list views. The chart aggregates data that is filtered based on the list view that's currently displayed. This object is available in API version 33.0 and later and is accessible by portal users.

[ListViewChartInstance](#)

Retrieves metadata for all standard and custom charts for a given entity in context of a given list view. This object is available in API versions 34.0 and later.

[LiveAgentSession](#)

This object is automatically created for each Chat session and stores information about the session. This object is available in API versions 28.0 and later.

[LiveAgentSessionHistory](#)

This object is automatically created for each Chat session and stores information about changes made to the session. This object is available in API versions 28.0 and later.

[LiveAgentSessionShare](#)

This object is automatically created for each Chat session and stores information about the session. This object is available in API versions 28.0 and later.

[LiveChatBlockingRule](#)

Represents a rule for blocking chat visitors' IP addresses from starting new chats with agents. This object is available in API version 34.0 and later.

[LiveChatObjectAccessConfig](#)

Represents the action you can perform on a specified object by the Chat API. This object is available in API version 53.0 and later.

[LiveChatObjectAccessDefinition](#)

Represents the parent record for one or more LiveChatObjectAccessConfig objects. This object is available in API version 53.0 and later.

[LiveChatButton](#)

Represents a button that allows visitors to request chats with Chat users. This object is available in API version 24.0 and later.

[LiveChatButtonDeployment](#)

Associates an automated chat invitation with a specific deployment. This object is available in API versions 28.0 and later.

[LiveChatButtonSkill](#)

Represents all the skills available to a LiveChatButton except the one currently assigned. To retrieve the skill currently assigned, query LiveChatButton. This object is available in API version 25.0 and later.

[LiveChatDeployment](#)

Represents the general settings for deploying Live Agent on a website. This object is available in API version 24.0 and later.

[LiveChatSensitiveDataRule](#)

Represents a rule for masking or deleting data of a specified pattern. Written as a regular expression (regex). This object is available in API version 35.0 and later.

Standard Objects

[LiveChatTranscript](#)

This object is automatically created for each Live Agent chat session and stores information about the session. This object is available in API version 24.0 and later.

[LiveChatTranscriptEvent](#)

Captures specific events that occur over the lifetime of a chat. This object is available in API version 24.0 and later.

[LiveChatTranscriptShare](#)

Represents a sharing entry on a LiveChatTranscript object. This object is available in API version 24.0 and later.

[LiveChatTranscriptSkill](#)

Represents a join between LiveChatTranscript and Skill. This object is available in API version 25.0 and later.

[LiveChatUserConfig](#)

Represents a setting that controls the console settings for Chat users. This object is available in API version 24.0 and later.

[LiveChatUserConfigProfile](#)

Represents a join between LiveChatUserConfig and Profile. This object is available in API version 24.0 and later.

[LiveChatUserConfigUser](#)

Represents a join between Live Chat User Config and User. This object is available in API version 24.0 and later.

[LiveChatVisitor](#)

Represents a website visitor who has started or tried to start a chat session. This object is available in API version 24.0 and later.

[Location](#)

Represents a warehouse, service vehicle, work site, or other element of the region where your team performs field service work. In API version 49.0 and later, you can associate activities with specific locations. Activities, such as the tasks and events related to a location, appear in the activities timeline when you view the location detail page. Also in API version 49.0 and later, Work.com users can view Employees as a related list on Location records. In API version 51.0 and later, this object is available for Omnichannel Inventory and represents physical locations where inventory is available for fulfilling orders.

[LocationGroup](#)

Represents a group of Omnichannel Inventory locations, providing an aggregate view of inventory availability across those locations. Omnichannel Inventory can create an inventory reservation for an order at the location group level, then assign the reservation to one or more locations in the group as needed. This object is available in API version 51.0 and later.

[LocationGroupAssignment](#)

Represents the assignment of a location to a location group. This object is available in API version 51.0 and later.

[LocationTrustMeasure](#)

Represents the COVID safety protocols that your business follows. For example, enforcement of masks, social distancing, cleanliness, and capacity limits. This object is available in API version 50.0 and later.

[LocWaitlistMsgTemplate](#)

Represents a junction object connecting LocationWaitlist to MessagingTemplate. This object is available in API version 50.0 and later.

[LocationWaitlist](#)

Represents a queue created for a specific location. Multiple queues can be created for a single location. For example, you can have a queue for each sales agent or a standard queue and a queue for vulnerable groups. The specific party of people in a queue is represented by LocationWaitlistedParty. This object is available in API version 50.0 and later.

[LocationWaitlistedParty](#)

Represents a specific party of people waiting in a queue. This object is available in API version 50.0 and later.

[LoginEvent](#)

The documentation has moved to [LoginEvent](#) in the *Platform Events Developer Guide*.

Standard Objects

[LoginGeo](#)

Represents the geographic location of the user's IP address for a login event. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) may vary. This object is available in API version 34.0 and later.

[LoginHistory](#)

Represents the login history for all successful and failed login attempts for organizations and enabled portals. This object is available in API version 21.0 and later.

[LoginIp](#)

Represents a validated IP address. This object is available in version 28.0 and later.

[LogoutEventStream](#)

The documentation has moved to [LogoutEventStream](#) in the *Platform Events Developer Guide*.

[LookedUpFromActivity](#)

This read-only object is displayed as a related list on an activity record (an event or a task); the list contains records that have custom lookup relationships from the activity to another object. This object is not queryable.

[Macro](#)

Represents a macro, which is a set of instructions that tells the system to perform one or more tasks. This object is available in API version 32.0 and later.

[MacroInstruction](#)

Represents an instruction in a macro. An instruction can specify the object that the macro interacts with, the context or publisher that the macro works within, the operation or action that the macro performs, and the target of the macro's actions.

[MacroUsage](#)

Represents macro usage on a record, including which macro was used, who used it, and how they used it. This object is available in API version 47.0 and later.

[MailmergeTemplate](#)

Represents a mail merge template (a Microsoft Word document) used for performing mail merges for your organization.

[MaintenanceAsset](#)

Represents an asset covered by a maintenance plan in field service. Assets can be associated with multiple maintenance plans.

[MaintenancePlan](#)

Represents a preventive maintenance schedule for one or more assets in field service.

[MaintenanceWorkRule](#)

Represents the recurrence pattern for a maintenance record. This object is available in API version 49.0 and later.

[ManagedContentInfo](#)

Allows the creation of relationship to Product using ProductMedia. This object is available in API version 49.0 and later.

[MarketingForm](#)

Represents a Pardot marketing form that has been synced to Salesforce. Use forms on your website and landing pages to collect information about visitors and turn anonymous visitors into identified prospects. This object is available in API version 42.0 and later.

[MarketingLink](#)

Represents a Pardot marketing link record, either a custom redirect or a file, that has been synced to Salesforce. This object is available in API version 42.0 and later.

[MatchingRule](#)

Represents a matching rule that is used to identify duplicate records. This object is available in API version 33.0 and later.

[MatchingRuleItem](#)

Represents criteria used by a matching rule to identify duplicate records. This object is available in API version 33.0 and later.

Standard Objects

[MediaChannel](#)

Defines a web page, a TV program, or a publication. A media channel may contain one to many Ad Spaces, into which Ad Servers can place or serve up ad creatives. This object is available in API version 54.0 and later.

[MediaContentType](#)

Stores details about an event or show that may be broadcast on TV or radio channels. This object is available in API version 54.0 and later.

[MessagingChannel](#)

Represents a communication channel that an end user can use to send a message to an agent. A communication channel can be an SMS number, a Facebook page, or another supported messaging channel. This object is available in API version 45.0 and later.

[MessagingChannelSkill](#)

Junction object that represents an association between MessagingChannel and Skill. This object is available in API version 45.0 and later.

[MessagingConfiguration](#)

Represents the details for a Messaging configuration. This object is available in API version 47.0 and later.

[MessagingDeliveryError](#)

Represents a log of triggered outbound failures to verify when a triggered outbound has failed. This object is available in API version 44.0 and later.

[MessagingEndUser](#)

Represents a single address—such as a phone number or Facebook page—communicating with a single Messaging channel. This object is available in API version 45.0 and later.

[MessagingLink](#)

Represents the link between a Messaging Channel and where it's shared. This object is available in API version 47.0 and later.

[MessagingSession](#)

Represents a session on a Messaging channel. This object is available in API version 47.0 and later.

[MessagingTemplate](#)

Represents a Messaging template used to send pre-formatted messages. This object is available in API version 47.0 and later.

[MetadataPackage](#)

Represents a package that has been developed in the org you're logged in to. Applies to unlocked, unmanaged, first-generation, and second-generation managed packages.

[MetadataPackageVersion](#)

Represents a package version (managed or unmanaged) that has been uploaded from the org you're logged in to.

[Metric](#)

The Metric object represents the components of a goal metric such as its name, metric type, and current value.

[MetricDataLink](#)

The link between the metric and the data source, such as a report.

[MetricsDataFile](#)

Represents a data file containing usage metrics on all installations of a managed package in a Salesforce instance. This object is available in API version 30.0 and later.

[MilestoneType](#)

Represents a milestone (required step in a customer support process). This object is available in API version 18.0 and later.

[MLField](#)

Represents a single field in a data definition. This object is available in API version 50.0 and later.

Standard Objects

[MLIntentUtteranceSuggestion](#)

Represents a customer input, used for training purposes in the feedback loop process of a conversation. Admins can add these inputs to the intent training model. This object is available in API version 51.0 and later.

[MLPredictionDefinition](#)

Represents a prediction definition that specifies details about the prediction. This object is available in API version 50.0 and later.

[MLRecommendationDefinition](#)

For internal use only.

[MobileSecurityPolicy](#)

Enables mobile security policies on the Salesforce mobile app with Enhanced Mobile Security. This object is available in API version 50.0 and later.

[MobileSecurityUserMetric](#)

Represents the metrics for users who have Enhanced Mobile Security policies enforced. This object is available in API version 51.0 and later.

[MobileSettingsAssignment](#)

Represents the assignment of a particular field service mobile settings configuration to a user profile. This object is available in API version 41.0 and later.

[MobSecurityCertPinConfig](#)

Configuration of mobile security certificate pinning on the Salesforce mobile app with Enhanced Mobile Security. This object is available in API version 53.0 and later.

[MobSecurityCertPinEvent](#)

The event of mobile security certificate pinning on the Salesforce mobile app with Enhanced Mobile Security. This object is available in API version 53.0 and later.

[MsgChannelLanguageKeyword](#)

Represents the consent configuration for a Messaging channel. This object is available in API version 48.0 and later.

[MyDomainDiscoverableLogin](#)

Represents configuration settings when the My Domain login page type is Discovery. Login Discovery provides an identity-first login experience, where the login page contains the identifier field only. Based on the identifier entered, a handler determines how to authenticate the user. This object is available in API version 45.0 and later.

[MutingPermissionSet](#)

Represents a set of disabled permissions and is used in conjunction with PermissionSetGroup. This object is available in API version 46.0 and later.

[Name](#)

Non-queryable object that provides information about foreign key traversals when the foreign key has more than one parent.

[NamedCredential](#)

Represents a named credential, which specifies the URL of a callout endpoint and its required authentication parameters in one definition. A named credential can be specified as an endpoint to simplify the setup of authenticated callouts. This object is available in API version 33.0 and later.

[NamespaceRegistry](#)

Represents a namespace that you can link to scratch orgs that were created from your org's Dev Hub. You use the namespace when developing, packaging, and releasing an app. You can't create this object with the API. Use the **Link Namespace** action in the Dev Hub graphical interface to insert a `NamespaceRegistry` record. This object is available in API version 41.0 and later.

Standard Objects

[NavigationLinkSet](#)

Represents the navigation menu in an Experience Cloud site. A navigation menu consists of items that users can click to go to other parts of the site. This object is available in API version 35.0 and later.

[NavigationMenuItem](#)

Represents a single menu item in a NavigationLinkSet. Use this object to create, delete, or update menu items in your Experience Cloud site's navigation menu. This object is available in API version 35.0 and later.

[NavigationMenuItemLocalization](#)

Represents the translated value of a navigation menu item in an Experience Cloud site. This object is available in API version 36.0 and later.

[Network](#)

Represents an Experience Cloud site. Salesforce Experience Cloud lets you create branded spaces for your employees, customers, and partners. You can customize and create experiences, whether they're communities, sites, or portals, to meet your business needs, then transition seamlessly between them. Experience Cloud sites let you share information, records, and files with coworkers and stakeholders all in one place. This object is available in API version 26.0 and later.

[NetworkActivityAudit](#)

Represents an audit trail of moderation actions in Experience Cloud sites. This object is available in API version 30.0 and later.

[NetworkAffinity](#)

Represents a junction object that associates a user profile with a Network object, that is, with an Experience Cloud site. Use NetworkAffinity to assign a default Experience Cloud site to a user profile. This object is available in API version 41.0 and later.

[NetworkDiscoverableLogin](#)

Represents the Login Discoverable page from where customers and partners log in to an Experience Cloud site. Customers and partners are users with an External Identity license or any communities license for Experience Cloud. This object is available in API version 44.0 and later.

[NetworkFeedResponseMetric](#)

Represents an object that stores the date and time values of question posts. It captures information for question creation, answer creation, and when an answer is marked as best answer. This object is available in API version 51.0 and later.

[NetworkMember](#)

Represents a member of an Experience Cloud site. Members can be either users in your company or external users with portal profiles. This object is available in API version 26.0 and later.

[NetworkMemberGroup](#)

Represents a group of members in an Experience Cloud site. Members can be either users in your internal org or external users assigned portal profiles. An administrator adds members to an Experience Cloud site by adding a profile or a permission set, and any user with the profile or permission set becomes a member of the site. This object is available in API version 26.0 and later.

[NetworkModeration](#)

Represents a flag on an item in a community. This object is available in API version 30.0 and later.

[NetworkPageOverride](#)

Represents information about custom pages used to override the default pages in Experience Cloud sites. You can create Experience Builder or Visualforce pages and override the default pages in a site. Using custom pages allows you to create a more personalized experience for your users. This object is available in API version 34.0 and later.

[NetworkSelfRegistration](#)

Represents the account that self-registering Experience Cloud users are associated with by default. Self-registering users in an Experience Cloud site are required to be associated with an account, which the administrator must specify while setting up self-registration for the site. If an account isn't specified, Salesforce creates person accounts (when enabled) for self-registering users. This object is available in API version 34.0 and later.

Standard Objects

[NetworkUserHistoryRecent](#)

Represents an Experience Cloud site user's history of accessed records. This object is available in API version 42.0 and later.

[Note](#)

Represents a note, which is text associated with a custom object or a standard object, such as a Contact, Contract, or Opportunity.

[NoteAndAttachment](#)

This read-only object contains all notes and attachments associated with an object.

[NoteTag](#)

Associates a word or short phrase with a Note.

[OAuthCustomScope](#)

Represents a permission defining the protected data that a connected app can access from an external entity when Salesforce is the OAuth authorization provider.

[OAuthCustomScopeApp](#)

Represents the name of the connected app to which the custom scope is assigned. This object is available in API version 49.0 and later.

[OAuthToken](#)

Represents an OAuth access token for connected app authentication. Use this object to create a user interface for token management. This object is available in API version 32.0 and later.

[ObjectPermissions](#)

Represents the enabled object permissions for the parent PermissionSet. This object is available in API version 24.0 and later.

[ObjectTerritory2AssignmentRule](#)

Represents a territory assignment rule that's associated with an object, such as Account. ObjectTerritory2AssignmentRuleItem can only be created or deleted if the BooleanFilter field on its corresponding ObjectTerritory2AssignmentRule is null. Available only if Enterprise Territory Management has been enabled for your organization.

[ObjectTerritory2AssignmentRuleItem](#)

A single row of selection criteria for an ObjectTerritory2AssignmentRule object. ObjectTerritory2AssignmentRuleItem can only be created or deleted if the BooleanFilter field on its corresponding ObjectTerritory2AssignmentRule object is a null value. Available only if Enterprise Territory Management has been enabled for your organization.

[ObjectTerritory2Association](#)

Represents an association (by assignment) between a territory and an object record, such as an account.

[OmniDataPack](#)

For internal use only.

[OmniDataTransform](#)

For internal use only.

[OmniDataTransformItem](#)

For internal use only.

[OmniESignature](#)

For internal use only.

[OmniInteractionConfig](#)

For internal use only.

[OmniInteractionAccessConfig](#)

For internal use only.

Standard Objects

[OmniProcess](#)

For internal use only.

[OmniProcessCompilation](#)

For internal use only.

[OmniProcessElement](#)

For internal use only.

[OmniProcessTransientData](#)

For internal use only.

[OmniScriptSavedSession](#)

For internal use only.

[OmniSupervisorConfig](#)

Represents the Omni-Channel supervisor configuration for an assigned group of supervisors. This object is available in API version 41.0 and later.

[OmniSupervisorConfigGroup](#)

Represents the group of agents who are visible to the supervisors of an Omni-Channel supervisor configuration. The group, if visible, appears in the Agents tab of Omni Supervisor. This object is available in API version 41.0 and later.

[OmniSupervisorConfigProfile](#)

Represents the supervisor profiles to which an Omni-Channel supervisor configuration applies. User-level configurations override profile-level configurations. This object is available in API version 41.0 and later.

[OmniSupervisorConfigQueue](#)

Represents the queues that are visible to the supervisors of an Omni-Channel supervisor configuration. The queue, if visible, appears in the Queues Backlog and Assigned Work tabs of Omni Supervisor. This object is available in API version 53.0 and later.

[OmniSupervisorConfigSkill](#)

Represents the skills that are visible to the supervisors of an Omni-Channel supervisor configuration. These skills, if visible, appear in the Skills Backlog tab of Omni Supervisor. This object is available in API version 53.0 and later.

[OmniSupervisorConfigUser](#)

Represents the users to which an Omni-Channel supervisor configuration applies. User-level configurations override profile-level configurations. This object is available in API version 41.0 and later.

[OmniUiCard](#)

For internal use only.

[OpenActivity](#)

This read-only object is displayed in a related list of open activities—future events and open tasks—related to an object. It includes activities for all contacts related to the object. OpenActivity fields for phone calls are only available if your organization uses Salesforce CRM Call Center.

[OperatingHours](#)

Represents the hours in which a service territory, service resource, or account is available for field service work in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

[OperatingHoursHistory](#)

Represents the history of changes made to tracked fields on an operating hours record. This object is available in API version 38.0 and later.

Standard Objects

[OperatingHoursHoliday](#)

Represents the day or hours for which a service territory and service resources exclusive to the service territory are unavailable in Salesforce Scheduler. This object is available in API version 54.0 and later.

[Opportunity](#)

Represents an opportunity, which is a sale or pending deal.

[OpportunityCompetitor](#)

Represents a competitor on an Opportunity.

[OpportunityContactRole](#)

Represents the role that a Contact plays on an Opportunity.

[OpportunityContactRoleSuggestionInsight](#)

Represents a suggestion for a new opportunity contact role. Available in API versions 45.0 and later.

[OpportunityFieldHistory](#)

Represents the history of changes to the values in the fields of an opportunity. This object is available in versions 13.0 and later.

[OpportunityHistory](#)

Represents the stage history of an Opportunity.

[OpportunityInsight](#)

Represents an individual insight (deal prediction, follow-up reminder, or key moment) related to an opportunity record.

[OpportunityLineItem](#)

Represents an opportunity line item, which is a member of the list of Product2 products associated with an Opportunity.

[OpportunityLineItemSchedule](#)

Represents information about the quantity, revenue distribution, and delivery dates for a particular OpportunityLineItem.

[OpportunityOwnerSharingRule](#)

Represents a rule for sharing an opportunity with users other than the owner.

[OpportunityPartner](#)

This object represents a partner relationship between an Account and an Opportunity. An OpportunityPartner record is created automatically when a Partner record is created for a partner relationship between an account and an opportunity.

[OpportunityShare](#)

Represents a sharing entry on an Opportunity.

[OpportunitySplit](#)

OpportunitySplit credits one or more opportunity team members with a portion of the opportunity amount. This object is available in API version 16.0 and later for pilot customers, and version 28.0 and later for others.

[OpportunitySplitType](#)

OpportunitySplitType provides unique labels and behavior for each split type. This object is available in API version 28.0 and later.

[OpportunityStage](#)

Represents the stage of an Opportunity in the sales pipeline, such as New Lead, Negotiating, Pending, Closed, and so on.

[OpportunityTag](#)

Associates a word or short phrase with an Opportunity.

[OpportunityTeamMember](#)

Represents a User on the opportunity team of an Opportunity.

[Order](#)

Represents an order associated with a contract or an account.

Standard Objects

[OrderAdjustmentGroup](#)

Group containing a set of adjustments applied to an order. This object is available in API version 48.0 and later.

[OrderAdjustmentGroupSummary](#)

Represents the current properties and state of a group of related price adjustments. Associated with a set of [OrderItemAdjustmentLineSummaries](#) that apply to [OrderItemSummaries](#) belonging to one [OrderSummary](#). Corresponds to one or more order adjustment group objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

[OrderDeliveryGroup](#)

A group of order items that share a delivery method and address. The delivery method and address are used during the fulfillment process, such as shipping as a gift, downloading, picking up in store, or shipping to a standard address. This object is available in API version 48.0 and later.

[OrderDeliveryGroupSummary](#)

Represents the current properties and state of a group of [OrderItemSummaries](#), belonging to one [OrderSummary](#), to be fulfilled using the same delivery method and delivered to the same address. A single shipment can include them all, but that isn't guaranteed. Corresponds to one or more order delivery group objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

[OrderDeliveryMethod](#)

Shows the customizations and options that a buyer selected for their delivery method. This object is available in API version 48.0 and later.

[OrderHistory](#)

Represents historical information about changes that have been made to the standard fields of the associated order, or to any custom fields with history tracking enabled.

[OrderItem](#)

Represents an order product that your organization sells.

[OrderItemAdjustmentLineItem](#)

An adjustment that has been made to an order item. This object is available in API version 48.0 and later.

[OrderItemAdjustmentLineSummary](#)

Represents the current properties and state of price adjustments on an [OrderItemSummary](#). Corresponds to one or more order item adjustment line item objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

[OrderItemSummary](#)

Represents the current properties and state of a product or charge on an [OrderSummary](#). Corresponds to one or more order item objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

[OrderItemSummaryChange](#)

Represents a change to an [OrderItemSummary](#), usually a reduction in quantity due to a cancel or return. Corresponds to a change order item. This object is available in API version 48.0 and later.

[OrderItemTaxLineItem](#)

The tax amount that has been applied to an order item. This object is available in API version 48.0 and later.

[OrderItemTaxLineItemSummary](#)

Represents the current tax on an [OrderItemSummary](#) or [OrderItemAdjustmentLineSummary](#). Corresponds to one or more order item tax line items, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

Standard Objects

[OrderItemType](#)

Shows whether the order product is a product line or charge line. This object is available in API version 48.0 and later.

[OrderOwnerSharingRule](#)

Represents a rule which determines order sharing access for the order's owners.

[OrderPaymentSummary](#)

Represents the current properties and state of payments using a single payment method that are applied to one OrderSummary. This object is available in API version 48.0 and later.

[OrderShare](#)

Represents a sharing entry on an Order. This object is available in API version 48.0 and later.

[OrderStatus](#)

Represents the status of the order entity. This object is available in API version 48.0 and later.

[OrderSummary](#)

Represents the current properties and state of an order. Corresponds to one or more order objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

[OrderSummaryRoutingSchedule](#)

Represents an attempt to route an order summary to one or more inventory locations for fulfillment. You can use it to schedule future attempts and to record completed attempts. This object is available in API version 51.0 and later.

[Organization](#)

Represents key configuration information for an organization.

[OrgDeleteRequest](#)

Represents a request to delete a developer edition (DE) org. This object is available in API version 42.0 and later. It is available only in Developer and Database.com editions.

[OrgWideEmailAddress](#)

Represents an organization-wide email address for user profiles.

[OutOfOffice](#)

Represents a user-set value on a profile that shows when the user intends to be out of the office. This object is available in API version 41.0 and later.

[OutgoingEmail](#)

For internal use only.

[OutgoingEmailRelation](#)

For internal use only.

[OwnedContentDocument](#)

Represents a file owned by a user. This object is available in version 30.0 and later.

[OwnerChangeOptionInfo](#)

Represents default and optional actions that can be performed when a record's owner is changed. Available in API version 35.0 and later, but to query for change owner metadata, use the OwnerChangeOptionInfo object in Tooling API instead. For more information, see [OwnerChangeOptionInfo](#) in the Tooling API.

[PackageLicense](#)

Represents a license for an installed managed package. This object is available in API version 31.0 and later.

[PackagePushError](#)

Represents an error encountered during a push request. The number of PackagePushError records created depends on the number of push jobs in the request that result in an error.

Standard Objects

[PackagePushJob](#)

Represents an individual push job for upgrading a package in an org from one version to another version. There can be multiple push jobs created for one push request. For example, if you want to upgrade five orgs as part of one push, you have one PackagePushRequest record and five PackagePushJob records.

[PackagePushRequest](#)

Represents the push request for upgrading a package in one or many orgs from one version to another version.

[PackageSubscriber](#)

Represents an installation of a package in an org. This object contains installation information for managed or unlocked packages developed in the org you're logged in to.

[Partner](#)

Represents a partner relationship between two Account records or between an Opportunity record and an Account record.

[PartnerFundAllocation](#)

Represents allocated funds from a partner marketing budget for channel partners. This object is available in API version 41.0 and later.

[PartnerFundClaim](#)

Represents a claim of funds from the partner marketing budget by a channel partner. This object is available in API version 41.0 and later.

[PartnerFundRequest](#)

Represents a request for funds from the partner marketing budget by a channel partner. This object is available in API version 41.0 and later.

[PartnerMarketingBudget](#)

Represents a budget that provides funds to channel partners for selling and marketing products and services. This object is available in API version 41.0 and later.

[PartnerNetworkConnection](#)

Represents a Salesforce to Salesforce connection between Salesforce organizations.

[PartnerNetworkRecordConnection](#)

Represents a record shared between Salesforce organizations using Salesforce to Salesforce.

[PartnerNetworkSyncLog](#)

Represents the Org Sync Log tab in Salesforce, where Salesforce administrators can track the replication of record inserts and updates being performed in Organization Sync. The Connection Detail page for the replication connection also displays the Org Sync Log's twenty most recent entries, and provides a link to the log.

[PartnerRole](#)

Represents a role for an account Partner, such as consultant, supplier, and so on.

[PartyConsent](#)

Represents consent preferences for an individual. This object is available in API version 48.0 and later.

[Payment](#)

Represents a single event where the customer creates a payment. For credit cards, this is a payment capture or payment sale, which won't show up in the end user's credit card statement. This object is available in API version 48.0 and later.

[PaymentAuthAdjustment](#)

Shows information about an adjustment made to an authorized transaction. This object is available in API version 51.0 and later.

Standard Objects

[PaymentAuthorization](#)

Represents a single payment authorization event where users can capture or reverse a payment against a reserve of funds. This object is available in API version 48.0 and later.

[PaymentGateway](#)

Platform entity that represents the connection to the external payment gateway. This object is available in API version 48.0 and later.

[PaymentGatewayLog](#)

Stores information exchanged between the Salesforce payments platform and external payment gateways. Gateway logs can also record payloads from external payment entities. This object is available in API version 48.0 and later.

[PaymentGatewayProvider](#)

Setup entity for payment gateways. Defines the connection to a payment gateway Apex adapter. This object is available in API version 48.0 and later.

[PaymentGroup](#)

Top-level object that groups of all the payment transactions that have been processed an order or contract. PaymentGroup is a standalone object, so it isn't required for users to execute payment transactions (authorizations, captures, refunds, and sales). This object is available in API version 48.0 and later.

[PaymentLineInvoice](#)

Represents a payment allocated to or unallocated from an invoice. This object is available in API version 48.0 and later.

[PaymentMethod](#)

The method that a buyer uses to compensate the seller of a good or service. Common payment methods include cash, checks, credit or debit cards, money orders, bank transfers, and online payment services. This object is available in API version 48.0 and later.

[PaymentRequest](#)

Represents a financial compensation request for goods or services provided by a third party. This object is available in API version 54.0 and later.

[PaymentRequestLine](#)

Represents the line item details of the financial compensation request. This object is available in API version 54.0 and later.

[PendingServiceRouting](#)

Represents a work assignment that's waiting to be routed. This object is available in API version 40.0 and later.

[PendingServiceRoutingInteractionInfo](#)

Represents PendingServiceRouting interaction information that's used when work is routed to an agent. For a screen pop, it specifies which records to open when work is routed to an agent from a specific channel. PendingServiceRoutingInteractionInfo is read-only. This object is available in API version 53.0 and later.

[Period](#)

Represents a fiscal period defined in FiscalYearSettings.

[PermissionSet](#)

Represents a set of permissions that's used to grant more access to one or more users without changing their profile or reassigning profiles. This object is available in API version 22.0 and later.

[PermissionSetAssignment](#)

Represents the association between a User and a PermissionSet. This object is available in API version 22.0 and later.

[PermissionSetGroup](#)

Represents a group of permission sets and the permissions within them. Use permission set groups to organize permissions based on job functions or tasks. Then, you can package the groups as needed. This object is available in API version 45.0 and later.

Standard Objects

[PermissionSetGroupComponent](#)

A junction object that relates the [PermissionSetGroup](#) and [PermissionSet](#) objects via their respective IDs; enables permission set group recalculation to determine the aggregated permissions for the group. This object is available in API version 45.0 and later.

[PermissionSetLicense](#)

Represents a license that's used to enable one or more users to receive a specified permission without changing their profile or reassigning profiles. You can use permission set licenses to grant access, but not to deny access. This object is available in API version 29.0 and later.

[PermissionSetLicenseAssign](#)

Represents the association between a [User](#) and a [PermissionSetLicense](#). This object is available in API version 29.0 and later.

[PermissionSetLicenseDefinition \(Developer Preview\)](#)

Represents the definition of a custom permission set license, which entitles specified features in a package. This object is available in API version 54.0 and later.

[PermissionSetTabSetting](#)

Represents a permission set tab setting. Requires the [View Setup](#) permission. Use this object to query all tab settings of the permission set. This object is available in API version 45.0 and later.

[PersonalizationTargetInfo](#)

Represents a target for an audience. This object is available in API version 47.0 and later.

[PersonTraining](#)

Represents an assignment of a learning module in Workforce Engagement. This object is available in API version 54.0 and later.

[PicklistValueInfo](#)

Represents the active picklist values for a given picklist field. This object is available in API version 40.0 and later.

[PipelineInspectionListView](#)

Represents a pipeline view or saved filter. A pipeline view specifies a set of opportunity records, based on specific criteria. This object is available in API version 53.0 and later.

[PlatformAction](#)

[PlatformAction](#) is a virtual read-only object. It enables you to query for actions displayed in the UI, given a user, a context, device format, and a record ID. Examples include standard and custom buttons, quick actions, and productivity actions.

[PlatformEventUsageMetric](#)

Contains usage data for event publishing and CometD-client delivery. Usage data is available for the last 24 hours, ending at the last hour, and for historical daily usage. [PlatformEventUsageMetric](#) contains separate usage metrics for platform events and change data capture events. This object is available in API version 50.0 and later.

[PlatformStatusAlertEvent](#)

The documentation has moved to [PlatformStatusAlertEvent](#) in the *Platform Events Developer Guide*.

[PortalDelegablePermissionSet](#)

[PortalDelegablePermissionSet](#) is a base platform object used to store permission sets that can be assigned by a delegated portal/external user admin (DPUA) to portal users. This object is available in API version 47.0 and later.

[PresenceConfigDeclineReason](#)

Represents the settings for a decline reason that a presence user provides when declining work. This object is available in API version 37.0 and later.

[PresenceDeclineReason](#)

Represents an Omni-Channel decline reason that agents can select when declining work requests. This object is available in API version 37.0 and later.

Standard Objects

[PresenceUserConfig](#)

Represents a configuration that determines a presence user's settings. This object is available in API version 32.0 and later.

[PresenceUserConfigProfile](#)

Represents a configuration that determines the settings that are assigned to presence users who are assigned to a specific profile. User-level configurations override profile-level configurations. This object is available in API version 32.0 and later.

[PresenceUserConfigUser](#)

Represents a configuration that determines the settings that are assigned to a presence user. These user-level configurations override profile-level configurations. This object is available in API version 32.0 and later.

[PriceAdjustmentSchedule](#)

Represents a series of tiered discounts based on the number of items purchased. This object is available in API version 47.0 and later.

[PriceAdjustmentTier](#)

Represents a discount tier in a price adjustment schedule. This object is available in API version 47.0 and later.

[Pricebook2](#)

Represents a price book that contains the list of products that your org sells.

[Pricebook2History](#)

Represents historical information about changes that have been made to the standard fields of the associated Pricebook2, or to any custom fields with history tracking enabled. This object is available in API version 54.0 and later.

[PricebookEntry](#)

Represents a product entry (an association between a Pricebook2 and Product2) in a price book.

[PricebookEntryAdjustment](#)

Read-only junction object created when you associate a price adjustment schedule with a price book entry. This object is available in API version 47.0 and later.

[PrivacyRequest](#)

See details and monitor the status of Data Subject Access Requests made in Privacy Center. This object is available in API version 54.0 and later.

[Problem](#)

Problems represent the root cause data of one or more incidents. This object contains all the details of a problem, documenting the history of the problem from detection to closure. This object is available in API version 53.0 and later.

[ProcessDefinition](#)

Represents the definition of a single approval process.

[ProcessException](#)

Represents a processing failure on an order summary. A separate process is required to resolve the failure that caused the process exception before order summary processing can continue. This object is available in API version 50.0 and later.

[ProcessInstance](#)

Represents an instance of a single, end-to-end approval process. Use this and the node, step, and workitem process instance objects to create approval history reports.

[ProcessInstanceHistory](#)

This read-only object shows all steps and pending approval requests associated with an approval process (ProcessInstance).

[ProcessInstanceStep](#)

Represents one work item in an approval process (ProcessInstance).

Standard Objects

[ProcessInstanceNode](#)

Represents a step in an instance of an approval process. Compare to [ProcessNode](#), which describes the step in a process definition. Use this object to retrieve approval history.

[ProcessInstanceWorkitem](#)

Represents a user's pending approval request.

[ProcessNode](#)

Describes a step in a process definition. Compare to [ProcessInstanceNode](#), which describes the step in a running process.

[ProducerCommission](#)

Represents a producer's commission for an insurance policy. The commission can be calculated from the commissionable transactions or can be populated from an external system. This object is available in API version 51.0 and later.

[Product2](#)

Represents a product that your org sells.

[Product2DataTranslation](#)

Represents the translated values of the data stored within a [Product2](#) record's fields. This object is available in API version 45.0 and later.

[ProductAttribute](#)

Represents the attributes that can be associated with a product. This object is available in API version 50.0 and later.

[ProductAttributeSet](#)

Represents a group of attributes that can be associated with a product. This object is available in API version 50.0 and later.

[ProductAttributeSetItem](#)

Represents a set of attributes that can be associated with a product. This object is available in API version 50.0 and later.

[ProductAttributeSetProduct](#)

Represents the product associated with a set of attributes. This object is available in API version 50.0 and later.

[ProductCategory](#)

Represents the category that products are organized in. This object is available in API version 49.0 and later.

[ProductCategoryDataTranslation](#)

Represents the translated values for the data stored within a [ProductCategory](#) record's fields. This object is available in API version 46.0 and later.

[ProductConsumed](#)

Represents an item from your inventory that was used to complete a work order or work order line item in field service.

[ProductEntitlementTemplate](#)

Represents predefined terms of customer support (Entitlement) that users can add to products ([Product2](#)).

[ProductItem](#)

Represents the stock of a particular product at a particular location in field service, such as all bolts stored in your main warehouse.

[ProductItemTransaction](#)

Represents an action taken on a product item in field service. Product item transactions are auto-generated records that help you track when a product item is replenished, consumed, or adjusted.

[ProductMedia](#)

Represents the rich media, including images and attachments, that can be added to products. This object is available in API version 49.0 and later.

Standard Objects

[ProductRequest](#)

Represents an order for a part or parts in field service.

[ProductRequestLineItem](#)

Represents a request for a part in field service. Product request line items are components of product requests.

[ProductRequired](#)

Represents a product that is needed to complete a work order or work order line item in field service.

[ProductServiceCampaign](#)

Represents a set of activities to be performed on a product service campaign asset, such as a product recall for safety issues or product defects. This object is available in API version 51.0 and later.

[ProductServiceCampaignItem](#)

Represents a product service campaign's asset. This object is available in API version 51.0 and later.

[ProductServiceCampaignItemStatus](#)

Represents a status for a product service campaign item in field service. This object is available in API version 51.0 and later.

[ProductServiceCampaignStatus](#)

Represents a status for a product service campaign in field service. This object is available in API version 51.0 and later.

[ProductTransfer](#)

Represents the transfer of inventory between locations in field service.

[ProductWarrantyTerm](#)

Defines the relationship between a product or product family and warranty term. This object is available in API version 50.0 and later.

[Profile](#)

Represents a profile, which defines a set of permissions to perform different operations. Operations can include creating a custom profile or querying, adding, updating, or deleting information.

[ProfileSkill](#)

Represents a profile skill, which describes a user's professional knowledge. This is a global record for the organization, and users are associated through the ProfileSkillUser object.

[ProfileSkillEndorsement](#)

Represents a detail relationship of ProfileSkillUser. An endorsement of a profile skill shows approval and support of another user's publicly declared skill.

[ProfileSkillShare](#)

Represents a sharing entry on a ProfileSkill.

[ProfileSkillUser](#)

Represents a detail relationship of User. The object connects profile skills with users.

[Promotion](#)

Represents a promotion for B2B stores. This object is available in API version 52.0 and later.

[PromotionMarketSegment](#)

Represents a market segment within B2B Commerce that promotions can be assigned to. This object is available in API version 52.0 and later.

[PromotionQualifier](#)

Represents the product, product category, or order that you want to target with your promotion qualifier in B2B Commerce. This object is available in API version 52.0 and later.

Standard Objects

[PromotionSegment](#)

Represents a promotion segment, which you can assign to different stores or buyer groups, allowing them to access the promotion. This object is available in API version 52.0 and later.

[PromotionSegmentBuyerGroup](#)

Represents a promotion segment, associated with a buyer group, and used for B2B Commerce. This object is available in API version 52.0 and later.

[PromotionSegmentSalesStore](#)

Represents a promotion segment, associated with a store, and used for B2B Commerce. This object is available in API version 52.0 and later.

[PromotionTarget](#)

Represents the product, product category, or order that you want to target with your promotion in B2B Commerce. This object is available in API version 52.0 and later.

[Prompt](#)

Represents record details about an in-app guidance prompt or walkthrough. Available in API version 46.0 and later.

[PromptAction](#)

Represents how the user interacted with the in-app guidance prompt or walkthrough. Available in API version 46.0 and later.

[PromptError](#)

Represents the error or warning associated with the PromptAction. Available in API version 52.0 and later.

[PromptActionOwnerSharingRule](#)

Represents a rule which determines `PromptAction` sharing access for the owners. Available in API version 46.0 and later.

[PromptActionShare](#)

Represents a sharing entry on a prompt action record. Available in API version 46.0 and later.

[PromptLocalization](#)

Represents the translated value of a label for record details about in-app guidance when the Translation Workbench is enabled for your org. Available in API version 48.0 and later.

[PromptVersion](#)

Represents an in-app guidance prompt or walkthrough. Available in API version 46.0 and later.

[PromptVersionLocalization](#)

Represents the translated value of a label for-app guidance when the Translation Workbench is enabled for your org. Available in API version 48.0 and later.

[PushTopic](#)

Represents a query that is the basis for notifying Streaming API clients of changes to records in an org. This object is available in API version 21.0 and later.

[QueueRoutingConfig](#)

Represents the settings that determine how work items are routed to agents. This object is available in API version 32.0 and later.

[Question](#)

Represents a question in a zone that users can view and reply to.

[QuestionDataCategorySelection](#)

A data category selection represents a data category that classifies a question.

[QuestionReportAbuse](#)

Represents a user-reported abuse on a Question in a Chatter Answers zone. This object is available in API version 24.0 and later.

Standard Objects

[QuestionSubscription](#)

Represents a subscription for a user following a Question. This object is available in API version 24.0 and later.

[QueueSubject](#)

Represents the mapping between a queue Group and the sObject types associated with the queue, including custom objects.

[QuickText](#)

This object stores a snippet of text that allows users to send a quick response to a customer. Use quick text to create greetings, answers to common questions, short notes, and more. This object is available in API version 24.0 and later.

[QuickTextUsage](#)

Represents the usage of quick text on a record, including which quick text was used, who used it, and how they used it. This object is available in API version 47.0 and later.

[Quote](#)

The Quote object represents a quote, which is a record showing proposed prices for products and services. Available in API version 18.0 and later.

[QuoteDocument](#)

Represents a quote in document format. Available in API version 18.0 and later.

[QuoteLineItem](#)

The QuoteLineItem object represents a quote line item, which is a member of the list of Product2 products associated with a Quote, along with other information about those line items on that quote. Available in API version 18.0 and later.

[RecentFieldChange](#)

Use this virtual object to see how an opportunity has changed in the past seven days. Learn the previous value of a field, who made the change, and when the change was made. This object is available in API version 52.0 and later.

[RecentlyViewed](#)

Represents records or list views that the current user has recently viewed or referenced (by viewing a related record). List views are available in API version 29.0 and later.

[Recommendation](#)

Represents the recommendations surfaced as offers and actions for Einstein Next Best Action. This object is available in API version 45.0 and later.

[RecordAction](#)

Represents a relationship between a record and an action, such as a flow. Create a RecordAction for every action that you want to associate with a particular record. Available in API version 42.0 and later.

[RecordActionHistory](#)

Represents the lifecycle of a RecordAction as it goes through different states. Available in API version 44.0 and later.

[RecordsetFilterCriteria](#)

Represents a set of filters that can be used to match service appointments or assets based on your criteria fields. For example, you can create recordset filter criteria so that only service appointments that satisfy the filter criteria are matched to the filtered shifts, and likewise only maintenance work rules that satisfy your criteria are matched to assets. This object is available in API version 50.0 and later. Assets and maintenance work rules are available in API version 52.0 and later.

[RecordsetFilterCriteriaRule](#)

Represents a rule using fields from the designated source object to create filters on the filtered, or target, object. RecordsetFilterCriteriaRule is associated with the RecordsetFilterCriteria object. This object is available in API version 50.0 and later.

[RecordType](#)

Represents a record type.

Standard Objects

[RecordTypeLocalization](#)

Represents the translated value of a label for a record type when the Translation Workbench is enabled for your organization.

[RecordVisibility \(Pilot\)](#)

Represents the visibility attributes that determine a record's read access. This object is read only and is available in API version 46.0 and later.

[RedirectWhitelistUrl](#)

Represents a trusted URL that users can navigate to without being shown a warning message. This object is available in API version 48.0 and later.

[Refund](#)

Represents a refund made against a payment. This object is available in API version 48.0 and later.

[RefundLinePayment](#)

A refund line that has been applied to a payment. This object is available in API version 48.0 and later.

[RegisteredExternalService](#)

Represents a registered external service used for checkout integrations by data integrators. This object is available in API version 49.0 and later.

[RemoteKeyCalloutEvent](#)

The documentation has moved to [RemoteKeyCalloutEvent](#) in the *Platform Events Developer Guide*.

[Reply](#)

Represents a reply that a user has submitted to a question in an answers zone.

[ReplyReportAbuse](#)

Represents a user-reported abuse on a Reply in a Chatter Answers zone. This object is available in API version 24.0 and later.

[ReplyText](#)

A text reply generated by Einstein Reply Recommendations that is based on closed chat transcripts. Admins review replies and publish them to quick text, editing them as needed. Einstein recommends relevant published replies to support agents in the Lightning Service Console, and agents can insert replies into chats or messaging sessions. This object is available in API version 49.0 and later.

[Report](#)

Represents a report, a set of data that meets certain criteria, displayed in an organized way. Access is read-only. This object is available in API version 20.0 and later.

[ReportTag](#)

Associates a word or short phrase with a Report. This object is available in API version 20.0 and later.

[ReputationLevel](#)

Represents a reputation level defined for an Experience Cloud site. This object is available in API version 32.0 and later.

[ReputationLevelLocalization](#)

Represents the translated value of a reputation level. Reputation level localization only applies for reputation levels in Experience Cloud sites. This object is available in API version 35.0 and later.

[ReputationPointsRule](#)

Represents the reputation point rules for an Experience Cloud site. Each rule specifies an action that members can earn points from and the points associated with those actions in a particular site. This object is available in API version 32.0 and later.

[ResourceAbsence](#)

Represents a time period in which a service resource is unavailable to work in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

Standard Objects

[ResourcePreference](#)

Represents an account's preference for a specified service resource on field service work.

[ReturnOrder](#)

Represents the return or repair of inventory or products in Field Service, or the return of order products in Order Management. This object is available in API version 42.0 and later.

[ReturnOrderItemAdjustment](#)

Represents a price adjustment on a return order line item. This object is available in API version 50.0 and later.

[ReturnOrderItemTax](#)

Represents the tax on a return order line item or return order item adjustment. This object is available in API version 50.0 and later.

[ReturnOrderLineItem](#)

Represents a specific product that is returned or repaired as part of a return order in Field service, or a specific order item that is returned as part of a return order in Order Management. This object is available in API version 42.0 and later.

[ReturnOrderOwnerSharingRule](#)

Represents the rules for sharing a return order with user records other than the owner or anyone above the owner in the role hierarchy. This object is available in API version 42.0 and later.

[RuleTerritory2Association](#)

Represents a record-assignment rule and its association to an object, such as Account. Available only if Enterprise Territory Management has been enabled for your organization.

[SalesAIScoreCycle](#)

Represents the cycle type and ID used to score records. This object is available in API version 47.0 and later.

[SalesAIScoreModelFactor](#)

Represents the factors that Sales Cloud Einstein uses to build a scoring model. Scoring models are used by features, such as Opportunity Scoring, to score individual records. This object is available in API version 47.0 and later.

[SalesChannel](#)

Represents the origin of an order. For example, a web storefront, physical store, marketplace, or mobile app. If you integrate Salesforce Order Management with Salesforce B2C Commerce, set up a SalesChannel corresponding to each Site in your B2C Commerce implementation. This object is available in API version 48.0 and later.

[SalesStoreCatalog](#)

Represents the catalog associated with a store. This object is available in API version 49.0 and later.

[SalesWorkQueueSettings](#)

Represents settings used to customize work queue options for third-party scoring. Third-party scoring enables custom number fields on person accounts, contacts, and leads. You must be a High Velocity Sales customer to update this object. Previously, you could only use the Einstein Intelligence Score for third-party scoring. Available starting in Version 47.0.

[SamlSsoConfig](#)

Represents a SAML Single Sign-On configuration. This object is available in API version 32.0 and later.

[SchedulingAdherenceDetail](#)

Represents the breakdown of daily shift adherence data by agent status. This object is available in API version 54.0 and later.

[SchedulingAdherenceSummary](#)

Represents daily shift adherence data for a service resource in a service territory and job profile on a specific date. This object is available in API version 54.0 and later.

[SchedulingConstraint](#)

Represents the scheduling constraints of each service resource. This object is available in API version 50.0 and later.

Standard Objects

[SchedulingObjective](#)

Represents business goals that the scheduling tools consider. This object is available in API version 53.0 and later.

[SchedulingRule](#)

Represents scheduling rules that are hard constraints in the scheduling logic engine. This object is available in API version 52.0 and later.

[SchedulingRuleParameter](#)

Represents scheduling rule parameters associated with a scheduling rule. This object is available in API version 52.0 and later.

[Scontrol](#)

A custom s-control, which is custom content that is hosted by the system but executed by the client application.

[ScontrolLocalization](#)

The translated value of the field label for an s-control.

[Scorecard](#)

Use scorecards to measure partner performance and establish benchmarks for channel programs within Experience Cloud. Display any report summary results that your channel account manager or executive team wants to see. This object is available in API version 40.0 and later.

[ScorecardAssociation](#)

Represents a connection between a specific scorecard and the associated account, channel program, or channel program level. This object is available in API version 41.0 and later.

[ScorecardMetric](#)

Stores information about a Salesforce report that is run and summarized to get a single value. The stored value is added as a metric to the related Scorecard object. This object is available in API version 40.0 and later.

[ScratchOrgInfo](#)

Represents a scratch org and its audit log. Use this object to create a scratch org and keep a log of its creation and deletion. This object is available in API version 41.0 and later.

[SearchPromotionRule](#)

Represents a promoted search term, which is one or more keywords that you associate with a Salesforce Knowledge article. When a user's search query includes these keywords, the associated article is returned first in search results. This object is available in API version 31.0 and later.

[SecurityCustomBaseline](#)

Provides the ability to read, create, and delete user-defined custom security baselines, which define an org's security standards. This object is available in API version 39.0 and later.

[SelfServiceUser](#)

Represents a Contact who has been enabled to use your organization's Self-Service portal, where he or she can obtain online support.

[Seller](#)

Represents the seller role of an individual with respect to a particular company or organization. This object is available in API version 53.0 and later.

[ServiceAppointment](#)

Represents an appointment to complete work for a customer in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

[ServiceAppointmentStatus](#)

Represents a possible status of a service appointment in field service.

Standard Objects

[ServiceChannel](#)

Represents a channel of work items that are received from your organization—for example, cases, chats, or leads. This object is available in API version 32.0 and later.

[ServiceChannelFieldPriority](#)

Represents a secondary routing priority field-value mapping. This object is available in API version 47.0 and later.

[ServiceChannelStatus](#)

Represents the status that's associated with a specific service channel. This object is available in API version 32.0 and later.

[ServiceChannelStatusField](#)

Represents the values that you use to indicate completed and in-progress work item status for the status field in the Status-Based Capacity routing model. This object is available in API version 49.0 and later.

[ServiceContract](#)

Represents a customer support contract (business agreement). This object is available in API version 18.0 and later.

[ServiceContractOwnerSharingRule](#)

Represents the rules for sharing a ServiceContract (customer service agreement) with users other than the owner. This object is available in API version 18.0 and later.

[ServiceCrew](#)

Represents a group of service resources who can be assigned to service appointments as a unit.

[ServiceCrewMember](#)

Represents a technician service resource that belongs to a service crew.

[ServiceCrewOwnerSharingRule](#)

Represents the rules for sharing a service crew with user records other than the owner or anyone above the owner in the role hierarchy.

[ServicePresenceStatus](#)

Represents a presence status that can be assigned to a service channel. This object is available in API version 32.0 and later.

[ServiceReport](#)

Represents a report that summarizes a work order, work order line item, or service appointment.

[ServiceReportLayout](#)

Represents a service report template in field service.

[ServiceResource](#)

Represents a service technician or service crew in field service in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

[ServiceResourceCapacity](#)

Represents the maximum number of scheduled hours or number of service appointments that a capacity-based service resource can complete within a specific time period. This object is available in API version 38.0 and later.

[ServiceResourceCapacityHistory](#)

Represents the history of changes made to tracked fields on a service resource capacity record. This object is available in API version 38.0 and later.

[ServiceResourceOwnerSharingRule](#)

Represents the rules for sharing a service resource with user records other than the owner or anyone above the owner in the role hierarchy. This object is available in API version 38.0 and later.

Standard Objects

[ServiceResourcePreference](#)

Represents the service resource scheduling preferences that are considered as a business objective in the scheduling logic engine. This object is available in API version 52.0 and later.

[ServiceResourceSkill](#)

Represents a skill that a service resource possesses in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

[ServiceSetupProvisioning](#)

Represents a task completed by the Service Setup Assistant. This object is available in API version 52.0 and later.

[ServiceTerritory](#)

Represents a geographic or functional region in which field service work can be performed in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

[ServiceTerritoryLocation](#)

Represents a location associated with a particular service territory in field service.

[ServiceTerritoryMember](#)

Represents a service resource who can be assigned to service appointments in a service territory in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

[ServiceTerritoryWorkType](#)

Represents the relationship between a ServiceTerritory object and a WorkType object for Salesforce Scheduler appointments. This object is available in API version 45.0 and later.

[SessionPermSetActivation](#)

The SessionPermSetActivation object represents a permission set assignment activated during an individual user session. When a SessionPermSetActivation object is inserted into a permission set, an activation event fires, allowing the permission settings to apply to the user's specific session. This object is available in API versions 37.0 and later.

[SetupAuditTrail](#)

Represents changes you or other admins made in your org's Setup area for at least the last 180 days. This object is available in API version 15.0 and later.

[SetupEntityAccess](#)

Represents the enabled setup entity access settings (such as for Apex classes) for the parent PermissionSet. This object is available in API version 25.0 and later.

[ShapeRepresentation](#)

Contains information about the shape of an org. The shape of an org includes features, settings, licenses, and limits information. You can easily create scratch orgs based on a source org's shape. This object is available in API version 50.0 and later.

[SharingRecordCollection](#)

Represents a collection of records. This object is available in API version 51.0 and later.

[SharingRecordCollectionItem](#)

Represents a single record in a collection of records. This object is available in API version 51.0 and later.

[SharingRecordCollectionMember](#)

Represents a user with access to a collection of records. This object is available in API version 51.0 and later.

[Shift](#)

Represents a shift for service resource scheduling. Available in API versions 46.0 and later.

[ShiftHistory](#)

Represents the history of changes made to tracked fields on a time sheet. Available in API versions 46.0 and later.

Standard Objects

[ShiftOwnerSharingRule](#)

Represents the rules for sharing a shift with user records other than the owner or anyone above the owner in the role hierarchy. Available in API versions 46.0 and later.

[ShiftPattern](#)

Represents a pattern of templates for creating shifts. This object is available in API version 51.0 and later.

[ShiftPatternEntry](#)

ShiftPatternEntry links a shift template to a shift pattern. This object is available in API version 51.0 and later.

[ShiftShare](#)

Represents a sharing entry on a field service shift. Available in API versions 46.0 and later.

[ShiftStatus](#)

Represents a shift, such as Tentative, Published, or Confirmed. Available in API versions 46.0 and later.

[ShiftTemplate](#)

Represents a template for creating shifts. This object is available in API version 51.0 and later.

[Shipment](#)

Represents the transport of inventory in field service or a shipment of order items in Order Management.

[ShipmentItem](#)

Represents an order item included in a shipment. This object is available in API version 51.0 and later.

[SignupRequest](#)

Represents a request for a new sign-up. This object is available in API version 27.0 and later.

[Site](#)

Represents a public website that is integrated with an org. This object is available in API version 16.0 and later.

[SiteDetail](#)

Represents the details of a Salesforce site or Experience Cloud site. Available in API Version 38.0 and later.

[SiteDomain](#)

SiteDomain is a read-only object, and a one-to-many replacement for the Site.TopLevelDomain field. This object is available in API version 21.0, and has been deprecated as of API version 26.0. In API version 26.0 and later, use the [Domain](#) and [DomainSite](#) objects instead.

[SiteHistory](#)

Represents the history of changes to the values in the fields of a site. This object is generally available in API version 18.0 and later.

[SiteframeWhitelistUrl](#)

Represents a list of external domains that you allow to frame your Salesforce site or Experience Cloud site pages. This object is available in API version 44.0 and later.

[Skill](#)

Represents a category or group that Chat users or field service resources can be assigned to. This object is available in API version 24.0 and later.

[SkillLevelDefinition](#)

Represents a skill which can be acquired by completing Sales Enablement (myTrailhead) modules. This object is available in API version 51.0 and later.

[SkillLevelProgress](#)

Represents training progress for a given user. This object is available in API version 51.0 and later.

Standard Objects

[SkillProfile](#)

Represents a join between Skill and Profile. This object is available in API version 24.0 and later.

[SkillRequirement](#)

Represents a skill that is required to complete a particular task in Field Service and Lightning Scheduler. Skill requirements can be added to work types, work orders, and work order line items in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later. You also can add skill requirements to work items in Omni-Channel skills-based routing using API version 42.0 and later.

[SkillUser](#)

Represents a join between Skill and User. This object is available in API version 24.0 and later.

[SlaProcess](#)

Represents an entitlement process associated with an Entitlement. This object is available in API version 19.0 and later.

[Snippet](#)

Represents a snippet, which is a container for rich text that can be reused across Pardot emails and email templates. This object is available in API version 47.0 and later.

[SnippetAssignment](#)

Represents a relationship between a snippet and a campaign. Assignments are required to use snippet content in Pardot emails and email templates. A snippet can be assigned to more than one campaign. This object is available in API version 47.0 and later.

[SocialPersona](#)

Represents a snapshot of a contact's profile on a social network such as Facebook or Twitter. This object is available in API version 22.0 and later.

[SocialPost](#)

Represents a snapshot of a post on a social network such as a Facebook or Twitter. This object is available in API version 23.0 and later.

[Solution](#)

Represents a detailed description of a customer issue and the resolution of that issue.

[SolutionStatus](#)

Represents the status of a Solution, such as Draft, Reviewed, and so on.

[SolutionTag](#)

Associates a word or short phrase with a Solution.

[SOSDeployment](#)

Represents the general settings for deploying SOS video call capability in a native mobile application. This object is available in API version 34.0 and later.

[SOSSession](#)

This object is automatically created for each SOS session and stores information about the session. This object is available in API versions 34.0 and later.

[SOSSessionActivity](#)

Captures information about specific events that occur during an SOS video call, such as when an SOS call begins or ends. This object is available in API version 34.0 and later.

[Stamp](#)

Represents a User Specialty. This object is available in API version 39.0 and later.

[StampAssignment](#)

Represents assignment of a User Specialty to a user. This object is available in API version 39.0 and later.

Standard Objects

[StaticResource](#)

Represents a static resource that can be used in Visualforce markup.

[StoreIntegratedService](#)

Represents an association between an integration and a store. This object is available in API version 49.0 and later.

[StreamingChannel](#)

Represents a channel that is the basis for notifying listeners of generic Streaming API events. This object is available in API version 29.0 and later.

[Salesforce Surveys Object Model](#)

Learn about how Salesforce Surveys objects relate to one another in Salesforce.

[Survey](#)

Represents a survey.

[SurveyEmailBranding](#)

Represents the configuration settings for invitation emails sent to survey participants for a particular survey.

[SurveyEngagementContext](#)

Represents the context based on which a survey invitation was sent or a survey response was received. This object is available in API version 49.0 and later.

[SurveyInvitation](#)

Represents the invitation sent to a participant to complete the survey.

[SurveyPage](#)

Represents a page, such as the title page or a question page, in a survey.

[SurveyQuestion](#)

Represents a question in a survey.

[SurveyQuestionChoice](#)

Represents an answer choice that a participant can select for a survey question.

[SurveyQuestionResponse](#)

Represents a participant's answer to a specific question.

[SurveyQuestionScore](#)

Represents the aggregate of responses for the following question types: date, multiple choice, picklist, radio, ranking, rating, scoring, slider, and [Net Promoter Score® \(NPS®\)](#).

[SurveyResponse](#)

Represents information about a participant's response to a survey, such as the status of the response, the participant's location, and when the survey was completed.

[SurveySubject](#)

Represents a relationship between a survey and another object, such as an account or a case.

[SurveyVersion](#)

Represents a version of a survey.

[SurveyVersionAddlInfo](#)

Represents additional information about a survey version. This information defines the default settings of a survey version. This object is available in API version 49.0 and later.

Standard Objects

[SvcCatalogRequest](#)

Represents a request made by a user using the Service Catalog. Catalog builders use this object to report on Service Catalog activity. This object is available in API version 53.0 and later.

[SvcCatalogReqRelatedItem](#)

Represents an item related to a Service Catalog Request. This object is available in API version 53.0 and later.

[TabDefinition](#)

Represents a custom tab. Returns only the tabs that the current user has access to. This object is available in API version 43.0 and later.

[TagDefinition](#)

Defines the attributes of child Tag objects.

[Task](#)

Represents a business activity such as making a phone call or other to-do items. In the user interface, Task and Event records are collectively referred to as activities.

[TaskPriority](#)

Represents the importance or urgency of a Task, such as High, Normal, or Low.

[TaskRelation](#)

Represents the relationship between a task and a lead, contacts, and other objects related to the task. If Shared Activities is enabled, this object doesn't support triggers, workflow, or data validation rules. This object is available in API version 24.0 and later.

[TaskStatus](#)

Represents the status of a Task, such as Not Started, Completed, or Closed.

[TaskTag](#)

Associates a word or short phrase with a Task.

[TaskWhoRelation](#)

Represents the relationship between a task and a lead or contacts. This object is available in API version 29.0 and later.

[TenantSecret](#)

This object stores an encrypted organization-specific key fragment that is used with the master secret to produce organization-specific data encryption keys. This object is available in API version 34.0 and later.

[TenantSecurityApiAnomaly](#)

Stores detected anomalies in how users typically make API calls. For more information, see [Threat Detection](#). This object is available to Security Center subscribers in API version 53.0 and later.

[TenantSecurityConnectedApp](#)

Stores the details for a connected object that was added to or removed from a Security Center tenant. This object is available to Security Center subscribers in API version 53.0 and later.

[TenantSecurityCredentialStuffing](#)

Stores when a user successfully logs in to Salesforce during an identified credential stuffing attack. For more information, see [Threat Detection](#). This object is available to Security Center subscribers in API version 53.0 and later.

[TenantSecurityHealthCheckBaselineTrend](#)

Stores metric details related to Health Check baseline settings. The Health Check detail page in Security Center displays scores and settings for all your tenants in one place. Use this object to get details about which metrics are collected and for which tenants, and changes made to the Health Check baseline. This object is available to Security Center subscribers in API version 54.0 and later.

Standard Objects

[TenantSecurityHealthCheckDetail](#)

Stores the details of Health Check scores for a connected tenant. The Health Check detail page in Security Center displays scores and settings for all your tenants in one place. Use this object to get settings and risks per tenant on a selected date. This object is available to Security Center subscribers in API version 53.0 and later.

[TenantSecurityHealthCheckTrend](#)

Stores the history of Security Health Check scores for a connected tenant within Security Center. Health Check in Security Center displays Health Check scores and the average risk settings for all your tenants in one place. This object belongs to the parent tenant and stores Health Check data pushed from child tenants. This object is available for Security Center subscribers in API version 53.0 and later.

[TenantSecurityLogin](#)

Stores the login details of a single user to a tenant, grouped by date and type. You can query this object to find out how many times the user logged in to a specific tenant using a specific login type (for example, username/password or SSO). This object is available to Security Center subscribers in API version 53.0 and later.

[TenantSecurityMobilePolicyTrend](#)

Stores metrics related to changes in mobile security policies across all tenants in Security Center. This object is available to Security Center subscribers in API version 54.0 and later.

[TenantSecurityMonitorMetric](#)

Stores the daily count and daily count change for a metric within Security Center. This object is available to Security Center subscribers in API version 53.0 and later.

[TenantSecurityNotification](#)

Stores information about notifications that were triggered in Security Center as a function of the Alerts feature. For more information, see [Create Alerts for Security Changes](#). This object is available to Security Center subscribers in API version 54.0 and later.

[TenantSecurityNotificationRule](#)

Stores an alert configured in the Security Center Alerts feature to notify recipients of changes made to security settings. For more information, see [Create Alerts for Security Changes](#). This object is available to Security Center subscribers in API version 53.0 and later.

[TenantSecurityPackage](#)

Stores details about managed and unmanaged packages that are added, updated, or removed from a tenant in Security Center. Use this object to identify whether new packages are installed, upgraded, or uninstalled from your connected tenants. This object is available to Security Center subscribers in API version 53.0 and later.

[TenantSecurityPolicy](#)

Stores security policies created and deployed in Security Center. For more information, see [Define and Deploy Security Policies \(Beta\)](#). This object is available to Security Center subscribers in API version 54.0 and later.

[TenantSecurityPolicyDeployment](#)

Stores the status of deployments of a Security Center policy on a tenant. For more information, see [Define and Deploy Security Policies \(Beta\)](#). This object is available to Security Center subscribers in API version 54.0 and later.

[TenantSecurityPolicySelectedTenant](#)

Stores the list of tenants selected for a Security Center policy. For more information, see [Define and Deploy Security Policies \(Beta\)](#). This object is available to Security Center subscribers in API version 54.0 and later.

[TenantSecurityReportAnomaly](#)

Stores anomalies in how users run or export reports, including unsaved reports, as detected by Threat Detection. For more information, see [Threat Detection](#). This object is available to Security Center subscribers in API version 53.0 and later.

Standard Objects

[TenantSecuritySessionHijacking](#)

Stores information about session hijacking events as detected by Threat Detection within connected tenants in Security Center. For more information, see [Threat Detection](#). This object is available for Security Center subscribers in API version 53.0 and later.

[TenantSecurityUserActivity](#)

Stores details related to how a user interacts with a tenant. Use this object to determine whether to reevaluate a user's access to your org for security purposes. You can check whether a user has never logged in, hasn't been active for 90 days, has a frozen account, or isn't using multi-factor authentication. This object is available to Security Center subscribers in API version 53.0 and later.

[TenantSecurityUserPerm](#)

Stores information on permissions assigned to a user. Use this object to see which tenants a user is assigned to. This object is available to Security Center subscribers in API version 53.0 and later.

[Territory](#)

Represents a flexible collection of accounts and users where the users have at least read access to the accounts, regardless of who owns the accounts. Only available if territory management has been enabled for your organization.

[Territory2](#)

Represents a sales territory. Available only if Enterprise Territory Management has been enabled for your organization.

[Territory2AlignmentLog](#)

Represents the start and end status of a territory assignment rule run job. This object is available in API version 54.0 and later.

[Territory2Model](#)

Represents a territory model. Available only if Enterprise Territory Management has been enabled for your organization.

[Territory2ModelHistory](#)

Represents the history of changes to the values in the fields on a territory model. Available only if Enterprise Territory Management has been enabled for your organization.

[Territory2ObjectExclusion](#)

Represents the objects that aren't included in territory assignment rule runs, even when they meet assignment rule criteria. This object is available in API version 54.0 and later.

[Territory2Type](#)

Represents a category for territories (Territory2). Every Territory2 must have a Territory2Type. Available only if Enterprise Territory Management has been enabled for your organization.

[TestSuiteMembership](#)

Associates an Apex class with an ApexTestSuite. This object is available in API version 36.0 and later.

[ThirdPartyAccountLink](#)

Represents the list of external users who authenticated using an authentication provider. This object is available in API version 32.0 and later.

[ThreatDetectionFeedback](#)

Represents feedback provided by a user about a Threat Detection event that occurred in your org. The feedback specifies whether the event was malicious, suspicious, not a threat, or unknown. Each ThreatDetectionFeedback object is associated with one of these Threat Detection storage events: ApiAnomalyEventStore, CredentialStuffingEventStore, ReportAnomalyEventStore, or SessionHijackingEventStore. This object is available in API version 49.0 and later.

[TimeSheet](#)

Represents a schedule of a service resource's time in field service. This object is available in API v47.0 and later.

[TimeSheetEntry](#)

Represents a span of time that a service resource spends on a field service task. This object is available in API version 47.0 and later.

Standard Objects

[TimeSlot](#)

Represents a period of time on a specified day of the week during which field service work can be performed in Field Service and Lightning Scheduler. Operating hours consist of one or more time slots. This object is available in API version 38.0 and later.

[TimeSlotHistory](#)

Represents the history of changes made to tracked fields on a time slot. This object is available in API version 38.0 and later.

[Topic](#)

Represents a topic on a Chatter post or record. This object is available in API version 28.0 and later.

[TopicAssignment](#)

Represents the assignment of a topic to a specific feed item, record, or file. This object is available in API version 28.0 and later.

[TopicLocalization](#)

Represents the translated version of a topic name. Topic localization applies only to navigational and featured topics in Experience Cloud sites. This object is available in API version 33.0 and later.

[TopicUserEvent](#)

Represents an action (such as comment, post, like, or share) made by a user on a topic. This object is available in API version 42.0 and later.

[TransactionSecurityPolicy](#)

Represents a transaction security policy definition.

[Translation](#)

The Translation object represents the languages enabled for translation in your Salesforce org. This object is available in API version 47.0 and later.

[TwoFactorInfo](#)

Stores a user's secret for multi-factor operations. Use this object when customizing multi-factor authentication in your organization. (Note that multi-factor authentication was formerly called two-factor authentication.) This object is available in API version 32.0 and later.

[TwoFactorMethodsInfo](#)

Stores information about which identity verification methods a user has registered. This object is available in API version 37.0 and later.

[TwoFactorTempCode](#)

Stores information about a user's temporary verification code for confirming their identity when logging in. This object is available in API version 37.0 and later.

[UiFormulaCriterion](#)

Represents a filter that helps define component visibility on a Lightning page. This object is available in API version 47.0 and later.

[UiFormulaRule](#)

Represents a set of one or more filters that define the conditions under which a component displays on a Lightning page. This object is available in API version 47.0 and later.

[UndecidedEventRelation](#)

Represents event participants (invitees or attendees) with the status `Not Responded` for a given event. This object is available in API versions 29.0 and later.

[User](#)

Represents a user in your organization.

[UserAccountTeamMember](#)

Represents a User on the default account team of another User.

Standard Objects

[UserAppInfo](#)

Stores the last Lightning app logged in to. This object is available in API version 38.0 and later.

[UserAppMenuCustomization](#)

Represents an individual user's settings for items in the app menu or App Launcher. This object is available in API version 35.0 and later.

[UserAppMenuItem](#)

Represents the organization-wide settings for items in the app menu or App Launcher that the requesting user has access to in Setup. This object is available in API version 35.0 and later.

[UserAuthCertificate](#)

Represents a user authentication certificate in your org. A user certificate is a unique PEM-encoded X.509 digital certificate to authenticate individual users to your org. This object is available in API version 45.0 and later.

[UserConfigTransferButton](#)

Represents the association between a Chat configuration and a live chat button. This association allows users associated with a specific configuration to transfer chats to a button queue.

[UserConfigTransferSkill](#)

Represents the association between a Chat configuration and a skill. This association allows users associated with a specific configuration to transfer chats to agents who have that skill.

[UserCustomBadge](#)

Represents a custom badge for a user. This object is available in API version 38.0 and later.

[UserCustomBadgeLocalization](#)

Represents the translated version of a custom badge for a user. This object is available in API version 38.0 and later.

[UserDailyMetric](#)

Represents the daily engagement metrics for a user. This object is available in API version 52.0 and later.

[UserDailyMetricOwnerSharingRule](#)

Represents the rules for sharing the user daily metric with users other than the owner.

[UserDevice](#)

Represents information unique to a device. Available in API version 43.0 and later.

[UserDeviceApplication](#)

Represents information on applications installed on a device that is accessing Salesforce. Available in API version 43.0 and later.

[UserDeviceHistory](#)

Represents tracking information on the UserDevice sObject. This object is available in API version 50.0 and later.

[UserEmailCalendarSync](#)

Represents the user assignments of an Einstein Activity Capture configuration. This object is available in API version 49.0 and later.

[UserEmailPreferredPerson](#)

Represents a mapping for a user's preferred record for an email address when multiple records match an email field. This object is available in API version 44.0 and later.

[UserEmailPreferredPersonShare](#)

Represents a sharing entry on a UserEmailPreferredPerson object. Sharing is not customizable for UserEmailPreferredPerson records. This object is available in API version 44.0 and later.

[UserLicense](#)

Represents a user license in your organization. A user license entitles a user to specific functionality and determines the profiles and permission sets available to the user.

Standard Objects

[UserListView](#)

Represents the customizations a user made to a list view. This object is available in API version 32.0 and later.

[UserListViewCriterion](#)

Represents the criterion for a user's customized list view. The criterion consists of the filters or sort order a user added to a list view for the Salesforce Mobile app. This object is available in API version 32.0 and later.

[UserLogin](#)

Represents the settings that affect a user's ability to log into an organization. To access this object, you need the `UserPermissions.ManageUsers` permission. This object is available in API version 29.0 and later.

[UserMembershipSharingRule](#)

Represents the rules for sharing user records from a source group to a target group. A user record contains details about a user. Users who are members of the source group can be shared with members of the target group. The source and target groups can be based on roles, portal roles, public groups, or territories. This object is available in API version 26.0 and later.

[UserMonthlyMetric](#)

Represents the monthly engagement metrics for a user. This object is available in API version 52.0 and later.

[UserMonthlyMetricOwnerSharingRule](#)

Represents the rules for sharing the user monthly metric with users other than the owner.

[UserPackageLicense](#)

Represents a license for an installed managed package, assigned to a specific user. This object is available in API version 31.0 and later.

[UserPermissionAccess](#)

Represents the permissions accessibility for a current user. Available in API version 41.0 and later.

[UserPrioritizedRecord](#)

Represents records that Pipeline Inspection users flag as important for tracking in pipeline views and filters. This object is available in API version 53.0 and later.

[UserPreference](#)

Represents a functional preference for a specific user in your organization.

[UserProfile](#)

Represents a Chatter user profile.

[UserProvAccount](#)

Represents information that links a Salesforce user account with an account in a third-party (target) system, such as Google, for users of connected apps with Salesforce user provisioning enabled. This object is available in API version 33.0 and later.

[UserProvAccountStaging](#)

Temporarily stores user account information while a user completes the User Provisioning Wizard. This information that is stored in the `UserProvAccount` object when you click the button to collect and analyze accounts on the target system.

[UserProvMockTarget](#)

Represents an entity for testing user data before committing the data to a third-party system for user provisioning.

[UserProvisioningConfig](#)

Represents information for a flow to use during a user provisioning request process, such as the attributes for an update. This object is available in API version 34.0 and later.

[UserProvisioningLog](#)

Represents messages generated during the process of provisioning users for third-party applications. This object is available in API version 33.0 and later.

Standard Objects

[UserProvisioningRequest](#)

Represents an individual provisioning request to create, update, or delete a single user account in a third-party service system (or another Salesforce organization). This object is available in API version 33.0 and later.

[UserRecordAccess](#)

Represents a user's access to a set of records. This object is read only and is available in API version 24.0 and later.

[UserRole](#)

Represents a user role in your organization.

[UserServicePresence](#)

Represents a presence user's real-time presence status. This object is available in API version 32.0 and later.

[UserShare](#)

Represents a sharing entry on a user record. This object is available in API version 26.0 and later.

[UserTeamMember](#)

Represents a single User on the default opportunity team of another User.

[UserTerritory](#)

Represents a User who has been assigned to a Territory.

[UserTerritory2Association](#)

Represents an association (by assignment) between a territory and a user record. Available only if Enterprise Territory Management has been enabled for your organization.

[UserWorkList](#)

Represents a list of work items in the My Feed tab for High Velocity Sales users.

[UserWorkListItem](#)

Represents an individual work item in the My Feed tab for High Velocity Sales users.

[VendorCallCenterStatusMap](#)

Stores a mapping between a call center vendor agent status and a Salesforce presence status for an associated call center. This object is available in API version 54.0 and later.

[VerificationHistory](#)

Represents the past six months of your org users' attempts to verify their identity. This object is available in API version 36.0 and later.

[VisualforceAccessMetrics](#)

Represents summary statistics for Visualforce pages.

[VideoCall](#)

Represents a video call.

[VideoCallParticipant](#)

Represents a participant in a video call.

[VideoCallRecording](#)

Represents a recording from a video call, such as a video recording, a voice recording, or a transcript.

[VoiceCall](#)

Represents a call in Service Cloud Voice or Sales Dialer.

[VoiceCallList](#)

Represents a prioritized list of numbers to call.

[VoiceCallListItem](#)

Represents a single phone number in a prioritized call list.

Standard Objects

[VoiceCallQualityFeedback](#)

Represents feedback given by a Sales Dialer user about the quality of a VoiceCall.

[VoiceCallRecording](#)

Represents a call recording in Service Cloud Voice and Sales Dialer. Call recordings for Service Cloud Voice with Amazon Connect and for Service Cloud Voice with Partner Telephony from Amazon Connect are stored in S3 buckets on your Amazon Web Services (AWS) account and can be accessed via AWS. Call recordings for Sales Dialer are saved as files in Salesforce.

[VoiceCoaching](#)

Represents a call that is using call monitoring.

[VoiceLocalPresenceNumber](#)

Represents a phone number with the same area code as the person who's being called.

[VoiceMailContent](#)

Represents a voicemail message left by a caller to the context user.

[VoiceMailGreeting](#)

Represents a custom greeting message that plays upon reaching a user's voicemail. This object is available in API version 41.0 and later.

[VoiceMailMessage](#)

Represents a prerecorded voicemail message.

[VoiceUserLine](#)

Represents a user's forwarding phone number.

[VoiceUserPreferences](#)

Represents the number the user displays when making outbound calls. This object is available in API version 41.0 and later.

[VoiceVendorInfo](#)

Represents information about the Service Cloud Voice or Sales Dialer provider's vendor.

[VoiceVendorLine](#)

Represents a user's phone number reserved with the vendor.

[Vote](#)

Represents a vote that a user has made on an Idea or a Reply.

[WarrantyTerm](#)

Represents warranty terms defining the labor, parts, and expenses covered, along with any exchange options, provided to rectify issues with products. This object is available in API version 50.0 and later.

[WaveAutoInstallRequest](#)

Provides access to the concrete object that represents a Tableau CRM auto install request. The auto install request tracks the progress of Tableau CRM applications created from Tableau CRM templates by the automated process user. This object is available in API version 38.0 and later.

[WebCart](#)

Represents an online shopping cart in a store built with B2B Commerce on Lightning, with total amounts for products, shipping and handling, and taxes. This object is available in API version 49.0 and later.

[WebCartAdjustmentGroup](#)

Group of price adjustments for a cart. This object is available in API version 52.0 and later.

[WebCartHistory](#)

WebCartHistory represents the history of changes to the values in the fields of the `webCart` object.

Standard Objects

[WebLink](#)

Represents a custom link to a URL or Scontrol.

[WebLinkLocalization](#)

Represents the translated value of the field label for a custom link to a URL or s-control when the Translation Workbench is enabled for your organization.

[WebStore](#)

Represents a B2B Commerce store. This object is available in API version 49.0 and later.

[WebStoreCatalog](#)

Represents the collection of products associated with a store. This object is available in API version 49.0 and later.

[WebStorePricebook](#)

Represents a store price book used in Lightning B2B Commerce. This object is available in API version 48.0 and later.

[Wishlist](#)

Represents a buyer-created list of [WishlistItems](#) in a store that's built with B2B Commerce on Lightning. Available in API version 49.0 and later.

[WishlistItem](#)

Represents an item on a `wishlist` in a store built with B2B Commerce for Lightning. Available in API version 49.0 and later.

[WorkAccess](#)

Used to grant or restrict user access to give badge definitions. Each badge definition record must have one `WorkAccess` record.

[WorkAccessShare](#)

Used to control Givers of `WorkBadgeDefinition` records.

[WorkBadge](#)

Represents information about who the badge was given to and which badge was given. A `WorkBadge` record is created for each recipient of a `WorkBadgeDefinition`.

[WorkBadgeDefinition](#)

Represents the attributes of a badge including the badge name, description, and image. Each `WorkBadge` record must have a lookup to a `WorkBadgeDefinition` since badge attributes (like badge name) are derived from the `WorkBadgeDefinition` object.

[WorkCoaching](#)

Represents a single coaching relationship between two users. One of the users is defined as the coach and the other is defined as a coachee. `WorkCoaching` is feed-enabled so there is a private feed available to the coach and coachee.

[WorkDemographic](#)

Represents the field values used to specify slices in the workload forecasting and capacity planning. This object is available in API version 49.0 and later.

[WorkFeedback](#)

Represents the answer to a question that a person was asked via a feedback request. Also used to store offered feedback without linking it to a particular question.

[WorkFeedbackQuestion](#)

Represents a free-form text type or multiple choice question within a set of questions.

[WorkFeedbackQuestionSet](#)

Represents a set of questions being asked. The question set is used to link all the individual requests where different recipients were asked the same set of questions on the same subject.

Standard Objects

[WorkFeedbackRequest](#)

Represents a single feedback request on a subject or topic (question) to a single recipient in the feedback application. In the case of offered feedback, `WorkFeedbackRequest` represents feedback that is offered about a subject. In the performance application, `WorkFeedbackRequest` represents a request for feedback on a set of questions from a question set, on a subject—for the recipient to complete and submit.

[WorkforceCapacity](#)

Represents the time series for actual or forecasted workforce allocation. This object is available in API version 51.0 and later.

[WorkforceCapacityUnit](#)

Represents the number of resources allocated or needed for a specific set of work items at a timestamp within a specific duration. This object is available in API version 51.0 and later.

[WorkGoal](#)

Represents the components of a goal, such as its description and associated metrics. This object has been deprecated as of API version 35.0. Use the `Goal` object to query information about WDC goals.

[WorkGoalCollaborator](#)

Represents collaborators on a `WorkGoal` object. This doesn't include `WorkGoal` followers, which is handled by Chatter Feed Follow functionality. This object has been deprecated as of API version 35.0. Use the `Goal` object to query information about WDC goals.

[WorkGoalCollaboratorHistory](#)

Represents the history of changes to the values in the fields in a `WorkGoalCollaborator` object. Access is read-only.

[WorkGoalHistory](#)

Represents the history of changes to the values in the fields of a `WorkGoal`. Access is read-only. This object has been deprecated as of API version 35.0. Use the `GoalHistory` object to query historical information for WDC goals.

[WorkGoalLink](#)

Represents the relationship between two goals (many to many relationship). This object has been deprecated as of API version 35.0. Use the `GoalLink` object to query information about the relationship between two WDC goals.

[WorkGoalShare](#)

Represents a sharing entry on a `WorkGoal` object. This object has been deprecated as of API version 35.0. Use the `GoalShare` object to query information about sharing for WDC goals.

[Workload](#)

Represents the time series for work item volume and average handling time from aggregation and forecasting processes. This object is available in API version 49.0 and later.

[WorkloadUnit](#)

Represents the number of work items and average handle time in a specific time interval. This object is available in API version 49.0 and later.

[WorkOrder](#)

Represents field service work to be performed for a customer. This object is available in API version 36.0 and later.

[WorkOrderHistory](#)

Represents the history of changes made to tracked fields on a work order. This object is available in API version 36.0 and later.

[WorkOrderLineItem](#)

Represents a subtask on a work order in field service. This object is available in API version 36.0 and later.

[WorkOrderLineItemHistory](#)

Represents the history of changes made to tracked fields on a work order line item. This object is available in API version 36.0 and later.

Standard Objects

[WorkOrderLineItemStatus](#)

Represents a possible status of a work order line item in field service.

[WorkOrderShare](#)

Represents a sharing entry on a work order. This object is available in API version 36.0 and later.

[WorkOrderStatus](#)

Represents a possible status of a work order in field service.

[WorkPerformanceCycle](#)

Represents feedback that is gathered to assess the performance of a specific set of employees.

[WorkPlan](#)

Represents a work plan for a work order or work order line item. This object is available in API version 52.0 and later.

[WorkPlanSelectionRule](#)

Represents a rule that selects a work plan for a work order or work order line item. This object is available in API version 52.0 and later.

[WorkPlanTemplate](#)

Represents a template for a work plan. This object is available in API version 52.0 and later.

[WorkPlanTemplateEntry](#)

Represents an object that associates a work step template with a work plan template. This object is available in API version 52.0 and later.

[WorkReward](#)

Used to store reward codes tied to a Reward Fund. Reward Funds must have at least one WorkReward record.

[WorkRewardFund](#)

Represents a Reward Fund and describes the Reward Fund attributes.

[WorkRewardFundType](#)

Represents the type of WorkRewardFund object.

[WorkStep](#)

Represents a work step in a work plan. This object is available in API version 52.0 and later.

[WorkStepStatus](#)

Represents a picklist for a status category on a work step. This object is available in API version 52.0 and later.

[WorkStepTemplate](#)

Represents a template for a work step. This object is available in API version 52.0 and later.

[WorkThanks](#)

Represents the source and message of a thanks post.

[WorkType](#)

Represents a type of work to be performed in Field Service and Lightning Scheduler. Work types are templates that can be applied to work order or work order line items. This object is available in API version 38.0 and later.

[WorkTypeGroup](#)

Represents a grouping of work types used to categorize types of appointments available in Lightning Scheduler, or to define scheduling limits in Field Service. This object is available in API version 45.0 and later.

[WorkTypeGroupMember](#)

Represents the relationship between a work type and the work type group it belongs to. This object is available in API version 45.0 and later.

AcceptedEventRelation

Represents event participants (invitees or attendees) with the status `Accepted` for a given event.

This object is available in API versions 29.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
EventId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the event. This is a relationship field.</p> <p>Relationship Name Event</p> <p>Relationship Type Lookup</p> <p>Refers To Event</p>
RelationId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the invitee. This is a polymorphic relationship field.</p> <p>Relationship Name Relation</p> <p>Relationship Type Lookup</p> <p>Refers To Calendar, Contact, Lead, User</p>

Field Name	Details
RespondedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates the most recent date and time when the invitee accepted an invitation to the event.</p>
Response	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the content of the response field. Label is Comment.</p>
Type	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates whether the invitee is a user, lead or contact, or resource.</p>

Usage

Query invitees who have accepted an invitation to an event

```
SELECT eventId, type, response FROM AcceptedEventRelation WHERE eventId='00UTD000000ZH5LA'
```

SEE ALSO:

[DeclinedEventRelation](#)

[UndecidedEventRelation](#)

Account

Represents an individual account, which is an organization or person involved with your business (such as customers, competitors, and partners).

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `merge()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can access their own accounts and any account shared with them.

Fields

Field Name	Details
AccountNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Account number assigned to this account (not the unique, system-generated ID assigned during creation). Maximum size is 40 characters.</p>
AccountSource	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The source of the account record. For example, <i>Advertisement, Data.com, or Trade Show</i>. The source is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.</p>
AnnualRevenue	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Estimated annual revenue of the account.</p>
BillingAddress	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the billing address. Read-only. See Address Compound Fields for details on compound address fields.</p>
BillingCity	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description Details for the billing address of this account. Maximum size is 40 characters.</p>
BillingCountry	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details for the billing address of this account. Maximum size is 80 characters.</p>
BillingCountryCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO country code for the account's billing address.</p>
BillingGeocodeAccuracy	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Accuracy level of the geocode for the billing address. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
BillingLatitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>BillingLongitude</code> to specify the precise geolocation of a billing address. Acceptable values are numbers between -90 and 90 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
BillingLongitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>BillingLatitude</code> to specify the precise geolocation of a billing address. Acceptable values are numbers between -180 and 180 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>

Field Name	Details
BillingPostalCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details for the billing address of this account. Maximum size is 20 characters.</p>
BillingState	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details for the billing address of this account. Maximum size is 80 characters.</p>
BillingStateCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO state code for the account's billing address.</p>
BillingStreet	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Street address for the billing address of this account.</p>
ChannelProgramName	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description Read only. Name of the channel program the account has enrolled.</p> <p> Note: If this account has enrolled more than one channel program, the oldest channel program name will be displayed.</p>
ChannelProgramLevelName	<p>Type string</p>

Field Name	Details
	<p>Properties Group, Nillable</p> <p>Description Read only. Name of the channel program level the account has enrolled.</p> <p> Note: If this account has enrolled more than one channel program level, the oldest channel program name will be displayed.</p>
CleanStatus	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates the record's clean status as compared with Data.com. Values are: <code>Matched</code>, <code>Different</code>, <code>Acknowledged</code>, <code>NotFound</code>, <code>Inactive</code>, <code>Pending</code>, <code>SelectMatch</code>, or <code>Skipped</code>.</p> <p>Several values for <code>CleanStatus</code> display with different labels on the account record detail page.</p> <ul style="list-style-type: none"> • <code>Matched</code> displays as <code>In Sync</code> • <code>Acknowledged</code> displays as <code>Reviewed</code> • <code>Pending</code> displays as <code>Not Compared</code>
ConnectionReceivedId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the <code>PartnerNetworkConnection</code> that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.</p>
ConnectionSentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the <code>PartnerNetworkConnection</code> that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new <code>PartnerNetworkRecordConnection</code> object to forward records to connections.</p>
Description	<p>Type textarea</p>

Field Name	Details
	<p>Properties Create, Nillable, Update</p> <p>Description Text description of the account. Limited to 32,000 KB.</p>
DunsNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the Dun & Bradstreet database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking. Maximum size is 9 characters. This field is available on business accounts, not person accounts.</p> <p> Note: This field is only available to organizations that use Data.com Prospector or Data.com Clean.</p>
Fax	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Fax number for the account.</p>
HasOptedOutOfEmail	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Update</p> <p>Description Indicates whether the contact doesn't want to receive email from Salesforce (<code>true</code>) or does (<code>false</code>). Label is Email Opt Out.</p>
Industry	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An industry associated with this account. Maximum size is 40 characters.</p>
IsCustomerPortal	<p>Type boolean</p>

Field Name	Details
	<p>Properties Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the account has at least one contact enabled to use the org's Customer Portal (<code>true</code>) or not (<code>false</code>). This field is available if Customer Portal is enabled OR digital experiences is enabled and you have Customer Portal licenses.</p> <p>If you change this field's value from <code>true</code> to <code>false</code>, you can disable up to 100 Customer Portal users associated with the account and permanently delete all of the account's Customer Portal roles and groups. You can't restore deleted Customer Portal roles and groups.</p> <p>This field can be updated in API version 16.0 and later.</p> <p> Tip: We recommend that you update up to 50 contacts simultaneously when changing the accounts on contacts enabled for a Customer Portal or partner portal. We also recommend that you make this update after business hours.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
IsPartner	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the account has at least one contact enabled to use the org's partner portal (<code>true</code>) or not (<code>false</code>). This field is available if partner relationship management (partner portal) is enabled OR digital experiences is enabled and you have partner portal licenses.</p> <p>If you change this field's value from <code>true</code> to <code>false</code>, you can disable up to 15 partner portal users associated with the account and permanently delete all of the account's partner portal roles and groups. You can't restore deleted partner portal roles and groups.</p> <p>Disabling a partner portal user in the Salesforce user interface or the API does not change this field's value from <code>true</code> to <code>false</code>.</p> <p>Even if this field's value is <code>false</code>, you can enable a contact on an account as a partner portal user via the API.</p> <p>This field can be updated in API version 16.0 and later.</p>

Field Name	Details
	<p> Tip: We recommend that you update up to 50 contacts simultaneously when changing the accounts on contacts enabled for a Customer Portal or partner portal. We also recommend that you make this update after business hours.</p>
IsPersonAccount	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Read only. Label is Is Person Account. Indicates whether this account has a record type of Person Account (<code>true</code>) or not (<code>false</code>).</p>
Jigsaw	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description References the ID of a company in Data.com. If an account has a value in this field, it means that the account was imported from Data.com. If the field value is <code>null</code>, the account was not imported from Data.com. Maximum size is 20 characters. Available in API version 22.0 and later. Label is Data.com Key. This field is available on business accounts, not person accounts.</p> <p> Important: The <code>Jigsaw</code> field is exposed in the API to support troubleshooting for import errors and reimporting of corrected data. Do not modify the value in the <code>Jigsaw</code> field.</p>
LastActivityDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Value is one of the following, whichever is the most recent:</p> <ul style="list-style-type: none"> • Due date of the most recent event logged against the record. • Due date of the most recently closed task associated with the record.
LastReferencedDate	<p>Type datetime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>

Field Name	Details
LastViewedDate	<p>Type datetime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
MasterRecordId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description If this object was deleted as the result of a merge, this field contains the ID of the record that was kept. If this object was deleted for any other reason, or has not been deleted, the value is <code>null</code>. This is a relationship field.</p> <p>Relationship Name MasterRecord</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>
NaicsCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments into industries, according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the U.S. business economy. Maximum size is 8 characters. This field is available on business accounts, not person accounts.</p> <p> Note: This field is only available to organizations that use Data.com Prospector or Data.com Clean.</p>
NaicsDesc	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>A brief description of an org's line of business, based on its NAICS code. Maximum size is 120 characters. This field is available on business accounts, not person accounts.</p> <p> Note: This field is only available to organizations that use Data.com Prospector or Data.com Clean.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Required. Label is Account Name. Name of the account. Maximum size is 255 characters. If the account has a record type of Person Account:</p> <ul style="list-style-type: none"> This value is the concatenation of the <code>FirstName</code>, <code>MiddleName</code>, <code>LastName</code>, and <code>Suffix</code> of the associated person contact. You can't modify this value.
NumberOfEmployees	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Label is Employees. Number of employees working at the company represented by this account. Maximum size is eight digits.</p>
OperatingHoursId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The operating hours associated with the account. Available only if Field Service is enabled. This is a relationship field.</p> <p>Relationship Name</p> <p>OperatingHours</p> <p>Relationship Type</p> <p>Lookup</p> <p>Refers To</p> <p>OperatingHours</p>
OwnerId	<p>Type</p> <p>reference</p>

Field Name	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the user who currently owns this account. Default value is the user logged in to the API to perform the create.</p> <p>If you have set up account teams in your org, updating this field has different consequences depending on your version of the API:</p> <ul style="list-style-type: none"> • For API version 12.0 and later, sharing records are kept, as they are for all objects. • For API version before 12.0, sharing records are deleted. • For API version 16.0 and later, users must have the “Transfer Record” permission in order to update (transfer) account ownership using this field. <p>This is a relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
Ownership	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Ownership type for the account, for example Private, Public, or Subsidiary.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the parent object, if any.</p> <p>This is a relationship field.</p> <p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>

Field Name	Details
PersonIndividualId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the data privacy record associated with this person's account. This field is available if you enabled Data Protection and Privacy in Setup. Available in API version 42.0 and later.</p>
Phone	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Phone number for this account. Maximum size is 40 characters.</p>
PhotoUrl	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Path to be combined with the URL of a Salesforce instance (for example, <code>https://yourInstance.salesforce.com/</code>) to generate a URL to request the social network profile image associated with the account. Generated URL returns an HTTP redirect (code 302) to the social network profile image for the account. Blank if Social Accounts and Contacts isn't enabled for the org or if Social Accounts and Contacts is disabled for the requesting user.</p>
Rating	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The account's prospect rating, for example Hot, Warm, or Cold.</p>
RecordTypeId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the record type assigned to this object.</p>

Field Name	Details
Salutation	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Honorific added to the name for use in letters, etc.</p>
ShippingAddress	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the shipping address. Read-only. See Address Compound Fields for details on compound address fields.</p>
ShippingCity	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details of the shipping address for this account. City maximum size is 40 characters</p>
ShippingCountry	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details of the shipping address for this account. Country maximum size is 80 characters.</p>
ShippingCountryCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO country code for the account's shipping address.</p>
ShippingGeocodeAccuracy	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p>

Field Name	Details
	<p>Description Accuracy level of the geocode for the shipping address. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
ShippingLatitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>ShippingLongitude</code> to specify the precise geolocation of a shipping address. Acceptable values are numbers between -90 and 90 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
ShippingLongitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>ShippingLatitude</code> to specify the precise geolocation of an address. Acceptable values are numbers between -180 and 180 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
ShippingPostalCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details of the shipping address for this account. Postal code maximum size is 20 characters.</p>
ShippingState	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details of the shipping address for this account. State maximum size is 80 characters.</p>
ShippingStateCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO state code for the account's shipping address.</p>

Field Name	Details
ShippingStreet	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The street address of the shipping address for this account. Maximum of 255 characters.</p>
Sic	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Standard Industrial Classification code of the company's main business categorization, for example, 57340 for Electronics. Maximum of 20 characters. This field is available on business accounts, not person accounts.</p>
SicDesc	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A brief description of an org's line of business, based on its SIC code. Maximum length is 80 characters. This field is available on business accounts, not person accounts.</p>
Site	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Name of the account's location, for example <code>Headquarters</code> or <code>London</code>. Label is Account Site. Maximum of 80 characters.</p>
TickerSymbol	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The stock market symbol for this account. Maximum of 20 characters. This field is available on business accounts, not person accounts.</p>
Tradestyle	<p>Type string</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A name, different from its legal name, that an org may use for conducting business. Similar to “Doing business as” or “DBA”. Maximum length is 255 characters. This field is available on business accounts, not person accounts.</p> <p> Note: This field is only available to organizations that use Data.com Prospector or Data.com Clean.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Type of account, for example, Customer, Competitor, or Partner.</p>
Website	<p>Type url</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The website of this account. Maximum of 255 characters.</p>
YearStarted	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date when an org was legally established. Maximum length is 4 characters. This field is available on business accounts, not person accounts.</p> <p> Note: This field is only available to organizations that use Data.com Prospector or Data.com Clean.</p>

IsPersonAccount Fields

These fields are the subset of person account fields that are contained in the child person contact record of each person account. If the `IsPersonAccount` field has the value `false`, the following fields have a null value and can't be modified. If `true`, the fields can be modified.

Person accounts are not enabled by default.

Field Name	Details
FirstName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description First name of the person for a person account. Maximum size is 40 characters.</p>
LastName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Last name of the person for a person account. Required if the record type is a person account record type. Maximum size is 80 characters.</p>
MiddleName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Middle name of the person for a person account. Maximum size is 40 characters. Contact Salesforce Customer Support to enable this field.</p>
PersonAssistantName	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The person account's assistant name. Label is Assistant. Maximum size is 40 characters.</p>
PersonAssistantPhone	<p>Type phone</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The person account's assistant phone. Label is Asst. Phone. Maximum size is 40 characters.</p>
PersonBirthDate	<p>Type date</p> <p>Properties Create, Filter, Nillable, Update</p>

Field Name	Details
	<p>Description</p> <p>The assistant name. Label is Birthdate.</p> <p> Note: The year portion of the <code>PersonBirthDate</code> field is ignored in filter criteria, including report filters, list view filters, and SOQL queries. For example, the following SOQL query returns person accounts with birthdays later in the year than today:</p> <pre>SELECT FirstName, LastName, PersonBirthDate FROM Account WHERE Birthdate > TODAY</pre>
PersonContactId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Nillable, Update</p> <p>Description</p> <p>The ID for the contact associated with this person account. Label is Contact ID.</p>
PersonDepartment	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Nillable, Update</p> <p>Description</p> <p>The department. Label is Department. Maximum size is 80 characters.</p>
PersonEmail	<p>Type</p> <p>email</p> <p>Properties</p> <p>Create, Filter, Nillable, Update</p> <p>Description</p> <p>Email address for this person account. Label is Email.</p>
PersonEmailBouncedDate	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Create, Filter, Nillable, Update</p> <p>Description</p> <p>If bounce management is activated and an email sent to the person account bounces, the date and time the bounce occurred.</p>
PersonEmailBouncedReason	<p>Type</p> <p>string</p>

Field Name	Details
	<p>Properties Create, Filter, Nillable, Update</p> <p>Description If bounce management is activated and an email sent to the person account bounces, the reason the bounce occurred</p>
PersonHasOptedOutOfEmail	<p>Type boolean</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Indicates whether the person account has opted out of email (<code>true</code>) or not (<code>false</code>). Label is Email Opt Out.</p>
PersonHomePhone	<p>Type phone</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The home phone number for this person account. Label is Home Phone.</p>
PersonLeadSource	<p>Type picklist</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The person account's lead source. Label is Lead Source.</p>
PersonMailingAddress	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the person account mailing address. Read-only. See Address Compound Fields for details on compound address fields.</p>
PersonMailingCity	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p>

Field Name	Details
	<p>Description</p> <p>Details about the person account's mailing city. Labels are Mailing City, Mailing Country, Postal Code, and State. Maximum size for city and country is 40 characters. Maximum size for postal code and state is 20 characters.</p>
PersonMailingGeocodeAccuracy	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Retrieve, Query, Restricted picklist, Nillable</p> <p>Description</p> <p>Accuracy level of the geocode for the person's mailing address. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
PersonMailingLatitude	<p>Type</p> <p>double</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>Used with <code>PersonMailingLongitude</code> to specify the precise geolocation of a person account's mailing address. Acceptable values are numbers between -90 and 90 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
PersonMailingLongitude	<p>Type</p> <p>double</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>Used with <code>PersonMailingLatitude</code> to specify the precise geolocation of a person account's mailing address. Acceptable values are numbers between -180 and 180 with up to 15 decimal places. See Compound Field Considerations and Limitations on page 42 for details on geolocation compound fields.</p>
PersonMailingStreet	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Create, Filter, Nillable, Update</p> <p>Description</p> <p>The mailing street address for this person account. Label is Mailing Street. Maximum size is 255 characters.</p>
PersonMobilePhone	<p>Type</p> <p>phone</p>

Field Name	Details
	<p>Properties Create, Filter, Nillable, Update</p> <p>Description The mobile phone number for this person account. Label is Mobile.</p>
<ul style="list-style-type: none"> PersonOtherCity PersonOtherCountry PersonOtherPostalCode PersonOtherState 	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Details about the alternate address for this person account. Labels are Other City, Other Country, Other Zip/Postal Code, and Other State.</p>
<ul style="list-style-type: none"> PersonOtherCountryCode PersonOtherStateCode 	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO country or state code for the alternate address of the person account.</p>
PersonOtherLatitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>PersonOtherLongitude</code> to specify the precise geolocation of a person account's alternate address. Acceptable values are numbers between -90 and 90 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
PersonOtherLongitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>PersonOtherLatitude</code> to specify the precise geolocation of a person account's alternate address. Acceptable values are numbers between -180 and 180 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
PersonOtherPhone	<p>Type phone</p>

Field Name	Details
	<p>Properties Create, Filter, Nillable, Update</p> <p>Description The alternate phone number for this person account. Label is Other Phone.</p>
PersonOtherStreet	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The person account's alternate street address. Label is Other Street.</p>
PersonTitle	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The person account's title. Label is Title. Maximum size is 80 characters.</p>
Suffix	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Name suffix of the person for a person account. Maximum size is 40 characters. Contact Salesforce Customer Support to enable this field.</p>

 **Note:** If you are importing Account data into Salesforce and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

Usage

Use this object to query and manage accounts in your org. Client applications can create, update, delete, or query Attachment records associated with an account via the API.

Client applications can also create or update account objects by converting a Lead via the `convertLead()` call.

If the values in the `IsPersonAccount` Fields are not null, you can't change `IsPersonAccount` to `false`, or an error occurs.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AccountChangeEvent (API version 44.0)

Change events are available for the object.

AccountFeed (API version 18.0)

Feed tracking is available for the object.

AccountHistory (API version 11.0)

History is available for tracked fields of the object.

AccountOwnerSharingRule

Sharing rules are available for the object.

AccountShare

Sharing is available for the object.

SEE ALSO:

[AccountShare](#)

[AccountTeamMember](#)

[Person Account Record Types](#)

AccountBrand

Represents the brand details of a Partner Account. This object is available in API version 43.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available only if digital experiences is enabled in your org and it has a Partner Community or Customer Community Plus license.

Fields

Field	Details
AccountId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the Account. This number is unique within your organization.</p>
Address	<p>Type address</p>

Field	Details
	<p>Properties Filter, Nillable</p> <p>Description The street address.</p>
City	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The city.</p>
CompanyName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The name of the company associated with the account brand.</p>
Country	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The country where the account is physically located.</p>
Email	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Email address associated with the account.</p>
GeocodeAccuracy	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist Sort, Update</p> <p>Description Stores data for accurate geocoded location.</p>
LastReferencedDate	<p>Type dateTime</p>

Field	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description Most recent date referenced.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Most recent date viewed.</p>
Latitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used along with <code>Longitude</code> to specify the precise geolocation of an address.</p>
LogoId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the logo.</p>
LogoUrl	<p>Type url</p> <p>Properties Nillable,</p> <p>Description URL of the logo. This field is available in API version 44.0 and later.</p>
Longitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>Latitude</code> to specify the precise geolocation of an address.</p>
Name	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Required. Name of the account.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Required. ID of the Owner.</p>
Phone	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Phone number.</p>
PostalCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The postal code where the user's IP address is physically located.</p>
State	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The address state.</p>
Street	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The address street.</p>
Website	<p>Type url</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Website for the Account Brand.</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

[AccountBrandOwnerSharingRule](#)

Sharing rules are available for the object.

[AccountBrandShare](#)

Sharing is available for the object.

AccountContactRelation

Represents a relationship between a contact and one or more accounts.

This object is available in API version 37.0. The AccountContactRelation object supports person accounts. That means that a person account can be either a related contact on a business account or a related account on a contact. A person account can also be related to another person account as either a related contact or related account.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
AccountContactRelationshipCurrency	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.</p>
AccountId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p>

Field Name	Details
	<p>Description</p> <p>ID of the account that is related to the contact. Field can't be modified when updating existing account-contact relationship records.</p>
ContactId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>ID of the contact that is related to the account. Field can't be modified when updating existing account-contact relationship records.</p>
EndDate	<p>Type</p> <p>date</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The date a relationship between a contact and account ended. Use with the <code>StartDate</code> to keep a history of the relationship.</p>
IsActive	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Indicates whether relationship is active (<code>true</code>) or not (<code>false</code>).</p>
IsDirect	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>Indicates whether the account associated with the contact is the contact's primary account (<code>true</code>) or not (<code>false</code>).</p>
Roles	<p>Type</p> <p>multipicklist</p> <p>Properties</p> <p>Create, Filter, Nillable, Update</p> <p>Description</p> <p>The contact's participating role in the account. Values are <code>Business User</code>, <code>Decision Maker</code>, <code>Economic Buyer</code>, <code>Economic Decision</code></p>

Field Name	Details
	Maker, Evaluator, Executive Sponsor, Influencer, Technical Buyer, and Other.
StartDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date a relationship between a contact and account began. Use with the End Date to keep a history of the relationship.</p>

Usage

Use this object to associate a single contact record to multiple account records so you can easily track the relationships between the people and businesses they work with.

When you insert a non-private contact in your org that associates a contact to multiple accounts, an AccountContactRelation is created and its validation rules, database insertion, and triggers are executed immediately after the contact is saved to the database. When you change a contact's primary account, an AccountContactRelation may be created or edited, and the AccountContactRelation validation rules, database changes, and triggers are executed immediately after the contact is saved to the database. See [Order of Execution](#).

AccountCleanInfo

Stores the metadata Data.com Clean uses to determine an account record's clean status. AccountCleanInfo helps you automate the cleaning or related processing of account records.

 **Note:** When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see [Data.com Prospector and Clean Retirement](#).

Account Clean Info provides a snapshot of the data in your Salesforce account record and its matched Data.com record at the time the Salesforce record was cleaned.

Account Clean Info includes a number of bit vector fields, whose component fields each correspond to individual object fields and provide related data or status information about those fields. For example, the bit vector field `IsDifferent` has an `IsDifferentState` field. If the `IsDifferentState` field's value is `False`, that means the `State` field value is *the same* on the Salesforce account record and its matched Data.com record.

AccountCleanInfo bit vector fields include:

- `CleanedBy` indicates who (a user) or what (a Clean job) cleaned the account record.
- `IsDifferent` indicates whether or not a field on the account record has a value that differs from the corresponding field on the matched Data.com record.
- `IsFlaggedWrong` indicates whether or not a field on the account record has a value that is flagged as wrong to Data.com.

- `IsReviewed` indicates whether or not a field on the account record is in a `Reviewed` state, which means that the value was reviewed but not accepted.

Their individual bits are defined here.

Supported Calls

`describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
<code>AccountId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique, system-generated ID assigned when the account record was created.</p>
<code>AccountSite</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Information about the account's location, such as single location, headquarters, or branch.</p>
<code>Address</code>	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the address. Read-only. See Address Compound Fields for details on compound address fields.</p>
<code>AnnualRevenue</code>	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Estimated annual revenue of the account.</p>
<code>City</code>	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the account.</p>
CleanedByJob	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the account record was cleaned by a Data.com Clean job (<code>true</code>) or not (<code>false</code>).</p>
CleanedByUser	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the account record was cleaned by a Salesforce user (<code>true</code>) or not (<code>false</code>).</p>
CompanyName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the company.</p>
CompanyStatusDataDotCom	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The status of the company per Data.com. Values are: Company is In Business per Data.com or Company is Out of Business per Data.com.</p>
Country	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name	Details
	<p>Description Details for the billing address of the account.</p>
DandBCompanyDunsNumber	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The D-U-N-S Number on the D&B Company record (if any) that is linked to the account.</p>
DataDotComId	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID Data.com maintains for the company.</p>
Description	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description A description of the account.</p>
DunsNumber	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the Dun & Bradstreet database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking.</p>
DunsRightMatchConfidence	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The account's DUNSRight confidence code.</p>

Field Name	Details
DunsRightMatchGrade	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The account's DUNSRight match grade.</p>
Fax	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The account's fax number.</p>
Industry	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The industry the account belongs to.</p>
IsDifferentAccountSite	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the account's AccountSite field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
IsDifferentAnnualRevenue	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the account's AnnualRevenue field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
IsDifferentCity	<p>Type boolean</p> <p>Properties Filter</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the account's <code>City</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentCompanyName</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>AccountName</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentCountry</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>Country</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentCountryCode</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>Country Code</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentDandBCompanyDunsNumber</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>DandBCompanyID</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentDescription</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the account's <code>Description</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentDunsNumber</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>DunsNumber</code> field value is different from the D-U-N-S Number on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentFax</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>Fax</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentIndustry</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>Industry</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentNaicsCode</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>NaicsCode</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentNaicsDescription</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the account's <code>NaicsDescription</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentNumberOfEmployees</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>NumberOfEmployees</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentOwnership</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>Ownership</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentPhone</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>Phone</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentPostalCode</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>PostalCode</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentSic</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the account's <code>Sic</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentSicDescription</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>SicDescription</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentState</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>State</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentStateCode</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>State Code</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentStreet</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>State</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentTickerSymbol</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the account's <code>TickerSymbol</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentTradestyle</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>Tradestyle</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentWebsite</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>Website</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentYearStarted</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>YearStarted</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongAccountSite</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>AccountSite</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongAddress</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p>

Field Name	Details
IsFlaggedWrongAnnualRevenue	<p>Description Indicates whether the account's <code>Address</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p> <p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's <code>AnnualRevenue</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
IsFlaggedWrongCompanyName	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's <code>CompanyName</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
IsFlaggedWrongDescription	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's <code>Description</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
IsFlaggedWrongDunsNumber	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's <code>DunsNumber</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
IsFlaggedWrongFax	<p>Type boolean</p> <p>Properties Filter, Update</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the account's Fax field value is flagged as wrong to Data.com (true) or not (false).</p>
IsFlaggedWrongIndustry	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's Industry field value is flagged as wrong to Data.com (true) or not (false).</p>
IsFlaggedWrongNaicsCode	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's NaicsCode field value is flagged as wrong to Data.com (true) or not (false).</p>
IsFlaggedWrongNaicsDescription	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's NaicsDescription field value is flagged as wrong to Data.com (true) or not (false).</p>

IsFlaggedWrongOwnership	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p>

Field Name	Details
	Description Indicates whether the account's <code>Ownership</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).
<code>IsFlaggedWrongPhone</code>	Type boolean Properties Filter, Update Description Indicates whether the account's <code>Phone</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).
<code>IsFlaggedWrongSic</code>	Type boolean Properties Filter, Update Description Indicates whether the account's <code>Sic</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).
<code>IsFlaggedWrongSicDescription</code>	Type boolean Properties Filter, Update Description Indicates whether the account's <code>SicDescription</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).
<code>IsFlaggedWrongTickerSymbol</code>	Type boolean Properties Filter, Update Description Indicates whether the account's <code>TickerSymbol</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).
<code>IsFlaggedWrongTradestyle</code>	Type boolean Properties Filter, Update

Field Name	Details
	<p>Description</p> <p>Indicates whether the account's <code>Tradestyle</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongWebsite</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>Website</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongYearStarted</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>YearStarted</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsInactive</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>Indicates whether the account has been reported to Data.com as <i>Inactive</i> (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedAccountSite</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>AccountSite</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedAddress</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p>

Field Name	Details
	<p>Description Indicates whether the account's <code>Address</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedAnnualRevenue</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's <code>AnnualRevenue</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedCompanyName</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's <code>CompanyName</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedDandBCompanyDunsNumber</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's <code>DandBCompanyID</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedDescription</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's <code>Description</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedDunsNumber</code>	<p>Type boolean</p> <p>Properties Filter, Update</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the account's <code>DunsNumber</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedFax</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>Fax</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedIndustry</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>Industry</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedNaicsCode</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>NaicsCode</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedNaicsDescription</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>NaicsDescription</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedNumberOfEmployees</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the account's <code>NumberOfEmployees</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedOwnership</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>Ownership</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedPhone</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>Phone</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedSic</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>Sic</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedSicDescription</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>SicDescription</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedTickerSymbol</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p>

Field Name	Details
	<p>Description Indicates whether the account's <code>TickerSymbol</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedTradestyle</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's <code>Tradestyle</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedWebsite</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's <code>Website</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedYearStarted</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's <code>YearStarted</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>LastMatchedDate</code>	<p>Type dateTime</p> <p>Properties Filter, Sort</p> <p>Description The date the account record was last matched and linked to a Data.com record.</p>
<code>LastStatusChangedById</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of who or what last changed the record's <code>Clean Status</code> field value: a Salesforce user or a Clean job.</p>

Field Name	Details
LastStatusChangedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date on which the record's <code>Clean Status</code> field value was last changed.</p>
Latitude	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Used with <code>Longitude</code> to specify the precise geolocation of a billing address. Data not currently provided.</p>
Longitude	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Used with <code>Latitude</code> to specify the precise geolocation of a billing address. Data not currently provided.</p>
NaicsCode	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments into industries, according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the U.S. business economy.</p>
NaicsDescription	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A brief description of an organization's line of business, based on its NAICS code.</p>
Name	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Group, Sort, Update</p> <p>Description Field label is Account Clean Info Name. The name of the account. Maximum size is 255 characters.</p>
NumberOfEmployees	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of employees working at the account.</p>
Ownership	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Ownership type for the account, for example Private, Public, or Subsidiary.</p>
Phone	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The phone number for the account.</p>
PostalCode	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the account.</p>
Sic	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Standard Industrial Classification code of the company's main business categorization, for example, 57340 for Electronics.</p>

Field Name	Details
SicDescription	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A brief description of an organization's line of business, based on its SIC code.</p>
State	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the account.</p>
Street	<p>Type textarea</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the account.</p>
TickerSymbol	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The stock market symbol for the account.</p>
Tradestyle	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A name, different from its legal name, that an organization can use for conducting business. Similar to "Doing business as" (DBA).</p>
Website	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name	Details
	<p>Description The website of the account.</p>
YearStarted	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The year the company was established or the year when current ownership or management assumed control of the company.</p>

Usage

Administrators can modify a limited set of AccountCleanInfo fields from the Account Clean Info page.

Developers can create triggers that read the Account Clean Info fields to help automate the cleaning or related processing of account records. For example, you might create a trigger that reads the `Clean Status` field on the Account object. If an account record's `Clean Status` field value is `Different` but the record has no `Billing Street` value, the trigger could update the record's status to `Not Compared`.

Create triggers that read AccountCleanInfo fields to help automate the cleaning or related processing of account records. For example:

- Keep account records' status `InSync` if the only difference from matched records is the `Phone` format (for example, `(415) 353-8000` on the account record versus `415 353 8000` on the matched Data.com record).

```
trigger AccountPhoneTrigger on Account (before update) {
    for (Account account: Trigger.new) {
        Account oldAccount = Trigger.oldMap.get(account.ID);
        if (account.CleanStatus == 'Different') {
            List <AccountCleanInfo> cleanInfo = [Select Id, IsDifferentPhone,
            IsReviewedPhone, Phone from AccountCleanInfo where AccountId = :account.Id];
            if (cleanInfo.size() > 0 && cleanInfo[0].IsDifferentPhone &&
            cleanInfo[0].Phone.StartsWith('+')) {
                // if Data.com phone number is marked Different but starts with '+',
            ignore this
                // and set the status to "Reviewed"
                AccountCleanInfo cleanInfoToUpdate = new AccountCleanInfo();
                cleanInfoToUpdate.Id = cleanInfo[0].Id;
                cleanInfoToUpdate.IsReviewedPhone = true;
                update cleanInfoToUpdate;
                account.CleanStatus = 'Reviewed';
            }
        }
    }
}
```

- Create a customized set of `Industry` field values for accounts. Use triggers to map values from fields on imported or cleaned records onto a standard set of values.

- Read the `CleanStatus` field value on the Account object. If that value is `Different`, but a Salesforce record has no street address value, update the record's status to `Not Compared`.

AccountContactRole

Represents the role that a Contact plays on an Account.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
<code>AccountId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the Account. This is a relationship field.</p> <p>Relationship Name Account</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>
<code>ContactId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. ID of the Contact associated with this account. This is a relationship field.</p> <p>Relationship Name Contact</p>

Field	Details
	<p>Relationship Type Lookup</p> <p>Refers To Contact</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
IsPrimary	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Specifies whether the Contact plays the primary role on the Account (<code>true</code>) or not (<code>false</code>). Note that each account has only one primary contact role. Label is Primary. Default value is <code>false</code>.</p>
Role	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Name of the role played by the Contact on this Account, such as Decision Maker, Approver, Buyer, and so on. Must be unique—there can't be multiple records in which the <code>AccountId</code>, <code>ContactId</code>, and <code>Role</code> values are identical. Different contacts can play the same role on the same account. A contact can play different roles on the same account.</p>

Usage

Use this object to define the role that a Contact plays on a given Account within the context of a specific Opportunity.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AccountContactRoleChangeEvent (API version 44.0)

Change events are available for the object.

SEE ALSO:

[Account](#)

[Contact](#)

AccountInsight

Represents an individual insight (a key business development) related to an account record.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

To see an insight related to a specific account, users need a Sales Cloud Einstein license and access to the account record. As of the Spring '20 release, Pardot and High Velocity Sales users no longer have access to this object.

Title	<p>Type string</p> <p>Properties Filter, Group, Nillable</p>

Field Name	Details
	<p>Description The title of the insight.</p>
TrendType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The trend type of the insight. Possible values include:</p> <ul style="list-style-type: none"> Negative Positive Informational
Type	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The type of insight. Possible values include:</p> <ul style="list-style-type: none"> M&A activity detected Company is expanding Leadership changes

Usage

This object is read-only and isn't supported with workflows, triggers, or process builder.

AccountOwnerSharingRule

Represents the rules for sharing an account with a User other than the owner.

Note: To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
AccountAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Update</p> <p>Description A value that represents the type of sharing being allowed. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All (This value isn't valid for creating or updating.)
CaseAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of access granted to the target Group for all child cases. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit
ContactAccessLevel	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description A value that represents the type of access granted to the target Group, UserRole, or User for any associated contacts. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit <p> Note: When DefaultContactAccess is set to Controlled by Parent, you can't create or update this field.</p>

Field	Details
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface. This field is available in API version 24.0 and later.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
GroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the source group. An Account owned by a User in the source Group triggers the rule to give access.</p>
OpportunityAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of access granted to the target Group for any associated Opportunity. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit

Field	Details
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface.</p>
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the User or Group being granted access.</p>

Usage

Use this object to manage the sharing rules for accounts. General sharing and territory management-related sharing use this object. For example, the following code creates an account owner sharing rule between two public groups, which can also contain portal users.

```
AccountOwnerSharingRule rule = new AccountOwnerSharingRule();
rule.setName("RuleName"); // Set the sharing rule name
rule.setDeveloperName("RuleDeveloperName"); // Set the sharing rule developer name
rule.setGroupId("00Gx000000000000"); // Set the group of users to share records from
rule.setUserOrGroupId("00Gx000000000001"); // Set the group of users to share records to
rule.setAccountAccessLevel("Edit");
rule.setOpportunityAccessLevel("Read");
rule.setCaseAccessLevel("None");
connection.create(rule);
```

 **Note:** The original territory management feature is now unavailable. For more information, see [The Original Territory Management Module Will Be Retired in the Summer '21 Release](#). The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

[Account](#)

[AccountShare](#)

[Metadata API Developer Guide: SharingRules](#)

AccountPartner

This object represents a partner relationship between two Account records. An AccountPartner record is created automatically when a Partner record is created for a partner relationship between two accounts.

 **Note:** This object is completely distinct from and independent of Account records that have been enabled for the partner portal.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
<code>AccountFromId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the main Account in the partner relationship. This is a relationship field.</p> <p>Relationship Name AccountFrom</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>
<code>AccountToId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the partner Account in the partner relationship. This is a relationship field.</p> <p>Relationship Name AccountTo</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>

Field	Details
IsPrimary	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the AccountPartner is the main account's primary partner (<code>true</code>) or not (<code>false</code>).</p>
OpportunityId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description ID of the opportunity in a partner relationship. This is a relationship field.</p> <p>Relationship Name Opportunity</p> <p>Relationship Type Lookup</p> <p>Refers To Opportunity</p>
ReversePartnerId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the account in a partner relationship.</p>
Role	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The UserRole that the partner Account has on the main Account. For example, <code>Consultant</code> or <code>Distributor</code>.</p>

Creating an Account-Account Partner Relationship

When you create a partner relationship between two accounts (when you create a Partner record and specify the `AccountFromId`), the API automatically creates two AccountPartner records, one for the forward relationship and one for the reverse. For example, if you

create a Partner relationship with “Acme, Inc.” as the `AccountFromId` and “Acme Consulting” as the `AccountToId`, the API automatically creates two `AccountPartner` records:

- The forward relationship `AccountPartner` with “Acme, Inc.” as the `AccountFromId` and “Acme Consulting” as the `AccountToId`.
- The reverse relationship `AccountPartner` with “Acme Consulting” as the `AccountFromId` and “Acme, Inc.” as the `AccountToId`.
- The value of the `Role` field in the reverse relationship `AccountPartner` is set to the `PartnerRole` record `ReverseRole` value associated with the value of the `Role` field in the forward relationship `AccountPartner`.

This mapping allows the API to manage the records and their relationships efficiently.

SEE ALSO:

[Partner](#)

[OpportunityPartner](#)

AccountRelationship

Represents a relationship of a given type between two accounts. This object is available in API version 45.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

In Digital Experience Settings, turn on the Enable Account Relationships org preference, which is off by default.

Fields

Field	Details
<code>AccountFromId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort,</p> <p>Description ID of the account that will gain access to data from <code>AccountTo</code>.</p>
<code>AccountToId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the account sharing data with <code>AccountFrom</code>.</p>

Field	Details
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (LastReferencedDate) but not viewed it.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of the account relationship.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the user who created the account relationship.</p>
Type	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description The relationship type. All account relationship sharing rules of that type will be applied to this account relationship.</p> <p>Standard values are:</p> <ul style="list-style-type: none"> • System Integrator • Agency

Field	Details
	<ul style="list-style-type: none"> • Advertiser • Reseller • Distributor • Developer • Broker • Lender • Institution • Contractor • Dealer • Consultant • Client • Vendor • Agent • Retailer • SubContractor • Supplier <p>Picklist items can be updated with your own values.</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

[AccountRelationshipFeed](#)

Feed tracking is available for the object.

[AccountRelationshipHistory](#)

History is available for tracked fields of the object.

[AccountRelationshipOwnerSharingRule](#)

Sharing rules are available for the object.

[AccountRelationshipShare](#)

Sharing is available for the object.

AccountRelationshipShareRule

Represents the rule that determines which object records are shared, how they are shared, the account relationship type that shares the records, and the level of access granted to the records. This object is available in API version 45.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
AccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Type of access granted by the share rule. Valid values are:</p> <ul style="list-style-type: none"> • Read (Read Only) • Edit (Read/Write)
AccountToCriteriaField	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Criteria that must be met for the data to be shared. Possible values are:</p> <ul style="list-style-type: none"> • Account.OwnerId • Account.ParentId • Campaign.OwnerId • Case.AccountId • Case.OwnerId • Contact.AccountId • Contact.OwnerId • Lead.ConvertedAccountId • Lead.OwnerId • Lead.PartnerAccountId • Opportunity.AccountId • Opportunity.OwnerId • Opportunity.PartnerAccountId • Order.AccountId • Order.ActivatedById • Order.CompanyAuthorizedById • Order.OwnerId • PartnerFundAllocation.CreatedById • PartnerFundAllocation.ChannelPartnerId • PartnerFundAllocation.OwnerId • PartnerFundClaim.CreatedById

Field	Details
	<ul style="list-style-type: none"> • PartnerFundClaim.OwnerId • PartnerFundRequest.ChannelPartnerId • PartnerFundRequest.CreatedById • PartnerFundRequest.OwnerId • PartnerMarketingBudget.CreatedById • PartnerMarketingBudget.ChannelPartnerId • PartnerMarketingBudget.OwnerId
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A meaningful explanation of the sharing rule.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The unique name of the record in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated but you can supply your own value if you create the record using the API.</p> <p> Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
EntityType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The type of data shared by this rule. Values are:</p> <ul style="list-style-type: none"> • Account • Campaign • Case • Contact

Field	Details
	<ul style="list-style-type: none"> • Lead • Opportunity • Order • PartnerFundAllocation • PartnerFundClaim • PartnerFundRequest • PartnerMarketingBudget
Language	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language of the account relationship share rule.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The label assigned to the sharing rule to identify it.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> • In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

Field	Details
StaticFormulaCriteria	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A way to further filter what data gets shared. This must be a deterministic formula and spanning is not allowed.</p>
Type	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Must match the type of an account relationship for data to be shared according to the AccountToCriteriaField and the StaticFormulaCriteria.</p>

AccountShare

Represents a sharing entry on an Account.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only users with access to the Account object can access this object.

Special Access Rules

Customer Portal users can't access this object.

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field	Details
AccountAccessLevel	<p>Type picklist</p>

Field**Details****Properties**

Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update

Description

Level of access that the User or Group has to the Account. The possible values are:

- Read
- Edit
- All (This value isn't valid for create or update calls.)

This field must be set to an access level that is at least equal to the organization's default Account access level. In addition, either this field, the `OpportunityAccessLevel` field, or the `CaseAccessLevel` field must be set higher than the organization's default access level.

AccountId

Type

reference

Properties

Create, Filter, Group, Sort

Description

ID of the Account associated with this sharing entry. This field can't be updated.

This is a relationship field.

Relationship Name

Account

Relationship Type

Lookup

Refers To

Account

CaseAccessLevel

Type

picklist

Properties

Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update

Description

Level of access that the User or Group has to cases associated with the account. The possible values are:

- None
- Read
- Edit

This field must be set to an access level that is at least equal to the organization's default `CaseAccessLevel`. This field can't be updated via the API if the `AccountAccessLevel` field is set to `All`. You can't update this field for the associated account owner via the API. You must update the account owner's `CaseAccessLevel` via the Salesforce user interface.

Field	Details
ContactAccessLevel	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Level of access that the User or Group has to contacts associated with the account. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit <p>This field must be set to an access level that is at least equal to the organization's default ContactAccessLevel. This field can't be updated via the API if the ContactAccessLevel field is set to "Controlled by Parent." You can't update this field for the associated account owner using the API. You must update the account owner's ContactAccessLevel via the Salesforce user interface.</p>
OpportunityAccessLevel	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Level of access that the User or Group has to opportunities associated with the Account. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit <p>This field must be set to an access level that is at least equal to the organization's default opportunity access level. This field can't be updated via the API if the AccountAccessLevel field is set to All. You can't use the API to update this field for the associated Account owner. You must update the Account owner's opportunityAccessLevel via the Salesforce user interface.</p>
RowCause	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to Manual (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.</p> <p>Valid values include:</p>

Field	Details
	<ul style="list-style-type: none"> • <code>Manual</code>—The User or Group has access because a User with “All” access manually shared the Account with the user or group. • <code>Owner</code>—The User is the owner of the Account • <code>Team</code>—The User or Group has team access (is an AccountTeamMember). • <code>Rule</code>—The User or Group has access via an Account sharing rule. • <code>GuestRule</code>—The user or group has access via an Account guest user sharing rule. • <code>ImplicitParent</code>—The User or Group has access because they’re the owner of or have sharing access to records related to the account, such as opportunities, cases, contacts, contracts, or orders. • <code>GuestParentImplicit</code>—The guest user has access because they have access to records related to the Account, such as opportunities, cases, contacts, contracts, or orders. • <code>LpuParentImplicit</code>—The User has access because they have access to records related to the Account, which are owned by high-volume Experience Cloud site users and shared via a share group. • <code>LpuImplicit</code>—The User has access to records owned by high-volume Experience Cloud site users via a share group. • <code>PortalImplicit</code>—The Account is associated with the portal user. • <code>ARImplicit</code>—The User, who belongs to a partner or customer account, has access to the Account via an account relationship data sharing rule. • <code>Territory2AssociationManual</code>—With Enterprise Territory Management in API version 44.0 and earlier, the <code>TerritoryManual</code> reason code was written to AccountShare records when you manually assigned an account to a territory. In API version 45.0 and later, <code>Territory2AssociationManual</code> replaces all instances of <code>TerritoryManual</code>, and the <code>Territory2AssociationManual</code> reason code is written to AccountShare records when you manually assign an account to a territory. • <code>Territory</code>—The territory has access via a territory assignment rule. • <code>TerritoryManual</code>—Deprecated starting in API version 45.0 and replaced by the <code>Territory2AssociationManual</code> value.

UserOrGroupId

Type

reference

Properties

Create, Filter, Group, Sort

Description

ID of the User or Group that has been given access to the Account. This field can't be updated.

This is a polymorphic relationship field.

Relationship Name

UserOrGroup

Relationship Type

Lookup

Field	Details
	<p>Refers To</p> <p>Group, User</p>

Usage

This object allows you to determine which users and groups can view or edit Account records owned by other users.

If you attempt to create an AccountShare record that matches an existing record, the request updates any modified fields and returns the existing record.

For example, the following code finds all accounts owned by a user and manually shares them to a portal user.

```
QueryResult result = conn.query("SELECT Id FROM Account WHERE OwnerId = '005D0000001LPFB'");
// Create a new AccountShare object
List<AccountShare> shares = new ArrayList<AccountShare>();
for (SObject rec : result.getRecords()) {
    AccountShare share = new AccountShare();
    share.setAccountId(rec.getId());
    //Set the portal user Id to share the accounts with
    share.setUserOrGroupId("003D000000QA8T1");
    share.setAccountAccessLevel("Edit");
    share.setOpportunityAccessLevel("Read");
    share.setCaseAccessLevel("Edit");
    shares.add(share);
}
conn.create(shares.toArray(new AccountShare[shares.size()]));
```

This code shares the accounts that the user owns at the time, but not those accounts that are owned later. For these types of shares, use an owner-based sharing rule, such as [AccountOwnerSharingRule](#).

If an account is shared in multiple ways with a user, you don't always see multiple sharing records. If a user has access to an account for one or more of the following RowCause values, the records in the AccountShare object are compressed into one record with the highest level of access.

- `ImplicitParent`
- `Manual`
- `Owner`

[Account](#)

[CaseShare](#)

[LeadShare](#)

[OpportunityShare](#)

AccountTag

Associates a word or short phrase with an Account.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ItemId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description ID of the tagged item.</p>
Name	<p>Type string</p> <p>Properties Create, Filter</p> <p>Description Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>
TagDefinitionId	<p>Type reference</p> <p>Properties Filter</p> <p>Description ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Restricted picklist</p> <p>Description Defines the visibility of a tag.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

AccountTag stores the relationship between its parent TagDefinition and the Account being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

AccountTeamMember

Represents a User who is a member of an Account team.

See also UserAccountTeamMember, which represents a User who is on the default account team of another user.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- This object is available only for Enterprise, Unlimited, and Performance Edition users who have enabled the account team functionality.
- Customer Portal users can't access this object.

Fields

Field Name	Details
AccountAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Level of access that the User has to the Account. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All <p>This field must be set to an access level that is at least equal to the organization's default Account access level. In addition, the users's AccountAccessLevel, ContactAccessLevel, OpportunityAccessLevel, or CaseAccessLevel field must be set higher than the organization's default access level.</p>
AccountId	<p>Type reference</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the Account to which this user is a team member. Must be a valid account ID.</p>
CaseAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Level of access that the User has to cases associated with the account. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit <p>This field must be set to an access level that is at least equal to the organization's default case access level. In addition, the users's <code>AccountAccessLevel</code>, <code>ContactAccessLevel</code>, <code>OpportunityAccessLevel</code>, or <code>CaseAccessLevel</code> field must be set higher than the organization's default access level. This field is available in API version 37.0 and later.</p>
ContactAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Level of access that the User has to contacts associated with the account. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit • Controlled By Parent <p>This field must be set to an access level that is at least equal to the organization's default contact access level. In addition, the users's <code>AccountAccessLevel</code>, <code>ContactAccessLevel</code>, <code>OpportunityAccessLevel</code>, or <code>CaseAccessLevel</code> field must be set higher than the organization's default access level. If the org-wide default for contacts is set to Controlled By Parent, users can't see or edit the Contact Access field. This field is available in API version 37.0 and later.</p>
CurrencyIsoCode	<p>Type picklist</p>

Field Name	Details
	<p>Properties Filter, Restricted picklist</p> <p>Description Available only for orgs with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the org.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p> <p> Note: An AccountTeamMember record that is deleted is not moved to the Recycle Bin. A deleted AccountTeamMember record can't be undeleted unless the record was cascade-deleted when deleting a related Account. For directly deleted AccountTeamMember records, don't use the <code>isDeleted</code> field to detect deleted records in SOQL queries or <code>queryAll()</code> calls.</p> <p>The <code>getDeleted()</code> call also doesn't show deleted account team members unless the record was deleted from an account related list or the Developer Console.</p>
OpportunityAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Level of access that the User has to opportunities associated with the account. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit <p>This field must be set to an access level that is at least equal to the organization's default opportunity access level. In addition, the user's <code>AccountAccessLevel</code>, <code>ContactAccessLevel</code>, <code>OpportunityAccessLevel</code>, or <code>CaseAccessLevel</code> field must be set higher than the organization's default access level. This field is available in API version 37.0 and later.</p>
PhotoURL	<p>Type URL</p> <p>Properties Filter, Nillable, Sort, Group</p>

Field Name	Details
	<p>Description Read only. Retrieves the users Chatter photo URL. This field is available in API version 37.0 and later.</p>
TeamMemberRole	<p>Type picklist</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Role associated with this team member. One of the valid team member roles defined for your organization. Label is Team Role.</p>
Title	<p>Type string</p> <p>Properties Filter, Nillable, Sort, Group</p> <p>Description Read only. Retrieves the user's title. This field is available in API version 37.0 and later.</p>
UserId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description Required. ID of the User who is a member of this account team. Must be a valid User ID.</p>

Usage

Use this object to manage the team members of a particular Account and to specify team member roles for those users on that account.

If team members are added by a user with group-based access, those members are removed after an account's owner is changed. This applies even if the **Keep account team** option is selected. A Salesforce admin, the account owner, or someone higher in the role hierarchy should add team members to keep team members related to the account.

If you use [SOQL statements to query all records in an organization](#), the ALL ROWS keywords don't query deleted account team member records.

SEE ALSO:

[Account](#)

AccountTerritoryAssignmentRule

An account assignment rule that assigns accounts to territories based on account fields. Only available if territory management has been enabled for your organization.

 **Note:** The original territory management feature is now unavailable. For more information, see [The Original Territory Management Module Will Be Retired in the Summer '21 Release](#). The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Spring '20 and later, only users with the View Setup and Configuration permission can access this object, and only users with the Manage Territories permission can edit this object.

Fields

Field	Details
<code>BooleanFilter</code>	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Advanced filter conditions that were specified for the rule in the online application. For example, "(1 AND 2) OR 3."</p>
<code>IsActive</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Update</p> <p>Description Indicates whether the rule is active (<code>true</code>) or inactive (<code>false</code>). Via the API, active rules run automatically when new accounts are created and existing accounts are edited. The exception is when the <code>IsExcludedFromRealign</code> field on an account is <code>true</code>, which prevents account assignment rules from evaluating that account.</p>
<code>IsInherited</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Update</p>

Field	Details
	<p>Description</p> <p>Indicates whether the rule is an inherited rule (<code>true</code>) or a local rule (<code>false</code>). An inherited rule also acts upon territories below it in the territory hierarchy. A local rule is created at the immediate territory and only impacts the immediate territory.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Update</p> <p>Description</p> <p>A name for the rule. Limit is 80 characters.</p>
TerritoryId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Update</p> <p>Description</p> <p>ID of the territory where accounts that satisfy this rule are assigned.</p>

Usage

A territory will not have any accounts (with the exception of manually assigned accounts) unless at least one account assignment rule is active for the territory.

SEE ALSO:

[AccountTerritoryAssignmentRuleItem](#)

[Territory](#)

[UserTerritory](#)

AccountTerritoryAssignmentRuleItem

A row of selection criteria for an AccountTerritoryAssignmentRule object. Only available if territory management has been enabled for your organization.

Note: The original territory management feature is now unavailable. For more information, see [The Original Territory Management Module Will Be Retired in the Summer '21 Release](#). The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

AccountTerritoryAssignmentRuleItem can be created or deleted if the `BooleanFilter` field on its corresponding AccountTerritoryAssignmentRule object is a null value.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Spring '20 and later, only users with the View Setup and Configuration permission can access this object, and only users with the Manage Territories permission can edit this object.

Fields

Field	Details
Field	<p>Type picklist</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The standard or custom account field to use as a criteria.</p>
Operation	<p>Type picklist</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The criteria to apply, such as "equals" or "starts with."</p>
RuleID	<p>Type reference</p> <p>Properties Create, Filter, Update</p> <p>Description ID of the associated AccountTerritoryAssignmentRule.</p>
SortOrder	<p>Type int</p> <p>Properties Create, Filter, Update</p> <p>Description The order in which this row is evaluated compared to other AccountTerritoryAssignmentRuleItem objects for the given AccountTerritoryAssignmentRule.</p>

Field	Details
Value	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The field value(s) to evaluate, such as 94105 if the Field is Billing Zip/Postal Code.</p>

Usage

- Both standard and custom account fields can be used as criteria for account assignment rules.
- A territory will not have any accounts (with the exception of manually assigned accounts) unless at least one account assignment rule is active for the territory.

SEE ALSO:

[AccountTerritoryAssignmentRule](#)

[Territory](#)

[UserTerritory](#)

AccountTerritorySharingRule

Represents the rules for sharing an Account within a Territory.

-  **Note:** The original territory management feature is now unavailable. For more information, see [The Original Territory Management Module Will Be Retired in the Summer '21 Release](#). The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
AccountAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of sharing being allowed. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All
CaseAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of access granted to the target group for all child cases of the account. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit
ContactAccessLevel	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description A value that represents the type of access granted to the target group for all related contacts on the account. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit <p> Note: This field is read only.</p>
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</p>
DeveloperName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface. This field is available in API version 24.0 and later.</p> <p> Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p>
GroupId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>The ID representing the source group. Accounts owned by users in the source territory trigger the rule to give access.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface.</p>
OpportunityAccessLevel	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Restricted picklist, Sort, Update</p>

Field	Details
	<p>Description</p> <p>A value that represents the type of access granted to the target group for all opportunities associated with the account. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit
UserOrGroupId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>The ID representing the user or group being given access, or, if a territory ID, the users assigned to that territory.</p>

Usage

Use this object to manage the sharing rules for a particular object. General sharing and Territory-related sharing use this object.

SEE ALSO:

[Account](#)

[AccountShare](#)

AccountUserTerritory2View

Represents the view of the Users in Assigned Territories related list in Lightning Experience. Available in API version 42.0 and later.

Note: This information applies to Enterprise Territory Management and not to the original territory management feature.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

As of Summer '20 and later, only standard and partner users can access this object.

Fields

Field Name	Details
AccountId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Unique identifier for the account associated with the Users in Assigned Territories related list.</p>
RoleInTerritory2	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The role of each user in the Users in Assigned Territories related list.</p>
Territory2Id	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Unique identifier for each territory in the Users in Assigned Territories related list.</p>
UserId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Unique identifier for each user in the Users in Assigned Territories related list.</p>

Usage

Use this object to show the users who are assigned to the territories assigned to an account.

A filter criterion with one `AccountId` is required when you execute a SOQL query on this object.

ActionCadence

Represents the definition of a 1 cadence. This object is available in API version 45.0 and later.

Use ActionCadence and its related objects to learn about an action cadence, including:

- The current state of the action cadence.
- The steps that the action cadence contains.
- Which leads, contacts, or person accounts are assigned to the action cadence.

The ActionCadence, ActionCadenceStep, ActionCadenceRule, and ActionCadenceRuleCondition objects define an action cadence and the steps that it contains. ActionCadenceTracker and ActionCadenceStepTracker track a prospect's movement through an active action cadence.

By learning when the action cadence objects are created and deleted, you can make the most of the action cadence API.

- An ActionCadence record is created when you use the High Velocity Sales app to create a sales cadence.
- An ActionCadenceStep record is created to represent a step. If the step is a branch step, then corresponding ActionCadenceRule and ActionCadenceRuleCondition records are also created.
- An ActionCadenceTracker record is created when you assign a prospect to an action cadence.
- An ActionCadenceStepTracker record is created each time the prospect moves to a new step.

All of these action cadence records exist until you use the High Velocity Sales app to delete an action cadence. If many prospects have been assigned to the action cadence, there can be many associated ActionCadenceTracker and ActionCadenceStepTracker records. In this case, deleting the action cadence can take some time. While the action cadence is being deleted, the ActionCadence record is in the Deleting state.

Supported Calls

`delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`,

Fields

Field	Details
ActivatedDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The date that the user activated the action cadence. ActionCadence objects are created in a draft state and must be manually activated before they're used.</p>
Description	<p>Type textarea</p> <p>Properties Nillable, Update</p> <p>Description The description of this action cadence.</p>
ErrorMessage	<p>Type string</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description If there was an error when activating the action cadence, this field contains the error message.</p>
FolderId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the folder that contains the action cadence. Available in API version 49.0 and later. This is a polymorphic relationship field.</p> <p>Relationship Name Folder</p> <p>Relationship Type Lookup</p> <p>Refers To Folder, Organization, User</p>
FolderName	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The name of the folder that contains the action cadence. Available in API version 49.0 and later.</p>
LastEditedDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The date and time this object was last edited.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date this object was last referenced.</p>

Field	Details
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date this action cadence was last viewed in the High Velocity Sales app.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort, Update</p> <p>Description The name of this action cadence. Every action cadence in an org must have a unique name.</p>
OwnerId	<p>Type reference</p> <p>Properties Filter, Group, Sort, Update</p> <p>Description The ID of the owner of the action cadence (typically the user who created it).</p> <p> Note: To change the owner of an action cadence, the new owner must have read access to action cadences enabled in their user profile.</p>
State	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description This entity's state. Possible values are:</p> <ul style="list-style-type: none"> • Active The user finished modifying the action cadence and has activated it. At this point, you can't make any more changes to the steps in the action cadence. • Deleting All records associated with this action cadence, including the ActionCadence record and all its related records, are being deleted. While in this state, the ActionCadence can't be attached to a prospect. • Draft ActionCadence objects are in the draft state when they're created. In this state, the ActionCadence can't be assigned to any prospect.

Field	Details
	<ul style="list-style-type: none"> Error An error occurred while trying to activate the action cadence. Inactive The user deactivated the action cadence. New targets can't be added to the action cadence. Existing targets continue in the action cadence until completion.

Usage

Use ActionCadence to learn how many action cadences are currently active:

```
select COUNT() from ActionCadence where State="Active"
```

Retrieve all ActionCadence records that have "West Coast" in their name:

```
SELECT ActionCadenceId FROM ActionCadence WHERE NAME LIKE '[West Coast Cadence]%'
```

Retrieve all ActionCadence records owned by a specific user:

```
SELECT ActionCadenceId FROM ActionCadence WHERE OwnerId = '<owner id>'
```

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ActionCadenceChangeEvent (API version 48.0)

Change events are available for the object.

[ActionCadenceStepTracker](#)

ActionCadenceRule

Represents the logic that a branch step uses to determine which branch an action cadence tracker follows in an action cadence. Use ActionCadenceRule to learn about a branch step, including its logic and what the next step is. This object is available in API version 48.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
ActionCadenceStepId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ActionCadenceStep that this rule is associated with.</p>
ConditionLogic	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The logical operator used to evaluate the rule conditions. Possible values are:</p> <ul style="list-style-type: none"> • AND <p>If this rule has several conditions, all of them must be <code>true</code> for this step to be <code>true</code>.</p>
GlobalEventType	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description If the action cadence rule contains a global exit condition, this field contains the type of event that the rule represents.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • EmailReply • EmailHardBounce • EmailSoftBounce • CallMeaningfulConnect • CallNotInterested • CallUnqualified • CallLeftVoicemail • CallCallBackLater <p>This field is available in API version 49.0 and later.</p>
GraphState	<p>Type picklist</p>

Field	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Represents the state of the <code>ActionCadenceRule</code> within the step graph, or sequence, of the related action cadence. Available in API version 53.0 and later.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <code>Included</code>—This step rule is part of the step graph. <code>Orphaned</code>—This step rule was removed from the step graph before the action cadence was activated. Orphaned step rules are deleted upon activation. <code>Pending</code>—This step rule has been created but hasn't been added to the step graph. Pending step rules can be added to the step graph in the future. <code>Retired</code>—This step rule was previously part of an active action cadence step graph and was removed during an edit after activation. Retired step rules can have associated step trackers.
<code>OutcomeNextStepName</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The next step in the action cadence if this rule evaluates as <code>true</code>. If this rule evaluates as <code>false</code>, the next step is <code>ActionCadenceStep.BranchDefaultStepName</code>.</p>
<code>ParentRuleName</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The value of the <code>RuleName</code> field of the previous rule in the action cadence. Must contain a valid rule name value unless this rule is the root rule. <code>null</code> if this rule is a root rule.</p> <p>This field is available in API version 49.0 and later.</p>
<code>RuleName</code>	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The name given to the rule. Every rule in an action cadence must have a unique name.</p>
<code>RuleType</code>	<p>Type picklist</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of step that this rule applies to. Possible values are:</p> <ul style="list-style-type: none"> • <code>BranchStep</code> — The rule evaluates the condition of a branch step. A branch step is an <code>ActionCadenceStep</code> record with the field <code>type</code> equal to <code>Branch</code>. • <code>RootStep</code> — The rule evaluates a global exit condition. <p>This field is available in API version 49.0 and later.</p>

Usage

Use `ActionCadenceRule` to see all the rules associated with a branch step:

```
select RuleName from ActionCadenceRule where ActionCadenceStep.ActionCadence.Name = "High Priority CFO"
```

SEE ALSO:

ActionCadenceRuleCondition

Represents the logic for a branch step. This object is available in API version 48.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
<code>ActionCadenceRuleId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the <code>ActionCadenceRule</code> that this condition is associated with.</p>

Field	Details
Operator	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The conditional operator for this rule. Possible values are:</p> <ul style="list-style-type: none"> • Equal
Resource	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The field to evaluate. Possible values are:</p> <ul style="list-style-type: none"> • CallDispositionCategory Use by branch steps. • EmailEngagement Used by ListenerBranch steps.
RuleConditionName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The name of the rule condition. Every rule condition in a sales cadence must have a unique name.</p>
Value	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The event that your sales cadence rule condition listens for to decide when the event is complete.</p> <p>Possible values for emails are:</p> <ul style="list-style-type: none"> • EmailOpen • EmailLinkClick <p>Possible values for calls are:</p> <ul style="list-style-type: none"> • CallMeaningfulConnect

Field	Details
	<ul style="list-style-type: none"> • CallUnqualified • CallLeftVoicemail • CallNotInterested • CallCallBackLater

Usage

Use ActionCadenceRuleContion to see all the rule conditions associated with a branch step:

```
select RuleConditionName from ActionCadenceRuleCondition where ActionCadenceStepId= <ID of a branch step>
```

SEE ALSO:

- [ActionCadence](#)
- [ActionCadenceRule](#)
- [ActionCadenceStep](#)
- [ActionCadenceStepTracker](#)

ActionCadenceStep

Represents a step in a sales cadence. Use ActionCadenceStep to learn which steps belong to a sales cadence, and how the steps are connected to each other. This object is available in API version 48.0 and later.

An ActionCadenceStep record is created to represent a step. If the step is a branch step, then corresponding ActionCadenceRule and ActionCadenceRuleCondition records are also created.

 **Note:** An ActionCadenceStep with `IsOrphan` equal to `true` can be part of a sales cadence but is never executed. To retrieve the steps that can be executed by the sales cadence, query for ActionCadenceStep records with `IsOrphan` equal to `false`. ActionCadenceStep records with `IsOrphan` equal to `true` are deleted.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
ActionCadenceId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p>

Field	Details
	<p>Description The ID of the ActionCadence that this step belongs to.</p>
AllCallsCallBackLater	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls having the call outcome Call Back Later.</p>
AllCallsLeftVoicemail	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls having the call outcome Left Voicemail.</p>
AllCallsMeaningfulConnect	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls having the call outcome Meaningful Connect.</p>
AllCallsNotInterested	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls having the call outcome Not Interested.</p>
AllCallsUncategorized	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls where the call outcome isn't categorized.</p>
AllCallsUnqualified	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description The number of calls having the call outcome Unqualified.</p>
AllEmailsBouncedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails that weren't delivered successfully.</p>
AllEmailsDeliveredCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails delivered.</p>
AllEmailsHardBouncedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails returned for a permanent reason — for example, the email address doesn't exist. This field is available in API version 50.0 and later.</p>
AllEmailsLinkClickedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of links inside an email that the sales rep clicked during this step. Multiple clicks on the same link count towards this total. This field is available in API version 50.0 and later.</p>
AllEmailsOpenedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails that the sales rep opened while working on this step. Multiple opens of the same email count towards this total.</p>

Field	Details
AllEmailsOutOfOfficeCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails that were returned because the recipient set an out-of-office responder. Multiple replies count towards this total. This field is available in API version 50.0 and later.</p>
AllEmailsRepliedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails that the sales reps replied to as part of this step. Multiple replies to the same email count towards this total, This field is available in API version 50.0 and later.</p>
AllEmailsSentCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of sent emails.</p>
AllEmailsSoftBouncedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails that were returned for temporary reasons — for example, the email is too large. This field is available in API version 50.0 and later.</p>
AllManuallyCompletedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of steps manually completed.</p>
AllOnTimeCompletedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description The number of steps completed on time.</p>
AllOverdueCompletedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of overdue steps that were completed.</p>
AllSkippedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of steps skipped.</p>
AllTotalCallsCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls that the sales rep made during this step.</p>
BranchDefaultStepName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the default step.</p>
ChainedCadenceId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the ActionCadence for the linked action cadence. Available only if the step type is <code>DaisyChain</code> (meaning that another action cadence is connected to this action cadence).</p>
GoToStepName	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description If this step's original next step was removed during an edit after activation, this field specifies the updated next step.</p>
GraphState	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Represents the state of the <code>ActionCadenceStep</code> within the step graph, or sequence, of the action cadence.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • <code>Included</code>—This step is part of the step graph. • <code>Orphaned</code>—This step was removed from the step graph before the action cadence was activated. Orphaned steps are deleted upon activation. • <code>Pending</code>—This step has been created but hasn't been added to the step graph. Pending steps can be added to the step graph in the future. • <code>Retired</code>—This step was previously part of an active action cadence step graph and was removed during an edit after activation. Retired steps can have associated step trackers.
HasVariant	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description This field is valid for email and call step types. If <code>true</code>, the step has email or call template variants. The template variants are defined in <code>ActionCadenceStepVariant</code> records. Available in API version 53.0 and later.</p> <p>The default value is 'false'.</p>
IsImmediateWakeUp	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description</p>
IsOrphan	<p>Type boolean</p>

Field	Details
	<p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If <code>true</code>, this step isn't executed by the action cadence and will be deleted. Steps with <code>IsOrphan</code> equal to <code>true</code> have <code>ParentStepName</code> equal to <code>null</code>.</p> <p> Note: To retrieve the active steps in an action cadence, include <code>IsOrphan=false</code> in your query.</p> <p>The default value is false.</p> <p>This field is available in API version 49.0 and later.</p>
IsThreaded	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description This field is valid for email steps. Email steps have <code>ActionCadence.StepType</code> equal to <code>SendAnEmail</code>. If <code>true</code>, the email for this email step is sent as a reply to the email conversation from the previous email step. By sending the email as a reply to a previous email, customers see a "conversation" view of the emails. Only emails from the same action cadence are grouped as conversations.</p> <p>This field can't be true for the first email step in an action cadence, because the first email from an action cadence must start a new conversation with the prospect.</p> <p>The default value is false. This field is available in API version 49.0 and later.</p>
ParentStepName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The step name (<code>ActionCadenceStep.StepName</code>) of the previous step in the action cadence. Must contain a valid step name value unless this step is the root step. <code>null</code> if this step is a parent step.</p>
RootStepId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the root step for this action cadence. Every action cadence has exactly one root step (so that the Salesforce api can find all the steps for this cadence).</p>

Field	Details
StepComments	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description A comment that provides additional information about this step.</p>
StepName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Unique identifier for this step. Generated by Salesforce.</p>
StepTitle	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The title given to the step when it was created.</p>
TemplateId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description If a template was added to this step, this field contains the template's ID. For example, if this step is a call step it can contain a template for a call script. Or, if this step is an email step, it can contain a template for an email.</p>
Type	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The type of step. Possible values are:</p> <ul style="list-style-type: none"> • <code>AutoSendAnEmail</code> — Salesforce automatically sends the specified email. • <code>Branch</code> — A branch step in the action cadence. • <code>CreateTask</code> — Used for custom steps. • <code>DaisyChain</code> — A daisy chain step. A daisy chain step connects this action cadence to another action cadence. It must be the last step in the path.

Field	Details
	<ul style="list-style-type: none"> • <code>ListenerBranch</code> — A branch step for emails. • <code>MakeACall</code> — The sales rep must call the prospect at this step. • <code>Root</code> — This step is the root step for the action cadence. • <code>SendAnEmail</code> — The sales rep must send the prospect an email at this step. • <code>Wait</code> — A wait step tells the sales rep not to do anything at this point in the action cadence.
<code>UniqueEmailsLinkClickedCount</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of links inside an email that the sales rep clicks during this step. Multiple clicks on the same link aren't counted. This field is available in API version 50.0 and later.</p>
<code>UniqueEmailsOpenedCount</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails that the sales rep opens as part of this step. Multiple openings of the same email aren't counted. This field is available in API version 50.0 and later.</p>
<code>UniqueEmailsRepliedCount</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails that the sales rep replies to as part of this step. Multiple replies to the same email aren't counted. This field is available in API version 50.0 and later.</p>
<code>WaitTimeInSeconds</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Required if the step type is <code>wait</code>. The time in seconds for this step to wait.</p>

Usage

Use ActionCadenceStep to see what steps your action cadence has:

```
select StepTitle from ActionCadenceStep where ActionCadence.ID= <the id of an action cadence> and IsOrphan=false
```

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ActionCadenceStepChangeEvent (API version 48.0)

Change events are available for the object.

SEE ALSO:

[ActionCadenceRuleCondition](#)

[ActionCadenceStepTracker](#)

ActionCadenceStepTracker

Represents a step in an active sales cadence for a specific sales cadence target. This object is available in API version 48.0 and later.

An ActionCadenceStepTracker record is created when a target moves to a new step in a sales cadence. Use ActionCadenceStepTracker to find information such as the step's current state, the reason it completed, and its type.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
ActionCadenceId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the ActionCadence that is related to the ActionCadenceStep.</p>
ActionCadenceName	<p>Type string</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the related ActionCadence object.</p>
ActionCadenceStepId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ActionCadenceStepTracker is the runtime version of an ActionCadenceStep. This field contains the ID of the related ActionCadenceStep.</p>
ActionCadenceTrackerId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the related ActionCadenceTracker.</p>
ActionTakenDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time that the action described in this step was taken.</p>
CompletedById	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The user ID of the sales rep who completed this step. A step can be assigned to several users before it's completed. This field is available in API version 50.0 and later.</p>
CompletionDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date this step completed. A step is completed either when the action is taken, or the step is skipped.</p>

Field	Details
CompletionReason	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The reason that this step completed: Possible values are:</p> <ul style="list-style-type: none"> • <code>AutomaticallyCompleted</code> — the sales rep successfully completed this step and moved to the next one. Salesforce automatically marks this step as completed. • <code>AutomaticallyExited</code> — the step exited because a global exit condition occurred. This value is available in API version 49.0 and later. • <code>ManuallyCompleted</code> — the sales rep manually marked this step as completed. • <code>ManuallySkipped</code> — the sales rep skipped this step.
DueDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Some steps have a due date to indicate when they must be completed. If this step has been assigned a due date, this field contains the date and time it is due.</p>
IsActionTaken	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description <code>true</code> if the sales rep completed an action during this step, such as making a phone call, otherwise <code>false</code>.</p>
SecondsOverdue	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description If this step has a due date that has passed, this field contains the number of seconds that has elapsed since the due date.</p>
State	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p>

Field	Details
	<p>Description</p> <p>The current state of this step. Possible values are:</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • <code>Active</code> — the current step that the sales rep is performing. There can only be one active step for a given target. • <code>Cancelled</code> — the sales rep canceled the step. Salesforce doesn't run any canceled steps. • <code>Completed</code> — this step is finished. Either the work in the step completed, or the step was skipped. • <code>Error</code> — an error occurred while executing this step. • <code>InProgress</code> — the sales rep has started the step, but it isn't yet completed. • <code>Paused</code> — the sales rep paused the step. • <code>Scheduled</code> — used for email steps. An email can be scheduled to be sent later. • <code>Queued</code> — used for automated email steps. The email step has started but the email is waiting in the queue to be sent.
StepTitle	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The name of the related step.</p>
StepType	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>The type of step to execute. Possible values are:</p> <ul style="list-style-type: none"> • <code>AutoSendAnEmail</code> • <code>Branch</code> • <code>CreateTask</code> • <code>DaisyChain</code> • <code>ListenerBranch</code> • <code>MakeACall</code> • <code>Root</code> • <code>SendAnEmail</code> • <code>Wait</code>

Field	Details
TargetId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the prospect that is assigned to this sales cadence.</p>
WasEverPaused	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the sales rep had ever paused this step (<code>true</code>), or not (<code>false</code>). This field is available in API version 50.0 and later.</p>

Usage

List all the steps that this prospect has completed in a given sales cadence:

```
select StepTitle from ActionCadenceStepTracker where TargetID = <target ID> and
ActionCadenceId=<action cadence id> and StepType="Completed"
```

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ActionCadenceStepTrackerChangeEvent (API version 48.0)

Change events are available for the object.

ActionCadenceStepVariant

Represents an email template or call script variant associated with an action cadence step. Email and call steps can have up to 3 variants associated so sales teams can compare the engagement results. This object is available in API version 53.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

High Velocity Sales and Allow Email Template and Call Script Variant Testing must be enabled.

Fields

Field	Details
ActionCadenceStepId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the related action cadence step. This is a relationship field.</p> <p>Relationship Name ActionCadenceStep</p> <p>Relationship Type Lookup</p> <p>Refers To ActionCadenceStep</p>
SplitPercentage	<p>Type percent</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The percentage of emails to send or calls to make using this email template or call script variant. The total for all variants must be 100%.</p>
TemplateId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the associated email template or call script. This is a polymorphic relationship field.</p>

Field	Details
	<p>Relationship Name Template</p> <p>Relationship Type Lookup</p> <p>Refers To CallTemplate, EmailTemplate</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of the associated action cadence step. Possible values are:</p> <ul style="list-style-type: none"> • AutoSendAnEmail • Branch • CreateTask • DaisyChain • LinkedInConnection • LinkedInMail • ListenerBranch • MakeACall • Root • SendAnEmail • Wait <p>Only email and call steps can have an associated action cadence step variant.</p>

Usage

Use ActionCadenceStepVariant to retrieve the email template or call script for an action cadence step:

```
SELECT SplitPercentage, TemplateId FROM ActionCadenceStepVariant WHERE
ActionCadenceStepId=:idValue]
```

Use ActionCadenceStepVariant to retrieve the call scripts from all call steps:

```
SELECT SplitPercentage, TemplateId, ActionCadenceStepId FROM ActionCadenceStepVariant WHERE
Type='MakeACall'
```

ActionCadenceTracker

Represents an active sales cadence target. This object is available in API version 45.0 and later.

An ActionCadenceTracker record is created when you add a target to a sales cadence. Use ActionCadenceTracker to learn about a running sales cadence target, including its state, current step, assigned prospect, and reason for completion.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
ActionCadenceId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the related ActionCadence.</p>
CompletionDisposition	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The target's disposition when it exited the action cadence. This field contains a value if the target's state is <code>Completed</code>. Sales reps can set this value when removing a target from a sales cadence. This field is available in API version 51.0 and later. Possible values are:</p> <ul style="list-style-type: none"> • <code>Bad Data</code> — some of the target's data is incorrect or invalid. • <code>Contact Later</code> — the target asked to be contacted at a later date. • <code>Customer Connected</code> — the sales rep contacted the target. • <code>Customer Engaged</code> — the target engaged with an email. • <code>Disqualified</code> — a sales rep determined that the target isn't qualified. • <code>Duplicate</code> — the target has a duplicate lead, contact, or person account record. • <code>No Response</code> — the target didn't reply to any outreach. • <code>Not Interested</code> — the target stated a lack of interest. • <code>Success</code> — the sales cadence outreach was successful.
CompletionReason	<p>Type picklist</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The reason that the target completed the sales cadence. This field contains a value if the target's state is <code>Completed</code>. Possible values are:</p> <ul style="list-style-type: none"> • <code>AutomaticallyExited</code> — the target completed because a global exit condition occurred. This value is available in API version 49.0 and later. • <code>DaisyChained</code> — the target completed because it's connected to another action cadence. • <code>LeadConverted</code> — the target completed because the lead converted. • <code>ManuallyRemoved</code> — the target completed because the sales rep removed it from the sales cadence. • <code>ManuallyRemovedNoAccess</code> — reserved for future use. • <code>NoMoreSteps</code> — the target completed the action cadence because all the action cadence steps were completed.
<code>CurrentStepId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the current <code>ActionCadenceStepTracker</code>.</p>
<code>DaisyChainIteration</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of this action cadence in a sequence of linked action cadences followed by this target. This value starts at 1 with the initial action cadence. A target can follow a sequence of up to 10 linked action cadences. Available in API version 53.0 and later.</p>
<code>ErrorMessage</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description If an error occurs while this target is being completed, this field contains the error message.</p>
<code>ExitGlobalRuleId</code>	<p>Type reference</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description If a global exit condition occurs, a target completes. One example of a global exit condition is an email returned because of an invalid address. If the target completed because a global exit condition occurred, this field contains the ID of the ActionCadenceRule record that evaluated as <code>true</code>.</p> <p>This field is available in API version 49 and later.</p>
IsTrackerActive	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the action cadence target is active (<code>true</code>) or not (<code>false</code>). An action cadence target is active if the state is <code>Running</code>, <code>Paused</code>, <code>Processing</code>, or <code>Initializing</code>. Only active targets count against the org limit of 150,000 trackers.</p> <p>This field is available in API version 50 and later.</p>
LastCompletedStepId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the last completed ActionCadenceStepTracker.</p>
OwnerId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the user who is assigned to complete the sales cadence steps for the target.</p>
RelatedToAttributionType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Defines when the sales cadence gets credit for the opportunity. Available in API version 51.0 and later.</p> <p>Possible values are:</p>

Field	Details
	<ul style="list-style-type: none"> • Activation—Attribute the opportunity to the sales cadence when the opportunity is created. • Maturation—Attribute the opportunity to the sales cadence only when the opportunity stage advances.
RelatedToId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the related opportunity if there's one. Available in API version 51.0 and later. This is a polymorphic relationship field.</p> <p>Relationship Name RelatedTo</p> <p>Relationship Type Lookup</p> <p>Refers To FtestUser, Opportunity</p>
ScheduledResumeDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time when the action cadence tracker is going to resume after it's paused or on a wait step. Available in API version 53.0 and later.</p>
State	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The state of the current action cadence tracker. Possible values are:</p> <ul style="list-style-type: none"> • Complete • Error • Initializing • Paused • Processing—Salesforce is working on changing the state of this action cadence tracker. We recommend that you filter out steps that have this state from your dashboards. • Running

Field	Details
TargetId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the target that is assigned to this action cadence.</p>

Usage

Use ActionCadenceTracker to see what targets are currently assigned to an active action cadence.

```
select TargetId from ActionCadenceTracker where ActionCadenceId=<Id of the action cadence>
and State= "Running"
```

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[ActionCadenceTrackerChangeEvent](#) (API version 48.0)

Change events are available for the object.

ActionCdncStpMonthlyMetric

Represents the monthly engagement metrics for an action cadence step. This object is available in API version 52.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

High Velocity Sales must be enabled.

Fields

Field	Details
ActionCadenceStepId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p>

Field	Details
	<p>Description The ID of the related action cadence step. This is a relationship field.</p> <p>Relationship Name ActionCadenceStep</p> <p>Relationship Type This is an overview-detail relationship field, where ActionCadenceStep is the master object.</p> <p>Refers To ActionCadenceStep</p>
AllCallsCallBackLater	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls in the month for this step with the call result Call Back Later.</p>
AllCallsLeftVoicemail	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls in the month for this step with the call result Left Voicemail.</p>
AllCallsMeaningfulConnect	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls in the month for this step with the call result Meaningful Connect.</p>
AllCallsNotInterested	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls in the month for this step with the call result Not Interested.</p>
AllCallsUncategorized	<p>Type int</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls in the month for this step with no call result specified.</p>
AllCallsUnqualified	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls in the month for this step with the call result Unqualified.</p>
AllEmailsBouncedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The total of hard and soft bounced emails for this step in the month. This is a calculated field.</p>
AllEmailsDeliveredCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of successfully delivered emails for this step in the month. This is a calculated field.</p>
AllEmailsHardBouncedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of hard bounced emails for this step in the month.</p>
AllEmailsLinkClickedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails containing a link clicked by the recipient for this step in the month.</p>

Field	Details
AllEmailsOpenedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails opened by the recipient for this step in the month.</p>
AllEmailsOutOfOfficeCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails that triggered an out of office reply for this step in the month.</p>
AllEmailsRepliedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails replied to for this step in the month.</p>
AllEmailsSentCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails sent for this step in the month. This is a calculated field.</p>
AllEmailsSoftBouncedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails soft bounced for this step in the month.</p>
AllEmailsTrackedSentCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description The number of emails sent with engagement tracking enabled for this step in the month.</p>
AllEmailsUntrackedSentCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails sent without engagement tracking for this step in the month.</p>
AllTotalCallsCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The total number of calls with all call results for this step in the month. This is a calculated field.</p>
HasTemplateAssigned	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether this step has an associated email template or call script. The default value is 'false'.</p>
IsCompoundMetric	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description When true, indicates that this metric represents engagement for a combination of the action cadence step and a single email template. The value is true for all action cadence steps created in Summer '21 and later. When false, indicates that the metric represents engagement for the action cadence step and all email templates used on the step. The value is false for all action cadence steps created in Spring '21 and earlier. The default value is 'false'.</p>
IsLocked	<p>Type boolean</p>

Field	Details
	<p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the monthly metric record is locked or not. The default value is <code>false</code>.</p>
MayEdit	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the monthly metric record can be edited or not. The default value is <code>false</code>.</p>
Month	<p>Type date</p> <p>Properties Filter, Group, Sort</p> <p>Description The month in which the engagement occurred.</p>
MonthInt	<p>Type int</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description The month in which the engagement occurred, in yyyyymm format.</p>
TemplateId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the email template or call script associated with this step. This is a polymorphic relationship field.</p> <p>Relationship Name Template</p> <p>Relationship Type Lookup</p> <p>Refers To CallTemplate, EmailTemplate</p>

Field	Details
UniqueEmailsLinkClickedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of unique recipients who clicked a link in an email for this step in the month.</p>
UniqueEmailsOpenedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of unique recipients who opened an email for this step in the month.</p>
UniqueEmailsRepliedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of unique recipients who replied to an email for this step in the month.</p>

ActionLinkGroupTemplate

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking on an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. Every action link belongs to an action link group and action links within the group are mutually exclusive. This object is available in API version 33.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Only users with the “Customize Application” permission can modify or delete this object.

Fields

Field Name	Details
Category	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The location of the action link group within the feed element. Values are:</p> <ul style="list-style-type: none"> • Primary—The action link group is displayed in the body of the feed element. • Overflow—The action link group is displayed in the overflow menu of the feed element.
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The name of the action link group template to use in code.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
ExecutionsAllowed	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The number of times an action link can be executed. Values are:</p> <ul style="list-style-type: none"> • Once—An action link can be executed only once across all users. • OncePerUser—An action link can be executed only once for each user. • Unlimited—An action link can be executed an unlimited number of times by each user. If the action link's <code>actionType</code> is <code>Api</code> or <code>ApiAsync</code>, you can't use this value.
HoursUntilExpiration	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>The number of hours from when the action link group is created until it's removed from associated feed elements and can no longer be executed. The maximum value is 8,760.</p>
IsPublished	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>If <code>true</code>, the action link group template is published. Action link group templates shouldn't be published until at least one ActionLinkTemplate is associated with it. Once set to <code>true</code>, this can't be set back to <code>false</code>.</p>
Language	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>The language of the <code>MasterLabel</code>.</p>
MasterLabel	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The name of the action link group template.</p>
NamespacePrefix	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the

Field Name	Details
	<p>installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.</p> <ul style="list-style-type: none"> In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

Usage

Define action link templates in Setup and use `ConnectApi` in Apex or Connect REST API to instantiate action links from the templates and to post feed elements with the action links.

If you delete a published action link group template, you delete all related action link information which includes deleting all action links that were instantiated using the template from feed items.

ActionLinkTemplate

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. This object is available in API version 33.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Only users with the "Customize Application" permission can modify or delete this object.

Fields

Field Name	Details
<code>ActionLinkGroupTemplateId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the ActionLinkGroupTemplate with which this action link template is associated. This is a relationship field.</p>

Field Name	Details
	<p>Relationship Name ActionLinkGroupTemplate</p> <p>Relationship Type Lookup</p> <p>Refers To ActionLinkGroupTemplate</p>
ActionUrl	<p>Type textarea</p> <p>Properties Create, Update</p> <p>Description The action link URL. For example, a <code>ui</code> action link URL is a Web page. A <code>Download</code> action link URL is a link to the file to download. <code>ui</code> and <code>Download</code> action link URLs are provided to clients. An <code>Api</code> or <code>ApiAsync</code> action link URL is a REST resource. <code>Api</code> and <code>ApiAsync</code> action link URLs aren't provided to clients. Links to Salesforce can be relative. All other links must be absolute and start with <code>https://</code>.</p> <p>Links to resources hosted on Salesforce servers can be relative, starting with a <code>/</code>. All other links must be absolute and start with <code>https://</code>. This field can contain context variables and binding variables in the form <code>{!Bindings.key}</code>, for example, <code>https://www.example.com/{!Bindings.itemId}</code>. Set the binding variable's value when you instantiate the action link group from the template.</p>
Headers	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Template for the HTTP headers sent when corresponding action links are invoked. This field can be used only for <code>Api</code> and <code>ApiAsync</code> action links. This field can contain context variables and binding variables in the form <code>{!Bindings.key}</code>.</p>
IsConfirmationRequired	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description If <code>true</code>, a confirmation dialog appears before the action is executed.</p>

Field Name	Details
IsGroupDefault	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description If <code>true</code>, action links derived from this template are the default or primary action in their action groups. There can be only one default action per action group.</p>
Label	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A custom label to display on the action link button. If none of the <code>LabelKey</code> values make sense for an action link, use a custom label. Set the <code>LabelKey</code> field to <code>None</code> and enter a label name in the <code>Label</code> field.</p> <p>Action links have four states: new, pending, success, and failed. These strings are appended to the label for each state:</p> <ul style="list-style-type: none"> • <i>Label</i> • <i>Label Pending</i> • <i>Label Success</i> • <i>Label Failed</i> <p>For example, if the value of <code>Label</code> is "Call Home," the values of the four action link states are: Call Home, Call Home Pending, Call Home Success, and Call Home Failed.</p> <p>If <code>LabelKey</code> has any value other than <code>None</code>, the <code>Label</code> field is empty.</p>
LabelKey	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Key for the set of labels to display for these action link states: new, pending, success, failed. For example, the Approve set contains these labels: Approve, Pending, Approved, Failed. For a complete list of keys and labels, see Action Link Labels in the <i>Connect REST API Developer Guide</i>.</p> <p>If none of the label key values make sense for an action link, set this field to <code>None</code> and enter a custom label name in the <code>Label</code> field.</p>
LinkType	<p>Type picklist</p>

Field Name

Details

Properties

Create, Filter, Group, Restricted picklist, Sort, Update

Description

The type of action link. One of these values:

- `Api`—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server.
- `ApiAsync`—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to `/connect/action-links/actionLinkId` to set the status to `SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete.
- `Download`—The action link downloads a file from the action URL.
- `Ui`—The action link takes the user to a web page at the action URL.

Method

Type

picklist

Properties

Create, Filter, Group, Restricted picklist, Sort, Update

Description

HTTP method for the action URL. One of these values:

- `HttpDelete`—Returns HTTP 204 on success. Response body or output class is empty.
- `HttpGet`—Returns HTTP 200 on success.
- `HttpHead`—Returns HTTP 200 on success. Response body or output class is empty.
- `HttpPatch`—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty.
- `HttpPost`—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success.
- `HttpPut`—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty.

`Ui` and `Download` action links must use `HttpGet`.

Position

Type

int

Properties

Create, Filter, Group, Sort, Update

Description

An integer specifying the position of the action link template relative to other action links in the group. 0 is the first position.

Field Name	Details
RequestBody	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Template for the HTTP request body sent when corresponding action links are invoked. This field can be used only for <code>Api</code> and <code>ApiAsync</code> action links. This field can contain context variables and binding variables in the form <code>{!Bindings.key}</code>.</p>
UserAlias	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description If you selected <code>CustomUser</code> or <code>CustomExcludedUser</code> for <code>UserVisibility</code>, this field is the alias for the custom user. Use the alias in a template binding to specify the custom user when an action link group is created using the template.</p>
UserVisibility	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Who can see the action link. This value is set per action link, not per action link group. One of these values:</p> <ul style="list-style-type: none"> • <code>Creator</code>—Only the creator of the action link can see the action link. • <code>Everyone</code>—Everyone can see the action link. • <code>EveryoneButCreator</code>—Everyone but the creator of the action link can see the action link. • <code>Manager</code>—Only the manager of the creator of the action link can see the action link. • <code>CustomUser</code>—Only the custom user can see the action link. • <code>CustomExcludedUser</code>—Everyone but the custom user can see the action link.

Usage

Create action link templates in Setup. Use Apex classes in the `ConnectApi` namespace or Connect REST API to instantiate action links from templates and to post feed elements with the action links.

For information about action links, see [Working with Action Links](#) in the *Apex Developer Guide* or the *Connect REST API Developer Guide*.

ActionPlan

Represents the instance of an action plan, a set of tasks created from an action plan template. This object is used by more than one cloud in Industries.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
<code>ActionPlanState</code>	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The status of work being done for the action plan.. Possible values are:</p> <ul style="list-style-type: none"> • Not Started • In Progress • Canceled • Complete
<code>ActionPlanTemplateVersionId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the version of the action plan template used to create this action plan. At creation, the referenced action plan template must be in the published state.</p>
<code>ActionPlanType</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description The action plan's type. Possible values are:</p>

Field Name	Details
	<ul style="list-style-type: none"> Industries Visit Execution
IsUsingHolidayHours	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates that task completion dates have been calculated by incrementing the task offset for each non-work day, excluding recurring holidays.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The most recent date on which a user referenced this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The most recent date on which a user viewed this record.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Name of the action plan.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the user who owns this record.</p>

Field Name	Details
StartDate	<p>Type date</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description The start date of this action plan.</p>
TargetId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The ID of the parent object record that relates to this action plan.</p> <p>For API version 48 and later, supported parent objects are Account, AssetsAndLiabilities, BusinessMilestone, Campaign, Card, Case, Claim, Contact, Contract, Financial Account, Financial Goal, Financial Holding, InsurancePolicy, InsurancePolicyCoverage, Lead, Opportunity, PersonLifeEvent, ResidentialLoanApplication, and Visit as well as custom objects with activities enabled.</p> <p>For API version 47 and later, supported parent objects are Account, BusinessMilestone, Campaign, Case, Claim, Contact, Contract, InsurancePolicy, InsurancePolicyCoverage, Lead, Opportunity, PersonLifeEvent, and Visit as well as custom objects with activities enabled.</p> <p>For API version 46 and later, supported parent objects are Account, Campaign, Case, Contact, Contract, Lead, and Opportunity as well as custom objects with activities enabled.</p> <p>For API version 45 and earlier: the only supported parent object is Account.</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

[ActionPlanOwnerSharingRule](#)

Sharing rules are available for the object.

[ActionPlanShare](#)

Sharing is available for the object.

ActionPlanItem

Represents the instance of an action plan item. This object is used by more than one cloud in Industries.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
<code>ActionPlanId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the action plan that this item belongs to.</p>
<code>ActionPlanTemplateItemId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The ID of the action plan template item this item was created from.</p>
<code>DisplayOrder</code>	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description Order in which tasks are displayed.</p>
<code>IsRequired</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether this action plan item is required.</p>
<code>ItemId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The ID of the task created by this action plan item.</p>

Field Name	Details
ItemState	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The action plan item's work state. Possible values are:</p> <ul style="list-style-type: none"> • Pending • In Progress • Completed • Canceled • Deleted
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Name of this action plan item.</p>

ActionPlanTemplate

Represents the instance of an action plan template. This object is used by more than one cloud in Industries.

Supported Calls

`create()` `delete()` `describeLayout()` `describeSOjects()` `getDeleted()` `getUpdated()` `query()` `retrieve()` `search()` `undelete()` `update()` `upsert()`

Fields

Field Name	Details
ActionPlanType	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description The action plan template's type. Possible values are:</p>

Field Name	Details
	<ul style="list-style-type: none"> • Industries • Visit Execution
Description	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The description of this action plan template.</p>
IsAdHocItemCreationEnabled	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether users can add tasks or other items to generated action plans.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The most recent date on which a user referenced this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The most recent date on which a user viewed this record.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The name of this action plan template.</p>

Field Name**Details**

TargetEntityType	<p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the user who owns this action plan template.</p>
<hr/>	
TargetEntityType	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description The parent object this action plan template relates to. Possible values are:</p> <ul style="list-style-type: none"> • Account • Business Milestone • Campaign • Case • Claim • Contact • Contract • Assets and Liabilities • Card • Financial Account • Financial Deal • Financial Goal • Financial Holding • Insurance Policy • Insurance Policy Coverage • Lead • Opportunity • Person Life Event • Residential Loan Application • Visit <p>For API version 47 and later, supported parent objects are Account, BusinessMilestone, Campaign, Case, Claim, Contact, Contract, InsurancePolicy, InsurancePolicyCoverage, Lead, Opportunity, PersonLifeEvent, and Visit as well as custom objects with activities enabled.</p> <p>For API version 46 and later, supported parent objects are Account, Campaign, Case, Contact, Contract, Lead, and Opportunity as well as custom objects with activities enabled.</p>

Field Name	Details
	For API version 45 and earlier: the only supported parent object is Account.
UniqueName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The unique name for this action plan template. This field is unique within your organization.</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ActionPlanTemplateOwnerSharingRule

Sharing rules are available for the object.

ActionPlanTemplateShare

Sharing is available for the object.

ActionPlanTemplateItem

Represents the instance of an item on an action plan template version. This object is used by more than one cloud in Industries.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSOjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
ActionPlanTemplateVersionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The version of the action plan template this item is for.</p>
DisplayOrder	<p>Type int</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The order in which this item is displayed within the action plan template version.</p>
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the task created from this template item is active.</p>
IsRequired	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the task created from this template item is required.</p>
ItemEntityType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The type of action plan template item entity. Always set to Task. Possible values are:</p> <ul style="list-style-type: none"> • Assessment Task • RecordAction • Signature Task • Task
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The most recent date on which a user referenced this record.</p>

Field Name	Details
ValueLiteral	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The value for this action plan template item.</p>

ActionPlanTemplateVersion

Represents the version of an action plan template. This object is used by more than one cloud in Industries.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
ActionPlanTemplateId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the action plan template this version represents.</p>
ActivationDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The date and time at which this version became active.</p>
InactivationDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The date and time at which this version became inactive.</p>

Field Name	Details
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The most recent date on which a user referenced this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The most recent date on which a user viewed this record.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The name of this version item.</p>
Status	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The action plan template version's state Default values are: Draft, Obsolete, and Published.</p>
Version	<p>Type int</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description The index number of this action plan template version.</p>

ActiveFeatureLicenseMetric

Represents the number of active, assigned, and purchased feature licenses in the org. This object is available in API version 52.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
ActiveUserCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Number of users assigned this feature license who have logged in within the last 30 days.</p>
AssignedUserCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Number of users assigned this feature license.</p>
FeatureType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Type of feature license. Possible values are:</p> <ul style="list-style-type: none"> • <code>AvantgoUser</code>—AvantGo User • <code>ChatterAnswersUser</code>—Chatter Answers User • <code>InteractionUser</code>—Flow User • <code>JigsawProspectingUser</code>—Data.com User • <code>KnowledgeUser</code>—Knowledge User • <code>LiveAgentUser</code>—Chat User • <code>MarketingUser</code>—Marketing User • <code>MobileUser</code>—Apex Mobile User

Field	Details
	<ul style="list-style-type: none"> • <code>OfflineUser</code>—Offline User • <code>SFContentUser</code>—Salesforce CRM Content User • <code>SiteforceContributorUser</code>—Site.com Contributor User • <code>SiteforcePublisherUser</code>—Site.com Publisher User • <code>SupportUser</code>—Service Cloud User • <code>WirelessUser</code>—Wireless User • <code>WorkDotComUserFeature</code>—WDC User
<code>MetricsDate</code>	<p>Type date</p> <p>Properties Filter, Group, Sort</p> <p>Description Date that feature license metrics were collected.</p>
<code>TotalLicenseCount</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of feature licenses in the organization.</p>

ActivePermSetLicenseMetric

Represents the number of active, assigned, and purchased permission set licenses in the org. This object is available in API version 52.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
<code>ActiveUserCount</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description Number of users assigned this permission set license who have logged in within the last 30 days.</p>
AssignedUserCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Number of users assigned this permission set license.</p>
MetricsDate	<p>Type date</p> <p>Properties Filter, Group, Sort</p> <p>Description Date that permission set license metrics were collected.</p>
PermissionSetLicenseId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the permission set license. This is a relationship field.</p> <p>Relationship Name PermissionSetLicense</p> <p>Relationship Type Lookup</p> <p>Refers To PermissionSetLicense</p>

ActiveProfileMetric

Represents the profile associated with the active, assigned, and purchased user licenses. This object is available in API version 52.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
ActiveUserCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Number of users assigned this profile who have logged in within the last 30 days.</p>
AssignedUserCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Number of users assigned this profile.</p>
MetricsDate	<p>Type date</p> <p>Properties Filter, Group, Sort</p> <p>Description Date that profile metrics were collected.</p>
ProfileId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the profile. This is a relationship field.</p> <p>Relationship Name Profile</p> <p>Relationship Type Lookup</p> <p>Refers To Profile</p>
UserLicenseId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p>

Field	Details
	<p>Description The ID of the user license. This is a relationship field.</p> <p>Relationship Name UserLicense</p> <p>Relationship Type Lookup</p> <p>Refers To UserLicense</p>

ActiveScratchOrg

Represents an active scratch org. This object is available in API version 41.0 and later.

Supported Calls

`delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description A description of this scratch org.</p>
Edition	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The org edition of this scratch org. Possible values are <code>Group</code>, <code>Developer</code>, <code>Enterprise</code>, and <code>Professional</code>. This field is read-only.</p>
ExpirationDate	<p>Type date</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description Date when the scratch org expires. This field is read-only.</p>
Features	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description The features enabled in this scratch org, such as <code>MultiCurrency</code>. See the <i>Salesforce DX Developer Guide</i> for the full list of valid features. This field is read-only.</p>
HasSampleData	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description Specifies whether the scratch org contains sample data. If set to <code>true</code>, the sample data is similar to the data in a Salesforce free trial org.</p>
LastLoginDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The date of the last user login to the scratch org. This field is read-only.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date this scratch org was last referenced. This field is read-only.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date this scratch org was last viewed. This field is read-only.</p>

Field Name	Details
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description The auto-generated ID of this scratch org. This field is read-only.</p>
Namespace	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace associated with this scratch org. This field is read-only.</p>
OrgName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the scratch org. This field is read-only.</p>
OwnerId	<p>Type reference</p> <p>Properties Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the user who owns this scratch org. This field is read-only.</p>
ScratchOrg	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The org ID of the scratch org. This field is read-only.</p>
ScratchOrgInfoId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description The id of the associated <code>ScratchOrgInfo</code> object. This field is read-only.</p>

Field Name	Details
SignupEmail	<p>Type email</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The email address of the Administration user. This field is read-only.</p>
SignupInstance	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The Salesforce instance on which this scratch org resides. This field is read-only.</p>
SignupTrialDays	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of days between the scratch org's creation and expiration. This field is read-only.</p>
SignupUsername	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The username of the Administration user of the scratch org. This field is read-only.</p>

Usage

Salesforce automatically creates an instance of this object after a `ScratchOrgInfo` record moves to the Active state. The new `ActiveScratchOrg` gets many of its field values from the `ScratchOrgInfo` object with which it is associated.

When you delete an `ActiveScratchOrg` record, its associated scratch org is deleted and its associated `ScratchOrgInfo` record is moved to the Deleted state.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

[ActiveScratchOrgFeed](#)

Feed tracking is available for the object.

ActiveScratchOrgHistory

History is available for tracked fields of the object.

ActiveScratchOrgOwnerSharingRule

Sharing rules are available for the object.

ActiveScratchOrgShare

Sharing is available for the object.

SEE ALSO:

[ScratchOrgInfo](#)

[NamespaceRegistry](#)

[Salesforce DX Developer Guide](#)

ActivityHistory

This read-only object is displayed in a related list of closed activities—past events and closed tasks—related to an object. It includes activities for all contacts related to the object. ActivityHistory fields for phone calls are only available if your organization uses Salesforce CRM Call Center.

Supported Calls

`describeSObjects()`

You can also enable `delete()` in API version 42.0 and later. See [Enable delete of Field History and Field History Archive](#).

Fields

Field	Details
<code>AccountId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the related account, which is determined as follows:</p> <ul style="list-style-type: none"> • The account associated with the <code>whatId</code>, if it exists; or • The account associated with the <code>whoId</code>, if it exists; otherwise • <code>null</code> <p>For information on IDs, see ID Field Type.</p> <p>This is a relationship field.</p> <p>Relationship Name Account</p> <p>Relationship Type Lookup</p>

Field	Details
	<p>Refers To Account</p>
ActivityDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates one of the following:</p> <ul style="list-style-type: none"> • The due date of a task • The due date of an event if <code>IsAllDayEvent</code> is set to <code>true</code> <p>This field has a time stamp that is always set to midnight in the Universal Time Coordinated (UTC) time zone. The time stamp doesn't represent the time of the activity; don't attempt to alter it to accommodate time zone differences. Label is <code>Date</code>.</p>
ActivityDateTime	<p>Type dateTime</p> <p>Properties Aggregate, Filter, Nillable, Sort</p> <p>Description Contains the event's due date if the <code>IsAllDayEvent</code> flag is set to <code>false</code>. The time portion of this field is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate. Label is Due Date Time.</p> <p>The value for this field and <code>StartDateTime</code> must match, or one of them must be <code>null</code>.</p>
ActivitySubtype	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Provides standard subtypes to facilitate creating and searching for specific activity subtypes. This field isn't updateable.</p> <p>ActivitySubtype values:</p> <ul style="list-style-type: none"> • Task • Email • Call • Event • List Email

Field	Details
ActivityType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Represents one of the following values: <code>Call</code>, <code>Email</code>, <code>Meeting</code>, or <code>Other</code>. Label is <code>Type</code>. These are default values, and can be changed.</p> <p><code>ActivityType</code> is the union of <code>TaskType</code> and <code>EventType</code>. If the same activity appears in both dynamic picklists, duplicate activities appear.</p> <p><code>TaskType</code> and <code>EventType</code> can each have a <code>Call</code> type. Internally, they are distinct from each other.</p>
AlternateDetailId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of a record the activity is related to which contains more details about the activity. For example, an activity can be related to an <code>EmailMessage</code> record.</p> <p>This is a relationship field.</p> <p>Relationship Name AlternateDetail</p> <p>Relationship Type Lookup</p> <p>Refers To EmailMessage</p>
CallDisposition	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Represents the result of a given call, for example, "we'll call back," or "call unsuccessful." Limit is 255 characters.</p>
CallDurationInSeconds	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>Duration of the call in seconds.</p>
CallObject	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Name of a call center. Limit is 255 characters.</p>
CallType	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>The type of call being answered: Inbound, Internal, or Outbound.</p>
CompletedDateTime	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The date and time the task was saved with a Closed status.</p> <ul style="list-style-type: none"> • For insert, if the task is saved with a Closed status the field is set. If the task is saved with an Open status the field is set to NULL. • For update, if the task is saved with a new Closed status, the field is reset. If the task is saved with a new non-closed status, the field is reset to NULL. If the task is saved with the same closed status (that is, unchanged) there is no change to the field. <p> Note: The status is a dynamic enum. If the Closed mapping is changed it won't cause an update of existing tasks. Only new insert/update operations are affected.</p>
ConnectionReceivedId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Indicates the ID of the PartnerNetworkConnection that shared this record with your organization. This field is available only if your organization has enabled Salesforce to Salesforce and only in API versions 28.0 and later.</p>

Field	Details
ConnectionSentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the PartnerNetworkConnection that your organization shared this record with. This field is available only if your organization has enabled Salesforce to Salesforce, and only in API versions 28.0 and later. The value is always null. You can use the PartnerNetworkRecordConnection object to forward records to connections.</p>
Description	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description Contains a description of the event or task. Limit is 32 KB.</p>
Division	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.</p>
DurationInMinutes	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the duration of the event or task.</p>
EndTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates the end date and time of the event or task. Available in versions 27.0 and later. This field is optional, depending on the following:</p>

Field	Details
	<ul style="list-style-type: none"> If <code>IsAllDayEvent</code> is true, you can supply a value for either <code>DurationInMinutes</code> or <code>EndDateTime</code>. Supplying values in both fields is allowed if the values add up to the same amount of time. If both fields are <code>null</code>, the duration defaults to one day. If <code>IsAllDayEvent</code> is false, a value must be supplied for either <code>DurationInMinutes</code> or <code>EndDateTime</code>. Supplying values in both fields is allowed if the values add up to the same amount of time.
<code>IsAllDayEvent</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If the value of this field is set to <code>true</code>, then the activity is an event spanning a full day, and the <code>ActivityDate</code> defines the date of the event. If the value of this field is set to <code>false</code>, then the activity may be an event spanning less than a full day, or it may be a task. Label is <code>All-Day Event</code>.</p>
<code>IsClosed</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether a task is closed; value is always <code>true</code>. This field is set indirectly by setting the <code>Status</code> field on the task—each picklist value has a corresponding <code>IsClosed</code> value. Label is <code>Closed</code>.</p>
<code>IsDeleted</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the activity has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is <code>Deleted</code>.</p>
<code>IsHighPriority</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates a high-priority task. This field is derived from the <code>Priority</code> field.</p>

Field	Details
IsOnlineMeeting	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the activity represents an online meeting (<code>true</code>) or not (<code>false</code>).</p> <p> Note: This field is not available in API version 16.0 or later.</p>
IsReminderSet	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether a reminder is set for an activity (<code>true</code>) or not (<code>false</code>).</p>
IsTask	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If the value of this field is set to <code>true</code>, then the activity is a task. If the value is set to <code>false</code>, then the activity is an event. Label is <code>Task</code>.</p>
IsVisibleInSelfService	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If the value of this field is set to <code>true</code>, then the activity can be viewed in the self-service portal. Label is <code>Visible in Self-Service</code>.</p>
Location	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description If the activity is an event, then this field contains the location of the event. If the activity is a task, then the value is <code>null</code>.</p>

Field	Details
OwnerId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the user or group who owns the activity. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Calendar, Group, User</p>
PrimaryAccountId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Contains the <code>AccountId</code> value from the activity record. Available in API versions 30.0 and later to organizations that use Shared Activities.</p>
PrimaryWhoId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Contains the <code>WhoId</code> value from the activity record. Available in API versions 30.0 and later to organizations that have enabled Shared Activities.</p>
Priority	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description Indicates the priority of a task, such as high, normal, or low.</p>
ReminderDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>Represents the time when the reminder is scheduled to fire, if <code>IsReminderSet</code> is set to <code>true</code>. If <code>IsReminderSet</code> is set to <code>false</code>, then the user may have deselected the reminder checkbox in the Salesforce user interface, or the reminder has already fired at the time indicated by the value.</p>
<code>StartDateTime</code>	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>Indicates the start date and time of the event.</p> <p>Available in versions 29.0 and later.</p> <p>If the event's <code>IsAllDayEvent</code> flag is set to <code>true</code> (indicating an all-day event), then the time stamp in <code>StartDateTime</code> is always set to midnight in the Coordinated Universal Time (UTC) time zone.</p> <p> Note: Don't attempt to alter the time stamp to account for any time zone differences.</p> <p>If the event's <code>IsAllDayEvent</code> flag is set to <code>false</code>, then you must translate the time portion of the time stamp in <code>StartDateTime</code> to or from a local time zone for the user or the application, as appropriate. The translation must be in the Coordinated Universal Time (UTC) time zone.</p> <p>If this field has a value, then <code>ActivityDate</code> and <code>ActivityDateTime</code> either must be null or must match the value of this field.</p> <p>If the activity is a task, <code>StartDateTime</code> is null</p>
<code>Status</code>	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Indicates the current status of a task, such as in progress or complete. Each predefined status field sets a value for <code>IsClosed</code>. To obtain picklist values, query <code>TaskStatus</code>.</p>
<code>Subject</code>	<p>Type</p> <p>combobox</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>Contains the subject of the task or event.</p>

Field	Details
WhatId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The <code>WhatId</code> represents nonhuman objects such as accounts, opportunities, campaigns, cases, or custom objects. <code>WhatIds</code> are polymorphic. Polymorphic means a <code>WhatId</code> is equivalent to the ID of a related object. The label is <code>Related To ID</code>. This is a polymorphic relationship field.</p> <p>Relationship Name What</p> <p>Relationship Type Lookup</p> <p>Refers To Account, Accreditation, AssessmentIndicatorDefinition, AssessmentTask, AssessmentTaskContentDocument, AssessmentTaskDefinition, AssessmentTaskOrder, Asset, AssetRelationship, AssignedResource, Award, BoardCertification, BusinessLicense, BusinessMilestone, BusinessProfile, Campaign, CareBarrier, CareBarrierDeterminant, CareBarrierType, CareDeterminant, CareDeterminantType, CareDiagnosis, CareInterventionType, CareMetricTarget, CareObservation, CareObservationComponent, CarePgmProvHealthcareProvider, CarePreauth, CarePreauthItem, CareProgram, CareProgramCampaign, CareProgramEligibilityRule, CareProgramEnrollee, CareProgramEnrolleeProduct, CareProgramEnrollmentCard, CareProgramGoal, CareProgramProduct, CareProgramProvider, CareProgramTeamMember, CareProviderAdverseAction, CareProviderFacilitySpecialty, CareProviderSearchableField, CareRegisteredDevice, CareRequest, CareRequestDrug, CareRequestExtension, CareRequestItem, CareSpecialty, CareSpecialtyTaxonomy, CareTaxonomy, Case, CommSubscriptionConsent, ContactEncounter, ContactEncounterParticipant, ContactRequest, Contract, CoverageBenefit, CoverageBenefitItem, CreditMemo, DelegatedAccount, DocumentChecklistItem, EnrollmentEligibilityCriteria, HealthcareFacility, HealthcareFacilityNetwork, HealthcarePayerNetwork, HealthcarePractitionerFacility, HealthcareProvider, HealthcareProviderNpi, HealthcareProviderSpecialty, HealthcareProviderTaxonomy, IdentityDocument, Image, IndividualApplication, Invoice, ListEmail, Location, MemberPlan, Opportunity, Order, OtherComponentTask, PartyConsent, PersonLifeEvent, PlanBenefit, PlanBenefitItem, ProcessException, Product2, ProductItem, ProductRequest, ProductRequestLineItem, ProductTransfer, PurchaserPlan, ReceivedDocument, ResourceAbsence, ReturnOrder, ReturnOrderLineItem, ServiceAppointment, ServiceResource, Shift, Shipment, ShipmentItem, Solution, Visit, VisitedParty, VolunteerProject, WorkOrder, WorkOrderLineItem</p>
WhoId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The WhoId represents a human such as a lead or a contact. WhoIds are polymorphic. Polymorphic means a WhoId is equivalent to a contact's ID or a lead's ID. The label is Name ID.</p> <p>If Shared Activities is enabled, the value of this field is the ID of the related lead or primary contact. If you add, update, or remove the WhoId field, you might encounter problems with triggers, workflows, and data validation rules that are associated with the record. The label is Name ID.</p> <p>If your organization uses Shared Activities, when you query activities in API version 30.0 or later, the returned value of the whoId field matches the value in the queried object, not necessarily in the activity record itself.</p> <p>If Shared Activities is enabled, the value of this field is not populated and the field PrimaryWhoId should be queried instead.</p> <p>This is a polymorphic relationship field.</p> <p>Relationship Name Who</p> <p>Relationship Type Lookup</p> <p>Refers To Contact, Lead</p>

Usage

Query activities that are related to an object

1. Optionally, issue a describe call against the object whose activities you wish to query, to get a suggestion of the correct SOQL to use.
2. Issue a SOQL relationship query with a main clause that references the object, and an inner clause that references the activity history; for example:

```
SELECT
  (SELECT ActivityDate, Description
   FROM ActivityHistories)
FROM Account
WHERE Name Like 'XYZ%'
```

The user interface enforces sharing rules, filtering out related-list items that a user doesn't have permission to see.

The following constraints on users who don't have the "View All Data" permission help prevent performance issues.

- In the main clause of the relationship query, you can reference only one record. For example, you can't filter on all records where the account name starts with "A." Instead, you must reference a single account record.

```
SELECT
  (SELECT ActivityDate, Description
   FROM ActivityHistories
```

```
ORDER BY ActivityDate DESC NULLS LAST, LastModifiedDate DESC
LIMIT 500)
FROM Account
WHERE Name = 'Acme'
LIMIT 1
```

- In the inner clause of the query, you can't use `WHERE`.
- In the inner clause of the query, you must specify a limit of 500 or fewer on the number of rows that are returned in the list.
- In the inner clause of the query, you must sort on `ActivityDate` in descending order and `LastModifiedDate` in descending order. You can optionally display nulls last. For example: `ORDER BY ActivityDate DESC NULLS LAST, LastModifiedDate DESC`.

SEE ALSO:

[Task](#)

ActivityMetric

Represents activities that were added to Salesforce automatically by Einstein Activity Capture and manually by users.

This object is available in API version 45.0.

Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Unless otherwise noted, Einstein Activity Capture and Activity Metrics must be enabled.

Fields

Field	Details
BaseId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, idLookup, Sort</p> <p>Description The ID of the record that the activities apply to.</p>
BaseType	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description The entity that corresponds to the Baseld</p>
FirstCallDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Indicates the date when the first call was made. This field is available only to High Velocity Sales users. Einstein Activity Capture and Activity Metrics aren't required.</p>
FirstEmailDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Indicates the date when the first email was sent. This field is available only to High Velocity Sales users. Einstein Activity Capture and Activity Metrics aren't required.</p>
InactiveDays	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the number of days since the most recent activity was completed. This field is derived from the Last Activity Date field.</p>
LastActivityDateLastModDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the LastActivityDateTime field was last modified.</p>
LastActivityDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Indicates the date when the most recent activity was completed.</p>

Field	Details
LastCallDateLastModDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the LastCallDateTime field was last modified.</p>
LastCallDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Indicates the date when the most recent call was made through Sales Dialer or Inbox.</p>
LastEmailDateLastModDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the LastEmailDateTime field was last modified.</p>
LastEmailDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Indicates the date when the most recent email was sent or received.</p>
LastEmailReceivedDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Indicates the date when the most recent email was received. Available in API version 54.0 and later.</p>
LastEmailSentDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description Indicates the date when the most recent email was sent. Available in API version 54.0 and later.</p>
LastEventDateLastModDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the LastEventDateTime field was last modified.</p>
LastEventDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Indicates the date when the most recent event was completed.</p>
LastTaskDateLastModDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the LastTaskDateTime field was last modified.</p>
LastTaskDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Indicates the date when the last task was completed.</p>
NextActivityDateLastModDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the NextActivityDateTime field was last modified.</p>
NextActivityDateTime	<p>Type dateTime</p>

Field	Details
	<p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Indicates the date of the next scheduled task or event. Only open tasks in the future are included.</p>

Usage

Use this object to see data about sales activities that were added to Salesforce manually and by Einstein Activity Capture. Activity Metric fields are derived from your activity data. For example, the Inactive Days field indicates the number of days since the most recent activity was completed. Create a trigger that notifies a user when there isn't any activity on an account for a certain amount of time.

ActivityUsrConnectionStatus

Represents the status of the email connections for Einstein Activity Capture users. You can also see whether users accepted the required terms of service to capture emails. This object is available in API version 54.0 and later.

Supported Calls

`describeSObjects()`, `query()`

Special Access Rules

To access this object, enable Einstein Activity Capture in your org.

Fields

Field	Details
<code>ConfigurationName</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the Einstein Activity Capture configuration that the user is assigned to.</p>
<code>ConnectivityStatus</code>	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p>

Field	Details
	<p>Description</p> <p>The status of the user's email connection.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • ACTIVE • DISABLED • INITIALIZING • NEEDSATTENTION • NEEDSATTENTIONGLOBAL (used when a org-level connection isn't working) • NEEDSATTENTIONHYBRID (used when both org-level and user-level connections aren't working) • PENDING • PROCESSING
EmailAddress	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The email address that's used to capture and sync data between Salesforce and the user's Microsoft or Google account.</p>
GlobalOauthTermsState	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>Indicates the user's terms of service status. When emails are enabled for Einstein Activity Capture, each user must accept the terms of service.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • ACCEPTED • DECLINED • PENDING <p>This field is available only if you use an org-level OAuth 2.0 or a service account authentication method.</p>
IsTermsOfServiceAccepted	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p>

Field	Details
	<p>Description</p> <p>Indicates whether the user has accepted the Einstein Activity Capture terms of service or not. When emails are enabled for Einstein Activity Capture, each user must accept the terms of service.</p> <p>The default value is 'false'.</p> <p>This field is available only if you use a user-level authentication method.</p>
UserId	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>ID of the user.</p>
UserName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The username of the Einstein Activity Capture user.</p>

Usage

Use `ActivityUsrConnectionStatus` to check the connection status of Einstein Activity Capture users and whether users accepted the required terms of service to capture emails.

AdCreativeSizeType

Defines the size of the Ad Creative. Example: 728 x 90 pixels. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
Height	<p>Type</p> <p>double</p>

Field	Details
	<p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Captures the Height of the Creative asset.</p>
MediaType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Captures the type of the AdSpace SizeType. Possible values are:</p> <ul style="list-style-type: none"> • Digital Banner • Digital Video • Outdoor • Print • Radio • TV
RunTime	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Captures the Creative Run time where applicable.</p>
UnitOfMeasure	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Represents the Unit of Measure for defining the Size of the Creative asset. Possible values are:</p> <ul style="list-style-type: none"> • Inches • Minutes • Pixels • Seconds • mm

Field	Details
Width	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Captures the width of the Creative asset.</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[AdCreativeSizeTypeFeed](#) on page 3944

Feed tracking is available for the object.

[AdCreativeSizeTypeHistory](#) on page 3956

History is available for tracked fields of the object.

[AdCreativeSizeTypeOwnerSharingRule](#) on page 3961

Sharing rules are available for the object.

[AdCreativeSizeTypeShare](#) on page 3967

Sharing is available for the object.

AdditionalNumber

Represents an optional additional number for a call center. This additional number is visible in the call center's phone directory.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
CallCenterId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>System field that contains the ID of the user who created the call center associated with this additional number. If value is null, this additional number is displayed in every call center's phone directory.</p>
Description	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Description of the additional number, such as Conference Room B.</p> <p>Limit: 255 characters.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, idLookup, Sort, Update</p> <p>Description</p> <p>The name of the additional number.</p> <p>Limit: 80 characters.</p>
Phone	<p>Type</p> <p>phone</p> <p>Properties</p> <p>Create, Filter, Nillable, Group, Sort, Update</p> <p>Description</p> <p>The phone number that corresponds to this additional number.</p>

Usage

Create an additional number for a call center directory. Use this object if the number is not easily categorized as a User, Contact, Lead, Account, or the other object. Examples include phone queues or conference rooms.

Address

Represents a mailing, billing, or home address.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

The following access checks must be enabled:

- Industries Insurance
- Retail Execution
- IndustriesVisit
- Field Service
- Order Management
 - Perms: FulfillmentOrder, OrderSummary, AdvancedOrderManagement, OrderCCS
 - Prefs: OrdersEnabled, EnhancedCommerceOrders
- Public Sector
- Employee Experience
- Contact Tracing For Employees

Fields

Field Name	Details
Address	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The full address.</p>
AddressType	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description Picklist of address types. The values are:</p> <ul style="list-style-type: none"> • Mailing • Shipping • Billing • Home
City	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The address city.</p>

Field Name	Details
Country	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The address country.</p>
Description	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A brief description of the address.</p>
DrivingDirections	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Directions to the address.</p>
GeocodeAccuracy	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The level of accuracy of a location's geographical coordinates compared with its physical address. A geocoding service typically provides this value based on the address's latitude and longitude coordinates.</p>
Latitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>Longitude</code> to specify the precise geolocation of the address. Acceptable values are numbers between -90 and 90 with up to 15 decimal places.</p>
LocationType	<p>Type picklist</p>

Field Name	Details
	<p>Properties Create, Defaulted on create, Filter, Filter, Group, Sort, Update</p> <p>Description Picklist of location types. The available values are:</p> <ul style="list-style-type: none"> • Warehouse (default) • Site • Van • Plant
Longitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>Latitude</code> to specify the precise geolocation of the address. Acceptable values are numbers between -180 and 180 with up to 15 decimal places.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description Name of the address.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description A lookup field to the parent location. This is a relationship field.</p> <p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To Location</p>
PostalCode	<p>Type string</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The address postal code.</p>
State	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The address state.</p>
Street	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The address street.</p>
TimeZone	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Picklist of available time zones.</p>

Usage

 **Important:** “Address” in Salesforce can also refer to the Address compound field found on many standard objects. When referencing the Address object in your Apex code, always use `Schema.Address` instead of `Address` to prevent confusion with the standard Address compound field. If referencing both the address object and the Address field in the same snippet, you can differentiate between the two by using `System.Address` for the field and `Schema.Address` for the object.

AdOrderItem

An extension to the Order LineItem and captures the details specific to an Ad Placement. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AdBleedAmountUom	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Specifies bleed height and width measurement.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Inches Pixels mm
AdBleedAmount	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Captures the distance from the edge.</p>
AdCreativeSizeTypes	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Semicolon separated user-selected Creative SizeTypes from the possible choices presented by each Ad Space. For example: 720 X 350; 400 X 350.</p>
AdCreativeUrl	<p>Type url</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Specifies the URL of the Ad Creative. It may or may not be hosted by Salesforce platform.</p>

Field	Details
AdPlacementPriorityType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Specifies the placement priority type chosen from the Ad Server's AdPriorityType record. Possible values are:</p> <ul style="list-style-type: none"> • Standard • Sponsorship
AdRequestedEndDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Captures the requested end date for the LineItem.</p>
AdRequestedStartDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Captures the requested start date for the placement.</p>
AdServerOrderIdentifier	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Nillable, Sort, Update</p> <p>Description Captures the OrderId generated at the Ad Server.</p>
AdServerOrderLineIdentifier	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Nillable, Sort, Update</p> <p>Description Captures the Order Line ItemId generated at the Ad Server.</p>
AdSpaceSpecificationId	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Lookup to the Ad Space Specification record. This is a relationship field.</p> <p>Relationship Name AdSpaceSpecificationId__r</p> <p>Relationship Type Lookup</p> <p>Refers To AdSpaceSpecification</p>
AdTimePerEpisode	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Captures the Ad Time for each episode Customer will be paying for in seconds.</p>
BonusAdTime	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Bonus commercial times in seconds provided to the customers.</p>
CostPerRatingPoint	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Cost Per Rating Point calculated on the basis of <code>QuoteLineItem.ImpliedRate / AdSpaceSpecification.AudienceSizeRating</code>.</p>
CustomerDayPart	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Customer PrimeTime depends on the combination of genre of the show, audience interest, demographics, and, so on.</p>

Field	Details
	<p>Possible values are:</p> <ul style="list-style-type: none"> • Non Prime Time • Prime Time
GrossRatingPoint	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Calculated on the basis of <code>AdSpaceSpecification.AudienceSizeRating * Paid Commercial Time</code> per 'Linear Commercial Time Slot Unit of the Org'.</p>
ImpliedRate	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used by publishers to organize the revenue structure within the deal. This value is often internal to the publisher organization and not customer facing.</p>
ImpliedTotal	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Calculated from the <code>ImpliedRate</code> and is used by publishers to organize the revenue structure within the deal. This value is often internal to the publisher organization and not customer facing.</p>
IsAdBleedEnabled	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if the Ad extends all the way to the edge of the page on at least one side. The default value is 'false'.</p>
MaximumFrequencyInterval	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Identifies the maximum frequency unit used for frequency capping.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Day • Hour • Minute • Second
MaximumFrequency	<p>Type</p> <p>double</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>Identifies maximum number of times the Ad is served for frequency capping.</p>
MaximumUserFrequencyInterval	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Identifies the maximum user frequency interval used for frequency capping.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Day • Hour • Minute • Second
MaximumUserFrequency	<p>Type</p> <p>double</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>Maximum number of times a unique user sees the Ad over a given time period.</p>
MediaType	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Captures the Media Type of the Placement record.</p>

Field	Details
	<p>Possible values are:</p> <ul style="list-style-type: none"> • Digital • Other • Outdoor • Print • Radio • TV
OrderId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Refers to the Order record. This is a relationship field.</p> <p>Relationship Name OrderId__r</p> <p>Relationship Type Master-detail</p> <p>Refers To Order (the master object)</p>
OrderItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Captures the Order Product for which the extension record is to be created. This is a relationship field.</p> <p>Relationship Name OrderItemId__r</p> <p>Relationship Type Lookup</p> <p>Refers To OrderItem</p>
PaidAdTime	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description Indicates total commercial time slots customer are paying for in seconds.</p>
QuoteLineItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Captures the Quote LineItem if the order is to be created for a Quote. This is a relationship field.</p> <p>Relationship Name QuoteLineItemId__r</p> <p>Relationship Type Lookup</p> <p>Refers To QuoteLineItem</p>
SponsorshipType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Captures advertiser's sponsorship interests for the Ad Space Specification. Possible values are:</p> <ul style="list-style-type: none"> • Co Presented By • Presented By • Sponsored By
TargetingParameters	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Ad Creative Targeting Parameters stored in JSON format.</p>
TotalAdTime	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Captures the Sum of Bonus and Paid Ad Time OR Ad Time Per Episode multiplied by No of Episodes on Media Content Title of Ad Space Specification.</p>
UserEngagementGoalType	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Specifies the user engagement goal defined in terms of clicks, impressions, and so on. This is derived from Ad Space Available GoalType.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • LIFETIME • DAILY
UserEngagementGoalUnitType	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Specifies the type of Goal Unit.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • IMPRESSIONS • CLICKS
UserEngagementGoalUnit	<p>Type</p> <p>double</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>Represents the number or percentage of impressions or clicks for the Ad Creative.</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[AdOrderItemFeed](#) on page 3944

Feed tracking is available for the object.

[AdOrderItemHistory](#) on page 3956

History is available for tracked fields of the object.

AdQuote

An extension to Quote and captures quote attributes specific to Advertising Sales Management. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
ImpliedTotalAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Presents the sum of the Implied Total of all Media Plan Placement records. This is a calculated field.</p>
Quote	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Specifies a quote, which is a record showing proposed prices for products and services. This is a relationship field.</p> <p>Relationship Name Quote</p> <p>Relationship Type Lookup</p> <p>Refers To Quote</p>
TotalAdTime	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Represents the Total Ad Time for the Media Placement. This is a calculated field.</p>

Field	Details
TotalBonusAdTime	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Represents the Total Bonus Ad Time for the Media Placement. This is a calculated field.</p>
TotalCostPerRatingPoint	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Represents the Total Cost Per Rating Point for the Media Placement. This is a calculated field.</p>
TotalGrossRatingPoint	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Represents the Total Gross Rating Point for the Media Placement. This is a calculated field.</p>
TotalPaidAdTime	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Represents the Total Paid Ad Time for the Media Placement. This is a calculated field.</p>

Associated Objects

AdRequestedStartDate	<p>Type</p> <p>dateTime</p>

Field	Details
	<p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Captures the requested start date for the placement.</p>
AdSpaceSpecificationAdServer	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Refers to the AdServer responsible to serve the Ad Creative. This is a calculated field.</p>
AdSpaceSpecificationId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Lookup to the Ad Space Specification record. This is a relationship field.</p> <p>Relationship Name AdSpaceSpecificationId__r</p> <p>Relationship Type Lookup</p> <p>Refers To AdSpaceSpecification</p>
AdSpaceSpecificationMediaChannel	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Refers to the Media Channel of the Ad Space Specification record. This is a calculated field.</p>
AdSpaceSpecificationType	<p>Type picklist</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Refers to the Ad Space Type for the Ad Space Specification record.</p>

Field	Details
	This is a calculated field.
AdTimePerEpisode	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Captures the Ad Time for each episode customer is paying for in seconds.</p>
BonusAdTime	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Bonus Ad times in seconds provided to the customer.</p>
CostPerRatingPoint	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Cost Per Rating Point calculated on the basis of <code>QuoteLineItem.Implied Rate / AdSpaceSpec.Audience Size rating</code>.</p>
CustomerDayPart	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Indicates Ad Space Specification chosen. Possible values are:</p> <ul style="list-style-type: none"> • Non Prime Time • Prime Time
GrossRatingPoint	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Calculated on the basis of <code>AdSpaceSpec.Audience Size Rating * Paid Commercial Time per TimeSlot</code>.</p>

Field	Details
ImpliedRate	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used by publishers to organize the revenue structure within the deal. This value is often internal to the publisher organization and not customer facing.</p>
ImpliedTotal	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Calculated from the ImpliedRate and is used by publishers to organize the revenue structure within the deal. This value is often internal to the publisher organization and not customer facing.</p>
IsAdBleedEnabled	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if the Ad extends all the way to the edge of the page on at least one side. The default value is 'false'.</p>
MaximumFrequencyInterval	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Specifies the maximum frequency unit used for frequency capping. Possible values are:</p> <ul style="list-style-type: none"> • Day • Hour • Minute • Second
MaximumFrequency	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description Specifies the maximum number of times Ad is served for frequency capping.</p>
MaximumUserFrequencyInterval	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Specifies maximum user frequency interval. Possible values are:</p> <ul style="list-style-type: none"> • Day • Hour • Minute • Second
MaximumUserFrequency	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Indicates maximum number of times a unique user sees the Ad over a given time period.</p>
MediaType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Captures the Media Type field of the Placement record. Possible values are:</p> <ul style="list-style-type: none"> • Digital • Other • Outdoor • Print • Radio • TV
PaidAdTime	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description Total Ad Time slots customer is paying for in seconds.</p>
PercentageAdTime	<p>Type percent</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Captures the percentage of the Commercial time slot the placement represents in the whole deal.</p>
QuoteLineItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Captures the Quote Lineltem for which the extension record is to be created. This is a relationship field.</p> <p>Relationship Name QuoteLineltemId__r</p> <p>Relationship Type Lookup</p> <p>Refers To QuoteLineltem</p>
QuoteLineItemProductCode	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Captures the Product Code of the Quote Lineltem's product. This is a calculated field.</p>
QuoteLineItemQuantity	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Refers to the Quantity field of the Quote Lineltem record. This is a calculated field.</p>

Field	Details
SponsorshipType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Captures advertiser's sponsorship interests for the Ad Space Specification. Possible values are:</p> <ul style="list-style-type: none"> • Co Presented By • Presented By • Sponsored By
TargetingParameters	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Stores Ad Creative targeting parameters in JSON format.</p>
TotalAdTime	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Captures the sum of Bonus and Paid Ad Time OR Ad Time Per Episode multiplied by No of Episodes on Media Content Title of Ad Space Specification.</p>
UserEngagementGoalType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Specifies the user engagement goal defined in terms of clicks, impressions, and so on.</p>
UserEngagementGoalUnitType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Specifies the type of goal unit.</p>

Field	Details
UserEngagementGoalUnit	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Represents the number or percentage of impressions or clicks that are reserved for the Ad Creative.</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[AdQuoteLineFeed on page 3944](#)

Feed tracking is available for the object.

[AdQuoteLineHistory on page 3956](#)

History is available for tracked fields of the object.

AdServer

Stores and delivers advertising content onto various platforms. This object is available in API version 54.0 and later.

An ad server is the ad technology that enables the management, serving, and tracking of an ad or internal promotion on media properties.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AdServerApplicationName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Arbitrary string identifying the publisher's application.</p>
AdServerNetworkIdentifier	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, idLookup, Nillable, Sort, Update</p> <p>Description Identifies the associated publisher's network.</p>
AllowedAdPriorityTypes	<p>Type multipicklist</p> <p>Properties Create, Filter, Nillable, Restricted picklist, Update</p> <p>Description Stores the available Ad Types for the selected Ad Server. Possible values are:</p> <ul style="list-style-type: none"> • Standard • Sponsorship <p>The picklist is dynamic. More values can be added dynamically.</p>
NamedCredentialReference	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Stores names of the credential references, which hold the authentication details associated with the AdServer record.</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[AdServerFeed on page 3944](#)

Feed tracking is available for the object.

[AdServerHistory on page 3956](#)

History is available for tracked fields of the object.

[AdServerOwnerSharingRule on page 3961](#)

Sharing rules are available for the object.

[AdServerShare on page 3967](#)

Sharing is available for the object.

AdServerAccount

Captures the mapping of an Account with an Ad Server. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AdServerAdvertiserIdentifier	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Nillable, Sort, Update</p> <p>Description Captures the AdvertiserID in the Ad Server.</p>
AdServerId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Specifies the AdServer ID for which the mapping is created. This is a relationship field.</p> <p>Relationship Name AdServerId__r</p> <p>Relationship Type Lookup</p> <p>Refers To AdServer</p>
AdvertiserId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Specifies the Advertiser account mapped to the Ad Server. This is a relationship field.</p> <p>Relationship Name AdvertiserId__r</p> <p>Relationship Type Master-detail</p> <p>Refers To Account (the master object)</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[AdServerAccountFeed](#) on page 3944

Feed tracking is available for the object.

[AdServerAccountHistory](#) on page 3956

History is available for tracked fields of the object.

AdServerUser

Captures the mapping of a User with an Ad Server. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AdServerId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Captures the Ad Server to which the User is mapped. This is a relationship field.</p> <p>Relationship Name AdServerId__r</p> <p>Relationship Type Lookup</p> <p>Refers To AdServer</p>
AdServerUserIdentifier	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Nillable, Sort, Update</p> <p>Description Captures the publisher's Contact and User Id sent during Order creation. This is equivalent of TraffickerId in GAM.</p>

Field	Details
UserId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Specifies the User record to which the AdServer mapping is created. This is a relationship field.</p> <p>Relationship Name UserId__r</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[AdServerUserFeed](#) on page 3944

Feed tracking is available for the object.

[AdServerUserHistory](#) on page 3956

History is available for tracked fields of the object.

[AdServerUserOwnerSharingRule](#) on page 3961

Sharing rules are available for the object.

[AdServerUserShare](#) on page 3967

Sharing is available for the object.

AdSpaceCreativeSizeType

Each Ad Space Creative Size Type defines the compatibility of an Ad Space with an Ad Creative Size Type. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AdCreativeSizeTypeId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Reference to the Ad Creative SizeType record. This is a relationship field.</p> <p>Relationship Name AdCreativeSizeTypeId__r</p> <p>Relationship Type Lookup</p> <p>Refers To AdCreativeSizeType</p>
AdSpaceSpecificationId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Reference to the AdSpace Specification record. This is a relationship field.</p> <p>Relationship Name AdSpaceSpecificationId__r</p> <p>Relationship Type Master-detail</p> <p>Refers To AdSpaceSpecification (the master object)</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[AdSpaceCreativeSizeTypeFeed](#) on page 3944

Feed tracking is available for the object.

[AdSpaceCreativeSizeTypeHistory](#) on page 3956

History is available for tracked fields of the object.

AdSpaceGroupMember

Defines the association of an Ad Space Specification record with an Ad Space Group record. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AdSpaceGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Refers to the AdSpace Specification record of the recordType AdSpaceGroup. This is a relationship field.</p> <p>Relationship Name AdSpaceGroupId__r</p> <p>Relationship Type Master-detail</p> <p>Refers To AdSpaceSpecification (the master object)</p>
AdSpaceGroupMemberId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Captures the AdSpace specification to be added as a Group member. This is a relationship field.</p> <p>Relationship Name AdSpaceGroupMemberId__r</p> <p>Relationship Type Lookup</p> <p>Refers To AdSpaceSpecification</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[AdSpaceGroupMemberFeed](#) on page 3944

Feed tracking is available for the object.

[AdSpaceGroupMemberHistory](#) on page 3956

History is available for tracked fields of the object.

AdSpaceSpecification

Defines a specific place or a group of places where an Ad Creative may be served. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AdServerAdSpaceIdentifier	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Nillable, Sort, Update</p> <p>Description Identifies the unique Ad Server name and Id for the Ad Space Specification.</p>
AdServerId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Specifies the Ad Server, which serves this Ad Space Specification. This is a relationship field.</p> <p>Relationship Name AdServerId__r</p> <p>Relationship Type Lookup</p> <p>Refers To AdServer</p>

Field	Details
AdSpaceType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates the AdSpace Type. Possible values are:</p> <ul style="list-style-type: none"> • 1 Page Standard • 1/2 Page Horizontal • 2 Page Spread • 2/3 Page Vertical • Billboard • Full banner WF DFP • Graphic Image • Leaderboard • Mid-Roll • Post-Roll • Pre-Roll • Skyscraper
AudienceSizeRating	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Captures the Audience Size rating for the Ad Space specification.</p>
EndDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Captures the end date and time for a scheduled program specification.</p>
EndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Captures the End Time for the Ad Space Specification.</p>

Field	Details
EndWeekDay	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Captures the day of the week on which the Ad Space Specification ends. Possible values are:</p> <ul style="list-style-type: none"> • Sunday • Monday • Tuesday • Wednesday • Thursday • Friday • Saturday
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Specifies whether the Ad Space Specification is active. The default value is 'false'.</p>
IsLiveBroadcast	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether a Broadcast schedule is a Live Telecast or a Recorded Telecast. The default value is 'false'.</p>
MediaContentTitleId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Refers to the Media Content Title record. This is a relationship field.</p> <p>Relationship Name MediaContentTitleId__r</p>

Field	Details
	<p>Relationship Type Lookup</p> <p>Refers To MediaContentTitle</p>
MediaChannelId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Refers to the Media Channel record. This is a relationship field.</p> <p>Relationship Name MediaChannelId__r</p> <p>Relationship Type Lookup</p> <p>Refers To MediaChannel</p>
Product2Id	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Refers to the Product record associated with the Ad Space Specification. The product is added to the Placement and is used to calculate the total cost of the Placement. This is a relationship field.</p> <p>Relationship Name Product2Id__r</p> <p>Relationship Type Lookup</p> <p>Refers To Product2</p>
ProgramRunType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Captures the schedule type. Possible values are:</p>

Field	Details
	<ul style="list-style-type: none"> • Premiere • Regular • Repeat
PublisherDayPart	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Captures the day time type for the Publisher. Possible values are:</p> <ul style="list-style-type: none"> • Non Prime Time • Prime Time
StartDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Captures the start date and time for a scheduled program specification.</p>
StartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Captures the Start Time for the Ad Space specification.</p>
StartWeekDay	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Captures the day of the week on which the Ad Space specification begins. Possible values are:</p> <ul style="list-style-type: none"> • Sunday • Monday • Tuesday • Wednesday • Thursday

Field	Details
	<ul style="list-style-type: none"> • Friday • Saturday
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Represents the type for a particular Ad Space Specification. Possible values are:</p> <ul style="list-style-type: none"> • Ad Space • Ad Space Group • Scheduled Program

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

Sharing is available for the object.

AgentWork

Represents a work assignment that's been routed to an agent. This object is available in API version 32.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access this object, [Omni-Channel](#) must be enabled.

Fields

Field	Details
AcceptDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the work item was accepted.</p>
ActiveTime	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The amount of time an agent actively worked on the work item. Tracks when the item is open and in focus in the agent's console. If After Conversation Work (beta) is in use, ActiveTime ends when the AfterConversationActualTime period ends or the agent closes the work item, whichever occurs first.</p> <p> Note: ActiveTime is tracked only for work that is routed using the tab-based capacity model.</p>
AfterConversationActualTime	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description (Beta) The number of seconds an agent spent on After Conversation Work (ACW) after customer contact ended. This field is available in API version 52.0 and later.</p>
AgentCapacityWhenDeclined	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The agent's capacity when declining work, either explicitly or through push timeout.</p>
AssignedDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the work item was assigned to an agent,</p>

Field	Details
CancelDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the work item was canceled.</p>
CapacityModel	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Indicates the capacity model used to determine agent capacity. Valid values are StatusBased and TabBased. This field is available in API version 50.0 and later.</p> <p> Note: A work item consumes agent capacity only if it was first assigned to the agent by Omni-Channel using queues or skills.</p>
CapacityPercentage	<p>Type percent</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The percentage of an agent's capacity for work items that's consumed by a specific type of work item from this service channel.</p> <p>When an agent's combined work items reach 100%, the agent won't receive new work items until there is enough open capacity for more work. For example, if you give phone calls a capacity percentage of 100, an agent on a call doesn't receive new work items until the call ends.</p>
CapacityWeight	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The amount of an agent's capacity for work items that's consumed by a work item from this service channel.</p> <p>For example, if cases are assigned a capacity weight of 2, an agent with a capacity of 6 can accept up to 3 cases before the agent is at capacity and can't receive new work items.</p>
CloseDateTime	<p>Type dateTime</p>

Field	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the work item was closed.</p>
DeclineDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Date and time when the agent declined this record.</p>
DeclineReason	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The provided reason for why an agent declined the work request.</p>
HandleTime	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The amount of time an agent had the work item open. Calculated by <code>Close Time - Accepted Time</code>. If After Conversation Work (beta) is in use, HandleTime ends when the AfterConversationActualTime period ends or the agent closes the work item, whichever occurs first.</p>
IsOwnerChangeInitiated	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether a work item owner change triggered the direct assignment of the work item to the agent. The default value is false. Status-Based Capacity Model has to be turned on to use this field. This field is available in API version 50.0 and later.</p>
IsPreferredUserRequired	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p>

Field	Details
	<p>Description</p> <p>Indicates whether a work item should stay with the preferred user even when the user is not available. The default value is false. This field is available in API version 50.0 and later.</p>
IsStatusChangeInitiated	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>Indicates whether a work item status change triggered the direct assignment of the work item to the agent. The default value is false. Status-Based Capacity Model has to be turned on to use this field. This field is available in API version 50.0 and later.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description</p> <p>An automatically generated ID number that identifies the record.</p>
OriginalGroupId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The ID of the queue that the work assignment was originally routed to.</p>
OriginalQueueId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The ID of the queue that the work assignment was originally routed to. Due to API changes, OriginalQueueId is no longer recommended. Use OriginalGroupId instead.</p>
OwnerId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The ID of the owner of the AgentWork. This field is available in API version 50.0 and later.</p>

Field	Details
PendingServiceRoutingId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The ID of the PendingServiceRouting on page 2724 from which the AgentWork was created. This field is available in API version 50.0 and later.</p>
PreferredUserId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the preferred user to handle the work. This field is available in API v46.0 and later.</p>
PushTimeout	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of seconds set for push timeout. 0 is returned when push timeout isn't enabled. Available in API version 36.0 and later.</p>
PushTimeoutDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the push timeout event occurred. Available in API version 36.0 and later.</p>
RequestDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the work was requested.</p>
RoutingModel	For internal use only.
RoutingPriority	For internal use only.
RoutingType	For internal use only.

Field	Details
SecondaryRoutingPriority	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the secondary routing priority.</p>
ServiceChannelId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the service channel that's associated with the work assignment.</p>
ShouldSkipCapacityCheck	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether to skip checking an agent's available capacity (<code>true</code>) or not (<code>false</code>) when an externally routed work item is created. This field is used when agents can simultaneously handle work from both Omni-Channel queues and queues using external routing.</p> <p>When <code>true</code>, the receiving agent can exceed their set capacity to accept the item, but they don't receive more Omni-Channel routed work. When <code>false</code>, the receiving agent can't exceed their set capacity and must have enough open capacity to accept the item.</p>
SpeedToAnswer	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The amount of time between when the work was requested and when an agent accepted it.</p>
Status	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The working status of the work item. Valid values are:</p> <ul style="list-style-type: none"> Assigned – The item is assigned to the agent but hasn't been opened.

Field	Details
	<ul style="list-style-type: none"> • Opened – The agent opened the item. • Unavailable – The item was assigned to the agent but the agent became unavailable (went offline or lost connection). • Declined – The item was assigned to the agent but the agent explicitly declined it. • DeclinedOnPushTimeout – The item was declined because push time-out is enabled and the item request timed out with the agent. • Closed – The item is closed. • Canceled – The item no longer needs to be routed. For example: a chat visitor cancels their Omni-Channel routed chat request before it reaches an agent. • Transferred – The item was transferred from an agent to another agent, queue, or skill.
UserId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the user that the work item was assigned to.</p>
WorkItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the object that's routed to the agent through Omni-Channel.</p>

Usage

AgentWork records can only be deleted if they have the status Closed, Declined, or Unavailable. They can't be deleted if their status is Assigned or Opened because they're active in Omni-Channel.

AgentWork records have the status Assigned when they're created. Once created, the record is automatically pushed to the assigned agent.

While the metadata for AgentWork indicates support for `upsert()` and `update()`, these calls aren't used with AgentWork because none of its fields can be updated.

Apex triggers are supported with AgentWork.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

AgentWorkOwnerSharingRule

Sharing rules are available for the object.

AgentWorkShare

Sharing is available for the object.

AgentWorkSkill

Represents a skill used to route a work assignment to an agent. AgentWorkSkill is used for reporting and represents the result of a routing decision. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

Special Access Rules

To access this object, [Omni-Channel](#) must be enabled.

Fields

Field	Details
AgentWorkId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The AgentWork object associated with this skill.</p>
IsAdditionalSkill	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description After a designated timeout period, a skill marked as additional is dropped from Omni-Channel routing. The case is then routed to the best-matched agent, even if the agent doesn't have all the skills. The default value is false. Available in API version 48.0 and later.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description An automatically generated ID number that identifies the record.</p>

Field	Details
SkillId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The skill that is required or additional.</p>
SkillLevel	<p>Type double</p> <p>Properties Filter, Sort</p> <p>Description The level of the required or additional skill. Skill levels can range from 1 to 10. Depending on your business needs, you might want the skill level to reflect years of experience, certification levels, or license classes.</p>
SkillPriority	<p>Type int</p> <p>Properties Aggregatable, Filter, Group, Nillable, Sort</p> <p>Description For additional skills, specifies the order in which skills are dropped if after the specified timeout no agent with that skill is available. Higher priority-value skills are dropped first. Lower priority-value skills, for example 0, are dropped last. Skills with the same priority value are dropped as a group. You can set skill priority using attribute setup for skills-based routing or Apex code.</p>
WasDropped	<p>Type boolean</p> <p>Properties Filter, Group, Sort</p> <p>Description For skills marked as additional, indicates if the skill was dropped from Omni-Channel routing because an agent with this skill was not available. The default value is false. Available in API version 48.0 and later.</p>

AIApplication

Represents an AI application such as Einstein Prediction Builder. This object is available in API version 50.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
Language	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language of the application. Possible values are:</p> <ul style="list-style-type: none"> • <code>da</code>—Danish • <code>de</code>—German • <code>en_US</code>—English • <code>es</code>—Spanish • <code>es_MX</code>—Spanish (Mexico) • <code>fi</code>—Finnish • <code>fr</code>—French • <code>it</code>—Italian • <code>ja</code>—Japanese • <code>ko</code>—Korean • <code>nl_NL</code>—Dutch • <code>no</code>—Norwegian • <code>pt_BR</code>—Portuguese (Brazil) • <code>ru</code>—Russian

Field	Details
	<ul style="list-style-type: none"> sv—Swedish th—Thai zh_CN—Chinese (Simplified) zh_TW—Chinese (Traditional)
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Label that identifies the AI application throughout the Salesforce user interface.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Specifies the namespace of the application if installed with a managed package.</p>
Status	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description Status of the AI application. Possible values are:</p> <ul style="list-style-type: none"> Disabled Enabled Migrated
Type	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The type of application. Possible values are:</p> <ul style="list-style-type: none"> PredictionBuilder

AIApplicationConfig

Additional prediction information related to an AI application. This object is available in API version 50.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Label that identifies the AI application throughout the Salesforce user interface.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Specifies the namespace of the application config, if installed with a managed package.</p>

AllInsightAction

Represents an Einstein prediction insight action. This object is available in API version 47.0 and later.

An Einstein insight is created every time an Einstein feature, such as Prediction Builder, makes a prediction. An insight is represented by a root `AIRecordInsight` and the following child objects: `AllInsightAction`, `AllInsightFeedback`, `AllInsightReason`, and `AllInsightValue`.

`AllInsightAction` is a one-to-many child of `AIRecordInsight`. `AllInsightAction` contains information about predicted actions for this particular insight. `AllInsightAction` has one or more `AllInsightValue` children which contain predicted values for the action. For example, an `AllInsightAction` could represent a quick action, and have a child `AllInsightValue` with the recommended value used by the quick action.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Prediction insight objects are only available in orgs that have Einstein features, such as Prediction Builder or Case Classification, enabled.

Fields

Field	Details
ActionId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The unique ID of the associated action, such as the ID of a Macro. This is a polymorphic relationship field.</p> <p>Relationship Name Action</p> <p>Relationship Type Lookup</p> <p>Refers To ApexClass, AuraDefinitionBundle</p>
ActionName	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The ID of the action. For example, a value of "Case.SendEmail" indicates a send email quick action on Case.</p>
AiRecordInsightId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique ID of the associated AIRecordInsight. This is a relationship field.</p> <p>Relationship Name AIRecordInsight</p> <p>Relationship Type Lookup</p> <p>Refers To AIRecordInsight</p>
Confidence	<p>Type double</p>

Field	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description Relative confidence strength of the generated prediction insight. Higher values (near 1.0) indicate stronger confidence.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The name of the AllInsightAction.</p>
Type	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The type of action. Possible values are:</p> <ul style="list-style-type: none"> • <code>InvocableAction</code>—Invocable Action • <code>Macro</code>—Macro • <code>QuickAction</code>—Quick action. • <code>StandardAction</code>—Standard Action. An example standard action would be to update a record.

Usage

When an Einstein feature makes a prediction and saves the results, the following events happen in a single atomic operation:

- An `AIRecordInsight` record is created and populated with information about the prediction insight. `AllInsightAction`, `AllInsightReason`, and `AllInsightValue` records are also created and made children of the `AIRecordInsight` record.
- If the Einstein feature uses AI prediction fields, prediction result values are written to the target AI prediction field.
- An `AIPredictionEvent` platform event is created, and any subscriber to `AIPredictionEvent` is notified.

When Einstein writes prediction results back to AI prediction fields, record save custom logic, such as Apex triggers, workflow rules, and assignment rules, aren't run. To add custom logic based on Einstein prediction results, use a platform event subscriber, such as Process Builder, to get notifications for `AIPredictionEvents` that contain references to Einstein insight objects.

Custom fields can't be added to Einstein insight objects.

Einstein insights contain information about target fields and predicted value. Be aware that your org may have created Einstein predictions that are associated with target fields with field-level security restrictions. Use data access features of Salesforce, such as user profiles and permission sets, if you need to control how users access Einstein insights records.

AllInsightFeedback

Represents an Einstein prediction insight feedback. This object is available in API version 47.0 and later.

An Einstein insight is created every time an Einstein feature, such as Prediction Builder, makes a prediction. An insight is represented by a root AIRecordInsight and the following child objects: AllInsightAction, AllInsightFeedback, AllInsightReason, and AllInsightValue.

AllInsightFeedback is a one-to-many child of AIRecordInsight. AllInsightFeedback contains information about explicit and implicit feedback collected from users for a particular insight.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Prediction insight objects are only available in orgs that have Einstein features, such as Prediction Builder or Case Classification, enabled.

Fields

Field	Details
ActualValue	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The raw feedback value. This field is null when no recommendation is selected.</p>
AiFeedback	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The feedback user sentiment. Possible values are:</p> <ul style="list-style-type: none"> • Negative—Negative feedback • Neutral—Neutral feedback • Positive—Positive feedback
AIInsightFeedbackType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The nature of the feedback. Possible values are:</p>

Field	Details
	<ul style="list-style-type: none"> • <code>Explicit</code>—Explicit feedback. For example, a user applies and saves an Einstein recommendation on a case. • <code>Implicit</code>—Implicit feedback. For example, a user edits or updates a case field without viewing or applying field recommendations from Einstein.
<code>AiRecordInsightId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique ID of the associated <code>AIRecordInsight</code>. This is a relationship field.</p> <p>Relationship Name <code>AiRecordInsight</code></p> <p>Relationship Type Lookup</p> <p>Refers To <code>AIRecordInsight</code></p>
<code>Name</code>	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The name of the <code>AllInsightFeedback</code>.</p>
<code>Rank</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The feedback score.</p>
<code>ValueId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The unique ID of the associated <code>AllInsightValue</code>. This is a polymorphic relationship field.</p>

Field	Details
	<p>Relationship Name Value</p> <p>Relationship Type Lookup</p> <p>Refers To AllInsightAction, AllInsightValue</p>

Usage

Salesforce creates AllInsightFeedback records based on user responses to predictions after the prediction has been created. User feedback, such as a thumbs up/down response or accepting a recommended value, results in the creation of a feedback record in which the feedback type is explicit. An implicit feedback record is created when Einstein makes a recommendation but the field is updated in another way, for example, by a process. Once the AllInsightFeedback record has been created, it's immutable.

Custom fields can't be added to Einstein insight objects.

AllInsightReason

Represents an Einstein prediction insight reason. This object is available in API version 47.0 and later.

An Einstein insight is created every time an Einstein feature, such as Prediction Builder, makes a prediction. An insight is represented by a root AIRecordInsight and the following child objects: AllInsightAction, AllInsightFeedback, AllInsightReason, and AllInsightValue.

AllInsightReason is a one-to-many child of AllInsightValue. AllInsightReason contains details about how Einstein predicted an insight value.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Prediction insight objects are only available in orgs that have Einstein features, such as Prediction Builder or Case Classification, enabled.

Fields

Field	Details
AiInsightValueId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique ID of the associated AllInsightValue.</p>

Field	Details
	<p>This is a relationship field.</p> <p>Relationship Name AllInsightValue</p> <p>Relationship Type Lookup</p> <p>Refers To AllInsightValue</p>
Contribution	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The contribution weight for this insight reason.</p>
FeatureType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of the feature, such as BOOL.</p>
FeatureValue	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The value of the feature, such as TRUE or FALSE.</p>
FieldName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the field the insight uses for its evaluation.</p>
FieldValue	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description The value for the field the insight uses for its evaluation.</p>
Intensity	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The intensity weight for this insight reason.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The name of the AllInsightReason.</p>
Operator	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The logical operator the insight uses to compare the field value with the expression value. For example, if the prediction evaluates whether the fieldValue for the field <code>bonus__c</code> is greater than \$5,000, the logical operator is <code>greater than</code>.</p>
ReasonLabelKey (Beta)	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The key used to map an Einstein Key Accounts Identification (Beta) insight phrase or phrases to the correct messaging template.</p>
RelatedInsightReasonId (Beta)	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID used to relate multiple insights to a single model reason in the Einstein Key Accounts Identification (Beta) feature. This is a relationship field.</p>

Field	Details
	<p>Relationship Name RelatedInsightReason</p> <p>Relationship Type Lookup</p> <p>Refers To AllsightReason</p>
SortOrder (Beta)	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A number value used to organize the phrases in the model's insights message in the Einstein Key Accounts Identification (Beta) feature.</p>
Variance	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The variance weight for this insight reason.</p>

Usage

When an Einstein feature makes a prediction and saves the results, the following events happen in a single atomic operation:

- An AIRecordInsight record is created and populated with information about the prediction insight. AllsightAction, AllsightReason, and AllsightValue records are also created and made children of the AIRecordInsight record.
- If the Einstein feature uses AI prediction fields, prediction result values are written to the target AI prediction field.
- An AIPredictionEvent platform event is created, and any subscriber to AIPredictionEvent is notified.

When Einstein writes prediction results back to AI prediction fields, record save custom logic, such as Apex triggers, workflow rules, and assignment rules, aren't run. To add custom logic based on Einstein prediction results, use a platform event subscriber, such as Process Builder, to get notifications for AIPredictionEvents that contain references to Einstein insight objects.

Custom fields can't be added to Einstein insight objects.

Einstein insights contain information about target fields and predicted value. Be aware that your org may have created Einstein predictions that are associated with target fields with field-level security restrictions. Use data access features of Salesforce, such as user profiles and permission sets, if you need to control how users access Einstein insights records.

AllsightValue

Represents an Einstein prediction insight value. This object is available in API version 47.0 and later.

An Einstein insight is created every time an Einstein feature, such as Prediction Builder, makes a prediction. An insight is represented by a root AIRecordInsight and the following child objects: AllsightAction, AllsightFeedback, AllsightReason, and AllsightValue.

AllsightValue is a one-to-many child of AIRecordInsight. AllsightValue represents a predicted value of a predicted insight.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Prediction insight objects are only available in orgs that have Einstein features, such as Prediction Builder or Case Classification, enabled.

Fields

Field	Details
<code>AiInsightActionId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The unique ID of the associated AllsightAction. Usage

When an Einstein feature makes a prediction and saves the results, the following events happen in a single atomic operation:

- An AIRecordInsight record is created and populated with information about the prediction insight. AllInsightAction, AllInsightReason, and AllInsightValue records are also created and made children of the AIRecordInsight record.
- If the Einstein feature uses AI prediction fields, prediction result values are written to the target AI prediction field.
- An AIPredictionEvent platform event is created, and any subscriber to AIPredictionEvent is notified.

When Einstein writes prediction results back to AI prediction fields, record save custom logic, such as Apex triggers, workflow rules, and assignment rules, aren't run. To add custom logic based on Einstein prediction results, use a platform event subscriber, such as Process Builder, to get notifications for AIPredictionEvents that contain references to Einstein insight objects.

Custom fields can't be added to Einstein insight objects.

Einstein insights contain information about target fields and predicted value. Be aware that your org may have created Einstein predictions that are associated with target fields with field-level security restrictions. Use data access features of Salesforce, such as user profiles and permission sets, if you need to control how users access Einstein insights records.

AIRecordInsight

Represents an Einstein prediction insight. This object is available in API version 47.0 and later.

An Einstein insight is created every time an Einstein feature, such as Prediction Builder, makes a prediction. An insight is represented by a root AIRecordInsight and the following child objects: AllInsightAction, AllInsightFeedback, AllInsightReason, and AllInsightValue.

AIRecordInsight contains information on the Einstein prediction, the AI prediction field where results were written to, and other details such as the type of prediction.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

Special Access Rules

Prediction insight objects are only available in orgs that have Einstein features, such as Prediction Builder or Case Classification, enabled.

Fields

Field	Details
AiApplicationId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique ID of the AiApplication that generated this prediction. This is a relationship field.</p> <p>Relationship Name AiApplication</p> <p>Relationship Type Lookup</p>

Field	Details

TargetSubjectType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p>

Field	Details
	<p>Description</p> <p>The type of the target object, such as Account or Case.</p>
Type	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>The type of insight. Possible values are:</p> <ul style="list-style-type: none"> • <code>Action</code>—An insight that indicates a suggested action, such as sending an email. • <code>Lookup</code>—An insight that indicates a related value not directly related to the target object and field. • <code>MultiValue</code>—An insight with multiple values, such as a multi-class classification. • <code>SimilarRecord</code>—An insight that indicates similar or duplicate records. • <code>SingleValue</code>—A single value insight, such as a regression number or a score.
ValidUntil	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The day and time this insight is valid until. After this day and time, the insight might no longer be valid due to new prediction results from new or changed data. If this field is <code>null</code>, this insight never expires.</p>

Usage

When an Einstein feature makes a prediction and saves the results, the following events happen in a single atomic operation:

- An `AIRecordInsight` record is created and populated with information about the prediction insight. `AllInsightAction`, `AllInsightReason`, and `AllInsightValue` records are also created and made children of the `AIRecordInsight` record.
- If the Einstein feature uses AI prediction fields, prediction result values are written to the target AI prediction field.
- An `AIPredictionEvent` platform event is created, and any subscriber to `AIPredictionEvent` is notified.

When Einstein writes prediction results back to AI prediction fields, record save custom logic, such as Apex triggers, workflow rules, and assignment rules, aren't run. To add custom logic based on Einstein prediction results, use a platform event subscriber, such as Process Builder, to get notifications for `AIPredictionEvents` that contain references to Einstein insight objects.

Custom fields can't be added to Einstein insight objects.

Einstein insights contain information about target fields and predicted value. Be aware that your org may have created Einstein predictions that are associated with target fields with field-level security restrictions. Use data access features of Salesforce, such as user profiles and permission sets, if you need to control how users access Einstein insights records.

Considerations for Case Classification

To generate reports about how well Einstein Case Classification predictions are working, use the root `AIRecordInsight` object and its child objects, `AllInsightFeedback` and `AllInsightValue`. For example, you can determine how many cases received predictions or how often agents accepted or rejected them.

- To determine how many cases received recommendations, the `AIRecordInsight` table identifies the case and contains a row for each field and each recommendation. In `AIRecordInsight`, the `TargetId` field contains the case ID. The `PredictionField` indicates which case field is being predicted. Each field value recommendation is contained in a separate `AllInsightValue` object with `AIRecordInsight` as the parent. For a picklist field, Einstein creates `AllInsightValue` objects with up to 10 field value recommendations. However, just the top three predictions appear to agents in the Einstein Field Recommendations component.
- To learn whether agents acted on any of the top three predictions, use the `AllInsightFeedback` object. When an agent updates fields after viewing Einstein's recommendations, or when Einstein applies a recommendation automatically, the object's `AIInsightFeedbackType` field contains `Explicit`. If the agent updates fields without viewing the predictions, such as on the case details tab, `AIInsightFeedbackType` is set to `Implicit`. When the agent applies the recommended value, the object's `AIFeedback` field is set to `Positive`; if the agent applies a different value, `AIFeedback` is `Negative`.

AllowedEmailDomain

Represents an allowed email domain for users in your organization. You can define an allowlist to restrict the email domains allowed in a user's `Email` field. This object is available in API version 29.0 and later.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

You must have the "Manage Internal Users" user permission to use this object.

 **Note:** If you don't see this object, contact your Salesforce representative to enable it.

Fields

Field	Details
<code>Domain</code>	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description An allowed email domain for users.</p>

AlternativePaymentMethod

Represents a payment method that doesn't have a defined Commerce Orders entity such as [CardPaymentMethod](#) on page 753 or [DigitalWallet](#) on page 1268. Common examples of alternative payment methods for Commerce Orders include CashOnDeliver, Klarna, and Direct Debit. `AlternativePaymentMethod` functions the same as any other type of payment method for processing transactions in the payment gateway. This object is available in API version 51.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access Commerce Payments entities, your org must have a Salesforce Order Management license. Commerce Payments entities are available only in Lightning Experience.

Fields

Field	Details
<code>AccountId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The account for the alternative payment method.</p>
<code>AlternativePaymentMethodNumber</code>	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description Salesforce ID number for the alternative payment method.</p>
<code>AuditEmail</code>	<p>Type email</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p>
<code>Comments</code>	<p>Type textarea</p>

Field	Details
	<p>Properties Create, Nillable, Update</p> <p>Description Users can add comments to provide additional details about a record. Maximum of 1000 characters.</p>
CompanyName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Company name for this payment method. Part of the payment method's address.</p>
Email	<p>Type email</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Email address of the payment method holder.</p>
GatewayToken	<p>Type encryptedstring</p> <p>Properties Create, Nillable, Update</p> <p>Description Tokenized form of the alternative payment method, returned by the gateway. Stored as encrypted text.</p>
GatewayTokenDetails	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Unique tokenized ID generated by the payment gateway when this payment method first interacts with the gateway. Used to identify the payment method during future transactions.</p>
IpAddress	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description IP address for the payment method owner.</p>

Field	Details
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (LastReferencedDate) but not viewed it.</p>
MacAddress	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Mac Address of the payment method holder.</p>
NickName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description User-defined nickname for this pamyent method.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The user who owns the alternative payment method.</p>
PaymentGatewayId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description ID of the payment gateway entity used to handle transactions from this payment method.</p>
PaymentMethodAddress	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description User address column type. First name and last name are listed as separate fields.</p>
PaymentMethodCity	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Part of the address for this payment method.</p>
PaymentMethodCountry	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Part of the address for this payment method.</p>
PaymentMethodGeocodeAccuracy	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Part of the address for this payment method.</p>
PaymentMethodLatitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Part of the address for this payment method.</p>
PaymentMethodLongitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description Part of the address for this payment method.</p>
PaymentMethodPostalCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Part of the address for this payment method.</p>
PaymentMethodState	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Part of the address for this payment method.</p>
PaymentMethodStreet	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Part of the address for this payment method.</p>
Phone	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Phone number of the payment method's owner.</p>
ProcessingMode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description Shows whether the payment method was created in Salesforce or externally. Required. Possible values are:</p> <ul style="list-style-type: none"> • <code>External</code>: Select this value if you create the alternative payment method record through any method other than Commerce Payments Connect API.

Field	Details
	<ul style="list-style-type: none"> • <code>Salesforce</code>: Select this value if you use Commerce Payments Connect API to create the alternative payment method record.
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The state of the payment method. Required. Possible values are:</p> <ul style="list-style-type: none"> • <code>Active</code>: The Payments Platform can use the alternative payment method to make payments. Active alternative payment methods can't be deleted. • <code>Cancelled</code>: The Payments Platform can no longer use the payment method to make payments. A value of <code>Cancelled</code> can't be changed back to <code>Active</code> or <code>InActive</code> • <code>InActive</code>: The Payment Platform currently can't use the payment method to make payments. Admins can change this value to <code>Active</code> or <code>Cancelled</code> when needed.

AnalyticsLicensedAsset

Represents a licensed Analytics asset. In this context, Analytics is Tableau CRM or Sonic. Available in API version 52.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
ConsumerNamespace	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The consumer namespace for the asset. The possible values are:</p> <ul style="list-style-type: none"> • <code>Industries</code>
LicenseType	<p>Type picklist</p>

Field	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The license type for the asset. The possible values are:</p> <ul style="list-style-type: none"> • EinsteinAnalytics • Sonic <p>The default value is EinsteinAnalytics.</p>

Announcement

Represents a Chatter group announcement. This object is available in API version 30.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
ExpirationDate	<p>Type dateTime</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description Required. The date on which the announcement expires. Announcements display on the group UI until 11:59 p.m. local time on the selected date.</p>
FeedItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. The ID of the FeedItem that contains the content of the announcement. Announcements are stored as text posts. This is a relationship field.</p> <p>Relationship Name FeedItem</p>

Field Name	Details
	<p>Relationship Type Lookup</p> <p>Refers To FeedItem</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the parent CollaborationGroup that the announcement belongs to. An announcement can belong only to a single Chatter group. This is a relationship field.</p> <p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To CollaborationGroup</p>
SendEmails	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Set to <code>true</code> to email all group members when an announcement is posted to the group. The default is <code>false</code>. This requires the user to have the "Send announcement on email" permission. This field is available in API version 36.0 and later.</p> <p> Note: This field is currently available to select customers through a pilot program. To be nominated to join this pilot program, contact Salesforce. Additional terms and conditions may apply to participate in the pilot program. Please note that pilot programs are subject to change, and as such, we cannot guarantee acceptance into this pilot program or a particular time frame in which this feature can be enabled. Any unreleased services or features referenced in this document, press releases, or public statements are not currently available and may not be delivered on time or at all. Customers who purchase our services should make their purchase decisions based upon features that are currently available.</p>

Usage

Group owners, managers, and users with the “Modify All Data” permission can use the Announcement object to create, edit, and delete group announcements. Creating a group announcement is a three-step process.

1. Use the FeedItem object to create a text post with the announcement’s content. Use the CollaborationGroup record you want to post the announcement to as the parent of this feed item.
2. Next, use the feed item ID and an expiration date to create the announcement record.
3. Finally, update the AnnouncementId field in the CollaborationGroup record with the ID of the announcement you created.

To delete the group announcement, simply delete the AnnouncementId value in the CollaborationGroup record. To restore a group announcement, update the AnnouncementId field for a group with the announcement’s ID. The expiration date for the announcement should be in the future and the feed item used to create the announcement should be parented by the same group.

ApexClass

Represents an Apex class.

 **Note:** Although Apex classes and triggers have the Create and Update field properties, a runtime exception occurs if you try to create or update them using the API. Instead, use the Ant Migration Tool, the Salesforce user interface, or the Salesforce Extensions for Visual Studio Code to create or update Apex classes or triggers.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()` `update()`, `upsert()`

Fields

Field	Details
ApiVersion	<p>Type double</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The API version for this class. Every class has an API version specified at creation.</p>
Body	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The Apex class definition. Limit: 1 million characters.</p>

Field	Details
BodyCrc	<p>Type double</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Sort, Update</p> <p>Description The CRC (cyclic redundancy check) of the class or trigger file.</p>
IsValid	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether any dependent metadata has changed since the class was last compiled (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
LengthWithoutComments	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Length of the class without comments.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Name of the class. Limit: 255 characters</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation. The namespace prefix can have one of the following values.</p>

Field	Details
	<ul style="list-style-type: none"> In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The current status of the Apex class. The following string values are valid:</p> <ul style="list-style-type: none"> <code>Active</code>—The class is active. <code>Deleted</code>—The class is marked for deletion. This is useful for managed packages, because it allows a class to be deleted when a managed package is updated. <code>Inactive</code>—This option is unused and is only supported for ApexTrigger. For more information, see the Metadata API Developer Guide.

ApexComponent

Represents a definition for a custom component that can be used in a Visualforce page alongside standard components such as `<apex:relatedList>` and `<apex:dataTable>`.

Represents a definition for a custom component that can be used in a Visualforce page alongside standard components such as `<apex:relatedList>` and `<apex:dataTable>`. For information, see the [Visualforce Developers Guide](#).

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Fields

Field	Details
ApiVersion	<p>Type double</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The API version for this custom component. Every custom component has an API version specified at creation. If the API version is less than 15.0 and <code>ApiVersion</code> is not specified, <code>ApiVersion</code> defaults to 15.0.</p>
ControllerKey	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The identifier for the controller associated with this custom component:</p> <ul style="list-style-type: none"> • If the <code>ControllerType</code> parameter is set to <code>Standard</code> or <code>StandardSet</code>, this value is the name of the sObject that defines the controller. • If the <code>ControllerType</code> parameter is set to <code>Custom</code>, this value is the name of the Apex class that defines the controller.
ControllerType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The type of controller associated with this Visualforce custom component. Possible values include:</p> <ul style="list-style-type: none"> • <code>Not Specified</code>, for custom components defined without a value for the <code>controller</code> attribute on the <code><apex:component></code> tag • <code>Standard</code>, a value that can't be used with custom components or errors may occur • <code>StandardSet</code>, a value that can't be used with custom components or errors may occur • <code>Custom</code>, for components that have a value for the <code>controller</code> attribute on the <code><apex:component></code> tag
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description Description of the Visualforce custom component.</p>
Markup	<p>Type textarea</p> <p>Properties Create, Update</p> <p>Description The Visualforce markup, HTML, Javascript, and any other Web-enabled code that defines the content of the custom component.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The text used to identify the Visualforce custom component in the Setup area of Salesforce. The Label for this field is Label.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Required. Name of this Visualforce custom component.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation. The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.

Field	Details
	<ul style="list-style-type: none"> In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

Usage

Use custom components to encapsulate a common design pattern and then reuse that pattern several times in one or more Visualforce pages. All users who can view Visualforce pages can view custom components, but the “Customize Application” permission is required to create or update custom components.

ApexLog

Represents a debug log containing information about a transaction, including information about Apex, Visualforce, and workflow and validation rules. This object is available in API version 19.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
<code>Application</code>	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description This value depends on the client type that triggered the log.</p> <ul style="list-style-type: none"> For API clients, this value is the client ID. For browser clients, this value is <code>Browser</code>.
<code>DurationMilliseconds</code>	<p>Type int</p> <p>Properties Filter, Group, Sort</p>

Field	Details
	<p>Description Duration of the transaction in milliseconds.</p>
Location	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies the location of the origin of the log. Values are:</p> <ul style="list-style-type: none"> • Monitoring—Log is generated as part of debug log monitoring. These types of logs are maintained for seven days or until a user deletes them. • SystemLog—Log is generated from the Developer Console. These types of logs are maintained for 24 hours or until the user clears them.
LogLength	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Length of the log in bytes.</p>
LogUserId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the user whose actions triggered the debug log. This is a polymorphic relationship field.</p> <p>Relationship Name LogUser</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
Operation	<p>Type string</p> <p>Properties Filter, Group, Sort</p>

Field	Details
	<p>Description Name of the operation that triggered the debug log, such as <code>APEXSOAP</code>, <code>Apex Sharing Recalculation</code>, and so on.</p>
<code>Request</code>	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Request type. Values are:</p> <ul style="list-style-type: none"> • <code>API</code>—Request came from the API • <code>Application</code>—Request came from the Salesforce user interface
<code>RequestIdentifier</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The unique identifier of the request that triggered the debug log. Use this request identifier to correlate multiple debug logs triggered by the same request.</p>
<code>StartTime</code>	<p>Type dateTime</p> <p>Properties Filter, Sort</p> <p>Description Start time of the transaction.</p>
<code>Status</code>	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Status of the transaction. This value is either <code>Success</code>, or the text of an unhandled Apex exception.</p>

Usage

You can read information about this object, as well as delete it, but you can't update or insert it.

[ApexClass](#)

[ApexTrigger](#)

[Developer Guide: Apex Developer Guide](#)

ApexPage

Represents a single Visualforce page.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Fields

Field	Details
<code>ApiVersion</code>	<p>Type double</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The API version for this page. Every page has an API version specified at creation. If the API version is less than 15.0 and <code>ApiVersion</code> is not specified, <code>ApiVersion</code> defaults to 15.0.</p>
<code>ControllerKey</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The identifier for the controller associated with this page:</p> <ul style="list-style-type: none"> If the <code>ControllerType</code> parameter is set to <code>Standard</code> or <code>StandardSet</code>, this value is the name of the sObject that defines the controller. If the <code>ControllerType</code> parameter is set to <code>Custom</code>, this value is the name of the Apex class that defines the controller.

Field	Details
ControllerType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The type of controller associated with this Visualforce page. Possible values include:</p> <ul style="list-style-type: none"> • <code>NotSpecified</code>, for pages defined with neither a <code>standardController</code> nor a <code>controller</code> attribute on the <code><apex:page></code> tag • <code>Standard</code>, for pages defined with the <code>standardController</code> attribute on the <code><apex:page></code> tag • <code>StandardSet</code>, for pages defined using the <code>standardController</code> and <code>recordSetVar</code> attribute on the <code><apex:page></code> tag • <code>Custom</code>, for pages defined with the <code>controller</code> attribute on the <code><apex:page></code> tag
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Description of the Visualforce page.</p>
IsAvailableInTouch	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if Visualforce tabs associated with the Visualforce page can be used in the Salesforce mobile app (<code>true</code>) or not (<code>false</code>). (Use of this field for Salesforce Touch is deprecated.) This field is available in API version 27.0 and later.</p> <p>Standard object tabs that are overridden with a Visualforce page aren't supported in the Salesforce mobile app, even if you set this field for the page. The default Salesforce app page for the object is displayed instead of the Visualforce page.</p>
IsConfirmationTokenRequired	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether <code>GET</code> requests for the page require a CSRF confirmation token (<code>true</code>) or not (<code>false</code>). This field is available in API version 28.0 and later.</p>

Field	Details
	<p>If you change this field's value from <code>false</code> to <code>true</code>, links to the page require a CSRF token to be added to them, or the page will be inaccessible.</p>
Markup	<p>Type textarea</p> <p>Properties Create, Update</p> <p>Description The Visualforce markup, HTML, Javascript, and any other Web-enabled code that defines the content of the page.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The text used to identify the Visualforce page in the Setup area of Salesforce. The Label is Label.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Required. Name of this Visualforce page.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.

Field	Details
	<ul style="list-style-type: none"> In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

Usage

Use Visualforce pages to add custom content that extends the base Salesforce application functionality. All users in Visualforce-enabled organizations can view Visualforce pages, but the “Customize Application” permission is required to create or update them.

SEE ALSO:

[ApexComponent](#)

[StaticResource](#)

[Developer Guide: Visualforce Developer Guide](#)

ApexPageInfo

Represents metadata about a single Visualforce page. This object is available in API version 48.0 and later.

Supported Calls

`describeSObjects()`, `query()`

Special Access Rules

As of Summer '20 and later, this object can only be accessed by users who can view a particular Visualforce page, and users with the View Setup and Configuration permission.

Fields

Field	Details
<code>ApexPageId</code>	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description ID for the Visualforce page.</p>
<code>ApiVersion</code>	<p>Type double</p>

Field	Details
	<p>Properties Filter, Sort</p> <p>Description The API version for the page. Every page has an API version specified at creation. If the API version is less than 15.0 and <code>ApiVersion</code> is not specified, <code>ApiVersion</code> defaults to 15.0.</p>
Description	<p>Type textarea</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Description of the Visualforce page.</p>
DurableId	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description For internal use only.</p>
IsAvailableInTouch	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates if Visualforce tabs associated with the Visualforce page can be used in the Salesforce app (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
IsShowHeader	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The <code>showHeader</code> value for the Visualforce page. This will be "unknown" if the Visualforce page uses an expression to compute <code>showHeader</code>. The default value is <code>true</code>.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The text used to identify the Visualforce page in the Setup area of Salesforce.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>Developer name of the Visualforce page.</p>
NamespacePrefix	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The namespace prefix associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> In Developer Edition orgs, the namespace prefix is set to the namespace prefix of the org for all objects that support it.  Note: If an object is in an installed managed package, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. In non-Developer Edition orgs, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. Objects outside of an installed managed package do not have a namespace prefix.

Usage

Use `ApexPageInfo` to query limited metadata about Visualforce pages. Some of this metadata corresponds to settings for a Visualforce page available in Visualforce Pages. To access Visualforce Pages, from *Setup*, in the *Quick Find* box, enter *Custom Code*. Then, select Visualforce Pages. Other values are only available via API. Use `ApexPageInfo` in [Visualforce pages](#) to add custom content that extends the base Salesforce application functionality.

Users can only query `ApexPageInfo` records if they can display the associated Visualforce page, or if they have the View Setup & Configuration permission. Allow users to view Visualforce pages by modifying their user profile or assigning permission sets.

ApexTestQueueItem

Represents a single Apex class in the Apex job queue. This object is available in API version 23.0 and later.

This object is available in API version 23.0 and later.

Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

The `enableApexTestReqViewSetup` field on the `ApexSettings` metadata type controls the activation of the critical update “Require View Setup permission to access Apex test data”. In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

Fields

Field Name	Description
<code>ApexClassId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The Apex class whose tests are to be executed. This is a relationship field.</p> <p>Relationship Name <code>ApexClass</code></p> <p>Relationship Type Lookup</p> <p>Refers To <code>ApexClass</code></p>
<code>ExtendedStatus</code>	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The pass rate of the test run. For example: “(4/6)”. This means that four out of a total of six tests passed. If the class fails to execute, this field contains the cause of the failure.</p>
<code>ParentJobId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name**Description****Description**

Points to the AsyncApexJob that represents the entire test run.

If you insert multiple Apex test queue items in a single bulk operation, the queue items share the same parent job. This means that a test run can consist of the execution of the tests of several classes if all the test queue items are inserted in the same bulk operation.

ShouldSkipCodeCoverage**Type**

boolean

Properties

Create, Defaulted on create, Filter, Group, Sort, Update

Description

Indicates whether to opt out of collecting code coverage information during Apex test runs. Available in API version 43.0 and later.

Status**Type**

picklist

Properties

Filter, Group, Restricted picklist, Sort, Update

Description

The status of the job. Valid values are:

- Holding¹
- Queued
- Preparing
- Processing
- Aborted
- Completed
- Failed

¹ This status applies to batch jobs in the Apex flex queue.

TestRunResultId**Type**

reference

Properties

Filter, Group, Nillable, Sort

Description

The ID of the associated [ApexTestRunResult](#) object.

Usage

Insert an `ApexTestQueueItem` object to place its corresponding Apex class in the Apex job queue for execution. The Apex job executes the test methods in the class.

To abort a class that is in the Apex job queue, perform an update operation on the `ApexTestQueueItem` object and set its `Status` field to `Aborted`.

If you insert multiple Apex test queue items in a single bulk operation, the queue items share the same parent job. This means that a test run can consist of the execution of the tests of several classes if all the test queue items are inserted in the same bulk operation.

ApexTestResult

Represents the result of an Apex test method execution. This object is available in API version 23.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

The `enableApexTestReqViewSetup` field on the `ApexSettings` metadata type controls the activation of the critical update “Require View Setup permission to access Apex test data”. In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

Fields

Field Name	Details
<code>ApexClassId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The Apex class whose test methods were executed. This is a relationship field.</p> <p>Relationship Name ApexClass</p> <p>Relationship Type Lookup</p> <p>Refers To ApexClass</p>
<code>ApexLogId</code>	<p>Type reference</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Points to the ApexLog for this test method execution if debug logging is enabled; otherwise, null. This is a relationship field.</p> <p>Relationship Name ApexLog</p> <p>Relationship Type Lookup</p> <p>Refers To ApexLog</p>
ApexTestRunResultId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the ApexTestRunResult that represents the entire test run. This is a relationship field.</p> <p>Relationship Name ApexTestRunResult</p> <p>Relationship Type Lookup</p> <p>Refers To ApexTestRunResult</p>
AsyncApexJobId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Points to the AsyncApexJob that represents the entire test run. This field points to the same object as ApexTestQueueItem.ParentJobId. This is a relationship field.</p> <p>Relationship Name AsyncApexJob</p>

Field Name	Details
	<p>Relationship Type Lookup</p> <p>Refers To AsyncApexJob</p>
Message	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The exception error message if a test failure occurs; otherwise, null.</p>
MethodName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The test method name.</p>
Outcome	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The result of the test method execution. Can be one of these values:</p> <ul style="list-style-type: none"> • Pass • Fail • CompileFail • Skip
QueueItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Points to the ApexTestQueueItem which is the class that this test method is part of. This is a relationship field.</p> <p>Relationship Name QueueItem</p>

Field Name	Details
	<p>Relationship Type Lookup</p> <p>Refers To ApexTestQueueItem</p>
RunTime	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The time it took the test method to run, in milliseconds.</p>
StackTrace	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The Apex stack trace if the test failed; otherwise, null.</p>
TestTimestamp	<p>Type dateTime</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The start time of the test method.</p>

Usage

You can query the fields of the `ApexTestResult` record that corresponds to a test method executed as part of an Apex class execution.

Each test method execution is represented by a single `ApexTestResult` record. For example, if an Apex test class contains six test methods, six `ApexTestResult` records are created. These records are in addition to the `ApexTestQueueItem` record that represents the Apex class.

Each `ApexTestResult` record has an associated [ApexTestResultLimits](#) on page 471 record, which captures the Apex limits used during execution of the test method.

ApexTestResultLimits

Captures the Apex test limits used for a particular test method execution. An instance of this object is associated with each `ApexTestResult` record. This object is available in API version 37.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

The `enableApexTestReqViewSetup` field on the `ApexSettings` metadata type controls the activation of the critical update “Require View Setup permission to access Apex test data”. In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

Fields

Field Name	Details
<code>ApexTestResultId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the associated ApexTestResult object. This is a relationship field.</p> <p>Relationship Name ApexTestResult</p> <p>Relationship Type Lookup</p> <p>Refers To ApexTestResult</p>
<code>AsyncCalls</code>	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The number of asynchronous calls made during the test run.</p>
<code>Callouts</code>	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The number of callouts made during the test run.</p>

Field Name	Details
Cpu	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The amount of CPU used during the test run, in milliseconds.</p>
Dml	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The number of DML statements made during the test run.</p>
DmlRows	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The number of rows accessed by DML statements during the test run.</p>
Email	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The number of email invocations made during the test run.</p>
LimitContext	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Indicates whether the test run was synchronous or asynchronous.</p>
LimitExceptions	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether your org has any limits that differ from the default limits.</p>
MobilePush	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The number of mobile push calls made during the test run.</p>
QueryRows	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The number of rows queried during the test run.</p>
Soql	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The number of SOQL queries made during the test run.</p>
Sosl	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The number of SOSL queries made during the test run.</p>

Usage

The ApexTestResultLimits object is populated for each test method execution, and it captures the limits used between the Test.startTest() and Test.stopTest() methods. If startTest() and stopTest() aren't called, limits usage is not captured. Note the following:

- The associated test method must be run asynchronously.
- Limits for asynchronous Apex operations (batch, scheduled, future, and queueable) that are called within test methods are not captured.
- Limits are captured only for the default namespace.

ApexTestRunResult

Contains summary information about all the test methods that were run in a particular Apex job. This object is available in API version 37.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

The `enableApexTestReqViewSetup` field on the `ApexSettings` metadata type controls the activation of the critical update “Require View Setup permission to access Apex test data”. In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

Fields

Field Name	Details
<code>AsyncApexJobId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The parent Apex job ID for the result. This is a relationship field.</p> <p>Relationship Name AsyncApexJob</p> <p>Relationship Type Lookup</p> <p>Refers To AsyncApexJob</p>
<code>ClassesCompleted</code>	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The total number of classes executed during the test run.</p>
<code>ClassesEnqueued</code>	<p>Type int</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The total number of classes enqueued during the test run.</p>
EndTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The time at which the test run ended.</p>
IsAllTests	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether all Apex test classes were run.</p>
JobName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Reserved for future use.</p>
MethodsCompleted	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The total number of methods completed during the test run. This value is updated after each class is run.</p>
MethodsEnqueued	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	Description The total number of methods enqueued for the test run. This value is initialized before the test runs.
MethodsFailed	Type int Properties Create, Filter, Group, Nillable, Sort, Update Description The total number of methods that failed during this test run. This value is updated after each class is run.
Source	Type string Properties Create, Filter, Group, Nillable, Sort, Update Description The source of the test run, such as the Developer Console.
StartTime	Type dateTime Properties Create, Filter, Sort, Update Description The time at which the test run started.
Status	Type picklist Properties Create, Filter, Group, Restricted picklist, Sort, Update Description The status of the test run. Values include: <ul style="list-style-type: none">• Queued• Processing• Aborted• Completed• Failed
TestTime	Type int

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The time it took the test to run, in seconds.</p>
UserId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The user who ran the test run. This is a relationship field.</p> <p>Relationship Name User</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>

ApexTestSuite

Represents a suite of Apex classes to include in a test run. A TestSuiteMembership object associates each class with the suite. This object is available in API version 36.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

The `enableApexTestReqViewSetup` field on the ApexSettings metadata type controls the activation of the critical update “Require View Setup permission to access Apex test data”. In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

Fields

Field Name	Description
TestSuiteName	<p>Type string</p>

Field Name	Description
	<p>Properties Create, Filter, Group, Sort, Unique, Update</p> <p>Description The name of the Apex test suite. This label appears in the user interface. This value is case-sensitive and must be unique.</p>

Usage

Insert a TestSuiteMembership object using an API call to associate an Apex class with an ApexTestSuite object. (ApexTestSuite and TestSuiteMembership aren't editable through Apex DML.) To remove the class from the test suite, delete the TestSuiteMembership object. If you delete an Apex test class or test suite, all TestSuiteMembership objects that contain that class or suite are deleted.

The following SOQL query returns the membership object that relates this Apex class to this test suite.

```
SELECT Id FROM TestSuiteMembership WHERE ApexClassId = '01pD0000000Fhy9IAC'
AND ApexTestSuiteId = '05FD00000004CDBMA2'
```

SEE ALSO:

[TestSuiteMembership](#)

ApexTrigger

Represents an Apex trigger.

 **Note:** Although Apex classes and triggers have the Create and Update field properties, a runtime exception occurs if you try to create or update them using the API. Instead, use the Ant Migration Tool, the Salesforce user interface, or the Salesforce Extensions for Visual Studio Code to create or update Apex classes or triggers.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Fields

Field	Details
ApiVersion	<p>Type double</p> <p>Properties Create, Filter, Sort, Update</p>

Field	Details
	<p>Description The API version for this trigger. Every trigger has an API version specified at creation.</p>
Body	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The Apex trigger definition. Limit: 1 million characters.</p>
BodyCrc	<p>Type double</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Sort, Update</p> <p>Description The CRC (cyclic redundancy check) of the class or trigger file.</p>
IsValid	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether any dependent metadata has changed since the trigger was last compiled (<code>true</code>) or not (<code>false</code>).</p>
LengthWithoutComments	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Length of the trigger without comments</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Name of the trigger. Limit: 255 characters</p>

Field	Details
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the namespacePrefix__componentName notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The current status of the Apex trigger. The following string values are valid:</p> <ul style="list-style-type: none"> <code>Active</code>—The trigger is active. <code>Inactive</code>—The trigger is inactive, but not deleted. <code>Deleted</code>—The trigger is marked for deletion. This is useful for managed packages, because it allows a class to be deleted when a managed package is updated. <p> Note: <code>Inactive</code> is not valid for <code>ApexClass</code>. For more information, see the Metadata API Developer Guide.</p>
TableEnumOrId	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Specifies the object associated with the trigger, such as Account or Contact.</p>
UsageAfterDelete	<p>Type boolean</p>

Field	Details
	<p>Properties Create, Filter, Update</p> <p>Description Specifies whether the trigger is an <code>after delete</code> trigger (<code>true</code>) or not (<code>false</code>).</p>
UsageAfterInsert	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether the trigger is an <code>after insert</code> trigger (<code>true</code>) or not (<code>false</code>).</p>
UsageAfterUndelete	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether the trigger is an <code>after undelete</code> trigger (<code>true</code>) or not (<code>false</code>).</p>
UsageAfterUpdate	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether the trigger is an <code>after update</code> trigger (<code>true</code>) or not (<code>false</code>).</p>
UsageBeforeDelete	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether the trigger is a <code>before delete</code> trigger (<code>true</code>) or not (<code>false</code>).</p>
UsageBeforeInsert	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether the trigger is a <code>before insert</code> trigger (<code>true</code>) or not (<code>false</code>).</p>

Field	Details
UsageBeforeUpdate	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether the trigger is a <code>before update</code> trigger (<code>true</code>) or not (<code>false</code>).</p>
UsageIsBulk	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether the trigger is defined as a bulk trigger (<code>true</code>) or not (<code>false</code>).</p> <p> Note: This field is not used for Apex triggers saved using Salesforce API version 10.0 or higher: all triggers starting with that version are automatically considered bulk, and this field will always return <code>true</code>.</p>

ApexTypeImplementor (Beta)

Represents Apex classes that directly or indirectly implement an interface. Using a SOQL query this object gets information about public or global classes and only global classes for installed managed packages. This object is available in API version 54.0 and later.

 **Note:** This feature is a Beta Service. Customer may opt to try such Beta Service in its sole discretion. Any use of the Beta Service is subject to the applicable Beta Services Terms provided at [Agreements and Terms](#).

During the beta, ApexTypeImplementor returns only Apex classes that are currently compiled, as indicated by the `isValid` field. See [Known Issues: ApexTypeImplementor is not returning implementation classes](#) for further details and to track changes.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field	Details
ApexClassId	<p>Type reference</p>

Field	Details
	<p>Properties Filter, Group, Sort</p> <p>Description The foreign key to the outer class that contains the Apex class implementing the interface. This is a relationship field.</p> <p>Relationship Name ApexClass</p> <p>Relationship Type Lookup</p> <p>Refers To ApexClass</p>
ClassName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Apex class name that implements the interface. For an inner class that implements the interface, the outer class and inner name separated by a period.</p>
ClassNamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix of the class that implements the interface.</p>
DurableId	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A unique identifier for the interface and implementor.</p>
InterfaceApexClassId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The foreign key to the outer class that contains the Apex class defining the interface. Null for built-in system interfaces, such as <code>System.Batchable</code>.</p>

Field	Details
	<p>This is a relationship field.</p> <p>Relationship Name InterfaceApexClass</p> <p>Relationship Type Lookup</p> <p>Refers To ApexClass</p>
InterfaceName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The interface name for which Apex class implementation is retrieved. For an inner interface, the outer Apex class name and the inner interface name separated by a period.</p>
InterfaceNamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix of the class that defines the interface.</p>
IsConcrete	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the implementing class is abstract (<code>false</code>) or not (<code>true</code>).</p>

AppAnalyticsQueryRequest

Represents a request for AppExchange App Analytics data.

AppExchange App Analytics is available for packages that passed security review and are registered to a License Management App (LMA). Usage data is provided as package usage logs, as month-based package usage summaries, or as point-in-time subscriber snapshots. Usage logs, monthly usage summaries, and subscriber snapshots are downloadable comma-separated value (.csv) files. For information on how to optimize your use of App Analytics, see [AppExchange App Analytics Best Practices](#).

Note: Usage data from [Government Cloud and Government Cloud Plus](#) orgs isn't available in App Analytics.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

See [Request AppExchange App Analytics](#) in the *ISVforce Guide*.

Fields

Field Name	Details
AvailableSince	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description</p> <p>An optional value used to limit the requested results file to data newly arrived in the data lake after the specified date and time. This field is always transferred in the Coordinated Universal Time (UTC) time zone. Use the <code>AvailableSince</code> field as part of your catch-up query strategy.</p> <p><code>AvailableSince</code> must be later than <code>StartTime</code> and <code>EndTime</code>, if specified. <code>AvailableSince</code> must be earlier than now. A query must include <code>StartTime</code>, <code>AvailableSince</code>, or both.</p> <p>For example, to schedule a catch-up query on <code>2021-04-03T18:00:00Z</code> for this date range:</p> <ul style="list-style-type: none"> • <code>StartTime=2021-03-29T00:00:00Z</code> • <code>EndTime=2021-03-30T00:00:00Z</code> <p>Valid <code>AvailableSince</code> values range from <code>2021-03-30T00:00:00Z</code> to <code>2021-04-03T18:00:00Z</code>.</p> <p>For more information on <code>AvailableSince</code> and catch-up queries, read AppExchange App Analytics Best Practices.</p>
DataType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>The type of usage data being requested. Valid values include:</p> <ul style="list-style-type: none"> • <code>PackageUsageLog</code> • <code>PackageUsageSummary</code> • <code>SubscriberSnapshot</code>

Field Name

Details

Note: In Summer '20, we changed the enum names from `CustomObjectUsageSummary` and `CustomObjectUsageLog` to `PackageUsageSummary` and `PackageUsageLog`.

If you wrote integrations using `CustomObjectUsageSummary` or `CustomObjectUsageLog`, they continue to work only with v47 and earlier. After you upgrade to v48, you must update the `DataType` to `PackageUsageSummary` and `PackageUsageLog`.

DownloadExpirationTime

Type

dateTime

Properties

Filter, Nillable, Sort

Description

The time when the download URL is no longer valid. The expiration time is 60 minutes after the query is completed.

DownloadSize

Type

long

Properties

Filter, Group, Nillable, Sort

Description

The size of the AppExchange App Analytics results file available for download, in bytes.

DownloadUrl

Type

textarea

Properties

Nillable

Description

URL that the user can download data from. Populated after the request is completed. This URL expires and is removed after the expiration time is reached.

EndTime

Type

dateTime

Properties

Create, Filter, Nillable, Sort

Description

Enter end time in format yyyy-MM-ddTHH:mm:ss.

Example:

2019-04-15T12:00:00

Field Name	Details
ErrorMessage	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Stores error message text that results from this query.</p>
FileCompression	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The file compression format of your requested results file. <code>FileCompression</code> and <code>FileType</code> must align. If <code>FileType</code> is <code>csv</code>, <code>FileCompression</code> defaults to <code>none</code> and can be <code>none</code> or <code>gzip</code>. If <code>FileType</code> is <code>parquet</code>, <code>FileCompression</code> is <code>snappy</code> by default and can be <code>snappy</code>, <code>gzip</code>, or <code>none</code>.</p> <p>Valid values include:</p> <ul style="list-style-type: none"> • <code>gzip</code> • <code>snappy</code> • <code>none</code>
FileType	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The data format of your requested results file. The default is <code>csv</code>. <code>FileCompression</code> and <code>FileType</code> must align. If <code>FileType</code> is <code>csv</code>, <code>FileCompression</code> defaults to <code>none</code> and can be <code>none</code> or <code>gzip</code>. If <code>FileType</code> is <code>parquet</code>, <code>FileCompression</code> is <code>snappy</code> by default and can be <code>snappy</code>, <code>gzip</code>, or <code>none</code>.</p> <p>Valid values include:</p> <ul style="list-style-type: none"> • <code>csv</code> • <code>parquet</code>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p>

Field Name	Details
	<p>Description</p> <p>The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description</p> <p>The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description</p> <p>The auto-generated name of the App Analytics query request.</p>
OrganizationIds	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Optional. Enter up to 16 comma-separated org IDs without spaces between IDs. Or enter up to 15 comma-separated org IDs with spaces between the IDs.</p> <p>To request data for all the orgs the package is installed in, leave the field blank.</p>
PackageIds	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Optional. Enter up to 16 comma-separated package IDs without spaces between IDs. Or enter up to 15 comma-separated package IDs with spaces between the IDs. Use the subscriber package ID that begins with 033. To retrieve a list of your second-generation managed package IDs, run <code>sfdx force:package:list --verbose</code> in Salesforce CLI.</p> <p>To request data on all packages registered to this License Management App, leave the field blank.</p>

Field Name	Details
QuerySubmittedTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time that the App Analytics query request was received for processing, in Coordinated Universal Time (UTC). <code>QuerySubmittedTime</code> is read only.</p>
RequestState	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Status of the query request. Valid values are:</p> <ul style="list-style-type: none"> • New • Pending • Complete • Expired • Failed • NoData
StartTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description Enter start time in format yyyy-MM-ddTHH:mm:ss. All App Analytics query requests must include <code>StartTime</code> or <code>AvailableSince</code> or both. Example: 2019-04-14T12:00:00</p>

Usage

To request usage data, log in to the License Management Org (LMO) that your package is registered to, and initiate the API request from the LMO. In a 24-hour period, you can download a maximum 20 GB of AppExchange App Analytics data.

See [Download Package Usage Logs](#), [Package Usage Summaries](#), and [Subscriber Snapshots](#) in the *ISVforce Guide*.

If requests to view package usage log or subscriber snapshot data are inactive for 90 days, we reserve the right to stop collecting this data. To resume data collection, log a support case in the [Salesforce Partner Community](#). For product, specify **Partner Programs & Benefits**. For topic, specify **ISV Technology Request**.

AppDefinition

Represents the metadata of an app and its navigation items. Metadata is returned only for apps that the current user can access. This object is available in API version 43.0 and later.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Details
Description	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The optional description of the application.</p>
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The developer name of the application.</p>
DurableId	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A unique virtual Salesforce ID for the application.</p>
HeaderColor	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The header color in the application. Specify the color with a hexadecimal code, such as #0000FF for blue.</p>

Field Name	Details
Id	<p>Type ID</p> <p>Properties Defaulted on create, Filter, Group, idLookup, Sort</p> <p>Description A default Salesforce ID.</p>
IsLargeFormFactorSupported	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the Large form factor is set in the <code>CustomApplication</code> metadata.</p>
IsMediumFormFactorSupported	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the Medium form factor is set in the <code>CustomApplication</code> metadata.</p>
IsNavAutoTempTabsDisabled	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the navigation automatically creates temporary tabs settings.</p>
IsNavPersonalizationDisabled	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether navigation personalization is disabled.</p>
IsNavTabPersistenceDisabled	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p>

Field Name	Details
	<p>Description Indicates whether workspace tabs are cleared for each new console session.</p>
IsOverrideOrgTheme	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether to override the global theme for the org. When <code>true</code>, the color scheme and logo that the user has set are used. When <code>false</code>, the global theme for the org is used, even if the user has set a color scheme and logo.</p>
IsSmallFormFactorSupported	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the Small form factor is set in the <code>CustomApplication</code> metadata.</p>
Label	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The localized label value corresponding to the <code>MasterLabel</code> field.</p>
LogoUrl	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The logo URL of the application as selected by the admin.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The non-translated label entered when the application was created.</p>

Field Name	Details
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace of the application.</p>
NavType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of navigation for the application. The value <code>Standard</code> is for Lightning Experience. The value <code>Console</code> is for Salesforce console. A null value is for Salesforce Classic.</p>
UiType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Indicates the type of custom application. The value <code>Aloha</code> is for Salesforce Classic, and <code>Lightning</code> is for Lightning Experience.</p>
UtilityBar	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the utility bar associated with this application.</p>

AppExtension

Represents a connection between the Field Service mobile app and another app, typically for passing record data to the Salesforce mobile app or other apps. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Field Service must be enabled.

Fields

Field Name	Details
AppExtensionLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The label in the UI for the app extension.</p>
AppExtensionName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The API name of the app extension.</p>
FieldServiceMobileSettingsId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of a set of field service mobile settings.</p>
InstallationUrl	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The URL that takes the user to the app install location, such as the App Store or Google Play.</p>
LaunchValue	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>A value directing the Field Service app to the appropriate app extension. The Launch Value can be a static URL or a dynamic value that you can represent with certain tokens. These tokens pass field information from the record that the user is currently viewing. The basic format for these tokens is based on the field names; for example: !\$Name.</p>
ScopedToObjectTypes	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Indicates the types of records from which the app extension can be activated. Scoping an app extension to an object lets users activate the app extension from records of the specified type. For example, to scope to both work orders and service appointments you would use the value <i>WorkOrder, ServiceAppointment</i>.</p>
Type	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description</p> <p>A picklist of types of app extensions: iOS, Android, Flow, and Lightning Apps</p>

AppMenuItem

Represents the organization's default settings for items in the app menu or App Launcher.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

Fields

Field	Details
ApplicationId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The 15-character ID for the menu item.</p>
CanvasAccessMethod	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>The access method for the canvas app. Values can be:</p> <ul style="list-style-type: none"> • <code>Get</code>—OAuth Webflow • <code>Post</code>—Signed Request
CanvasEnabled	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>Indicates if the app menu item is a canvas app (<code>true</code>) or not (<code>false</code>). The default setting is <code>false</code>.</p>
CanvasOptions	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Represents the options enabled for a canvas connected app. The options are:</p> <ul style="list-style-type: none"> • <code>PersonalEnabled</code>—The app is enabled as a canvas personal app. • <code>HideHeader</code>—The publisher header, which contains the “What are you working on?” text, is hidden. • <code>HideShare</code>—The publisher Share button is hidden. <p>This field is available in API version 34.0 and later.</p>
CanvasReferenceId	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The canvas app unique identifier.</p>
CanvasSelectedLocations	<p>Type</p> <p>string</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The selected locations for the canvas app which define where the canvas app can appear in the user interface. For example:</p> <div style="border: 1px solid #ccc; padding: 5px; margin: 5px 0;">Chatter, ChatterFeed, Publisher, ServiceDesk</div>
CanvasUrl	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The URL of the canvas app.</p>
Description	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A description of this menu item.</p>
IconUrl	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The icon for the menu item's application.</p>
InfoUrl	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The URL for more information about the application.</p>
IsAccessible	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If <code>true</code>, the current user is authorized to use the app. The default setting is <code>false</code>.</p>

Field	Details
IsRegisteredDeviceOnly	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If <code>true</code>, indicates that the app is available to registered devices only. The default setting is <code>false</code>. Available in API version 49.0 and later.</p>
IsUsingAdminAuthorization	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If <code>true</code>, the app is pre-authorized for certain users by the administrator. The default setting is <code>false</code>.</p>
IsVisible	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort, Update</p> <p>Description If <code>true</code>, the app is visible to users of the organization. The default setting is <code>false</code>.</p>
Label	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The app's name.</p>
LogoUrl	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The logo for the menu item's application. The default is the initials of the <code>Label</code> value.</p>
MobileAppBinaryId	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description The URL for the Mobile App Binary file.</p>
MobileAppInstallUrl	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The location mobile users are directed to install the app. Available in API version 49.0 and later.</p>
MobileAppInstalledDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time that a user installed a mobile app. Available in API version 49.0 and later.</p>
MobileAppInstalledVersion	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The version of the user's installed mobile app. Available in API version 49.0 and later.</p>
MobileAppVer	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The version number of the mobile app. Available in API version 49.0 and later.</p>
MobileDeviceType	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The supported device form factors for the mobile app. Available in API version 49.0 and later.</p>
MobileMinOsVer	<p>Type string</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The minimum version required for the app. Available in API version 49.0 and later.</p>
MobilePlatform	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The mobile platform for the app. Possible values include:</p> <ul style="list-style-type: none"> • <code>android</code> - Android • <code>ios</code> - iOS <p>Available in API version 49.0 and later.</p>
MobileStartUrl	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The location mobile users are directed to after they've authenticated. This field is used with connected apps and Experience Builder sites. For sites only, this location is a fully qualified domain name. For other apps, it's a relative URL.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The API name of the item.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation.</p> <p>The namespace prefix can have one of the following values:</p>

Field	Details
	<ul style="list-style-type: none"> In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
<code>SortOrder</code>	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The index value that controls where this item appears in the menu. For example, a menu item with a sort order of 5 appears between items with sort order values of 3 and 9.</p>
<code>StartUrl</code>	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description For a connected app, the location users are directed to after they've authenticated. Otherwise, the application's default start page.</p>
<code>Type</code>	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of application represented by this item. The types are:</p> <ul style="list-style-type: none"> <code>ConnectedApplication</code> <code>Network</code> <code>ServiceProvider</code> <code>TabSet</code>
<code>UserSortOrder</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The index value that represents where the user set this item in the menu (or App Launcher). For example, an item with a sort order value of 5 appears between items with sort order values of 3 and 9.</p> <p>This value is separate from SortOrder so you can create logic incorporating both values. For example, if you want the user-sorted items to appear first, followed by the organization order for the rest, use:</p> <pre>SELECT ApplicationId,SortOrder,UserSortOrder FROM AppMenuItem order by userSortOrder NULLS LAST, sortOrder NULLS LAST</pre>

Usage

Use this read-only object to view an entry in the Lightning Platform app menu or the App Launcher. You can create a SOQL query to retrieve all items, even items the user does not see from the user interface.

There are many ways you can use AppMenuItem. Here are some examples:

- Build your own App Launcher or app menu in Salesforce. Create a custom page showing all the apps you have access to and that lets you run them using single sign-on.
- Build your own App Launcher or app menu on a tablet or mobile app. You can have your own app for launching applications on various mobile devices.
- Build an app launcher into your company's intranet. There's no need to have it run on Salesforce because Salesforce APIs let you integrate with Salesforce programmatically and build an app launcher.

Tip: To get metadata information about apps and their tabs, use the Apex `Schema.describeTabs()` method, REST API `/vXX.X/tabs/` resource, or SOAP API `describeTabs()` call.

AppointmentAssignmentPolicy

Stores information about resource assignment rules. This object is available in API version 52.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
FullName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description The API name of the AppointmentAssignmentPolicy object.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
Language	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language of the appointment assignment policy. Possible values are:</p> <ul style="list-style-type: none"> • Possible values are: • da (Danish) • de (German) • en_US (English) • es (Spanish) • es_MX (Spanish - Mexican) • fi (Finnish) • fr (French) • it (Italian) • ja (Japanese) • ko (Korean) • nl_NL (Dutch) • no (Norwegian) • pt_BR (Portuguese - Brazilian) • ru (Russian) • sv (Swedish) • th (Thai) • zh_CN (Chinese - Simplified) • zh_TW (Chinese - Traditional)
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The label for the appointment assignment policy.</p>

Field	Details
PolicyApplicableDuration	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The frequency at which the utilization of service resources is calculated. This field is available in API version 53.0 and later.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Parameter-Based • Monthly • Weekly <p>The default value is Parameter-Based.</p>
PolicyType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The type of appointment assignment policy.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • loadBalancing
UtilizationFactor	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Specifies the count type for the resource utilization. This field is available in API version 53.0 and later.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • NumberOfAppointments • TotalAppointmentDuration <p>The default value is TotalAppointmentDuration.</p>

AppointmentScheduleAggr

Records the utilization of a service resource, by date, for the Load Balancing appointment assignment policy. This object is available in API version 52.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AppointmentDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date of the appointment.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The name or ID of the AppointmentScheduleAggr object.</p>
ResourceUtilizationCount	<p>Type integer</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of appointments scheduled for a service resource. Available in API version 53.0 and later. This is a calculated field.</p>
ServiceResourceId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The service resource associated with the appointment scheduling aggregate. This is a relationship field.</p> <p>Relationship Name ServiceResource</p> <p>Relationship Type Lookup</p>

Field	Details
	<p>Refers To ServiceResource</p>
TotalResourceUtilization	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The number of minutes for which the service resource has scheduled appointments. This is a calculated field.</p>
UsageType	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Specify the usage type of the AppointmentScheduleAggr object. Possible values are:</p> <ul style="list-style-type: none"> • FSL_Daily • FSL_Monthly • FSL_Weekly • LightningScheduler <p>The default value is 'LightningScheduler'.</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[AppointmentScheduleAggrOwnerSharingRule](#) on page 3961

Sharing rules are available for the object.

[AppointmentScheduleAggrShare](#) on page 3967

Sharing is available for the object.

AppointmentScheduleLog

Stores service appointments of each service Resource. This object is used to calculate the utilization of a service resource for the AppointmentScheduleAggr object. This object is available in API version 52.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AppointmentDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date of the appointment.</p>
AppointmentScheduleAggrId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The appointment scheduling aggregate associated with the appointment scheduling log. This is a relationship field.</p> <p>Relationship Name AppointmentScheduleAggr</p> <p>Relationship Type Lookup</p> <p>Refers To AppointmentScheduleAggr</p>
IsUsedForResourceUtilization	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the appointment scheduling log is used for deriving the appointment scheduling aggregate. The default value is 'false'.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p>

Field	Details
	<p>Description The name or ID of the AppointmentScheduleLog object.</p>
RelatedRecordId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The service appointment, resource absence, event, or any other related record associated with the appointment scheduling log. This is a polymorphic relationship field.</p> <p>Relationship Name RelatedRecord</p> <p>Relationship Type Lookup</p> <p>Refers To Event, ServiceAppointment</p>
ResourceUtilization	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The number of minutes the service resource already has scheduled appointments for.</p>
ServiceResourceId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The service resource associated with the appointment scheduling log. This is a relationship field.</p> <p>Relationship Name ServiceResource</p> <p>Relationship Type Lookup</p> <p>Refers To ServiceResource</p>
UsageType	<p>Type picklist</p>

Field	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Specify the product associated with the AppointmentScheduleLog object.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • FSL_Daily—FSL - Daily • FSL_Monthly—FSL - Monthly • FSL_Weekly—FSL - Weekly • LightningScheduler—Lightning Scheduler <p>The default value is 'LightningScheduler'.</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[AppointmentScheduleLogChangeEvent](#) on page 3972

Change events are available for the object.

[AppointmentScheduleLogFeed](#) on page 3944

Feed tracking is available for the object.

[AppointmentScheduleLogHistory](#) on page 3956

History is available for tracked fields of the object.

[AppointmentScheduleLogOwnerSharingRule](#) on page 3961

Sharing rules are available for the object.

[AppointmentScheduleLogShare](#) on page 3967

Sharing is available for the object.

AppointmentSchedulingPolicy

Represents a set of rules for scheduling appointments using Salesforce Scheduler. This object is available in API version 45.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
AppointmentAssignmentPolicyId	Type reference

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The name or ID of the appointment assignment policy. This is a relationship field, available in version 52.0 and later.</p> <p>Relationship Name AppointmentAssignmentPolicy</p> <p>Relationship Type Lookup</p> <p>Refers To AppointmentAssignmentPolicy</p>
AppointmentStartTimeInterval	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The proposed time interval in minutes between appointment start times. For example, set the interval to 15. Appointments can then begin at the top of the hour and at 15-minute intervals thereafter (10:00 AM, 10:15 AM, 10:30 AM, and so on). Possible values are:</p> <ul style="list-style-type: none"> • 5 • 10 • 15 • 20 • 30 • 45 • 60 • 90 • 120 • 150 • 180 • 240 • 300 • 360 • 420 • 480
DeveloperName	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The API name of the AppointmentSchedulingPolicy object.</p>
ExtCalEventHandlerId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The API name of the custom Apex class that checks service resources' external calendar events and returns the time slots where service resources are already booked. Available in API version 50.0 and later. This is a relationship field.</p> <p>Relationship Name ExtCalEventHandler</p> <p>Relationship Type Lookup</p> <p>Refers To ApexClass</p>
IsOrgDefault	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether this scheduling policy is the default appointment scheduling policy for Lightning Scheduler appointments in this org.</p>
Language	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language of the appointment scheduling policy. Possible values are:</p> <ul style="list-style-type: none"> • Possible values are: • da (Danish) • de (German) • en_US (English) • es (Spanish)

Field	Details
	<ul style="list-style-type: none"> • es_MX (Spanish - Mexican) • fi (Finnish) • fr (French) • it (Italian) • ja (Japanese) • ko (Korean) • nl_NL (Dutch) • no (Norwegian) • pt_BR (Portuguese - Brazilian) • ru (Russian) • sv (Swedish) • th (Thai) • zh_CN (Chinese - Simplified) • zh_TW (Chinese - Traditional)
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The label for the appointment scheduling policy.</p>
ShouldConsiderCalendarEvents	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this policy checks the Salesforce calendar for resource availability. The default value is 'false'.</p>
ShouldEnforceExcludedResource	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this appointment scheduling policy prevents excluded service resources from being assigned to appointments.</p>
ShouldEnforceRequiredResource	<p>Type boolean</p>

Field	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this appointment scheduling policy allows only required service resources to be assigned to appointments.</p>
ShouldMatchSkill	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this appointment scheduling policy allows only required service resources who have certain skills to be assigned to appointments.</p>
ShouldMatchSkillLevel	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this appointment scheduling policy allows only required service resources who have certain skills and skill levels to be assigned to appointments.</p>
ShouldRespectVisitingHours	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this appointment scheduling policy prevents users from scheduling appointments outside of an account's visiting hours.</p>
ShouldUsePrimaryMembers	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this appointment scheduling policy allows only service resources who are primary members of a service territory to be assigned to appointments.</p>
ShouldUseSecondaryMembers	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Indicates whether this appointment scheduling policy allows service resources who are secondary members of a service territory to be assigned to appointments.</p>

AppointmentTopicTimeSlot

Junction object that is a lookup to a work type or a work type group for a time slot. This object is available in API version 52.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
<code>AppointmentTopicTimeSlotKey</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, idLookup, Nillable, Sort, Update</p> <p>Description</p> <p>Non-editable validating field used to ensure no two rows have the same time slot and work type or work type group values in an instance.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description</p> <p>Name or ID of the AppointmentTopicTimeSlot object.</p>
<code>OperatingHoursId</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The operating hours that contain the time slot.</p> <p>This is a relationship field.</p>

Field	Details
	<p>Relationship Name OperatingHours</p> <p>Relationship Type Lookup</p> <p>Refers To OperatingHours</p>
TimeSlotId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the time slot. This is a relationship field.</p> <p>Relationship Name TimeSlot</p> <p>Relationship Type Lookup</p> <p>Refers To TimeSlot</p>
WorkTypeGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The work type group associated with this time slot. This is a relationship field.</p> <p>Relationship Name WorkTypeGroup</p> <p>Relationship Type Lookup</p> <p>Refers To WorkTypeGroup</p>
WorkTypeId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The work type associated with this time slot.</p>

Field	Details
	This is a relationship field.
	Relationship Name WorkType
	Relationship Type Lookup
	Refers To WorkType

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AppointmentTopicTimeSlotChangeEvent on page 3972

Change events are available for the object.

AppointmentTopicTimeSlotFeed on page 3944

Feed tracking is available for the object.

AppointmentTopicTimeSlotHistory on page 3956

History is available for tracked fields of the object.

AppointmentTopicTimeSlotOwnerSharingRule on page 3961

Sharing rules are available for the object.

AppointmentTopicTimeSlotShare on page 3967

Sharing is available for the object.

Approval

Represents an approval request for a Contract.

 **Note:** This object is read-only and is specific to approvals on the Contract object. It isn't equal to or involved in the approval processes represented by the ProcessInstance, which is more powerful.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
ApproveComment	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Text entered by the user when they approved or rejected this approval request. Required. Limit: 4,000 characters.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
OwnerId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description Required. ID of the User being asked to approve or reject the approval request. Must be a valid User ID. Required.</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description Required. ID of the Contract associated with this approval request. Must be a valid contract ID.</p>
RequestComment	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Text entered by the User who created the approval request. Optional. This field can't be updated after the Approval has been created. Limit: 4,000 characters.</p>

Field	Details
Status	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Required. Status of this approval request. One of the following picklist values:</p> <ul style="list-style-type: none"> • <code>Pending</code>—Specified only when the Approval request is created (<code>create ()</code> call) • <code>Approved</code>—Specified only when the Approval request is approved (<code>update ()</code> call) • <code>Rejected</code>—Specified when the Approval request is rejected (<code>update ()</code> call) or when it is created (<code>create ()</code> call) and immediately rejected for archival/historical purposes.

Usage

This object allows client applications to programmatically handle approval requests for a Contract. Initially, to request a Contract approval, a client application might create a new Approval request record, specifying the `ParentId`, `OwnerId` (user approving or rejecting the request), `Status` (`Pending`), and (optionally) `RequestComment` fields. Note that when a client application creates the first approval request, if the value of the Contract `Status` field is `Draft`, then the Approval `Status` for this record is automatically changed to `In Approval Process` (see `ContractStatus` for more information).

A client application might subsequently update an existing Approval request, specifying the `Status` (`Approved` or `Rejected`) and an `ApproveComment` (required); the `RequestComment` field can't be updated. Updating an Approval record (either to approve or reject) requires the client application to be logged in with "Approve Contract" permission. To update an Approval request, its `Status` must be `Pending`—a client application can't update an Approval that has already been `Approved` or `Rejected`. To re-submit an approval request for a given Contract, a client application must create a new, separate Approval record and repeat the approval process.

Once a Contract has been approved (not rejected), the Contract `LastApprovedDate` field is automatically updated, however the Contract `Status` field isn't updated, it keeps the value `InApproval`.

An approved Contract must be activated explicitly. Client applications can activate a Contract by setting the value in its `Status` field to `Activated`, or a User can activate a Contract via the Salesforce user interface.

A Contract can have multiple approval requests in various states (`Pending`, `Approved`, and `Rejected`). In addition, one User can have multiple approval requests associated with the same Contract.

Client applications can't explicitly delete Approval records. Approval records are deleted automatically if the parent Contract is deleted.

SEE ALSO:

[Object Basics](#)

AppTabMember

Represents the list of tabs for each of the available apps. This object is available in API version 43.0 and later.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Details
AppDefinitionId	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The ID of the <code>AppDefinition</code> object. This is a relationship field.</p> <p>Relationship Name AppDefinition</p> <p>Relationship Type Lookup</p> <p>Refers To AppDefinition</p>
DurableId	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A unique virtual Salesforce ID for the color.</p>
SortOrder	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number used to sort this tab in the application.</p>
TabDefinitionId	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The ID of the <code>TabDefinition</code> object.</p>

Field Name	Details
	<p>This is a relationship field.</p> <p>Relationship Name TabDefinition</p> <p>Relationship Type Lookup</p> <p>Refers To TabDefinition</p>
WorkspaceDriverField	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Refers to the workspace mapping in the CustomApplication Metadata API object.</p>

ApptBundleAggrDurDnscale

Sums the duration of the bundle members, reduced by a predefined percentage. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

- Field Service must be enabled.
- Bundling must be enabled in the Field Service Settings.
- The Field Service Admin, Field Service Bundle for Dispatcher, and Field Service Integration permission sets must be enabled.

Fields

Field	Details
BundleAggregationPolicyId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p>

Field	Details
	<p>Description The ID of the parent appointment bundle aggregation policy. This is a relationship field.</p> <p>Relationship Name BundleAggregationPolicy</p> <p>Relationship Type Lookup</p> <p>Refers To ApptBundleAggrPolicy</p>
FromBundleMemberNumber	<p>Type int</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description The number of the first bundle member to which the downscale is applied.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
MaxReduction	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The maximum reduction that can be applied to a bundle member.</p>

Field	Details
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of the appointment bundle aggregation downscale policy.</p>
PercentageOfReduction	<p>Type int</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description The percentage of duration reduction.</p>
ToBundleMemberNumber	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The number of the last bundle member to which the downscale is applied.</p>

ApptBundleAggrPolicy

Policy that defines how the property values of the bundle members are aggregated and assigned to the bundle. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

- Field Service must be enabled.
- Bundling must be enabled in the Field Service Settings.
- The Field Service Admin, Field Service Bundle for Dispatcher, and Field Service Integration permission sets must be enabled.

Fields

Field	Details
AggregationAction	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The aggregation action to be performed. Possible values are: All default and custom Service Appointment fields.</p>
AggregationFieldType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The target field type in the bundle to which the aggregation is directed. Possible values are:</p> <ul style="list-style-type: none"> • Boolean • Date • Numeric • Picklist • Picklist-Multi • Skills • String
AggregationOrder	<p>Type int</p> <p>Properties Create, Defaulted on create, Filter, Group, idLookup, Nillable, Sort, Update</p> <p>Description The order the aggregation is triggered.</p>
BundleFieldName	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Name of the target field in the bundle where the value is taken from the bundle member. Possible values are: All default and custom Service Appointment fields.</p>

Field	Details
BundleMemberAddiFieldName	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Name of an additional source field that is connected to the initial source field in the bundle member from which the value is taken. Possible values are: All default and custom Service Appointment fields.</p>
BundleMemberFieldName	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Name of the source field in the bundle member from which the value is taken. Possible values are: All default and custom Service Appointment fields.</p>
BundlePolicyId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the parent bundle policy. This is a relationship field.</p> <p>Relationship Name BundlePolicy</p> <p>Relationship Type Lookup</p> <p>Refers To ApptBundlePolicy</p>
ConstantValue	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The constant value that is used in the aggregation.</p>
DateValue	<p>Type picklist</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Represents how the date value will be determined.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • End of Day • Now • Null • Start of Day
DoesAllowDuplicateStrings	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if you want to allow the same string to appear more than once when using the 'Sum based on Bundle Members' action type.</p>
DownscaleSortDirection	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Applies only if the Set Downscaled Duration action is set. The downscaling sorting direction of the bundle member service appointments, according to their duration.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Ascending • Descending
FilterCriteriaId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The active recordset filter criteria used for aggregating the bundle members. This is a relationship field.</p> <p>Relationship Name FilterCriteria</p> <p>Relationship Type Lookup</p>

Field	Details
	<p>Refers To RecordsetFilterCriteria</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (LastReferencedDate) but not viewed it.</p>
MaxBundleDuration	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The maximum bundle duration that can be accumulated from the bundle members (after downscaling).</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of the appointment bundle aggregation policy.</p>
ShouldUpdateOnCreationOnly	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if you want to update the field in the bundle only when it is created.</p>

ApptBundleConfig

Represents the general parameters that define the behavior of the bundle. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

- Field Service must be enabled.
- Bundling must be enabled in the Field Service Settings.
- The Field Service Admin, Field Service Bundle for Dispatcher, and Field Service Integration permission sets must be enabled.

Fields

Field	Details
AddToBundleStatuses	<p>Type multipicklist</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Update</p> <p>Description The statuses of service appointment that are allowed to be bundled. Possible values are:</p> <ul style="list-style-type: none"> • Accepted • Canceled • Cannot Complete • Completed • Dispatched • In Progress • None • Rejected • Scheduled <p>The default value is 'None'.</p>
BundleStatusesToPropagate	<p>Type multipicklist</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Update</p>

Field	Details
	<p>Description</p> <p>The bundle statuses that when updated are inherited by the bundle members.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Accepted • Canceled • Cannot Complete • Completed • Dispatched • In Progress • None • Rejected • Scheduled <p>The default value is 'None'.</p>
CriteriaForAutoUnbundlingId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The criteria that causes a bundle service appointment to be unbundled.</p> <p>This is a relationship field.</p> <p>Relationship Name</p> <p>CriteriaForAutoUnbundling</p> <p>Relationship Type</p> <p>Lookup</p> <p>Refers To</p> <p>RecordsetFilterCriteria</p>
LastReferencedDate	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
<code>MemberStatusesNotToPropagate</code>	<p>Type</p> <p>multipicklist</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Nillable, Update</p> <p>Description</p> <p>The bundle member statuses that are not overridden when the bundle's status is updated.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Accepted • Canceled • Cannot Complete • Completed • Dispatched • In Progress • None • Rejected • Scheduled <p>The default value is 'None'.</p>
<code>Name</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, idLookup, Sort, Update</p> <p>Description</p> <p>The name of the Appointment Bundle Config.</p>
<code>OwnerId</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>ID of the owner of this object.</p> <p>This is a polymorphic relationship field.</p> <p>Relationship Name</p> <p>Owner</p>

Field	Details
	<p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
RemoveFromBundleStatuses	<p>Type multipicklist</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Update</p> <p>Description The statuses of service appointments that are allowed to be removed from a bundle. Possible values are:</p> <ul style="list-style-type: none"> • Accepted • Canceled • Cannot Complete • Completed • Dispatched • In Progress • None • Rejected • Scheduled <p>The default value is 'None'.</p>
StatusOnRemovalFromBundle	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The status that a service appointment is given when it is removed from a bundle. Possible values are:</p> <ul style="list-style-type: none"> • Accepted • Canceled • Cannot Complete • Completed • Dispatched • In Progress • None • Rejected • Scheduled

Field	Details
	The default value is 'None'.
StatusesNotToUpdateOnUnbundle	<p>Type multipicklist</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Update</p> <p>Description The statuses that shouldn't be updated when a bundle is unbundled. Possible values are:</p> <ul style="list-style-type: none"> • Accepted • Canceled • Cannot Complete • Completed • Dispatched • In Progress • None • Rejected • Scheduled <p>The default value is 'None'.</p>

ApptBundlePolicy

Policy that defines how the bundling of service appointments should be handled. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

- Field Service must be enabled.
- Bundling must be enabled in the Field Service Settings.
- The Field Service Admin, Field Service Bundle for Dispatcher, and Field Service Integration permission sets must be enabled.

Fields

Field	Details
BundleEndTimeFieldName	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description This field is reserved for future use.</p>
BundleStartTimeFieldName	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description This field is reserved for future use.</p>
CanAllowSchleDepndInBundle	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description This field is reserved for future use.</p>
ConstantTimeValue	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description This field is reserved for future use.</p>
FilterCriteriaId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The active recordset filter criteria used for the bundle members. Only service appointments that meet the criteria can be bundled. This is a relationship field.</p> <p>Relationship Name FilterCriteria</p>

Field	Details
	<p>Relationship Type Lookup</p> <p>Refers To RecordsetFilterCriteria</p>
IsAutomaticBundling	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if the policy is relevant for automatic bundling.</p>
IsManualBundling	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if the policy is relevant for manual bundling. The default value is 'false'.</p>
IsTimeCalcByBundleDurationFld	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description This field is reserved for future use.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
<code>LimitAmountOfBundleMembers</code>	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The maximum number of bundle members that can be included in a bundle.</p>
<code>LimitDurationOfBundle</code>	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The maximum duration of a bundle.</p>
<code>Name</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, idLookup, Sort, Update</p> <p>Description</p> <p>Name of the bundle policy.</p>
<code>OwnerId</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>ID of the owner of this object.</p> <p>This is a polymorphic relationship field.</p> <p>Relationship Name</p> <p>Owner</p> <p>Relationship Type</p> <p>Lookup</p> <p>Refers To</p> <p>Group, User</p>

Field	Details
Priority	<p>Type int</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The priority level that this bundle policy should be given when the bundle policies are analyzed using the automatic mode.</p>

ApptBundlePolicySvcTerr

Represents a link between the BundlePolicy and the ServiceTerritory. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

- Field Service must be enabled.
- Bundling must be enabled in the Field Service Settings.
- The Field Service Admin, Field Service Bundle for Dispatcher, and Field Service Integration permission sets must be enabled.

Fields

Field	Details
BundlePolicyId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the parent bundle policy. This is a relationship field.</p> <p>Relationship Name BundlePolicy</p> <p>Relationship Type Lookup</p> <p>Refers To ApptBundlePolicy</p>

Field	Details
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (LastReferencedDate) but not viewed it.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of the appointment bundle service territory.</p>
ServiceTerritoryId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the service territory. This is a relationship field.</p> <p>Relationship Name ServiceTerritory</p> <p>Relationship Type Lookup</p> <p>Refers To ServiceTerritory</p>

ApptBundleRestrictPolicy

Policy that defines the restrictions that are considered while forming a bundle. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

- Field Service must be enabled.
- Bundling must be enabled in the Field Service Settings.
- The Field Service Admin, Field Service Bundle for Dispatcher, and Field Service Integration permission sets must be enabled.

Fields

Field	Details
BundlePolicyId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the parent bundle policy. This is a relationship field.</p> <p>Relationship Name BundlePolicy</p> <p>Relationship Type Lookup</p> <p>Refers To ApptBundlePolicy</p>
DoesAllowEmpty	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Allows a bundle member service appointment with an empty Restriction Field Name to be bundled.</p>
DoesRestrictAutomaticMode	<p>Type boolean</p>

Field	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if you want to apply this restriction when using the automatic mode.</p>
DoesRestrictManualMode	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if you want to apply this restriction when using the manual mode.</p>
IsRestrictByDateOnly	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if you want the bundle to be restricted according to the calendar date only, ignoring the time of day.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p>

Field	Details
	<p>Description</p> <p>The name of the appointment bundle restriction policy.</p>
RestrictionFieldName	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Name of the field in the service appointment used for applying the restriction.</p> <p>Possible values are: All default and custom Service Appointment fields.</p>

ApptBundleSortPolicy

Policy that defines the properties by which the bundle members are sorted within the bundle. Can also be used in the automatic mode for determining the order of the automatic selection of bundle members. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

- Field Service must be enabled.
- Bundling must be enabled in the Field Service Settings.
- The Field Service Admin, Field Service Bundle for Dispatcher, and Field Service Integration permission sets must be enabled.

Fields

Field	Details
BundlePolicyId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>The ID of the parent bundle policy.</p> <p>This is a relationship field.</p> <p>Relationship Name</p> <p>BundlePolicy</p>

Field	Details
	<p>Relationship Type Lookup</p> <p>Refers To ApptBundlePolicy</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Name of the appointment bundle sort policy.</p>
SortDirection	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The order of the appointments in a bundle Possible values are:</p> <ul style="list-style-type: none"> • Ascending • Descending
SortFieldName	<p>Type picklist</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Name of the field in the service appointment used for sorting the bundle members. Possible values are: All default and custom Service Appointment fields.</p>
SortOrder	<p>Type int</p> <p>Properties Create, Defaulted on create, Filter, Group, idLookup, Nillable, Sort, Update</p> <p>Description The order of fields used for sorting the bundle members.</p>
SortType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The applied sort type for arranging the bundle. Sort for Automatic Bundling defines the order that automated bundling uses to examine the candidate service appointments to be bundled. Sort Within a Bundle defines the order of bundle members. It's also used when you unbundle to define the order that the service appointments are scheduled on the Gantt. Possible values are:</p> <ul style="list-style-type: none"> SortForAutomaticBundling—Sort For Automatic Bundling SortWithinABundle—Sort Within a Bundle

AppUsageAssignment

The AppUsageAssignment object defines the type of application that consumes information from a certain record. When an application attempts an application-specific action on the record, the application first evaluates that the object has the correct AppUsageAssignment for that application. If the assignment is correct, the action proceeds normally. If the assignment is incorrect or doesn't exist, the application may return an error. Each AppUsageAssignment has an AppUsageType metadata type that contains the actual application definition. This way, the AppUsageAssignment acts as a junction object for assigning a certain AppUsageType across multiple objects. This object is available in API version 50.0 and later.

Salesforce application developers configure the AppUsageType metadata. Depending on the platform's requirements, some partners and system integrators may need to create AppUsageAssignments and assign them to records on their own. In other cases, the application is provided with flows used to assign app usage assignments to records in an org. For example, let's say you have a ShoppingCart application that provides commerce services with custom Shopping Cart fields on the order. When a user orders from the shopping cart application, the application has a flow that creates an order with a Shopping Cart app usage assignment. The assignment has an AppUsageType field with a value of ShoppingCart. This value represents the ShoppingCart metadata type that the flow configured for the app usage assignment.

! **Important:** AppUsageType metadata types are configured by Salesforce application developers only. They can't be accessed or reviewed by users. Users can

Supported Calls

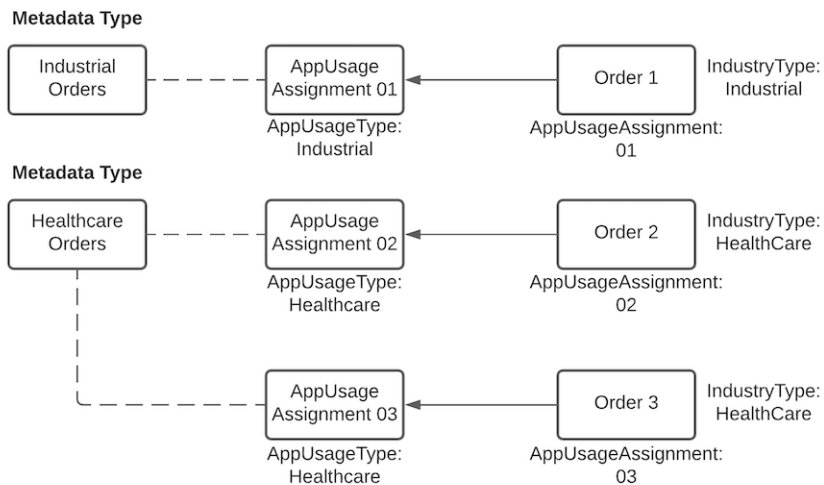

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AppUsageType	<p>Type string</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The name of the application that the AppUsageAssignment represents.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description Optional user-defined name for the AppUsageAssignment.</p>
RecordId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The specific record that the AppUsageAssignment has been assigned to. This is a relationship field.</p> <p>Relationship Name Record</p> <p>Relationship Type Lookup</p> <p>Refers To Order</p>

Usage

This flowchart shows the record relationships in a sample AppUsageAssignment configuration. In this case, the org has two applications that provide additional features to orders, called "Industrial Orders" and "Healthcare Orders." When a sales rep makes an order, they set the order's Industry Type field to Industrial or Healthcare based on the order details. The Industrial Orders and Healthcare Orders applications both have flows that evaluate the order's Industry Type field, and then create and assign an app usage assignment accordingly. This flowchart shows an instance where a sales rep has created one Industrial order and two Healthcare orders.

Article Type__DataCategorySelection

A data category selection represents a data category that classifies an article. This object is available in API version 19.0 and later.

This object can be used to associate an article with data categories from a data category group or to query the category selections for an article.

The object name is variable and has a syntax of *Article Type__DataCategorySelection*, where *Article Type* is the Object Name for the article type associated with the article. For example, *Offer__DataCategorySelection* represents the association between the *Offer* article type and its data categories. Every article is associated with an article type.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `getDeleted()`, `retrieve()`

Special Access Rules

Knowledge must be enabled in your org. Not available in Lightning Knowledge. Users can only access, create or delete data category selection visible to their role, permission set, or profile. If a user has partial visibility on an article's categorization, only the visible categories are returned.

Fields

Field Name	Details
DataCategoryGroupName	<p>Type DataCategoryGroupReference</p> <p>Properties Create</p> <p>Description Unique name of the data category group which has categories associated with the article.</p>
DataCategoryName	<p>Type DataCategoryGroupReference</p> <p>Properties Create</p> <p>Description Unique name of the data category associated with the article.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description ID of the article associated with the data category selection.</p>

Usage

Every article in Salesforce Knowledge can be categorized. A data category selection represents a category that has been selected to classify an article. You can use the *Article Type__DataCategorySelection* object to query and manage article categorization in your org. Client applications can create a categorization for an article with a Draft status. They can also delete and query article categorizations.

 **Note:** When using *Article Type__DataCategorySelection* to classify an article, you can't select both a category (for example USA) and one of its descendants (California) or ascendant categories (North America). In this case, only the first category is selected.

Answers zones use *QuestionDataCategorySelection* to classify questions.

SOQL Sample

The following SOQL query returns the data category selections used to classify the article whose ID is `ka0D000000005ApIAI`.

```
SELECT Id,DataCategoryName, ParentId
      FROM Offer__DataCategorySelection WHERE ParentId='ka0D000000005ApIAI'
```

This clause only returns category unique names. To retrieve category labels use the following clause:

```
SELECT Id, toLabel (DataCategoryName), ParentId
FROM Offer__DataCategorySelection WHERE ParentId='ka0D000000005ApIAI'
```

 **Tip:** You can also use relationship queries to retrieve categorizations from an article type.

[Knowledge](#)

Asset

Represents an item of commercial value, such as a product sold by your company or a competitor, that a customer has purchased.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AccountId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description (Required) ID of the Account associated with this asset. Must be a valid account ID. Required if <code>ContactId</code> isn't specified. This field is a relationship field.</p> <p>Relationship Name Account</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>
AssetLevel	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The asset's position in an asset hierarchy. If the asset has no parent or child assets, its level is 1. Assets that belong to a hierarchy have a level of 1 for the root asset, 2 for the child assets of the root asset, 3 for their children, and so forth.</p> <p> Note: On assets created before the introduction of this field, the asset level defaults to -1. After the asset record is updated, the asset level is calculated and automatically updated.</p>
AssetProvidedById	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The account that provided the asset, typically a manufacturer. This field is a relationship field.</p> <p>Relationship Name AssetProvidedBy</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>
AssetServicedById	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The account in charge of servicing the asset. This field is a relationship field.</p> <p>Relationship Name AssetServicedBy</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>
Availability	<p>Type percent</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description The percentage of expected uptime where the asset was available for use.</p>
AverageUptimePerDay	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The average number of hours per day the asset is expected to be available for use.</p>
ConsequenceOfFailure	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The business impact associated with the asset's failure. Using this field, you can address the asset's health and take action using Flows. To enable this field, use Object Manager to update the field availability. Make sure that the field is visible for field-level security and for page layout. To learn more, see What Determines Field Access. The picklist values aren't predefined in orgs created before Winter '22 that aren't Field Service enabled. This field is available in API version 53.0 and later.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Insignificant • Minor • Moderate • Major • Critical
ContactId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Required if <code>AccountId</code> isn't specified. ID of the Contact associated with this asset. Must be a valid contact ID that has an account parent (but doesn't need to match the asset's <code>AccountId</code>).</p> <p>This field is a relationship field.</p> <p>Relationship Name Contact</p> <p>Relationship Type Lookup</p>

Field	Details
	<p>Refers To Contact</p>
CurrentAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Represents the total amount due during the current asset state period. If no asset state period is current, the value defaults to 0.</p> <p>This field is available in API version 50.0 and later. This field is available when Salesforce Billing is enabled.</p>
CurrentLifecycleEndDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Represents the end of the period shown as current. System-populated field inherited from the end date of the current asset state period. If that field is empty, as with an evergreen subscription, the Current Lifecycle End Date field is also empty.</p> <p>This field is available in API version 50.0 and later. This field is available when Salesforce Billing is enabled.</p>
CurrentMrr	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The asset's monthly recurring revenue during the current asset state period. System-populated field inherited from the monthly recurring revenue on the current asset state period. If no asset state period is current, the value is 0. Label is Current Monthly Recurring Revenue.</p> <p>This field is available in API version 50.0 and later. This field is available when Salesforce Billing is enabled.</p>
CurrentQuantity	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The asset's quantity during the current asset state period. System-populated field inherited from the quantity on the current asset state period. If no asset state period is current, the value is 0.</p> <p>This field is available in API version 50.0 and later. This field is available when Salesforce Billing is enabled.</p>
Description	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Create, Nillable, Update</p> <p>Description</p> <p>Description of the asset.</p>
DigitalAssetStatus	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Status of digital tracking of the asset. The default picklist includes the following values:</p> <ul style="list-style-type: none"> • On • Off • Warning • Error
ExternalIdentifier	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The ID of the matching record in an external system. This field is available in API version 49.0 and later.</p>
HasLifecycleManagement	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>True if this asset is a lifecycle-managed asset, otherwise false. You can't switch an asset to a lifecycle-managed asset or the reverse. This field is system populated.</p> <p>The default value is <i>false</i>.</p>

Field	Details
	This field is available in API version 50.0 and later. This field is available when Salesforce Billing is enabled.
InstallDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Date when the asset was installed.</p>
IsCompetitorProduct	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this Asset represents a product sold by a competitor (<code>true</code>) or not (<code>false</code>). Default value is <code>false</code>. Its UI label is Competitor Asset.</p>
IsInternal	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates that the asset is produced or used internally (<code>true</code>) or not (<code>false</code>). Default value is <code>false</code>. Its UI label is Internal Asset.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time that the asset was last modified. Its UI label is Last Modified Date.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time that the asset was last viewed.</p>
LifecycleEndDate	<p>Type dateTime</p>

Field	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description Represents the end of the asset's lifecycle. System-populated field inherited from the end date of the final asset state period. If that field is empty, as with an evergreen subscription, the lifecycle has no end date.</p> <p>This field is available in API version 50.0 and later. This field is available when Salesforce Billing is enabled.</p>
LifecycleStartDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Represents the beginning of the asset's lifecycle. System-populated field inherited from the start date of the earliest asset state period. This field can't be edited. When a new asset action affects the start date of an asset state period, the period is deleted and a new one is generated.</p> <p>This field is available in API version 50.0 and later. This field is available when Salesforce Billing is enabled.</p>
LocationId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The asset's location. Typically, this location is the place where the asset is stored, such as a warehouse or van.</p>
ManufactureDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date when the asset was manufactured. This field is available from API version 49.0 and later.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description (Required) Name of the asset. Label is Asset Name.</p>

Field	Details
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The asset's owner. By default, the asset owner is the user who created the asset record. Its UI label is Asset Owner. This field is a relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The asset's parent asset. Its UI label is Parent Asset. This field is a relationship field.</p> <p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To Asset</p>
Price	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Price paid for this asset.</p>
Product2Id	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description (Optional) ID of the Product2 associated with this asset. Must be a valid Product2 ID. Its UI label is Product. This field is a relationship field.</p> <p>Relationship Name Product2</p> <p>Relationship Type Lookup</p> <p>Refers To Product2</p>
ProductCode	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The product code of the related product.</p>
ProductDescription	<p>Type string</p> <p>Properties Filter, Sort, Nillable</p> <p>Description The product description of the related product.</p>
ProductFamily	<p>Type picklist</p> <p>Properties Filter, Group, Sort, Nillable</p> <p>Description The product family of the related product.</p>
PurchaseDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Date on which this asset was purchased.</p>
Quantity	<p>Type double</p>

Field	Details
	<p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Quantity purchased or installed.</p>
Reliability	<p>Type percent</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The percentage of expected uptime where the asset wasn't subject to unplanned downtime.</p>
RootAssetId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description (Read only) The top-level asset in an asset hierarchy. Depending on where an asset lies in the hierarchy, its root could be the same as its parent. Its UI label is Root Asset. This field is a relationship field.</p> <p>Relationship Name RootAsset</p> <p>Relationship Type Lookup</p> <p>Refers To Asset</p>
SerialNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Serial number for this asset.</p>
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Customizable picklist of values. The default picklist includes the following values:</p> <ul style="list-style-type: none"> • Purchased

Field	Details
	<ul style="list-style-type: none"> • Shipped • Installed • Registered • Obsolete
StatusReason	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The explanation of the device status. This field is available from API version 49.0 and later. Possible values are:</p> <ul style="list-style-type: none"> • Not Ready • Off • Offline • Online • Paused • Standby
StockKeepingUnit	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The SKU assigned to the related product.</p>
SumDowntime	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Accumulated downtime (planned and unplanned), determined as follows:</p> <ul style="list-style-type: none"> • When only <code>UptimeRecordStart</code> is set, the sum of all downtime from <code>UptimeRecordStart</code> • When <code>UptimeRecordStart</code> and <code>UptimeRecordEnd</code> are set, the sum of all downtime from <code>UptimeRecordStart</code> to <code>UptimeRecordEnd</code> <p>Otherwise, downtime isn't accumulated.</p>
SumUnplannedDowntime	<p>Type double</p>

Field	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description Accumulated unplanned downtime, determined as follows:</p> <ul style="list-style-type: none"> • When only <code>UptimeRecordStart</code> is set, the sum of all unplanned downtime from <code>UptimeRecordStart</code> • When <code>UptimeRecordStart</code> and <code>UptimeRecordEnd</code> are set, the sum of all unplanned downtime from <code>UptimeRecordStart</code> to <code>UptimeRecordEnd</code> <p>Otherwise, unplanned downtime isn't accumulated.</p>
<code>TotalLifecycleAmount</code>	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The total amount of revenue for the asset, including revenue from each stage in the asset lifecycle.</p>
<code>UptimeRecordEnd</code>	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The date until which <code>SumDowntime</code> and <code>SumUnplannedDowntime</code> are accumulated.</p>
<code>UptimeRecordStart</code>	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The date from which <code>SumDowntime</code> and <code>SumUnplannedDowntime</code> are accumulated.</p>
<code>UsageEndDate</code>	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Date when usage for this asset ends or expires.</p>
<code>Uuid</code>	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The unique ID for the asset. This field is available in API version 49.0 and later.</p>

Usage

Use this object to track products sold to customers. With asset tracking, a client application can quickly determine which products were previously sold or are currently installed at a specific account. You can also create hierarchies of up to 10,000 assets.

For example, suppose that your company wants to renew and upsell opportunities on products sold in the past. Similarly, your company can track competitive products in a customer environment where products can be replaced or swapped out.

Asset tracking is also useful for product support, providing detailed information to assist with product-specific support issues. For example, the `PurchaseDate` or `SerialNumber` can indicate whether a given product has certain maintenance requirements, including product recalls. Similarly, the `UsageEndDate` can indicate when the asset was removed from service or when a license or warranty expires.

If an application creates an Asset record, it must specify a `Name` and either an `AccountId`, `ContactId`, or both.

Associated Objects

This object has the following associated objects. If the API version isn't specified, those objects are available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AssetChangeEvent (API version 44.0)

Change events are available for the object.

AssetFeed

Feed tracking is available for the object.

AssetHistory

History is available for tracked fields of the object.

AssetOwnerSharingRule

Sharing rules are available for the object.

AssetShare

Sharing is available for the object.

SEE ALSO:

[Object Basics](#)

AssetAction

Represents a change made to a lifecycle-managed asset. The fields can't be edited. This object is available in API version 50.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

Special Access Rules

To use Customer Asset Lifecycle Management APIs, you must have the Access Customer Asset Lifecycle Management APIs permission and Read access to the Asset, Asset Action, Asset Action Source, and Asset State Period objects.

Fields

Field	Details
ActionDate	<p>Type dateTime</p> <p>Properties Filter, Sort</p> <p>Description The date when an asset action change is recorded. This date can differ from the start date of the related asset state period. For example, suppose that a customer cancels a subscription in June, and the subscription expires in October. The date the customer cancels the subscription (June) is the action date of the asset action. The cancellation's effective date (October) is the start date of the asset state period.</p>
ActualTaxChange	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The rollup of actual tax from all asset action sources. This field is populated by the system. Label is Change in Actual Tax. This field is a calculated field.</p>
AdjustmentAmountChange	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The rollup of adjustment amount from all asset action sources. This field is populated by the system. Label is Change in Adjustment Amount. This field is a calculated field.</p>
Amount	<p>Type currency</p>

Field	Details
	<p>Properties Filter, Sort</p> <p>Description The delta in the total asset amount resulting from an asset action.</p>
AssetActionNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The ID of the asset action. Label is Name.</p>
AssetId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the related lifecycle-managed asset. Label is Asset. This field is a relationship field.</p> <p>Relationship Name Asset</p> <p>Relationship Type Lookup</p> <p>Refers To Asset</p>
Category	<p>Type picklist</p> <p>Properties Filter, Group, Sort</p> <p>Description A category to apply to the asset action. In your layouts and reports, replace this optional picklist with the required Business Category picklist. Label is Category. Available in API version 55.0 and earlier. Possible values are:</p> <ul style="list-style-type: none"> • Cancellations • Cross-Sells • Downsells • Initial Sale • Other

Field	Details
	<ul style="list-style-type: none"> • Renewals • Terms And Conditions Changes • Transfers • Upsells
CategoryEnum	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The business category of the asset action, for use in reporting. Asset action totals are broken out by the picklist values on this required field, and those totals are in turn reflected on assets. The following categories are available. They aren't customizable. Label is Business Category. Possible values are:</p> <ul style="list-style-type: none"> • Cancellations • Cross-Sells • Downsell • Initial Sale • Other • Renewals • Terms And Conditions Changes • Transfers • Upsells
EstimatedTaxChange	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The rollup of estimated tax from all asset action sources. This field is populated by the system. Label is Change in Estimated Tax. This field is a calculated field.</p>
MrrChange	<p>Type currency</p> <p>Properties Filter, Sort</p> <p>Description The delta in the asset's monthly recurring revenue resulting from an asset action. For example, suppose that the MRR during an asset state period is \$200 and the next asset action adds \$100. Then this field's value is \$100. Label is Change in Monthly Recurring Revenue.</p>

Field	Details
ProductAmountChange	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The rollup of product amount from all asset action sources. This field is populated by the system. Label is Change in Product Amount. This field is a calculated field.</p>
QuantityChange	<p>Type double</p> <p>Properties Filter, Sort</p> <p>Description The delta in the asset quantity resulting from an asset action. For example, suppose that the asset quantity during an asset state period is 20 and the next asset action adds 10. Then this field's value is 10. Label is Change in Quantity.</p>
SubtotalChange	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The rollup of subtotal from all asset action sources. This field is populated by the system. Label is Change in Subtotal. This field is a calculated field.</p>
TotalAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The sum of the current and previous asset action amount. This field is populated by the system. This field is a calculated field.</p>
TotalCancellationsAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description The sum of current and previous asset action amounts categorized as <code>Cancellations</code>. This field is populated by the system.</p>
TotalCrossSellsAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The sum of current and previous asset action amounts categorized as <code>Cross-Sells</code>. This field is populated by the system.</p>
TotalDownsellsAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The sum of current and previous asset action amounts categorized as <code>Downsells</code>. This field is populated by the system.</p>
TotalInitialSaleAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The sum of current and previous asset action amounts categorized as <code>Initial Sale</code>. This field is populated by the system.</p>
TotalMrr	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The sum of the monthly recurring revenue for the current and previous asset action. This field is populated by the system. Label is Total Monthly Recurring Revenue.</p>
TotalOtherAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description The sum of current and previous asset action amounts categorized as <code>Other</code>. This field is populated by the system.</p>
TotalQuantity	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The sum of the changes in quantity for the current and previous asset action. This field is populated by the system.</p>
TotalRenewalsAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The sum of current and previous asset action amounts categorized as <code>Renewals</code>. This field is populated by the system.</p>
TotalTermsAndConditionsAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The sum of current and previous asset action amounts categorized as <code>Terms and Conditions Changes</code>. This field is populated by the system. Label is Total Terms and Conditions Changes Amount.</p>
TotalTransfersAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The sum of current and previous asset action amounts categorized as <code>Transfers</code>. This field is populated by the system.</p>
TotalUpsellsAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The sum of current and previous asset action amounts categorized as Upsells. This field is populated by the system.</p>
Type	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>The REST API used to generate the asset action. This field is populated by the system.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Cancel • Change • Generate

AssetActionSource

Represents an optional way to record what transactions caused changes to lifecycle-managed assets. Use it to trace financial and other information about asset actions. This object supports Salesforce order products and work order line items, and transaction IDs from other systems. The fields can't be edited. This object is available in API version 50.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

Special Access Rules

To use Customer Asset Lifecycle Management APIs, you must have the Access Customer Asset Lifecycle Management APIs permission and Read access to the Asset, Asset Action, Asset Action Source, and Asset State Period objects.

Fields

Field	Details
ActualTax	<p>Type</p> <p>currency</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The region-specific tax amount determined at time of the order.</p>

Field	Details
AdjustmentAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description An adjustment to the product amount, such as a discount.</p>
AssetActionId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The related asset action, that is, the change caused by an asset action source transaction. This field is a relationship field.</p> <p>Relationship Name AssetAction</p> <p>Relationship Type Lookup</p> <p>Refers To AssetAction</p>
AssetActionSourceNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The ID of the asset action source. Label is Name.</p>
EndDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The end date of the service or change.</p>
EstimatedTax	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The estimate of the region-specific tax amount made at time of the transaction.</p>

Field	Details
ExternalReference	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of an asset action source transaction originating in a system outside of Salesforce.</p>
ExternalReferenceDataSource	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A system outside of Salesforce that contains asset action source transactions.</p>
ProductAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The product amount after the asset action source transaction.</p>
Quantity	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The product quantity or the change in product quantity after the asset action source transaction.</p>
ReferenceEntityItemId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of an asset action source transaction originating in Salesforce. The transaction can be an order product or a work order line item. This field is a polymorphic relationship field.</p> <p>Relationship Name ReferenceEntityItem</p> <p>Relationship Type Lookup</p>

Field	Details
	<p>Refers To OrderItem, WorkOrderLineItem</p>
StartDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The start date of the service or change.</p>
Subtotal	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The sum of the product amount and the adjustment amount. This field is a calculated field.</p>
TransactionDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date of a source transaction, such as an order date.</p>

AssetDowntimePeriod

Represents a period during which an asset is not able to perform as expected. Downtime periods include planned activities, such as maintenance, and unplanned events, such as mechanical breakdown. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AssetDowntimePeriodNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The unique number of this asset downtime period record.</p>
AssetId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the asset this asset downtime period record is for.</p>
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The description of this asset downtime period.</p>
DowntimeType	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The type of this asset downtime period. Possible values are:</p> <ul style="list-style-type: none"> • Planned • Unplanned
EndTime	<p>Type dateTime</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The time this asset downtime period ended.</p>
IsExcluded	<p>Type boolean</p>

Field	Details
	<p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Whether this asset downtime period is excluded from the calculation of accumulated downtime and accumulated unplanned downtime, and therefore not included in availability and reliability calculations.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
StartTime	<p>Type dateTime</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The time this asset downtime period started.</p>

AssetOwnerSharingRule

Represents the rules for sharing an Asset with users other than the owner. This object is available in API version 33.0 and later.

Note: To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The [SharingRules](#) Metadata API type is enabled for all orgs.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
AssetAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of sharing being allowed. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A description of the sharing rule. Maximum size is 1000 characters.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
GroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p>

Field	Details
	<p>Description</p> <p>The ID representing the source group. Cases owned by users in the source group trigger the rule to give access.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface.</p>
UserOrGroupId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>The ID representing the target user or group. Target users or groups are given access.</p>

Usage

Use this object to manage the sharing rules for assets. General sharing uses this object.

[Metadata API Developer Guide: SharingRules](#)

AssetRelationship

Represents a non-hierarchical relationship between assets due to replacement, upgrade, or other circumstances.

Asset relationships appear in the Primary Assets and Related Assets related lists on asset records in the UI.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
AssetId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The replacement asset. This is a relationship field.</p> <p>Relationship Name Asset</p> <p>Relationship Type Lookup</p> <p>Refers To Asset</p>
AssetRelationshipNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description An auto-generated number identifying the asset relationship.</p>
FromDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The day the replacement asset is installed.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date when the asset relationship was last modified. Its label in the user interface is <code>Last Modified Date</code>.</p>
LastViewedDate	<p>Type dateTime</p>

Field Name	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description The date the asset relationship was last viewed.</p>
RelatedAssetId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The asset being replaced. This is a relationship field.</p> <p>Relationship Name RelatedAsset</p> <p>Relationship Type Lookup</p> <p>Refers To Asset</p>
RelationshipType	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description The type of relationship between the assets. This field comes with three values—Replacement, Upgrade, and Crossgrade—but you can create more in Setup.</p>
ToDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The day the replacement asset is uninstalled.</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

[AssetRelationshipFeed](#)

Feed tracking is available for the object.

AssetRelationshipHistory

History is available for tracked fields of the object.

AssetShare

Represents a sharing entry on an Asset. This object is available in API version 33.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users can't access this object.

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field	Details
<code>AssetAccessLevel</code>	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Level of access that the User or Group has to the Asset. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All This value is not valid for creating or deleting records. <p>This field must be set to an access level that is higher than the organization's default access level for cases.</p>
<code>AssetId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the Asset associated with this sharing entry. This field can't be updated. This is a relationship field.</p> <p>Relationship Name Asset</p>

Field	Details
	<p>Relationship Type Lookup</p> <p>Refers To Asset</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
RowCause	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to <code>Manual</code> (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.</p> <p>Valid values include:</p> <ul style="list-style-type: none"> • <code>Manual</code>—The User or Group has access because a user with “All” access manually shared the Asset with them. • <code>Owner</code>—The User is the owner of the Asset. • <code>Rule</code>—The User or Group has access via an Asset sharing rule. • <code>GuestRule</code>—The User or Group has access via an Asset guest user sharing rule. • <code>ImpImplicit</code>—The User has access to records owned by high-volume Experience Cloud site users via a share group.
UserOrGroupId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the User or Group that has been given access to the Asset. This field can't be updated. This is a polymorphic relationship field.</p> <p>Relationship Name UserOrGroup</p> <p>Relationship Type Lookup</p>

Field	Details
	Refers To Group, User

Usage

This object allows you to determine which users and groups can view and edit Asset records owned by other users.

If you attempt to create a new record that matches an existing record, request updates any modified fields and returns the existing record.

AssetStatePeriod

Represents a time span when an asset has the same quantity, amount, and monthly recurring revenue (MRR). An asset has as many asset state periods as there are changes to it (asset actions) during its lifecycle. The dashboard and related pages show the current asset state period. The fields can't be edited. This object is available in API version 50.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

Special Access Rules

To use Customer Asset Lifecycle Management APIs, you must have the Access Customer Asset Lifecycle Management APIs permission and Read access to the Asset, Asset Action, Asset Action Source, and Asset State Period objects.

Fields

Field	Details
Amount	Type currency Properties Filter, Sort Description An asset's total amount during an asset state period.
AssetId	Type reference Properties Filter, Group, Sort Description The asset related to an asset state period. Label is Asset .

Field	Details
	<p>This field is a relationship field.</p> <p>Relationship Name Asset</p> <p>Relationship Type Lookup</p> <p>Refers To Asset</p>
AssetStatePeriodNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The ID of the asset state period. Label is Name.</p>
EndDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The end date and time of an asset state period. On an asset that is an evergreen subscription, the last asset state period has no end date.</p>
Mrr	<p>Type currency</p> <p>Properties Filter, Sort</p> <p>Description An asset's monthly recurring revenue during an asset state period.</p>
Quantity	<p>Type double</p> <p>Properties Filter, Sort</p> <p>Description The total quantity of an asset during an asset state period.</p>
StartDate	<p>Type dateTime</p> <p>Properties Filter, Sort</p>

Field	Details
	<p>Description</p> <p>The start date and time of an asset state period.</p>

AssetTag

Associates a word or short phrase with an Asset.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ItemId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter</p> <p>Description</p> <p>ID of the tagged item.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter</p> <p>Description</p> <p>Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>
TagDefinitionId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type</p> <p>picklist</p>

Field Name	Details
	<p>Properties Create, Filter, Restricted picklist</p> <p>Description Defines the visibility of a tag.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

AssetTag stores the relationship between its parent TagDefinition and the Asset being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

AssetTokenEvent

The documentation has moved to [AssetTokenEvent](#) in the *Platform Events Developer Guide*.

AssetWarranty

Defines the warranty terms applicable to an asset along with any exclusions and extensions. This object is available in API version 50.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
<code>AssetId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the asset this warranty term applies to.</p>

Field	Details
AssetWarrantyNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The identifier of the asset warranty record.</p>
EndDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date on which this warranty term expires.</p>
ExchangeType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The type of exchange offered by this warranty term.</p>
Exclusions	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Description of any exclusions.</p>
ExpensesCovered	<p>Type percent</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The percentage of expenses covered.</p>
ExpensesCoveredEndDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date on which cover for expenses ends.</p>

Field	Details
IsTransferable	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Defines whether the warranty term can be transferred to a new owner.</p>
LaborCovered	<p>Type percent</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The percentage of labor covered.</p>
LaborCoveredEndDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date on which cover for labor ends.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date when the asset warranty term was last modified. Its label in the user interface is <code>Last Modified Date</code>.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date when the asset warranty term was last viewed.</p>
PartsCovered	<p>Type percent</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description The percentage of parts covered.</p>
PartsCoveredEndDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date on which cover for parts ends.</p>
Pricebook2Id	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the price book item associated with this asset warranty term.</p>
StartDate	<p>Type date</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The date on which cover under this warranty term starts.</p>
WarrantyTermId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the warranty term this asset warranty term extends.</p>
WarrantyType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The type of the warranty.</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[AssetWarrantyChangeEvent](#)

Change events are available for the object.

AssignedResource

Represents a service resource who is assigned to a service appointment in Field Service and Lightning Scheduler. Assigned resources appear in the Assigned Resources related list on service appointments. This object is available in API version 38.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
<code>ActualTravelTime</code>	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The number of minutes that the service resource needs to travel to the assigned service appointment. You can enter a value with up to two decimal places.</p>
<code>ApptAssistantInfoUrl</code>	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The URL that contains the status of the mobile worker approaching the service appointment, the Community URL, and the expiry of the URL. Available in version 51.0 and later.</p>
<code>AssignedResourceNumber</code>	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description An auto-generated number identifying the resource assignment.</p>

Field Name	Details
EstimatedTravelTime	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The estimated number of minutes needed for the service resource to travel to the service appointment they're assigned to. You can enter a value with up to two decimal places.</p>
LocationStatus	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The status of the mobile worker approaching the service appointment. When the location status changes to one of these values, a status update containing <code>ApptAssistantInfoUrl</code> is sent to the customer. Available in version 51.0 and later.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • EnRoute • LastMile
IsPrimaryResource	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the service resource is a primary resource or not. The default value is false. Available in API version 47.0 and later.</p>
ServiceAppointmentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The service appointment that the resource is assigned to. This is a relationship field.</p> <p>Relationship Name ServiceAppointment</p> <p>Relationship Type Lookup</p>

Field Name	Details
	<p>Refers To ServiceAppointment</p>
ServiceCrewId	<p>Type reference</p> <p>Properties Create, Update, Filter, Group, Sort, Nillable</p> <p>Description The service crew that the resource is assigned to.</p> <p> Note: Since service resources can represent crews or individuals, appointments are typically assigned to crews in the following way:</p> <ol style="list-style-type: none"> 1. Create a service resource of the Crew type that represent the crew. 2. Create an assigned resource on the service appointment and select the crew resource in the <code>ServiceResourceId</code> field. <p>As an alternative, you can assign appointments to crew members separately. This lets you track each member's travel time and see a list of the crew members in the Assigned Resources related list. To take this approach, create an assigned resource for each crew member. List the crew member in the <code>ServiceResourceId</code> field and the crew they belong to in the <code>ServiceCrewId</code> field.</p>
ServiceResourceId	<p>Type reference</p> <p>Properties Create, Update, Filter, Group, Sort</p> <p>Description The resource who is assigned to the service appointment. This is a relationship field.</p> <p>Relationship Name ServiceResource</p> <p>Relationship Type Lookup</p> <p>Refers To ServiceResource</p>

Usage

You can assign multiple service resources to a service appointment. Service resources who are assigned to service appointments cannot be deactivated until they are removed from the appointments.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AssignedResourceChangeEvent (API version 48.0)

Change events are available for the object.

AssignedResourceFeed

Feed tracking is available for the object.

AssignmentRule

Represents an assignment rule associated with a Case or Lead.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `search()`

Special Access Rules

- This object is read only. Assignment rules are created, configured, and deleted in the user interface.
- Customer Portal users can't access this object.

Fields

Field	Details
Active	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether this assignment rule is active (<code>true</code>) or not (<code>false</code>).</p>
Name	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Name of this assignment rule.</p>
SubjectType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p>

Field	Details
	<p>Description</p> <p>Type of assignment rule—Case or Lead.</p>

Usage

Before creating or updating a new Case or Lead, a client application can query (by name) the AssignmentRule to obtain the ID of the assignment rule to use, and then assign that ID to the `assignmentRuleId` field of the AssignmentRuleHeader. The AssignmentRuleHeader can be set using either SOAP API or REST API.

Assignment rules can also be specified when creating or upserting Case or Lead objects via the Bulk API or the Bulk 2.0 API.

[Object Basics](#)

AssociatedLocation

Represents a link between an account and a location in Field Service. You can associate multiple accounts with one location. For example, a shopping center location may have multiple customer accounts.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Field Service must be enabled.

Fields

Field Name	Details
ActiveFrom	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>Date and time the associated location is active.</p>
ActiveTo	<p>Type</p> <p>dateTime</p>

Field Name	Details
	<p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Date and time the associated location stops being active.</p>
AssociatedLocationNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description Auto-generated number identifying the associated location.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date the associated location was last modified.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date the associated location was last viewed.</p>
LocationId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The location associated with the address. This is a relationship field.</p> <p>Relationship Name Location</p> <p>Relationship Type Lookup</p> <p>Refers To Location</p>

Field Name	Details
ParentRecordId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The account associated with the location. This is a relationship field.</p> <p>Relationship Name ParentRecord</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Picklist of address types. The values are:</p> <ul style="list-style-type: none"> • Bill To • Ship To

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

[AssociatedLocationHistory](#)

History is available for tracked fields of the object.

AsyncApexJob

Represents an individual Apex sharing recalculation job, a batch Apex job, a method with the `future` annotation, or a job that implements `Queueable`. Use this object to query Apex batch jobs in your organization.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

The `enableAsyncRequiresViewSetup` field on the `ApexSettings` metadata type controls the activation of the critical update “Require View Setup permission to enqueue async Apex Jobs”. In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

Fields

Field Name	Details
<code>ApexClassId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the Apex class executing the job. Label is <code>Class ID</code>. This is a relationship field.</p> <p>Relationship Name ApexClass</p> <p>Relationship Type Lookup</p> <p>Refers To ApexClass</p>
<code>CompletedDate</code>	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time when the job was completed.</p>
<code>CronTriggerId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the <code>CronTrigger</code> for the <code>AsyncApexJob</code>. This field only applies to <code>BatchApex</code> and <code>ScheduledApex</code> job types. This field is available in API version 53.0 and later. For scheduled jobs created before version 53.0, this field is populated on subsequent execution. This is a relationship field.</p> <p>Relationship Name CronTrigger</p>

Field Name	Details
	<p>Relationship Type Lookup</p> <p>Refers To CronTrigger</p>
ExtendedStatus	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description If one or more errors occurred during the batch processing, this field contains a short description of the first error. A more detailed description of that error, along with any subsequent errors, is emailed to the last user who modified the batch class. This field is available in API version 19.0 and later.</p>
JobItemsProcessed	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Number of job items processed. Label is <code>Batches Processed</code>.</p>
JobType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The type of job being processed. Valid values are:</p> <ul style="list-style-type: none"> • ApexToken • BatchApex • BatchApexWorker • Future • Queueable • ScheduledApex • SharingRecalculation • TestRequest • TestWorker
LastProcessed	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description Last ID that was processed and committed.</p>
LastProcessedOffset	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Offset of the last ID that was processed and committed.</p>
MethodName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the Apex method being executed. Label is <code>Apex Method</code>.</p>
NumberOfErrors	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Total number of batches with a failure. A batch is considered transactional, so any unhandled exceptions constitute an entire failure of the batch. Label is <code>Failures</code>.</p>
ParentJobId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description For batch Apex jobs that run using chunking implementation, multiple child jobs of type <code>BatchApexWorker</code> are created. Each of these child job records contains the job Id of the parent Apex job that started their execution. For batch Apex jobs that run using a non-chunking implementation, child jobs aren't created.</p>
Status	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p>

Field Name	Details
	<p>Description</p> <p>The status of the job. Valid values are:</p> <ul style="list-style-type: none"> Aborted Completed Failed Holding¹ Preparing Processing Queued <p>¹ This status applies to batch jobs in the Apex flex queue.</p>
TotalJobItems	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Total number of batches processed. Each batch contains a set of records. Label is <code>Total Batches</code>.</p>

Usage

Use this object to query Apex batch jobs in your organization.

AsyncOperationLog

Represents an async operations log containing progress and status information about external synchronizations to the Omnichannel Inventory service. This object is available in API version 51.0 and later.

Supported Calls

`delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`

Special Access Rules

This object is only available in Omnichannel Inventory orgs.

Fields

Field	Details
AsyncOperationNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The auto-generated number assigned to the operation.</p>
Description	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Description of the operation.</p>
Error	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The error message for the operation. Applies only if the operation has an error.</p>
ExternalReference	<p>Type string</p> <p>Properties Filter, Group, idLookup, Nillable, Sort</p> <p>Description The unique external reference ID per type.</p>
FinishedAt	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time the operation finished.</p>
LastStatusUpdateAt	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description The date and time the status of the operation was last updated.</p>
Request	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description The request sent to the external service.</p>
Response	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description The full response from the external service.</p>
StartedAt	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time the operation started.</p>
Status	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The status of the operation. Possible values are:</p> <ul style="list-style-type: none"> • Completed • Error • In Progress • New
Type	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p>

Field	Details
	<p>Description</p> <p>The type of operation that is being tracked.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Location Management

AttachedContentDocument

This read-only object contains all `ContentDocument` objects associated with an object.

Supported Calls

`describeSObjects()`

Fields

Field Name	Details
<code>ContentDocumentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the attached <code>ContentDocument</code>. This is a relationship field.</p> <p>Relationship Name ContentDocument</p> <p>Relationship Type Lookup</p> <p>Refers To ContentDocument</p>
<code>ContentSize</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Size of the document in bytes.</p>

Field Name	Details
ContentUrl	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description URL for links and Google Docs. This field is set only for links and Google Docs, and is one of the fields that determine the <code>FileType</code>. This field is available in API version 31.0 and later.</p>
ExternalDataSourceName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Name of the external data source in which the document is stored. This field is set only for external documents that are connected to Salesforce. This field is available in API version 32.0 and later.</p>
ExternalDataSourceType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Type of external data source in which the document is stored. This field is set only for external documents that are connected to Salesforce. This field is available in API version 35.0 and later.</p>
FileExtension	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description File extension of the attached <code>ContentDocument</code>. This field is available in API version 31.0 and later.</p>
FileType	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name**Details****Description**

Type of document, determined by the file extension.

LinkedEntityId

Type

reference

Properties

Filter, Group, Sort

Description

ID of the record the `ContentDocument` is attached to.

This is a relationship field.

Field Name	Details
	<p>Organization, OtherComponentTask, PartyConsent, PersonEducation, PersonLanguage, PersonLifeEvent, PersonName, PlanBenefit, PlanBenefitItem, Product2, ProductFulfillmentLocation, ProductItem, ProductItemTransaction, ProductRequest, ProductRequestLineItem, ProductRequired, ProductTransfer, ProfileSkill, ProfileSkillEndorsement, ProfileSkillUser, ProviderSearchSyncLog, PurchaserPlan, PurchaserPlanAssn, ReceivedDocument, Report, ReportAnomalyEventStore, ResourceAbsence, ResourcePreference, ReturnOrder, ReturnOrderLineItem, ServiceAppointment, ServiceResource, ServiceResourceSkill, ServiceTerritory, ServiceTerritoryMember, ServiceTerritoryWorkType, SessionHijackingEventStore, Shift, Shipment, ShipmentItem, Site, SkillRequirement, SocialPost, Solution, Task, ThreatDetectionFeedback, User, Visit, VisitedParty, Visitor, VoiceCall, VolunteerProject, WorkBadgeDefinition, WorkOrder, WorkOrderLineItem, WorkType, WorkTypeGroup, WorkTypeGroupMember</p>
SharingOption	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Controls whether or not sharing is frozen for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is <code>Allowed</code>, which means that new shares are allowed. When set to <code>Restricted</code>, new shares are prevented without affecting existing shares.</p> <p>This field is available in API versions 35.0 and later.</p>
Title	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description Title of the attached <code>ContentDocument</code>.</p>

Usage

Use this object to list all `ContentDocument` objects attached to an object via a feed post.

To retrieve `ContentDocument` objects, issue a `describe` call on an object, which returns a query result for each activity since the record was created. You can't directly query this object.

AttachedContentNote

This read-only object contains all `ContentNote` objects associated with an object. This object is available in API version 35.0 and later.

Supported Calls

`describeSObjects()`

Special Access Rules

- Notes must be enabled.
- Chatter must be enabled.

Fields

Field Name	Details
<code>ContentDocumentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the attached <code>ContentNote</code></p>
<code>ContentSize</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Size of the note in bytes.</p>
<code>FileExtension</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description File extension of the attached <code>ContentNote</code>.</p>
<code>FileType</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Type of file for the note. All notes have a file type of <code>SNOTE</code>.</p>
<code>LinkedEntityId</code>	<p>Type reference</p>

Field Name	Details
	<p>Properties Filter, Group, Sort</p> <p>Description ID of the record the <code>ContentNote</code> is attached to.</p>
<code>TextPreview</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A preview of the note, up to 255 characters.</p>
<code>Title</code>	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Title of the note.</p>

Usage

Use this object to list all `ContentNote` objects attached to an object.

To retrieve `ContentNote` objects, issue a `describe` call on an object, which returns a query result for each note created or attached. You can't directly query this object.

Attachment

Represents a file that a User has uploaded and attached to a parent object.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
<code>Body</code>	<p>Type base64</p>

Field	Details
	<p>Properties Create, Update</p> <p>Description Required. Encoded file data.</p>
BodyLength	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Size of the file (in bytes).</p>
ConnectionReceivedId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the PartnerNetworkConnection that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.</p>
ConnectionSentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the PartnerNetworkConnection that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new PartnerNetworkRecordConnection object to forward records to connections.</p>
ContentType	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The content type of the attachment.</p> <p>If the <code>Don't allow HTML uploads as attachments or document records</code> security setting is enabled for your organization, you cannot upload files with the following file extensions: <code>.htm</code>, <code>.html</code>, <code>.htt</code>, <code>.htx</code>, <code>.mhtm</code>, <code>.mhtml</code>, <code>.shtm</code>, <code>.shtml</code>, <code>.acgi</code>, <code>.svg</code>.</p> <p>When you insert a document or attachment through the API, make sure that this field is set to the appropriate MIME type.</p>

Field	Details
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Description of the attachment. Maximum size is 500 characters. This field is available in API version 18.0 and later.</p>
IsEncrypted	<p>This information is about Shield Platform Encryption and not Classic Encryption.</p> <p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the attachment is encrypted using Shield Platform Encryption (<code>true</code>) or not (<code>false</code>). This field is available in API version 34.0 and later.</p>
IsPartnerShared	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this record is shared with a connection using Salesforce to Salesforce. Label is <code>Is Shared With Partner</code>.</p>
IsPrivate	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this record is viewable only by the owner and administrators (<code>true</code>) or viewable by all otherwise-allowed users (<code>false</code>). During a create or update call, it is possible to mark an Attachment record as private even if you are not the owner. This can result in a situation in which you can no longer access the record that you just inserted or updated. Label is Private. Attachments on tasks or events can't be marked private.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p>

Field	Details
	<p>Description Required. Name of the attached file. Maximum size is 255 characters. Label is File Name.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the User who owns the attachment. This field isn't required for API version 9.0 or later. The owner of an attachment on a task or event must be the same as the owner of the task or event. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Calendar, User</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the parent object of the attachment. The following objects are supported as parents of attachments:</p> <ul style="list-style-type: none"> • Account • Asset • Campaign • Case • Contact • Contract • Custom objects • EmailMessage • EmailTemplate • Event • Lead • Opportunity • Product2 • Solution

Field	Details
	<ul style="list-style-type: none"> Task <p>This is a polymorphic relationship field.</p> <p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To Account, Accreditation, AssessmentIndicatorDefinition, AssessmentTask, AssessmentTaskContentDocument, AssessmentTaskDefinition, AssessmentTaskOrder, Asset, Award, BoardCertification, BusinessLicense, BusinessMilestone, BusinessProfile, Campaign, CareBarrier, CareBarrierDeterminant, CareBarrierType, CareDeterminant, CareDeterminantType, CareDiagnosis, CareMetricTarget, CareObservationComponent, CarePgmProvHealthcareProvider, CareProgram, CareProgramCampaign, CareProgramEligibilityRule, CareProgramEnrollee, CareProgramEnrolleeProduct, CareProgramEnrollmentCard, CareProgramGoal, CareProgramProduct, CareProgramProvider, CareProgramTeamMember, CareProviderAdverseAction, CareProviderFacilitySpecialty, CareRegisteredDevice, CareRequest, CareRequestDrug, CareRequestExtension, CareRequestItem, CareSpecialty, CareTaxonomy, Case, CommSubscription, CommSubscriptionChannelType, CommSubscriptionConsent, CommSubscriptionTiming, Contact, Contract, CreditMemo, DelegatedAccount, EmailMessage, EmailTemplate, EngagementChannelType, EnrollmentEligibilityCriteria, Event, HealthcareFacility, HealthcareFacilityNetwork, HealthcarePayerNetwork, HealthcarePractitionerFacility, HealthcareProvider, HealthcareProviderNpi, HealthcareProviderSpecialty, HealthcareProviderTaxonomy, IdentityDocument, Image, IndividualApplication, Invoice, Lead, Location, MemberPlan, Opportunity, Order, OtherComponentTask, PersonEducation, PersonLifeEvent, Product2, ProductRequest, ProductRequestLineItem, PurchaserPlan, ReceivedDocument, ServiceAppointment, ServiceResource, Shift, SocialPost, Solution, Task, Visit, VisitedParty, Visitor, VolunteerProject, WorkOrder, WorkOrderLineItem</p>

 **Note:** If you are importing Attachment data and want to set the value for an audit field, such as `CreatedDate`, contact Salesforce. For example, for compliance reasons, you may prefer to set the `CreatedDate` to the date the record was originally created in your system, rather than the date it was imported into Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

Usage

The API sends and receives the binary file attachment data encoded as a base64Binary data type. Before creating a record, client applications must encode the binary attachment data as base64. Upon receiving a response, client applications must decode the base64 data to binary (this conversion is usually handled for you by the SOAP client).

The create call restricts these files to a maximum size of 25 MB. For a file attached to a Solution, the limit is 1.5 MB. The maximum email attachment size is 3 MB.

The API supports attachments on email in create, delete, or update calls. The query call does not return attachments parented by email, unless the user performing the query has the "Modify All Data" permission.

 **Note:**

- Attachment records are not searched during text searches.
- When issued by an administrator, the query results include Attachment records from the Recycle Bin.
- When issued by a non-administrator, the `queryAll()` call results do not include Attachment records from the Recycle Bin.

Access to fields depends on the method being used:

- All of the fields are accessible using the `describeSObjects()` and `query()` calls. With the `create()` call, you can insert the `Name`, `ParentId`, `Body`, `IsPrivate`, and `OwnerId` fields.
- To modify existing records, the `update()` call gives you access to change the `Name`, `Body`, `IsPrivate`, and `OwnerId` fields.
- You can access all of the fields using a `query()` call. However, you can't receive the `Body` field for multiple records in a single `query()` call. If your query returns the `Body` field, your client application must ensure that only one row with one Attachment is returned; otherwise, an error occurs. A more effective approach is to return IDs (but not Attachment records in the `Body` field) from a `query()` call and then pass them into `retrieve()` calls that return the `Body` field.
- For information about accessing the attachments of archived activities, see Archived Activities.

SEE ALSO:

[Note](#)

Audience

Represents an audience that is defined by criteria and can be assigned and used for targeting in an Experience Cloud site. This object is available in API version 44.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

Fields

Field	Details
AudienceName	<p>Type string</p> <p>Properties Filter, Group, Sort, Update</p> <p>Description Name of the audience.</p>
ContainerId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p>

Field	Details
	<p>Description</p> <p>ID of the site or org that contains the audience. ContainerId is nillable in API versions 47.0 and earlier.</p>
Description	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Description of the audience.</p>
DeveloperName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Sort, Update</p> <p>Description</p> <p>The unique name of the audience in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated, but you can supply your own value if you create the record using the API.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
FormulaFilterType	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Formula filter for the criteria used to define the audience. Valid values are:</p> <ul style="list-style-type: none"> • <code>AllCriteriaMatch</code>—Matching all the conditions (AND). • <code>AnyCriterionMatches</code>—Matching at least one condition (OR). • <code>CustomLogicMatches</code>—Matching condition logic (AND and OR) and numbered criteria groups. This value is available in API version 45.0 and later.
Language	<p>Type</p> <p>picklist</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Language of the audience. Valid values are:</p> <ul style="list-style-type: none"> • Chinese (Simplified): zh_CN • Chinese (Traditional): zh_TW • Danish: da • Dutch: nl_NL • English: en_US • Finnish: fi • French: fr • German: de • Italian: it • Japanese: ja • Korean: ko • Norwegian: no • Portuguese (Brazil): pt_BR • Russian: ru • Spanish: es • Spanish (Mexico): es_MX Spanish (Mexico) defaults to Spanish for customer-defined translations. • Swedish: sv • Thai: th The Salesforce user interface is fully translated to Thai, but Help is in English.
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort, Update</p> <p>Description Master label for the audience. This internal name doesn't get translated.</p>

AuraDefinition

Represents an Aura component definition, such as component markup, a client-side controller, or an event. This object is available in API version 32.0 and later.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only your Salesforce org's internal users can access this object.

Fields

Field Name	Details
AuraDefinitionBundleId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the bundle containing the definition. A bundle contains a Lightning definition and all its related resources. This is a relationship field.</p> <p>Relationship Name AuraDefinitionBundle</p> <p>Relationship Type Lookup</p> <p>Refers To AuraDefinitionBundle</p>
DefType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The definition type. Valid values are:</p> <ul style="list-style-type: none"> • APPLICATION — Lightning Aura Components app • CONTROLLER — client-side controller • COMPONENT — component markup • EVENT — event definition • HELPER — client-side helper • INTERFACE — interface definition • RENDERER — client-side renderer • STYLE — style (CSS) resource • PROVIDER — reserved for future use • MODEL — deprecated, do not use • TESTSUITE — reserved for future use • DOCUMENTATION — documentation markup • TOKENS — tokens collection

Field Name	Details
	<ul style="list-style-type: none"> • DESIGN — design definition • SVG — SVG graphic resource • MODULE — reserved for future use
Format	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The format of the definition. Valid values are:</p> <ul style="list-style-type: none"> • XML for component markup • JS for JavaScript code • CSS for styles • TEMPLATE_CSS reserved for future use • SVG for an SVG graphic
Source	<p>Type textarea</p> <p>Properties Create, Update</p> <p>Description The contents of the definition. This is all the markup or code for the definition.</p>

Usage

For more information, see the [Lightning Aura Components Developer Guide](#).

AuraDefinitionBundle

Represents a Lightning Aura component definition bundle, such as a component or application bundle. A bundle contains a Lightning Aura component definition and all its related resources. This object is available in API version 32.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
ApiVersion	<p>Type double</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The API version for this bundle. Every bundle has an API version specified at creation.</p>
Description	<p>Type textarea</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The text description of the bundle. Maximum size of 255 characters.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The unique name of the record in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated but you can supply your own value if you create the record using the API.</p> <p> Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
Language	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language of the MasterLabel.</p>
MasterLabel	<p>Type string</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Master label for the Lightning bundle. This internal label doesn't get translated.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the namespacePrefix__componentName notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> • In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

Usage

For more information, see the [Lightning Aura Components Developer Guide](#).

AuraDefinitionBundleInfo

For internal use only.

AuraDefinitionInfo

For internal use only.

AuthConfig

Represents authentication options for an org with a My Domain configured, an Experience Cloud site, or a custom domain. This object is available in API version 32.0 and later.

The fields for this object control the options that display on the login page of an org configured with a My Domain, an Experience Cloud site, or custom domain.

- Logging in with a username and password
- Using SAML for single sign-on
- Authentication provider logins from a third-party service, such as Facebook or Twitter

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

You must have “View Setup and Configuration” permission to view the settings.

Fields

Field Name	Details
<code>AuthOptionsAuthProvider</code>	<p>Type boolean</p> <p>Properties Filter</p> <p>Description If <code>true</code>, at least one Auth. Provider is selected to show up on the login page, and this object has child <code>AuthConfigProvider</code> objects for each provider.</p>
<code>AuthOptionsCertificate</code>	<p>Type boolean</p> <p>Properties Filter</p> <p>Description If <code>true</code>, certificate-based login displays on the My Domain login page.</p>
<code>AuthOptionsSaml</code>	<p>Type boolean</p> <p>Properties Filter</p> <p>Description If <code>true</code>, at least one SAML configuration is selected to show up on the login page. If the organization has only one SAML configuration, this value indicates whether that configuration is selected to show up on the login page. If the organization has multiple SAML configurations, see the child <code>AuthConfigProvider</code> objects for each configuration.</p>

Field Name	Details
AuthOptionsUsernamePassword	<p>Type boolean</p> <p>Properties Filter</p> <p>Description If <code>true</code>, the login option for a username and password appears on the login page.</p>
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The name of the domain created using My Domain or, for an Experience Cloud site, a concatenated string of <code>site name_site prefix</code>.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
IsActive	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Whether this configuration is in use.</p>
Language	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language for the organization.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The text that's used to identify the Visualforce page in Setup.</p>
NamespacePrefix	<p>Type string</p>

Field Name

Details

Properties

Filter, Group, Nillable, Sort

Description

The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***namespacePrefix__componentName*** notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.
- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

Type

Type

picklist

Properties

Filter, Group, Restricted picklist, Sort

Description

The organization type for this object.

- `Org` (includes custom domains)
- `Community`
- `Site`
- `Portal`

Url

Type

string

Properties

Filter, Group, idLookup, Sort

Description

The login URL of the organization for this AuthConfig object. Each URL has only one associated AuthConfig object.

AuthConfigProviders

Represents an authentication provider that's configured in an organization. This object is a child of the AuthConfig object. This object is available in API version 32.0 and later.

This object links the authentication configuration for an organization to the Auth. Provider through the `AuthOptionsAuthProvider` field of the `AuthConfig` object. The login page of a Community or My Domain can allow multiple SAML configurations and multiple authentication providers. These configurations can be set to show up as buttons on the login page. Each configuration has an `AuthConfigProvider` object.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

You must have "View Setup and Configuration" permission to view the settings.

Fields

Field Name	Details
<code>AuthConfigId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID for this configuration. This is a relationship field.</p> <p>Relationship Name AuthConfig</p> <p>Relationship Type Lookup</p> <p>Refers To AuthConfig</p>
<code>AuthProviderId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the Auth. Provider or SAML configuration. This is a polymorphic relationship field.</p> <p>Relationship Name AuthProvider</p> <p>Relationship Type Lookup</p>

Field Name	Details
	Refers To AuthProvider, SamlSsoConfig

AuthorizationForm

Represents the specific version and effective dates of a form that is associated with consent, such as a privacy policy or terms and conditions. This object is available in API version 46.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Data Protection and Privacy is enabled.

Fields

Field Name	Details
<code>DefaultAuthFormTextId</code>	Type reference
	Properties Create, Filter, Group, Nillable, Sort, Update
	Description Required. The ID of the default authorization form text to use if text isn't available for a specific language. This is a relationship field.
	Relationship Name DefaultAuthFormText
	Relationship Type Lookup
	Refers To AuthorizationFormText
<code>EffectiveFromDate</code>	Type date
	Properties Create, Filter, Group, Nillable, Sort, Update

Field Name	Details
	<p>Description The date when the authorization form takes effect.</p>
EffectiveToDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date when the authorization form is no longer in effect.</p>
IsSignatureRequired	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the authorization form requires a signature.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Required. The name of the authorization form.</p>

Field Name	Details
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the owner of the account associated with this customer. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
RevisionNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The revision number of the authorization form. For example, "rev1.21."</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

[AuthorizationFormHistory](#)

History is available for tracked fields of the object.

[AuthorizationFormOwnerSharingRule](#)

Sharing rules are available for the object.

[AuthorizationFormShare](#)

Sharing is available for the object.

AuthorizationFormConsent

Represents the date and way in which a user consented to an authorization form. This object is available in API version 46.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Data Protection and Privacy is enabled.

Fields

Field Name	Details
AuthorizationFormTextId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. The authorization form text that the Individual consented to. This is a relationship field.</p> <p>Relationship Name AuthorizationFormText</p> <p>Relationship Type Lookup</p> <p>Refers To AuthorizationFormText</p>
ConsentCapturedDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Required. The date and time that consent was given.</p>
ConsentCapturedSource	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable Sort, Update</p> <p>Description Required. The source through which consent was captured. For example, user@example.com, www.example.com.</p>
ConsentCapturedSourceType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p>

Field Name	Details
	<p>Description Required. The source type through which consent was captured. For example, phone, email, or website.</p>
ConsentGiverId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. The ID of the person consenting to the authorization form. This is a polymorphic relationship field.</p> <p>Relationship Name ConsentGiver</p> <p>Relationship Type Lookup</p> <p>Refers To Account, CareProgramEnrollee, Contact, Individual, User</p>
DocumentVersionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the document version for which consent is given. This is a relationship field.</p> <p>Relationship Name DocumentVersion</p> <p>Relationship Type Lookup</p> <p>Refers To ContentVersion</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>

Field Name	Details
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Required. The name of the authorization form consent.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Required. The ID of the owner of the account associated with this customer. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
RelatedRecordId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of a record showing consent of an authorization form. This is a polymorphic relationship field.</p> <p>Relationship Name RelatedRecord</p>

Field Name	Details
	<p>Relationship Type Lookup</p> <p>Refers To Account, Visit</p>
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The status of the authorization form. Possible values are:</p> <ul style="list-style-type: none"> • Seen • Signed
PartyId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description This field was removed in API version 47.0. Use <code>ConsentGiverId</code> instead.</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[AuthorizationFormConsentChangeEvent \(API version 47.0\)](#)

Change events are available for the object.

[AuthorizationFormConsentHistory](#)

History is available for tracked fields of the object.

[AuthorizationFormConsentOwnerSharingRule](#)

Sharing rules are available for the object.

[AuthorizationFormConsentShare](#)

Sharing is available for the object.

AuthorizationFormDataUse

Represents the data use consented to in an authorization form. This object is available in API version 46.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Data Protection and Privacy is enabled.

Fields

Field Name	Details
<code>AuthorizationFormId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. The ID of the associated authorization form record. This is a relationship field.</p> <p>Relationship Name AuthorizationForm</p> <p>Relationship Type Lookup</p> <p>Refers To AuthorizationForm</p>
<code>DataUsePurposeId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. Identifies the data use purpose record associated with the authorization form. This is a relationship field.</p> <p>Relationship Name DataUsePurpose</p> <p>Relationship Type Lookup</p> <p>Refers To DataUsePurpose</p>

Field Name	Details
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Required. The name of the authorization form data use.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the owner of the account associated with this customer. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

AuthorizationFormDataUseHistory

History is available for tracked fields of the object.

AuthorizationFormDataUseOwnerSharingRule

Sharing rules are available for the object.

AuthorizationFormDataUseShare

Sharing is available for the object.

AuthorizationFormText

Represents an authorization form's text and language settings. This object is available in API version 46.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Data Protection and Privacy is enabled.

Fields

Field Name	Details
AuthorizationFormId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. The ID of the associated authorization form record. This is a relationship field.</p> <p>Relationship Name AuthorizationForm</p> <p>Relationship Type Lookup</p> <p>Refers To AuthorizationForm</p>
ContentDocumentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description The ID of the ContentDocument that provides the authorization form's text. This is a relationship field.</p> <p>Relationship Name ContentDocument</p> <p>Relationship Type Lookup</p> <p>Refers To ContentDocument</p>
FullAuthorizationFormUrl	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The URL where the full text of the authorization form is located.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Locale	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>The combined language and locale ISO code that control the language of the authorization form text. <code>Locale</code> and <code>LocaleSelection</code> have the same function.</p> <p> Note: <code>Locale</code> can contain custom values not included in the picklist if added before version 47.0.</p>
<code>LocaleSelection</code>	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>The combined language and locale ISO code that control the language of the authorization form text. <code>Locale</code> and <code>LocaleSelection</code> have the same function.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, idLookup, Sort, Update</p> <p>Description</p> <p>Required. The name of the authorization form text.</p>
<code>SummaryAuthFormText</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>A shortened version of the authorization form that is displayed to the user.</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

[AuthorizationFormTextHistory](#)

History is available for tracked fields of the object.

AuthProvider

Represents an authentication provider (auth provider). An auth provider lets users log in to your Salesforce org from an external service provider, such as Facebook, Google, or GitHub.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Only users with Customize Application and Manage AuthProviders permissions can access this object.

Fields

Field Name	Details
AppleTeam	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Required when using Apple as a third-party authentication provider. A 10-character team ID, obtained from an Apple developer account. Available in API version 48.0 and later.</p>
AuthorizeUrl	<p>Type url</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Required when creating an OpenID Connect authentication provider. The OAuth authorization endpoint URL. Available in API version 29.0 and later. In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value.</p>
ConsumerKey	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The app's key that is registered at the third-party (external) authentication provider. In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value.</p>
ConsumerSecret	<p>Type string</p> <p>Properties Create, Nillable</p>

Field Name	Details
	<p>Description</p> <p>The consumer secret of the authentication provider that is registered at the third-party SSO provider. It's used by the consumer for identification to Salesforce. In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value. You can create your own consumer secret on <code>create()</code>. However, after you set it, you can't change the value.</p>
CustomMetadataTypeRecord	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Required when creating a custom authentication provider plug-in. The API name of the custom authentication provider. Available in API version 36.0 and later.</p>
DefaultScopes	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description For OpenID Connect authentication providers, the scopes to send with the authorization request, if not specified when a flow starts. Available in API version 29.0 and later. In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. Used when referring to the authentication provider from a program.</p>
EcKey	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Required when using Apple as a third-party authentication provider. Available in API version 48.0 and later.</p>

Field Name	Details
ErrorUrl	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A custom error URL for the authentication provider to use to report errors.</p>
ExecutionUserId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Required when specifying a registration handler class. The username of the Salesforce admin or system user who runs the Apex handler, which provides the context in which the Apex handler runs. For example, if the Apex handler creates a contact, the creation can be easily traced back to the registration process. In production, use a system user. The user must have the Manage Users permission. Available in API version 27.0 and later.</p>
FriendlyName	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Required. A user-friendly name for the authentication provider.</p>
IconUrl	<p>Type url</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The path to an icon to use as a button on the login page. Users click the button to log in with the associated authentication provider, such as Twitter or Facebook. Available in API version 32.0 and later.</p>
IdTokenIssuer	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>Available when configuring an OpenID Connect authentication provider, the source of the authentication token in https: URI format. If provided, Salesforce validates the returned <code>id_token</code> value. OpenID Connect requires returning an <code>id_token</code> value with the <code>access_token</code> value. Available in API version 30.0 and later.</p>
LinkKickoffUrl	<p>Type url</p> <p>Properties Nillable</p> <p>Description The URL for linking existing Salesforce users to a third-party account. This field is read-only. Available in API version 43.0 and later.</p>
LogoutUrl	<p>Type url</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The destination for users after they log out if they authenticated using single sign-on. The URL must be fully qualified with an http or https prefix, such as <code>https://acme.my.salesforce.com</code>. Available in API version 33.0 and later.</p>
OauthKickoffUrl	<p>Type url</p> <p>Properties Nillable</p> <p>Description The URL for obtaining OAuth access tokens for a third party. This field is read-only. Available in API version 43.0 and later.</p>
OptionsIncludeOrgIdInId	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Used to differentiate between users with the same user ID from two sources (such as two sandboxes). If enabled (<code>true</code>), Salesforce stores the org ID of the third-party identity in addition to the user ID. After you enable this setting, you</p>

Field Name	Details
	can't disable it. Applies only to a Salesforce-managed auth provider. Available in API version 32.0 and later.
OptionsSendAccessTokenInHeader	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description If enabled (<code>true</code>), the access token is sent to the <code>UserInfoUrl</code> in a header instead of a query string. Available in API version 30.0 and later.</p>
OptionsSendClientCredentialsInHeader	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Required when creating an OpenID Connect authentication provider. If enabled (<code>true</code>), the client credentials are sent in a header to the <code>tokenUrl</code> instead of a query string. The credentials are in the standard OpenID Connect Basic Credentials header format, which is <code>Basic <token></code>, where <code><token></code> is the base64-encoded string <code>"clientkey:clientsecret"</code>. Available in API version 30.0 and later.</p>
OptionsSendSecretInApis	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Determines whether the encrypted consumer secret appears in API responses. If enabled (default), the secret appears in the response. If disabled (<code>false</code>), responses don't include the consumer secret. For security, you can disable the setting. However, keep in mind that:</p> <ul style="list-style-type: none"> • By disabling this setting, the consumer secret is excluded from API responses in all API versions. • Change sets and other metadata deployments break because both the consumer key and secret are expected. To fix this problem, insert the consumer key manually during deployment. <p>Available in API version 47.0 and later.</p>
PluginId	<p>Type reference</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An existing Apex class that extends the <code>Auth.AuthProviderPluginClass</code> abstract class. Available in API version 39.0 and later.</p>
ProviderType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Required. The third-party authentication provider to use. Valid values include:</p> <ul style="list-style-type: none"> • <code>Apple</code>. Available in API version 48.0 and later. • <code>Custom</code>—A provider configured with a custom authentication provider plug-in. Available in API version 36.0 and later. • <code>Facebook</code>. • <code>GitHub</code>—Provides authentication for a <code>GitHub</code> provider. Used to log in users of your Lightning Platform app to GitHub using OAuth. When logged in to GitHub, your app can make calls to GitHub APIs. The <code>GitHub</code> provider isn't available as an SSO provider, so users can't log in to your Salesforce org using their GitHub login credentials. Available in API version 35.0 and later. • <code>Google</code>. • <code>Janrain</code>. • <code>LinkedIn</code>. Available in API version 32.0 and later. • <code>MicrosoftACS</code>—Microsoft Access Control Service provides authentication for a Microsoft Office 365 service, like SharePoint Online. Available in API version 31.0 and later. • <code>OpenIdConnect</code>. Available in API version 29.0 and later. • <code>Salesforce</code>. • <code>Slack</code>. Available in API version 54.0 and later. • <code>Twitter</code>. Available in API version 32.0 and later.
RegistrationHandlerId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An existing Apex class that implements the <code>Auth.RegistrationHandler</code> interface.</p>

Field Name	Details
SsoKickoffUrl	<p>Type url</p> <p>Properties Nillable</p> <p>Description The URL for performing SSO into Salesforce from a third party by using its third-party credentials. This field is read-only. Available in API version 43.0 and later.</p>
TokenUrl	<p>Type url</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The OAuth token endpoint URL of an OpenID Connect authentication provider. Available in API version 29.0 and later. In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value.</p>
UserInfoUrl	<p>Type url</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The OpenID Connect endpoint URL of the OpenID Connect authentication provider. Available in API version 29.0 and later. In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value.</p>

AuthSession

The AuthSession object represents an individual user session in your organization. This object is available in versions 29.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
CreatedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description The date and time this session was created. This field is a standard system field.</p>
Id	<p>Type id</p> <p>Properties Defaulted on create, Filter, Group, ID Lookup, Sort</p> <p>Description The current session's ID.</p>
IsCurrent	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If <code>true</code>, the session is a member of the user's current session family. This field is available in API version 37.0 and later.</p>
LastModifiedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description The date and time this session was last updated. A session expires when the current date and time equals <code>LastModifiedDate + NumSecondsValid</code>. This field is a standard system field.</p>
LoginGeoId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The 18-character ID for the record of the geographic location of the user for a login event. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) can vary. This field is available in API version 34.0 and later.</p>

Field Name	Details
	<p>This is a relationship field.</p> <p>Relationship Name LoginGeo</p> <p>Relationship Type Lookup</p> <p>Refers To LoginGeo</p>
LoginHistoryId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The 18-character ID for a successful login event. When a session is reused, Salesforce updates the <code>LoginHistoryId</code> with the value from the most recent login. This field is available in API version 33.0 and later.</p> <p>This is a relationship field.</p> <p>Relationship Name LoginHistory</p> <p>Relationship Type Lookup</p> <p>Refers To LoginHistory</p>
LoginType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of login used to access the session. Possible values are:</p> <ul style="list-style-type: none"> • AJAX Toolkit • Apex Office Toolkit • AppExchange • Application • AppStore • Certificate-based login • Chatter Communities Eternal User Third Party SSO • Chatter Communities External User • Community • Customer Service Portal Third-Party SSO

Field Name	Details
	<ul style="list-style-type: none"> • Customer Service Portal • DataJunction • DB Replication • Employee Login to Community • Excel Integration • Help and Training • HOTP YubiKey • Lightning Login • Networks Portal API Only • Offline Client • Order Center • Other Apex API • Outlook Integration • Partner Portal Third-Party SSO • Partner Portal • Partner Product • Passwordless Login • Remote Access 2.0 • Remote Access Client • Sales Anywhere • Salesforce Outlook Integration • Salesforce.com Website • SAML Chatter Communities External User SSO • SAML Customer Service Portal SSO • SAML Idp Initiated SSO • SAML Partner Portal SSO • SAML Sfdc Initiated SSO • SAML Site SSO • Self-Service • Signup • Sync • SysAdmin Switch • Third Party SSO • Validate
LogoutUrl	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description The page or view to display after users log out of an Experience Cloud site, or an org if they authenticated using SAML. This field is available in API version 32.0 and later.</p>
NumSecondsValid	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of seconds before the session expires, starting from the last update time.</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The 18-character ID for the parent session, if one exists (for example, if the current session is for a canvas app). If the current session doesn't have a parent, this value is the current session's own ID.</p>
SessionSecurityLevel	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Standard or High, depending upon the authentication method used.</p>
SessionType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of session. Common ones are UI, Content, API, and Visualforce.</p>
SourceIp	<p>Type string</p> <p>Properties Filter, Group, Sort</p>

Field Name	Details
	<p>Description</p> <p>IP address of the end user's device from which the session started. This address can be an IPv4 or IPv6 address.</p>
UserType	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>The kind of user for this session. Types include Standard, Partner, Customer Portal Manager, High Volume Portal, and CSN Only.</p>
UsersId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The user's Salesforce user ID.</p> <p>This is a relationship field.</p> <p>Relationship Name</p> <p>Users</p> <p>Relationship Type</p> <p>Lookup</p> <p>Refers To</p> <p>User</p>

Usage

The AuthSession object exposes session data and enables read and delete operations on that data. For example, use this object to create a report showing who is signed in to your organization. Or you can use this object to create a tool to delete a session, ending that user's session. For a user, only their own sessions are available, while administrators can see all sessions.

You can't change user sessions with this object. You can only read and delete them.

BackgroundOperation

Represents a background operation in an asynchronous job queue. This object is available in API version 35.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
Error	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The error message for the operation. Applies only if the operation has an error status.</p>
ExecutionGroup	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Applies only if the operation is merged with other operations into an execution group to be processed in bulk. Identifies the execution group.</p>
ExpiresAt	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description After this time, the operation is removed from the asynchronous job queue. Applies only if the operation has a status of complete, canceled, error, or merged.</p>
FinishedAt	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description When the operation reached the status of completed or error.</p>
GroupLeaderId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Applies only if the operation is merged with other operations into an execution group to be processed in bulk. Identifies the operation that's selected as the leader of the execution group. This is a relationship field.</p>

Field Name	Details
	<p>Relationship Name GroupLeader</p> <p>Relationship Type Lookup</p> <p>Refers To BackgroundOperation</p>
Name	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description Identifies the background operation.</p>
NumFollowers	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Applies only if the operation is merged with other operations into an execution group to be processed in bulk. Number of other operations that are in the execution group.</p>
ParentKey	<p>Type string</p> <p>Properties Filter, Group, idLookup, Nillable, Sort</p> <p>Description Tag that identifies related sets of operations, if any.</p>
ProcessAfter	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The operation is scheduled to be processed after this time.</p>
RetryBackoff	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name

Details

Description

Applies only if the operation has an error status. The first retry is attempted immediately. Each subsequent retry is increasingly delayed according to an exponential expression that's multiplied by the `RetryBackoff`, in milliseconds.

Specifically, the delay time is $(2^n - 1) \times R$, where n is the `RetryCount`, and R is the `RetryBackoff`.

The default value for `RetryBackoff` depends on the type of operation. For example, the `RetryBackoff` default for write operations on external objects is 1,000 milliseconds. For write operations, retries are attempted immediately, after 3 seconds, after 7 seconds, after 15 seconds, and so on.

RetryCount

Type

int

Properties

Filter, Group, Nillable, Sort

Description

Number of attempted retries. Applies only if the operation has an error status.

RetryLimit

Type

int

Properties

Filter, Group, Nillable, Sort

Description

Maximum number of retries to attempt. Applies only if the operation has an error status.

SequenceGroup

Type

string

Properties

Filter, Group, Nillable, Sort

Description

Identifies the sequence group. Applies only if the operation is merged with other operations into an execution group to be processed in bulk. Within an execution group, operations can be placed into a sequence group to be executed in a specific order.

SequenceNumber

Type

int

Properties

Filter, Group, Nillable, Sort

Field Name**Details****Description**

Order position within the sequence group. Applies only if the operation is merged with other operations into an execution group to be processed in bulk. Within an execution group, operations can be placed into a sequence group to be executed in a specific order.

StartedAt

Type

dateTime

Properties

Filter, Nillable, Sort

Description

When the operation started running.

Status

Type

picklist

Properties

Filter, Group, Nillable, Restricted picklist, Sort

Description

Status of the background operation. The options are:

- New
- Scheduled
- Canceled
- Merged
- Waiting
- Running
- Error
- Complete

SubmittedAt

Type

dateTime

Properties

Filter, Nillable, Sort

Description

When the operation was added to the job queue.

Timeout

Type

int

Properties

Filter, Group, Nillable, Sort

Field Name	Details
	<p>Description</p> <p>Maximum time in milliseconds to wait for results after the operation started running.</p>
Type	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>Type of the background operation. The options are:</p> <ul style="list-style-type: none"> • AsyncQuery • ExternalChangeDataCapture • ExternalObject • ExternalObjectSync • Sweeper • WebCart • XClean
WorkerUri	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, idLookup, Nillable, Sort</p> <p>Description</p> <p>URI of the worker that performed the operation.</p> <p>Example for a Salesforce Connect OData operation:</p> <pre>services/data/v35.0/xds/upsert</pre>

Usage

The BackgroundOperation object lets you:

- Monitor the job status of asynchronous operations.
- View errors that are related to the asynchronous operations.
- Extract statistics for the asynchronous job queue.

BackgroundOperationResult

Stores error messages generated when running Async SOQL queries or importing data into big objects using Bulk API. This is a big object, available in API version 37.0 and later.

Each instance of `BackgroundOperationResult` represents one error. The `Message` field stores the text of the error message. The `ParentID` field stores the:

- job ID of the query, in case of Async SOQL
- batch ID for the data import, in case of Bulk API

Bulk API validates data at the time of import, and generates an error message for the first occurrence of invalid data in any row of the data file. The validation performed depends on the type of data being imported.

- **Text**—The length of the input string must be less than or equal to the length of the corresponding text field in the target object.
- **Number**—The input data must be a number, whose scale and precision are compatible with the corresponding number field in the target object.
- **ID**—The input data must be a valid 15- or 18-character ID.
- **DateTime**—The input data must be a valid `dateTime` value, in the approved format.
- **Lookup**—The lookup value must be a valid 15- or 18-character ID.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Details
<code>CreatedById</code>	<p>Type ID</p> <p>Properties Nillable</p> <p>Description The user ID of the user initiating the Bulk API or Async SOQL request.</p>
<code>CreatedDate</code>	<p>Type <code>dateTime</code></p> <p>Properties Defaulted on create</p> <p>Description The date and time at which the Bulk API or Async SOQL request was made.</p>
<code>Data</code>	<p>Type string</p> <p>Properties Nillable</p> <p>Description The data that generated the error message. The total length is limited to 2,000 characters, and each column can occupy a maximum of 50 characters. Any data exceeding those limits is truncated.</p>

Field Name	Details
Id	<p>Type ID</p> <p>Properties Defaulted on create, idLookup</p> <p>Description The ID of the error message.</p>
Message	<p>Type string</p> <p>Properties Nillable</p> <p>Description The text of the error message.</p>
MessageType	<p>Type picklist</p> <p>Properties Nillable, Restricted picklist</p> <p>Description The type of error message. The possible values are: ERROR, WARNING, or INFO.</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Sort</p> <p>Description The batch ID, in case of Bulk API, or the job ID, in case of Async SOQL.</p>

Usage

You can check for errors by querying the `BackgroundOperationResult` object. For example, this query returns details of all errors in a data file imported using Bulk API, whose batch ID is `751xx0000000060AAQ`.

```
SELECT CreatedById, CreatedDate, Id, Message, MessageType, ParentId FROM
BackgroundOperationResult WHERE ParentId = "751xx0000000060AAQ"
```

 **Note:** You can only view errors resulting from Async SOQL or Bulk API requests that you initiated, unless you have the global permission to view all data.

BatchApexErrorEvent

The documentation has moved to [BatchApexErrorEvent](#) in the *Platform Events Developer Guide*.

Bookmark

Represents a link between opportunities that share common information.

This object is available to organizations with the Similar Opportunities feature enabled.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
ID	<p>Type ID</p> <p>Properties Defaulted on create, Filter</p> <p>Description ID of the bookmark. Label is Bookmark ID.</p>
FromId	<p>Type ID</p> <p>Properties Filter</p> <p>Description The originating opportunity. Label is Bookmarked From ID</p>
ToId	<p>Type ID</p> <p>Properties Filter</p> <p>Description The opportunity to which the originating opportunity is linked. Label is Bookmarked To ID.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>

Usage

The Bookmark object works with the Opportunity object only.

Use this read-only object to query the bookmarks between opportunities in your organization. In the online application, users can search for opportunities that share attributes with their opportunity. The user can then bookmark the appropriate opportunities for future reference.

BrandTemplate

Letterhead for HTML EmailTemplate.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
Description	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Description of the letterhead. Limited to 1000 characters.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is Letterhead Unique Name.</p>

Field	Details
	<p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
<code>IsActive</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the letterhead is available for use (<code>true</code>) or not (<code>false</code>). Label is Active.</p>
<code>Name</code>	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Label of the template as it appears in the user interface. Limited to 255 characters. Label is Brand Template Name.</p>
<code>NamespacePrefix</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> • In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
<code>Value</code>	<p>Type textarea</p> <p>Properties Create, Update</p>

Field	Details
	<p>Description</p> <p>The contents of the letterhead, in HTML, including any logos.</p>

Usage

Use this object to brand EmailTemplate records with your letterhead. You can also set a brand template to active or inactive. For example, if you have five different marketing brands, you can maintain each different brand in one template, and assign to the appropriate EmailTemplate.

SEE ALSO:

[EmailTemplate](#)

BriefcaseAssignment

Represents the assignment of a briefcase definition to selected users and user groups. This object is available in API version 50.0 and later.

Use this object to assign selected records for users and groups to view offline. Briefcase objects are available in orgs that have Briefcase Builder and Field Service enabled.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
BriefcaseId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>Required. ID of the briefcase definition. Label is Briefcase Definition ID.</p>
UserOrGroupId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>Required. ID of the user or group requiring access to the briefcase. Label is User or Group ID.</p>

BriefcaseDefinition

Represents a briefcase definition. A briefcase makes selected records available for users to view when they're offline in the Salesforce Field Service mobile app for iOS and Android. This object is available in API version 50.0 and later.

Briefcase objects are available in orgs that have Briefcase Builder and Field Service enabled.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Packaging Considerations

An org can have up to 5 briefcases. Installed briefcases are counted against this limit. You can't install a package that includes a briefcase if your org already has 5 briefcases. When a managed package includes a briefcase, the only changes allowed for the briefcase are activating or deactivating and assigning users or groups to the briefcase.

Fields

Field	Details
Description	<p>Type textarea</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Description of the briefcase definition. Limited to 1024 characters.</p>
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Limited to 80 characters. Label is Name.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
IsActive	<p>Type boolean</p>

Field	Details
	<p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the briefcase is available for use (<code>true</code>) or not (<code>false</code>). Label is Active.</p>
Language	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language for the briefcase. This field defaults to the user's language unless the org is multi-language enabled. Specifies the language of the labels returned.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Chinese (Simplified): <code>zh_CN</code> • Chinese (Traditional): <code>zh_TW</code> • Danish: <code>da</code> • Dutch: <code>n1_NL</code> • English: <code>en_US</code> • Finnish: <code>fi</code> • French: <code>fr</code> • German: <code>de</code> • Italian: <code>it</code> • Japanese: <code>ja</code> • Korean: <code>ko</code> • Norwegian: <code>no</code> • Portuguese (Brazil): <code>pt_BR</code> • Russian: <code>ru</code> • Spanish: <code>es</code> • Spanish (Mexico): <code>es_MX</code> Spanish (Mexico) defaults to Spanish for customer-defined translations. • Swedish: <code>sv</code> • Thai: <code>th</code> The Salesforce user interface is fully translated to Thai, but Help is in English.
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The master label for the briefcase. This internal label doesn't get translated. Limited to 80 characters.</p>

Field	Details
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

Usage

Use this object to query a briefcase or a list of briefcases with selected records and user assignments. For example:

```
SELECT Id, Description FROM BriefcaseDefinition
WHERE Id in (SELECT BriefcaseId FROM BriefcaseRule
WHERE TargetEntity='Account')
AND Id in (SELECT BriefcaseId FROM BriefcaseAssignment where
UserOrGroupId='00GR0000000VtwUMAS')
```

BriefcaseRule

Represents a rule that specifies records for a briefcase definition. This object is available in API version 50.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
BriefcaseId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description Required. ID of the briefcase definition. Label is Briefcase Definition ID.</p>
FilterLogic	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The filter logic for record selection, for example, 1 AND 2 where 1 and 2 correspond to filter 1 and filter 2. Filter logic operators include AND and OR. Limited to 255 characters. Label is Filter Logic.</p>
IsAscendingOrder	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Required. Indicates whether the records should be sorted in ascending order. Label is Ascending.</p>
OrderBy	<p>Type picklist</p> <p>Properties Nillable, Restricted picklist</p> <p>Description The field to order the records by, which determines how the records can be sorted. For example, AccountName or CreatedBy. Label is Order By.</p>
QueryScope	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Required. A group of records to restrict the scope of this rule. Possible values are:</p>

Field	Details
	<ul style="list-style-type: none"> assignedToMe everything <p>The default value is <code>everything</code> (All Records). The value <code>assignedToMe</code> is available only for the <code>ServiceAppointment</code> object.</p>
RecordLimit	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The record limit for the object. The recommended number for record limit is up to 500 records per object for optimal performance. The maximum number is 2000. Label is Limit.</p>
TargetEntity	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The standard or custom object that the briefcase rule evaluates. Label is Target Object.</p>

BriefcaseRuleFilter

Represents a filter criteria for a briefcase rule. This object is available in API version 50.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
BriefcaseRuleId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description Required. ID of the briefcase rule.</p>

Field	Details
FilterOperator	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Required. The comparison operator for this rule filter. Possible values are:</p> <ul style="list-style-type: none"> • d—Ends with • e—Equals • g—Greater than • h—Greater than or equal • i—Like • l—Less than • m—Less than or equal • s—Starts with
FilterSeqNumber	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Required. The filter number. When you apply multiple filters, the filters are numbered sequentially, 1, 2, 3, and so on.</p>
FilterValue	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The value for the field and criteria. For example, <code>true</code> or <code>false</code> for a boolean field whose criteria or filter operator is Equals. Capitalization matters with date filter operators. Be sure to specify date literals in uppercase. Some valid date literals include TODAY, YESTERDAY and TOMORROW.</p>
TargetEntityField	<p>Type picklist</p> <p>Properties Restricted picklist</p> <p>Description Required. The field to filter by. Compound fields and encrypted fields aren't supported. Label is Field.</p>

Budget

Tracks an estimate of future revenue or expenses during a specific time period. This object is available in API version 53.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
Amount	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The total amount of funds for a Budget shown in currency format.</p>
Description	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The description of the Budget and its related business processes.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.</p>

Field	Details
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of the Budget.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the owner of this record. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
PeriodEndDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Last day in the date range for which the Budget applies.</p>
PeriodName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The name of the time period to which the Budget applies.</p>
PeriodStartDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description First day in the date range for which the Budget applies.</p>

Field	Details
Quantity	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The quantity used to track a Budget for non-currency projects. For example, this could be number of hours or number of resources.</p>
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The status of the Budget. Possible values are:</p> <ul style="list-style-type: none"> • Active • Archived • Planned
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Categorizes the Budget by how it will be used. Possible values are:</p> <ul style="list-style-type: none"> • Department • Program • Project

BudgetAllocation

Represents a subsection of a Budget that shows where allocated resources are being applied. This object is available in API version 53.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
Amount	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The total amount of allocated funds.</p>
BudgetId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The Budget that this Budget Allocation is related to. This is a relationship field.</p> <p>Relationship Name Budget</p> <p>Relationship Type Lookup</p> <p>Refers To Budget</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.</p>
Name	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of the Budget Allocation.</p>
Quantity	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The total quantity amount allocated for non-currency projects.</p>
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The status of the Budget Allocation. Possible values are:</p> <ul style="list-style-type: none"> • Allocated • Committed • Finalized

BusinessBrand

Represents a unique brand for a business that belongs to a parent entity. This object is available in API version 53.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Required. Name of this business brand.</p>
OrgId	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The Salesforce ID of the business brand.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the account owner associated with this business brand. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
ParentId	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the parent entity that this business brand is a child of. This is a relationship field.</p> <p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To BusinessBrand</p>

BusinessHours

Specifies the business hours of your support organization. Escalation rules are run only during these hours.

If business hours are associated with any Holiday records, then business hours and escalation rules associated with business hours are suspended during the dates and times specified as holidays.

Supported Calls

`create()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

All users, even those without the “View Setup and Configuration” user permission, can view business hours via the API.

Fields

Field	Details
BusinessHoursId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the BusinessHours associated with the SlaProcess.</p>
IsActive	<p>Type boolean</p>

Field	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the business hours is active (<code>true</code>) or not active (<code>false</code>).</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of the business hours.</p>
IsDefault	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the business hours are set as the default business hours (<code>true</code>) or not (<code>false</code>).</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date when the business hours were last viewed.</p>
FridayEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business closes.</p>
FridayStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business opens.</p>

Field	Details
MondayEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business closes.</p>
MondayStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business opens.</p>
SaturdayEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business closes.</p>
SaturdayStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business opens.</p>
SundayEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business closes.</p>
SundayStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business opens.</p>

Field	Details
ThursdayEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business closes.</p>
ThursdayStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business opens.</p>
TimeZoneSidKey	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The time zone of the business hours.</p>
TuesdayEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business closes.</p>
TuesdayStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business opens.</p>
WednesdayEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business closes.</p>

Field	Details
WednesdayStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business opens.</p>

Usage

Use this object to specify the business hours at which your support team operates. Escalation rules only run during the business hours with which they are associated. To set business hours to 24-hours a day, set the times from midnight to midnight (00:00:00 ~ 00:00:00) on each day.

By default, business hours are set from 12:00 AM to 12:00 AM in the default time zone specified in your organization's profile.

SEE ALSO:

[Object Basics](#)

BusinessProcess

Represents a business process.

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
Description	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Description of this business process. Limit: 255 characters.</p>

Field	Details
IsActive	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this business process can be presented to users in the Salesforce user interface (<code>true</code>) or not (<code>false</code>) when creating a new record type or changing the business process of an existing record type.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Required. Name of this business process. Limit: 80 characters.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> • In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
TableEnumOrId	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description Required. One of the following values: Case, Opportunity, or Solution. Label is Entity Enumeration Or ID.</p>

Usage

Use the BusinessProcess object to offer different subsets of picklist values to different users for the LeadStatus, CaseStatus, and OpportunityStage fields. Similar to a RecordType, a BusinessProcess identifies the type of a row in a Case, Lead, or Opportunity and implies a subset of picklist values for these three fields. The values for the remaining picklist fields are driven by RecordType.

[Object Basics](#)

BusinessProcessDefinition

Setup object that stores information about stages in a customer lifecycle map. The stages are associated with surveys and questions created using Salesforce Surveys. This object is reserved for internal use, and is available in API version 49.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
<code>BusinessProcessGroupId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description Unique identifier of the customer lifecycle map associated with the stage.</p>
<code>DeveloperName</code>	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Developer name of the stage.</p>
<code>Language</code>	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language of the MasterLabel. Possible values are:</p>

Field	Details
	<ul style="list-style-type: none"> • da—Danish • de—German • en_US—English • es—Spanish • es_MX—Spanish (Mexico) • fi—Finnish • fr—French • it—Italian • ja—Japanese • ko—Korean • nl_NL—Dutch • no—Norwegian • pt_BR—Portuguese (Brazil) • ru—Russian • sv—Swedish • th—Thai • zh_CN—Chinese (Simplified) • zh_TW—Chinese (Traditional)
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Label of the stage.</p>
ProcessDescription	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description Description of the stage.</p>
SequenceNumber	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The position of the stage in the associated customer lifecycle map.</p>

BusinessProcessFeedback

Setup object that stores information about the survey and the question associated with each stage in a customer lifecycle map. Customer lifecycle maps are used to track the scores provided by customers across their lifecycle using Salesforce Surveys. This object is reserved for internal use, and is available in API version 49.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
<code>ActionName</code>	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Name of the survey used to gather feedback.</p>
<code>ActionParam</code>	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Name of the question used to gather feedback.</p>
<code>ActionType</code>	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description Method of collecting feedback. Possible value is:</p> <ul style="list-style-type: none"> PHONE_CALL SURVEY
<code>BusinessProcessDefinitionId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p>

Field	Details
	<p>Description</p> <p>Unique identifier of the stage associated with the survey and question.</p>

BusinessProcessGroup

Setup object that stores information about customer lifecycle maps. Customer lifecycle maps are used to track the scores provided by customers across their lifecycle using Salesforce Surveys. This object is reserved for internal use, and is available in API version 49.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
CustomerSatisfactionMetric	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>Represents the question type that measures the customers' Net Promote Score or satisfaction score across their lifecycle.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • NPS • Rating
Description	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Nullable</p> <p>Description</p> <p>Description of the customer lifecycle map.</p>
DeveloperName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Sort</p>

Field	Details
	<p>Description Developer name the customer lifecycle map.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
Language	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language of the MasterLabel. Possible values are:</p> <ul style="list-style-type: none"> • da—Danish • de—German • en_US—English • es—Spanish • es_MX—Spanish (Mexico) • fi—Finnish • fr—French • it—Italian • ja—Japanese • ko—Korean • nl_NL—Dutch • no—Norwegian • pt_BR—Portuguese (Brazil) • ru—Russian • sv—Swedish • th—Thai • zh_CN—Chinese (Simplified) • zh_TW—Chinese (Traditional)
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Label of the customer lifecycle map.</p>

BuyerAccount

Represents an account that is enabled as a buyer for Lightning B2B Commerce. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

The BuyerAccount object is available only if the B2B Commerce license is enabled.

Fields

Field	Details
AvailableCredit	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The amount of credit available to a buyer account. This is a calculated field.</p>
BuyerId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the buyer account. This is a relationship field.</p> <p>Relationship Name Buyer</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p> <p> Note: This field is unique within your organization.</p>
BuyerStatus	<p>Type picklist</p>

Field	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description Status of the buyer account. Possible values are:</p> <ul style="list-style-type: none"> • Active • Inactive • On Hold • Pending <p>The default value is 'Pending'.</p>
CommerceType	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description The type of commerce that the buyer account is conducting, using the Commerce app. Possible values are:</p> <ul style="list-style-type: none"> • Buyer • Reseller • Seller <p>The default value is 'Buyer'.</p>
CreditLimit	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The limit of credit available to the buyer account.</p>
CreditStatus	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description The type or status of the buyer account's credit ranking. Possible values are:</p> <ul style="list-style-type: none"> • Bad Credit • Delinquent

Field	Details
	<ul style="list-style-type: none"> • Good Credit • On Hold <p>The default value is 'Good Credit'.</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Three-letter ISO currency code associated with the buyer account record. Possible values are:</p> <ul style="list-style-type: none"> • USD—U.S. Dollar <p>The default value is 'USD'.</p>
CurrentBalance	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The balance carried by the buyer account.</p>
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the buyer account is active (<code>true</code>) or not (<code>false</code>). The default value is 'false'.</p>
MaximumOrderLimit	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The maximum number of orders that can be placed by the buyer account.</p>
MinimumOrderLimit	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description The minimum number of orders that can be placed by the buyer account.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of the buyer account.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the buyer account owner. This is a relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
PayerId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the buyer account payer. This is a relationship field.</p> <p>Relationship Name Payer</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>
SendToId	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of account that an order is sent to. This is a relationship field.</p> <p>Relationship Name SendTo</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

BuyerAccountFeed on page 3944

Feed tracking is available for the object.

BuyerAccountHistory on page 3956

History is available for tracked fields of the object.

BuyerAccountShare on page 3967

Sharing is available for the object.

BuyerGroupPricebook

Represents a buyer group price book used in Lightning B2B Commerce. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

The BuyerGroupPricebook object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
BuyerGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the buyer group that the price book record is assigned to.</p>
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Determines whether the BuyerGroupPricebook is active (<code>true</code>) or not (<code>false</code>). Default value is <code>false</code>.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The name of the Buyer Group Price Book record.</p>
Pricebook2Id	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the price book assigned to the buyer group.</p>
Priority	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The sequential priority used to determine the price of a product. This field is only available for web stores that use the Priority pricing strategy.</p>

Usage

Use the BuyerGroupPricebook object to assign a price book to a set of buyer users. Assigning a price book to a buyer group allows buyers within that buyer group to retrieve product prices from the price book. When a buyer has multiple price book assignments, including multiple prices for the same product, the store Pricing Strategy determines the price.

Limits

The are organization limits on Buyer Group Price Book records, price books that you can associate to a given buyer group, and buyer groups that you can associate to a given price book.

- Maximum **total** number of Buyer Group Price Book records: 5,000
- Maximum number of price books associated to a given buyer group: 50
- Maximum number of buyer groups associated to a given price book: 100

CalcProcStepRelationship

Defines a parent-child relationship between two Expression Set Steps in an Expression Set Version. The label for this object is Expression Set Step Relationship. This object is available in API version 53.0 and later.

Parent-child step relationships collectively determine the step order.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Access to Expression Sets requires OmniStudio licenses.

Fields

Field	Details
CalcProcStepId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the child Expression Set Step. This is a relationship field.</p> <p>Relationship Name CalcProcStep</p> <p>Relationship Type Lookup</p> <p>Refers To CalculationProcedureStep</p>
CalcProcVersionId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the related Expression Set Version. This is a relationship field.</p> <p>Relationship Name CalcProcVersion</p> <p>Relationship Type Lookup</p> <p>Refers To CalculationProcedureVersion</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The Expression Set Step Relationship name.</p>
ParentCalcProcStepId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p>

Field	Details
	<p>Description The ID of the parent Expression Set Step. This is a relationship field.</p> <p>Relationship Name ParentCalcProcStep</p> <p>Relationship Type Lookup</p> <p>Refers To CalculationProcedureStep</p>
RelationshipType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The type of relationship between the parent and child steps. Possible values are:</p> <ul style="list-style-type: none"> • <code>Bypass</code>—The parent is a condition step. If the condition is false, the child is the next step. • <code>ParentChild</code>—The child is the next step after the parent.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[CalcProcStepRelationshipFeed](#) on page 3944

Feed tracking is available for the object.

[CalcProcStepRelationshipHistory](#) on page 3956

History is available for tracked fields of the object.

CalculationMatrix

Matches input values to a table row and returns the row's output values. The label for this object is Decision Matrix. This object is available in API version 53.0 and later.

Decision Matrices are useful for implementing complex rules in a systematic, readable way. There are two types: Standard and Grouped. A Grouped Decision Matrix groups rows in different versions by one or two keys such as geographic region or product code.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Access to Decision Matrices requires OmniStudio licenses.

Fields

Field	Details
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description A text description of the Decision Matrix.</p>
GroupKey	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A key for grouping matrix rows in different versions, such as geographic region or product code.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, it's possible the user only accessed this record or list view (<code>LastReferencedDate</code>) but didn't view it.</p>

Field	Details
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The Decision Matrix name.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the user who currently owns this matrix. Default value is the user logged in to the API to perform the create action. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
SubGroupKey	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A subkey for grouping matrix rows in different versions, such as geographic region or product code. For example, if the <code>GroupKey</code> is <code>Country</code>, the <code>SubGroupKey</code> can be <code>State</code> or <code>Province</code>.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The Decision Matrix type. A Standard Decision Matrix has no special features. A Grouped Decision Matrix groups rows by one or two keys (<code>GroupKey</code> and <code>SubGroupKey</code>) such as geographic region or product code. Possible values are:</p> <ul style="list-style-type: none"> • Grouped

Field	Details
	<ul style="list-style-type: none"> Standard

Usage

Expression Sets, OmniScripts, and Integration Procedures can call Decision Matrices.

CalculationMatrixColumn

Defines a column in a Decision Matrix. The label for this object is Decision Matrix Column. This object is available in API version 53.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Access to Decision Matrices requires OmniStudio licenses.

Fields

Field	Details
ApiName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The API name of the column.</p>
CalculationMatrixId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the Decision Matrix to which this column belongs. This is a relationship field.</p> <p>Relationship Name CalculationMatrix</p>

Field	Details
	<p>Relationship Type Lookup</p> <p>Refers To CalculationMatrix</p>
ColumnType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether the column matches matrix input or is returned as output. Possible values are:</p> <ul style="list-style-type: none"> • Input • Output
DataType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of data in the column. Possible values are:</p> <ul style="list-style-type: none"> • Boolean • Currency • Number • NumberRange • Percent • Text • TextRange
DisplaySequence	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The position of this column in the column order.</p>
IsWildcardColumn	<p>Type boolean</p>

Field	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Specifies that this column can contain a wildcard value such as <code>ALL</code>. The default value is <code>false</code>.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The column name.</p>
RangeValues	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description A list of values that define range boundaries.</p>
WildcardColumnValue	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The value that indicates a wildcard, for example <code>ALL</code>. Applicable if <code>IsWildcardColumn</code> is <code>true</code>.</p>

CalculationMatrixRow

Defines a row in a Decision Matrix. The label for this object is Decision Matrix Row. This object is available in API version 53.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Access to Decision Matrices requires OmniStudio licenses.

Fields

Field	Details
CalculationMatrixVersionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the Decision Matrix Version to which this row belongs. This is a relationship field.</p> <p>Relationship Name CalculationMatrixVersion</p> <p>Relationship Type Lookup</p> <p>Refers To CalculationMatrixVersion</p>
EndDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The last date on which this row version is active. Applicable if <code>IsVersionEnabled</code> is <code>true</code>.</p>
InputData	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The input columns and associated values for this row of the matrix.</p>
IsVersionEnabled	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Specifies whether the associated matrix version is active. Derived from the associated Decision Matrix Version (CalculationMatrixVersion object). The default value is <code>false</code>.</p>

Field	Details
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The row name.</p>
OutputData	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The output columns and associated values for this row of the matrix.</p>
StartDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The first date on which this row version is active. Applicable if <code>IsVersionEnabled</code> is <code>true</code></p>

CalculationMatrixVersion

Defines a version of a Decision Matrix. The label for this object is Decision Matrix Version. This object is available in API version 53.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Access to Decision Matrices requires OmniStudio licenses.

Fields

Field	Details
CalculationMatrixId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the Decision Matrix to which this version belongs. This is a relationship field.</p> <p>Relationship Name CalculationMatrix</p> <p>Relationship Type Lookup</p> <p>Refers To CalculationMatrix</p>
EndDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The last date on which this matrix version is active.</p>
GroupKey	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A key for grouping matrix rows in different versions, such as geographic region or product code. Derived from the associated Decision Matrix (CalculationMatrix object).</p>
GroupKeyValue	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The value of the GroupKey for this version. For example, if the GroupKey is Country, the GroupKeyValue can be United States.</p>
IsEnabled	<p>Type boolean</p>

Field	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Specifies whether this version is active. The default value is <code>false</code>.</p>
LoadProcessStatus	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The status of a data upload from a <code>.csv</code> file. Possible values are:</p> <ul style="list-style-type: none"> • <code>Completed</code> • <code>CompletedWithErrors</code> • <code>Failed</code> • <code>InProgress</code> • <code>Pending</code>
MatrixType	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The matrix type, either <code>Standard</code> or <code>Grouped</code>. A <code>Grouped</code> Decision Matrix groups rows in different Decision Matrix Versions by one or two keys such as geographic region or product code. Derived from the associated Decision Matrix (<code>CalculationMatrix</code> object).</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The matrix version name.</p>
Rank	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>When the invocation time of a matrix call is between the <code>StartDateTime</code> and <code>EndDateTime</code> of more than one enabled matrix version, the version with the highest <code>Rank</code> is chosen.</p>
<code>StartDateTime</code>	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>The first date on which this matrix version is active.</p>
<code>SubGroupKey</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>A subkey for grouping matrix rows in different versions, such as geographic region or product code. For example, if the <code>GroupKey</code> is <code>Country</code>, the <code>SubGroupKey</code> can be <code>State</code> or <code>Province</code>. Derived from the associated Decision Matrix (CalculationMatrix object).</p>
<code>SubGroupKeyValue</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The value of the <code>SubGroupKey</code> for this version. For example, if the <code>SubGroupKey</code> is <code>State</code> or <code>Province</code>, the <code>SubGroupKeyValue</code> can be <code>California</code>.</p>
<code>VersionNumber</code>	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The version number.</p>

CalculationProcedure

Performs a series of calculations using matrix lookups and user-defined variables and constants. The label for this object is Expression Set. This object is available in API version 53.0 and later.

Expression Sets accept input variables and return output variables, both in JSON format. Expression Sets are especially useful for determining prices, rates, and quotes.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Access to Expression Sets requires OmniStudio licenses.

Fields

Field	Details
Description	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A text description of the Expression Set.</p>
InputVariablesMetadata	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Metadata for the Expression Set's input variables.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The timestamp when the current user last viewed this record or list view. If this value is null, it's possible the user only accessed this record or list view (<code>LastReferencedDate</code>) but didn't view it.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, idLookup, Sort, Update</p> <p>Description</p> <p>The Expression Set name.</p>
OutputVariablesMetadata	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Create, Nillable, Update</p> <p>Description</p> <p>Metadata for the Expression Set's output variables.</p>
OwnerId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The ID of the user who currently owns this Expression Set. Default value is the user logged in to the API to perform the create action.</p> <p>This is a polymorphic relationship field.</p> <p>Relationship Name</p> <p>Owner</p> <p>Relationship Type</p> <p>Lookup</p> <p>Refers To</p> <p>Group, User</p>

Usage

OmniScripts and Integration Procedures can call Expression Sets. Expression Sets can call Decision Matrices.

CalculationProcedureStep

Defines a step in an Expression Set. The label for this object is Expression Set Step. This object is available in API version 53.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Access to Expression Sets requires OmniStudio licenses.

Fields

Field	Details
CalculationMatrixId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the Decision Matrix this step calls. Applicable only if the <code>StepType</code> is <code>MatrixLookup</code> or <code>GroupMatrixLookup</code>. This is a relationship field.</p> <p>Relationship Name CalculationMatrix</p> <p>Relationship Type Lookup</p> <p>Refers To CalculationMatrix</p>
CalculationMatrixType	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The type of the Decision Matrix this step calls. Applicable only if this step calls a Decision Matrix. If the <code>StepType</code> is <code>MatrixLookup</code>, the value of this field is <code>Standard</code>. If the <code>StepType</code> is <code>GroupMatrixLookup</code>, the value of this field is <code>Grouped</code>.</p>
CalculationProcedure	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the Expression Set to which this step belongs.</p>

Field	Details
CalculationProcedureVersionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the Expression Set Version to which this step belongs. This is a relationship field.</p> <p>Relationship Name CalculationProcedureVersion</p> <p>Relationship Type Lookup</p> <p>Refers To CalculationProcedureVersion</p>
ConditionsConvertedText	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The condition expression converted to postfix notation. Applicable only if the <code>StepType</code> is <code>Condition</code>.</p>
ConditionsExpressionText	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The condition expression as the user entered it. Applicable only if the <code>StepType</code> is <code>Condition</code>.</p>
ConditionsUiFormattedText	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The condition expression converted to JSON format for UI display. Applicable only if the <code>StepType</code> is <code>Condition</code>.</p>
Description	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A text description of the Expression Set Step.</p>
FormulaConvertedText	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The formula expression converted to postfix notation. Applicable only if the <code>StepType</code> is <code>Calculation</code>.</p>
FormulaExpressionText	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The formula expression as the user entered it. Applicable only if the <code>StepType</code> is <code>Calculation</code>.</p>
FormulaUiFormattedText	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The formula expression converted to JSON format for UI display. Applicable only if the <code>StepType</code> is <code>Calculation</code>.</p>
InputVariablesFormatText	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description A list of the input matrix columns or procedure variables applicable to the step.</p>
IsConditionalStep	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Specifies that this step is conditional.</p>

Field	Details
	The default value is <code>false</code> .
<code>IsResultIncluded</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Specifies that the result of this step is included in the Expression Set output. The default value is <code>false</code>.</p>
<code>Name</code>	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The step name.</p>
<code>OutputVariablesFormatText</code>	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description A list of the output matrix columns or procedure variables applicable to the step. Applicable only if the <code>StepType</code> is <code>MatrixLookup</code>, <code>GroupMatrixLookup</code>, or <code>ReferenceProcedure</code>.</p>
<code>OutputVariablesMappingText</code>	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Maps Decision Matrix output variables to Expression Set variables. Applicable only if the <code>StepType</code> is <code>MatrixLookup</code> or <code>GroupMatrixLookup</code>.</p>
<code>ReferenceProcedureId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the child Expression Set this step calls. Applicable only if the <code>StepType</code> is <code>ReferenceProcedure</code>. This is a relationship field.</p>

Field	Details
	<p>Relationship Name ReferenceProcedure</p> <p>Relationship Type Lookup</p> <p>Refers To CalculationProcedure</p>
ReturnMessageValueSet	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description A set of messages to return based on the result of a step with a <code>StepType</code> of <code>Condition</code>.</p>
Stage	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The stage of Expression Set invocation. The <code>Aggregation</code> stage applies only to steps with a <code>StepType</code> of <code>Aggregation</code>.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • <code>Aggregation</code> • <code>Calculation</code>
StageStepSequence	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Sequence order of the step within the Expression Set. Used only for Expression Sets migrated from a Salesforce Industries package. New Expression Sets use Expression Set Step Relationship objects to order their steps.</p>
StepType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The type of action this step performs.</p> <p>Possible values are:</p>

Field	Details
	<ul style="list-style-type: none"> • Aggregation—Returns an average, maximum, minimum, or sum of a list of values. • Calculation—Performs a mathematical operation, which can include variables and constants. • Condition—Defines a condition that determines whether other steps are invoked. • GroupMatrixLookup—Calls a Grouped Decision Matrix. • MatrixLookup—Calls a Standard Decision Matrix. • ReferenceProcedure—Calls a child Expression Set.

CalculationProcedureVariable

Defines a variable in an Expression Set. The label for this object is Expression Set Variable. This object is available in API version 53.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Access to Expression Sets requires OmniStudio licenses.

Fields

Field	Details
ApiName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The API name of this variable.</p>
CalculationMatrixName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The name of the Decision Matrix to which this variable belongs. Applicable only if this variable references a Decision Matrix column.</p>

Field	Details
CalculationProcedureVersionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the Expression Set Version to which this variable belongs. This is a relationship field.</p> <p>Relationship Name CalculationProcedureVersion</p> <p>Relationship Type Lookup</p> <p>Refers To CalculationProcedureVersion</p>
DataType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The data type of this variable. Possible values are:</p> <ul style="list-style-type: none"> • Boolean • Currency • Date • Number • Percent • Text
DefaultValue	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The default value of this variable.</p>
DisplayName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description The user-readable name of this variable.</p>
IsEditable	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description If <code>true</code>, specifies that a variable is NOT auto-imported from a step that calls a Decision Matrix or a child Expression Set. The default value is <code>false</code>.</p>
IsUserDefined	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Specifies whether a variable is defined by the user. The default value is <code>false</code>.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of this variable.</p>
Precision	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The number of decimal places. Applicable if the <code>DataType</code> is <code>Currency</code>, <code>Number</code>, or <code>Percent</code>.</p>
UiDisplayOrder	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The display order of the variable in the UI.</p>

CalculationProcedureVersion

Defines a version of an Expression Set. The label for this object is Expression Set Version. This object is available in API version 53.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Access to Expression Sets requires OmniStudio licenses.

Fields

Field	Details
CalculationProcedureId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the Expression Set to which this version belongs. This is a relationship field.</p> <p>Relationship Name CalculationProcedure</p> <p>Relationship Type Lookup</p> <p>Refers To CalculationProcedure</p>
Constants	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description A serialized JSON object containing information about each constant. This information includes the name, data type, alias, and precision.</p>
Description	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A text description of the Expression Set Version.</p>
EndDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The last date on which this Expression Set Version is active.</p>
IsEnabled	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Specifies whether this Expression Set Version is active. The default value is <code>false</code>.</p>
IsLoopingEnabled	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Specifies whether looping is enabled in this Expression Set Version. The default value is <code>false</code>.</p>
LastSimulatedVariablesInput	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The input variables and results of the most recent simulation.</p>
LoopEnd	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The name of the end variable for looping.</p>

Field	Details
LoopIncrement	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The name of the interval variable for looping.</p>
LoopStart	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The name of the start variable for looping.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The version name.</p>
Rank	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description When more than one enabled version matches an Expression Set call, and the <code>StartDateTime</code> to <code>EndDateTime</code> spans overlap, the version with the highest Rank is chosen.</p>
StartDateTime	<p>Type dateTime</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Sort, Update</p> <p>Description The first date on which this Expression Set Version is active.</p>
VersionNumber	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description The version number.</p>

Calendar

Represents a calendar. This can be a default user calendar, public calendar, resource calendar, or holiday calendar. This object is available in API version 45.0 and later.

Newly created users are assigned a default calendar automatically. Similarly, holiday calendars are created automatically for each organization.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `search()`

Special Access Rules

Users with "View Setup and Configuration" user permissions can create, edit, and delete public and resource calendars in the user interface. All users, even those without the "View Setup and Configuration" user permission, can view calendars via the API.

Fields

All fields are readable only.

Field	Details
<code>IsActive</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description This field indicates whether a user can save events to the calendar.</p>
<code>Name</code>	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description A user provided name that identifies the calendar. It is text-indexed for searchability. Note that this is not an enumerated field; it can be any string to a maximum length of 80 characters.</p>
<code>Type</code>	<p>Type picklist</p>

Field	Details
	<p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The type of the calendar. Possible values are:</p> <ul style="list-style-type: none"> • <code>Holiday</code> (Holiday Calendar) • <code>Public</code> (Public Calendar) • <code>Resource</code> (Resource Calendar) • <code>User</code> (User Calendar)
<code>UserId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the user that owns that calendar record. If <code>Type=User</code>, there's a <code>UserId</code> associated (foreign key reference to the user). Otherwise, the user field is null.</p>

CalendarView

These calendars can be created and assigned to users other than the creator. Available calendars include object, shared, public, resource, and user list calendars. Object calendars represent a calendar based on a Salesforce object, either standard or custom. This object is available in API version 51.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

All fields and entities referenced by field values must be accessible by the `CalendarView` creator even if the creator isn't the `CalendarView` owner.

Fields

Field	Details
<code>Color</code>	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Represents the color used in the background for records displayed in a user's calendar view within the user interface.</p>
CurrencyIsoCode	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.</p>
DateHandlingType	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>Determined by the data type of the <code>StartField</code>. Valid values include:</p> <ul style="list-style-type: none"> • Date • Datetime
DisplayField	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Represents the <code>SubjectType</code> field used as the subject for records displayed in a user's calendar view within the user interface.</p>
EndField	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>An optional field that represents the <code>sObjectType</code> field used as the end time for records displayed in a user's calendar view within the user interface. Must be a date or <code>dateTime</code> field that matches the type in <code>StartField</code>.</p>
FillPattern	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Represents the pattern displayed as the background for records displayed in a user's calendar view within the user interface. Valid values include:</p> <ul style="list-style-type: none"> • <code>verticalStripes</code> • <code>ascDiagonalStripes</code> • <code>descDiagonalStripes</code>
<code>IsDisplayed</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Defines whether users can see a calendar's records in their calendar view in the user interface. When <code>true</code>, records are visible in the user's calendar view. When <code>false</code>, records are hidden from the user's calendar view. The default is <code>true</code>.</p>
<code>ListViewFilterId</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>References the <code>ListView</code> used to filter records represented by the <code>CalendarView</code>. <code>ListView</code> must have the same <code>sObjectType</code>. If no <code>ListViewFilterId</code> is defined, the calendar displays only records with the same owner as the <code>CalendarView</code>.</p> <p>This is a relationship field.</p> <p>Relationship Name</p> <p><code>ListViewFilter</code></p> <p>Relationship Type</p> <p>Lookup</p> <p>Refers To</p> <p><code>ListView</code></p>
<code>Name</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, idLookup, Sort, Update</p> <p>Description</p> <p>A user-provided name that identifies the calendar. This isn't an enumerated field; it can be any string to a maximum length of 80 characters.</p>
<code>OwnerId</code>	<p>Type</p> <p>reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort</p> <p>Description Represents the owner of the CalendarView. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
PublisherId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Represents the user, user list, public, or resource calendar from where event data is populated. This is a polymorphic relationship field.</p> <p>Relationship Name Publisher</p> <p>Relationship Type Lookup</p> <p>Refers To Calendar, ListView, User</p>
SubjectType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description The type of standard or custom Salesforce object that is used to create records for the CalendarView. Use the API name of the desired <code>SubjectType</code>.</p>
StartField	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Represents the <code>SubjectType</code> field used as the start time for records displayed in a user's calendar view within the user interface. Must be a date or dateTime field type.</p>

Usage

To distribute a CalendarView to multiple users, IDs can be pulled from a group, user list, or profile. For this example, a CalendarView based on opportunity close dates is being distributed to a sales team in a public group, Sales Group:

```
Group userGroup = [SELECT Id FROM Group WHERE Name = 'Sales Group' LIMIT 1];
List<Id> groupId = new List<Id>();
groupId.add(userGroup.id);
List<GroupMember> groupMembers = [SELECT UserOrGroupId FROM GroupMember
    WHERE GroupId IN: groupId];

List<CalendarView> calendarViews = new List<CalendarView>();
for (GroupMember groupMember : groupMembers) {
    CalendarView calendarView = new CalendarView(name = 'Opportunity Close
        Dates', SubjectType = 'Opportunity', StartField = 'CloseDate', DisplayField =
        'Name', OwnerId = groupMember.UserOrGroupId);
    calendarViews.add(calendarView);
}
insert calendarViews;
```

CallCenter

Represents a call center, which is a logical representation of a single computer-telephony integration (CTI) system instance in an organization.

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
AdapterUrl	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description An optional field that specifies the location of where the CTI adapter is hosted. For example, <code>http://localhost:11000</code>. This field is available in API version 23.0 or later.</p>

Field	Details
CustomSettings	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description Specifies settings in the call center definition file, such as whether the call center uses the Open CTI, and SoftPhone properties, such as height in pixels. This field is available for Open CTI and in API version 25.0 or later.</p>
Id	<p>Type ID</p> <p>Properties Defaulted on create, Filter</p> <p>Description System field that uniquely identifies this call center. Label is Call Center ID. This ID is created automatically when the call center is created.</p>
InternalName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The internal name of the call center. Limit is 80 characters.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort</p> <p>Description The name of the call center. Limit is 80 characters.</p>
Version	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The version of the CTI Toolkit used to create the call center (for versions 2.0 and later). This field is available in API version 18.0 and later.</p>

Usage

Create a call center or query an existing call center.

CallCenterRoutingMap

Stores a mapping between a user or queue in a Salesforce org to a user or queue in an external system's call center. This object is available in API version 53.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
CallCenterId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Reference to a call center. This is a relationship field.</p> <p>Relationship Name CallCenter</p> <p>Relationship Type Lookup</p> <p>Refers To CallCenter</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The developer name is a combination of the Salesforce user ID or queue name, and the call center ID, with an underscore between these two values.</p> <ul style="list-style-type: none"> [SALESFORCE_USER_ID]_[CALL_CENTER_ID] [SALESFORCE_QUEUE_NAME]_[CALL_CENTER_ID]
ExternalId	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Unique identifier for the external system's user or queue.</p>
Language	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language of the MasterLabel.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The master label of the CallCenterRoutingMap.</p>
ReferenceRecordId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Lookup field to a Salesforce user or queue. This is a polymorphic relationship field.</p> <p>Relationship Name ReferenceRecord</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>

CallCoachConfigModifyEvent

Represents a Conversation Insights configuration change. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `describeSObjects()`

Fields

Field	Details
ChangeType	<p>Type picklist</p> <p>Properties Create, Restricted picklist</p> <p>Description The type of configuration change made. Possible values are:</p> <ul style="list-style-type: none">• FEATURE• OTHER• PROVIDER• USER
OrganizationId	<p>Type string</p> <p>Properties Create</p> <p>Description The ID of the Salesforce org with the related change.</p>
ProviderIdChange	<p>Type string</p> <p>Properties Create, Nillable</p> <p>Description The ID of the provider related to the change.</p>
ReplayId	<p>Type string</p> <p>Properties Nillable</p> <p>Description The ID of the related event as it is positioned in the event stream.</p>

CallCoachingMediaProvider

Represents the media provider for call recordings. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
IsActive	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Whether the connection with the provider is active or not.</p>
ProviderDescription	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The description of the media provider.</p>
ProviderName	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort</p> <p>Description The name of the media provider.</p>

CallDisposition

Represents a call result value that sales reps select when logging a call. This object is available in API version 47.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

As of Spring '20 and later, only your Salesforce org's internal users can access this object.

Fields

Field	Details
Disposition	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description The result of a phone call, such as whether a call was connected or the rep left a voicemail.</p>
DispositionCategoryId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The related call outcome that is used in reports and branching criteria for sales cadences.</p>

CallDispositionCategory

Represents the call outcome of a phone call that is used in reports and branching criteria for sales cadences. This object is available in API version 47.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

As of Spring '20 and later, only your Salesforce org's internal users can access this object.

Fields

Field	Details
Category	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description The name of the call outcome.</p>

Field	Details
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
Language	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language of the call category. Possible values are:</p> <ul style="list-style-type: none"> • da—Danish • de—German • en_US—English • es—Spanish • es_MX—Spanish (Mexico) • fi—Finnish • fr—French • it—Italian • ja—Japanese • ko—Korean • nl_NL—Dutch • no—Norwegian • pt_BR—Portuguese (Brazil) • ru—Russian • sv—Swedish • th—Thai • zh_CN—Chinese (Simplified) • zh_TW—Chinese (Traditional)

Field	Details
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The static name of the call outcome.</p>

CallTemplate

Represents a call script for users to read when making calls.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
Description	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The description of the call script.</p>
HtmlBody	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description The body content of the call script.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The time stamp that indicates when the current user last viewed a record that is related to this CallTemplate.</p>

Field	Details
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The time stamp that indicates when the current user last viewed this CallTemplate. If this value is null, this record might have been only referenced (LastReferencedDate) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description The name of the call script.</p>
OwnerId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the user who owns the call script.</p>
TemplateType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of call template. Possible values are:</p> <ul style="list-style-type: none"> • Text
TotalCalls	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The total number of calls that use the CallTemplate.</p>
TotalCallsCallBackLater	<p>Type int</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The total Call Back Later call results that use the CallTemplate.</p>
TotalCallsLeftVoicemail	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The total Left Voicemail call results that use the CallTemplate.</p>
TotalCallsMeaningfulConnect	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The total Meaningful Connect call results that use the CallTemplate.</p>
TotalCallsNotInterested	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The total Not Interested call results that use the CallTemplate.</p>
TotalCallsUncategorized	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The total uncategorized call results that use the CallTemplate.</p>
TotalCallsUnqualified	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The total Unqualified call results that use the CallTemplate.</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[CallTemplateChangeEvent](#) (API version 48.0)

Change events are available for the object.

Campaign

Represents and tracks a marketing campaign, such as a direct mail promotion, webinar, or trade show.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
<code>ActualCost</code>	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Amount of money spent to run the campaign.</p>
<code>AmountAllOpportunities</code>	<p>Type currency</p> <p>Properties Filter, Sort</p> <p>Description Amount of money in all opportunities associated with the campaign, including closed/won opportunities. Label is Value Opportunities in Campaign.</p>
<code>AmountWonOpportunities</code>	<p>Type currency</p> <p>Properties Filter, Sort</p>

Field	Details
	<p>Description Amount of money in closed or won opportunities associated with the campaign. Label is Value Won Opportunities in Campaign.</p>
BudgetedCost	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Amount of money budgeted for the campaign.</p>
CampaignImageId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the campaign image. Available in API version 42.0 and later.</p>
CampaignMemberRecordTypeId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The record type ID for CampaignMember records associated with the campaign. This is a relationship field.</p> <p>Relationship Name CampaignMemberRecordType</p> <p>Relationship Type Lookup</p> <p>Refers To RecordType</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.</p>

Field	Details
Description	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description Description of the campaign. Limit: 32 KB. Only the first 255 characters display in reports.</p>
EndDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Ending date for the campaign. Responses received after this date are still counted.</p>
ExpectedResponse	<p>Type percent</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Percentage of responses you expect to receive for the campaign.</p>
ExpectedRevenue	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Amount of money you expect to generate from the campaign.</p>
HierarchyActualCost	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Calculated field for the total amount of money spent to run the campaigns in a campaign hierarchy. Label is Total Actual Cost in Hierarchy.</p>
HierarchyBudgetedCost	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description Calculated field for the total amount of money budgeted for the campaigns in a campaign hierarchy. Label is Total Budgeted Cost in Hierarchy.</p>
HierarchyExpectedRevenue	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Calculated field for the total amount of money you expect to generate from the campaigns in a campaign hierarchy. Label is Total Expected Revenue in Hierarchy.</p>
HierarchyNumberSent	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Calculated field for the total number of individuals targeted by the campaigns in a campaign hierarchy. For example, the number of email messages sent. Label is Total Num Sent in Hierarchy.</p>
IsActive	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether this campaign is active (<code>true</code>) or not (<code>false</code>). Default value is <code>false</code>. Label is Active.</p>
LastActivityDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Value is one of the following, whichever is the most recent:</p> <ul style="list-style-type: none"> • Due date of the most recent event logged against the record. • Due date of the most recently closed task associated with the record.
LastReferencedDate	<p>Type datetime</p> <p>Properties Filter, Nillable, Sort,</p>

Field	Details
	<p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type datetime</p> <p>Properties Filter, Nillable, Sort,</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description Required. Name of the campaign. Limit: is 80 characters.</p>
NumberOfContacts	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Number of contacts associated with the campaign. Label is Total Contacts.</p>
NumberOfConvertedLeads	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Number of leads that were converted to an account and contact due to the marketing efforts in the campaign. Label is Converted Leads.</p>
NumberOfLeads	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Number of leads associated with the campaign. Label is Leads in Campaign.</p>

Field	Details
NumberOfOpportunities	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Number of opportunities associated with the campaign. Label is Opportunities in Campaign.</p>
NumberOfResponses	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Number of contacts and unconverted leads with a Member Status equivalent to "Responded" for the campaign. Label is Responses in Campaign.</p>
NumberOfWonOpportunities	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Number of closed or won opportunities associated with the campaign. Label is Won Opportunities in Campaign.</p>
NumberSent	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Number of individuals targeted by the campaign. For example, the number of emails sent. Label is Num Sent.</p>
OwnerId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the user who owns this campaign. Default value is the user logging in to the API to perform the create. This is a relationship field.</p> <p>Relationship Name Owner</p>

Field	Details
	<p>Relationship Type Lookup</p> <p>Refers To User</p>
ParentCampaign	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The campaign above the selected campaign in the campaign hierarchy.</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the parent Campaign record, if any. This is a relationship field.</p> <p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To Campaign</p>
RecordTypeId	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description ID of the record type assigned to this object.</p>
StartDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Starting date for the campaign.</p>

Field	Details
Status	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description Status of the campaign, for example, Planned, In Progress. Limit: 40 characters.</p>
TenantId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the associated Pardot business unit. Read-only. Available in API version 51.0 and later. This is a relationship field.</p> <p>Relationship Name Tenant</p> <p>Relationship Type Lookup</p> <p>Refers To PardotTenant</p>
TotalAmountAllOpportunities	<p>Type currency</p> <p>Properties Filter</p> <p>Description Calculated field for total amount of all opportunities associated with the campaign hierarchy, including closed/won opportunities. Label is Total Value Opportunities in Hierarchy.</p>
TotalAmountAllWonOpportunities	<p>Type currency</p> <p>Properties Filter</p> <p>Description Calculated field for amount of all closed/won opportunities associated with the campaign hierarchy. Label is Total Value Won Opportunities in Hierarchy.</p>
TotalNumberOfContacts	<p>Type int</p> <p>Properties Filter</p>

Field	Details
	<p>Description Calculated field for number of contacts associated with the campaign hierarchy. Label is Total Contacts in Hierarchy.</p>
TotalNumberOfConvertedLeads	<p>Type int</p> <p>Properties Filter</p> <p>Description Calculated field for the total number of leads associated with the campaign hierarchy that were converted into accounts, contacts, and opportunities. Label is Total Converted Leads in Hierarchy.</p>
TotalNumberOfLeads	<p>Type int</p> <p>Properties Filter</p> <p>Description Calculated field for total number of leads associated with the campaign hierarchy. This number also includes converted leads. Label is Total Leads in Hierarchy.</p>
TotalNumberOfOpportunities	<p>Type int</p> <p>Properties Filter</p> <p>Description Calculated field for the total number of opportunities associated with the campaign hierarchy. Label is Total Opportunities in Hierarchy.</p>
TotalNumberOfResponses	<p>Type int</p> <p>Properties Filter</p> <p>Description Calculated field for number of contacts and unconverted leads that have a Member Status equivalent to "Responded" for the campaign hierarchy. Label is Total Responses in Hierarchy.</p>
TotalNumberOfWonOpportunities	<p>Type int</p> <p>Properties Filter</p>

Field	Details
	<p>Description</p> <p>Calculated field for the total number of won opportunities associated with the campaign hierarchy. Label is Total Won Opportunities in Hierarchy.</p>
Type	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Type of campaign, for example, Direct Mail or Referral Program. Limit: 40 characters.</p>

Usage

Client applications can create, update, delete, and query Attachment records associated with a campaign via the API.

The Campaign object is defined only for those organizations that have the marketing feature enabled and valid marketing licenses. In addition, it is accessible only to those users that are enabled as marketing users. If the organization does not have the marketing feature or valid marketing licenses, this object does not appear in the `describeGlobal()` call, and you can't use `describeObjects()` or `query()` with the Campaign object.

Note: The main constituent of a campaign is a CampaignMember. You will commonly need to update campaigns with CampaignMember.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

CampaignChangeEvent (API version 44.0)

Change events are available for the object.

CampaignFeed (API version 18.0)

Feed tracking is available for the object.

CampaignHistory (API version 40.0)

History is available for tracked fields of the object.

CampaignOwnerSharingRule

Sharing rules are available for the object.

CampaignShare

Sharing is available for the object.

SEE ALSO:

[Object Basics](#)

CampaignInfluence

Represents the association between a campaign and an opportunity in Customizable Campaign Influence. This object is available in API version 37.0 and later.

Note: This information applies only to [Customizable Campaign Influence](#) and not to [Campaign Influence 1.0](#).

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

To access this object, Customizable Campaign Influence must be enabled. Customer Portal users can't access this object.

Fields

Field Name	Details
CampaignId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the associated campaign.</p>
ContactId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The ID of the contact on the associated opportunity.</p>
Influence	<p>Type percent</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Sort, Update</p> <p>Description The percentage of the associated opportunity's Amount field attributed to the associated campaign.</p>

Field Name	Details
ModelId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the campaign influence model associated with the record.</p>
OpportunityId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the associated opportunity.</p>
RevenueShare	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The amount of revenue from the associated opportunity attributed to the associated campaign.</p>

Usage

Use this object to create campaign influence records for your custom campaign influence models. Do not create campaign influence records for the Primary Campaign Source model. Records added to the Primary Campaign Source model via the API are deleted when the model is recalculated.

CampaignInfluenceModel

This read-only object represents a campaign influence model in Customizable Campaign Influence. Use campaign influence models to group `CampaignInfluence` records created by a specific set of triggers and workflows that you define. The Primary Campaign Source influence model is the default model. This object is available in API version 37.0 and later.

Note: This information applies only to [Customizable Campaign Influence](#) and not to [Campaign Influence 1.0](#).

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

To access this object, Customizable Campaign Influence must be enabled. Customer Portal users can't access this object.

Fields

Field Name	Details
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The API name of the influence model. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
IsActive	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the model is active. Active models can generate campaign influence records. Deactivating a model deletes its campaign influence records. Custom models are always active and this field is ignored.</p>
IsDefaultModel	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the model is the default model (<code>true</code>) or not (<code>false</code>). <code>CampaignInfluence</code> records associated with the default model appear in 3 locations.</p> <ul style="list-style-type: none"> • The Campaign Influence related list on opportunities • The Influenced Opportunities related list on campaigns • The Campaign Statistics section on campaigns <p>The value of <code>IsDefaultModel</code> can only be true for 1 model at a time.</p>

Field Name	Details
IsModelLocked	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the model is locked (<code>true</code>) or not (<code>false</code>). Records for locked models can only be added, updated, or deleted via the API.</p>
Language	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language of the influence model.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The label for the influence model.</p>
ModelDescription	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The description of the influence model.</p>
ModelType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Indicates whether the model is the Primary Campaign Source influence model, or a custom model. These values are the allowed.</p> <ul style="list-style-type: none"> • 1: Primary Campaign Source Model • 2: Custom Model • 3: First Touch Model • 4: Last Touch Model • 5: Even Distribution Model

Field Name	Details
	<ul style="list-style-type: none"> 6: Data-Driven Model
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the namespacePrefix__componentName notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
RecordPreference	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description The value of this field determines when to create campaign influence records.</p> <ul style="list-style-type: none"> AllRecords: Creates records regardless of the revenue attribution percentage. RecordsWithAttribution: Creates records only when the revenue attribution is greater than 0%.

CampaignMember

Represents the association between a campaign and either a lead or a contact.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
CampaignId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the Campaign to which this Lead or Contact is associated. This is a relationship field.</p> <p>Relationship Name Campaign</p> <p>Relationship Type Lookup</p> <p>Refers To Campaign</p>
City	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The city for the address of the lead or contact.</p>
CompanyOrAccount	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The company or account of the lead or contact.</p>
ContactId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description Required. ID of the Contact who is associated with a Campaign. This is a relationship field.</p>

Field	Details
	<p>Relationship Name Contact</p> <p>Relationship Type Lookup</p> <p>Refers To Contact</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.</p>
Country	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The country for the address of the lead or contact.</p>
Description	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description The description of the associated lead or contact.</p>
DoNotCall	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates that the contact doesn't wish to be called.</p>
Email	<p>Type email</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description Email address for the contact or lead.</p>
Fax	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Fax number for the contact or lead.</p>
FirstName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The first name of the contact or lead.</p>
FirstRespondedDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the date on which the campaign member was first given a responded status.</p>
HasOptedOutOfEmail	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the contact or lead would prefer not to receive email from Salesforce (<code>true</code>) or not (<code>false</code>).</p>
HasOptedOutOfFax	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates that the contact or lead doesn't wish to receive faxes.</p>
HasResponded	<p>Type boolean</p>

Field	Details
	<p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the campaign member has responded to the campaign (<code>true</code>) or not (<code>false</code>). Label is Responded.</p>
LastName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The last name of the contact or lead. Limit is 80 characters.</p>
LeadId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description Required. ID of the Lead who is associated with a Campaign. This is a relationship field.</p> <p>Relationship Name Lead</p> <p>Relationship Type Lookup</p> <p>Refers To Lead</p>
LeadOrContactId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the associated lead or contact.</p>
LeadOrContactOwnerId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the owner of the associated lead or contact. This is a polymorphic relationship field.</p>

Field	Details
	<p>Relationship Name LeadOrContactOwner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
LeadSource	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The source from which the lead was obtained.</p>
MobilePhone	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The mobile phone number of the lead or contact.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description First and last name of the contact or lead with which the campaign member is associated.</p>
Phone	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The phone number of the lead or contact.</p>
PostalCode	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The postal code of the lead or contact.</p>

Field	Details
RecordTypeId	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description ID of the record type assigned to this object. To change the record type, modify the <code>CampaignMemberRecordTypeId</code> field on the associated Campaign.</p>
Salutation	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Salutation for the lead or contact.</p>
State	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The state for the address of the lead or contact. Limit is 80 characters.</p>
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Controls the <code>HasResponded</code> flag on this object. You can't directly set the <code>HasResponded</code> flag, as it's read-only. You can set it indirectly by setting this field in a create or update call. Each predefined value implies a <code>HasResponded</code> flag value. Each time you update this field, you implicitly update the <code>HasResponded</code> flag. In the Salesforce user interface, Marketing users can define valid status values for the <code>Status</code> picklist. They can choose one status as the default status. For each <code>Status</code> field value, they can also select which values to count as "Responded," meaning that the <code>HasResponded</code> flag is set to <code>true</code> for those values.</p> <p>40 character limit.</p> <p> Note: When creating or updating campaign members, use the text value for <code>Status</code> instead of the ID from the <code>CampaignMemberStatus</code> object.</p>
Street	<p>Type string</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The street for the address of the lead or contact.</p>
Title	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Title for the lead or contact.</p>
Type	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates whether the campaign member is a lead or a contact.</p>

 **Note:** If you're importing CampaignMember data into Salesforce and want to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself..

Usage

Each record has a unique ID, and must contain either a `ContactId` or a `LeadId`, but can't contain both. Any attempt to create a single record with both results in a successful insert but only the `ContactId` is inserted. However, you can create two separate records on a Campaign—one for the Lead and one for the Contact.

Standard fields from a Contact or Lead are associated with the CampaignMember object but you can't query them directly. To include a lead's `Phone` in your query, for example, query the field from the Lead object.

```
SELECT Id, (SELECT Phone FROM Lead)
FROM CampaignMember
```

This object is defined only for those organizations that have the marketing feature and valid marketing licenses. If the organization doesn't have the marketing feature or valid marketing licenses, this object doesn't appear in the `describeGlobal()` call, and you can't use `describeSObjects()` or `query()` with the CampaignMember object.

In API version 16.0 and later, a `create()` call only creates record; in earlier versions, a `create()` call creates and updates records. The API determines whether a record exists with the specified `CampaignId` and either `ContactId` or `LeadId`.

 **Note:** Only use a `ContactId` or `LeadId`, but not both, unless you want to track lead-based campaign members you convert to contacts.

When using the API, the `create()` call only requires read access to campaigns.

If the record doesn't exist for the given `ContactId` or `LeadId`, then a new record is created. If the record exists, an error is returned and no update is made. To update an existing record, specify the ID of the `CampaignMember` record to update.

In API versions 15.0 and earlier, if you submit multiple records using a single create request, and if more than one record matches an existing record, only the first record submitted updates the existing record. If any of the submitted records match each other but don't match existing records, only the last record submitted is created.

To delete a record, specify the ID of the `CampaignMember` record to delete.

When creating or updating records, the `Status` field value specified in the call is verified as a valid status for the given Campaign:

- If the specified `Status` value is a valid status, the value is updated, and the `HasResponded` field is updated to either `true` or `false`, depending on the `Status` value association with `HasResponded`.
- If the specified `Status` value isn't a valid status, the API assigns the default status to the `Status` field and updates the `HasResponded` field with the associated value. However, if the given Campaign doesn't have a default status, the API assigns the value specified in the call to the `Status` field, and the `HasResponded` field is set to `false`.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

CampaignMemberChangeEvent (API version 46.0)

Change events are available for the object.

SEE ALSO:

[Campaign](#)

[CampaignMemberStatus](#)

CampaignMemberStatus

One or more member status values defined for a campaign.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users can't access this object.

You can't delete a `CampaignMemberStatus` if that status is designated as the default status or if the status is currently used in a Campaign.

Fields

Field	Details
<code>CampaignId</code>	Type reference

Field	Details
	<p>Properties Filter, Group, Sort</p> <p>Description ID of the campaign associated with this member status.</p>
HasResponded	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether this status is equivalent to “Responded” (<code>true</code>) or not (<code>false</code>). Beginning with API version 39.0, at least one <code>CampaignMemberStatus</code> on each campaign must have a <code>hasResponded</code> value of <code>true</code>.</p>
IsDefault	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether this status is the default status (<code>true</code>) or not (<code>false</code>). Beginning with API version 39.0, there must be a default <code>CampaignMemberStatus</code> defined for every campaign.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
Label	<p>Type string</p> <p>Properties Filter, Sort</p> <p>Description Label for the status in the picklist. Limited to 765 characters.</p>
SortOrder	<p>Type int</p> <p>Properties Filter, Group, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Unique number order where this campaign member status appears in the picklist.</p>

Usage

Use this object to create picklist items for the member status in a campaign.

This object is defined only for those organizations that have the marketing feature and valid marketing licenses. In addition, the object is accessible only to those users that are enabled as marketing users. If the organization does not have the marketing feature or valid marketing licenses, this object does not appear in a `describeGlobal()` call, and you can't use `describeObjects()` or `query()` with the CampaignMember object.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

CampaignMemberStatusChangeEvent (API version 46.0)

Change events are available for the object.

SEE ALSO:

[Campaign](#)

[CampaignMember](#)

CampaignOwnerSharingRule

Represents the rules for sharing a campaign with User records other than the owner or anyone above the owner in the role hierarchy.

 **Note:** To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The [SharingRules](#) Metadata API type is enabled for all orgs.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
CampaignAccessLevel	<p>Type</p> <p>picklist</p>

Field	Details
	<p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of access granted to the target Group, or UserRole. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface. This field is available in API version 24.0 and later.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
GroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the source group. A Campaign owned by a User in the source Group triggers the rule to give access.</p>

Field	Details
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface.</p>
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the User or Group being granted access.</p>

Usage

Use this object to manage the sharing rules for campaigns.

SEE ALSO:

[Metadata API Developer Guide: SharingRules](#)

CampaignShare

Represents a sharing entry on a Campaign.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only users with access to the Campaign object can access this object.

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field	Details
CampaignId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the Campaign associated with this sharing entry. This field can't be updated. This is a relationship field.</p> <p>Relationship Name Campaign</p> <p>Relationship Type Lookup</p> <p>Refers To Campaign</p>
CampaignAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Level of access that the User or Group has to the Campaign. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All (This value is not valid for creating or updating records.) <p>This field must be set to an access level that is higher than the organization's default access level for Campaign.</p>
RowCause	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to <code>Manual</code> (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <code>Rule</code>—The User or Group has access via a Campaign sharing rule. • <code>GuestRule</code>—The User or Group has access via a Campaign guest user sharing rule. • <code>Manual</code>—The User or Group has access because a User with "All" access manually shared the Campaign with them. • <code>Owner</code>—The User is the owner of the Campaign.

Field	Details
	<ul style="list-style-type: none"> <code>LpuImplicit</code>—The User has access to records owned by high-volume Experience Cloud site users via a share group. <code>ARImplicit</code>—The User, who belongs to a partner or customer account, has access to the Campaign via an account relationship data sharing rule.
<code>UserOrGroupId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the User or Group that has been given access to the Campaign. This field can't be updated. This is a polymorphic relationship field.</p> <p>Relationship Name UserOrGroup</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>

Usage

This object allows you to determine which users and groups can view or edit Campaign records owned by other users.

CampaignTag

Associates a word or short phrase with a Campaign.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
<code>ItemId</code>	<p>Type reference</p> <p>Properties Create, Filter</p>

Field Name	Details
	<p>Description ID of the tagged item.</p>
Name	<p>Type string</p> <p>Properties Create, Filter</p> <p>Description Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>
TagDefinitionId	<p>Type reference</p> <p>Properties Filter</p> <p>Description ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Restricted picklist</p> <p>Description Defines the visibility of a tag. Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

CampaignTag stores the relationship between its parent TagDefinition and the Campaign being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

CardPaymentMethod

References a credit card or debit card payment method. This entity implements the PaymentMethod entity interface. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access Commerce Payments entities, your org must have a Salesforce Order Management license with the Payment Platform org permission activated. Commerce Payments entities are available only in Lightning Experience.

Fields

Field	Details
AccountId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Customer account for the payment method. This is a relationship field.</p> <p>Relationship Name Account</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>
AuditEmail	<p>Type email</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Email of the payment method holder. This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the CardPaymentMethod page layout on their own.</p>
AutoCardType	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description Card network type, derived from the card number. This is a system field.</p>

Field	Details
CardBin	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description First six digits of the card number.</p>
CardCategory	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Defines whether the card is a credit card or debit card. Possible values are:</p> <ul style="list-style-type: none">• CreditCard—Credit Card• DebitCard—Debit Card
CardHolderFirstName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description First name of the cardholder.</p>
CardHolderLastName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Last name of the cardholder.</p>
CardHolderName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Full name of the cardholder.</p>
CardLastFour	<p>Type int</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description Last four digits of the credit card or debit card.</p>
CardPaymentMethodNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description System-defined unique ID for the card payment method.</p>
CardType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description Defines the credit card bank. Possible values are:</p> <ul style="list-style-type: none"> • AmericanExpress • DinersClub • JCB • Maestro • MasterCard • Visa
CardTypeCategory	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Defines the credit card bank. Used for internal reference. Possible values are:</p> <ul style="list-style-type: none"> • AmericanExpress • DinersClub • JCB • Maestro • Master • Visa

Field	Details
Comments	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Users can add comments to provide additional details about a record. Maximum of 1000 characters.</p>
CompanyName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Company of the cardholder.</p>
DisplayCardNumber	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Masked digits for the full credit card number except the last four digits.</p>
Email	<p>Type email</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Email address of the card payment method holder.</p>
ExpiryMonth	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The card's expiration month.</p>
ExpiryYear	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description The card's expiration year.</p>
GatewayDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The date that the card payment method interacted with the payment gateway.</p>
GatewayResultCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The result of the card payment method's interaction with the payment gateway during a transaction request.</p>
GatewayResultCodeDescription	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Additional information about the gateway result code. Descriptions will vary between payment gateway providers.</p>
GatewayToken	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Unique token ID generated by the payment gateway for the card payment method for future transactions. This version is not encrypted.</p> <p>If you try to record a GatewayToken while the digital wallet already has a GatewayToken or GatewayTokenEncrypted value, Salesforce throws an error.</p>
GatewayTokenDetails	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Additional information about the gateway token.</p>

Field	Details
GatewayTokenEncrypted	<p>Type encryptedstring</p> <p>Properties Create, Nillable, Update</p> <p>Description Encrypted version of the unique token ID generated by the payment gateway to represent the card payment method for future transactions. Encrypted using Salesforce Classic Encryption. Available in API v52.0 and later.</p>
InputCardNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description Field for users to enter a credit card number when storing an external-type card payment method. After entry, the credit card number doesn't persist in Salesforce, so the <code>InputCardNumber</code> value always appears blank. The credit card number will appear as a masked value in <code>DisplayCardNumber</code>, which shows only the last four digits.</p>
IpAddress	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description IP address of the card payment method holder. This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the <code>CardPaymentMethod</code> page layout on their own.</p>
InputCardNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description Input field for the card number. This field doesn't store the card number directly, but instead populates <code>CardBin</code>, <code>LastFour</code>, and <code>DisplayCardNumber</code> based on the value entered in <code>InputCardNumber</code>.</p>
LastReferencedDate	<p>Type dateTime</p>

Field	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.</p>
MacAddress	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description MAC address of the card payment method holder. This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the CardPaymentMethod page layout on their own.</p>
NickName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description User-defined nickname for the card payment method.</p>
PaymentGatewayId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The payment gateway used to create a gateway token. For transactions with a saved payment method in Salesforce, this field stores the payment gateway record used in the transaction. This is a relationship field.</p> <p>Relationship Name PaymentGateway</p>

Field	Details
	<p>Relationship Type Lookup</p> <p>Refers To PaymentGateway</p>
PaymentMethodAddress	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description Full address related to the card payment method. Also known as the billing address.</p>
PaymentMethodCity	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Part of the address for the payment method.</p>
PaymentMethodCountry	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Part of the address for the payment method.</p>
PaymentMethodGeocodeAccuracy	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Part of the address for the payment method. Possible values are:</p> <ul style="list-style-type: none"> • Address • Block • City • County • ExtendedZip • NearAddress • Neighborhood

Field	Details
	<ul style="list-style-type: none"> • State • Street • Unknown • Zip
PaymentMethodLatitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Part of the address for the payment method.</p>
PaymentMethodLongitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Part of the address for the payment method.</p>
PaymentMethodPostalCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Part of the address for the payment method.</p>
PaymentMethodState	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Part of the address for the payment method.</p>
PaymentMethodStreet	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Part of the address for the payment method.</p>
Phone	<p>Type phone</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Phone number of the card payment method holder.</p> <p>This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the CardPaymentMethod page layout on their own.</p>
ProcessingMode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description Defines whether the card payment method is used for transactions made inside or outside the payment platform.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • <code>External</code>—Transactions happened outside of the Salesforce payments platform. • <code>Salesforce</code>—Salesforce made and recorded an external call to the payment platform. <p>This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the CardPaymentMethod page layout on their own.</p> <p> Important: <code>ProcessingMode</code> is required to create a <code>CardPaymentMethod</code> entity.</p>
SfResultCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Shows the results of the card payment method's interaction with the payment gateway.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • <code>Decline</code> • <code>Indeterminate</code> • <code>PermanentFail</code> • <code>RequiresReview</code> • <code>Success</code> • <code>SystemError</code> • <code>ValidationError</code>
StartMonth	<p>Type int</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Start month of the card.</p>
StartYear	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Start year of the card.</p>
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Possible values are:</p> <ul style="list-style-type: none"> • Active • Canceled • InActive

Usage

The following fields drop zeroes that appear at the beginning of the field value, and introduce commas for values with four or more digits:

- CardLastFour
- CardBin
- ExpiryYear

For example, a CardLastFour entered value of `0004112233445566` would appear as `4,112,233,445,566` on the record.

As a workaround, create a String-type custom formula field with the same label as the field that you want to replace, then hide the original field. Here are some examples for replacing CardLastFour, CardBin, and ExpiryYear.

CardLastFour

```
IF(ISBLANK(CardLastFour), NULL, RIGHT("0000" & TEXT(CardLastFour) , 4))
```

CardBin

```
IF(ISBLANK(CardBin), NULL, RIGHT("000000" & TEXT(CardBin) , 6))
```

ExpiryYear

```
IF(ISBLANK(ExpiryYear), NULL, TEXT(ExpiryYear))
```

CartCheckoutSession

Represents a checkout session used in Lightning B2B Commerce checkout. This object is available in API version 48.0 and later.

A checkout session is tied to a single web cart, but there can be multiple checkout sessions for a single cart.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
<code>BackgroundOperationId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the in progress background operation.</p>
<code>CurrencyIsoCode</code>	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The currency used for the checkout session. Default value is <code>USD</code>. Possible values are:</p> <ul style="list-style-type: none"> • <code>USD</code>—U.S. Dollar
<code>IsArchived</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether checkout processing is archived (<code>true</code>) or not (<code>false</code>). Once a session is archived, it can't be unarchived. Default value is <code>false</code>.</p>

Field	Details
IsError	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the session is in error state (<code>true</code>) or not (<code>false</code>). Default value is <code>false</code>.</p>
IsProcessing	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Determines whether checkout processing is in progress (<code>true</code>) or not (<code>false</code>). Default value is <code>false</code>.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of the checkout session.</p>
NextState	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The next state of the checkout session.</p>
OrderId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of a created order once the checkout session has gone from cart to order.</p>
State	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description</p> <p>The current state of the checkout session.</p>
WebCartId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>The ID of the cart that is used to create the checkout session.</p>

CartDeliveryGroup

Represents shipping information for the delivery of items in an order against a store built with B2B Commerce on Lightning Experience. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

The CartDeliveryGroup object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
CartId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>The ID the WebCart on page 3765 that's associated with this delivery group.</p>
CurrencyIsoCode	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p>

Field	Details
	<p>Description</p> <p>The ISO code for the currency that's specified on the buyer's account. Default value is USD. Possible values are:</p> <ul style="list-style-type: none"> • USD—U.S. Dollar
DeliverToAddress	<p>Type</p> <p>address</p> <p>Properties</p> <p>Filter, Nillable</p> <p>Description</p> <p>The address to which a buyer order is delivered.</p>
DeliverToCity	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The city to which a buyer order is delivered.</p>
DeliverToCountry	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The country to which a buyer order is delivered.</p>
DeliverToGeocodeAccuracy	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Aggregate, Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>The geocode location to which a buyer order is delivered. Possible values are:</p> <ul style="list-style-type: none"> • Address • Block • City • County • ExtendedZip • NearAddress • Neighborhood • State

Field	Details
	<ul style="list-style-type: none">• Street• Unknown• Zip
DeliverToLatitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The latitude of a buyer delivery location.</p>
DeliverToLongitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The longitude of a buyer delivery location.</p>
DeliverToName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The name of the person to which to deliver a buyer order.</p>
DeliverToPostalCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The postal code to which to deliver a buyer order.</p>
DeliverToState	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The state to which to deliver a buyer order.</p>
DeliverToStreet	<p>Type textarea</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The street to which to deliver a buyer order.</p>
DeliveryMethodId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID for the delivery method to use to deliver a buyer order.</p>
DesiredDeliveryDate	<p>Type datetime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The date that a buyer requests to have an order delivered.</p>
GrandTotalAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Sum of all cart items' TotalAmount, or CartDeliveryGroup TotalAmount plus CartDeliveryGroup TotalTaxAmount.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Name field, Sort, Update</p> <p>Description The name of this CartDeliveryGroup record. Name can be up to 255 characters.</p>
ShippingInstructions	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Instructions for delivering an order.</p>

Field	Details
TotalAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Sum of all cart items <code>TotalPrice</code>, or <code>TotalProductAmount</code> plus <code>TotalChargeAmount</code>.</p>
TotalChargeAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Cart items can be of type Product or Charge. This field contains the sum of all the cart items <code>TotalPrice</code> for all cart items of the <code>CHARGE</code> type.</p>
TotalChargeTaxAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Cart items can be of type Product or Charge. This field contains the Sum of all the cart items <code>TotalTaxAmount</code> for all cart items of the <code>CHARGE</code> type.</p>
TotalProductAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Cart items can be of type Product or Charge. This field contains the sum of all the cart items <code>TotalPrice</code> for all cart items of the <code>PRODUCT</code> type.</p>
TotalProductTaxAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Cart items can be of type Product or Charge. Sum of all the cart items <code>TotalTaxAmount</code> for all cart items of the <code>PRODUCT</code> type.</p>
TotalTaxAmount	<p>Type currency</p>

Field	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description Sum of all cart items <code>TotalTaxAmount</code>, or <code>TotalProductTaxAmount</code> plus <code>TotalChargeTaxAmount</code>.</p>

CartDeliveryGroupMethod

Represents the selected delivery method for a cart delivery group used in Lightning B2B Commerce checkout. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
<code>CartCheckoutSessionId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The unique ID used to identify your cart checkout session.</p>
<code>CartDeliveryGroupId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the cart delivery group associated with the checkout session.</p>
<code>CurrencyIsoCode</code>	<p>Type picklist</p>

Field	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The currency used for your shipping fee. Default value is USD. Possible values are:</p> <ul style="list-style-type: none"> • USD—U.S. Dollar
DeliveryMethodId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the selected order delivery method.</p>
ExternalProvider	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the external shipping method provider. Optional field.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Name of the delivery method.</p>
ShippingFee	<p>Type currency</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description Shipping fee associated with the delivery method. Required field.</p>
WebCartId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the WebCart associated with the cart delivery group method. Required field.</p>

Usage

Use the `CartDeliveryGroupMethod` object to give commerce buyers the ability to choose a delivery method for a cart delivery group. Shipping integrations populate the delivery options that are available for a cart delivery group.

CartItem

Represents an item in a `WebCart` that's active in a store built with B2B Commerce on Lightning Experience. Cart item can be of type `Product` or `Charge`. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

The `CartItem` object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
<code>AdjustmentAmount</code>	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Non-itemized adjustments for this cart item.</p>
<code>AdjustmentTaxAmount</code>	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The tax that's calculated on the <code>AdjustmentAmount</code>.</p>
<code>CartDeliveryGroupId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the <code>CartDeliveryGroup</code> that's associated with a cart item.</p>

Field	Details
CartId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the <code>WebCart</code> that's associated with a cart item.</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The ISO code for the currency that's specified on the buyer's account. Default value is <code>USD</code>. Possible values are:</p> <ul style="list-style-type: none"> • <code>EUR</code>—Euro • <code>USD</code>—U.S. Dollar
DistributedAdjustmentAmount	<p>Type currency</p> <p>Properties Defaulted on create, Filter, Nillable, Sort</p> <p>Description A calculated field that determines the amount of a cart-wide promotional adjustment when distributed across all items in the cart. This field is available in API version 52.0 and later. You receive \$10 off, and there are 5 items in the cart. The distributed adjustment is (-\$2).</p>
DistributedAdjustmentTaxAmount	<p>Type currency</p> <p>Properties Defaulted on create, Filter, Nillable, Sort</p> <p>Description A calculated field that determines the amount of a cart-wide tax adjustment due to promotions when distributed across all items in the cart. This field is available in API version 52.0 and later. EXAMPLE: Your discount causes a cart-wide tax reduction of (-\$10), and there are 5 items in the cart. The distributed tax adjustment is (-\$2).</p>
ItemizedAdjustmentAmount	<p>Type currency</p> <p>Properties Defaulted on create, Filter, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>A calculated field that determines the total amount of promotional adjustments that are specific to an item. This field is available in API version 52.0 and later.</p> <p>EXAMPLE: One cart item has one discount code for \$10 off. Your itemized adjustment amount is (-\$10) for that item.</p>
ItemizedAdjustmentTaxAmount	<p>Type</p> <p>currency</p> <p>Properties</p> <p>Defaulted on create, Filter, Nillable, Sort</p> <p>Description</p> <p>A calculated field that determines the total amount of promotion-related tax adjustments that are specific to an item. This field is available in API version 52.0 and later.</p> <p>EXAMPLE: One cart item has one discount code for \$10 off. This reduces the tax on that item by (-\$2). Your itemized adjustment tax amount is (-\$2) for that item.</p>
ListPrice	<p>Type</p> <p>currency</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>The original price of the cart item. Typically shown with a line through it. List price is shown only when it's higher than the negotiated price. If the list price is the same or lower, it isn't shown to the buyer. This field is available in API version 52.0 and later.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, idLookup, Sort, Update</p> <p>Description</p> <p>The name of this <code>CartItem</code> record. <code>Name</code> can be up to 255 characters.</p>
Product2Id	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The ID of a product type cart item. Cart items can be of type <code>PRODUCT</code> or <code>CHARGE</code>.</p>
Quantity	<p>Type</p> <p>double</p>

Field	Details
	<p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The number of a given cart item in a cart.</p>
SalesPrice	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The discounted price of a cart item.</p>
Sku	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The Shelf-Keeping Unit ID of a cart item.</p>
TotalAdjustmentAmount	<p>Type currency</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The total amount of all promotional adjustments on the item, both distributed and itemized. This field is available in API version 52.0 and later.</p>
TotalAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The total cost of this cart item, including taxes and adjustments.</p>
TotalLineAmount	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Total amount for this cart item, based on sales price and quantity.</p>

Field	Details
TotalLineTaxAmount	<p>Type currency</p> <p>Properties Defaulted on create, Filter, Nillable, Sort</p> <p>Description Total tax amount for TotalLineAmount.</p>
TotalListPrice	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Total amount for this cart item, based on ListPrice. We provide this value for comparison. It's not the price that the buyer is paying.</p>
TotalPrice	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Total amount for this cart item, including adjustments but excluding taxes.</p> <p> Note: Although this field is Nillable, if you want to use Commerce Webstore Cart Promotions, this field is required.</p>
TotalPriceAfterAllAdjustments	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Total price after all price adjustments are applied. This field is available in API version 52.0 and later.</p> <p> Note: Although this field is Nillable, if you want to use Commerce Webstore Cart Promotions, this field is required.</p>
TotalPromoAdjustmentAmount	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Total itemized and distributed adjustment amount in cart (only for promotions). This field is available in API version 52.0 and later.</p>

Field	Details
TotalPromoAdjustmentTaxAmount	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Total itemized and distributed adjustment tax amount in cart (only for promotions). This field is available in API version 52.0 and later.</p>
TotalTaxAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Total tax amount for this cart item. This value includes taxes for both TotalLineAmount and AdjustmentAmount.</p>
Type	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The CartItem type. Possible values are:</p> <ul style="list-style-type: none">• Product• Charge
UnitAdjustedPrice	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Price per quantity unit after a discount or surcharge is applied. This field is available in API version 50.0 and later.</p>
UnitAdjustmentAmount	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Discount or surcharge to apply to a quantity unit. This amount is added to the <code>SalesPrice</code> to get the <code>UnitAdjustedPrice</code>. This field is available in API version 50.0 and later.</p>

CartItemPriceAdjustment

Price adjustment for a cart item. This object is available in API version 52.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

The `CartItemPriceAdjustment` object is available only if the B2B Commerce license is enabled.

Fields

Field	Details
<code>AdjustmentSource</code>	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Price adjustment type.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • <code>Discretionary</code> • <code>Promotion</code> • <code>System</code>

Field	Details
AdjustmentTargetType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Target for the price adjustment (the cart itself or individual items). Possible values are:</p> <ul style="list-style-type: none"> • Cart • Item
AdjustmentType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Indicates if the price adjustment is applied as percentage or an absolute amount. Possible values are:</p> <ul style="list-style-type: none"> • AdjustmentAmount • AdjustmentPercentage
AdjustmentValue	<p>Type double</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description Numeric value of the adjustment (for example, 10 if the price adjustment is either 10% off or \$10 off).</p>
CartItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the parent cart item to which this adjustment belongs. This is a relationship field.</p> <p>Relationship Name CartItem</p> <p>Relationship Type Lookup</p>

Field	Details
	<p>Refers To CartItem</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The ISO code for the currency that's specified on the buyer's account. Default value is USD. Possible values are:</p> <ul style="list-style-type: none"> • EUR—Euro • USD—U.S. Dollar
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Description of the price adjustment.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Name of the price adjustment.</p>
PriceAdjustmentCauseId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of entity that caused this adjustment (for example, a promotion ID). This is a relationship field.</p> <p>Relationship Name PriceAdjustmentCause</p> <p>Relationship Type Lookup</p> <p>Refers To Promotion</p>

Field	Details
Priority	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description If there are multiple price adjustments, sequence in which the price adjustments are applied.</p>
TotalAmount	<p>Type currency</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description Total price after applying price adjustments.</p>
TotalTax	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Tax on the total adjusted price.</p>
WebCartAdjustmentGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the cart's adjustment group. This is a relationship field.</p> <p>Relationship Name WebCartAdjustmentGroup</p> <p>Relationship Type Lookup</p> <p>Refers To WebCartAdjustmentGroup</p>

CartTax

Represents taxes for a line item in a `WebCart` that's active in a store built with B2B Commerce on Lightning Experience. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

The CartTax object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
AdjustmentTargetType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Target for the price adjustment (the cart itself or individual items). This field is available in API version 52.0 and later.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Cart • Item
Amount	<p>Type currency</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description Calculated tax amount.</p>
CartId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the <code>WebCart</code> being taxed.</p>
CartItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p>

Field	Details
	<p>Description The ID of a cart item being taxed.</p>
CartItemPriceAdjustmentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of a price adjustment for a cart item being taxed. (This field is available in API version 52.0 and later.)</p> <p>Refers To CartItemPriceAdjustment</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The ISO code for the currency that's specified on the buyer's account. Default value is USD. Valid values include:</p> <ul style="list-style-type: none"> • USD—U.S. Dollar
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description A description of the tax. Enter up to 2000 characters.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of this <code>CartTax</code> record. <code>Name</code> can be up to 255 characters.</p>
TaxCalculationDate	<p>Type date</p> <p>Properties Create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description The date this tax was calculated.</p>
TaxRate	<p>Type percent</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The applied tax rate for this line of tax.</p>
TaxType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The type of tax for this line of tax. Possible values are:</p> <ul style="list-style-type: none"> • Actual • Estimated

CartValidationOutput

Associate errors to cart entities, such as cart line items, delivery groups, and the like, in a store built with B2B Commerce on Lightning Experience. An example error is "Out of stock." Available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

The CartValidationOutput object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
BackgroundOperationId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the background operation that ran the validation.</p>
CartId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the related <code>WebCart</code>.</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The ISO code for the currency that's specified on the buyer's account. Default value is <code>USD</code>. Possible values are:</p> <ul style="list-style-type: none"> • <code>EUR</code>—Euro • <code>USD</code>—U.S. Dollar
IsDismissed	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the validation process is finished. Default value is <code>false</code>.</p>
Level	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Describes the type of output resulting from the validation process. Possible values are:</p> <ul style="list-style-type: none"> • <code>0</code> (<code>Info</code>) • <code>1</code> (<code>Error</code>)

Field	Details
	<ul style="list-style-type: none"> • 2 (Warning)
Message	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Defines the message to show in the log when validation is complete. Message can be up to 255 characters.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of this <code>CartValidationOutput</code> record. Name can be up to 255 characters.</p>
RelatedEntityId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Foreign key to <code>WebCart</code>, <code>CartItem</code>, and <code>CartDeliveryGroup</code>.</p>
RelatedEntityPrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Three-character prefix for the related entity.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The <code>CartValidationOutput</code> type. Possible values are:</p> <ul style="list-style-type: none"> • 0 (Inventory) • 1 (Taxes) • 2 (Pricing) • 3 (Shipping)

Field	Details

Case

Represents a case, which is a customer issue or problem.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AccountId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the account associated with this case. This is a relationship field.</p> <p>Relationship Name Account</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>
BusinessHoursId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description ID of the business hours associated with this case.</p>
Comments	<p>Type textarea</p> <p>Properties Create, Delete, Layout, Nillable, Query, Retrieve, Search, Sort, Undelete, Update</p> <p>Description Used to insert a new CaseComment. Email textarea has a length of 4000 chars.</p>
CaseNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description Assigned automatically when each case is inserted. It can't be set directly, and it can't be modified after the case is created.</p>
ClosedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time when the case was closed.</p>
CommunityId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description ID of the zone associated with this case. This field is available in API version 24.0 and later.</p>
ConnectionReceivedId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the PartnerNetworkConnection that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.</p>

Field	Details
ConnectionSentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the PartnerNetworkConnection that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new PartnerNetworkRecordConnection object to forward records to connections.</p>
ContactEmail	<p>Type email</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Email address for the contact. The Case.ContactEmail field displays the Email field on the contact on page 947 that is referenced by Case.ContactId. Label is <code>Contact Email</code>. This field is available in API version 38.0 and later.</p>
ContactFax	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Fax number for the contact. Label is <code>Contact Fax</code>. This field is available in API version 38.0 and later.</p>
ContactId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the associated contact. This is a relationship field.</p> <p>Relationship Name Contact</p> <p>Relationship Type Lookup</p> <p>Refers To Contact</p>

Field	Details
ContactMobile	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Mobile telephone number for the contact. Label is <code>Contact Mobile</code>. This field is available in API version 38.0 and later.</p>
ContactPhone	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Telephone number for the contact. Label is <code>Contact Phone</code>. This field is available in API version 38.0 and later.</p>
CreatorFullPhotoUrl	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description URL of the user's profile photo from the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.</p>
CreatorName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Name of the user who posted the question or reply. Only the first name of internal users (agents) appears to portal users in the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.</p>
CreatorSmallPhotoUrl	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description URL of the user's thumbnail photo from the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.</p>

Field	Details
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description A text description of the case. Limit: 32 KB.</p>
FeedItemId	<p>Type reference</p> <p>Properties Create, Group, Nillable, Sort</p> <p>Description ID of the question in Chatter associated with the case. This field is available in API version 33.0 and later, and is only accessible in organizations where Question-to-Case is enabled.</p>
HasCommentsUnreadByOwner	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether a case contains comments that the case owner hasn't read (<code>true</code>) or not (<code>false</code>).</p>
HasSelfServiceComments	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether a case has comments added by a Self-Service user (<code>true</code>) or not (<code>false</code>). Only visible when Customer Portal is enabled.</p>
IsClosed	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the case is closed (<code>true</code>) or open (<code>false</code>). This field is controlled by the <code>Status</code> field; it can't be set directly. Label is <code>Closed</code>.</p>
IsClosedOnCreate	<p>Type boolean</p>

Field	Details
	<p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the case was closed at the same time that it was created (<code>true</code>) or not (<code>false</code>). This flag is read-only and is automatically set when a record is created. It can't be set to <code>true</code> unless the <code>IsClosed</code> flag is also <code>true</code>.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is <code>Deleted</code>.</p>
IsEscalated	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the case has been escalated (<code>true</code>) or not. A case's escalated state does not affect how you can use a case, or whether you can query, delete, or update it. You can set this flag via the API. Label is <code>Escalated</code>.</p>
IsSelfServiceClosed	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the case is closed for Self-Service users (<code>true</code>) or not (<code>false</code>).</p>
IsStopped	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether an entitlement process on a case is stopped (<code>true</code>) or not (<code>false</code>).</p>
IsVisibleInSelfService	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p>

Field	Details
	<p>Description</p> <p>Indicates whether the case can be viewed in the Customer Service Portal, Partner Service Portal, and Self-Service Portal (<code>true</code>) or not (<code>false</code>). This field is applied for case visibility in the Partner Relationship Management, Customer Service Portal, and the earlier version of Self Service Portal. The field does not alter sharing and will not prevent usage of a direct URL to a case if a portal user has read or write access.</p>
Language	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>The language of the case. The Language field is available when you enable Einstein Case Classification in Enterprise, Performance, and Unlimited edition orgs with Service Cloud. By default, only Einstein classification apps use this field.</p>
LastReferencedDate	<p>Type</p> <p>datetime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type</p> <p>datetime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
MasterRecordId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>If this object was deleted as the result of a merge, this field contains the ID of the record that was kept. If this object was deleted for any other reason, or has not been deleted, the value is <code>null</code>.</p> <p>This is a relationship field.</p>

Field	Details
	<p>Relationship Name MasterRecord</p> <p>Relationship Type Lookup</p> <p>Refers To Case</p>
Origin	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The source of the case, such as <code>Email</code>, <code>Phone</code>, or <code>Web</code>. Label is <code>Case Origin</code>.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the contact who owns the case. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the parent case in the hierarchy. The label is <code>Parent Case</code>. This is a relationship field.</p> <p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To Case</p>

Field	Details
Priority	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description The importance or urgency of the case, such as High, Medium, or Low.</p>
QuestionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The question in the answers zone that is associated with the case. This field does not appear if you don't have an answers zone enabled.</p>
Reason	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The reason why the case was created, such as Instructions not clear, or User didn't attend training.</p>
RecordTypeId	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description ID of the record type assigned to this object.</p>
SlaStartDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Shows the time that the case entered an entitlement process. If you have the Edit permission on cases, you can update or reset the time. This field is available in API version 18.0 and later.</p>
SourceId	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the social post source.</p>
Status	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description The status of the case, such as New, Closed, or Escalated. This field directly controls the <code>IsClosed</code> flag. Each predefined <code>Status</code> value implies an <code>IsClosed</code> flag value. For more information, see <code>CaseStatus</code>.</p>
StopStartDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time an entitlement process was stopped on the case. This field is available in API version 18.0 and later.</p>
Subject	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The subject of the case. Limit: 255 characters.</p>
SuppliedCompany	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The company name that was entered when the case was created. Label is <code>Company</code>.</p>
SuppliedEmail	<p>Type email</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>The email address that was entered when the case was created. Label is <code>Email</code>.</p> <p>If your organization has an active auto-response rule, <code>SuppliedEmail</code> is required when creating a case via the API. Auto-response rules use the email in the contact specified by <code>ContactId</code>. If no email address is in the contact record, the email specified here is used.</p>
<code>SuppliedName</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The name that was entered when the case was created. Label is <code>Name</code>.</p>
<code>SuppliedPhone</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The phone number that was entered when the case was created. Label is <code>Phone</code>.</p>
<code>Type</code>	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The type of case, such as <code>Feature Request</code> or <code>Question</code>.</p>

 **Note:** If you are importing Case data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

Usage

Use the Case object to manage cases for your organization. Client applications can query, update, and delete Attachment records associated with a case via the API.

Assignment Rules

When you query or update a case, your client application can have the case automatically assigned to one or more User records based on assignment rules that have been configured in the user interface. To use this feature, your client application must set either of the following options (but not both) in the `AssignmentRuleHeader` used in the create or update:

Field	Field Type	Details
<code>assignmentRuleId</code>	reference	ID of the assignment rule to use. Can be an inactive assignment rule. If unspecified and <code>useDefaultRule</code> is <code>true</code> , then the default assignment rule is used. To find the ID for a given assignment rule, query the <code>AssignmentRule</code> object (specifying <code>RuleType="caseAssignment"</code>), iterate through the returned <code>AssignmentRule</code> objects, find the one you want to use, retrieve its ID, and then specify its ID in this field in the <code>AssignmentRuleHeader</code> .
<code>useDefaultRule</code>	boolean	Specifies whether to use the default rule for rule-based assignment (<code>true</code>) or not (<code>false</code>). The default rule is assigned by users in the Salesforce user interface.

For a code example that shows setting the `AssignmentRuleHeader` for a Lead (which is similar to setting the `AssignmentRuleHeader` for a Case), see [Lead](#).

Separating Accounts from Contacts in Cases

In releases before 8.0, the `AccountId` could not be specified, it was derived from the contact's account. This behavior will continue to be supported in future releases, but you can also now specify an `AccountId`. If you do not specify the `AccountId` during the creation of a case, the value will default to the contact's `AccountId`.

 **Note:** When a record is updated, if the `ContactId` has not changed, then the `AccountId` is not regenerated. This prevents the API from overwriting a value previously changed in the Salesforce user interface. However, if an API call changes the `ContactId` and the `AccountId` field is empty, then the `AccountId` is generated using the contact's account.

Using `_case` with Java

Depending on the development tool you use, you might need to write your application using `_case` instead of `Case`, because `case` is a reserved word in Java.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

CaseChangeEvent (API version 44.0)

Change events are available for the object.

CaseFeed (API version 18.0)

Feed tracking is available for the object.

CaseHistory

History is available for tracked fields of the object.

CaseOwnerSharingRule

Sharing rules are available for the object.

CaseShare

Sharing is available for the object.

SEE ALSO:

[Account](#)

[CaseMilestone](#)

CaseArticle

Represents the association between a Case and a KnowledgeArticle. This object is available in API version 20.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Access to this object is controlled by the parent Case and KnowledgeArticle. However, when querying, access is only controlled by the parent Case.

Customer Portal users can't access this object.

Fields

Field	Details
ArticleLanguage	<p>Type picklist</p> <p>Properties Filter, Restricted picklist</p> <p>Description The language of the article associated with the case.</p>
ArticleVersionNumber	<p>Type int</p> <p>Properties Create, Group, Nillable</p> <p>Description The number assigned to a version of an article. This field is available in API version 24.0 and later.</p>
CaseId	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the Case associated with the KnowledgeArticle.</p>
IsSharedByEmail	<p>Type int</p> <p>Properties Create, Group, Nillable</p> <p>Description Indicates that the article has been shared with the customer through an email.</p>
KnowledgeArticleId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the KnowledgeArticle associated with the Case.</p>

Usage

This object represents the association of a knowledge article with a Case. An article is associated with a case when it's relevant to a specific issue, when it helps an agent solve the case, or when the agent sends the article to a customer.

You can use this object to include case-article associations in Apex and Visualforce.

You can't update this object via the API. If you attempt to create a record that matches an existing record, the create request simply returns the existing record.

SEE ALSO:

[Case](#)

[KnowledgeArticle](#)

CaseComment

Represents a comment that provides additional information about the associated Case.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
CommentBody	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Text of the CaseComment. The maximum size of the comment body is 4,000 bytes. Label is Body.</p>
ConnectionReceivedId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the PartnerNetworkConnection that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.</p>
ConnectionSentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the PartnerNetworkConnection that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new PartnerNetworkRecordConnection object to forward records to connections.</p>
CreatorFullPhotoUrl	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description URL of the user's profile photo from the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.</p>
CreatorName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>Name of the user who posted the question or reply. Only the first name of internal users (agents) appears to portal users in the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.</p>
CreatorSmallPhotoUrl	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>URL of the user's thumbnail photo from the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.</p>
IsDeleted	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter</p> <p>Description</p> <p>Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
IsNotificationSelected	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Update</p> <p>Description</p> <p>Indicates whether an email notification is sent to the case contact when a CaseComment is created or updated. When this field is queried, it always returns null.</p> <p>This field is available only when the <code>Enable Case Comment Notification to Contacts</code> setting is enabled on the Support Settings page in Setup. To send email notifications for CaseComment, you must use the <code>EmailHeader triggerUserEmail</code>.</p> <p>Available in API version 43.0 and later.</p>
IsPublished	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Indicates whether the CaseComment is visible to customers in the Self-Service portal (<code>true</code>) or not (<code>false</code>). Label is Published. This is the only CaseComment field that can be updated via the API.</p>

Field	Details
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort,</p> <p>Description Required. ID of the parent Case of the CaseComment. This is a relationship field.</p> <p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To Case</p>

 **Note:** If you're importing CaseComment data and must set the value for an audit field, such as `CreatedDate`, contact Salesforce. Record id's can't delete CaseComments entities when calling the `Database.delete()` Apex method or its analogous SOAP API. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

Usage

In the Salesforce user interface, comments are entered by a User working on a Case. All users have access to create and view CaseComment in the Salesforce user interface and when using the API. In the API, CaseComment records can't be modified after insertion unless the user has the "Modify All" object-level permission for Cases or the "Modify All Data" permission. If not, users can only update the `IsPublished` field, and can't delete CaseComment.

SEE ALSO:

[Object Basics](#)

CaseContactRole

Represents the role that a given Contact plays on a Case.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
CasesId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the cases associated with this contact. This is a relationship field.</p> <p>Relationship Name Cases</p> <p>Relationship Type Lookup</p> <p>Refers To Case</p>
ContactId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. ID of the contact. This is a relationship field.</p> <p>Relationship Name Contact</p> <p>Relationship Type Lookup</p> <p>Refers To Contact</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
Role	<p>Type picklist</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Name of the role played by the contact on this case, such as Technical Contact, Business Contact, Decision Maker, and so on. Must be unique—there can't be multiple records in which the <code>CaseId</code>, <code>ContactId</code>, and <code>Role</code> values are identical. Different contacts can play the same role on the same case. A contact can play different roles on the same case.</p>

Usage

Use this object to define the role that a given Case plays on a given Contact. For example, you can use this object to be able to see all contacts who are associated to a case, or, given a contact, be able to query all cases that they are associated with, even if they are not the primary contact on the case.

CaseHistory

Represents historical information about changes that have been made to the associated Case.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

You can also enable `delete()` in API version 42.0 and later. See [Enable delete of Field History and Field History Archive](#).

Special Access Rules

This object is always read-only.

Fields

Field	Details
<code>CaseId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the Case associated with this record. This is a relationship field.</p> <p>Relationship Name Case</p>

Field	Details
	<p>Relationship Type Lookup</p> <p>Refers To Case</p>
DataType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Data type of the field that was changed.</p>
Field	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Name of the case field that was modified, or a special value to indicate some other modification to the case. The possible values, in addition to the case field names, are:</p> <ul style="list-style-type: none"> • ownerAssignment—The owner of the case was changed. • ownerAccepted—A user took ownership of a case from a queue. • ownerEscalated—The owner of the case was changed due to case escalation. • external—A user made the case visible to customers in the Customer Self-Service Portal.
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description New value of the modified case field. Maximum of 255 characters.</p>
OldValue	<p>Type anyType</p>

Field	Details
	<p>Properties Nillable, Sort</p> <p>Description Previous value of the modified case field. Maximum of 255 characters.</p>

Usage

Case history entries are indirectly created each time a case is modified.

Two rows are added to this record when foreign key fields change. One row contains the foreign key object names that display in the online application. For example, Jane Doe is recorded as the name of a Contact. The other row contains the actual foreign key ID that is only returned to and visible from the API.

This object respects field level security on the parent object.

[Object Basics](#)

CaseMilestone

Represents a milestone (required step in a customer support process) on a Case. This object is available in API version 18.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

Fields

Field	Details
BusinessHoursId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the BusinessHours associated with the CaseMilestone.</p>
CaseId	<p>Type reference</p> <p>Properties Filter</p>

Field	Details
	<p>Description ID of the case.</p>
CompletionDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Update</p> <p>Description The date and time the milestone was completed.</p>
ElapsedTimeInDays	<p>Type double</p> <p>Properties Filter, Nillable</p> <p>Description The time required to complete a milestone in days.</p>
ElapsedTimeInHrs	<p>Type double</p> <p>Properties Filter, Nillable</p> <p>Description The time required to complete a milestone in hours.</p>
ElapsedTimeInMins	<p>Type int</p> <p>Properties Filter, Nillable</p> <p>Description The time required to complete a milestone in minutes.</p>
IsCompleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the milestone is completed (<code>true</code>) or not (<code>false</code>).</p>
IsViolated	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p>

Field	Details
	<p>Description Indicates whether the milestone is violated (<code>true</code>) or not (<code>false</code>).</p>
MilestoneTypeId	<p>Type reference</p> <p>Properties Filter, Nillable</p> <p>Description The ID of the milestone on the case.</p>
StartDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Update</p> <p>Description The date and time the milestone started on the case.</p>
TargetDate	<p>Type dateTime</p> <p>Properties Filter</p> <p>Description The date and time the milestone must be completed.</p>
TargetResponseInDays	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The time to complete the milestone in days.</p>
TargetResponseInHrs	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The time to complete the milestone in hours.</p>
TargetResponseInMins	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description The time to complete the milestone in minutes.</p>
TimeRemainingInDays	<p>Type double</p> <p>Properties Group, Nillable, Sort</p> <p>Description Time remaining to reach the milestone target, measured in days.</p>
TimeRemainingInHrs	<p>Type text</p> <p>Properties Nillable</p> <p>Description Time remaining to reach the milestone target, measured in hours.</p>
TimeRemainingInMins	<p>Type text</p> <p>Properties Group, Nillable, Sort</p> <p>Description Time remaining to reach the milestone target. The format is minutes and seconds.</p>
TimeSinceTargetInDays	<p>Type double</p> <p>Properties Nillable, Sort</p> <p>Description The time elapsed since the milestone target, measured in days.</p>
TimeSinceTargetInHrs	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description The time elapsed since the milestone target, measured in hours.</p>
TimeSinceTargetInMins	<p>Type string</p> <p>Properties Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The time elapsed since the milestone target. The format is minutes and seconds.</p>

Usage

This object lets you view a milestone on a case. It also lets you view if the milestone was completed and when it must be completed.

SEE ALSO:

- [Case](#)
- [MilestoneType](#)
- [SlaProcess](#)

CaseOwnerSharingRule

Represents the rules for sharing a case with users other than the owner.

 **Note:** To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The [SharingRules](#) Metadata API type is enabled for all orgs.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
<code>CaseAccessLevel</code>	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description</p> <p>A value that represents the type of sharing being allowed. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit

Field	Details
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface.</p> <p>This field is available in API version 24.0 and later.</p> <p> Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p>
GroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the source group. Cases owned by users in the source group trigger the rule to give access.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface.</p>

Field	Details
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the target user or group. Target users or groups are given access.</p>

Usage

Use this object to manage the sharing rules for cases. General sharing and territory management-related sharing use this object.

SEE ALSO:

[Case](#)

[CaseShare](#)

[Metadata API Developer Guide: SharingRules](#)

CaseRelatedIssue

This object acts as a junction between a customer issue (Case) and the Incident or Problem that represents an associated service failure. This object is available in API version 53.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
CaseId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description A relationship field that represents the case you're linking a Problem or Incident to.</p> <p>Relationship Name Case</p> <p>Relationship Type Lookup</p>

Field	Details
	<p>Refers To Case</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description A brief description of the related case.</p>
RelatedEntityType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Shows what type of object the related entity is. Possible values are:</p> <ul style="list-style-type: none"> • Incident • Problem
RelatedIssueId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description A polymorphic relationship field that represents a related Problem or Incident.</p> <p>Relationship Name RelatedIssue</p> <p>Relationship Type Lookup</p> <p>Refers To Incident, Problem</p>
RelationshipType	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Shows how two records relate to each other. Possible values are:</p>

Field	Details
	<ul style="list-style-type: none"> • Root Cause • Similar <p>The default value is 'Root Cause'.</p>
UniqueKeyIndex	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description This field is unique within your organization.</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[CaseRelatedIssueFeed](#) on page 3944

Feed tracking is available for the object.

[CaseRelatedIssueHistory](#) on page 3956

History is available for tracked fields of the object.

CaseShare

Represents a sharing entry on a Case.

Supported Calls

`describeSObjects()`, `create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only users with access to the Case object can access this object.

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field	Details
CaseAccessLevel	<p>Type picklist</p>

Field	Details
	<p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Level of access that the User or Group has to the Case. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All This value is not valid for creating or deleting records. <p>This field must be set to an access level that is higher than the organization's default access level for cases.</p>
CaseId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the Case associated with this sharing entry. This field can't be updated. This is a relationship field.</p> <p>Relationship Name Case</p> <p>Relationship Type Lookup</p> <p>Refers To Case</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
RowCause	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to <code>Manual</code> (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings. Valid values include:</p>

Field	Details
	<ul style="list-style-type: none"> • Manual—The User or Group has access because a user with “All” access manually shared the Case with them. • Owner—The User is the owner of the Case. • ImplicitChild—The User or Group has access to the Case on the Account associated with this Case. • RelatedPortalUser—The portal user is the contact on the Case. • Rule—The User or Group has access via a Case sharing rule. • GuestRule—The User or Group has access via a Case guest user sharing rule. • Team—The User or Group has team access. • LpuImplicit—The User has access to records owned by high-volume Experience Cloud site users via a share group. • ARImplicit—The User, who belongs to a partner or customer account, has access to the Case via an account relationship data sharing rule.
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the User or Group that has been given access to the Case. This field can't be updated. This is a polymorphic relationship field.</p> <p>Relationship Name UserOrGroup</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>

Usage

This object allows you to determine which users and groups can view and edit Case records owned by other users.

If you attempt to create a new record that matches an existing record, request updates any modified fields and returns the existing record.

SEE ALSO:

[AccountShare](#)

[LeadShare](#)

[OpportunityShare](#)

CaseSolution

Represents the association between a Case and a Solution.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
CaseId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the Case associated with the Solution. This is a relationship field.</p> <p>Relationship Name Case</p> <p>Relationship Type Lookup</p> <p>Refers To Case</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
SolutionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the Solution associated with the case. This is a relationship field.</p> <p>Relationship Name Solution</p>

Field	Details
	Relationship Type Lookup
	Refers To Solution

Usage

You can't update this object via the API. If you attempt to create a record that matches an existing record, the request simply returns the existing record.

SEE ALSO:

[CaseShare](#)

[SolutionStatus](#)

CaseStatus

Represents the status of a Case, such as New, On Hold, or In Process.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object's name.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
ApiName	Type string
	Properties Filter, Group, idLookup, Sort
	Description Uniquely identifies a picklist value so it can be retrieved without using an id or primary label.
IsClosed	Type boolean
	Properties Defaulted on create, Filter, Group, Sort

Field	Details
	<p>Description</p> <p>Indicates whether this case status value represents a closed Case (<code>true</code>) or not (<code>false</code>). Multiple case status values can represent a closed Case.</p>
<code>IsDefault</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>Indicates whether this is the default case status value (<code>true</code>) or not (<code>false</code>) in the picklist.</p>
<code>MasterLabel</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Label for this case status value. This display value is the internal label that does not get translated.</p>
<code>SortOrder</code>	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Number used to sort this value in the case status picklist. These numbers are not guaranteed to be sequential, as some previous case status values might have been deleted.</p>

Usage

This object represents a value in the case status picklist. The case status picklist provides additional information about the status of a Case, such as whether a given `STATUS` value represents an open or closed case. Query the `CaseStatus` object to retrieve the set of values in the case status picklist, and then use that information while processing Case records to determine more information about a given case. For example, the application could test whether a given case is open or closed based on its `STATUS` value and the value of the `IsClosed` property in the associated `CaseStatus` object.

SEE ALSO:

[Object Basics](#)

CaseSubjectParticle

Represents the Social Business Rules custom format for the **Case Subject** field on cases created from inbound social posts. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The unique name for the CaseSubjectParticle object.</p> <p>This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated, but you can supply your own value if you create the record using the API.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
Index	<p>Type int</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Required. The order in which the custom Case Subject is generated, meaning if the social network is 0 and the social message is 1, then the subject generates as <code>Twitter Tweet</code>.</p>
Language	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p>

Field	Details
	<p>Description</p> <p>The language of the case subject field.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • ar—Arabic • da—Danish • de—German • en_US—English • es—Spanish • es_MX—Spanish (Mexico) • fi—Finnish • fr—French • it—Italian • iw—Hebrew • ja—Japanese • ko—Korean • nl_NL—Dutch • no—Norwegian • pt_BR—Portuguese (Brazil) • ru—Russian • sv—Swedish • th—Thai • zh_CN—Chinese (Simplified) • zh_TW—Chinese (Traditional)
MasterLabel	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Label for the case subject field.</p>
TextField	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Specifies inbound social content added to Case Subject in case records.</p>

Field	Details
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Required. Specifies the custom Case Subject format from which inbound social content appears in case records.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • ColonSeparator • Content—Message • HyphenSeparator • MessageType • PipeSeparator • ProvidedString • RealName • Sentiment • SocialHandle • SocialNetwork • Source

Usage

In the Salesforce UI, case subjects are brief descriptions of cases. They are what agents see on cases first. Social Business Rules specify the brief descriptions of cases created from social posts. Using `CaseSubjectParticle` objects you can build your own case subject format, where each object represents a social post's component. For example, combining `CaseSubjectParticle` objects with components for types `MessageType`, `RealName`, and `SocialNetwork` results in "Tweet Customer123 Twitter".

CaseTag

Associates a word or short phrase with a Case

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ItemId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description ID of the tagged item.</p>
Name	<p>Type string</p> <p>Properties Create, Filter</p> <p>Description Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>
TagDefinitionId	<p>Type reference</p> <p>Properties Filter</p> <p>Description ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Restricted picklist</p> <p>Description Defines the visibility of a tag. Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

CaseTag stores the relationship between its parent TagDefinition and the Case being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

CaseTeamMember

Represents a case team member, who works with a team of other users to help resolve a case.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Spring '20 and later, only users with read access to the Case object can access this object.

When accessing from Apex code, use the `WITH SECURITY_ENFORCED` clause to enable field-level and object-level security permissions checking for `SOQL SELECT` queries, including subqueries and cross-object relationships. To learn more, see [Filter SOQL Queries Using WITH SECURITY_ENFORCED](#).

Fields

Field	Details
MemberId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the user or contact who is a member on a case team. This is a polymorphic relationship field.</p> <p>Relationship Name Member</p> <p>Relationship Type Lookup</p> <p>Refers To Contact, User</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the case with which the case team member is associated.</p>

Field	Details
	<p>This is a relationship field.</p> <p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To Case</p>
TeamRoleId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the case team role with which the case team member is associated. This is a relationship field.</p> <p>Relationship Name TeamRole</p> <p>Relationship Type Lookup</p> <p>Refers To CaseTeamRole</p>
TeamTemplateId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the predefined team with which the case team member is associated. This is a relationship field.</p> <p>Relationship Name TeamTemplate</p> <p>Relationship Type Lookup</p> <p>Refers To CaseTeamTemplate</p>
TeamTemplateMemberId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description The ID of the team member included in a predefined case team. This is a relationship field.</p> <p>Relationship Name TeamTemplateMember</p> <p>Relationship Type Lookup</p> <p>Refers To CaseTeamTemplateMember</p>

CaseTeamRole

Represents a case team role. Every case team member has a role on a case, such as “Customer Contact” or “Case Manager.”

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Spring '20 and later, only users with read access to the Case object can access this object.

Fields

Field	Details
AccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of access granted to the target Group for cases. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit
Name	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of the case team role.</p>
PreferencesVisibleInCSP	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Indicates whether or not the case team role is visible to Customer Portal users.</p>

CaseTeamTemplate

Represents a predefined case team, which is a group of users that helps resolve a case.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Spring '20 and later, only users with read access to the Case object can access this object.

Fields

Field	Details
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A text description of the predefined case team.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p>

Field	Details
	<p>Description</p> <p>The name of the predefined case team.</p>

CaseTeamTemplateMember

Represents a member on a predefined case team, which is a group of users that helps resolve cases.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Spring '20 and later, only users with read access to the Case object can access this object.

Fields

Field	Details
MemberId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>The ID of the user or contact who is a team member on a predefined case team.</p>
TeamRoleId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The ID of the predefined case team member's case team role.</p>
TeamTemplateId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>The ID of the predefined case team's template.</p>

CaseTeamTemplateRecord

The CaseTeamTemplateRecord object is a linking object between the Case and CaseTeamTemplate objects. To assign a predefined case team to a case (customer inquiry), create a CaseTeamTemplateRecord record and point the `ParentId` to the case and the `TeamTemplateId` to the predefined case team.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

As of Spring '20 and later, only users with read access to the Case object can access this object.

Fields

Field	Details
<code>ParentId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the case with which the case team template record is associated. This is a relationship field.</p> <p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To Case</p>
<code>TeamTemplateId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the predefined case team with which the case team template record is associated. This is a relationship field.</p> <p>Relationship Name TeamTemplate</p> <p>Relationship Type Lookup</p>

Field	Details
	Refers To CaseTeamTemplate

CategoryData

Represents a logical grouping of Solution records.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
CategoryNodeId	Type reference Properties Create, Filter, Group, Sort, Update Description ID of the CategoryNode associated with the solution.
IsDeleted	Type boolean Properties Defaulted on create, Filter Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted .
RelatedSubjectId	Type reference Properties Create, Filter, Group, Sort, Update Description ID of the solution related to the category.

Usage

This object allows you to assign one or more categories to a Solution. It is an intermediate data table with two foreign keys that defines the relationship between a CategoryNode and a Solution record.

CategoryData has two foreign keys:

- The first foreign key, `CategoryNodeId`, refers to the ID of a CategoryNode.
- The other foreign key, `RelatedSubjectId`, refers to a Solution ID.

This is a many-to-many relationship, so there can be multiple rows returned with a `CategoryNodeId`. A Solution can be associated with multiple categories.

SEE ALSO:

[Object Basics](#)

CategoryNode

Represents a tree of Solution categories.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Customer Portal users can't access this object.
- Attempting to delete a CategoryNode that has children (referred by `CategoryNode.Parent`), or is referred to elsewhere, causes a failure.

Fields

Field	Details
<code>MasterLabel</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label for the category node.</p>
<code>ParentId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description ID of the parent of this node, if any.</p>
SortOrder	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Indicates the sort order of child CategoryNode objects.</p>
SortStyle	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Indicates whether the sort order is alphabetical or custom.</p>

Usage

A CategoryNode defines a category of solutions. In the user interface, you can edit category definitions from Setup by entering *Solution Categories* in the **Quick Find** box, then selecting **Solution Categories**.

CategoryNodeLocalization

When the Translation Workbench is enabled for your organization, the CategoryNodeLocalization object provides the translation of the label of a solution category.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, Unlimited, or Performance Edition and be enabled for the Translation Workbench.
- To view this object, you must have the “View Setup and Configuration” permission.

Fields

Field	Details
CategoryNodeId	<p>Type reference</p> <p>Properties Create, Filter, Nillable</p> <p>Description The ID of the solution CategoryNode that is being translated.</p>
LanguageLocaleKey	<p>Type picklist</p> <p>Properties Create, Filter, Nillable, Restricted picklist</p> <p>Description This field is available in API version 16.0 and earlier. It is the same as the <code>Language</code> field.</p>
Language	<p>Type picklist</p> <p>Properties Create, Filter, Nillable, Restricted picklist</p> <p>Description This field is available in API version 17.0 and later. The combined language and locale ISO code, which controls the language for labels displayed in an application.</p> <p>This picklist contains the following fully-supported languages:</p> <ul style="list-style-type: none">• Chinese (Simplified): zh_CN• Chinese (Traditional): zh_TW• Danish: da• Dutch: nl_NL• English: en_US• Finnish: fi• French: fr• German: de• Italian: it• Japanese: ja• Korean: ko• Norwegian: no• Portuguese (Brazil): pt_BR• Russian: ru

Field**Details**

- Spanish: `es`
- Spanish (Mexico): `es_MX` Spanish (Mexico) defaults to Spanish for customer-defined translations.
- Swedish: `sv`
- Thai: `th` The Salesforce user interface is fully translated to Thai, but Help is in English.

The following end-user only languages are available.

- Arabic: `ar`
- Bulgarian: `bg`
- Croatian: `hr`
- Czech: `cs`
- English (UK): `en_GB`
- Greek: `el`

NamespacePrefix	<p>Type string</p>

Field	Details
	<p>Properties Filter, Nillable</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> • In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
Value	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The actual translated label for the solution category. Label is Translation.</p>

Usage

Use this object to translate the labels of your solution categories into a supported language. Users with the Translation Workbench enabled can view category node translations, but either the “Customize Application,” “Manage Translation,” or “Manage Categories” permission is required to create or update category node translations.

ChangeRequest

Represents a decision to implement a formal request for a change (RFC). This object is available in API version 53.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
BusinessJustification	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description A description of the business reason to implement the change. This field can store up to 32 KB of data, but only the first 255 characters display in reports.</p>
BusinessReason	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The core reason for creating the change request. Possible values are:</p> <ul style="list-style-type: none"> • t2
Category	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The type of change request. Administrators set field values.</p>
ChangeRequestNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The unique, system-generated change request number.</p>
ChangeType	<p>Type picklist</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The type of change request. Administrators set field values. Possible values are:</p> <ul style="list-style-type: none"> • Emergency • Major • Normal • Standard
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description A description of the change request. This field can store up to 32 KB of data, but only the first 255 characters display in reports.</p>
EstimatedEndTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The date and time (in UTC) when the change request is estimated to be implemented.</p>
EstimatedStartTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The estimated date and time (in UTC) when the change request is implemented.</p>
FinalReviewDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The date and time (in UTC) when the change request was reviewed.</p>
FinalReviewNotes	<p>Type textarea</p>

Field	Details
	<p>Properties Create, Nillable, Update</p> <p>Description Notes left by the change request reviewer. This field can store up to 32 KB of data, but only the first 255 characters display in reports.</p>
Impact	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Shows the impact of a requested change. Possible values are:</p> <ul style="list-style-type: none"> • High • Low • Medium <p>The default value is 'High'.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description A polymorphic relationship field that represents the user or group assigned as the change reviewer.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
Priority	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The impact and urgency of a requested change. Possible values are:</p> <ul style="list-style-type: none"> • Critical • High • Low • Moderate <p>The default value is 'Critical'.</p>
RemediationPlan	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description A description of the steps required to resolve the incident. This field can store up to 32 KB of data, but only the first 255 characters display in reports.</p>
ReviewerId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the user who reviewed the change request. This is a relationship field.</p> <p>Relationship Name Reviewer</p>

Field	Details
	<p>Relationship Type Lookup</p> <p>Refers To User</p>
RiskImpactAnalysis	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description An assessment of the risk involved with the implementation of the change request. Administrators set field values, and each value can have up to 20 characters.</p>
RiskLevel	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The risk level associated with adopting the requested change. Feed tracking is available for the object.

[ChangeRequestRelatedIssueHistory](#) on page 3956

History is available for tracked fields of the object.

ChannelObjectLinkingRule

Represents a rule for linking a channel interaction with an object (such as Lead or Contact). This object is available in API version 47.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
<code>ActionForNoRecordFound</code>	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Action to take when no matching records are found. Possible values are:</p> <ul style="list-style-type: none"> • <code>CreateNewRecordAndLink</code>—Create Record and Link (Recommended) • <code>PromptAgent</code>—Prompt Agent
<code>ActionForSingleRecordFound</code>	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Action to take when one matching record is found. Possible values are:</p> <ul style="list-style-type: none"> • <code>AutoLink</code>—Auto-Link Record (Recommended) • <code>PromptAgent</code>—Prompt Agent

Field	Details
ChannelType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description The type of channel used for this rule. Possible values are:</p> <ul style="list-style-type: none"> • FacebookMessenger • Phone • Text • WeChat • WhatsApp
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The description for this linking rule.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
IsLinkedRecordOpenedAsSubTab	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Indicates whether to open the linked record as a subtab when the link is established.</p>
IsRuleActive	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Indicates whether the rule is active.</p>
Language	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>The language for this linking rule.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • ar—Arabic • bg—Bulgarian • cs—Czech • da—Danish • de—German • el—Greek • en_GB—English (UK) • en_US—English • es—Spanish • es_MX—Spanish (Mexico) • fi—Finnish • fr—French • hr—Croatian • hu—Hungarian • in—Indonesian • it—Italian • iw—Hebrew • ja—Japanese • ko—Korean • nl_NL—Dutch • no—Norwegian • pl—Polish

	<ul style="list-style-type: none"> • pt_BR—Portuguese (Brazil) • pt_PT—Portuguese (European) • ro—Romanian • ru—Russian • sk—Slovak • sl—Slovene • sv—Swedish • th—Thai • tr—Turkish • uk—Ukrainian • vi—Vietnamese • zh_CN—Chinese (Simplified) • zh_TW—Chinese (Traditional)
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The unique label name for this rule.</p>
ObjectToLink	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description The type of object to link to the channel interaction. Possible values are:</p> <ul style="list-style-type: none"> • Contact
RuleName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Name of the rule as it appears in the UI. Maximum length is 80 characters.</p>

ChannelProgram

Represents a channel program that vendors use to market and sell their products through channel partners. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Fields

Field Name	Details
Category	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Category of the channel program. Categories group channel programs by type. For example, a reseller category would include all the different regional reseller channel programs.</p>
Description	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Description of the channel program.</p>
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the channel program is active. New channel programs are inactive by default.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p>

Field Name	Details
	<p>Description</p> <p>The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (LastReferencedDate) but not viewed it.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Name of the channel program.</p>
OwnerId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>ID of the owner of the channel program.</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

[ChannelProgramFeed](#)

Feed tracking is available for the object.

[ChannelProgramHistory](#)

History is available for tracked fields of the object.

[ChannelProgramOwnerSharingRule](#)

Sharing rules are available for the object.

[ChannelProgramShare](#)

Sharing is available for the object.

ChannelProgramLevel

Represents a level, based on member experience, in a channel program. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
Description	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Description of the channel program level.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Name of the channel program level.</p>

Field Name	Details
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Required. ID of the user who is the owner of the record.</p>
ProgramId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the channel program.</p>
Rank	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An integer associated with the level. For example, 1 represents the lowest level, 2 the next level up, etc.</p>
RecordTypeId	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description ID of the record type assigned to this object.</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

[ChannelProgramLevelFeed](#)

Feed tracking is available for the object.

[ChannelProgramLevelHistory](#)

History is available for tracked fields of the object.

[ChannelProgramLevelOwnerSharingRule](#)

Sharing rules are available for the object.

[ChannelProgramLevelShare](#) (API version 43.0)

Sharing is available for the object.

ChannelProgramMember

Represents a partner who is a member of a channel program. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Most recent date referenced. This field is available in API version 45.0 and later.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Most recent date viewed. This field is available in API version 45.0 and later.</p>
LevelId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the channel program level.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description Name of the channel program member.</p>
OwnerId	<p>Type reference</p>

Field Name	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Required. ID of the user who is the owner of the record.</p>
PartnerId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the partner.</p>
ProgramId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the channel program.</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ChannelProgramMemberFeed (API version 46.0)

Feed tracking is available for the object.

ChannelProgramMemberHistory (API version 46.0)

History is available for tracked fields of the object.

ChannelProgramMemberOwnerSharingRule

Sharing rules are available for the object.

ChannelProgramMemberShare (API version 43.0)

Sharing is available for the object.

ChatterActivity

ChatterActivity represents the number of posts and comments made by a user and the number of comments and likes on posts and comments received by the same user. This object is available in API version 23.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedComments made by the ParentId.</p>
CommentReceivedCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedComments received by the ParentId.</p>
InfluenceRawRank	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Number indicating the ParentId's Chatter influence rank, which is calculated based on the ParentId's ChatterActivity statistics, relative to the other users in the organization. This field is available in API version 26.0 and later.</p>
LikeReceivedCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedLikes received by the ParentId.</p>
NetworkId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the Experience Cloud site to which the ChatterActivity belongs. This field is available only if digital experiences is enabled in your org. This field is available in API version 26.0 and later.</p>

Field Name	Details
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the object type to which the ChatterActivity is related. In API version 54.0, the <code>ParentId</code> must be a <code>UserId</code> or <code>SelfServiceUser</code> ID.</p>
PostCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedItems made by the ParentId.</p>

Usage

- Use this object to reference the Chatter activity statistics, which include the number of posts and comments made by a user and the number of comments and likes on posts and comments received by the same user.
- You can directly query for ChatterActivity.

```
SELECT Id, PostCount, LikeReceivedCount
FROM ChatterActivity
WHERE ParentId = UserId
```

-  **Note:** To query ChatterActivity, you must provide the `ParentId`. In API version 54.0, the `ParentId` must be a `UserId` or `SelfServiceUser` ID.
- A ChatterActivity record is created for users the first time they post or comment. Users who have never posted or commented don't have ChatterActivity records. If users make only one post and then delete it, they do have ChatterActivity records. In both cases, the user interface displays zeros for their Chatter activity.
- Use the `InfluenceRawRank` field to reference a user's Chatter influence rank. This field is available in API version 26.0 and later.

[FeedLike](#)

ChatterAnswersActivity

Represents the reputation of a User in Chatter Answers zones. This object is available in API version 25.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
<code>BestAnswerReceivedCount</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of best answers the User has received from other users.</p>
<code>BestAnswerSelectedCount</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of best answers the User has selected.</p>
<code>QuestionsCount</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of Question records posted by the User.</p>
<code>QuestionSubscrCount</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of Question records the User has selected to follow.</p>
<code>QuestionSubscrReceivedCount</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of users following Question records posted by the User.</p>

Field Name	Details
QuestionUpVotesCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of up votes the User has marked on Question records posted by other users.</p>
QuestionUpVotesReceivedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of up votes the User has received from other users on the Question records he or she has posted.</p>
RepliesCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of Reply records posted by the User.</p>
ReplyDownVotesCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of down votes the User has marked on Reply records posted by other users.</p>
ReplyDownVotesReceivedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of down votes the User has received from other users on the Reply records he or she has posted.</p>
ReplyUpVotesCount	<p>Type int</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of up votes the User has marked on the Reply records posted by other users.</p>
ReplyUpVotesReceivedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of up votes the User has received from other users on the Reply records he or she has posted.</p>
ReportAbuseOnQuestionsCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of abuses that the User has reported on Question records posted by other users.</p>
ReportAbuseOnRepliesCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of abuses that the User has reported on Reply records posted by other users.</p>
ReportAbuseReceivedOnQnCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of abuses reported by other users on the Question records posted by the User.</p>
ReportAbuseReceivedOnReCount	<p>Type int</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description the number of abuses reported by other users on the Reply records posted by the User.</p>
UserId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The User ID associated with this reputation.</p>
CommunityId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID for the zone associated with this reputation.</p>

Usage

Use this object to view metrics on User activity in Chatter Answers. For example, you can use the ChatterAnswersActivity object to view the number of Question records a user is following in Chatter Answers zones.

SEE ALSO:

[Reply](#)

[User](#)

ChatterAnswersReputationLevel

Represents a reputation level within a Chatter Answers zone. This object is available in API version 26.0 and later.

 **Note:** With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see [End of Support for Chatter Answers in Spring '18](#).

Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`

Fields

Field	Details
CommunityID	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the zone for which you're creating the reputation level.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Name of the reputation level.</p>
Value	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Minimum number of points for this level.</p>

Usage

Use to create or edit reputation levels for the zone.

ChatterConversation

Represents a private conversation in Chatter, consisting of messages that conversation members have sent or received. This object is available in API version 23.0 and later.

Supported Calls

`describeObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
Id	<p>Type ID</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description ID of the conversation.</p>

Usage

Use this object to identify private conversations in Chatter. Users can access this object if they have the Manage Chatter Messages and Direct Messages permission. This object is read-only via the API and is provided only to allow administrators to view users' Chatter messages; for example, for compliance purposes.

SEE ALSO:

[ChatterConversationMember](#)

[ChatterMessage](#)

ChatterConversationMember

Represents a member of a private conversation in Chatter. A member has either sent messages to or received messages from other conversation participants. This object is available in API version 23.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ConversationId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the associated ChatterConversation.</p>
MemberId	<p>Type reference</p>

Field Name	Details
	<p>Properties Filter, Group, Sort</p> <p>Description ID of the conversation member.</p>

Usage

Use this object to view members of private conversations in Chatter. Users can access this object if they have the Manage Chatter Messages and Direct Messages permission. This object is read-only via the API and is provided only to allow administrators to view users' Chatter messages; for example, for compliance purposes.

SEE ALSO:

[ChatterConversation](#)

[ChatterMessage](#)

ChatterExtension

Represents a Rich Publisher App that's integrated with the Chatter publisher. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
CompositionComponentEnumOrId	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The ID of the composition component for the Rich Publisher App. This field requires a value.</p>
Description	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The description of your custom Rich Publisher App. This field requires a value.</p>

Field	Details
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The name of the developer who is responsible for the app.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
ExtensionName	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of your extension. This field requires a value.</p>
HeaderText	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The text to show in the header of your app composer. Header text is required for Lightning type extensions.</p>
HoverText	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The text to show when a user mouses over your extension's icon. Mouse-over text is required for Lightning type extensions.</p>
IconId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The icon to show in the Chatter publisher. Use an existing file asset ID from your org. This field requires a value. This is a relationship field.</p>

Field	Details
	<p>Relationship Name Icon</p> <p>Relationship Type Lookup</p> <p>Refers To ContentAsset</p>
IsProtected	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description An auto-generated value. It currently has no impact.</p>
Language	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language used for this instance of the <code>ChatterExtension</code>. This field requires a value.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The master label for the <code>ChatterExtension</code> object. This field requires a value.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The prefix to use for the extension's namespace.</p>
RenderComponentEnumOrId	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p>

Field	Details
	<p>Description</p> <p>The rendering component of the Rich Publisher App that you provide. It's comprised of the <code>lightning:availableForChatterExtensionRenderer</code> interface. This field requires a value.</p>
Type	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Describes the type of the extension. Currently, the only value supported is <i>Lightning</i>. Included to allow for other possible types in the future.</p>

ChatterExtensionConfig

Configuration for the Chatter extension for Experience Cloud sites. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
CanCreate	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Determines whether the <code>ChatterExtension</code> can create an instance that appears by rendering.</p>
CanRead	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Determines whether the <code>ChatterExtension</code> can be viewed.</p>

Field	Details
ChatterExtensionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the <code>ChatterExtension</code>. This is a relationship field.</p> <p>Relationship Name ChatterExtension</p> <p>Relationship Type Lookup</p> <p>Refers To ChatterExtension</p>
NetworkId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the Experience Cloud site where the <code>ChatterExtension</code> is deployed.</p>
Position	<p>Type int</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description The position of the <code>ChatterExtension</code> icon in the Chatter publisher.</p>

ChatterMessage

Represents a message sent as part of a private conversation in Chatter. This object is available in API version 23.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
Body	<p>Type textarea</p> <p>Properties Update</p> <p>Description Text of the message.</p>
ConversationId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the conversation that the message is associated with.</p>
SenderId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the sender.</p>
SenderNetworkId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the Experience Cloud site from which the message was sent. This field is available only if digital experiences is enabled in your org. This field is available in API version 32.0 and later.</p>
SentDate	<p>Type dateTime</p> <p>Properties Filter, Sort</p> <p>Description Date the message was sent.</p>

Usage

Use this object to view and delete messages sent or received via private conversations in Chatter. Users can access this object if they have the Manage Chatter Messages and Direct Messages permission. Users with the Moderate Experiences Chatter Messages permission can access this object in Experience Cloud sites they're a member of, only if the message has been flagged as inappropriate. This object is provided to allow administrators to view and delete users' Chatter messages, for example, for compliance purposes.

Messages are hard deleted. That is, they're removed completely without a trip to the Recycle Bin.

Deleting a message that resulted from sharing a file with someone doesn't also delete the file.

[ChatterConversationMember](#)

ClaimRecovery

Represents a recovery of funds on an insurance claim through subrogation and salvage activities. Recovered amounts can come from a salvage company or through legal litigation or arbitration. Master-detail child object of Claim. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if the add-on license for Claims Management is enabled.

Fields

Field	Details
ClaimCoverageId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The claim coverage associated with the claim recovery. This is a relationship field.</p> <p>Relationship Name ClaimCoverage</p> <p>Relationship Type Lookup</p>

Field	Details
	<p>Refers To ClaimCoverage</p>
ClaimId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The claim associated with the claim recovery. This is a relationship field.</p> <p>Relationship Name Claim</p> <p>Relationship Type Lookup</p> <p>Refers To Claim</p>
EstimatedAmount	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The estimated amount the insurance carrier identified to pursue for the claim recovery.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.</p>
Name	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of the Claim Recovery record.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the record owner. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
RecoveredAmount	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The actual amount the insurance carrier recovered.</p>
RecoveryFromAccountId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The account that the claim is recovered from. This is a relationship field.</p> <p>Relationship Name RecoveryFromAccount</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>

Field	Details
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Status of the claim recovery. Possible values include:</p> <ul style="list-style-type: none"> • Accepted Recovery • Disputed Recovery • Estimated • Pursued
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Type of claim recovery. Possible values include:</p> <ul style="list-style-type: none"> • Salvage • Subrogation

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[ClaimRecoveryFeed](#) on page 3944

Feed tracking is available for the object.

[ClaimRecoveryHistory](#) on page 3956

History is available for tracked fields of the object.

[ClaimRecoveryOwnerSharingRule](#) on page 3961

Sharing rules are available for the object.

[ClaimRecoveryShare](#) on page 3967

Sharing is available for the object.

ClientBrowser

Represents a cookie added to the browser upon login, and also includes information about the browser application where the cookie was inserted. This object is available in version 28.0 and later.

Supported Calls

`describeSObjects()`, `delete()`, `query()`, `retrieve()`

Fields

Field	Details
FullUserAgent	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Detailed information about the client (browser). For example, <code>Mozilla/5.0 (Windows; U; Windows NT 5.1; en-US; rv:1.9.0.1) Gecko/2008070208 Firefox/3.0.1</code></p>
LastUpdate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Represents the last time the cookie was changed.</p>
ProxyInfo	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The browser's current proxy information.</p>
UsersId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the user associated with this item. This is a relationship field.</p> <p>Relationship Name Users</p> <p>Relationship Type Lookup</p>

Field	Details
	<p>Refers To</p> <p>User</p>

Usage

At every login, the device the login request is from is checked against the known devices using ClientBrowser. A match means a cookie was found on the browser that matches an entry in the ClientBrowser table, so the device is known. No match means that no matching cookie was found, so the device is unknown, and the user is asked to confirm their identity.

CollaborationGroup

Represents a Chatter group. This object is available in API version 19.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

The visibility of information in groups depends on the type of group and the user's permissions.

- **Members:** Any user with the Create and Own New Chatter Groups permission can create public, private, and unlisted groups, including in any Experience Cloud sites they belong to.
- **Owners and managers:** Users can modify group details for any group they own or manage. Owners can also delete groups they own.
- **Nonmembers:** These user permissions allow group access regardless of group membership.
 - View All Data—Allows users to view all public and private groups across their org and its Experience Cloud sites. Users with this permission can't view unlisted group information, unless they have the Modify Unlisted Groups permission as well.
 - Modify All Data—Allows users to view, modify, and delete all public and private groups across their org and its Experience Cloud sites. Users with this permission can't view or modify unlisted group information, unless they have the Manage Unlisted Groups permission as well.
 - Create and Set Up Experiences—Allows users to view, modify, and delete all public and private groups in Experience Cloud sites.
 - Manage Unlisted Groups—Allows users to search for, access, and modify any unlisted group in an org and its Experience Cloud sites.
 - Data Export—Allows users to export any data from Salesforce, including private and unlisted group data from an org and its Experience Cloud sites.
- **Apex and Visualforce:** Apex code runs in system mode, which means that the permissions of the current user aren't taken into account.
 - Visualforce pages that display groups might expose unlisted or private group data to users who aren't members.
 - Because system mode disregards the user's permissions, all users who are accessing a Visualforce page that's showing a group can act as an owner of that group.

- AppExchange apps that are written in Apex and that access all groups will expose unlisted groups to users who aren't members.

To limit and manage access to the unlisted and private groups in your org:

- Explicitly filter out unlisted and private group information from SOQL queries in all Apex code.
- Use permission sets, profile-level permissions, and sharing checks in your code to further limit group access.
- Use Apex triggers on the CollaborationGroup object to monitor and manage the creation of groups. In Setup, enter *Group Triggers* in the **Quick Find** box, then select **Group Triggers** to add triggers.

Fields

Field	Details
AnnouncementId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Contains the ID of the Announcement last associated with the group. This field is available in API version 30.0 and later. This is a relationship field.</p> <p>Relationship Name Announcement</p> <p>Relationship Type Lookup</p> <p>Refers To Announcement</p>
BannerPhotoUrl	<p>Type url</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The URL for the group's banner photo. The URL is updated every time a photo is uploaded and reflects the most recent photo. If a newer photo has been uploaded, the URL returned for an older photo is not guaranteed to return a photo. Query this field for the URL of the most recent photo. This field is available in API version 36.0 and later.</p>
CanHaveGuests	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description</p> <p>If set to <code>true</code>, indicates that a group allows customers. Chatter customers are people outside your company's email domains. Customers can see only the groups they're invited to. They can interact only with members of those groups. Customers can't see any Salesforce information.</p> <p>This field is available starting in API version 23.0, but groups that allow customers are accessible from earlier API versions. However, when accessed from earlier API versions, groups that allow customers aren't distinguishable from private groups. We strongly recommend that you upgrade to the latest API version. If you must use an earlier version, name groups that allow customers to indicate that they include customers.</p>
CollaborationType	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description</p> <p>The type of Chatter group. Available values are:</p> <ul style="list-style-type: none"> • <code>Public</code>—Anyone can see and post updates. Anyone can join a public group. • <code>Private</code>—Only members can see the group feed and post updates. Non-members can only see the group name and a few other details in list views, search, and on the group page. The group's owner or managers must add members who request to join the group. • <code>Unlisted</code>—Only members and users with the Manage Unlisted Groups permission can see the group and post updates. Other users can't access the group or see it in lists, search, and feeds.
Description	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>Description of the group.</p>
FullPhotoUrl	<p>Type</p> <p>url</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The URL for the group's profile photo.</p> <p>The URL is updated every time a photo is uploaded and reflects the most recent photo. If a newer photo has been uploaded, the URL returned for an older photo is not guaranteed to return a photo. Query this field for the URL of the most recent photo.</p>

Field	Details
	This field is available in API version 20.0 and later.
GroupEmail	<p>Type email</p> <p>Properties Nillable, Sort</p> <p>Description The email address for posting to the group. For private groups, only visible to members and users with Modify All Data or View All Data permissions. This field is available in API version 29.0 and later.</p>
HasPrivateFieldsAccess	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If set to <code>true</code>, indicates that a user can see the <code>InformationBody</code> and <code>InformationTitle</code> fields in a private group. This field is set to <code>true</code> for members of a private group and users with Modify All Data or View All Data permissions.</p>
InformationBody	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The text of the Information section. For private groups, only visible to members and users with Modify All Data or View All Data permissions.</p>
InformationTitle	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The title of the Information section. For private groups, only visible to members and users with Modify All Data or View All Data permissions.</p>
IsArchived	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the group is archived (<code>true</code>) or not (<code>false</code>).</p>

Field	Details
	This field is available in API version 28.0 and later.
<code>IsAutoArchiveDisabled</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether automatic archiving is disabled for the group (<code>true</code>) or not (<code>false</code>). This field is available in API version 29.0 and later.</p>
<code>IsBroadcast</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the group is a broadcast group (<code>true</code>) or not (<code>false</code>). This field is available in API version 36.0 and later.</p>
<code>LastFeedModifiedDate</code>	<p>Type dateTime</p> <p>Properties Filter, Sort</p> <p>Description The date of the last post or comment on the group.</p>
<code>LastReferencedDate</code>	<p>Type datetime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
<code>LastViewedDate</code>	<p>Type datetime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
<code>MediumPhotoUrl</code>	<p>Type url</p>

Field	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description The URL for the larger, cropped photo size.</p>
MemberCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of members in the group.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Name of the group. Group names must be unique across public and private groups. Unlisted groups don't require unique names.</p>
NetworkId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description ID of the Experience Cloud site that this group is part of. This field is available only if digital experiences is enabled in your org. You can only add a <code>NetworkId</code> when creating a group. You can't change or add a <code>NetworkId</code> for an existing group. This field is available in API version 26.0 and later.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the owner of the group. Only the current group owner or people with the Modify All Data permission can update the <code>OwnerId</code>. This is a relationship field.</p> <p>Relationship Name Owner</p>

Field	Details
	<p>Relationship Type Lookup</p> <p>Refers To User</p>
SmallImageUrl	<p>Type url</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The URL for a thumbnail of the group's profile photo. The URL is updated every time a photo is uploaded and reflects the most recent photo. If a newer photo has been uploaded, the URL returned for an older photo is not guaranteed to return a photo. Query this field for the URL of the most recent photo. This field is available in API version 20.0 and later.</p>

Usage

Use this object to create, edit, or delete groups in an org or Experience Cloud site. Deleting a group permanently deletes all posts and comments to the group. It also deletes all files and links posted to the group and removes the files from other locations where they were shared.

As a Chatter group member, you can post to the group using the CollaborationGroupFeed object. As a Chatter group owner or manager, you can add or remove group members using the CollaborationGroupMember object, post announcements to the group using the Announcement object, and accept or decline requests to join private groups using the CollaborationGroupMemberRequest object. Additionally, the group owner, manager, or your Salesforce system administrator can invite people to join the group using the [CollaborationInvitation](#) object.

The Salesforce system administrator doesn't need to be a member of the group in order to send invitations using the API.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

CollaborationGroupFeed

Feed tracking is available for the object.

SEE ALSO:

[CollaborationGroupMember](#)

[CollaborationGroupMemberRequest](#)

CollaborationGroupMember

Represents a member of a Chatter group. This object is available in API version 19.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `describeLayout()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
<code>CollaborationGroupId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the associated CollaborationGroup. This is a relationship field.</p> <p>Relationship Name CollaborationGroup</p> <p>Relationship Type Lookup</p> <p>Refers To CollaborationGroup</p>
<code>CollaborationRole</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The role of a group member. Group owners and managers can change roles for members of their groups. The valid values are:</p> <ul style="list-style-type: none"> • <code>Standard</code>—Indicates that a user is a group member. Members can post and comment in the group. • <code>Admin</code>—Indicates that a user is a group manager. Managers can post and comment, change member roles, edit group settings, add and remove members, delete posts and comments, and edit the group information field. <p> Note: To change the group owner, use the <code>OwnerId</code> field on the CollaborationGroup object.</p>
<code>LastFeedAccessDate</code>	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>Date and time when a group member last accessed the group's feed. The value is only updated when a member explicitly consumes the group's feed, not when the member sees group posts in other feeds, like the profile feed.</p>
MemberId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>ID of the group member.</p> <p>This is a relationship field.</p> <p>Relationship Name</p> <p>Member</p> <p>Relationship Type</p> <p>Lookup</p> <p>Refers To</p> <p>User</p>
NotificationFrequency	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Required. The frequency at which Salesforce sends Chatter group email digests to this member. Can only be set by the member or users with the "Modify All Data" permission. The valid values are:</p> <ul style="list-style-type: none"> • D—Daily • w—Weekly • N—Never • P—On every post <p>The default value is specified by the member in their Chatter email settings. In communities, the <code>Email on every post</code> option is disabled once more than 10,000 members choose this setting for the group. All members who had this option selected are automatically switched to <code>Daily digests</code>.</p>

Usage

Use this object to view, create, and delete Chatter group members. You must be a group owner or manager to create members for private Chatter groups.

SEE ALSO:

[CollaborationGroup](#)

[CollaborationGroupMemberRequest](#)

CollaborationGroupMemberRequest

Represents a request to join a private Chatter group. This object is available in API version 21.0 and later.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
CollaborationGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the private Chatter group. This is a relationship field.</p> <p>Relationship Name CollaborationGroup</p> <p>Relationship Type Lookup</p> <p>Refers To CollaborationGroup</p>
RequesterId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the user requesting to join the group; must be the ID of the context user. This is a relationship field.</p>

Field	Details
	<p>Relationship Name Requester</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
ResponseMessage	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description Optional message to be included in the notification email when <code>Status</code> is <code>Declined</code>.</p>
Status	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The status of the request. Available values are:</p> <ul style="list-style-type: none"> • Accepted • Declined • Pending

Usage

This object represents a request to join a private Chatter group, and can be used to accept or decline requests to join private groups you own or manage. On create, an email is sent to the owner and managers of the private group to be accepted or declined. When the `Status` is `Accepted` or `Declined`, an email is sent to notify the requester. When the `Status` is `Declined`, a `ResponseMessage` is optionally included to provide additional details.

Note the following when working with requests:

- Users with the “Modify All Data” or “View All Data” permission can view records for all groups, regardless of membership.
- A user can be a member of 300 groups. Requests to join groups count against this limit.
- `Status` can't be specified on create.
- You can only update a request when the `Status` is `Pending`.
- You can't delete or update a request with a `Status` of `Accepted` or `Declined`.

SEE ALSO:

- [CollaborationGroup](#)
- [CollaborationGroupMember](#)

CollaborationGroupRecord

Represents the records associated with Chatter groups.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
CollaborationGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the Chatter group. This is a relationship field.</p> <p>Relationship Name CollaborationGroup</p> <p>Relationship Type Lookup</p> <p>Refers To CollaborationGroup</p>
NetworkId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Optional. The ID of the Experience Cloud site that the group belongs to. Available from API version 34.0.</p>
RecordId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. The ID of the record associated with the Chatter group. This is a polymorphic relationship field.</p>

Field	Details
	<p>Relationship Name Record</p> <p>Relationship Type Lookup</p> <p>Refers To Account, Campaign, Case, Contact, Contract, Lead, Opportunity</p>

CollaborationInvitation

Represents an invitation to join Chatter, either directly or through a group. This object is available in API version 21.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Invitations are available if “Allow Invitations” is enabled for your organization.

Invitations are limited to your allowed domain(s) unless the invite is sent from a private group that allows customers. Allowed domains are set by the administrator.

Invitations to customers are available if “Allow Customer Invitations” is enabled for your organization. Users must have the “Invite Customers to Chatter” permission to send invitations to people outside their Chatter domain.

Fields

Field	Details
<code>InvitedUserEmail</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The email address for the user invited to join Chatter. Label is <code>Invited Email</code>.</p>
<code>InvitedUserEmailNormalized</code>	<p>Type email</p> <p>Properties Filter, Group, Sort</p>

Field	Details
	<p>Description A normalized version of the <code>InvitedUserEmail</code> entered. Label is <code>Invited Email (Normalized)</code>.</p>
<code>InviterId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The person that initiated the invitation.</p>
<code>OptionalMessage</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description An optional message from the person sending the invitation to the person receiving it.</p>
<code>ParentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Used when the email address on the invitation is different than the one entered when the invitee accepts the invitation.</p>
<code>SharedEntityId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the user or group associated with this invitation.</p> <ul style="list-style-type: none"> • If the invitation is to join Chatter, the <code>SharedEntityId</code> is the ID of the User that created the invitation. The invitee will auto-follow the inviter. • If the invitation is to join a group within Chatter, the <code>SharedEntityId</code> is the ID of the Chatter CollaborationGroup. • To invite a customer, set <code>SharedEntityId</code> to the ID of the private CollaborationGroup with Allow Customers turned on.
<code>Status</code>	<p>Type picklist</p>

Field	Details
	<p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The status of the invitation. Possible values are:</p> <ul style="list-style-type: none"> • Sent • Accepted • Canceled

Usage

Use this object to create or delete (cancel) invitations to join Chatter. You can either invite a user to join Chatter directly or as part of a CollaborationGroup.

 **Note:** To invite someone to join a CollaborationGroup, you must be either the owner or a manager of the group or a Salesforce system administrator.

The Salesforce system administrator doesn't need to be a member of the group in order to send invitations using the API.

When the person accepts your CollaborationGroup invitation, they join the CollaborationGroup and Chatter as well.

 **Note:** You can't send invitations to users of the organization the invite was sent from.

Invited users can view profiles, post on their feed, and join groups, but they can't see your Salesforce data or records.

If your organization allows groups with customers, owners and managers of private groups with the "Allow Customers" setting, as well as system administrators, can use this object to invite customers.

Java Samples

The following example shows how to send an invitation to join Chatter:

```
public void invitePeople(String inviterUserId, String invitedEmail) throws Exception {
    CollaborationInvitation invitation = new CollaborationInvitation();
    invitation.setSharedEntityId(inviterUserId); //pass the userId of the inviter
    invitation.setInvitedUserEmail(invitedEmail); //email of the invited user
    insert(invitation);
}
```

The following example shows how to send an invitation to a customer user from a group that allows customers:

```
public void inviteToGroup(String groupName, String invitedEmail) throws Exception {
    QueryResult qr = query("select id from collaborationgroup where name = '" +
        groupName); //pass the group name
    String groupId = qr.getRecords()[0].getId();
    CollaborationInvitation invitation = new CollaborationInvitation();
    invitation.setSharedEntityId(groupId); //pass the groupId
    invitation.setInvitedUserEmail(invitedEmail); //email of the invited user
    insert(invitation);
}
```

Apex Samples

```
String emailAddress = 'bob@external.com';
CollaborationGroup chatterGroup = [SELECT Id
    FROM CollaborationGroup
    WHERE Name='All acme.com'
    LIMIT 1];
CollaborationInvitation inv = New CollaborationInvitation();
inv.SharedEntityId = chatterGroup.id;
inv.InvitedUserEmail = emailAddress;

try {
    Insert inv;
} catch(DMLException e){
    System.debug('There was an error with the invite: '+e);
}
```

CollabDocumentMetric

Represents the engagement metrics for a Quip thread (document or spreadsheet) that's linked to a Salesforce record. This object is available in API version 50.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
Document	<p>Type string</p> <p>Properties Filter, Group, idLookup, Nillable, Sort</p> <p>Description The Quip thread ID.</p>
Site	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the Quip site in which the thread is located.</p>
SourceTemplate	<p>Type string</p>

Field	Details
	<p>Properties Filter, Group, idLookup, Nillable, Sort</p> <p>Description The ID of the template (if any) on which a Quip thread is based.</p>
DocumentTitle	<p>Type string</p> <p>Properties Filter, Group, idLookup, Nillable, Sort</p> <p>Description The title of the thread.</p>
MetricDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date on which the metric was gathered.</p>
LastUpdatedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The most recent date on which the thread was updated.</p>
ViewerCount	<p>Type int</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The number of thread views by user for the specified MetricDate.</p>
UpdateCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description For the specified MetricsDate, the number of changes made to the thread.</p>
EditorCount	<p>Type int</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description For the specified MetricDate, the number of users who edited the Quip thread.</p>
CommenterCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description For the specified MetricDate, the number of users who commented on the Quip thread.</p>

CollabDocumentMetricRecord

Represents an association between a CollabDocumentMetric and a Salesforce record. It tracks which Salesforce record, such as an Account or Contact, is linked to a Quip thread for which metrics were gathered using CollabDocumentMetric. CollabDocumentMetricRecord is available in API version 50.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
ParentRecord	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the Salesforce record.</p>
QuipDocumentMetric	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the CollabDocumentMetric record.</p>

Field	Details
MetricDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date on which the metric was gathered.</p>
EntityType	<p>Type string</p> <p>Properties Filter, Group, idLookup, Nillable, Sort</p> <p>Description The object type of the Salesforce record, such as Account or Contact.</p>

CollabTemplateMetric

Represents the engagement metrics for a Quip template. This object is available in API version 50.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
Template	<p>Type string</p> <p>Properties Filter, Group, idLookup, Nillable, Sort</p> <p>Description The ID of the template.</p>
TemplateTitle	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The title of the template.</p>

Field	Details
Site	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the Quip site on which the template is available.</p>
MetricDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date on which the metric was gathered.</p>
LastUpdatedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The most recent date on which the template was updated.</p>
TotalDocumentCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of documents created based on the template.</p>

CollabTemplateMetricRecord

Represents an association between a CollabTemplateMetric and a Salesforce record. It tracks which Salesforce record, such as an Account or Contact, is linked to a Quip template for which metrics were gathered using CollabTemplateMetric. CollabTemplateMetricRecord is available in API version 50.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
ParentRecord	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the Salesforce record.</p>
QuipDocumentMetric	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the CollabTemplateMetric record.</p>
MetricDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date on which the metric was gathered.</p>
EntityType	<p>Type string</p> <p>Properties Filter, Group, idLookup, Nillable, Sort</p> <p>Description The object type of the Salesforce record, such as Account or Contact.</p>

CollabUserEngagementMetric

Represents the user engagement metrics for a Quip thread in a Quip template or document. This object is available in API version 50.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of comments by the user for the specified <code>MetricDate</code>.</p>
EditCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of edits by the user for the specified <code>MetricDate</code>.</p>
MetricDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date of the gathered metric.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The unique name of the <code>CollabUserEngagementMetric</code> object.</p>
QuipThread	<p>Type string</p> <p>Properties Filter, Group, idLookup, Nillable, Sort</p> <p>Description The Quip thread ID.</p>
QuipThreadTitle	<p>Type string</p> <p>Properties Filter, Group, idLookup, Nillable, Sort</p>

Field	Details
	<p>Description The title of the Quip document, sheet, slide, and so forth.</p>
QuipThreadType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of Quip thread. The possible values are:</p> <ul style="list-style-type: none"> • CHAT • DOCUMENT • SHEET • SLIDE • TEMPLATE
QuipUser	<p>Type string</p> <p>Properties Filter, Group, idLookup, Nillable, Sort</p> <p>Description The ID of the Quip user.</p>
SalesforceUserId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the Salesforce user.</p>
Site	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the Quip site.</p>
SourceTemplate	<p>Type string</p> <p>Properties Filter, Group, idLookup, Nillable, Sort</p>

Field	Details
	<p>Description The ID of the source template.</p>
ViewCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of views by the user for the specified <code>MetricDate</code>.</p>

CollabUserEngmtRecordLink

Represents an association between a `CollabUserEngagementMetric` and a Salesforce record. It tracks which Salesforce record, such as an Account or Contact, is associated with the user engagement metric. This object is available in API version 50.0 and later.

 **Note:** The `CollabUserEngmtRecordLink` object is now deprecated. You can still access user engagement metrics for metric dates before August 12, 2021. To obtain user engagement metric for dates starting from August 12, 2021, follow the instructions in the [Quip Engagement Metrics documentation](#).

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
<code>MetricDate</code>	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date of the gathered metric.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The unique name of the <code>CollabUserEngmtRecordLink</code> object.</p>

Field	Details
ObjectType	<p>Type string</p> <p>Properties Filter, Group, idLookup, Nillable, Sort</p> <p>Description The object type of the Salesforce record, such as Account or Contact.</p>
ParentRecordId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the Salesforce record.</p>
UserEngagementMetricId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the CollabUserEngagementMetric record.</p>

ColorDefinition

Represents the color-related metadata for a custom tab. This object is available in API version 43.0 and later.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Details
Color	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The color described in web color RGB format—for example, “00FF00”.</p>

Field Name	Details
Context	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The color context, which determines whether the color is the main color (or primary) for the tab.</p>
DurableId	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A unique virtual Salesforce ID for the color.</p>
TabDefinitionId	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The TabDefinition ID. This is a relationship field.</p> <p>Relationship Name TabDefinition</p> <p>Relationship Type Lookup</p> <p>Refers To TabDefinition</p>
Theme	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The icon's theme.</p>

CombinedAttachment

This read-only object contains all notes, attachments, Google Docs, documents uploaded to libraries in Salesforce CRM Content, and files added to Chatter that are associated with a record.

Supported Calls

`describeSObjects()`

Fields

Field Name	Details
<code>ContentSize</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Size of the document in bytes.</p>
<code>ContentUrl</code>	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description URL for links and Google Docs. This field is set only for links and Google Docs, and is one of the fields that determine the <code>FileType</code>. This field is available in API version 31.0 and later.</p>
<code>ExternalDataSourceName</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Name of the external data source in which the document is stored. This field is set only for external documents that are connected to Salesforce. This field is available in API version 32.0 and later.</p>
<code>ExternalDataSourceType</code>	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p>

Field Name	Details
	<p>Description</p> <p>Type of external data source in which the document is stored. This field is set only for external documents that are connected to Salesforce.</p> <p>This field is available in API version 35.0 and later.</p>
FileExtension	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>File extension of the document.</p> <p>This field is available in API version 31.0 and later.</p>
FileType	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Type of document, determined by the file extension.</p>
ParentId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>The ID of the parent object.</p> <p>This is a relationship field.</p> <p>Relationship Name</p> <p>Parent</p> <p>Relationship Type</p> <p>Lookup</p> <p>Refers To</p> <p>Account, Accreditation, ActivationTarget, ActivationTrgtIntOrgAccess, ApiAnomalyEventStore, AssessmentIndicatorDefinition, AssessmentTask, AssessmentTaskContentDocument, AssessmentTaskDefinition, AssessmentTaskIndDefinition, AssessmentTaskOrder, Asset, AssetRelationship, AssignedResource, Award, BoardCertification, BusinessLicense, BusinessMilestone, BusinessProfile, Campaign, CareBarrier, CareBarrierDeterminant, CareBarrierType, CareDeterminant, CareDeterminantType, CareDiagnosis, CareInterventionType, CareMetricTarget, CareObservation, CareObservationComponent, CarePgmProvHealthcareProvider, CarePreauth, CarePreauthItem, CareProgram,</p>

Field Name	Details
	<p>CareProgramCampaign, CareProgramEligibilityRule, CareProgramEnrollee, CareProgramEnrolleeProduct, CareProgramEnrollmentCard, CareProgramGoal, CareProgramProduct, CareProgramProvider, CareProgramTeamMember, CareProviderAdverseAction, CareProviderFacilitySpecialty, CareProviderSearchableField, CareRegisteredDevice, CareRequest, CareRequestDrug, CareRequestExtension, CareRequestItem, CareSpecialty, CareSpecialtyTaxonomy, CareTaxonomy, Case, CodeSet, CollaborationGroup, CommSubscription, CommSubscriptionChannelType, CommSubscriptionConsent, CommSubscriptionTiming, ConsumptionSchedule, Contact, ContactEncounter, ContactEncounterParticipant, ContentWorkspace, Contract, ConversationEntry, CoverageBenefit, CoverageBenefitItem, CredentialStuffingEventStore, CreditMemo, CreditMemoLine, Dashboard, DashboardComponent, DataStream, DelegatedAccount, DocumentChecklistItem, EmailMessage, EmailTemplate, EngagementChannelType, EnhancedLetterhead, EnrollmentEligibilityCriteria, Event, HealthcareFacility, HealthcareFacilityNetwork, HealthcarePayerNetwork, HealthcarePractitionerFacility, HealthcareProvider, HealthcareProviderNpi, HealthcareProviderSpecialty, HealthcareProviderTaxonomy, Identifier, IdentityDocument, Image, IndividualApplication, Invoice, InvoiceLine, Lead, ListEmail, Location, MarketSegment, MarketSegmentActivation, MemberPlan, MessagingSession, MktCalculatedInsight, OperatingHours, Opportunity, Order, OrderItem, Organization, OtherComponentTask, PartyConsent, PersonEducation, PersonLanguage, PersonLifeEvent, PersonName, PlanBenefit, PlanBenefitItem, Product2, ProductFulfillmentLocation, ProductItem, ProductItemTransaction, ProductRequest, ProductRequestLineItem, ProductRequired, ProductTransfer, ProfileSkill, ProfileSkillEndorsement, ProfileSkillUser, ProviderSearchSyncLog, PurchaserPlan, PurchaserPlanAssn, ReceivedDocument, Report, ReportAnomalyEventStore, ResourceAbsence, ResourcePreference, ReturnOrder, ReturnOrderLineItem, ServiceAppointment, ServiceResource, ServiceResourceSkill, ServiceTerritory, ServiceTerritoryMember, ServiceTerritoryWorkType, SessionHijackingEventStore, Shift, Shipment, ShipmentItem, Site, SkillRequirement, SocialPost, Solution, Task, ThreatDetectionFeedback, User, Visit, VisitedParty, Visitor, VoiceCall, VolunteerProject, WorkBadgeDefinition, WorkOrder, WorkOrderLineItem, WorkType, WorkTypeGroup, WorkTypeGroupMember</p>
RecordType	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The parent object type.</p>
SharingOption	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort</p>

Field Name	Details
	<p>Description</p> <p>Controls whether or not sharing is frozen for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is <code>Allowed</code>, which means that new shares are allowed. When set to <code>Restricted</code>, new shares are prevented without affecting existing shares.</p> <p>This field is available in API versions 35.0 and later.</p>
Title	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Title of the attached file.</p>

Usage

Use this object to list all notes, attachments, documents uploaded to libraries in Salesforce CRM Content, and files added to Chatter for a record, such as a related list on a detail page.

To determine if an object supports the `CombinedAttachment` object, call `describeSObject()` on the object. For example, `describeSObject('Account')` returns all the child relationships of the `Account` object, including `CombinedAttachment`. You can then query the `CombinedAttachment` child relationship.

```
SELECT Name, (SELECT Title FROM CombinedAttachments)
FROM Account
```

You can't directly query `CombinedAttachment`.

CommerceEntitlementBuyerGroup

Represents the entitlement policy for a buyer group. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

Special Access Rules

The `CommerceEntitlementBuyerGroup` object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
BuyerGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The unique ID for the buyer group.</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description The standard code for the currency. Possible values are:</p> <ul style="list-style-type: none"> • GBP—British Pound • USD—U.S. Dollar
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The name of the entitlement buyer group.</p>
PolicyId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The unique ID for the entitlement policy.</p>

CommerceEntitlementPolicy

Represents an entitlement policy, which determines what products and prices a user can see. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

The `CommerceEntitlementPolicy` object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
<code>CanViewPrice</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description Determines whether a user can view the price of a product (<code>true</code>) or not (<code>false</code>). Default value is <code>false</code>.</p>
<code>CanViewProduct</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description Determines whether a user can view the product (<code>true</code>) or not (<code>false</code>). Default value is <code>false</code>.</p>
<code>CurrencyIsoCode</code>	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The standard code for the currency. Possible values are:</p> <ul style="list-style-type: none"> • GBP—British Pound • USD—U.S. Dollar
<code>Description</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description The entitlement policy description.</p>
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Determines if the entitlement policy is active (<code>true</code>) or inactive (<code>false</code>). Default value is <code>false</code>.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of the entitlement policy.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique ID for the entitlement policy owner.</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

CommerceEntitlementPolicyOwnerFeed on page 3944

Feed tracking is available for the object.

CommerceEntitlementPolicyHistory on page 3956

History is available for tracked fields of the object.

CommerceEntitlementPolicyOwnerSharingRule

Sharing rules are available for this object.

CommerceEntitlementPolicyShare

Represents the entitlement rule for sharing products and prices with users other than the owner. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

The CommerceEntitlementPolicyShare object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
AccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Possible values are:</p> <ul style="list-style-type: none"> All—Owner Edit—Read/Write Read—Read Only
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The unique ID of the parent entitlement policy.</p>

Field	Details
RowCause	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Possible values are:</p> <ul style="list-style-type: none"> • <code>CompliantCollaboration</code>—Compliant Data Sharing • <code>GuestParentImplicit</code>—Associated guest user sharing • <code>GuestPersonImplicit</code>—Associated Guest User Sharing • <code>GuestRule</code>—Guest User Sharing Rule • <code>ImplicitChild</code>—Account Sharing • <code>ImplicitParent</code>—Associated record owner or sharing • <code>ImplicitPerson</code>—Person Contact • <code>Manual</code>—Manual Sharing • <code>Owner</code> • <code>Rule</code>—Sharing Rule • <code>SurveyShare</code>—Survey Sharing Rule • <code>Team</code>—Sales Team • <code>Territory</code>—Territory Assignment Rule • <code>Territory2AssociationManual</code>—Territory Manual • <code>Territory2Forecast</code>—Territory assignment for forecasting and reporting • <code>TerritoryManual</code>—Territory Manual • <code>TerritoryRule</code>—Territory Sharing Rule
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The unique ID of the associated user or buyer group.</p>

CommerceEntitlementProduct

Represents the entitlement policy for a product. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

Special Access Rules

The CommerceEntitlementProduct object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description The standard code for the currency. Possible values are:</p> <ul style="list-style-type: none"> • GBP—British Pound • USD—U.S. Dollar
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The product entitlement policy name.</p>
PolicyId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The unique ID for the product entitlement policy.</p>
ProductId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The unique ID for the product referenced in the entitlement policy.</p>

CommissionSchedule

Represents a commission calculation and rate definition. Calculates commission values for a commissionable event.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
ApplicableObject	<p>Type multipicklist</p> <p>Properties Create, Filter, Nillable, Restricted picklist, Update</p> <p>Description The object for which this Commission Schedule calculates commissions. Possible values are:</p> <ul style="list-style-type: none"> • Contract • InsurancePolicy • Producer • Quote
CalcProcessInputMapping	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The input mappings from the object fields to the variables used in the commission calculation.</p>
CalcProcessOutput	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The formula applied to this Commission Schedule's process output that calculates the final commission amount.</p>
CalcProcessOutputConvNotation	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description An optimized version of the CalcProcessOutput formula that calculates the commission. Not user-editable.</p>

Field	Details
CalculationProcessName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The name of the Integration Procedure, Calculation Matrix, or Calculation Procedure this Commission Schedule uses for calculations.</p>
CalculationType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The type of calculation or process used when this Commission Schedule is used. Possible values are:</p> <ul style="list-style-type: none"> • Amount • CalculationMatrix • CalculationProcedure • IntegrationProcedure • Rate
CommissionAmount	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The commission amount for the Commission Schedule when the process type is Amount.</p>
CommissionRate	<p>Type percent</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The commission percentage for the Commission Schedule when the process type is Rate.</p>
CommissionStructureType	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Indicates whether the commission calculation is Flat or Tiered when the process type is Matrix.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Flat • Tiered <p>The default value is Flat.</p>
EffectiveEndDate	<p>Type</p> <p>date</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The effective end date of the Commission Schedule.</p>
EffectiveStartDate	<p>Type</p> <p>date</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The effective start date of the Commission Schedule.</p>
IsActive	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Indicates whether the Commission Schedule is active.</p> <p>The default value is false.</p>
LastReferencedDate	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, idLookup, Sort, Update</p> <p>Description</p> <p>The name of the Commission Schedule.</p>
OwnerId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The ID of the record owner.</p> <p>This is a polymorphic relationship field.</p> <p>Relationship Name</p> <p>Owner</p> <p>Relationship Type</p> <p>Lookup</p> <p>Refers To</p> <p>Group, User</p>
TierDefinition	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Create, Nillable, Update</p> <p>Description</p> <p>Internal-only. Applies when the CalculationType is CalculationMatrix.</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[CommissionScheduleFeed](#)

Feed tracking is available for the object.

[CommissionScheduleHistory](#)

History is available for tracked fields of the object.

CommissionScheduleOwnerSharingRule

Sharing rules are available for the object.

CommissionScheduleShare

Sharing is available for the object.

CommissionScheduleAssignment

Represents the commission calculation applicable to a specific product or producer for one or multiple commissionable events.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
CommissionableEventType	<p>Type multipicklist</p> <p>Properties Create, Filter, Nillable, Restricted picklist, Update</p> <p>Description The event that results in the commission calculation. Possible values are:</p> <ul style="list-style-type: none"> Contracting Endorsement Issue Policy Policy Issuance
CommissionScheduleId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the associated Commission Schedule, which is the commission calculation tied to the product or producer. This is a relationship field.</p> <p>Relationship Name CommissionSchedule</p> <p>Relationship Type Lookup</p>

Field	Details
	<p>Refers To CommissionSchedule</p>
EffectiveEndDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The last date when the Commission Schedule is in effect for the product or producer.</p>
EffectiveStartDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The first date when the Commission Schedule is in effect for the product or producer.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.</p>
MaxCommissionAmount	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The maximum commission calculated for the product or producer for a commissionable event. Constrains the output from the Commission Schedule.</p>
MaxCommissionRate	<p>Type percent</p>

Field	Details
	<p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The maximum commission rate that a producer receives for a commissionable event.</p>
MinCommissionAmount	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The minimum commission calculated for the product or producer for a commissionable event. Constrains the output from the Commission Schedule.</p>
MinCommissionRate	<p>Type percent</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The minimum commission rate that a producer receives for a commissionable event.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description Name of the Commission Schedule Assignment.</p>
ProducerId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The producer, broker, brokerage, or other user who receives the commission. This is a relationship field.</p> <p>Relationship Name Producer</p> <p>Relationship Type Lookup</p> <p>Refers To Producer</p>

Field	Details
Product2Id	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The product for which commissions are calculated. This is a relationship field.</p> <p>Relationship Name Product2</p> <p>Relationship Type Lookup</p> <p>Refers To Product2</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

[CommissionScheduleAssignmentFeed](#)

Feed tracking is available for the object.

[CommissionScheduleAssignmentHistory](#)

History is available for tracked fields of the object.

CommSubscription

Represents a customer's subscription preferences for a specific communication. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
DataUsePurposeId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description ID of the data use purpose record associated with the communication subscription.</p>
IsDefault	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if this communication subscription is the default (<code>true</code>) or not (<code>false</code>). This field has a default value of <code>false</code>. Only one communication subscription record can be the default.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Required. Name of the communication subscription record.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the account owner associated with this customer. This is a polymorphic relationship field.</p>

Field	Details
	<p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

[CommSubscriptionFeed](#)

Feed tracking is available for the object.

[CommSubscriptionHistory](#)

History is available for tracked fields of the object.

[CommSubscriptionOwnerSharingRule](#)

Sharing rules are available for the object.

[CommSubscriptionShare](#)

Sharing is available for the object.

CommSubscriptionChannelType

Represents the engagement channel through which you can reach a customer for a communication subscription. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
CommunicationSubscriptionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the associated communication subscription record. This is a relationship field.</p>

Field	Details
	<p>Relationship Name CommunicationSubscription</p> <p>Relationship Type Lookup</p> <p>Refers To CommSubscription</p>
EngagementChannelTypeId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the associated engagement channel type record. This is a relationship field.</p> <p>Relationship Name EngagementChannelType</p> <p>Relationship Type Lookup</p> <p>Refers To EngagementChannelType</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p>

Field	Details
	<p>Description Required. Name of the communication subscription channel type record.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID account owner associated with this customer. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

[CommSubscriptionChannelTypeFeed](#)

Feed tracking is available for the object.

[CommSubscriptionChannelTypeHistory](#)

History is available for tracked fields of the object.

[CommSubscriptionChannelTypeOwnerSharingRule](#)

Sharing rules are available for the object.

[CommSubscriptionChannelTypeShare](#)

Sharing is available for the object.

CommSubscriptionConsent

Represents a customer's consent to a communication subscription. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

With certain page layout and field-level security settings, some fields aren't visible or editable.

Field	Details
BusinessBrandId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the Business Brand that the individual has given consent to for a communication subscription. This is a relationship field. This field is available in API version 53.0 and later.</p> <p>Relationship Name BusinessBrand</p> <p>Relationship Type Lookup</p> <p>Refers To BusinessBrand</p>
CommSubscriptionChannelTypeId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the associated communication subscription channel type record. This is a relationship field.</p> <p>Relationship Name CommSubscriptionChannelType</p> <p>Relationship Type Lookup</p> <p>Refers To CommSubscriptionChannelType</p>
ConsentCapturedDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Required. Date when the customer's consent was captured.</p>
ConsentCapturedSource	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Required. Source through which consent was captured. For example, user@example.com or www.example.com.</p>
ConsentGiverId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the person who gave consent to the communication subscription on behalf of the contact point.</p> <p> Note: If the contact point gave consent, don't use <code>ConsentGiverId</code>.</p> <p>This is a polymorphic relationship field.</p> <p>Relationship Name ConsentGiver</p> <p>Relationship Type Lookup</p> <p>Refers To Account, Contact, Individual, User</p>
ContactPointId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the contact point, such as an Individual or person account, associated with the communication subscription consent.</p> <p>This is a polymorphic relationship field.</p> <p>Relationship Name ContactPoint</p> <p>Relationship Type Lookup</p> <p>Refers To ContactPointAddress, ContactPointEmail, ContactPointPhone</p>
EffectiveFromDate	<p>Type date</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. Date when consent starts.</p>
EffectiveToDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Date when consent ends.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Required. Name of the communication subscription consent record.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the account owner associated with this customer. This is a polymorphic relationship field.</p>

Field	Details
	<p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
PartyRoleId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the Party Role for the individual you want to associate consent with. This is a polymorphic relationship field. This field is available in API version 53.0 and later.</p> <p>Relationship Name PartyRole</p> <p>Relationship Type Lookup</p> <p>Refers To Customer, Seller</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

CommSubscriptionConsentChangeEvent (API version 49.0)

Change events are available for the object.

CommSubscriptionConsentFeed

Feed tracking is available for the object.

CommSubscriptionConsentHistory

History is available for tracked fields of the object.

CommSubscriptionConsentOwnerSharingRule

Sharing rules are available for the object.

CommSubscriptionConsentShare

Sharing is available for the object.

CommSubscriptionTiming

Represents a customer's timing preferences for receiving a communication subscription. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
CommSubscriptionConsentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the associated communication subscription consent record. This is a relationship field.</p> <p>Relationship Name CommSubscriptionConsent</p> <p>Relationship Type Lookup</p> <p>Refers To CommSubscriptionConsent</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p>

Field	Details
	<p>Description Required. Name of the communication subscription timing record.</p>
Offset	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The amount of time before or after an event or the specific day of the week to communicate with the contact point. Set the unit of time in the <code>Unit</code> field.</p> <p>For example, if you set <code>Unit</code> as <code>Week</code> and <code>Offset</code> as <code>-4</code>, communicate with the contact point four weeks before the event. If you set <code>Offset</code> as <code>4</code>, communicate with the contact point four weeks after the event.</p>
PreferredTimeEnd	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description End of the preferred time span in which to reach the customer.</p>
PreferredTimeStart	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Start of the preferred time span in which to reach the customer.</p>
PreferredTimeZone	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Time zone of the preferred time span.</p>
Unit	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The unit of time that works with the <code>Offset</code> field to determine the communication timing.</p>

Field	Details
	Possible values are: <ul style="list-style-type: none"> • Day • DayOfWeek • Hour • Month • Week

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

CommSubscriptionTimingFeed

Feed tracking is available for the object.

CommSubscriptionTimingHistory

History is available for tracked fields of the object.

Community (Zone)

Represents a zone that contains Idea or Question objects.

 **Note:** Starting with the Summer '13 release, Chatter Answers and Ideas communities were renamed to zones. In API version 28, the API object label has changed to `Zone`, but the API type is still `Community`.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
CanCreateCase	Type boolean Properties Defaulted on create, Filter, Group, Sort Description Indicates whether users can ask private questions in the zone using Chatter Answers.
DataCategoryName	Type string Properties Filter, Nillable, Group, Sort

Field	Details
	<p>Description The data category associated with the zone.</p>
Description	<p>Type textarea</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Text description of the zone.</p>
HasChatterService	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether Chatter Answers is available in the zone.</p>
IsActive	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the zone is active or inactive. An idea or question can only be posted to an active zone.</p>
IsPublished	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the zone is available in portals.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description The name of the zone.</p>
NetworkId	<p>Type reference</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the Experience Cloud site that this zone is associated with. This field is available only if digital experiences is enabled in your org. This field is available in API version 54.0 and later.</p>

Usage

Use this object to create a zone in Ideas, Chatter Answers, or Answers. Zones help organize ideas and questions into logical groups and are shared by the Ideas, Answers, and Chatter Answers.

ConnectedApplication

Represents a connected app and its details; all fields are read-only.

Connected apps link client applications, third-party services, other Salesforce organizations, apps, and resources to your organization. The connected app configuration specifies authorization and security settings for these resources. This object exposes the settings for a specified connected app.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
<code>MobileSessionTimeout</code>	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Length of time after which the system logs out inactive mobile users.</p>
<code>MobileStartUrl</code>	<p>Type url</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Users are directed to this URL after they've authenticated when the app is accessed from a mobile device.</p>

Field Name	Details
Name	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description The unique name for this object.</p>
OptionsAllowAdminApprovedUsersOnly	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether access is limited to users granted approval to use the connected app by an administrator. Manage profiles for the app by editing each profile's Access list.</p>
OptionsFullContentPushNotifications	For internal use only.
OptionsHasSessionLevelPolicy	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Specifies whether the connected app requires a High Assurance level session.</p>
OptionsIsInternal	For internal use only.
OptionsRefreshTokenValidityMetric	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Specifies whether the refresh token validity is based on duration or inactivity. If <code>true</code>, the token validity is measured based on the last use of the token; otherwise, it is based on the token duration.</p>
PinLength	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p>

Field Name	Details
	<p>Description</p> <p>For mobile apps, this field is the PIN length requirement for users of the connected app. Valid values are 4, 5, 6, 7, or 8.</p>
RefreshTokenValidityPeriod	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The duration of an authorization token until it expires in hours, months, or days as set in the connected app management page.</p>
StartUrl	<p>Type</p> <p>url</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>If the app is not accessed from a mobile device, users are directed to this URL after they've authenticated.</p>

Consumption Rate

Consumption rates describe the billing rate for a range of usage within a consumption schedule. All consumption schedules require at least one consumption rate in order to rate usage on a usage product. This object is available in API version 45.0 and later.

The consumption rate sets a quantity-based boundary for usage and defines how much your product costs when its usage falls within that boundary. Consumption rates price usage at a per-unit fee or a flat fee across the entire range of usage.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
ConsumptionScheduleId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p>

Field	Details
	<p>Description The consumption schedule that contains the consumption rate. This is a relationship field.</p> <p>Relationship Name ConsumptionSchedule</p> <p>Relationship Type Lookup</p> <p>Refers To ConsumptionSchedule</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Available only for orgs with the multicurrency feature enabled. Possible values are:</p> <ul style="list-style-type: none"> • AUD—Australian Dollar • CAD—Canadian Dollar • GBP—British Pound • JPY—Japanese Yen • USD—U.S. Dollar
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Description of the consumption rate.</p>
LowerBound	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The lowest quantity of usage for the consumption rate.</p>
Name	<p>Type string</p>

Field	Details
	<p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description Required. Default name of this record. Label is Product Name.</p>
Price	<p>Type currency</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The price for usage that falls within the consumption rate's bounds.</p>
PricingMethod	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description How Salesforce applies the consumption rate's price to the total quantity of usage within a usage summary. Possible values are:</p> <ul style="list-style-type: none"> • FlatFee—Salesforce applies the rate's price to the entire quantity of usage. • PerUnit—Salesforce applies the rate's price to each individual quantity of usage within the usage summary.
ProcessingOrder	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The order for processing the usage rate across multiple rates. Consumption rates are evaluated beginning with the lowest processing order.</p>
UpperBound	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The highest quantity of usage for the consumption rate.</p>

Consumption Schedule

A consumption schedule organizes a set of consumption rates by which usage-based products are quoted and billed. This object is available in API version 45.0 and later.

Salesforce uses consumption schedules to group consumption rates. Your consumption schedule defines the unit of measurement and rating method for the schedule's rates. It also defines the billing frequency that Salesforce Billing uses to invoice a usage product.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
BillingTerm	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The number used with the billing term unit to determine billing frequency.</p>
BillingTermUnit	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The unit used with the billing term to determine billing frequency Possible values are:</p> <ul style="list-style-type: none"> • Month— • Quarter— • Year—
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Available only for orgs with the multicurrency feature enabled. Possible values are:</p> <ul style="list-style-type: none"> • AUD—Australian Dollar

Field	Details
	<ul style="list-style-type: none"> • CAD—Canadian Dollar • GBP—British Pound • JPY—Japanese Yen • USD—U.S. Dollar
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Description of the consumption schedule.</p>
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this record is active (<code>true</code>) or not (<code>false</code>). Label is Active.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
MatchingAttribute	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description Salesforce Billing matches usage with a consumption schedule if the records share Matching Attribute value.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Required. Default name of this record. Label is Product Name.</p>
NumberOfRates	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of consumption rates in this consumption schedule.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The user who owns a consumption schedule record. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
RatingMethod	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A specific use case to rate usage against the schedule. This field is the controlling picklist for the Type field. Possible values are:</p> <ul style="list-style-type: none"> • Tier

Field	Details
SBQQ__Category__c	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description This field is available only with Salesforce CPQ. You can define custom categories to organize consumption schedules in separate tabs on sales rep UI. If you do this, make sure to create a field set for each category. Possible values are:</p> <ul style="list-style-type: none"> • Rates
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Defines how rate tiers are calculated. Possible values are:</p> <ul style="list-style-type: none"> • Range—The schedule prices only using the tier that applies to the usage quantity. • Slab—Usage within a given bound receives pricing equal to its tier's value.
UnitOfMeasure	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A unit of measure defines how you quantify instances of usage for your usage products. For example, if your usage product is a cloud storage subscription, you could provide a value of GB for your unit of measure.</p>
blng__BillingRule__c	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description This field is available only with Salesforce Billing. Salesforce Billing invoices usage summaries based off their related consumption schedule's billing rule.</p>
blng__RevenueRecognitionRule__c	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description This field is available only with Salesforce Billing. Salesforce Billing recognizes usage summary revenue based off the summary's related revenue recognition rule.</p>
blng__TaxRule__c	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description This field is available only with Salesforce Billing. Salesforce Billing taxes usage summary invoice lines based off the summary's related tax rule.</p>

Contact

Represents a contact, which is a person associated with an account.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `merge()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can access only portal-enabled contacts.

Fields

Field	Details
AccountId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the account that's the parent of this contact.</p>

Field	Details
	<p>We recommend that you update up to 50 contacts simultaneously when changing the accounts on contacts enabled for a Customer Portal or partner portal. We also recommend that you make this update after business hours.</p> <p>This is a relationship field.</p> <p>Relationship Name Account</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>
AssistantName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The assistant's name.</p>
AssistantPhone	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The assistant's telephone number.</p>
Birthdate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The contact's birthdate.</p> <p>Filter criteria for report filters, list view filters, and SOQL queries ignore the year portion of the Birthdate field. For example, this SOQL query returns contacts with birthdays later in the year than today:</p> <pre>SELECT Name, Birthdate FROM Contact WHERE Birthdate > TODAY</pre>
CanAllowPortalSelfReg	<p>Type boolean</p>

Field	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this contact can self-register for your Customer Portal (<code>true</code>) or not (<code>false</code>).</p>
CleanStatus	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates the record's clean status as compared with Data.com. Values include: <code>Matched</code>, <code>Different</code>, <code>Acknowledged</code>, <code>NotFound</code>, <code>Inactive</code>, <code>Pending</code>, <code>SelectMatch</code>, or <code>Skipped</code>.</p> <p>Several values for <code>CleanStatus</code> appear with different labels on the contact record.</p> <ul style="list-style-type: none"> • <code>Matched</code> appears as <code>In Sync</code> • <code>Acknowledged</code> appears as <code>Reviewed</code> • <code>Pending</code> appears as <code>Not Compared</code>
ConnectionReceivedId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the <code>PartnerNetworkConnection</code> that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.</p>
ConnectionSentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the <code>PartnerNetworkConnection</code> that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new <code>PartnerNetworkRecordConnection</code> object to forward records to connections.</p>
Department	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description The contact's department.</p>
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description A description of the contact. Label is Contact Description up to 32 KB.</p>
DoNotCall	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates that the contact does not want to receive calls.</p>
Email	<p>Type email</p> <p>Properties Create, Filter, Group, idLookup, Nillable, Sort, Update</p> <p>Description The contact's email address.</p>
EmailBouncedDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description If bounce management is activated and an email sent to the contact bounces, the date and time of the bounce.</p>
EmailBouncedReason	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description If bounce management is activated and an email sent to the contact bounces, the reason for the bounce.</p>
Fax	<p>Type phone</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The contact's fax number. Label is Business Fax.</p>
FirstCallDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time of the first call placed to the contact. This field is available in API version 48.0 and later if you enabled High Velocity Sales.</p>
FirstEmailDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time of the first email sent to the contact. This field is available in API version 48.0 and later if you enabled High Velocity Sales.</p>
FirstName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The contact's first name up to 40 characters.</p>
HasOptedOutOfEmail	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the contact doesn't want to receive email from Salesforce (<code>true</code>) or does (<code>false</code>). Label is Email Opt Out.</p>
HasOptedOutOfFax	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the contact prohibits receiving faxes.</p>

Field	Details
HomePhone	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The contact's home telephone number.</p>
IndividualId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the data privacy record associated with this contact. This field is available if Data Protection and Privacy is enabled. This is a relationship field.</p> <p>Relationship Name Individual</p> <p>Relationship Type Lookup</p> <p>Refers To Individual</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
IsEmailBounced	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If bounce management is activated and an email is sent to a contact, indicates whether the email bounced (<code>true</code>) or not (<code>false</code>).</p>
IsPersonAccount	<p>Type boolean</p>

Field	Details
	<p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Read only. Indicates whether this account has a record type of Person Account (<code>true</code>) or not (<code>false</code>). Label is Is Person Account.</p>
Jigsaw	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description References the company's ID in Data.com. If an account has a value in this field, it means that the account was imported from Data.com. If the field value is <code>null</code>, the account was not imported from Data.com. Maximum size is 20 characters. Available in API version 22.0 and later. Label is Data.com Key.</p> <p> Important: The <code>Jigsaw</code> field is exposed in the API to support troubleshooting for import errors and reimporting of corrected data. Do not modify this value.</p>
LastActivityDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Value is the most recent of either:</p> <ul style="list-style-type: none"> • Due date of the most recent event logged against the record. • Due date of the most recently closed task associated with the record.
LastName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. Last name of the contact up to 80 characters.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>

Field	Details
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
LeadSource	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The lead's source.</p>
MailingAddress	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the mailing address. Read-only. For details on compound address fields, see Address Compound Fields.</p>
MailingCity	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Mailing address details.</p>
MailingState	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Mailing address details.</p>
MailingCountry	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description Mailing address details.</p>
MailingPostalCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Mailing address details.</p>
MailingStateCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO codes for the mailing address's state and country.</p>
MailingCountryCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO codes for the mailing address's state and country.</p>
MailingStreet	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Street address for mailing address.</p>
MailingGeocodeAccuracy	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update, Query, Restricted picklist, Nillable</p> <p>Description Accuracy level of the geocode for the mailing address. For details on geolocation compound field, see Compound Field Considerations and Limitations.</p>
MailingLatitude	<p>Type double</p>

Field	Details
	<p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>MailingLongitude</code> to specify the precise geolocation of a mailing address. Acceptable values are numbers between -90 and 90 up to 15 decimal places. For details on geolocation compound fields, see Compound Field Considerations and Limitations.</p>
<code>MailingLongitude</code>	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>MailingLatitude</code> to specify the precise geolocation of a mailing address. Acceptable values are numbers between -180 and 180 up to 15 decimal places. For details on geolocation compound fields, see Compound Field Considerations and Limitations.</p>
<code>MasterRecordId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description If this record was deleted as the result of a merge, this field contains the ID of the record that remains. If this record was deleted for any other reason, or has not been deleted, the value is <code>null</code>. This is a relationship field.</p> <p>Relationship Name MasterRecord</p> <p>Relationship Type Lookup</p> <p>Refers To Contact</p>
<code>MiddleName</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The contact's middle name up to 40 characters. To enable this field, ask Salesforce Customer Support for help.</p>
<code>MobilePhone</code>	<p>Type phone</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Contact's mobile phone number.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Concatenation of <code>FirstName</code>, <code>MiddleName</code>, <code>LastName</code>, and <code>Suffix</code> up to 203 characters, including whitespaces.</p>
OtherAddress	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the other address. Read-only. For details on compound address fields, see Address Compound Fields.</p>
OtherCity	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Alternate address details.</p>
OtherCountry	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Alternate address details.</p>
OtherPostalCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Alternate address details.</p>

Field	Details
OtherState	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Alternate address details.</p>
OtherCountryCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO codes for the alternate address's state and country.</p>
OtherStateCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO codes for the alternate address's state and country.</p>
OtherGeocodeAccuracy	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Accuracy level of the geocode for the other address. For details on geolocation compound fields, see Compound Field Considerations and Limitations.</p>
OtherLatitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>OtherLongitude</code> to specify the precise geolocation of an alternate address. Acceptable values are numbers between -90 and 90 up to 15 decimal places. For details on geolocation compound fields, see Compound Field Considerations and Limitations.</p>
OtherLongitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description Used with <code>OtherLatitude</code> to specify the precise geolocation of an alternate address. Acceptable values are numbers between -180 and 180 up to 15 decimal places. For details on geolocation compound fields, see Compound Field Considerations and Limitations.</p>
OtherPhone	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Telephone for alternate address.</p>
OtherStreet	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Street for alternate address.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the owner of the account associated with this contact. This is a relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
Phone	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Telephone number for the contact. Label is Business Phone.</p>

Field	Details
PhotoUrl	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Path to be combined with the URL of a Salesforce instance (<i>Example:</i> <code>https://yourInstance.salesforce.com/</code>) to generate a URL to request the social network profile image associated with the contact. Generated URL returns an HTTP redirect (code 302) to the social network profile image for the contact. Empty if Social Accounts and Contacts isn't enabled or if Social Accounts and Contacts is disabled for the requesting user.</p>
RecordTypeId	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description ID of the record type assigned to this object.</p>
ReportsToId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description This field doesn't appear if <code>IsPersonAccount</code> is <code>true</code>. This is a relationship field.</p> <p>Relationship Name ReportsTo</p> <p>Relationship Type Lookup</p> <p>Refers To Contact</p>
Salutation	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Honorific abbreviation, word, or phrase to be used in front of name in greetings, such as Dr. or Mrs.</p>

Field	Details
Suffix	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Name suffix of the contact up to 40 characters. To enable this field, ask Salesforce Customer Support for help.</p>
Title	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Title of the contact, such as CEO or Vice President.</p>

 **Note:** If you are importing contact data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself..

Usage

Use this object to manage individual people who are associated with an account. You can create, query, delete, or update any attachment associated with a contact.

Create or update contacts by converting a lead with the `convertLead()` call.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AccountChangeEvent (API version 44.0)

Change events are available for the object.

ContactFeed (API version 18.0)

Feed tracking is available for the object.

ContactHistory (API version 11.0)

History is available for tracked fields of the object.

ContactOwnerSharingRule

Sharing rules are available for the object.

ContactShare

Sharing is available for the object.

[Object Basics](#)

ContactCleanInfo

Stores the metadata Data.com Clean uses to determine a contact record's clean status. Helps you automate the cleaning or related processing of contact records. ContactCleanInfo includes a number of bit vector fields.

 **Note:** When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see [Data.com Prospector and Clean Retirement](#).

Contact Clean Info provides a snapshot of the data in your Salesforce contact record and its matched Data.com record at the time the Salesforce record was cleaned.

Contact Clean Info includes a number of bit vector fields, whose component fields each correspond to individual object fields and provide related data or status information about those fields. For example, the bit vector field `IsDifferent` has an `IsDifferentEmail` field. If the `IsDifferentEmail` field's value is `False`, that means the `Email` field value is *the same* on the Salesforce contact record and its matched Data.com record.

ContactCleanInfo bit vector fields include:

- `CleanedBy` indicates who (a user) or what (a Clean job) cleaned the contact record.
- `IsDifferent` indicates whether or not a field on the contact record has a value that differs from the corresponding field on the matched Data.com record.
- `IsFlaggedWrong` indicates whether or not a field on the contact record has a value that is flagged as wrong to Data.com.
- `IsReviewed` indicates whether or not a field on the contact record is in a `Reviewed` state, which means that the value was reviewed but not accepted.

Fields

Field Name	Details
Address	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the address. Read-only. See Address Compound Fields for details on compound address fields.</p>

Field Name	Details
City	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the contact.</p>
CleanedByJob	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact record was cleaned by a Data.com Clean job (<code>true</code>) or not (<code>false</code>).</p>
CleanedByUser	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact record was cleaned by a Salesforce user (<code>true</code>) or not (<code>false</code>).</p>
ContactId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique, system-generated ID assigned when the contact record was created.</p>
ContactStatusDataDotCom	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The status of the contact per Data.com. Values are: Contact is Active per Data.com, Phone is Wrong per Data.com , Email is Wrong per Data.com, Phone and Email are Wrong per Data.com, Contact Not at Company per Data.com, Contact is Inactive per Data.com, Company this contact belongs to is out of business per Data.com, Company</p>

Field Name	Details
	this contact belongs to never existed per Data.com or Email address is invalid per Data.com.
Country	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the contact.</p>
DataDotComID	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID Data.com maintains for the contact.</p>
Email	<p>Type email</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The email address for the contact.</p>
FirstName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The contact's first name.</p>
IsDifferentCity	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact's City field value is different from the corresponding value on its matched Data.com record (true) or not (false).</p>
IsDifferentCountry	<p>Type boolean</p>

Field Name	Details
	<p>Properties Filter</p> <p>Description Indicates whether the contact's <code>Country</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentCountryCode</code>	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact's <code>Country Code</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentEmail</code>	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact's <code>Email</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentFirstName</code>	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact's <code>First Name</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentLastName</code>	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact's <code>Last Name</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentPhone</code>	<p>Type boolean</p> <p>Properties Filter</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the contact's <code>Phone</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentPostalCode</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the contact's <code>Postal Code</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentState</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the contact's <code>State</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentStateCode</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the contact's <code>State Code</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentStreet</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the contact's <code>Street</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentTitle</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the contact's <code>Title</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongAddress</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the contact's <code>Address</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongEmail</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the contact's <code>Email</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongName</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the contact's <code>Name</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongPhone</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the contact's <code>Phone</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongTitle</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p>

Field Name	Details
	<p>Description Indicates whether the contact's <code>Title</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsInactive</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the contact has been reported to Data.com as <i>Inactive</i> (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedAddress</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the contact's <code>Address</code> field value is in a <i>Reviewed</i> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedEmail</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the contact's <code>Email</code> field value is in a <i>Reviewed</i> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedName</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the contact's <code>Name</code> field value is in a <i>Reviewed</i> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedPhone</code>	<p>Type boolean</p> <p>Properties Filter, Update</p>

Field Name	Details
	<p>Description Indicates whether the contact's <code>Phone</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedTitle</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the contact's <code>Title</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>LastMatchedDate</code>	<p>Type dateTime</p> <p>Properties Filter, Sort</p> <p>Description The date the contact record was last matched and linked to a Data.com record.</p>
<code>LastName</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The contact's last name.</p>
<code>LastStatusChangedById</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of who or what last changed the record's <code>Clean Status</code> field value: a Salesforce user or a Clean job.</p>
<code>LastStatusChangedDate</code>	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date on which the record's <code>Clean Status</code> field value was last changed.</p>

Field Name	Details
Latitude	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Used with <code>Longitude</code> to specify the precise geolocation of a billing address. Data not currently provided.</p>
Longitude	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Used with <code>Latitude</code> to specify the precise geolocation of a billing address. Data not currently provided.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, Sort, Update</p> <p>Description Field label is Contact Clean Info Name. The name of the contact. Maximum size is 255 characters.</p>
Phone	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The phone number for the contact.</p>
PostalCode	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the contact.</p>
State	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the contact.</p>
Street	<p>Type textarea</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the contact.</p>
Title	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The contact's title.</p>

Usage

Developers can create triggers that read the Contact Clean Info fields to help automate the cleaning or related processing of contact records.

Create a customized set of `Title` field values. Use triggers to map values from fields on imported or cleaned records onto a standard set of values.

ContactDailyMetric

Represents the daily engagement metrics for a contact. This object is available in API version 52.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

High Velocity Sales must be enabled.

Fields

Field	Details
AllCallsCallBackLater	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls in the day for this contact with the call result Call Back Later.</p>
AllCallsLeftVoicemail	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls in the day for this contact with the call result Left Voicemail.</p>
AllCallsMeaningfulConnect	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls in the day for this contact with the call result Meaningful Connect.</p>
AllCallsNotInterested	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls in the day for this contact with the call result Not Interested.</p>
AllCallsUncategorized	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of calls in the day for this contact with no call result specified.</p>
AllCallsUnqualified	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description The number of calls in the day for this contact with the call result Unqualified.</p>
AllEmailsBouncedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The total of hard and soft bounced emails for this contact in the day. This is a calculated field.</p>
AllEmailsDeliveredCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of successfully delivered emails for this contact in the day. This is a calculated field.</p>
AllEmailsHardBouncedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of hard bounced emails for this contact in the day.</p>
AllEmailsOutOfOfficeCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails that triggered an out of office reply for this contact in the day.</p>
AllEmailsSentCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails sent to this contact in the day. This is a calculated field.</p>

Field	Details
AllEmailsSoftBouncedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails soft bounced for this contact in the day.</p>
AllEmailsTrackedSentCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails sent to this contact with engagement tracking enabled in the day.</p>
AllEmailsUntrackedSentCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails sent to this contact without engagement tracking enabled in the day.</p>
AllTotalCallsCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The total number of calls to this contact with all call results in the day. This is a calculated field.</p>
ContactId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the related contact. This is a relationship field.</p> <p>Relationship Name Contact</p> <p>Relationship Type Lookup</p>

Field	Details
	<p>Refers To Contact</p>
DailyCutOffTimeStamp	<p>Type dateTime</p> <p>Properties Filter, Sort</p> <p>Description The time of day when each 24 hour metrics period starts and ends.</p>
Date	<p>Type date</p> <p>Properties Filter, Group, Sort</p> <p>Description The date on which the engagement occurred.</p>
DateInt	<p>Type int</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description The date on which the engagement occurred, in yyyyymmdd format.</p>
IsLocked	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the daily metric record is locked or not. The default value is <code>false</code>.</p>
MayEdit	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the daily metric record can be edited or not. The default value is <code>false</code>.</p>

Field	Details
UniqueEmailsLinkClickedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of individual emails in which the contact clicked a link in the day.</p>
UniqueEmailsOpenedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of individual emails opened by the contact in the day.</p>
UniqueEmailsRepliedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of individual emails replied to by the contact in the day.</p>

ContactMonthlyMetric

Represents the monthly engagement metrics for a contact. This object is available in API version 52.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

High Velocity Sales must be enabled.

Field	Details
	<p>Description</p> <p>The number of individual emails opened by the contact in the month.</p>
UniqueEmailsRepliedCount	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of individual emails replied to by the contact in the month.</p>

ContactPointAddress

Represents a contact's billing or shipping address, which is associated with an individual or person account. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
ActiveFromDate	<p>Type</p> <p>date</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The date when the contact's address became active.</p>
ActiveToDate	<p>Type</p> <p>date</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The date when the contact's address is no longer active.</p>
Address	<p>Type</p> <p>address</p>

Field	Details
	<p>Properties Filter, Nillable</p> <p>Description The full address.</p>
AddressType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Indicates the type of address. Possible values are:</p> <ul style="list-style-type: none"> • Billing • Shipping
BestTimeToContactEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The latest time to contact the individual.</p>
BestTimeToContactStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The earliest time to contact the individual.</p>
BestTimeToContactTimezone	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The timezone applied to the best time to contact the individual.</p>
City	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description The address city.</p>
ContactPointPhoneId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Represents the primary phone number associated with this address. This is a relationship field.</p> <p>Relationship Name ContactPointPhone</p> <p>Relationship Type Lookup</p> <p>Refers To ContactPointPhone</p>
Country	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The address country.</p>
GeocodeAccuracy	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The level of accuracy of a location's geographical coordinates compared with its physical address. A geocoding service typically provides this value based on the address's latitude and longitude coordinates. Possible values are:</p> <ul style="list-style-type: none"> • Address • Block • City • County • ExtendedZip • NearAddress • Neighborhood

Field	Details
	<ul style="list-style-type: none"> • State • Street • Unknown • Zip
IsDefault	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether a contact's address is the preferred method of communication (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
IsPrimary	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether a contact's address is their primary address (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last referenced a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Latitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Used with <code>Longitude</code> to specify the precise geolocation of the address. Acceptable values are numbers between -90 and 90 with up to 15 decimal places.</p>
<code>Longitude</code>	<p>Type</p> <p>double</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>Used with <code>Latitude</code> to specify the precise geolocation of the address. Acceptable values are numbers between -180 and 180 with up to 15 decimal places.</p>
<code>Name</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, idLookup, Sort, Update</p> <p>Description</p> <p>The name of the contact.</p>
<code>OwnerId</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The ID of the account's owner associated with this contact.</p> <p>This is a polymorphic relationship field.</p> <p>Relationship Name</p> <p>Owner</p> <p>Relationship Type</p> <p>Lookup</p> <p>Refers To</p> <p>Group, User</p>
<code>ParentId</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The ID of the contact's parent record. Only an individual or account can be a contact's parent.</p> <p>This is a polymorphic relationship field.</p>

Field	Details
	<p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To Account, Individual</p>
PostalCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The address postal code.</p>
State	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The address state.</p>
Street	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The address street.</p>
UsageType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Specify the usage type of this address. For instance, whether it's a work address or a home address.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Home • Temp • Work

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ContactPointChangeEvent

Change events are available for the object.

ContactPointPhone

History is available for tracked fields of the object.

ContactPointEmail

Sharing rules are available for the object.

ContactPointPhoneShare

Sharing is available for the object.

ContactPointConsent

Represents a customer's consent to be contacted via a specific contact point, such as an email address or phone number. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

With certain page layout and field-level security settings, some fields aren't visible or editable.

Field	Details
BusinessBrandId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the Business Brand that the individual has given consent to for a contact point. This is a relationship field. This field is available in API version 53.0 and later.</p> <p>Relationship Name BusinessBrand</p> <p>Relationship Type Lookup</p> <p>Refers To BusinessBrand</p>

Field	Details
CaptureContactPointType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Required. Indicates how you captured consent. Possible values are:</p> <ul style="list-style-type: none"> • Email • MailingAddress • Phone • Social • Web
CaptureDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Required. Date when consent was captured.</p>
CaptureSource	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Required. Indicates how you captured consent. For example, a website or online form.</p>
ContactPointId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the contact point record through which the customer is consenting to be contacted. This is a polymorphic relationship field.</p> <p>Relationship Name ContactPoint</p> <p>Relationship Type Lookup</p> <p>Refers To ContactPointAddress, ContactPointEmail, ContactPointPhone</p>

Field	Details
DataUsePurposeId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the data use purpose record that you want to associate this consent with. This is a relationship field.</p> <p>Relationship Name DataUsePurpose</p> <p>Relationship Type Lookup</p> <p>Refers To DataUsePurpose</p>
DoubleConsentCaptureDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Date when double opt-in was captured.</p>
EffectiveFrom	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Date when consents starts.</p>
EffectiveTo	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Date when consent ends.</p>
EngagementChannelTypeId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>ID of the engagement channel record through which the customer is consenting to be contacted.</p>
LastReferencedDate	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, idLookup, Sort, Update</p> <p>Description</p> <p>Name of the contact point type consent record.</p>
OwnerId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>ID of the account owner associated with this customer.</p> <p>This is a polymorphic relationship field.</p> <p>Relationship Name</p> <p>Owner</p> <p>Relationship Type</p> <p>Lookup</p> <p>Refers To</p> <p>Group, User</p>

Field	Details
PartyRoleId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the Party Role for the individual you want to associate consent with. This is a polymorphic relationship field. This field is available in API version 53.0 and later.</p> <p>Relationship Name PartyRole</p> <p>Relationship Type Lookup</p> <p>Refers To Customer, Seller</p>
PrivacyConsentStatus	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Required. Identifies whether the individual or person account associated with this record agrees to this form of contact. Possible values are:</p> <ul style="list-style-type: none"> • NotSeen • OptIn • OptOut • Seen

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ContactPointConsentChangeEvent

Change events are available for the object.

ContactPointConsentHistory

History is available for tracked fields of the object.

ContactPointConsentOwnerSharingRule

Sharing rules are available for the object.

ContactPointConsentShare

Sharing is available for the object.

ContactPointEmail

Represents a contact's email, which is associated with an individual or person account. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
ActiveFromDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date when the contact's email became active.</p>
ActiveToDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date when the contact's email is no longer active.</p>
BestTimeToContactEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The latest time to contact the individual.</p>
BestTimeToContactStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The earliest time to contact the individual.</p>

Field	Details
BestTimeToContactTimezone	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The timezone applied to the best time to contact the individual.</p>
EmailAddress	<p>Type email</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. The email address of the contact.</p>
EmailDomain	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The domain of the contact's email, which is everything after the @ sign.</p>
EmailLatestBounceDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The date and time when an email failed to reach its recipient.</p>
EmailLatestBounceReasonText	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The reason why the email didn't reach its recipient.</p>
EmailMailBox	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A subset of the contact's email, which is everything before the @ sign.</p>

Field	Details
IsPrimary	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether a contact's email is their primary email (<code>true</code>) or not (<code>false</code>).</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, idLookup, Nillable, Sort</p> <p>Description The email of the contact.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the account's owner associated with this contact. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p>

Field	Details
	<p>Refers To Group, User</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the contact's parent. Only an individual or account can be a contact's parent. This is a polymorphic relationship field.</p> <p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To Account, Individual</p>
UsageType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Specify the usage type of this email. For instance, whether it's a work email or a temporary email. Possible values are:</p> <ul style="list-style-type: none"> • Home • Temp • Work

ContactPointPhone

Represents a contact's phone number, which is associated with an individual or person account. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
ActiveFromDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date when the contact's phone number became active.</p>
ActiveToDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date when the contact's phone number is no longer active.</p>
AreaCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The area code of the phone number's location for the contact.</p>
BestTimeToContactEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description The latest time to contact the individual.</p>
BestTimeToContactStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The earliest time to contact the individual.</p>
BestTimeToContactTimezone	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The timezone applied to the best time to contact the individual.</p>
ExtensionNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The phone number extension for the contact.</p>
FormattedInternationalPhoneNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The internationally recognized format for the contact's phone number.</p>
FormattedNationalPhoneNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The nationally recognized format for the contact's phone number.</p>
IsBusinessPhone	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description Indicates whether a contact's phone number is a business number (<code>true</code>) or not (<code>false</code>).</p>
IsFaxCapable	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether a contact's phone number is a fax number (<code>true</code>) or not (<code>false</code>).</p>
IsPersonalPhone	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether a contact's phone number is a personal number (<code>true</code>) or not (<code>false</code>).</p>
IsPrimary	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether a contact's phone number is their primary number (<code>true</code>) or not (<code>false</code>).</p>
IsSmsCapable	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether a contact's phone number can receive text messages (<code>true</code>) or not (<code>false</code>).</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p>

Field	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, idLookup, Nillable, Sort</p> <p>Description The phone number for the contact.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the account's owner associated with this contact. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the contact's parent. Only an individual or account can be a contact's parent. This is a polymorphic relationship field.</p> <p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To Account, Individual</p>

Field	Details
PhoneType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The type of phone number for the contact. Possible values are:</p> <ul style="list-style-type: none">• Home• Mobile
PreferenceRank	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Specify how this phone numbers ranks in terms of preference among the contact's other phone numbers.</p>
TelephoneNumber	<p>Type phone</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. The phone number for the contact.</p>
UsageType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Specify the usage type of this number. For instance, whether it's a work phone or a home phone. Possible values are:</p> <ul style="list-style-type: none">• Home• Temp• Work

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ContactPointConsentChangeEvent

Change events are available for the object.

ContactPointPhoneHistory

History is available for tracked fields of the object.

ContactPointPhoneOwnerSharingRule

Sharing rules are available for the object.

ContactPointPhoneShare

Sharing is available for the object.

ContactPointTypeConsent

Represents consent for a contact point type, such as email or phone. This object is available in API version 45.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Data Protection and Privacy is enabled.

LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p>

Field Name	Details
	<p>Description Name of the contact point type consent record.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the owner of the account associated with this customer. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
PartyId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. Represents the record based on the Individual object you want to associate consent with. This is a relationship field.</p> <p>Relationship Name Party</p> <p>Relationship Type Lookup</p> <p>Refers To Individual</p>
PartyRoleId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the Party Role for the individual you want to associate consent with. This is a polymorphic relationship field. This field is available in API version 53.0 and later.</p>

Field Name	Details
	<p>Relationship Name PartyRole</p> <p>Relationship Type Lookup</p> <p>Refers To Customer, Seller</p>
PrivacyConsentStatus	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Required. Identify whether the individual associated with this record agrees to this form of contact. Possible values are:</p> <ul style="list-style-type: none"> • NotSeen • Seen • OptIn • OptOut

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ContactPointConsentChangeEvent (API version 47.0)

Change events are available for the object.

ContactPointTypeConsentHistory

History is available for tracked fields of the object.

ContactPointTypeConsentOwnerSharingRule

Sharing rules are available for the object.

ContactPointTypeConsentShare

Sharing is available for the object.

ContactOwnerSharingRule

Represents the rules for sharing a contact with a User other than the owner.

 **Note:** To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The [SharingRules](#) Metadata API type is enabled for all orgs.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
ContactAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of access granted to the target Group, UserRole, or User for Contacts. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface.</p> <p>This field is available in API version 24.0 and later.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>

Field	Details
GroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the source group. A Contact owned by a User in the source Group triggers the rule to give access.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface.</p>
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the User or Group being granted access.</p>

Usage

Use this object to manage the sharing rules for contacts.

[Contact](#)

[ContactShare](#)

[Metadata API Developer Guide: SharingRules](#)

ContactRequest

Represents a customer's request for support to get back to them about an issue. This object is available in API version 45.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The contact request number.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the Salesforce record that owns the request. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>

Field Name	Details
PreferredChannel	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The channel the customer selected as their preferred method of communication in the contact request flow. For example:</p> <ul style="list-style-type: none">• Phone
PreferredPhone	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The phone number the customer provided when requesting help in the contact request flow.</p>
RequestDescription	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The description of the customer's issue that they provided when requesting help in the contact request flow.</p>
RequestReason	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description The reason the customer provided when requesting help in the contact request flow. These values are customizable in Object Manager. The default values are:</p> <ul style="list-style-type: none">• Account• Billing• Case• General• Order• Other• Product

Field Name	Details
Status	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The status of the contact request. For example:</p> <ul style="list-style-type: none"> Abandoned Attempted Contacted New
WhatId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the Salesforce record the contact request is related to, such as an account, case, opportunity, or work order. This is a polymorphic relationship field.</p> <p>Relationship Name What</p> <p>Relationship Type Lookup</p> <p>Refers To Account, Case, Opportunity, WorkOrder</p>
WhoId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the Salesforce contact record the contact request is related to, such as a contact, lead, or user. This is a polymorphic relationship field.</p> <p>Relationship Name Who</p> <p>Relationship Type Lookup</p> <p>Refers To Contact, Lead, User</p>

Usage

Contact request records are created when a customer fills out an online form. This form is created using a flow that uses the type `ContactRequestFlow`. There's a guided setup experience to create this flow on the Customer Contact Requests page in Setup. You then add the flow to an Experience Cloud site using either the Flows component or the Contact Request Button & Flow component.

Contact Request works in Experience Cloud sites, whether they require authentication or not. Make sure that your users have the Run Flows permission, including your Guest User profile. Without this permission, members won't see the button or the form to submit contact requests.

By default, all Standard User and System Administrator profiles have access to the object. Make sure that your users profiles, like service agents, have at least read access on the contact request object.

You can create queues for contact requests and route them with Omni-Channel.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ContactRequestOwnerSharingRule

Sharing rules are available for the object.

ContactRequestShare

Sharing is available for the object.

SEE ALSO:

[Salesforce Help: Set Up and Manage Contact Requests](#)

ContactRequestShare

Represents a list of access levels to a ContactRequest with an explanation of the access level. This object is available in API version 45.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
AccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Level of access that the User or Group has to contact requests. The possible values are:</p>

Field Name	Details
	<ul style="list-style-type: none"> • Read • Edit • All (This value is not valid for <code>create()</code> or <code>update()</code> calls.) <p>This value must be set to an access level that is higher than the organization's default access level for contact requests.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the parent object, if any. This is a relationship field.</p> <p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To ContactRequest</p>
RowCause	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Reason that this sharing entry exists. You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings. Possible values are:</p> <ul style="list-style-type: none"> • <code>Manual</code>—The User or Group has access because a user with “All” access manually shared the ContactRequest with them. • <code>Owner</code>—The User is the owner of the ContactRequest. • <code>Rule</code>—The User or Group has access via a ContactRequest sharing rule. • <code>GuestRule</code>—The User or Group has access via a ContactRequest guest user sharing rule.
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p>

Field Name	Details
	<p>Description ID of the User or Group that has been given access to the ContactRequest. This is a polymorphic relationship field.</p> <p>Relationship Name UserOrGroup</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>

Usage

This object lets you determine which users and groups can view and edit ContactRequest records owned by other users.

If you attempt to create a new record that matches an existing record, the `create()` call updates any modified fields and returns the existing record.

SEE ALSO:

[Salesforce Help: Set Up and Manage Contact Requests](#)

ContactShare

Represents a list of access levels to a Contact along with an explanation of the access level. For example, if you have access to a record because you own it, the `ContactAccessLevel` is `All` and `RowCause` is `Owner`.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

As of Summer '20 and later, only users with access to the Contact object can access this object.

Fields

Field	Details
<code>ContactId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p>

Field	Details
	<p>Description ID of the Contact associated with this sharing entry. This field can't be updated. This is a relationship field.</p> <p>Relationship Name Contact</p> <p>Relationship Type Lookup</p> <p>Refers To Contact</p>
ContactAccessLevel	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Level of access that the User or Group has to cases associated with the account Contact. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All This value is not valid for create or update. <p>This field must be set to an access level that is higher than the organization's default access level for contacts.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
RowCause	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to <code>Manual</code> (default). There are many possible values, including:</p> <ul style="list-style-type: none"> • <code>Rule</code>—The User or Group has access via a Contact sharing rule. • <code>GuestRule</code>—The User or Group has access via a Contact guest user sharing rule.

Field	Details
	<ul style="list-style-type: none"> <code>ImplicitChild</code>—The User or Group has access to the Contact via sharing access on the associated Account. <code>ImplicitPerson</code>—The User or Group has access to the business contact of a person account via a Contact sharing rule. <code>GuestPersonImplicit</code>—The guest user has access to the business contact of a person account via a Contact sharing rule. <code>PortalImplicit</code>—The Contact is associated with the portal user. <code>LpuImplicit</code>—The User has access to records owned by high-volume Experience Cloud site users via a share group. <code>ARImplicit</code>—The User, who belongs to a partner or customer account, has access to the Contact via an account relationship data sharing rule. <code>Manual</code>—The User or Group has access because a User with “All” access manually shared the Contact with them. <code>Owner</code>—The User is the owner of the Contact.
<code>UserOrGroupId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the User or Group that has been given access to the Contact. This field can't be updated. This is a polymorphic relationship field.</p> <p>Relationship Name UserOrGroup</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>

Usage

This object allows you to determine which users and groups can view or edit Contact records owned by other users.

SEE ALSO:

[AccountShare](#)

ContactSuggestionInsight

Represents a suggestion for a new contact record. Available in API versions 45.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

To add or decline contact suggestions, users need a Sales Cloud Einstein license and edit access on accounts. As of the Spring '20 release, Pardot and High Velocity Sales users no longer have access to this object.

Fields

Field Name	Details
AccountId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the related account.</p>
Address	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The address of the suggested contact.</p>
City	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The city of the suggested contact.</p>
ContactTitle	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The title of the suggested contact.</p>
Country	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The country of the suggested contact.</p>
CreatedRecordId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the created contact record.</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description Available only for orgs with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.</p>
Division	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description The division of the suggested contact.</p>
Email	<p>Type email</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The email address of the suggested contact.</p>
FirstName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The first name of the suggested contact.</p>

Field Name	Details
GeocodeAccuracy	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Accuracy level of the geocode for the address. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p> <p> Note: This field is available in the API only.</p>
LastName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The last name of the suggested contact.</p>
LastOperationUserId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the user who last performed a related operation.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>

Field Name	Details
Latitude	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Used in conjunction with <code>Longitude</code> to specify the precise geolocation of an address.</p>
Longitude	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Used in conjunction with <code>Latitude</code> to specify the precise geolocation of an address.</p>
Phone	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The phone number of the suggested contact.</p>
PostalCode	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The postal code of the suggested contact.</p>
RationaleLabel	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The reason why this entry is a suggested contact.</p>
State	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name	Details
	<p>Description The state of the suggested contact.</p>
Status	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The status of the suggested contact. Possible values include:</p> <ul style="list-style-type: none"> • New • Pending • Added • Declined
Street	<p>Type textarea</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The street of the suggested contact.</p>

Usage

This object is read-only and isn't supported in workflows, triggers, process builder, or Visualforce pages.

ContactTag

Associates a word or short phrase with a Contact.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ItemId	<p>Type reference</p>

Field Name	Details
	<p>Properties Create, Filter</p> <p>Description ID of the tagged item.</p>
Name	<p>Type string</p> <p>Properties Create, Filter</p> <p>Description Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>
TagDefinitionId	<p>Type reference</p> <p>Properties Filter</p> <p>Description ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Restricted picklist</p> <p>Description Defines the visibility of a tag. Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

ContactTag stores the relationship between its parent TagDefinition and the Contact being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

ContentAsset

Represents a Salesforce file that has been converted to an asset file in a custom app in Lightning Experience. Use asset files for org setup and configuration. Asset files can be packaged and referenced by other components. This object is available in API version 38.0 and later.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object's name.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Only admin users can edit or delete ContentAssets.
- Users with file access can create and query ContentAssets.
- It isn't necessary to create asset files for regular, collaborative use of Salesforce Files. "Assetize" files only when they're used in setup and configuration situations.
- Neither the file (ContentDocument) nor the asset settings record (ContentAssets) can be deleted if the asset file is referenced by another component.
- ContentAsset doesn't support search or most recently used (MRU) lists.
- ContentAsset doesn't support Apex triggers.

Fields

Field	Details
ContentDocumentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the document. This is a relationship field.</p> <p>Relationship Name ContentDocument</p> <p>Relationship Type Lookup</p> <p>Refers To ContentDocument</p>
DeveloperName	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The unique name of the asset file in the API. ContentAsset.DeveloperName:</p> <ul style="list-style-type: none"> • must be 40 characters or fewer • must begin with a letter • can contain only underscores and alphanumeric characters • can't include spaces • can't end with an underscore • can't contain 2 consecutive underscores <p>In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p>
IsVisibleByExternalUsers	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether unauthenticated users can see the asset file.</p>
Language	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language for this document. This field defaults to the user's language unless the org is multi-language enabled. Specifies the language of the labels returned. The value must be a valid user locale (language and country), such as <code>de_DE</code> or <code>en_GB</code>. For more information on locales, see the <code>Language</code> field on the <code>CategoryNodeLocalization</code> object.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The label for the asset file. This internal label doesn't get translated.</p>
NamespacePrefix	<p>Type string</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p>

ContentBody

Represents the body of a file in Salesforce CRM Content or Salesforce Files. This object is available in API version 40.0 and later.

Supported Calls

`describeSObjects()`

Special Access Rules

Cannot be queried, inserted, updated, or deleted directly.

Fields

Field	Details
Id	<p>Type ID</p> <p>Properties , Filter, Group, idLookup, Sort</p> <p>Description ID of the file body.</p>

Usage

ContentBody is intended for internal Salesforce use. If you need to access the file content body, please use ContentVersion.

ContentDistribution

Represents information about sharing a document externally. This object is available in API version 32.0 and later.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

- Content deliveries must be enabled to query content deliveries.
- Users (including users with the “View All Data” permission) can query only the files that they have access to. If the file is managed by a Content Library, the user must have “Deliver Content” enabled in the library permission definition and be a member of the library. If the file isn’t managed by a Content Library, the user must have the “Enable Creation of Content Deliveries for Salesforce Files” permission.
- Users can query the `DistributionPublicUrl` and `Password` fields only if they are the file owner, if the file is shared with them, or if the `RelatedRecordId` specifies a record that the users can access.
- If the shared document is deleted, the delete cascades to any associated ContentDistribution. The ContentDistribution is still queryable by using the `QueryAll` verb.
- If the shared document is archived, the only fields that users can edit are `ExpiryDate` and `PreferencesExpires`.
- Customer Portal users can’t access this object.
- Chatter Free users can’t access this object.

Fields

Field Name	Details
<code>ContentDocumentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the shared document.</p>
<code>ContentDownloadUrl</code>	<p>Type string</p> <p>Properties Sort, Nillable</p> <p>Description The link for downloading the file. This field is available in API version 40.0 and later.</p>
<code>ContentVersionId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the shared document version.</p>

Field Name	Details
	<p>This is a relationship field.</p> <p>Relationship Name ContentVersion</p> <p>Relationship Type Lookup</p> <p>Refers To ContentVersion</p>
DistributionPublicUrl	<p>Type string</p> <p>Properties Nillable, Sort</p> <p>Description URL of the link to the shared document.</p>
ExpiryDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Date when the shared document becomes inaccessible.</p>
FirstViewDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Date when the shared document is first viewed.</p>
LastViewDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Date when the shared document was last viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p>

Field Name	Details
	<p>Description Name of the content delivery.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the user who owns the shared document. This is a relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
PdfDownloadUrl	<p>Type string</p> <p>Properties Sort, Nillable</p> <p>Description The link for downloading the file as a PDF. This field is available in API version 40.0 and later.</p>
Password	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description A password that allows access to a shared document.</p>
PreferencesAllowOriginalDownload	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description When <code>true</code>, the shared document can be downloaded as the file type that it was uploaded as.</p>

Field Name	Details
	<p>When <code>false</code>, download availability depends on whether a preview of the file exists. If a preview exists, the file can't be downloaded. If a preview doesn't exist, the file can still be downloaded.</p> <p>If the shared document is a link, it can't be downloaded.</p>
<code>PreferencesAllowPDFDownload</code>	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description When <code>true</code>, the shared document can be downloaded as a PDF if the original file type is PDF or if a PDF preview has been generated.</p>
<code>PreferencesAllowViewInBrowser</code>	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description When <code>true</code>, a preview of the shared document can be viewed in a Web browser.</p>
<code>PreferencesExpires</code>	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description When <code>true</code>, access to the shared document expires on the date that's specified by <code>ExpiryDate</code>.</p>
<code>PreferencesLinkLatestVersion</code>	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description When <code>true</code>, users see the most recent version of a shared document. When <code>false</code>, users see the version of the document that's shared, even if it isn't the most recent version.</p>
<code>PreferencesNotifyOnVisit</code>	<p>Type boolean</p> <p>Properties Create, Filter, Update</p>

Field Name	Details
	<p>Description</p> <p>When <code>true</code>, the owner of the shared document is emailed the first time that someone views or downloads the shared document.</p>
PreferencesNotifyRndtnComplete	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Filter, Update</p> <p>Description</p> <p>When <code>true</code>, the owner of the shared document is emailed when renditions of the shared document that can be previewed in a Web browser are generated.</p>
PreferencesPasswordRequired	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Filter, Update</p> <p>Description</p> <p>When <code>true</code>, a password, specified by <code>Password</code>, is required to access the shared document.</p>
RelatedRecordId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>ID of the record, such as an Account, Campaign, or Case, that the shared document is related to.</p> <p>This is a polymorphic relationship field.</p> <p>Relationship Name</p> <p>RelatedRecord</p> <p>Relationship Type</p> <p>Lookup</p> <p>Refers To</p> <p>Account, Campaign, Case, Contact, EmailMessage, Lead, ListEmail, Opportunity</p>
ViewCount	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of times that the shared document has been viewed.</p>

Usage

Use this object to create, update, delete, or query information about a document shared externally via a link or via Salesforce CRM Content delivery.

The ContentDistribution object supports triggers before and after these operations: insert, update, delete. It supports triggers after undelete.

 **Example:** The VP of Marketing wants file authors to specify whether their files can be shared with external people using content delivery. He also wants some files to have a password. You can add a custom field `DeliveryPolicy` on the ContentVersion object. Make the custom field a picklist with the values, `Allowed`, `Blocked`, and `Password required`. Add the field to the ContentVersion layout so that the user can set the delivery policy per file. Then, add an insert trigger for the ContentDistribution object to enforce the rules based on the delivery policy set in the file.

 **Note:** The `ContentVersionId` for ContentDistribution must be unique.

This trigger for the ContentDistribution object enforces the delivery policy rules for each file:

```
trigger deliveryPolicy on ContentDistribution (before insert) {
    for (ContentDistribution cd : trigger.new) {
        String versionId = DeliveryPolicyHelper.getContentVersionId(cd);
        ContentVersion version = [select DeliveryPolicy__c from ContentVersion where
Id = :versionId];
        String policy = version.DeliveryPolicy__c;
        if (policy.equals('Blocked')) {
            cd.addError('This file is not allowed to be delivered.');
```

The trigger calls this helper class:

```
public class DeliveryPolicyHelper {
    public static String getContentVersionId(ContentDistribution cd) {
        if (cd.ContentVersionId != null) {
            return cd.ContentVersionId;
        } else {
            String versionId = [select LatestPublishedVersionId from ContentDocument
where Id = :cd.ContentDocumentId].get(0).LatestPublishedVersionId;
            return versionId;
        }
    }

    public static boolean requirePassword(ContentDistribution cd) {
        return cd.PreferencesPasswordRequired;
    }
}
```

 **Important:** Apex has a per organization limit of 10 concurrent requests that last longer than 5 seconds. A trigger that uploads files can easily hit this limit.

ContentDistributionView

Represents information about views of a shared document. This read-only object is available in API version 32.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

Special Access Rules

- Content deliveries must be enabled to query content deliveries.
- Users (including users with the “View All Data” permission) can query only the files that they have access to. If the file is managed by a Content Library, the user must have “Deliver Content” enabled in the library permission definition and be a member of the library. If the file isn’t managed by a Content Library, the user must have the “Enable Creation of Content Deliveries for Salesforce Files” permission.
- ContentDistributionView can be deleted by an admin.
- If the shared document is deleted, the delete cascades to any associated ContentDistributionView. The ContentDistributionView is still queryable by using the `QUERYALL` verb.
- Customer Portal users can’t access this object.
- Chatter Free users can’t access this object.

Fields

Field Name	Details
DistributionId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the content delivery that the document is part of. This is a relationship field.</p> <p>Relationship Name Distribution</p> <p>Relationship Type Lookup</p> <p>Refers To ContentDistribution</p>
IsDownload	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p>

Field Name	Details
	<p>Description <code>true</code> if the shared document is downloaded; <code>false</code> if the shared document is viewed.</p>
<code>IsInternal</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description <code>true</code> if the shared document is viewed by a user in the same organization; <code>false</code> if viewed by an external user.</p>
<code>ParentViewId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of this instance of accessing the shared document.</p>

Usage

Use this read-only object to query information about users who are accessing shared documents.

ContentDocument

Represents a document that has been uploaded to a library in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content. This object is available in API version 21.0 and later for Salesforce Files.

The maximum number of documents that can be published is 30,000,000. Archived files count toward this limit and toward storage usage limits.

- Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 200,000 new versions per 24-hour period.
- Developer Edition and trial users can publish a maximum of 2,500 new versions per 24-hour period.

Supported Calls

`delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`

Special Access Rules

- By default, users (including users with the View All Data permission) can only query files they have access to, including:

- Salesforce Files in their personal library and in libraries they're a member of, regardless of library permissions (API version 17.0 and later).
- Salesforce Files they own, shared directly with them, posted on their profile, or posted on groups they can see (API version 21.0 and later).

Enable the Query All Files permission to let your View All Data users bypass the restrictions on querying files.

- Query All Files returns all files, including files in non-member libraries and files in unlisted groups.
 - Users can't edit, upload new versions, or delete files they don't have access to.
 - View All Data permission is required to enable Query All Files.
- Customer and Partner Portal users must have the View Content in Portal permission to query content in libraries where they have access.
 - A Salesforce CRM Content document can be deleted if any of the following are true:
 - The document is published into a personal library or is in the user's upload queue.
 - The document is published into a public library, the user trying to delete the document is the file owner, and is a member of that library.
 - The document is published into a public library and the user trying to delete the document is not the owner but has the Manage Library or Delete Content library permission enabled.

For API version 25.0 and later, you can change ownership of Salesforce Files and Salesforce CRM Content documents.

- A user can change ownership of a Salesforce CRM Content document or Salesforce file if any of the following are true:
 - The user is the current owner.
 - The user has either the Modify All Data or Manage Salesforce CRM Content permission enabled.
 - The user has the Manage Library permission enabled for the library containing the document.
-  **Note:** When the owner of a ContentDocument is changed, [ContentDocumentLink](#) may be triggered. This action deletes the ContentDocumentLink to the old owner and inserts one to the new owner.
-  **Note:**
- The user who is becoming the owner of the document must be a visible user who is active, but the original owner can be inactive.
 - A document's owner can be changed to a user who doesn't have access to the library that contains the document. Library administrators must give the new owner membership to the library.

Fields

Field	Details
ArchivedById	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the user who archived the document. This field is available in API version 24.0 and later.</p>

Field	Details
ArchivedDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The date when the document was archived. This field is available in API version 24.0 and later.</p>
ContentAssetId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description If the ContentDocument is an asset file, this field points to the asset. For most entities, the value of this field is null. This field is available in API version 38.0 and later. This is a relationship field.</p> <p>Relationship Name ContentAsset</p> <p>Relationship Type Lookup</p> <p>Refers To ContentAsset</p>
ContentModifiedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Date the document was modified. ContentModifiedDate updates when, for example, the document is renamed or a new document version is uploaded. When you're uploading the first version of a document, ContentModifiedDate can be set to the current time or anytime in the past. This field is available in API version 32.0 and later.</p>
ContentSize	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The size of the document in bytes.</p> <p>This field is available in API version 31.0 and later.</p>
Description	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Filter, Nillable, Sort, Update</p> <p>Description</p> <p>A description of the document.</p> <p>This field is available in API version 31.0 and later.</p>
Division	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.</p>
FileExtension	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>File extension of the document.</p> <p>This field is available in API version 31.0 and later.</p>
FileType	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Type of document, determined by the file extension.</p> <p>This field is available in API version 31.0 and later.</p>
IsArchived	<p>Type</p> <p>boolean</p>

Field	Details
	<p>Properties Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the document has been archived (<code>true</code>) or not (<code>false</code>).</p>
LastReferencedDate	<p>Type datetime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type datetime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
LatestPublishedVersionId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the latest document version (<code>ContentVersion</code>). This is a relationship field.</p> <p>Relationship Name LatestPublishedVersion</p> <p>Relationship Type Lookup</p> <p>Refers To ContentVersion</p>
OwnerId	<p>Type reference</p> <p>Properties Filter, Group, Sort, Update</p> <p>Description ID of the owner of this document. This is a relationship field.</p>

Field	Details
	<p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the library that owns the document. Created automatically when inserting a ContentVersion via the API for the first time. This field is available in API version 24.0 and later when Salesforce CRM Content is enabled.</p>
PublishStatus	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description Indicates if and how the document is published. Valid values are:</p> <ul style="list-style-type: none"> • P—The document is published to a public library and is visible to other users. Label is Public. • R—The document is published to a personal library and is not visible to other users. Label is Personal Library. • U—The document is not published because publishing was interrupted. Label is Upload Interrupted.
SharingOption	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Controls whether sharing is frozen for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is Allowed, which means that new shares are allowed. When set to Restricted, new shares are prevented without affecting existing shares. This field is available in API versions 35.0 and later.</p>

Field	Details
SharingPrivacy	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Controls sharing privacy for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is <code>Visible to Anyone With Record Access</code>. When set to <code>Private on Records</code>, the file is private on records but can be shared selectively with others.</p> <p>This field is available in API versions 41.0 and later.</p>
Title	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort, Update</p> <p>Description The title of a document.</p>

Usage

- Use this object to retrieve, query, update, and delete the latest version of a document in a library or a Salesforce file. Use the `ContentVersion` object to create, query, retrieve, search, edit, and update a specific version of a Salesforce CRM Content document or Salesforce file.
- The `query()` call doesn't return archived documents. The `queryAll()` call returns archived documents.
- You can't add new versions of archived documents.
- To query a file that is accessible only through a record share, you must specify the content ID of the file. When SOQL querying the `ContentVersion` object, either the `ContentVersionId` or the `ContentDocumentId` must be compounded by an AND operator.

For example,

```
SELECT FileExtension, Title FROM ContentVersion
WHERE (ContentDocumentId = '<ContentDocumentId>' or Id='<ContentVersionId>') and
IsLatest=true
```

```
SELECT Id, VersionData, FileExtension, Title FROM ContentVersion
WHERE ContentDocumentId='<ContentDocumentId>' AND FirstPublishLocationId =
'<FirstPublishLocationId>'
```

- To create a document, create version via the `ContentVersion` object without setting the `ContentDocumentId`. This process automatically creates a parent document record. When adding a new version of the document, you must specify an existing `ContentDocumentId` which initiates the revision process for the document. When the latest version is published, the title, owner, and publish status fields are updated in the document.
- When you delete a document, all versions of that document are deleted, including ratings, comments, and tags.

- If you query versions in the API, versions with a `PublishStatus` of `Upload Interrupted` are not returned.
- A document record is a container for multiple version records. You create a version to add a document to the system. The new version contains the actual file data which allows the document to have multiple versions. The version stores the body of the uploaded document.
- Assign topics to `ContentDocument` using `TopicAssignment` in API version 37.0 or later.

Associated Objects

This object has the following associated objects. Unless noted, associated objects are available in the same API version as this object.

ContentDocumentFeed (API version 20.0)

Feed tracking is available for the object.

ContentDocumentHistory

History is available for tracked fields of the object.

SEE ALSO:

[ContentDocumentHistory](#)

[ContentVersion](#)

ContentDocumentHistory

Represents the history of a document. This object is available in versions 17.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

You can also enable `delete()` in API version 42.0 and later. See [Enable delete of Field History and Field History Archive](#).

Special Access Rules

- Customer and Partner Portal users must have the “View Content in Portal” permission to query content in libraries where they have access.
- A user can query all versions of a document from their personal library and any version that is part of or shared with a library where they are a member, regardless of library permissions.

Fields

Field	Details
<code>ContentDocumentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p>

Field	Details
	<p>Description ID of the document. This is a relationship field.</p> <p>Relationship Name ContentDocument</p> <p>Relationship Type Lookup</p> <p>Refers To ContentDocument</p>
DataType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Data type of the field that was changed.</p>
Division	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.</p>
Field	<p>Type picklist</p> <p>Properties Filter, Group, Sort, Restricted picklist</p> <p>Description The name of the field that was changed. Possible values include:</p> <ul style="list-style-type: none"> • <code>contentDocPublished</code>—The document is published into a library. • <code>contentDocUnpublished</code>—The document is archived or removed from a library, either directly or when the owning library is changed. • <code>contentDocRepublished</code>—The document is removed from the archive. • <code>contentDocFeatured</code>—The document is featured. • <code>contentDocSubscribed</code>—The document is subscribed to. • <code>contentDocUnsubscribed</code>—The document is no longer subscribed to.

Field	Details
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The new value of the field that was changed.</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The latest value of the field before it was changed.</p>

Usage

Use this read-only object to query the history of a document.

SEE ALSO:

[ContentDocument](#)

ContentDocumentLink

Represents the link between a Salesforce CRM Content document, Salesforce file, or ContentNote and where it's shared. A file can be shared with other users, groups, records, and Salesforce CRM Content libraries. This object is available in versions 21.0 and later for Salesforce CRM Content documents and Salesforce Files.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- In API versions 33.0 and later, you can create and delete ContentDocumentLink objects with a `LinkedEntityId` of any record type that can be tracked in the feed, even if feed tracking is disabled for that record type.
- In API versions 25.0 and later, you can create ContentDocumentLink objects with a `LinkEntityId` of type User, CollaborationGroup, or Organization.
- In API versions 21.0 and later, users with explicit Viewer access (the file has been directly shared with the user) to a file can delete ContentDocumentLink objects between the file and other users who have Viewer access. In the same API versions, any user with Viewer access to a file can delete ContentDocumentLink objects between the file and organizations or groups of which they are a member.

- For orgs with digital experiences enabled, a document can only be shared with users and groups that are a part of the Experience Cloud site the file was created in.

Fields

Field	Details
ContentDocumentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the document. This is a relationship field.</p> <p>Relationship Name ContentDocument</p> <p>Relationship Type Lookup</p> <p>Refers To ContentDocument</p>
LinkedEntityId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the linked object. Can include Chatter users, groups, records (any that support Chatter feed tracking including custom objects), and Salesforce CRM Content libraries. Using the API only, you can relate notes to custom settings. This is a polymorphic relationship field.</p> <p>Relationship Name LinkedEntity</p> <p>Relationship Type Lookup</p> <p>Refers To Account, Accreditation, ActivationTarget, ActivationTrgtIntOrgAccess, ApiAnomalyEventStore, AssessmentIndicatorDefinition, AssessmentTask, AssessmentTaskContentDocument, AssessmentTaskDefinition, AssessmentTaskIndDefinition, AssessmentTaskOrder, Asset, AssetRelationship, AssignedResource, Award, BoardCertification, BusinessLicense, BusinessMilestone, BusinessProfile, Campaign, CareBarrier, CareBarrierDeterminant, CareBarrierType, CareDeterminant, CareDeterminantType, CareDiagnosis, CareInterventionType, CareMetricTarget, CareObservation, CareObservationComponent, CarePgmProvHealthcareProvider, CarePreauth, CarePreauthItem, CareProgram,</p>

Field	Details
	<p>CareProgramCampaign, CareProgramEligibilityRule, CareProgramEnrollee, CareProgramEnrolleeProduct, CareProgramEnrollmentCard, CareProgramGoal, CareProgramProduct, CareProgramProvider, CareProgramTeamMember, CareProviderAdverseAction, CareProviderFacilitySpecialty, CareProviderSearchableField, CareRegisteredDevice, CareRequest, CareRequestDrug, CareRequestExtension, CareRequestItem, CareSpecialty, CareSpecialtyTaxonomy, CareTaxonomy, Case, CodeSet, CollaborationGroup, CommSubscription, CommSubscriptionChannelType, CommSubscriptionConsent, CommSubscriptionTiming, ConsumptionSchedule, Contact, ContactEncounter, ContactEncounterParticipant, ContentWorkspace, Contract, ConversationEntry, CoverageBenefit, CoverageBenefitItem, CredentialStuffingEventStore, CreditMemo, CreditMemoLine, Dashboard, DashboardComponent, DataStream, DelegatedAccount, DocumentChecklistItem, EmailMessage, EmailTemplate, EngagementChannelType, EnhancedLetterhead, EnrollmentEligibilityCriteria, Event, HealthcareFacility, HealthcareFacilityNetwork, HealthcarePayerNetwork, HealthcarePractitionerFacility, HealthcareProvider, HealthcareProviderNpi, HealthcareProviderSpecialty, HealthcareProviderTaxonomy, Identifier, Image, IndividualApplication, Invoice, InvoiceLine, Lead, ListEmail, Location, MarketSegment, MarketSegmentActivation, MemberPlan, MessagingSession, MktCalculatedInsight, OperatingHours, Opportunity, Order, OrderItem, Organization, OtherComponentTask, OutgoingEmail, PartyConsent, PersonEducation, PersonLanguage, PersonLifeEvent, PersonName, PlanBenefit, PlanBenefitItem, Product2, ProductFulfillmentLocation, ProductItem, ProductItemTransaction, ProductRequest, ProductRequestLineItem, ProductRequired, ProductTransfer, ProfileSkill, ProfileSkillEndorsement, ProfileSkillUser, ProviderSearchSyncLog, PurchaserPlan, PurchaserPlanAssn, ReceivedDocument, Report, ReportAnomalyEventStore, ResourceAbsence, ResourcePreference, ReturnOrder, ReturnOrderLineItem, ServiceAppointment, ServiceResource, ServiceResourceSkill, ServiceTerritory, ServiceTerritoryMember, ServiceTerritoryWorkType, SessionHijackingEventStore, Shift, Shipment, ShipmentItem, Site, SkillRequirement, SocialPost, Solution, Task, ThreatDetectionFeedback, Topic, User, Visit, VisitedParty, Visitor, VoiceCall, VolunteerProject, WorkBadgeDefinition, WorkOrder, WorkOrderLineItem, WorkType, WorkTypeGroup, WorkTypeGroupMember</p>
ShareType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Required. The permission granted to the user of the shared file in a library. This is determined by the permission the user already has in the library. This field is available in API version 25.0 and later.</p> <p>v Viewer permission. The user can explicitly view but not edit the shared file.</p> <p>c Collaborator permission. The user can explicitly view and edit the shared file.</p>

Field	Details
	<p>I</p> <p>Inferred permission. The user's permission is determined by the related record. For shares with a library, this is defined by the permissions the user has in that library. Inferred permission on shares with libraries and file owners is available in API versions 21.0 and later. Inferred permission on shares with standard objects is available in API versions 36.0 and later.</p>
Visibility	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Specifies whether this file is available to all users, internal users, or shared users. This field is available in API version 26.0 and later.</p> <p>Visibility can have the following values.</p> <ul style="list-style-type: none"> • AllUsers—The file is available to all users who have permission to see the file. • InternalUsers—The file is available only to internal users who have permission to see the file. • SharedUsers—The file is available to all users who can see the feed to which the file is posted. SharedUsers is used only for files shared with users, and is available only when an org has private org-wide sharing on by default. The SharedUsers value is available in API version 32.0 and later. <p>Note the following exceptions for Visibility.</p> <ul style="list-style-type: none"> • AllUsers & InternalUsers values apply to files posted on standard and custom object records, but not to users, groups, or content libraries. • For posts to a record feed, Visibility is set to InternalUsers for all internal users by default. • External users can set Visibility only to AllUsers. • On user and group posts, only internal users can set Visibility to InternalUsers. • For posts to a user feed, if the organization-wide default for user sharing is set to private, Visibility is set to SharedUsers. • Only internal users can update Visibility. • Visibility can be updated on links to files posted on standard and custom object records, but not to users, groups, or content libraries. • Visibility is updatable in API version 43.0 and later. <p>The visibility setting on ContentDocumentLink determines a file's visibility on a record post. When a file has multiple references posted in a feed, the file's visibility is determined by the most visible setting.</p>

Usage

Use this object to query the locations where a file is shared or query which files are linked to a particular location. For example, the following query returns a particular document shared with a Chatter group:

```
SELECT ContentDocument.title FROM ContentDocumentLink WHERE ContentDocumentId =
'069D00000000so2' AND LinkedEntityId = '0D5000000089123'
```

- You can't run a query without filters against ContentDocumentLink.
- You can't filter on ContentDocument fields if you're filtering by ContentDocumentId. You can only filter on ContentDocument fields if you're filtering by LinkedEntityId.
- You can't filter on the related object fields. For example, you can't filter on the properties of the account to which a file is linked. You can filter on the properties of the file, such as the title field.

A SOQL query must filter on one of Id, ContentDocumentId, or LinkedEntityId.

The ContentDocumentLink object supports triggers before and after these operations: insert, update, delete.

 **Example:** This trigger for the ContentDocumentLink object prevents public XLSX files from being shared.

```
trigger NoShareXLSX on ContentDocumentLink (after insert) {
    for (ContentDocumentLink cdl : trigger.new) {
        if (!CDLHelper.isSharingAllowed(cdl)) {
            cdl.addError('Sorry, you cannot share this file.');
        }
    }
}
```

The trigger calls this helper class.

```
public class CDLHelper {

    /**
     * Gets FileExtension of the inserted content.
     */
    public static String getFileExtension(ContentDocumentLink cdl) {
        String fileExtension;
        String docId = cdl.ContentDocumentId;
        FileExtension = [select FileExtension from ContentVersion where ContentDocumentId
= :docId].get(0).FileExtension;
        return FileExtension;
    }

    /**
     * Checks the file's PublishStatus and FileExtension to decide whether user can
share the file with others.
     * PublishStatus 'P' means the document is in a public library.
     */
    public static boolean isSharingAllowed(ContentDocumentLink cdl) {
        String docId = cdl.ContentDocumentId;
        ContentVersion version = [select PublishStatus,FileExtension from ContentVersion
where ContentDocumentId = :docId].get(0);
        if (version.PublishStatus.equals('P') && (version.FileExtension != null &&
version.FileExtension.equals('xlsx'))) {
            return false;
        }
    }
}
```

```

        return true;
    }

    /**
     * Gets the parent account name if the file is linked to an account.
     */
    public static String getAccountName(ContentDocumentLink cdl) {
        String name;
        String id = cdl.LinkedEntityId;
        if (id.substring(0,3) == '001') {
            name = [select Name from Account where Id = :id].get(0).Name;
        }
        return name;
    }
}

```

! **Important:** Apex has a per organization limit of 10 concurrent requests that last longer than 5 seconds. A trigger that uploads files, like bulk `ContentVersion` creation, can easily hit the SOQL queries limit.

SEE ALSO:

[ContentDocument](#)

ContentDocumentListViewMapping

Represents an association between a `ListView` and a Quip `ContentDocument`. Applies to Quip file types only. Maintains the mapping between a list view and Quip document when the list view is exported to a newly created Quip document. This object is available in API version 44.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To use this object, the Files Connect and Quip permissions must be enabled in the org.

To insert and update this object through the API, the `QuipMassAction` gater permission must also be enabled.

Fields

Field	Details
<code>ContentDocumentId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p>

Field	Details
	<p>Description ID of the document.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this document.</p>
ListViewId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the list view associated with the document.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Name of the document.</p>

Usage

ContentDocumentListViewMapping is used primarily by the Quip list view integration feature. Only Quip file types (Quip sheets and docs) are supported. The ContentDocumentId field must point to a Quip file.

ContentDocumentSubscription

Represents a subscription for a user following or commenting on a file in a library. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
<code>ContentDocumentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the file. This is a relationship field.</p> <p>Relationship Name ContentDocument</p> <p>Relationship Type Lookup</p> <p>Refers To ContentDocument</p>

<code>IsDocumentSub</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Specifies whether the user follows the file.</p>
<code>UserId</code>	<p>Type reference</p>

Field	Details
	<p>Properties Filter, Group, Sort</p> <p>Description ID of the user following or commenting on the file. This is a relationship field.</p> <p>Relationship Name User</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>

ContentFolder

Represents a folder in a content library for adding files. This object is available in API version 34.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

- Salesforce CRM Content or Chatter must be enabled to access ContentFolder.
- All users with a content feature license can modify folders in their personal library.
- To modify a folder, the user must be a member of the library and have permission to modify folders.

Fields

Field Name	Details
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Name of the folder.</p>
ParentContentFolderId	<p>Type reference</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the ParentFolder. This is a relationship field.</p> <p>Relationship Name ParentContentFolder</p> <p>Relationship Type Lookup</p> <p>Refers To ContentFolder</p>

ContentFolderItem

Represents a file (ContentDocument) or folder (ContentFolder) that resides in a ContentFolder in a ContentWorkspace. This object is available in API version 35.0 and later.

Supported Calls

`describeSObjects()`, `describeLayout()`, `query()`, `retrieve()`

Special Access Rules

Fields

Field Name	Details
ContentSize	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The file or folder size of the ContentFolderItem.</p>
FileExtension	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name	Details
	<p>Description</p> <p>Specifies the file extension if the ContentFolderItem is a file.</p>
FileType	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Specifies the type of file if ContentFolderItem is a file.</p>
IsFolder	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>Indicates that the ContentFolderItem is a folder, and not a file.</p>
ParentContentFolderId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The ID of the ContentFolder that the ContentFolderItem resides in.</p> <p>This is a relationship field.</p> <p>Relationship Name</p> <p>ParentContentFolder</p> <p>Relationship Type</p> <p>Lookup</p> <p>Refers To</p> <p>ContentFolder</p>
Title	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>The name of the file or folder.</p>

ContentFolderLink

Defines the association between a library and its root folder. This object is available in API version 34.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

- Salesforce CRM Content must be enabled to access ContentFolderLink.
- ContentFolderLink is read-only in the context of a library.

Fields

Field Name	Details
ContentFolderId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the folder. This is a relationship field.</p> <p>Relationship Name ContentFolder</p> <p>Relationship Type Lookup</p> <p>Refers To ContentFolder</p>
EnableFolderStatus	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Indicates the status of enabling folders for the library. Valid values are:</p> <ul style="list-style-type: none"> • C — Completed folder enablement • S — Started folder enablement • F — Failed folder enablement <p>This field is available in API version 39.0 and later.</p>

Field Name	Details
ParentEntityId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description Name of the entity the folder hierarchy is linked to.</p>

ContentFolderMember

Defines the association between a file and a folder. This object is available in API version 34.0 and later.

Supported Calls

`describeSObjects()`, `delete()`, `query()`, `retrieve()`, `update()`

Special Access Rules

- Salesforce CRM Content or Chatter must be enabled to access ContentFolderMember.
- All users with a content feature license can modify folders in their personal library.
- To modify ContentFolderMember, the user must be a member of the library and have permission to modify folders.

Fields

Field Name	Details
ChildRecordId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the file. This is a relationship field.</p> <p>Relationship Name ChildRecord</p> <p>Relationship Type Lookup</p> <p>Refers To ContentDocument</p>

Field Name	Details
ParentContentFolderId	<p>Type reference</p> <p>Properties Filter, Group, Sort, Update</p> <p>Description ID of the folder the file is in. This is a relationship field.</p> <p>Relationship Name ParentContentFolder</p> <p>Relationship Type Lookup</p> <p>Refers To ContentFolder</p>

ContentHubItem

Represents a file or folder in a Files Connect external data source, such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

Special Access Rules

Chatter and Files Connect must be enabled for the organization.

Supported Calls

`describeSObjects()`, `query()`, `search()`

Fields

Field Name	Details
ContentHubRepositoryId	<p>Type reference</p> <p>Properties Filter, Group, Nillable</p> <p>Description The ID for the related external data source described by the ContentHubRepository object.</p>

Field Name	Details
ContentModifiedDate	<p>Type dateTime</p> <p>Properties Nillable</p> <p>Description Date the file or folder content last changed.</p>
ContentSize	<p>Type int</p> <p>Properties Group, Nillable</p> <p>Description File or folder size.</p>
Description	<p>Type string</p> <p>Properties Filter, Group, Nillable</p> <p>Description Explanation of item in external data source.</p>
ExternalContentUrl	<p>Type url</p> <p>Properties Group, Nillable</p> <p>Description The URL of the document content in the external data source.</p>
ExternalDocumentUrl	<p>Type url</p> <p>Properties Group, Nillable</p> <p>Description The URL of the detail page in the external data source.</p>
ExternalId	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID for the file or folder in the external data source.</p>

Field Name	Details
FileExtension	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description File format extension, such as .doc or .pdf</p>
FileType	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description Complete file type, such as "Microsoft Word Document."</p>
IsFolder	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether item is a folder or file.</p>
MimeType	<p>Type string</p> <p>Properties Filter, Group, Nillable</p> <p>Description MIME type of the content.</p>
Name	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Name of the file or folder in the external data source.</p>
Owner	<p>Type string</p> <p>Properties Filter, Group, Nillable</p> <p>Description Username of the content owner in the external data source.</p>

Field Name	Details
ParentId	<p>Type string</p> <p>Properties Filter, Group, Nillable</p> <p>Description The ID of the parent folder for the record.</p> <p>This field isn't returned in queries or searches of the ContentHubItem object. It supports only WHERE clauses, such as the following:</p> <pre>WHERE ContentHubRepositoryId = <ID of external source> and ParentId = <ID of parent folder or record>.</pre> <p>Or specify <code>WHERE ParentId = <name of root folder></code> to return the children of the root folder.</p> <p> Tip: The ParentId field supports both Salesforce IDs (in the format "0CHxxx") and external IDs.</p>
Title	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description The title that appears in the content, which often differs from the Name of the containing file or folder.</p>
UpdatedBy	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description Username for the person who last updated the file.</p>

Usage

The following SOQL query examples show how to retrieve files and folders from a Files Connect external data source. These examples use placeholders for ID values for the repository ID and folder IDs. Before running these queries, replace the placeholders with valid ID values for your external data source and folders.

 **Important:** You must filter queries and searches on ContentHubItem with the ContentHubRepositoryId field; for example, `SELECT Id FROM ContentHubItem WHERE ContentHubRepositoryId = <ID of external data source>`.

Example 1: Get the ID and name of the root folder in an external file source.

```
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = NULL
```

Example 2: List all folders and files under the specified root folder.

```
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = '<root folder ID>'
```

Example 3: List all external file data sources by querying ContentHubRepository.

```
SELECT DeveloperName
FROM ContentHubRepository
```

Example 4: List all files and folders in a given folder and external file source.

```
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = '<parent folder ID>'
```

Example 5: To return only folders in the result set, add `IsFolder = true` in the `WHERE` clause to a query that returns files and folders. For example, the following query lists all folders under the root folder.

```
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = '<root folder ID>'
      AND IsFolder = true
```

Example 6: Retrieve a link that is used to open the specified document in an external source.

```
SELECT ExternalDocumentUrl
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND Id = '<document ID>'
```

SOSL Example: Retrieve the ID and name of all documents that contain the search string. The result set is limited to the first 10 documents.

```
FIND {<search string>}
RETURNING ContentHubItem(Id, Name
                        WHERE ContentHubRepositoryId = '<repository ID>')
LIMIT 10
```

ContentHubRepository

Represents a Files Connect external data source such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

Special Access Rules

Chatter and Files Connect must be enabled for the organization.

Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique name of the record in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated but you can supply your own value if you create the record using the API.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Master label for the external data source. This display value is the internal label and does not get translated.</p>
Type	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The data source type. Possible values are:</p> <ul style="list-style-type: none"> • <code>contenthubGoogleDrive</code> • <code>contenthubOffice365</code> • <code>contenthubOneDrive</code> • <code>contenthubSharepoint</code> • <code>contenthubBox</code> • <code>contenthubQuip</code>

ContentNote

Represents a note created with the enhanced note taking tool, released in Winter '16. This object is available in API version 32.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

- Notes must be enabled.

Fields

Field	Details
<code>Content</code>	<p>Type base64</p> <p>Properties Create, Nillable, Update</p> <p>Description The content or body of the note, which can include properly formatted HTML or plain text. When a document is uploaded or downloaded via the API, it must be base64 encoded (for upload) or decoded (for download). Any special characters within plain text in the <code>Content</code> field must be escaped. You can escape special characters by calling <code>content.escapeHtml4()</code>. If the input contains unsafe HTML characters, we automatically strip them out before saving the content.</p>
<code>ContentModifiedDate</code>	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Date the document was modified. <code>ContentModifiedDate</code> updates when, for example, the document is renamed or a new document version is uploaded. This field is available in API version 48.0 and later.</p>
<code>ContentSize</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Size of the note in bytes.</p>

Field	Details
CreatedById	<p>Type reference</p> <p>Properties Create (for users assigned the Set Audit Fields Upon Creation permission), Defaulted on createFilter, Group, Sort, Update (for users assigned the Set Audit Fields Upon Creation permission)</p> <p>Description ID of the user who created the note.</p>
CreatedDate	<p>Type dateTime</p> <p>Properties Create (for users assigned the Set Audit Fields Upon Creation permission), Defaulted on create, Filter, Sort, Update (for users assigned the Set Audit Fields Upon Creation permission)</p> <p>Description Date the note was created.</p>
FileExtension	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description File extension of the note.</p>
FileType	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Type of file for the note. All notes have a file type of <code>SNOTE</code>.</p>
Id	<p>Type id</p> <p>Properties Defaulted on createFilter, Group, Nillable, Sort</p> <p>Description ID of the note.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p>

Field	Details
	<p>Description Indicates whether the note has been deleted.</p>
IsReadOnly	<p>Type boolean</p> <p>Properties Defaulted on create, Group, Sort</p> <p>Description Indicates whether the note is read only.</p>
LastModifiedById	<p>Type reference</p> <p>Properties Defaulted on create, Filter, Group, Sort, Update (for users assigned the Set Audit Fields Upon Creation permission)</p> <p>Description The ID of the user who last modified the note.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Date the note was last viewed. This field is available in API version 35.0 and later.</p>
LatestContentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Lookup to the note's ContentBody. This field is available in API version 52.0 and later. This is a relationship field.</p> <p>Relationship Name LatestContent</p> <p>Relationship Type Lookup</p> <p>Refers To ContentBody</p>
LatestPublishedVersionId	<p>Type reference</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the ContentVersion for the latest published version of the note.</p>
OwnerId	<p>Type reference</p> <p>Properties Create (for users assigned the Set Audit Fields Upon Creation permission), Defaulted on create, Filter, Group, Sort, Update (for users assigned the Set Audit Fields Upon Creation permission)</p> <p>Description ID of the owner of the note.</p>
SharingPrivacy	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Controls sharing privacy for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is <code>Visible to Anyone With Record Access</code>. When set to <code>Private on Records</code>, the file is private on records but can be shared selectively with others.</p> <p>This field is available in API versions 41.0 and later.</p>
TextPreview	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A preview of the note's content. This field is available in API version 35.0 and later.</p>
Title	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Namefield, Sort, Update</p> <p>Description Title of the note.</p>

Usage

- Use ContentNote to create, query, retrieve, search, edit, and update notes.
- ContentNote is built on ContentVersion, and so it has many of the same usages.
- Not all fields can be set for notes. Only the Content and Title fields can be updated.
- The maximum file size you can upload via SOAP API is 50 MB. When a document is uploaded or downloaded via the API, it's converted to base64. This conversion increases the document size by approximately 37%. Account for the base64 conversion increase so that the file you plan to upload is less than 50 MB after conversion.
- You can convert old Note records to Lightning Experience, so users can view and edit notes from the Notes & Attachments related list in Lightning Experience. Users can edit their converted notes, which are accessible from the Notes related list and Notes tab. Copy old Note records to newly created ContentNote records. Users assigned the Set Audit Fields Upon Creation permission can set the owner, created date, and last modified date on ContentNote records.
- SOQL and SOSL queries on the ContentNote return only the most recent version of the note.
- To relate a note to a record, use [ContentDocumentLink](#).

For example, the following Apex code creates a note and escapes any special characters so they're converted to their HTML equivalents.

 **Note:** Apex code doesn't need to be encoded to base64 before it's uploaded and downloaded.

```
ContentNote cn = new ContentNote();
cn.Title = 'test1';
String body = 'Hello World. Before insert/update, escape special characters such as ", ',
    &, and other standard escape characters.';
cn.Content = Blob.valueOf(body.escapeHTML4());
insert(cn);
```

In this example, the following code creates a note using text that is already formatted as HTML, so it doesn't need to be escaped.

```
ContentNote cn = new ContentNote();
cn.Title = 'test2';
String body = '<b>Hello World. Because this text is already formatted as HTML, it does not
    need to be escaped.
    Special characters such as &quot;;, etc. must already use their HTML equivalents.</b>';
cn.Content = body;
insert(cn);
```

ContentNotification

Represents a notification for a file. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
EntityIdentifierId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the object with the notification.</p>
EntityType	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Type of object with the notification. One of the following.</p> <ul style="list-style-type: none"> • ContentDocument • ContentTagName • ContentVersion • ContentWorkspace • ContentWorkspacePermission • User
Nature	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Type of notification.</p>
Subject	<p>Type textarea</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Subject of the notification.</p>
Text	<p>Type textarea</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description Text of the notification.</p>
UsersId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the user who received the notification. This is a relationship field.</p> <p>Relationship Name Users</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>

ContentTagSubscription

Represents a subscription for a user following a tag on a file. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
UserId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the user following the tag on the file. This is a relationship field.</p>

Field	Details
	Relationship Name User
	Relationship Type Lookup
	Refers To User

ContentUserSubscription

Represents a subscription for a user following another user. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
SubscribedToUserId	Type reference
	Properties Filter, Group, Sort
	Description ID of the user who is followed by another user. This is a relationship field.
	Relationship Name SubscribedToUser
	Relationship Type Lookup
	Refers To User
SubscriberUserId	Type reference

Field	Details
	<p>Properties Filter, Group, Sort</p> <p>Description ID of the user who follows another user. This is a relationship field.</p> <p>Relationship Name SubscriberUser</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>

ContentVersion

Represents a specific version of a document in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content documents. This object is available in versions 20.0 and later for Salesforce Files.

The maximum number of versions that can be published in a 24-hour period is 200,000.

Note: Depending on how files are shared, queries on ContentDocument and ContentVersion without specifying an ID won't return all files a user has access to. For example, if a user only has access to a file because they have access to a record that the file is shared with, the file won't be returned in a query such as "SELECT Id FROM ContentDocument."

Supported Calls

`create()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

- All users with a content feature license can create versions in their personal library. Customer and Partner Portal users must also supply the `NetworkId` of the Experience Cloud site in the request.
- By default, users (including users with the "View All Data" permission) can only query files they have access to, including:
 - Salesforce Files in their personal library and in libraries they're a member of, regardless of library permissions (API version 17.0 and later).
 - Salesforce Files they own, shared directly with them, posted on their profile, or posted on groups they can see (API version 21.0 and later).

Enable the Query All Files permission to let your View All Data users bypass the restrictions on querying files.

- Query All Files returns all files, including files in non-member libraries and files in unlisted groups.
- Users can't edit, upload new versions, or delete files they don't have access to.
- View All Data permission is required to enable Query All Files.
- All users can update versions in their personal library.

- The owner of a version or document can update the document if they are a member of the library, regardless of library permissions.
- To update a Salesforce CRM Content document, the user must be a member of the library with one of these library privileges enabled:
 - Add Content
 - Add Content On Behalf of Others
 - Manage Library
- Customer and Partner Portal users must have the View Content in Portal permission to query content in libraries where they have access.
- Customer and Partner Portal users can only publish, version, or edit documents if they have a Salesforce CRM Content feature license.
- `FileType` is defined by either `ContentUrl` for links or `PathOnClient` for documents, but not both.
- In API version 34.0 and later, any file can be shared with libraries, whether the file originated in Chatter or in Salesforce CRM Content.
- In API version 39.0 and later, custom Apex download handlers can be created that can control access to documents. See the [Apex Developer Guide](#) for more information.

Fields

Field	Details
Checksum	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description MD5 checksum for the file.</p>
ContentBodyId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description Allows inserting a file version independently of the file blob being uploaded. This field is available for query and insert only. It can only point to a ContentBody record. This field is available in API version 40.0 and later.</p> <p>This is a relationship field.</p> <p>Relationship Name ContentBody</p> <p>Relationship Type Lookup</p> <p>Refers To ContentBody</p>
ContentDocumentId	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the document. This is a relationship field.</p> <p>Relationship Name ContentDocument</p> <p>Relationship Type Lookup</p> <p>Refers To ContentDocument</p>
ContentLocation	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description Origin of the document. Valid values are:</p> <ul style="list-style-type: none"> • S—Document is located within Salesforce. Label is Salesforce. • E—Document is located outside of Salesforce. Label is External. • L—Document is located on a social network and accessed via Social Customer Service. Label is Social Customer Service.
ContentModifiedById	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the user who modified the document. This is a relationship field.</p> <p>Relationship Name ContentModifiedBy</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
ContentModifiedDate	<p>Type dateTime</p>

Field	Details
	<p>Properties Create, Filter, Nillable, Sort</p> <p>Description Date the document was modified. ContentModifiedDate updates when, for example, the document is renamed or a new document version is uploaded. When uploading the first version of a document, ContentModifiedDate can be set to the current time or any time in the past.</p>
ContentSize	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Size of the document in bytes. Always zero for links.</p>
ContentUrl	<p>Type url</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description URL for links. This is only set for links. One of the fields that determines the FileType. The character limit in API versions 33.0 and later is 1,300. The character limit in API versions 32.0 and earlier was 255.</p>
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Description of the content version.</p>
Division	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the org has the Division permission enabled.</p>

Field	Details
ExternalDataSourceId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the external document referenced in the <code>ExternalDataSource</code> object. This is a relationship field.</p> <p>Relationship Name ExternalDataSource</p> <p>Relationship Type Lookup</p> <p>Refers To ExternalDataSource</p>
ExternalDocumentInfo1	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Stores the URL of the file in the external content repository. The integration from the external source determines the content for this string. After the reference or copy is created, the URL of the external file is updated when you:</p> <ul style="list-style-type: none"> • Republish a file reference in Lightning Experience • Open the document • Create a file reference in the Connect REST API with <code>reuseReference</code> set to true. <p>When the file is updated, the shared link is updated to the most current version.</p>
ExternalDocumentInfo2	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Contains the external file ID. Salesforce determines the content for this string, which is private. The content can change without notice, depending on the external system. After the file reference is created, this field isn't updated, even if the file path changes.</p>
FeaturedContentBoost	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description Read only. Designates a document as featured.</p>
FeaturedContentDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Date the document was featured.</p>
FileExtension	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description File extension of the document. This field is available in API version 31.0 and later.</p>
FileType	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Type of content determined by <code>ContentUrl</code> for links or <code>PathOnClient</code> for documents.</p>
FirstPublishLocationId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description ID of the location where the version was first published. If the version is first published into a user's personal library or My Files, the field will contain the ID of the user who owns the personal library or My Files. In Lightning Experience, if the first version is published into a public library, the field will contain the ID of that library. Accepts all record IDs supported by <code>ContentDocumentLink</code> (anything a file can be attached to, like records and groups). Setting <code>FirstPublishLocationId</code> allows you to create a file and share it with an initial record/group in a single transaction, and have the option to create more links to share the file with other records or groups later. When a file is created, it's automatically linked to the record, and <code>PublishStatus</code> will change to <code>Public</code> from <code>Pending/Personal</code>.</p>

Field**Details**

This field is only set the first time a version is published via the API.

`FirstPublishLocationId` can't be set to another ID when a new content version is inserted.

Note: Salesforce updates the `FirstPublishLocationId` updates automatically when a new `OwnerId` is added to the `ContentVersion`. For example, when you publish a new version with a different `OwnerId` than the current `OwnerId`, the `FirstPublishLocationId` of all previous versions updates to the previous `OwnerId`. The new published version sets the `FirstPublishLocationId` to the new `OwnerId`.

This is a polymorphic relationship field.

Field	Details
Language	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language for this document. This field defaults to the org's default language unless the multi language setting is enabled.</p> <p>Specifies the language of the labels returned. The value must be a valid user locale (language and country), such as <code>de_DE</code> or <code>en_GB</code>. For more information on locales, see the Language field on the <code>CategoryNodeLocalization</code> object.</p>
NegativeRatingCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Read only. The number of times different users have given the document a thumbs down.</p> <p>Rating counts for the latest version are not version-specific. If Version 1 receives 10 thumbs-down votes, and Version 2 receives 2 thumbs-down votes, the <code>NegativeRatingCount</code> on Version 2 is 12. However, rating counts are not retroactive for prior versions. The <code>NegativeRatingCount</code> on Version 1 is 10.</p>
NetworkId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description ID of the Experience Cloud site that this file originated from. This field is available in API version 26.0 and later, if digital experiences is enabled for your org.</p> <p>You can add a <code>NetworkId</code> only when creating a file. You can't change or add a <code>NetworkId</code> for an existing file.</p>
Origin	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description The source of the content version. Valid values are:</p> <ul style="list-style-type: none"> • C—Content document from the user's personal library. Label is Content. The <code>FirstPublishLocationId</code> must be the user's ID. If <code>FirstPublishLocationId</code> is left blank, it defaults to the user's ID.

Field	Details
	<ul style="list-style-type: none"> H—Salesforce file from the user's My Files. Label is Chatter. The <code>FirstPublishLocationId</code> must be the user's ID. If <code>FirstPublishLocationId</code> is left blank, it defaults to the user's ID. Origin can only be set to H if Chatter is enabled for your organization. <p>This field defaults to C. Label is Content Origin.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the owner of this document. This is a relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
PathOnClient	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The complete path of the document. One of the fields that determines the <code>FileType</code>.</p> <p> Note: Specify a complete path including the path extension in order for the document to be visible in the Preview tab.</p>
PositiveRatingCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Read only. The number of times different users have given the document a thumbs up. Rating counts for the latest version are not version-specific. If Version 1 receives 10 thumbs-up votes, and Version 2 receives 2 thumbs-up votes, the <code>PositiveRatingCount</code> on Version 2 is 12. However, rating counts are not retroactive for prior versions. The <code>PositiveRatingCount</code> on Version 1 is 10.</p>

Field	Details
PublishStatus	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description Indicates if and how the document is published. Valid values are:</p> <ul style="list-style-type: none"> • P—The document is published to a public library and is visible to other users. Label is Public. • R—The document is published to a personal library and is not visible to other users. Label is Personal Library. • U—The document is not published because publishing was interrupted. Label is Upload Interrupted.
RatingCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Read only. Total number of positive and negative ratings.</p>
ReasonForChange	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The reason why the document was changed. This field can only be set when inserting a new version (revising) a document.</p>
RecordTypeId	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description ID of the record type of the version. Custom fields are restricted in <code>RecordTypeId</code>. When an administrator creates a custom field via the API it must be added to at least one page layout:</p> <ul style="list-style-type: none"> • If the custom field is added to the page layout associated with the General record type, the <code>RecordTypeId</code> that corresponds to that record type does not have to be set on the version record.

Field	Details
	<ul style="list-style-type: none"> If the custom field is added to the page layout associated with a custom record type, the <code>RecordTypeId</code> that corresponds to that record type must be set on the version record.
SharingOption	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Controls whether sharing is frozen for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is <code>Allowed</code>, which means that new shares are allowed. When set to <code>Restricted</code>, new shares are prevented without affecting existing shares.</p> <p>This field is available in API versions 35.0 and later.</p>
SharingPrivacy	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Controls sharing privacy for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is <code>Visible to Anyone With Record Access</code>. When set to <code>Private on Records</code>, the file is private on records but can be shared selectively with others.</p> <p>This field is available in API versions 41.0 and later.</p>
TagCsv	<p>Type textarea</p> <p>Properties Create, Nillable, Sort, Update</p> <p>Description Text used to apply tags to a content version via the API.</p>
TextPreview	<p>Type string</p> <p>Properties Nillable, Filter, Group, Sort</p> <p>Description A preview of a document. Available in API version 35.0 and later.</p>
Title	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The title of a document.</p>
VersionData	<p>Type base64</p> <p>Properties Create, Nillable, Update</p> <p>Description The content or body of the note, which can include properly formatted HTML or plain text. When a document is uploaded or downloaded via the API, it should be base64 encoded (for upload) or decoded (for download). Any special characters within plain text in the <code>Content</code> field must be escaped. You can escape special characters by calling <code>content.escapeHtml4()</code>.</p> <p>This field can't be set for links.</p> <p>The maximum file size you can upload via the SOAP API is 50 MB. When a document is uploaded or downloaded via the API, it is converted to base64 and stored in <code>VersionData</code>. This conversion increases the document size by approximately 37%. Account for the base64 conversion increase so that the file you plan to upload is less than 50 MB after conversion.</p> <p>If a custom Apex download handler is active, this field is accessed from the API, and the download is not allowed, Salesforce will return a <code>CONTENT_CUSTOMIZED_DOWNLOAD_EXCEPTION</code> error.</p>
VersionNumber	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The version number. The number increments with each version of the document, for example, 1, 2, 3.</p>

Usage

- Use this object to create, query, retrieve, search, edit, and update a specific version of a Salesforce CRM Content document or Salesforce file. Use the `ContentDocument` object to retrieve, query, update, and delete the latest version of a document, but not a content pack, in a library or a Salesforce file.
- Use this object to create, query, retrieve, search, edit, and update a specific version of a Salesforce file. Use the `ContentDocument` object to retrieve, query, update, and delete the latest version of a Salesforce file.
- To query a file that is shared only with a record, you must specify the content ID of the file.
- Not all fields can be set for Salesforce Files.

- You can only update a version if it is the latest version and if it is published.
 - You can't archive versions.
 - Using API version 32.0 and later, you can update record types on versions.
 - You can't delete a version via the API.
 - The maximum file size you can upload via the SOAP API is 50 MB. When a document is uploaded or downloaded via the API, it is converted to base64 and stored in `VersionData`. This conversion increases the document size by approximately 37%. Account for the base64 conversion increase so that the file you plan to upload is less than 50 MB after conversion.
 - To download a document via the API, you must export the `VersionData` of the document. This does not increase the download count.
 - When you upload a document from your local drive using the Data Loader, you must specify the actual path in both `VersionData` and `PathOnClient`. `VersionData` identifies the location and extracts the format and `PathOnClient` identifies the type of document being uploaded.
 - SOQL queries on the ContentVersion object return all versions of the document. SOSL searches on the ContentVersion object return only the most recent version of the document.
 - If you query versions in the API, versions with a `PublishStatus` of `Upload Interrupted` are not returned.
 - Documents published into a personal library assume the default record type that is set for the user profile of the person publishing the document (General, if no default is set for the user profile).
-  **Note:** An administrator can rename the default (*Content Version Layout*) page layout.
- Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 200,000 new versions per 24-hour period. Developer Edition and trial users can publish a maximum of 2,500 new versions per 24-hour period.
 - Custom validation rules can prevent an update of documents published into a personal library via the API.

Applying Tags to ContentVersion Records

Tags can be applied to ContentVersion records using either Enterprise or Partner API.

To apply tags to a ContentVersion record, set a value in the `TagCsv` field. For example, setting this field to `one, two, three` creates and associates three tags to that version.

- The maximum length of the `TagCsv` field is 2,000 characters.
- The maximum length of an individual tag is 100 characters.
- When tags are applied to a version, the content is indexed automatically and the tags are searchable.
- You can't apply tags to a `TagCsv` that is published into a personal library.
- You can't apply tags using the ContentDocument object.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different uppercase and lowercase letters. The case of the original tag is always used.

To delete tags from a ContentVersion record, perform a standard API update, and remove any values from the `TagCsv` field that you want to delete. For example, if the original `TagCsv` is `one, two, three`, perform an API update specifying `one, three` in the `TagCsv` field to delete `two`. To delete all tags from a ContentVersion you perform a standard API update by setting the field to `null`.

If you create a ContentVersion record and want to revise it via the API, you insert another ContentVersion record but associate it to the same ContentDocument record as the original. This has an impact on tagging:

- If you insert the revision and do not set any value in the `TagCsv` field, any tags applied to the previous version are automatically applied to the new version.
- If you insert the revision and specify a new `TagCsv` field, no tags transfer over and the tags you specify are applied instead.

When you perform a SOQL query for a `ContentVersion` record and select the `TagCsv` field, all the tags associated with that record are returned. The tags in the string are always ordered alphabetically even if they were inserted in a different order. You can't use the `TagCsv` field as part of a filter in a SOQL query. You can't query all tags in your organization.

Library tagging rules:

- API tagging respects the tagging restrictions that exist on any library that the document is published into. For example, if the library is in restricted tagging mode and only allows tags `one, three`, you can't save a version with a `TagCsv` of `one, two, three`.
- If the library is in guided tagging mode, you can apply tags to the `ContentVersion`. You can't query the value of guided tags on a library, but you can query the tagging model of a library.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

[ContentVersionHistory](#)

History is available for tracked fields of the object.

SEE ALSO:

[ContentDocument](#)

[ContentVersionHistory](#)

ContentVersionComment

Represents a comment on a version of a file. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
<code>ContentDocumentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p>

Field	Details
	<p>Description ID of the file. This is a relationship field.</p> <p>Relationship Name ContentDocument</p> <p>Relationship Type Lookup</p> <p>Refers To ContentDocument</p>
ContentVersionId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the version of the file. This is a relationship field.</p> <p>Relationship Name ContentVersion</p> <p>Relationship Type Lookup</p> <p>Refers To ContentVersion</p>
UserComment	<p>Type textarea</p> <p>Properties Filter, Nillable, Sort</p> <p>Description ID of the user who commented on the file.</p>

ContentVersionHistory

Represents the history of a specific version of a document. This object is available in version 17.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

You can also enable `delete()` in API version 42.0 and later. See [Enable delete of Field History and Field History Archive](#).

Special Access Rules

- Customer and Partner Portal users must have the “View Content in Portal” permission to query content in libraries where they have access.
- A user can query all versions of a document from their personal library and any version that is part of or shared with a library where they are a member, regardless of library permissions.

 **Note:** To record an event in `contentVersionViewed`, make sure:

- All files are published to a Content Library.
- The details page is viewed in Salesforce Classic.

Fields

Field	Details
ContentVersionId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the version. This is a relationship field.</p> <p>Relationship Name ContentVersion</p> <p>Relationship Type Lookup</p> <p>Refers To ContentVersion</p>

For example, if your company is organized into different business units, you could create a division for each business unit, such as “North</p>

Field	Details
	America, "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.
Field	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The name of the field that was changed. Possible values include:</p> <ul style="list-style-type: none"> • <code>contentVersionCreated</code>—A new version is created. • <code>contentVersionUpdated</code>—The title, description, or any custom field on the version is changed. • <code>contentVersionDownloaded</code>—A version is downloaded. • <code>contentVersionViewed</code>—The version details are viewed. • <code>contentVersionRated</code>—The version is rated. • <code>contentVersionCommented</code>—The version receives a comment. • <code>contentVersionDataReplaced</code>—The new version replaces the previous version, which can happen only when the new version is uploaded immediately after the previous version.
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The new value of the field that was changed.</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The latest value of the field before it was changed.</p>

Usage

Use this read-only object to query the history of a document version.

SEE ALSO:

[ContentVersion](#)

ContentVersionRating

Represents a rating on a version of a file. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
<code>ContentVersionId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the version of the file. This is a relationship field.</p> <p>Relationship Name ContentVersion</p> <p>Relationship Type Lookup</p> <p>Refers To ContentVersion</p>

ContentWorkspace

Represents a content library. This object is available in versions 17.0 and later.

 **Note:** This object doesn't apply to personal libraries.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

 **Note:** `create()`, `update()` and `delete()` on `ContentWorkspace` are supported in API version 40.0 and later only.

Special Access Rules

- The Access Libraries user permission allows orgs to make libraries available to users without requiring that they have the legacy Salesforce CRM Content license. This permission is available for profiles and permission sets on most standard user licenses, and isn't available for High Volume Customer Portal, Customer Community, or Chatter Free licenses. Available in API versions 40.0 and later.
- Users with the Create Libraries user perm or the Manage Salesforce CRM Content administrator permission can create libraries (ContentWorkspaces) from the Libraries tab in Salesforce Classic and from the API.
- Customer and Partner Portal users can only edit the library document object if they have a Salesforce CRM Content feature license.
- Customer and Partner Portal users can query this object if they have the "View Content in Portal" permission. A user can query all public libraries where they're members, regardless of library permissions.
- Automated process users can't publish documents to libraries (ContentWorkspaces).

Fields

Field	Details
DefaultRecordTypeId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the default content type for the library. Content types are the containers for custom fields in Salesforce CRM Content.</p>
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Text description of the content library.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The unique name of the library in the API. Allows a link to the library to be packaged when an asset file is added to a package. Although libraries aren't a packageable entity, references to libraries with a developer name will be included in the package when asset files are packaged. These links can then be restored in the target org.</p> <p>This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Label is Unique Name.</p> <p>This field is available in API version 39.0 and later.</p>
IsRestrictContentTypes	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Read only. Indicates whether content types have been restricted (<code>true</code>) or not (<code>false</code>).</p>

Field	Details

Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Name of the library.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The unique name of the library in the API. Allows a link to the library to be packaged when an asset file is added to a package. Limit: 15 characters. This field is available in API version 39.0 and later.</p>
RootContentFolderId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of root folder of the library. This field is available in API version 39.0 and later.</p>
ShouldAddCreatorMembership	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Group</p> <p>Description Automatically create a library membership for the user creating the library. Note this field isn't meant for query and always returns false in query. This field is available in API version 40.0 and later.</p>
TagModel	<p>Type picklist</p>

Field**Details****Properties**

Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort

Description

The type of tagging assigned to a library. Valid values are:

- U — Unrestricted. No restrictions on tagging. Users can enter any tag when publishing or editing content.
- G — Guided. Users can enter any tag when publishing or editing content, but they're also offered a list of suggested tags.
- R — Restricted. Users must choose from a list of suggested tags.

WorkspaceImageId

Type

reference

Properties

Create, Filter, Group, Nillable, Sort, Update

Description

ID of a library image. Image files can be assigned to libraries for branding and easy identification. Library image is visible to all users, even if they aren't library members. This field is available in API version 43.0 and later.

ContentAsset

WorkspaceType

Type

picklist

Properties

Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort

Description

Differentiates between different types of libraries. Valid values are:

- R — Regular library

Field	Details
	<ul style="list-style-type: none"> • B — Org asset library <p>This field is available in API version 39.0 and later.</p>

Usage

Use this object to query libraries to find out where documents can be published.

If the content type isn't specified when publishing a new version into a library, it is determined by the `DefaultRecordTypeId` of the primary library.

As of 40.0, you can create, update, or delete a library via the API.

SEE ALSO:

[ContentWorkspaceDoc](#)

ContentWorkspaceDoc

Represents a link between a document and a public library in Salesforce CRM Content. This object is available in versions 17.0 and later.

 **Note:** This object does not apply to documents and versions in a personal library.

Supported Calls

`create()`, `delete()`, `describeObjects()` `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Customer and Partner Portal users must have the “View Content in Portal” permission in order to query and obtain content in libraries where they have access.
- Customer and Partner Portal users can only edit documents if they have a Salesforce CRM Content feature license.
- To create a `ContentWorkspaceDoc`, you must be a member of the library with one of these library privileges enabled:
 - “Add Content”
 - “Add Content On Behalf of Others”
 - “Manage Library”
- To query all library documents in a library, a user must be a member of that library, regardless of library permissions.

IsOwner	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Read only. Indicates whether the library owns the document and determines permissions for that document (<code>true</code>) or not (<code>false</code>). Documents can belong to more than one library, but only one library owns the document and determines its permissions.</p>

Usage

- Use this object to link a document to one or more libraries.
- To share a document with additional libraries, create additional ContentWorkspaceDoc records which join the document to the additional libraries.

- Inserting a ContentWorkspaceDoc triggers the publish process for public libraries.
- A document can be published into many public libraries, but it will always be owned by one library which controls the security of the document.
- A document can only be published into the document owner's personal library. You can't publish into another user's personal library. Personal libraries are not visible via the API.
- To publish a document into a personal library, you must specify your user ID as the first publish location ID. If you leave the first publish location ID blank, it defaults to the current user's ID.
- A document can be published from a personal library into a public library, but once it has been published into the public library, it can't be published into the personal library again.
- You can't publish a document from a personal library into a public library that has restricted content types.
- You can't update or delete a library document via the API.

SEE ALSO:

[ContentWorkspace](#)

ContentWorkspaceMember

Represents a member of a content library. This object is available in API version 40.0 and later.

Manage library membership from the API.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

A user can create/update/delete memberships if they have the Manage Salesforce CRM Content admin perm or the Manage Library permission for the library concerned.

Fields

Field	Details
ContentWorkspaceId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the library. This is a relationship field.</p> <p>Relationship Name ContentWorkspace</p>

Field	Details
	<p>Relationship Type Lookup</p> <p>Refers To ContentWorkspace</p>
ContentWorkspacePermissionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The id of the library permission or role. This is a relationship field.</p> <p>Relationship Name ContentWorkspacePermission</p> <p>Relationship Type Lookup</p> <p>Refers To ContentWorkspacePermission</p>
MemberId	<p>Type reference</p> <p>Properties Create, Filter, Group, Namepointing, Sort</p> <p>Description ID of the library member (the member is either a user or a group). This is a polymorphic relationship field.</p> <p>Relationship Name Member</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
MemberType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of library member. Valid values are:</p> <ul style="list-style-type: none"> • G - Group

Field	Details
	<ul style="list-style-type: none"> U - User

Usage

Use this object to create, update, or delete members from a library.

ContentWorkspacePermission

Represents a library permission. This object is available in API version 40.0 and later.

A library permission is a group of privileges assigned to each content library member. It determines which tasks a member can perform in a particular library. The same user can have a different library permission in each of his or her libraries.

Note: Library permissions do not apply to personal libraries. All library users can save files in their personal libraries.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

The ability to create permissions requires either the Manage Salesforce CRM Content admin perm or the Manage Content Permissions user perm.

Fields

Field	Details
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Namefield, Sort, Update</p> <p>Description Name of the library.</p>

Field	Details
PermissionsAddComment	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to post comments to any content in the library and view all comments in the library. Users can edit or delete their own comments.</p>
PermissionsAddContent	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to publish new content to the library, upload new content versions, or restore archived (deleted) content. Content authors can also change any tags associated with their content and archive or delete their own content.</p>
PermissionsAddContentOBO	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to choose an author when publishing content in the library.</p>
PermissionsArchiveContent	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to archive and restore any content in the library.</p>
PermissionsChatterSharing	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to make content from this library accessible outside of the library, sharing with a record or in Chatter. From a record or from Chatter, select a file from the library and attach it to a record or a post.</p>
PermissionsDeleteContent	<p>Type boolean</p>

Field	Details
	<p>Properties Create, Filter, Update</p> <p>Description Permission for user to delete any content in the library. Authors can undelete their own content from the Recycle Bin.</p>
PermissionsDeliverContent	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to share content outside the org via a content delivery or public link.</p>
PermissionsFeatureContent	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to identify any content in the library as "featured."</p>
PermissionsManageWorkspace	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to perform any action in the library. This privilege is required to edit a library's name and description, add or remove library members, or delete a library. Manage Library is a super permission which provides all other permission options listed except Deliver Content. Creating a library requires the Manage Salesforce CRM Content app permission or Create Libraries system permission.</p>
PermissionsModifyComments	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to edit or delete comments made to any content in the library.</p>
PermissionsOrganizeFileAndFolder	<p>Type boolean</p> <p>Properties Create, Filter, Update</p>

Field	Details
	<p>Description</p> <p>Permission for user to create, rename, and delete folders in libraries.</p>
PermissionsTagContent	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Filter, Update</p> <p>Description</p> <p>Permission for user to add tags when publishing content or editing content details in the library.</p>
PermissionsViewComments	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Filter, Update</p> <p>Description</p> <p>Permission for user to view comments.</p>
Type	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>Provides the type of access a user has to a library. Valid values are:</p> <ul style="list-style-type: none"> • Library Administrator • Author • Viewer • Custom

ContentWorkspaceSubscription

Represents a subscription for a user following a library. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
ContentWorkspaceId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the library. This is a relationship field.</p> <p>Relationship Name ContentWorkspace</p> <p>Relationship Type Lookup</p> <p>Refers To ContentWorkspace</p>
UserId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the user following the library. This is a relationship field.</p> <p>Relationship Name User</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>

Contract

Represents a contract (a business agreement) associated with an Account.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AccountId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. ID of the Account associated with this contract. This is a relationship field.</p> <p>Relationship Name Account</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>
ActivatedById	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the User who activated this contract. This is a relationship field.</p> <p>Relationship Name ActivatedBy</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
ActivatedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description Date and time when this contract was activated.</p>
BillingAddress	<p>Type address</p> <p>Properties Filter, Nillable</p>

Field	Details
	<p>Description</p> <p>The compound form of the billing address. Read-only. See Address Compound Fields for details on compound address fields.</p>
BillingCity	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Details for the billing address. Maximum size is 40 characters.</p>
BillingCountry	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Details for the billing address of this account. Maximum size is 80 characters.</p>
BillingCountryCode	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The ISO country code for the contract's billing address.</p>
BillingGeocodeAccuracy	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>The accuracy of the geocode for the billing address.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Address • Block • City • County • ExtendedZip • NearAddress • Neighborhood • State

Field	Details
	<ul style="list-style-type: none"> • Street • Unknown • Zip
BillingLatitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>BillingLongitude</code> to specify the precise geolocation of a billing address. Acceptable values are numbers between -90 and 90 with up to 15 decimal places.</p>
BillingLongitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>BillingLatitude</code> to specify the precise geolocation of a billing address. Acceptable values are numbers between -180 and 180 with up to 15 decimal places.</p>
BillingPostalCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details for the billing address of this account. Maximum size is 20 characters.</p>
BillingState	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details for the billing address. Maximum size is 80 characters.</p>
BillingStateCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO state code for the contract's billing address.</p>

Field	Details
BillingStreet	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Street address for the billing address.</p>
CompanySignedDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Date on which the contract was signed by your organization.</p>
CompanySignedId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the User who signed the contract. This is a relationship field.</p> <p>Relationship Name CompanySigned</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
ContractNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description Number of the contract.</p>
ContractTerm	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Number of months that the contract is valid.</p>

Field	Details
CustomerSignedDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Date on which the customer signed the contract.</p>
CustomerSignedId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the Contact who signed this contract. This is a relationship field.</p> <p>Relationship Name CustomerSigned</p> <p>Relationship Type Lookup</p> <p>Refers To Contact</p>
CustomerSignedTitle	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Title of the customer who signed the contract.</p>
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Description of the contract.</p>
EndDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort,</p>

Field	Details
	<p>Description Read-only. Calculated end date of the contract. This value is calculated by adding the <code>ContractTerm</code> to the <code>StartDate</code>.</p>
<code>IsDeleted</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
<code>LastActivityDate</code>	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Value is one of the following, whichever is the most recent:</p> <ul style="list-style-type: none"> • Due date of the most recent event logged against the record. • Due date of the most recently closed task associated with the record.
<code>LastApprovedDate</code>	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Last date the contract was approved.</p>
<code>LastReferencedDate</code>	<p>Type datetime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
<code>LastViewedDate</code>	<p>Type datetime</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
OwnerExpirationNotice	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Number of days ahead of the contract end date (15, 30, 45, 60, 90, and 120). Used to notify the owner in advance that the contract is ending.</p>
OwnerId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>ID of the user who owns the contract.</p> <p>This is a relationship field.</p> <p>Relationship Name</p> <p>Owner</p> <p>Relationship Type</p> <p>Lookup</p> <p>Refers To</p> <p>User</p>
Pricebook2Id	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>ID of the pricebook, if any, associated with this contract.</p>
RecordTypeId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Nillable, Update</p> <p>Description</p> <p>ID of the record type assigned to this object.</p>

Field	Details
ShippingAddress	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the shipping address. Read-only. See Address Compound Fields for details on compound address fields.</p>
ShippingCity	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details of the shipping address. City maximum size is 40 characters.</p>
ShippingCountry	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details of the shipping address. Country maximum size is 80 characters.</p>
ShippingCountryCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO country code for the contract's shipping address.</p>
ShippingLatitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>ShippingLongitude</code> to specify the precise geolocation of a shipping address. Acceptable values are numbers between -90 and 90 with up to 15 decimal places.</p>
ShippingLongitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description Used with <code>ShippingLatitude</code> to specify the precise geolocation of an address. Acceptable values are numbers between -180 and 180 with up to 15 decimal places.</p>
<code>ShippingPostalCode</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details of the shipping address. Postal code maximum size is 20 characters.</p>
<code>ShippingState</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details of the shipping address. State maximum size is 80 characters.</p>
<code>ShippingStateCode</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO state code for the contract's shipping address.</p>
<code>ShippingStreet</code>	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The street address of the shipping address. Maximum of 255 characters.</p>
<code>SpecialTerms</code>	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Special terms that apply to the contract.</p>
<code>StartDate</code>	<p>Type date</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Start date for this contract. Label is Contract Start Date.</p>
Status	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The picklist of values that indicate order status. Each value is within one of two status categories defined in <code>StatusCode</code>. For example, the status picklist may contain: Ready to Ship, Shipped, Received as values within the Activated <code>StatusCode</code>.</p>
StatusCode	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The status category for the contract. A contract can be Draft, InApproval, or Activated. Label is Status Category.</p>

Usage

The Contract object represents a business agreement.

The `Status` field specifies the current state of a contract. Status strings (defined in the `ContractStatus` object) represent its current state (Draft, InApproval, or Activated).

Client applications must initially create a Contract in a non-Activated state. Client applications can subsequently activate a Contract by updating it and setting the value in its `Status` field to Activated; however, the `Status` field is the only field you can update when activating the Contract.

Once a Contract has been activated, your client application can't change its status; however, prior to activation, your client application can change the status value from Draft to InApproval via the API. Also, your client application can delete contracts whose status is Draft or InApproval but not when a contract status is Activated.

Client applications can use the API to create, update, delete, and query any Attachment associated with a contract.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AccountChangeEvent (API version 46.0)

Change events are available for the object.

ContractFeed (API version 18.0)

Feed tracking is available for the object.

ContractHistory

History is available for tracked fields of the object.

SEE ALSO:

[ContractContactRole](#)

[ContractStatus](#)

ContractContactRole

Represents the role that a given Contact plays on a Contract.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
ContactId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the Contact associated with this Contract. This is a relationship field.</p> <p>Relationship Name Contact</p> <p>Relationship Type Lookup</p> <p>Refers To Contact</p>
ContractId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the Contract.</p>

Field	Details
	<p>This is a relationship field.</p> <p>Relationship Name Contract</p> <p>Relationship Type Lookup</p> <p>Refers To Contract</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
IsPrimary	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Specifies whether this Contact plays the primary role on this Contract (<code>true</code>) or not (<code>false</code>). Note that each contract has only one primary contact role. Default is <code>false</code>. Labels is Primary.</p>
Role	<p>Type picklist</p> <p>Properties Create, Filter, Nillable, Group, Sort, Update</p> <p>Description Name of the role played by the Contact on this Contract, such as Decision Maker, Approver, Buyer, and so on. Must be unique—there can't be multiple records in which the <code>ContractId</code>, <code>ContactId</code>, and <code>Role</code> values are identical. Different contacts can play the same role on the same contract. A contact can play different roles on the same contract.</p>

Usage

Use the `ContractContactRole` object to define the role that a given Contact plays on a given Contract within the context of a specific Opportunity.

SEE ALSO:

[ContractStatus](#)

ContractLineItem

Represents a product covered by a service contract (customer support agreement). This object is available in API version 18.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AssetId	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Required. ID of the Asset associated with the contract line item. Must be a valid asset ID.</p>
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Description of the contract line item.</p>
Discount	<p>Type percent</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The discount for the product as a percentage. When updating, if you specify <code>Discount</code> without specifying <code>TotalPrice</code>, the <code>TotalPrice</code> will be adjusted to accommodate the new <code>Discount</code> value, and the <code>UnitPrice</code> will be held constant. If you specify both <code>Discount</code> and <code>Quantity</code>, you must also specify either <code>TotalPrice</code> or <code>UnitPrice</code> so the system can determine which one to automatically adjust.</p>
EndDate	<p>Type date</p>

Field	Details
	<p>Properties Create, Filter, Nillable, Update</p> <p>Description The last day the contract line item is in effect.</p>
LastReferencedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
LineItemNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Update</p> <p>Description Automatically-generated number that identifies the contract line item.</p>
ListPrice	<p>Type currency</p> <p>Properties Filter, Nillable</p> <p>Description Corresponds to the <code>UnitPrice</code> on the <code>PricebookEntry</code> that is associated with this line item, which can be in the standard pricebook or a custom pricebook. A client application can use this information to show whether the unit price (or sales price) of the line item differs from the pricebook entry list price.</p>
LocationId	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The location associated with the contract line item.</p>
ParentContractLineItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The line item's parent line item, if it has one.</p>
PricebookEntryId	<p>Type reference</p> <p>Properties Create, Filter, Update</p> <p>Description Required. ID of the associated PricebookEntry. Only exists if Product2 is enabled.</p>
Product2Id	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The product related to the contract line item.</p>
Quantity	<p>Type double</p> <p>Properties Create, Filter, Update</p> <p>Description Number of units of the contract line item (product) included in the associated service contract.</p>
RootContractLineItemId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description (Read only) The top-level line item in a contract line item hierarchy. Depending on where a line item lies in the hierarchy, its root could be the same as its parent.</p>

Field	Details
ServiceContractId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description Required. ID of the ServiceContract associated with the contract line item. Must be a valid asset ID.</p>
StartDate	<p>Type date</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The first day the contract line item is in effect.</p>
Status	<p>Type picklist</p> <p>Properties Filter, Nillable</p> <p>Description Status of the contract line item.</p>
Subtotal	<p>Type currency</p> <p>Properties Filter, Nillable</p> <p>Description Contract line item's sales price multiplied by the <code>Quantity</code>.</p>
TotalPrice	<p>Type currency</p> <p>Properties Filter, Nillable</p> <p>Description This field is available only for backward compatibility. It represents the total price of the ContractLineItem</p> <p>If you specify <code>Discount</code> and <code>Quantity</code>, this field or <code>UnitPrice</code> is required.</p> <p>This field is nillable, but you can't set both <code>TotalPrice</code> and <code>UnitPrice</code> to null in the same update request. To insert the <code>TotalPrice</code> for a contract line item via the API (given only a unit price and the quantity), calculate this field as the unit price multiplied by the quantity.</p>

Field	Details
UnitPrice	<p>Type currency</p> <p>Properties Create, Filter, Update</p> <p>Description The unit price for the contract line item. In the user interface, this field's value is calculated by dividing the total price of the contract line item by the quantity listed for that line item. Label is Sales Price.</p> <p>This field or <code>TotalPrice</code> is required. You can't specify both.</p> <p>If you specify <code>Discount</code> and <code>Quantity</code>, this field or <code>TotalPrice</code> is required.</p>

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ContractLineItemChangeEvent (API version 44.0)

Change events are available for the object.

ContractLineItemHistory

History is available for tracked fields of the object.

ContractStatus

Represents the status of a Contract, such as Draft, InApproval, Activated, Terminated, or Expired.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object's name.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
ApiName	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description Uniquely identifies a picklist value so it can be retrieved without using an id or primary label.</p>

Field	Details
IsDefault	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether this is the default contract status value (<code>true</code>) or not (<code>false</code>) in the picklist.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Label for this contract status value. This display value is the internal label that does not get translated.</p>
SortOrder	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Number used to sort this value in the contract status picklist. These numbers are not guaranteed to be sequential, as some previous contract status values might have been deleted.</p>
StatusCode	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Code indicating the status of a contract. One of the following values:</p> <ul style="list-style-type: none"> • Draft • InApproval • Activated <p>Two other values (<code>Terminated</code> and <code>Expired</code>) are defined but are not available for use via the API.</p>

Usage

This object represents a value in the contract status picklist. The contract status picklist provides additional information about the status of a Contract, such as its current state (`Draft`, `InApproval`, or `Activated`). You can query these records to retrieve the set of

values in the contract status picklist, and then use that information while processing Contract objects to determine more information about a given contract. For example, the application could test whether a given contract is activated based on its `Status` value and the value of the `StatusCode` property in the associated `ContractStatus` object.

SEE ALSO:

[ContractContactRole](#)

ContractTag

Associates a word or short phrase with a Contract.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
<code>ItemId</code>	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description ID of the tagged item.</p>
<code>Name</code>	<p>Type string</p> <p>Properties Create, Filter</p> <p>Description Name of the tag. If this value does not already exist, a new <code>TagDefinition</code> is created and becomes the parent of this <code>Tag</code> object. Otherwise, a <code>TagDefinition</code> with the same name becomes the parent of this <code>Tag</code> object. Parent relationships are created automatically.</p>
<code>TagDefinitionId</code>	<p>Type reference</p> <p>Properties Filter</p> <p>Description ID of the parent <code>TagDefinition</code> object that owns the tag.</p>

Field Name	Details
Type	<p>Type picklist</p> <p>Properties Create, Filter, Restricted picklist</p> <p>Description Defines the visibility of a tag. Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

ContractTag stores the relationship between its parent TagDefinition and the Contract being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

Conversation

Represents a conversation between an end user and an agent. Available in API version 49.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
ConversationChannelId	<p>Type reference</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description The record ID of the channel used to initialize the conversation. This can either be a messaging channel for the Messaging product or a call center for the Service Cloud Voice product. Available in API version 50.0 and later.</p>

Field	Details
ConversationIdentifier	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description A unique identifier generated for the conversation.</p>
EndTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time that a conversation ends.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The autogenerated name of the conversation.</p>
StartTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time that a conversation starts.</p>

ConversationContextEntry

Represents the context of a message or an event in the chat history between an agent and a messaging user. This object is available in API version 47.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only authenticated internal and external users can access this object.

Fields

Field	Details
ConversationContextEntryName	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The autogenerated number of the entry.</p>
CustomDetailContextKey	<p>Type textarea</p> <p>Properties Create, Nillable</p> <p>Description The key or name of the pre-chat field specified by the admin in the pre-chat implementation, for example, <code>customer_email</code>.</p>
CustomDetailContextValue	<p>Type textarea</p> <p>Properties Create, Nillable</p> <p>Description The value entered in the pre-chat field by a user before starting the chat.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The Conversation ID this entry is associated with.</p>

ConversationEntry

Represents a message or an event in the chat history between an agent and a messaging user. This object is available in API version 43.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

To use the ConversationEntry object, enable the Access Conversation Entries user permission, which is available in API version 50.0 and later. Earlier versions do not require permissions.

Fields

Field	Details
ActorId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The ID of the author. The possible values can be <code>null</code> or any ID in the following domain set:</p> <ul style="list-style-type: none"> • BotDefinition • LiveChatVisitor • MessagingEndUser • User <p>This is a polymorphic relationship field.</p> <p>Relationship Name Actor</p> <p>Relationship Type Lookup</p> <p>Refers To MessagingEndUser, User</p>
ActorName	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The name of the author sending the message or event.</p>
ActorType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description The author of this entry in the chat history. The valid values include:</p> <ul style="list-style-type: none"> • Agent • Bot

Field	Details
	<ul style="list-style-type: none"> • EndUser • Supervisor • System
ClientDuration	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The length in milliseconds for the entry. This field is used with voice messages and other applicable use cases. This value may be 0 if not set by the client. This field is available in API version 51.0 and later.</p>
ClientTimestamp	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The timestamp sent by the client when it generated the entry. This field is available in API version 51.0 and later.</p>
ConversationId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The MessagingSession ID this entry belongs to. This is a polymorphic relationship field.</p> <p>Relationship Name Conversation</p> <p>Relationship Type Lookup</p> <p>Refers To MessagingSession, VoiceCall</p>
EntryEndTime	<p>Type datetime</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The timestamp that this entry ended in the chat history. This field is available in API version 48.0 and later.</p>

Field	Details
EntryTime	<p>Type datetime</p> <p>Properties Create, Filter, Sort</p> <p>Description The timestamp of this entry in the chat history.</p>
EntryTimeMillisecs	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The milliseconds value for the time when an entry was received by the server. Note that the related <code>EntryTime</code> field does not provide millisecond accuracy. This field is available in API version 51.0 and later.</p>
EntryType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description The type of entry in the chat history. Can be a message (<code>text</code>) or an event. The possible values include:</p> <ul style="list-style-type: none"> • <code>Text</code> • <code>AdminOptedIn</code> • <code>AdminOptedOut</code> • <code>BotEscalated</code> • <code>ChatbotClosedIdleSession</code> • <code>ChatbotEndedChatByAction</code>—Conversation ended by automated action • <code>ChatbotEndedTransferNotConfigured</code>—Conversation ended because transfer fail is not configured • <code>ChatbotEstablished</code> • <code>ChatbotNotEstablished</code> • <code>EndUserOptedIn</code> • <code>EndUserOptedOut</code>
HasAttachments	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p>

Field	Details
	<p>Description Indicates whether a message has attachments associated with it (<code>true</code>) or not (<code>false</code>).</p>
Message	<p>Type textarea</p> <p>Properties Create, Nillable</p> <p>Description The message or event sent by the author.</p>
MessageDeliverTime	<p>Type datetime</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description Unused field reserved for future use.</p>
MessageIdentifier	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p>
MessageReadTime	<p>Type datetime</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description Unused field reserved for future use.</p>
MessageSendTime	<p>Type datetime</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description Unused field reserved for future use.</p>
MessageStatus	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The status of the message sent by the author. The valid values include:</p>

Field	Details
	<ul style="list-style-type: none"> • Delivered • Error • Pending • Read • Sent
MessageStatusCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The code associated with a message status. <code>MessageStatusCode</code> is only populated when a message is undeliverable</p>
Seq	<p>Type int</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The sequence position of this entry in the chat history.</p>
ServerReceivedTimestamp	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The timestamp recorded when the server received the entry. This is a unique value and is used for ordering. This value can also be referred to as the “transcripted timestamp.” This field is available in API version 51.0 and later.</p>

ConversationParticipant

Represents an active participant in a conversation. A new `ConversationParticipant` record is created each time a participant joins a conversation. This object is available in API version 49.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
AppType	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The type of app used by the participant, such as Facebook, SMS, or Voice. The nillable property is available in API version 51.0 and later.</p>
ConversationId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The record ID of the conversation that this participant is part of.</p>
JoinedTime	<p>Type dateTime</p> <p>Properties Filter, Sort</p> <p>Description The date and time that a participant joined a conversation.</p>
LastActiveTime	<p>Type dateTime</p> <p>Properties Filter, Sort</p> <p>Description The date and time that a participant was last active during a conversation.</p>
LeftTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time that a participant left a conversation.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p>

Field	Details
	<p>Description The autogenerated name of the conversation participants.</p>
ParticipantContext	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description An identifier, such as a Facebook page, to add context about this participant.</p>
ParticipantEntityId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the record connected to this participant record, such as a Contact, Messaging End User, or User record.</p>
ParticipantKey	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A value that uniquely identifies this participant.</p>
ParticipantRole	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The role of this participant in the conversation, such as Agent, End User, or Supervisor.</p>

CorsWhitelistEntry

Represents an entry in the cross-origin resource sharing (CORS) allowlist. Origins included in the allowlist can request REST resources from that Salesforce org.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object's name.

Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The unique name of the record in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated but you can supply your own value if you create the record using the API.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
Language	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description This picklist contains the following fully-supported languages:</p> <ul style="list-style-type: none"> • Chinese (Simplified): <code>zh_CN</code> • Chinese (Traditional): <code>zh_TW</code> • Danish: <code>da</code> • Dutch: <code>n1_NL</code> • English: <code>en_US</code> • Finnish: <code>fi</code> • French: <code>fr</code> • German: <code>de</code> • Italian: <code>it</code> • Japanese: <code>ja</code> • Korean: <code>ko</code> • Norwegian: <code>no</code>

Field Name	Details
	<ul style="list-style-type: none"> • Portuguese (Brazil): <code>pt_BR</code> • Russian: <code>ru</code> • Spanish: <code>es</code> • Spanish (Mexico): <code>es_MX</code> Spanish (Mexico) defaults to Spanish for customer-defined translations. • Swedish: <code>sv</code> • Thai: <code>th</code> The Salesforce user interface is fully translated to Thai, but Help is in English.
<code>MasterLabel</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Primary label for the CORS allowlist entry.</p>
<code>NamespacePrefix</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description For managed packages, this field is the namespace prefix assigned to the package. For unmanaged packages, this field is blank.</p>
<code>UrlPattern</code>	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The origin URL pattern must include the HTTPS protocol (unless you're using your localhost) and a domain name, and can include a port. The wildcard character (*) is supported and must be in front of a second-level domain name. For example, <code>https://*.example.com</code> adds all subdomains of <code>example.com</code> to the allowlist.</p> <p>The origin URL pattern can be an IP address. But an IP address and a domain that resolve to the same address aren't the same origin, and you must add them to the CORS allowlist as separate entries.</p> <p>Google Chrome™ and Mozilla® Firefox® browser extensions are also allowed as resources in API version 53 and later. Chrome extensions must use the prefix <code>chrome-extension://</code> and 32 characters without digits or capital letters, for example <code>chrome-extension://abdkkegmcbiomijcbdaodaf1gehffed</code>. Firefox extensions must use the prefix <code>moz-extension://</code> and an 8-4-4-4-12 format of small alphanumeric characters, for example <code>moz-extension://1234ab56-78c9-1df2-3efg-4567891hi1j2</code>.</p>

Usage

Cross-Origin Resource Sharing (CORS) allows web browsers to request resources from other origins. For example, using CORS, the JavaScript for a web application at `https://www.example.com` can request a resource from `https://www.salesforce.com`. To allow access to supported Salesforce APIs, Apex REST resources, and Lightning Out from JavaScript code in a web browser, add the requesting origin to your Salesforce CORS allowlist.

If a browser that supports CORS makes a request to an origin in the Salesforce CORS allowlist, Salesforce returns the origin in the `Access-Control-Allow-Origin` HTTP header, along with any additional CORS HTTP headers. If the origin isn't included in the allowlist, Salesforce returns HTTP status code 403.

 **Important:** CORS doesn't support requests for unauthenticated resources, including OAuth endpoints. You must pass an OAuth token with requests that require it.

CORS is a W3C recommendation to enable browsers to request resources from origins other than their own.

Coupon

A coupon associated with a promotion. This object is available in API version 54.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

The Coupon object is available only if the B2B Commerce license is enabled.

Fields

Field	Details
CouponCode	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Coupon code for the coupon. A buyer can use the coupon code to qualify for a promotion.</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description Available only for orgs with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.</p>

Field	Details
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Description of the coupon.</p>
EndTime	<p>Type dateTime</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The end date and time when the coupon is no longer active.</p>
LastReferencedDate	<p>Type datetime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type datetime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description Name of the coupon.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description The ID of the owner of this coupon. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
PromotionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the promotion associated with the coupon. This is a relationship field.</p> <p>Relationship Name Promotion</p> <p>Relationship Type Lookup</p> <p>Refers To Promotion</p>
StartDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The start date and time when the coupon is active.</p>
Status	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Status of the coupon. Possible values are:</p> <ul style="list-style-type: none"> • Active • Inactive

Field	Details
	The default value is <code>Inactive</code>

CreditMemo

Represents a document that is used to adjust or rectify errors made in an invoice. The invoice has already been processed and sent to a customer. This object is available in API version 48.0 and later.

A credit memo always decreases the balance of an invoice or invoice lines. Users can apply positive credit memos to positive invoices or invoice lines, and negative credit memos to negative invoices or invoice lines. For example, a \$10 credit memo would reduce the balance of a \$100 invoice line to \$90. A -\$10 credit memo would reduce the balance of a -\$100 credit memo to -\$110.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

To access these entities, your org must have a Salesforce Order Management license. These entities are available only in Lightning Experience.

Fields

Field	Details
<code>Balance</code>	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Amount of the credit memo available for allocation.</p>
<code>BillToContactId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description Inherited from the account's Bill to Account. This is a relationship field.</p> <p>Relationship Name BillToContact</p>

Field	Details
	<p>Relationship Type Lookup</p> <p>Refers To Contact</p>
BillingAccountId	<p>Type reference</p> <p>Properties Filter, Group, Sort, Update</p> <p>Description The customer account for this invoice. This is a relationship field.</p> <p>Relationship Name BillingAccount</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>
CreditDate	<p>Type date</p> <p>Properties Filter, Group, Sort, Update</p> <p>Description The date that the credit memo was posted.</p>
CreditMemoNumber	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description System number for the credit memo.</p>
Description	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description Description of the credit memo.</p>

Field	Details
DocumentNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description System-generated number for organization of financial documents. Can be sequential or random.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
OwnerId	<p>Type reference</p> <p>Properties Filter, Group, Sort, Update</p> <p>Description The user who owns a credit memo record. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
ReferenceEntityId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description The ID of the order or order summary that created this credit memo.</p>
Status	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Status of the credit memo. Possible values are:</p> <ul style="list-style-type: none"> • Cancelled: Reserved for future use. • Draft: The credit memo is not yet recorded as a financial transaction. Certain fields can still be edited. • Pending: Reserved for future use. • Posted: The credit memo has been recorded as a financial transaction. Most fields can't be edited.
TotalAdjustmentAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Sum of TotalAmount values for the credit memo's adjustment lines.</p>
TotalAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Sum of the credit memo's TotalLineAmount and TotalAdjustmentAmount.</p>
TotalAmountWithTax	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Total credit memo amount, with tax included.</p>
TotalChargeAmount	<p>Type currency</p>

Field	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description Sum of <code>TotalAmount</code> values for the credit memo's charge lines. values for all of this credit memo's credit memo lines.</p>
<code>TotalTaxAmount</code>	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Sum of <code>TotalAmount</code> values for the credit memo's tax lines.</p>

CreditMemoLine

Represents a partial or full application of a credit memo's balance against an invoice or invoice line. This object is available in API version 48.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

To access these entities, your org must have a Salesforce Order Management license. These entities are available only in Lightning Experience.

Fields

Field	Details
<code>AdjustmentAmount</code>	<p>Type currency</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description Sum of adjustments made to the credit memo.</p>
<code>ChargeAmount</code>	<p>Type currency</p>

Field	Details
	<p>Properties Filter, Nillable, Sort, Update</p> <p>Description Sum of charges made to the credit memo.</p>
CreditMemoId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the parent credit memo. This is a relationship field.</p> <p>Relationship Name CreditMemo</p> <p>Relationship Type Lookup</p> <p>Refers To CreditMemo</p>
Description	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description Description of the credit memo line.</p>
EndDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description For credit memos made from a time-based service, the end date of the billing for the service.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort, Update</p> <p>Description Name of the credit memo line.</p>

Field	Details
Product2Id	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description The product that was charged or ordered to create the credit memo line. This is a relationship field.</p> <p>Relationship Name Product2</p> <p>Relationship Type Lookup</p> <p>Refers To Product2</p>
ReferenceEntityItemId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description The order item or adjustment item that created the credit memo line.</p>
ReferenceEntityType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The type of transaction that created the credit memo line. Possible values are:</p> <ul style="list-style-type: none"> • DeliveryCharge • OrderProduct
ReferenceEntityTypeCode	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The type of object that created the credit memo line. Possible values are:</p> <ul style="list-style-type: none"> • Charge • Product

Field	Details
RelatedLineId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description The original invoice line that was adjusted or taxed. This is a relationship field.</p> <p>Relationship Name RelatedLine</p> <p>Relationship Type Lookup</p> <p>Refers To CreditMemoLine</p>
StartDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description For credit memo lines made from a time-based service, the first date of the billing for the service.</p>
Status	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description State of the credit memo line. Inherited from the invoice's status.</p>
TaxAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description Total tax for the credit memo.</p>
TaxCode	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description The code used to calculate tax rate for the invoice line.</p>
TaxEffectiveDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description The date used to calculate the credit memo line's TaxAmount.</p>
TaxName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description User-defined name for applied tax.</p>
TaxRate	<p>Type percent</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description Percentage value used for calculating tax.</p>
TotalAmount	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The total amount of the credit memo line before any applicable tax.</p>
TotalAmountWithTax	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Total amount of tax for this credit memo line, with tax included. Sum of TotalAmount and TaxAmount.</p>
Type	<p>Type picklist</p>

Field	Details
	<p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Shows the type of transaction for the invoice line.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Adjustment • Charge • Tax

Crisis

Represents a major crisis event that affects an Employee in an InternalOrganizationUnit. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

Work.com uses this object to track and describe crisis situations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access this object, you must be assigned a Workplace Command Center permission set license and the Provides access to Workplace Command Center features system permission.

Fields

Field	Details
<code>CrisisType</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. The type or category of crisis.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Economic Crisis • Natural Disaster

Field	Details
	<ul style="list-style-type: none"> • Pandemic • War
Description	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The crisis description.</p>
EndDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date the crisis ended.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Required. The crisis record name.</p>
OwnerId	<p>Type reference</p>

Field	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the user who currently owns this record. Default value is the user logged in to the API to perform the create operation.</p>
StartDate	<p>Type date</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. The date the crisis started.</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

CrisisHistory (API version 49.0)

History is available for tracked fields of the object.

CrisisOwnerSharingRule

Sharing rules are available for the object.

CrisisShare (API version 49.0)

Sharing is available for the object.

[Workplace Command Center for Work.com Developer Guide: Extend Work.com with Custom Solutions](#)

CronJobDetail

Contains details about the associated scheduled job, such as the job's name and type. This object is available in API version 29.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
JobType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of the associated scheduled job. The following are the available job types. Each job type label is listed with its value in parenthesis. Use the job type value when querying for a specific job type.</p> <ul style="list-style-type: none"> • 1—Data Export • 3—Dashboard Refresh • 4—Reporting Snapshot • 6—Scheduled Flow • 7—Scheduled Apex • 8—Report Run • 9—Batch Job • A—Reporting Notification
Name	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description The name of the associated scheduled job.</p>

Usage

Use this object to query additional information about a scheduled job, such as the job's name and type.

CronTrigger

Contains schedule information for a scheduled job. CronTrigger is similar to a cron job on UNIX systems. This object is available in API version 17.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
CronExpression	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The cron expression used to initiate the schedule.</p> <p>Syntax:</p> <div style="border: 1px solid #add8e6; padding: 5px; margin: 10px 0;"> <p><i>Seconds Minutes Hours Day_of_month Month Day_of_week Optional_year</i></p> </div> <p>See schedule(jobName, cronExpression, schedulableClass) in the <i>Apex Reference Guide</i>.</p>
CronJobDetailId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the CronJobDetail record containing more details about this scheduled job.</p> <p>This is a relationship field.</p> <p>Relationship Name CronJobDetail</p> <p>Relationship Type Lookup</p> <p>Refers To CronJobDetail</p>
EndTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time when the job either finished or will finish.</p>
NextFireTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The next date and time the job is scheduled to run. null if the job is not scheduled to run again.</p>
OwnerId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Owner of the job.</p>
PreviousFireTime	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The most recent date and time the job ran. null if the job has not run before current local time.</p>
StartTime	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The date and time when the most recent iteration of the scheduled job started.</p>
State	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The current state of the job. The job state is managed by the system. Possible values are:</p> <ul style="list-style-type: none"> • WAITING—The job is waiting for execution. • ACQUIRED—The job has been picked up by the system and is about to execute. • EXECUTING—The job is executing. • COMPLETE—The trigger has fired and is not scheduled to fire again. • ERROR—The trigger definition has an error. • DELETED—The job has been deleted. • PAUSED—A job can have this state during patch and major releases. After the release has finished, the job state is automatically set to WAITING or another state.

Field	Details
	<ul style="list-style-type: none"> BLOCKED—Execution of a second instance of the job is attempted while one instance is running. This state lasts until the first job instance is completed. PAUSED_BLOCKED—A job has this state due to a release occurring. When the release has finished and no other instance of the job is running, the job's status is set to another state.
TimesTriggered	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of times this job has been triggered.</p>
TimeZoneSidKey	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Returns the timezone ID. For example, <i>America/Los_Angeles</i>.</p>

Usage

Use this object to query scheduled jobs in your organization.

CspTrustedSite

Represents a CSP Trusted Site. The Lightning Component framework uses Content Security Policy (CSP) to impose restrictions on content. The main objective is to help prevent cross-site scripting (XSS) and other code injection attacks. To use third-party APIs that make requests to an external (non-Salesforce) server or to use a WebSocket connection, add a CSP Trusted Site. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
Context	<p>Type picklist</p>

Field	Details
	<p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Declares the scope of trust for the listed third-party host.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • <code>All</code>—Whitelists the host for both Lightning Experience and Experience Builder sites. • <code>Communities</code>—Whitelists the host for Experience Builder sites only. • <code>FieldServiceMobileExtension</code>—Whitelists the host for the Field Service Mobile Extensions only. • <code>LEX</code>—Whitelists the host for Lightning Experience only.
Description	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The description of the trusted site. Limit: 255 characters.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The developer name of the trusted site.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
EndpointUrl	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The URL for the trusted site.</p>
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the trusted site is active.</p>

Field	Details
<code>IsApplicableToConnectSrc</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if Lightning components can load URLs using script interfaces from this site.</p>
<code>IsApplicableToFontSrc</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if Lightning components can load fonts from this site.</p>
<code>IsApplicableToFrameSrc</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if Lightning components can load resources contained in <code><iframe></code> elements from this site.</p>
<code>IsApplicableToImgSrc</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if Lightning components can load images from this site.</p>
<code>IsApplicableToMediaSrc</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if Lightning components can load audio and video from this site.</p>
<code>IsApplicableToStyleSrc</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description Indicates if Lightning components can load style sheets from this site.</p>
Language	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language for the trusted site.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Master label for this trusted site.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Namespace prefix for this trusted site.</p>

Usage

CSP is a W3C standard that defines rules to control the source of content that can be loaded on a page. All CSP rules work at the page level, and apply to all components and libraries. By default, the framework's headers allow content to be loaded only from secure (HTTPS) URLs and forbid XHR requests from JavaScript.

When you configure a CSP Trusted Site, you can add the site's URL to the list of allowed sites for the following directives in the CSP header.

- `connect-src`
- `frame-src`
- `img-src`
- `style-src`
- `font-src`
- `media-src`

This change to the CSP header directives allows Lightning components to load resources, such as images, styles, and fonts, from the site. It also allows client-side code to make requests to the site.

CurrencyType

Represents the currencies used by an organization for which the multicurrency feature is enabled.

Supported Calls

`create()`, `describeSObjects()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

- This object is not available in single-currency organizations.
- You need the “Customize Application” permission to edit this object.
- Your client application can't delete this object.
- Customer Portal users can't access this object.

Fields

Field	Details
<code>ConversionRate</code>	<p>Type double</p> <p>Properties Filter</p> <p>Description Required. Conversion rate of this currency type against the corporate currency.</p>
<code>DecimalPlaces</code>	<p>Type int</p> <p>Properties Filter</p> <p>Description Required. For this currency, specifies the number of digits to the right of the decimal point, such as zero (0) for JPY or 2 for USD.</p>
<code>IsActive</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether this currency type is active (<code>true</code>) or not (<code>false</code>). Inactive currency types do not appear in picklists in the user interface. Label is Active. This field defaults to <code>false</code> if no value is provided when updating or inserting a record.</p>

Field	Details
IsCorporate	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether this currency type is the corporate currency (<code>true</code>) or not (<code>false</code>). Label is Corporate Currency. All other currency conversion rates are applied against this corporate currency. If a currency is already defined as the corporate currency in the user interface, it can't be unset. When a non-corporate currency is set to a corporate currency, the system reconfigures all conversion rates based on the new corporate currency.</p>
IsoCode	<p>Type picklist</p> <p>Properties Filter, Restricted picklist</p> <p>Description Required. ISO code of the currency. Must be one of the valid alphabetic, three-letter currency ISO codes defined by the ISO 4217 standard, such as <code>USD</code>, <code>GBP</code>, or <code>JPY</code>. Must be unique within your organization. Label is Currency ISO Code.</p>

Usage

This object is for multicurrency organizations only. Use this object to define the currencies your organization uses.

When updating an existing record, make sure to provide values for all fields to avoid undesired changes to the `CurrencyType`. For example, if a value for `IsActive` is not provided, the default (`false`) is used, which could result in a currently active `CurrencyType` becoming inactive.

[DatedConversionRate](#)

[Object Basics](#)

CustomBrand

Represents a custom branding and color scheme. This object is available in API version 28.0 and later.

Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

This object is available only when your org has digital experiences enabled.

Fields

Field Name	Details
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the parent entity that this branding applies to. The parent entity can be an Experience Cloud site, organization, topic, or reputation level.</p> <p>The branding applies to the entity that the <code>ParentId</code> references. For example, if the <code>ParentId</code> references a network ID, the branding applies to that Experience Cloud site only, and if the <code>ParentId</code> references an organization ID, the branding applies to the organization that it is accessed through, and so on. Label is <code>Branded Entity ID</code>.</p>

Usage

Use this object along with [CustomBrandAsset](#) to apply a custom branding scheme to your Experience Cloud site. The branding scheme for the site shows in both the user interface and in the Salesforce mobile app. You must have Create and Manage Experiences to customize site branding.

You can also use this object to apply a custom branding scheme to your org when it is accessed through the Salesforce mobile app.

SEE ALSO:

[Network](#)

CustomBrandAsset

Represents a branding element in a custom branding scheme. For example, a color, logo image, header image, or footer text. A `CustomBrandAsset` can apply to an Experience Cloud site or to an org using the Salesforce mobile app. This object is available in API version 28.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

This object is available only when your org has digital experiences enabled.

Fields

Field Name	Details
AssetCategory	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Values include:</p> <ul style="list-style-type: none"> • MotifZerenaryColor—The background color for the header. Label is <code>Zerenary motif color</code>. If this CustomBrandAsset is for a network, this is the header color for the network. If it is for an org, this is the header color when users access the Salesforce mobile app. • MotifPrimaryColor—The color used for the active tab. Label is <code>Primary motif color</code>. Not used for the Salesforce mobile app branding. • MotifSecondaryColor—The color used for the top borders of lists and tables. Label is <code>Secondary motif color</code>. Not used for the Salesforce mobile app branding. • MotifTertiaryColor—The background color for section headers on edit and detail pages. Label is <code>Tertiary motif color</code>. Not used for the Salesforce mobile app branding. • MotifQuaternaryColor—If this CustomBrandAsset is for a network, this is the background color for network pages. If it is for an org, this is the background color on a splash page. Label is <code>Quaternary motif color</code>. • MotifZerenaryComplementColor—Font color used with <code>zerenaryColor</code>. Label is <code>Zerenary motif colors complement color</code>. • MotifPrimaryComplementColor—Font color used with <code>primaryColor</code>. Label is <code>Primary motif colors complement color</code>. Not used for the Salesforce mobile app branding. • MotifTertiaryComplementColor—Font color used with <code>tertiaryColor</code>. Label is <code>Tertiary motif colors complement color</code>. Not used for the Salesforce mobile app branding.

Field Name	Details
	<ul style="list-style-type: none"> • MotifQuaternaryComplementColor—Font color used with <code>quaternaryColor</code>. Label is <code>Quaternary motif colors complement color</code>. Not used for the Salesforce mobile app branding.
	<ul style="list-style-type: none"> • PageHeader—An image that appears on the header of the pages. Can be an <code>.html</code>, <code>.gif</code>, <code>.jpg</code>, or <code>.png</code> file. Label is <code>Page Header</code>. Not used for the Salesforce mobile app branding.
	<ul style="list-style-type: none"> • PageFooter—An image that appears on the footer of the pages. Must be an <code>.html</code> file. Label is <code>Page Footer</code>. Not used for the Salesforce mobile app branding.
	<ul style="list-style-type: none"> • LoginFooterText—The text that appears in the footer of the login page. Label is <code>Footer text displayed on the login page</code>. Not used for the Salesforce mobile app branding.
	<ul style="list-style-type: none"> • LoginLogoImageId—The logo that appears on the login page for external users. In the Salesforce mobile app, this logo also appears on the Experience Cloud site splash page. Label is <code>Logo image displayed on the login page</code>.
	<ul style="list-style-type: none"> • LargeLogoImageId—Only used for the Salesforce mobile app. The logo that appears on the splash page when you start the Salesforce mobile app. Label is <code>Large logo image</code>.
	<ul style="list-style-type: none"> • SmallLogoImageId—Only used for the Salesforce mobile app. The logo that appears on the publisher in the Salesforce mobile app. Label is <code>Small logo image</code>.
	<ul style="list-style-type: none"> • StaticLogoImageUrl—The logo that appears on the login page for external users. Label is <code>Static logo image url</code>.
	<ul style="list-style-type: none"> • LoginQuaternaryColor—The background color that appears on the Experience Cloud site login page for external users. Label is <code>Login background color</code>.
	<ul style="list-style-type: none"> • LoginRightFrameUrl—The URL to the contents that appears on right side of the Experience Cloud site login page for external users. Label is <code>Login right frame url</code>.
	<ul style="list-style-type: none"> • LogoAssetId—Navigation tile menu item images. Label is <code>Logo asset image</code>.
	<ul style="list-style-type: none"> • LoginPrimaryColor—The background color of the login button. Label is <code>Login primary color</code>.
	<ul style="list-style-type: none"> • LoginBackgroundImageUrl—The path to the image URL that appears as the background on the Experience Cloud site's login page. Label is <code>Background image url</code>.
	<ul style="list-style-type: none"> • LargeLogoAssetId—Navigational topic images. Label is <code>Large logo asset image</code>.

Field Name	Details
	<ul style="list-style-type: none"> MediumLogoAssetId—Featured topic images. Label is Medium logo asset image.
AssetSourceId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the document uploaded to the Documents folder if the value of AssetCategory is:</p> <ul style="list-style-type: none"> PageHeader PageFooter LoginLogoImageId LargeLogoImageId SmallLogoImageId <p>ID of the content asset if the value of the AssetCategory is:</p> <ul style="list-style-type: none"> LogoAssetId LargeLogoAssetId MediumLogoAssetId

ForeignKeyAssetId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>This field was removed in API version 41.0, and is available in earlier versions for backward compatibility only. Use <code>AssetSourceId</code> instead.</p> <p>ID of the document used if the value of <code>AssetCategory</code> is <code>PageHeader</code>, <code>PageFooter</code>, or <code>LoginLogoImageId</code>.</p>
TextAsset	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>Text used if the <code>AssetCategory</code> is <code>LoginFooterText</code>.</p>

Usage

Use this object to add basic branding elements—color scheme, header or footer images, login page logo, or footer text—to the branding scheme ([CustomBrand](#)) for your Experience Cloud site. You must have Create and Manage Experiences to customize site branding.

If you're using digital experiences in the Salesforce mobile app, the loading page shows the logo.

SEE ALSO:

[Network](#)

CustomHelpMenuItem

Represents the items within a section of the Lightning Experience help menu that the admin added to display custom, org-specific help resources. This object is available in API version 44.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Packaging Considerations

Although you can package custom Help Menu section information, the section won't appear in the Help Menu Setup page or the Help Menu user interface of orgs where the package is installed. Instead, customers must view the data in the `CustomHelpMenuItem` and `CustomHelpMenuSection` objects and then manually add resources on the Help Menu Setup page. See [Define Custom Help for the Lightning Experience Help Menu](#) for more information.

Fields

Field	Details
LinkUrl	<p>Type url</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description Required. The URL for the resource. Specify up to 1,000 characters.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. The name of the resource. Specify up to 100 characters.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the custom help section the item belongs to. This is a relationship field.</p> <p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To CustomHelpMenuSection</p>
SortOrder	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. The order of the item within the custom section. Valid values are 1 through 15.</p>

CustomHelpMenuSection

Represents a section of the Lightning Experience help menu that the admin added to display custom, org-specific help resources. This object is available in API version 44.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Packaging Considerations

Although you can package custom Help Menu section information, the section won't appear in the Help Menu Setup page or the Help Menu user interface of orgs where the package is installed. Instead, customers must view the data in the CustomHelpMenuItem and CustomHelpMenuSection objects and then manually add resources on the Help Menu Setup page. See [Define Custom Help for the Lightning Experience Help Menu](#) for more information.

Fields

Field	Details
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The unique name of the custom help section in the API. This name can contain only underscores and alphanumeric characters and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. The label corresponds to section title in the user interface. Limit: 80 characters.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance slows down while Salesforce generates one for each record.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
Language	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Required. Language of the label. Possible values are:</p> <ul style="list-style-type: none"> da (Danish)

Field	Details
	<ul style="list-style-type: none"> • de (German) • en_US (English) • es (Spanish) • es_MX (Spanish (Mexico)) • fi (Finnish) • fr (French) • it (Italian) • ja (Japanese) • ko (Korean) • nl_NL (Dutch) • no (Norwegian) • pt_BR (Portuguese (Brazil)) • ru (Russian) • sv (Swedish) • th (Thai) • zh_CN (Chinese (Simplified)) • zh_TW (Chinese (Traditional))
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. The name of the resource. Specify up to 100 characters.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> • In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.

Field	Details
	<ul style="list-style-type: none"> In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

CustomHTTPHeader

Represents a custom HTTP header that provides context information from Salesforce such as region, org details, or the role of the person viewing the external object. This object is available in API version 43.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

As of Spring '20 and later, only authenticated internal and external users can access this object.

Fields

Field Name	Details
<code>Description</code>	<p>Type textarea</p> <p>Properties Filter, Nillable, Sort</p> <p>Description A text description of the header field's purpose.</p>
<code>HeaderFieldName</code>	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Name of the header field. The name must contain at least one alphanumeric character or underscore. It can also include: <code>! # \$ % & ' * + - . ^ _ ` ~</code></p>
<code>HeaderFieldValue</code>	<p>Type string</p> <p>Properties Filter, Sort</p>

Field Name	Details
	<p>Description</p> <p>A formula that resolves to the value for the header. The values in the formula must evaluate to a string. If the formula resolves to null and an empty string, the header isn't sent.</p>
IsActive	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>Indicates whether the custom HTTP header is available to use.</p>
ParentId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>ID of the entity that the custom HTTP header is related to.</p> <p>This is a polymorphic relationship field.</p> <p>Relationship Name</p> <p>Parent</p> <p>Relationship Type</p> <p>Lookup</p> <p>Refers To</p> <p>ExternalDataSource, NamedCredential</p>

Usage

For each OData external data source, define up to 10 HTTP headers to request data.

 **Note:** HTTP headers aren't supported on named credentials.

CustomNotificationType

Stores information about custom notification types. This object is available in API version 47.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
CustomNotifTypeName	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Unique, Update</p> <p>Description Specifies a notification type name. The notification type name is unique within your organization. Maximum number of characters: 80.</p>
Description	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Specifies a general description of the notification type, which is displayed with the notification type name. Maximum number of characters: 255.</p>
Desktop	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the desktop delivery channel is enabled (<code>true</code>) or not (<code>false</code>). The default is <code>false</code>.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Specifies the API name of the notification type.</p>
Language	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Specifies the language of the custom notification type. The value for this field is the language value of the org.</p>

Field	Details
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Specifies the notification type label.</p>
Mobile	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the mobile delivery channels is enabled (<code>true</code>) or not (<code>false</code>). The default is <code>false</code>.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Specifies the namespace of the notification type, if installed with a managed package.</p>

CustomPermission

Represents a permission created to control access to a custom process or app, such as sending email. This object is available in API version 31.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

As of Summer '20 and later, only users who have one of these permissions can access this object:

- View Setup and Configuration
- Manage Session Permission Set Activations
- Assign Permission Sets

Fields

Field Name	Details
Description	<p>Type textarea</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A description of the custom permission. Limit: 255 characters.</p>
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique name of the custom permission in the API. This name can contain only underscores and alphanumeric characters and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. The label corresponds to Name in the user interface. Limit: 80 characters.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
IsLicensed	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description When enabled (true) indicates that the appropriate Salesforce license is required before accessing the permission. This field is available in API version 50.0 and later.</p>
Language	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language of the custom permission. Valid values are:</p> <ul style="list-style-type: none"> Chinese (Simplified): zh_CN

Field Name	Details
	<ul style="list-style-type: none"> • Chinese (Traditional): zh_TW • Danish: da • Dutch: nl_NL • English: en_US • Finnish: fi • French: fr • German: de • Italian: it • Japanese: ja • Korean: ko • Norwegian: no • Portuguese (Brazil): pt_BR • Russian: ru • Spanish: es • Spanish (Mexico): es_MX Spanish (Mexico) defaults to Spanish for customer-defined translations. • Swedish: sv • Thai: th The Salesforce user interface is fully translated to Thai, but Help is in English.
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The custom permission label, which corresponds to Label in the user interface. Limit: 80 characters.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the namespacePrefix__componentName notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> • In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the

Field Name	Details
	<p>installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.</p> <ul style="list-style-type: none"> In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

Usage

Use the CustomPermission object to determine users' access to custom permissions.

For example, to query all permission sets where the Button1 permission is enabled:

```
SELECT Id, DeveloperName,
(select Id, Parent.Name, Parent.Profile.Name from SetupEntityAccessItems)
FROM CustomPermission
WHERE DeveloperName = 'Button1'
```

To query all permission sets and profiles with custom permissions:

```
SELECT Assignee.Name, PermissionSet.Id,
PermissionSet.Profile.Name,
PermissionSet.isOwnedByProfile,
PermissionSet.Label
FROM PermissionSetAssignment
WHERE PermissionSetId
IN (SELECT ParentId
FROM SetupEntityAccess
WHERE SetupEntityType =
'CustomPermission')
```

To query for all SetupEntityAccess rows with custom permissions:

```
SELECT Id, ParentId, Parent.Name, SetupEntityId
FROM SetupEntityAccess
WHERE SetupEntityType='CustomPermission'
AND ParentId
IN (SELECT Id
FROM PermissionSet
WHERE isOwnedByProfile = false)
```

[CustomPermissionDependency](#)

[PermissionSet](#)

[Profile](#)

[SetupEntityAccess](#)

CustomPermissionDependency

Represents the dependency between two custom permissions when one custom permission requires that you enable another custom permission. This object is available in API version 32.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

As of Spring '20 and later, only users with View Setup and Configuration permission can access this object.

Fields

Field Name	Details
CustomPermissionId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the custom permission that requires the permission that's specified in <code>RequiredCustomPermissionId</code>. This is a relationship field.</p> <p>Relationship Name CustomPermission</p> <p>Relationship Type Lookup</p> <p>Refers To CustomPermission</p>
RequiredCustomPermissionId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the custom permission that must be enabled when <code>CustomPermissionId</code> is enabled. This is a relationship field.</p> <p>Relationship Name RequiredCustomPermission</p>

Field Name	Details
	<p>Relationship Type Lookup</p> <p>Refers To CustomPermission</p>

Usage

The following Apex class contains a method that returns the IDs of all custom permissions that are required for the given custom permission ID. To use this class, save it in your organization.

```
public class CustomPermissionUtil {
    public String[] getAllRequiredCustomPermissions(String customPermId) {
        return getAllRequiredHelper(new String[]{customPermId});
    }

    private String[] getAllRequiredHelper(String[] customPerms) {
        CustomPermissionDependency[] requiredPerms = [SELECT RequiredCustomPermissionId
                                                    FROM CustomPermissionDependency
                                                    WHERE CustomPermissionId
                                                    IN :customPerms];

        String[] requiredPermIds = new String[{}];
        for (CustomPermissionDependency cpd : requiredPerms) {
            requiredPermIds.add(cpd.RequiredCustomPermissionId);
        }
        if (requiredPermIds.size() > 0) {
            customPerms.addall(getAllRequiredHelper(requiredPermIds));
            return customPerms;
        } else {
            return customPerms;
        }
    }
}
```

For more information about using Apex classes, see the [Apex Developer Guide](#).

[CustomPermission](#)

Customer

Represents the customer role of an individual with respect to a particular company or organization. This object is available in API version 53.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
CustomerStatusType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The status of the customer account.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Active • Inactive
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Required. Name of this customer.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the user who owns the record.</p> <p>This is a polymorphic relationship field.</p>

Field	Details
	<p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
PartyId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Required. Represents the individual object related to this customer record. This is a relationship field.</p> <p>Relationship Name Party</p> <p>Relationship Type Lookup</p> <p>Refers To Individual</p>
TotalLifeTimeValue	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The total revenue amount gained from this customer.</p>

DandBCompany

Represents a Dun & Bradstreet® company record, which is associated with an account added from Data.com. This object is available in API version 25.0 and later.

 **Note:** When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see [Data.com Prospector and Clean Retirement](#).

 **Warning:** You can update fields in the DandBCompany object; however, field changes may be overwritten by Data.com Clean jobs or by using the Data.com Clean button.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Only organizations with Data.com Premium Prospector or Data.com Premium Clean can access this object.

Fields

Field Name	Details
Address	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the address. Read-only. See Address Compound Fields for details on compound address fields.</p>
City	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The city where a company is physically located. Maximum size is 40 characters.</p>
CompanyCurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The code used to represent a company's local currency. This data is provided by the International Organization for Standardization (ISO) and is based on their three-letter currency codes. For example, USD is the ISO code for United States Dollar. Maximum size is 3 characters.</p>
Country	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The country where a company is physically located. Maximum size is 40 characters.</p>

Field Name	Details
CountryAccessCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The required code for international calls. Maximum size is 4 characters.</p>
CurrencyCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The currency in which the company's sales volume is expressed. The full list of values can be found at the Optimizer Resources page maintained by Dun & Bradstreet. Maximum size is 4 characters.</p>
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description A brief description of the company, which may include information about its history, its products and services, and its influence on a particular industry. Maximum size is 32000 characters.</p>
DomesticUltimateBusinessName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The primary name of the Domestic Ultimate, which is the highest ranking subsidiary, specified by country, within an organization's corporate structure. Maximum size is 255 characters.</p>
DomesticUltimateDunsNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The D-U-N-S Number for the Domestic Ultimate, which is the highest ranking subsidiary, specified by country, within an organization's corporate structure. Maximum size is 9 characters.</p>

Field Name	Details
DunsNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the Dun & Bradstreet database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking. Maximum size is 9 characters.</p>
EmployeeQuantityGrowthRate	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The yearly growth rate of the number of employees in a company expressed as a decimal percentage. The data includes the total employee growth rate for the past two years.</p>
EmployeesHere	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The number of employees at a specified location, such as a branch location. Maximum size is 15 characters.</p>
EmployeesHereReliability	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The reliability of the <code>EmployeesHere</code> figure. Available values include:</p> <ul style="list-style-type: none"> • 0—Actual number • 1—Low • 2—Estimated (for all records) • 3—Modeled (for non-US records)
EmployeesTotal	<p>Type double</p>

Field Name	Details
	<p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The total number of employees in the company, including all subsidiary and branch locations. This data is only available on records that have a value of <i>Headquarters/Parent</i> in the <code>LocationStatus</code> field. Maximum size is 15 characters.</p>
EmployeesTotalReliability	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The reliability of the <code>EmployeesTotal</code> figure. Available values include:</p> <ul style="list-style-type: none"> • 0—Actual number • 1—Low • 2—Estimated (for all records) • 3—Modeled (for non-US records) <p>A blank value indicates this data is unavailable.</p>
FamilyMembers	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The total number of family members, worldwide, within an organization, including the Global Ultimate, its subsidiaries (if any), and its branches (if any). Maximum size is 5 characters.</p>
Fax	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The company's facsimile number.</p>
FifthNaics	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description An additional NAICS code used to further classify an organization by industry. Maximum size is 6 characters.</p>
FifthNaicsDesc	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A brief description of an organization's line of business, based on the corresponding NAICS code. Maximum size is 120 characters.</p>
FifthSic	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.</p>
FifthSic8	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.</p>
FifthSic8Desc	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.</p>
FifthSicDesc	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.</p>
FipsMsaCode	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The Federal Information Processing Standards (FIPS) and the Metropolitan Statistical Area (MSA) codes identify the organization's location. The MSA codes are defined by the US Office of Management and Budget. Maximum size is 5 characters.</p>
FipsMsaDesc	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>A brief description of an organization's FIPS MSA code. Maximum size is 255 characters.</p>
FortuneRank	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The numeric value of the company's Fortune 1000 ranking. A null or blank value means that the company isn't ranked as a Fortune 1000 company.</p>
FourthNaics	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>An additional NAICS code used to further classify an organization by industry. Maximum size is 6 characters.</p>
FourthNaicsDesc	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p>

Field Name**Details**

Field Name	Details
	<p>Description A brief description of an organization's line of business, based on the corresponding NAICS code. Maximum size is 120 characters.</p>
FourthSic	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.</p>
FourthSic8	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.</p>
FourthSic8Desc	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.</p>
FourthSicDesc	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.</p>
GeoCodeAccuracy	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>The level of accuracy of a location's geographical coordinates compared with its physical address. Available values include:</p> <ul style="list-style-type: none"> • A – <i>Non-US rooftop accuracy</i> • B – <i>Block level</i> • C – <i>Places the address in the correct city</i> • D – <i>Rooftop level</i> • I – <i>Street intersection</i> • M – <i>Mailing address level</i> • N – <i>Not matched</i> • P – <i>PO BOX location</i> • S – <i>Street level</i> • T – <i>Census tract level</i> • Z – <i>ZIP code level</i> • 0 (zero) – <i>Geocode could not be assigned</i>
GlobalUltimateBusinessName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The primary name of the Global Ultimate, which is the highest entity within an organization's corporate structure and may oversee branches and subsidiaries. Maximum size is 255 characters.</p>
GlobalUltimateDunsNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The D-U-N-S Number of the Global Ultimate, which is the highest entity within an organization's corporate structure and may oversee branches and subsidiaries. Maximum size is 9 characters.</p>
GlobalUltimateTotalEmployees	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>The total number of employees at the Global Ultimate, which is the highest entity within an organization's corporate structure and may oversee branches and subsidiaries. Maximum size is 15 characters.</p>
ImportExportAgent	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Identifies whether a business imports goods or services, exports goods or services, and/or is an agent for goods. Available values include:</p> <ul style="list-style-type: none"> • A—Importer/exporter/agent • B—Importer/exporter • C—Importer • D—Importer/agent • E—Exporter/agent • F—Agent (keeps no inventory and does not take title goods) • G—None or data not available • H—Exporter
IncludedInSnP500	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>A true or false value. If <code>true</code>, the company is listed in the S&P 500 Index. If <code>false</code>, the company isn't listed in the S&P 500 Index.</p>
Latitude	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Used with longitude to specify a precise location, which is then used to assess the Geocode Accuracy. Maximum size is 11 characters.</p>
LegalStatus	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p>

Field Name	Details
	<p>Description Identifies the legal structure of an organization.</p>
LocationStatus	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Identifies the organizational status of a company. Available values are <i>Single location</i>, <i>Headquarters/Parent</i>, and <i>Branch</i>. Available values include:</p> <ul style="list-style-type: none"> • 0—Single location (no other entities report to the business) • 1—Headquarters/parent (branches and/or subsidiaries report to the business) • 2—Branch (secondary location to a headquarters location)
Longitude	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Used with latitude to specify a precise location, which is then used to assess the Geocode Accuracy. Maximum size is 11 characters.</p>
MailingAddress	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the mailing address. Read-only. See Address Compound Fields for details on compound address fields.</p>
MailingCity	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The city where a company has its mail delivered. Maximum size is 40 characters.</p>
MailingCountry	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>The country where a company has its mail delivered. Maximum size is 40 characters.</p>
MailingPostalCode	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The postal code that a company uses on its mailing address. Maximum size is 20 characters.</p>
MailingState	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The state where a company has its mail delivered. Maximum size is 20 characters.</p>
MailingStreet	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The street address where a company has its mail delivered. Maximum size is 255 characters.</p>
MarketingPreScreen	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>The probability that a company will pay with a significant delay compared to the agreed terms. The risk level is based on the standard Commercial Credit Score, and ranges from low risk to high risk. Available values include:</p> <ul style="list-style-type: none"> • L—<i>Low risk of delinquency</i> • M—<i>Moderate risk of delinquency</i> • H—<i>High risk of delinquency</i> <p> Important: Use this information for marketing pre-screening purposes only.</p>

Field Name	Details
MarketingSegmentationCluster	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Twenty-two distinct, mutually exclusive profiles, created as a result of cluster analysis of Dun & Bradstreet data for US organizations.</p>
MinorityOwned	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates whether an organization is owned or controlled by a member of a minority group. Available values include:</p> <ul style="list-style-type: none"> • Y—Minority owned • N—Not minority owned
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The primary or registered name of a company. Maximum size is 255 characters.</p>
NationalId	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The identification number used in some countries for business registration and tax collection. Maximum size is 255 characters.</p>
NationalIdType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description A code value that identifies the type of national identification number used. The full list of resources can be found at the Optimizer Resources page maintained by Dun & Bradstreet. Maximum size is 5 characters.</p>

Field Name	Details
OutOfBusiness	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates whether the company at the specified address has discontinued operations. Available values include:</p> <ul style="list-style-type: none"> • Y—Out of business • N—Not out of business
OwnOrRent	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates whether a company owns or rents the building it occupies. Available values include:</p> <ul style="list-style-type: none"> • 0—Unknown or not applicable • 1—Owns • 2—Rents
ParentOrHqBusinessName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The primary name of the parent or headquarters company. Maximum size is 255 characters.</p>
ParentOrHqDunsNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The D-U-N-S Number for the parent or headquarters. Maximum size is 9 characters.</p>
Phone	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description A company's primary telephone number.</p>
PostalCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The postal code that corresponds to a company's physical location. Maximum size is 20 characters.</p>
PremisesMeasure	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A numeric value for the measurement of the premises.</p>
PremisesMeasureReliability	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A descriptive accuracy of the measurement such as actual, estimated, or modeled.</p>
PremisesMeasureUnit	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A descriptive measurement unit such as acres, square meters, or square feet.</p>
PrimaryNaics	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the US business economy. The full list of</p>

Field Name	Details
	values can be found at the Optimizer Resources page maintained by Dun & Bradstreet. Maximum size is 6 characters.
PrimaryNaicsDesc	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A brief description of an organization's line of business, based on its NAICS code. Maximum size is 120 characters.</p>
PrimarySic	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The four-digit Standard Industrial Classification (SIC) code is used to categorize business establishments by industry. ThirdSic8Desc	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.</p>
ThirdSicDesc	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.</p>
TradeStyle1	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>A name, different from its legal name, that an organization may use for conducting business. Similar to "Doing business as" or "DBA". Maximum size is 255 characters.</p>
TradeStyle2	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>An additional tradestyle used by the organization. Maximum size is 255 characters.</p>
TradeStyle3	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>An additional tradestyle used by the organization. Maximum size is 255 characters.</p>
TradeStyle4	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>An additional tradestyle used by the organization. Maximum size is 255 characters.</p>
TradeStyle5	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>An additional tradestyle used by the organization. Maximum size is 255 characters.</p>
URL	<p>Type</p> <p>url</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An organization's primary website address. Maximum size is 104 characters.</p>
UsTaxId	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The identification number for the company used by the Internal Revenue Service (IRS) in the administration of tax laws. Also referred to as Federal Taxpayer Identification Number. Maximum size is 9 characters.</p>
WomenOwned	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates whether a company is more than 50 percent owned or controlled by a woman. Available values include:</p> <ul style="list-style-type: none"> • Y—Owned by a woman • N—Not owned by a woman, or unknown
YearStarted	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The year the company was established or the year when current ownership or management assumed control of the company. Maximum size is 4 characters.</p>

Usage

Use this object to manage D&B Company records in your organization.

Dashboard

Represents a dashboard, which shows data from custom reports as visual components. Access is read-only. This object is available in API version 20.0 and later.

Supported Calls

`describeSObjects()`, `describeLayout()`, `query()`, `retrieve()`, `search()`

Fields

Field	Details
BackgroundDirection	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description Returns the direction of the background fade. Available values are:</p> <ul style="list-style-type: none"> • Top to Bottom • Left to Right • Diagonal (default value) <p>Label is Background Fade Direction.</p>
BackgroundEnd	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Returns the ending fade color in hexadecimal. Label is Ending Color.</p>
BackgroundStart	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Returns the starting fade color in hexadecimal. Label is Starting Color.</p>
Description	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Returns the description of the dashboard. Limit: 255 characters.</p>
DeveloperName	<p>Type string</p>

Field

Details

Properties

Filter, Group, Sort

Description

Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is `Dashboard Unique Name`.

Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.

FolderId

Type

reference

Properties

Filter, Group, Sort

Description

Required. Returns the ID of the Folder that contains the dashboard. See `Folder`.

This is a relationship field.

Relationship Name

Folder

Relationship Type

Lookup

Refers To

Folder, User

FolderName

Type

string

Properties

Filter, Nillable, Sort

Description

Name of the folder that contains the dashboard. Available in API version 35.0 and later.

IsDeleted

Type

boolean

Properties

Defaulted on create, Filter

Field	Details
	<p>Description</p> <p>Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
LastReferencedDate	<p>Type</p> <p>datetime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type</p> <p>datetime</p> <p>Properties</p> <p>Filter, Nillable, Sort,</p> <p>Description</p> <p>The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
LeftSize	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>Returns the size of the left column of the dashboard.</p> <p>Available values are:</p> <ul style="list-style-type: none"> • Narrow • Medium • Wide
MiddleSize	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>Returns the size of the middle column of the dashboard.</p> <p>Available values are:</p> <ul style="list-style-type: none"> • Narrow

Field	Details
	<ul style="list-style-type: none"> • Medium • Wide
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the namespacePrefix__componentName notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> • In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
RightSize	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Returns the size of the right column in the dashboard.</p> <p>Available values are:</p> <ul style="list-style-type: none"> • Narrow • Medium • Wide
RunningUserId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description Returns the ID of the running user specified for the dashboard.</p> <p>If the dashboard was created in Lightning Experience and is configured to run as the viewing user, returns the user ID of the dashboard creator.</p>

Field	Details
	<p>If the dashboard was created in Salesforce Classic and is configured to run as the logged-in user, returns the user ID of the last specified running user.</p> <p>This is a relationship field.</p> <p>Relationship Name RunningUser</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
TextColor	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Returns the body text color in hexadecimal. Label is <code>Text Color</code>.</p>
Title	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description Returns the title of the dashboard. Limit: 80 characters.</p>
TitleColor	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Returns the title text color in hexadecimal. Label is <code>Title Color</code>.</p>
TitleSize	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Returns the title font size in points. Label is <code>Title Size</code>.</p>
Type	<p>Type picklist</p>

Field	Details
	<p>Properties</p> <p>Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>Returns the dashboard type. Available values are:</p> <ul style="list-style-type: none"> • <code>SpecifiedUser</code>—The dashboard displays data according to the access level of one specific running user. • <code>LoggedInUser</code>—The dashboard displays data according to the access level of the logged-in user. • <code>MyTeamUser</code>—The dashboard displays data according to the access level of the logged-in user, and managers can view dashboards from the point of view of users beneath them in the role hierarchy.

Supported Query Scopes

Use these scopes to help specify the data that your SOQL query returns.

allPrivate

Records saved in all users' private folders.

Requires the user permission "Manage All Private Reports and Dashboards" and [Enhanced Analytics Folder Sharing](#). If your organization was created after the Summer '13 release, you already have Enhanced Analytics Folder Sharing. Available in API version 36.0 and later.

created

Records created by the user running the query.

everything

All records except records saved in other users' private folders.

mine

Records saved in the private folder of the user running the query.

Usage

Provides read only access to the current values in the dashboard fields.

Example: Dashboards in an Inactive User's Private Folder

This SOQL query returns dashboards saved in a specific user's private folder.

```
SELECT Id FROM Dashboard USING SCOPE allPrivate WHERE CreatedByID = '005A0000000Bc2deFG'
```

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

DashboardFeed

Feed tracking is available for the object.

SEE ALSO:

[DashboardTag](#)

[Report](#)

DashboardComponent

Represents a dashboard component, which can be a chart, metric, table, or gauge on a dashboard. Access is read-only. This object is available in API version 21.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
CustomReportId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Requires the user permission "Manage All Private Reports and Dashboards." The ID of the report that provides data for the dashboard component. See Report.</p>
DashboardId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the dashboard that contains the dashboard component. See Dashboard. This is a relationship field.</p> <p>Relationship Name Dashboard</p> <p>Relationship Type Lookup</p> <p>Refers To Dashboard</p>

Field	Details
Name	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the dashboard component.</p>

Usage

Provides read only access to the current values in dashboard component fields.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

[DashboardComponentFeed](#)

Feed tracking is available for the object.

DashboardTag

Associates a word or short phrase with a Dashboard. This object is available in API version 20.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ItemId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description ID of the tagged item.</p>
Name	<p>Type string</p> <p>Properties Create, Filter</p>

Field Name	Details
	<p>Description</p> <p>Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>
TagDefinitionId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Restricted picklist</p> <p>Description</p> <p>Defines the visibility of a tag.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

DashboardTag stores the relationship between its parent TagDefinition and the Dashboard being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

[Dashboard](#)

DataAssessmentFieldMetric

Represents summary statistics for matched, blank, and differing fields in account records of an org compared to records in Data.com. This object is available in API version 37.0 and later.

 **Note:** When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see [Data.com Prospector and Clean Retirement](#).

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Child Relationships

DataAssessmentFieldMetric is a child object of [DataAssessmentMetric](#) object.

Fields

Field Name	Details
DataAssessmentMetricId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description A unique number that identifies the parent DataAssessmentMetric record. This is a relationship field.</p> <p>Relationship Name DataAssessmentMetric</p> <p>Relationship Type Lookup</p> <p>Refers To DataAssessmentMetric</p>
FieldName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the assessed field.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p>

Field Name	Details
	<p>Description An optional field used to name your record.</p>
NumMatchedBlanks	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of matched records that contain blank fields.</p>
NumMatchedDifferent	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of matched records that have a different value for this field.</p>
NumMatchedInSync	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of matched records that have the same value for this field.</p>
NumUnmatchedBlanks	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of unmatched records that contain blank fields.</p>

DataAssessmentMetric

Represents a summary of statistics for fields matched and unmatched in your account records with Data.com account records. This object is available in API version 37.0 and later.

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see [Data.com Prospector and Clean Retirement](#).

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description An optional field used to name your record.</p>

UpdatedDate	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Nullable, Sort</p> <p>Description</p> <p>The last date and time when the information for this company was updated.</p>
Website	<p>Type</p> <p>url</p> <p>Properties</p> <p>Nullable</p>

Field Name	Details
	<p>Description</p> <p>The standard URL for the company's home page.</p>
YearStarted	<p>Type</p> <p>string</p> <p>Properties</p> <p>Nullable</p> <p>Description</p> <p>The year when the company was founded.</p>
Zip	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Nullable</p> <p>Description</p> <p>A numeric postal code that's designated for the address.</p>

Usage

Use the DatacloudCompany object to search the Data.com database for companies with the specific criteria that you enter. Use this object to find company records that you are interested in purchasing for your organization. Data.com APIs use the term "company," which is similar to Salesforce term "accounts."

 **Important:** DatacloudCompany can't be used in Apex test methods, because an external web service call is required to access it. These calls are not allowed in Apex test methods.

DatacloudContact

The fields and properties for Data.com contact records. This object is available in API version 30.0 or later.

 **Note:** When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see [Data.com Prospector and Clean Retirement](#).

Field Name**Details**

LocationStatus

Type

picklist

Properties

Filter, Nillable, Restricted picklist

Description

Identifies the organizational status of a company. A numeric value represents each value.

Organizational status	Numeric value
<i>Single location:</i> The business has no branches or subsidiaries.	0
<i>Headquarters/Parent:</i> A parent company that owns more than 50 percent of another company. When the company also has branches, it's the headquarters.	1
<i>Branch:</i> A secondary location of a business.	2

Note: Only the numeric value is accepted in an API request.

Longitude

Type

string

Properties

Nillable

Description

Used with latitude to specify a precise location, which is used to assess the Geocode Accuracy.

MailingCity

Type

string

Properties

Nillable

Description

The city where a company has its mail delivered.

MailingCountry

Type

string

Field Name	Details
	<p>Properties Nillable</p> <p>Description The country where a company has its mail delivered.</p>

Name	<p>Type string</p> <p>Properties Filter, Nillable</p> <p>Description The primary or registered name of a company.</p>
NationalId	<p>Type string</p> <p>Properties Nillable</p> <p>Description The identification number used in some countries for business registration and tax collection.</p>
NationalIdType	<p>Type picklist</p> <p>Properties Nillable, Restricted picklist</p> <p>Description A code value that identifies the type of national identification number that's used.</p>

Field Name	Details
OutOfBusiness	<p>Type picklist</p> <p>Properties Nillable, Restricted picklist</p> <p>Description Indicates whether the company at the specified address has discontinued operations.</p>
OwnOrRent	<p>Type picklist</p> <p>Properties Nillable, Restricted picklist</p> <p>Description Indicates whether a company owns or rents the building it occupies.</p>
ParentOrHqBusinessName	<p>Type string</p> <p>Properties Nillable</p> <p>Description The primary name of the parent or headquarters company.</p>
ParentOrHqDunsNumber	<p>Type string</p> <p>Properties Filter, Nillable</p> <p>Description The D-U-N-S number for the parent or headquarters.</p>
Phone	<p>Type phone</p> <p>Properties Nillable</p> <p>Description A company's primary telephone number.</p>
PremisesMeasure	<p>Type int</p> <p>Properties Group, Nillable</p>

Field Name	Details
	<p>Description A numeric value for the measurement of the premises.</p>
PremisesMeasureReliability	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description A descriptive accuracy of the measurement such as actual, estimated, or modeled.</p>
PremisesMeasureUnit	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description A descriptive measurement unit such as acres, square meters, or square feet.</p>
PrimaryNaics	<p>Type string</p> <p>Properties Nillable</p> <p>Description The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the US business economy.</p>
PrimaryNaicsDesc	<p>Type string</p> <p>Properties Nillable</p> <p>Description A brief description of an organization's line of business, based on its NAICS code.</p>
PrimarySic	<p>Type string</p> <p>Properties Nillable</p> <p>Description The four-digit SIC code that's used to categorize business establishments by industry.</p>

Field Name	Details
PrimarySic8	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description The eight-digit Standard Industrial Classification (SIC) code is used to categorize business establishments by industry. The full list of values can be found at the Optimizer Resources page maintained by Dun & Bradstreet. Maximum size is 8 characters.</p>
PrimarySic8Desc	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.</p>
PrimarySicDesc	<p>Type string</p> <p>Properties Nillable</p> <p>Description A brief description of an organization's line of business, based on its SIC code.</p>
PriorYearEmployees	<p>Type int</p> <p>Properties Group, Nillable</p> <p>Description The total number of employees for the prior year.</p>
PriorYearRevenue	<p>Type double</p> <p>Properties Nillable</p> <p>Description The annual revenue for the prior year.</p>
PublicIndicator	<p>Type picklist</p>

Field Name	Details
	<p>Properties Nillable, Restricted picklist</p> <p>Description Indicates whether ownership of the company is public or private.</p>
Revenue	<p>Type double</p> <p>Properties Nillable</p> <p>Description The annual revenue of a company in US dollars.</p>
SalesTurnoverGrowthRate	<p>Type double</p> <p>Properties Nillable</p> <p>Description The increase in annual revenue from the previous value for an equivalent period expressed as a decimal percentage.</p>
SalesVolume	<p>Type double</p> <p>Properties Nillable</p> <p>Description The total annual sales revenue in the headquarters' local currency. Dun & Bradstreet tracks revenue data for publicly traded companies, Global Ultimates, Domestic Ultimates, and some headquarters.</p>
SalesVolumeReliability	<p>Type picklist</p> <p>Properties Nillable, Restricted picklist</p> <p>Description The reliability of the SalesVolume figure.</p>
SecondNaics	<p>Type string</p> <p>Properties Nillable</p>

Field Name	Details
	<p>Description</p> <p>A NAICS code used to further classify an organization by industry.</p>
SecondNaicsDesc	<p>Type string</p> <p>Properties Nillable</p> <p>Description</p> <p>A brief description of an organization's line of business, based on the corresponding NAICS code.</p>
SecondSic	<p>Type string</p> <p>Properties Nillable</p> <p>Description</p> <p>A SIC code used to further classify an organization by industry.</p>
SecondSic8	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description</p> <p>An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.</p>
SecondSic8Desc	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description</p> <p>A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.</p>
SecondSicDesc	<p>Type string</p> <p>Properties Nillable</p> <p>Description</p> <p>A brief description of an organization's line of business, based on the corresponding SIC code.</p>

Field Name	Details
SixthNaics	<p>Type string</p> <p>Properties Nillable</p> <p>Description A NAICS code used to further classify an organization by industry.</p>
SixthNaicsDesc	<p>Type string</p> <p>Properties Nillable</p> <p>Description A brief description of an organization's line of business, based on the corresponding SIC code.</p>
SixthSic	<p>Type string</p> <p>Properties Nillable</p> <p>Description A SIC code used to further classify an organization by industry.</p>
SixthSic8	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.</p>
SixthSic8Desc	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.</p>
SixthSicDesc	<p>Type string</p>

Field Name	Details
	<p>Properties Nillable</p> <p>Description A brief description of an organization's line of business, based on the corresponding SIC code.</p>
SmallBusiness	<p>Type picklist</p> <p>Properties Nillable, Restricted picklist</p> <p>Description Indicates whether the company is designated a small business as defined by the Small Business Administration of the US government.</p>
State	<p>Type string</p> <p>Properties Nillable</p> <p>Description The state where a company is physically located.</p>
StockExchange	<p>Type string</p> <p>Properties Nillable</p> <p>Description The corresponding exchange for a company's stock symbol, for example, NASDAQ or NYSE.</p>
StockSymbol	<p>Type string</p> <p>Properties Nillable</p> <p>Description The abbreviation that's used to identify publicly traded shares of a particular stock.</p>
Street	<p>Type string</p>

Field Name	Details
	<p>Properties Nillable</p> <p>Description The street address where a company is physically located.</p>
Subsidiary	<p>Type picklist</p> <p>Properties Nillable, Restricted picklist</p> <p>Description Indicates whether a company is more than 50 percent owned by another organization.</p>
ThirdNaics	<p>Type string</p> <p>Properties Nillable</p> <p>Description A NAICS code used to further classify an organization by industry.</p>
ThirdNaicsDesc	<p>Type string</p> <p>Properties Nillable</p> <p>Description A brief description of an organization's line of business, based on the corresponding NAICS code.</p>
ThirdSic	<p>Type string</p> <p>Properties Nillable</p> <p>Description A SIC code used to further classify an organization by industry.</p>
ThirdSic8	<p>Type string</p> <p>Properties Group, Nillable</p>

Field Name	Details
	<p>Description</p> <p>An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.</p>
ThirdSic8Desc	<p>Type</p> <p>string</p> <p>Properties</p> <p>Group, Nillable</p> <p>Description</p> <p>A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.</p>
ThirdSicDesc	<p>Type</p> <p>string</p> <p>Properties</p> <p>Nillable</p> <p>Description</p> <p>A brief description of an organization's line of business, based on the corresponding SIC code.</p>
TradeStyle1	<p>Type</p> <p>string</p> <p>Properties</p> <p>Nillable</p> <p>Description</p> <p>A name, different from its legal name, that an organization may use for conducting business. Similar to "Doing business as" or "DBA".</p>
TradeStyle2	<p>Type</p> <p>string</p> <p>Properties</p> <p>Nillable</p> <p>Description</p> <p>A tradestyle used by the organization.</p>
TradeStyle3	<p>Type</p> <p>string</p> <p>Properties</p> <p>Nillable</p> <p>Description</p> <p>A tradestyle used by the organization.</p>

Field Name	Details
TradeStyle4	<p>Type string</p> <p>Properties Nillable</p> <p>Description A tradestyle used by the organization.</p>
TradeStyle5	<p>Type string</p> <p>Properties Nillable</p> <p>Description A tradestyle used by the organization.</p>
UsTaxId	<p>Type string</p> <p>Properties Nillable</p> <p>Description The identification number for the company used by the Internal Revenue Service (IRS) in the administration of tax laws. Also referred to as Federal Taxpayer Identification Number.</p>
Website	<p>Type url</p> <p>Properties Filter, Group, Nillable</p> <p>Description An organization's primary website address.</p>
WomenOwned	<p>Type picklist</p> <p>Properties Nillable, Restricted picklist</p> <p>Description Indicates whether a company is more than 50 percent owned or controlled by a woman.</p>
YearStarted	<p>Type string</p>

Field Name	Details
	<p>Properties Nillable</p> <p>Description The year when the company was established or the year when current ownership or management assumed control of the company.</p>
zip	<p>Type string</p> <p>Properties Nillable</p> <p>Description A five or nine-digit code that's used to help sort mail.</p>

Usage

Use this object to return D&B Company information. These fields are read-only.

 **Important:** DatacloudDandBCompany can't be used in Apex test methods, because an external web service call is required to access it. These calls are not allowed in Apex test methods.

DatacloudOwnedEntity

Represents fields in the DatacloudOwnedEntity object. The DatacloudOwnedEntity object tracks user-purchased records. This object is available in API version 30.0 or later.

 **Note:** When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see [Data.com Prospector and Clean Retirement](#).

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
DataDotComKey	<p>Type string</p>

Field Name	Details
	<p>Properties Create, Filter, Sort</p> <p>Description The Data.com contact or company record identification number used by the DatacloudPurchaseUsage object to keep track of purchased records. This is equivalent to the Data.com record ID for a contact or company.</p>
DatacloudEntityType	<p>Type picklist</p> <p>Properties Create, Filter, Restricted picklist, Sort</p> <p>Description The type of Data.com record you want to purchase.</p> <ul style="list-style-type: none"> • 0—contact • 1—company
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description An optional field used to name your record.</p>
PurchaseType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description A read only field set by the API to identify the purchase type.</p> <ul style="list-style-type: none"> • Added • Export • API
PurchaseUsageId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The unique identification number for the DatacloudPurchaseUsage object created by making a REST POST request.</p>

Field Name	Details
	<ul style="list-style-type: none"> 0—contact 1—company
UserId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description A unique identifier for the user making the purchase.</p>

Usage

The Datacloud object that tracks records that are purchased and owned by a specific user.

DatacloudPurchaseUsage

Represents an object used to identify and track Data.com record purchases. This object is available in API version 30.0 or later.

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see [Data.com Prospector and Clean Retirement](#).

Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
DatacloudEntityType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The type of Data.com record you want to purchase.</p> <ul style="list-style-type: none"> 0—indicates contact entity type.

Field Name	Details
	<ul style="list-style-type: none"> • 1—indicates company entity type.
Description	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An optional field. You can add a description for your purchase.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description An optional field used to name your record.</p>
PurchaseType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description A read only field set by the API to identify the purchase type.</p> <ul style="list-style-type: none"> • Added • Export • API
Usage	<p>Type double</p> <p>Properties Filter, Sort</p> <p>Description A read only field set by the API. It is used to track the points used to purchase records.</p>
UserId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description A read only field set by the API that identifies the user purchasing the records.</p>

Field Name	Details
UserType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A read only field set by the API with 2 user types.</p> <ul style="list-style-type: none"> • Monthly Usage • List Pool User

Usage

The DatacloudPurchaseUsage object allows you to track Data.com record purchases for CRM users.

DataIntegrationRecordPurchasePermission

Indicates Lightning Data purchase credits that a Salesforce admin has granted to users.

This object is available in API versions 42.0 and later.

Supported Calls

`describeSObjects()`, `create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Spring '20 and later, only your Salesforce org's internal users can access this object.

Fields

Field Name	Details
ExternalObject	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates the name of the data service record matched to the Salesforce record.</p>
UserId	<p>Type reference</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Indicates the ID of a user to whom purchase credits are assigned. This is a relationship field.</p> <p>Relationship Name User</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
UserRecordPurchaseLimit	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Represents the number of purchase credits assigned to a user.</p>

DatasetExport

Represents a dataset exported from Tableau CRM. When a dataset is exported, the data is converted into a .csv file and the schema is stored in a separate JSON file. These files are stored in two objects: DatasetExport and DatasetExportPart. DatasetExport acts as the header and includes the JSON schema.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
CompressedMetadataLength	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description This field is required when a record in an object contains a BLOB (binary large object) field. In the DataExport object, Metadata is the BLOB field.</p>

Field	Details
Metadata	<p>Type base64</p> <p>Properties Nillable</p> <p>Description Contains the JSON schema that describes the data in the CSV. This schema includes column metadata such as type, format, and defaultValue.</p>
MetadataLength	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description This field is required when a record in an object contains a BLOB (binary large object) field. In the DataExport object, Metadata is the BLOB field.</p>
Owner	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description User ID of the owner, as specified in the <code>userId</code> parameter in the export node of the dataflow that created the record. Only the specified owner can read the content of the record.</p>
PublisherInfo	<p>Type string</p> <p>Properties Filter, idLookup, Sort</p> <p>Description Identifies the export record to facilitate searching when a user has multiple export records. By default, this column is set to the ID of the dataflow that generated the export record, concatenated with the name of the specific export node. PublisherInfo is unique within your organization.</p> <p> Note: A dataflow can have multiple export nodes.</p>
PublisherType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p>

Field	Details
	<p>Description</p> <p>Target of the export, as specified in the <code>target</code> parameter in the export node of the dataflow that created the record. The value must be <code>EinsteinDiscovery</code>.</p>
Status	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>Status of the export. The possible values are:</p> <ul style="list-style-type: none"> • New • InProgress • Completed • Canceled • Failed <p> Note: The content of the Metadata field can be downloaded when the status is Completed.</p>

Usage

This object is used with the `DatasetExportPart` object for exporting data from a dataset in Tableau CRM for use in Einstein Discovery. An export is initiated using the export node in an Analytics dataflow.

SEE ALSO:

[DatasetExportPart](#)

DatasetExportPart

Represents a dataset exported from Tableau CRM. When a dataset is exported, the data is converted into a .csv file and the schema is stored in a separate JSON file. These files are stored in two objects: `DatasetExport` and `DatasetExportPart`. `DatasetExportPart` contains parts of the .csv file.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
CompressedDataFileLength	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description This field is required when a record in an object contains a BLOB (binary large object) field. In the DataExportPart object, DataFile is the BLOB field.</p>
DataFile	<p>Type base64</p> <p>Description Contains a part of the dataset data from the generated .csv file. Maximum size is 32 MB.</p>
DataFileLength	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description This field is required when a record in an object contains a BLOB (binary large object) field. In the DataExportPart object, DataFile is the BLOB field.</p>
DatasetExportId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the parent record that the part record is associated with.</p>
Owner	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description User ID of the owner, as specified in the <code>userId</code> parameter in the export node of the dataflow that created the record. Only the specified owner can read the content of the record.</p>
PartNumber	<p>Type int</p> <p>Properties Filter, Group, Sort</p>

Field	Details
	<p>Description</p> <p>Used with the DatasetExportId to uniquely identify the data part. Parts are assembled sequentially based on their numbers.</p>

Usage

This object is used with the DatasetExport object for exporting data from a dataset in Tableau CRM for use in Einstein Discovery. An export is initiated using the export node in an Analytics dataflow.

[DatasetExport](#)

DataUseLegalBasis

Represents the legal basis for contacting a customer, such as billing or contract. This object is available in API version 45.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Data Protection and Privacy is enabled.

Fields

Field Name	Details
Description	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Description of the data use legal basis.</p>
LastReferencedDate	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p>

Field Name	Details
	<p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Specifies a name for the legal basis. For example, "billing" or "contract".</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the owner of the account associated with this customer. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
Source	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Indicates the source of the legal basis. For example, the URL of a contract.</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

DataUseLegalBasisHistory

History is available for tracked fields of the object.

DataUseLegalBasisOwnerSharingRule

Sharing rules are available for the object.

DataUseLegalBasisShare

Sharing is available for the object.

DataUsePurpose

Represents the reason for contacting a prospect or customer, such as for billing, marketing, or surveys. This object is available in API version 45.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Data Protection and Privacy is enabled.

Fields

Field Name	Details
CanDataSubjectOptOut	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Required. Indicates whether the customer can decline contact for the described purpose.</p>
Description	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Indicates the purpose for contacting a customer.</p>

Field Name	Details
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.</p>
LegalBasisId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Identifies the legal basis record associated with the data use purpose. This is a relationship field.</p> <p>Relationship Name LegalBasis</p> <p>Relationship Type Lookup</p> <p>Refers To DataUseLegalBasis</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Required. Identifies the reason for contacting a customer. For example, billing or marketing.</p>
OwnerId	<p>Type reference</p>

Field Name	Details
	Properties Create, Defaulted on create, Filter, Group, Sort, Update
	Description The ID of the owner of the account associated with this customer. This is a polymorphic relationship field.
	Relationship Name Owner
	Relationship Type Lookup
	Refers To Group, User

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

DataUsePurposeHistory

History is available for tracked fields of the object.

DataUsePurposeOwnerSharingRule

Sharing rules are available for the object.

DataUsePurposeShare

Sharing is available for the object.

DatedConversionRate

Represents the dated exchange rates used by an organization for which the multicurrency and the effective dated currency features are enabled.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`,

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
ConversionRate	<p>Type double</p> <p>Properties Filter, Update</p> <p>Description Required. Conversion rate of this currency type against the corporate currency.</p>
IsoCode	<p>Type picklist</p> <p>Properties Filter, Restricted picklist</p> <p>Description Required. ISO code of the currency. Must be one of the valid alphabetic, three-letter currency ISO codes defined by the ISO 4217 standard, such as USD, GBP, or JPY. Must be unique within your organization. Label is Currency ISO Code.</p>
NextStartDate	<p>Type date</p> <p>Properties Filter, Nillable</p> <p>Description Read only. The date on which the next effective dated exchange rate will start. Effectively the day after the end date for this exchange rate.</p>
StartDate	<p>Type date</p> <p>Properties Filter</p> <p>Description The date on which the effective dated exchange rate starts.</p>

Usage

This object is for multicurrency organizations with advanced currency management enabled. Use this object to define the exchange rates your organization uses for a date range. This object is not available in single-currency organizations, nor is it available if the organization does not have advanced currency management enabled.

DeclinedEventRelation

Represents event participants (invitees or attendees) with the status `Declined` for a given event. This object is available in API versions 29.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
<code>EventId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the event. This is a relationship field.</p> <p>Relationship Name Event</p> <p>Relationship Type Lookup</p> <p>Refers To Event</p>
<code>RelationId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the invitee. This is a polymorphic relationship field.</p> <p>Relationship Name Relation</p> <p>Relationship Type Lookup</p> <p>Refers To Calendar, Contact, Lead, User</p>
<code>RespondedDate</code>	<p>Type dateTime</p>

Field Name	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description Indicates the most recent date and time when the invitee declined an invitation to the event.</p>
Response	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the content of the response field. Label is Comment.</p>
Type	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates whether the invitee is a user, lead or contact, or resource.</p>

Usage

Query invitees who have declined an invitation to an event

```
SELECT eventId, type, response FROM DeclinedEventRelation WHERE eventId='00UTD000000ZH5LA'
```

SEE ALSO:

[AcceptedEventRelation](#)

[UndecidedEventRelation](#)

DelegatedAccount

Represents the external managed account. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

You must have a Partner or Customer Community Plus license. You can't edit the visibility of DelegatedAccount metadata on user profiles.

Fields

Field	Details
AccessBuyFor	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description The access that an admin authorizes for an external user to buy for other accounts. This field is available in API version 50.0 and later. A B2B Commerce license is required to use AccessBuyFor.</p>
AccessManageUsers	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description The access that an admin authorizes for an external user to manage external users on other accounts. This includes managing permission sets, membership, passwords, and activation. This field is available in API version 50.0 and later. Delegated External User Administrator permission is required to use AccessManageUsers.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
ManagedById	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the managing user. This is a relationship field.</p> <p>Relationship Name ManagedBy</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Name of the external managed account.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the record owner. This is a polymorphic relationship field.</p> <p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To Group, User</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the managing users account. This field is available in API version 50.0 and later. This is a relationship field.</p>

Field	Details
	<p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>
TargetId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the account being managed. This is a relationship field.</p> <p>Relationship Name Target</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>

DeleteEvent

Represents a record that has been soft deleted. Search on this object was available in API version 48.0, then removed in API version 50.0.

DeleteEvent is a read-only object. You can't create, update, or delete it directly. To create a DeleteEvent record, soft delete a record of another type, like an Account. To remove a DeleteEvent record, use the [emptyRecycleBin\(\)](#) API or hard delete the corresponding Record.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
DeletedById	<p>Type reference</p> <p>Properties Filter, Group, Sort</p>

Field	Details
	<p>Description The ID of the user who deleted the record. This is a relationship field.</p> <p>Relationship Name DeletedBy</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
DeletedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time when the record was deleted.</p>
Record	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the record that was deleted.</p>
RecordName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the record that was deleted.</p>
SubjectName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The type of record that was deleted, for example, Account.</p>

DigitalSignature

Represents a signature captured on a service report in field service.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

Special Access Rules

Field Service must be enabled.

Fields

Field Name	Details
DigitalSignatureNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description An auto-generated number identifying the signature.</p>
DocumentBody	<p>Type base64</p> <p>Properties Create</p> <p>Description The captured signature image.</p>
DocumentContentType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description The data type of the captured signature.</p>
DocumentLength	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name	Details
	<p>Description The length of the captured signature.</p>
DocumentName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The name of the captured signature image.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the service appointment, work order, or work order line item that the service report is generated for. This is a polymorphic relationship field.</p> <p>Relationship Name Parent</p> <p>Relationship Type Lookup</p> <p>Refers To AuthorizationFormConsent, Order, ServiceAppointment, WorkOrder, WorkOrderLineItem</p>
Place	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The place where the report was signed.</p>
SignatureType	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description The role of the person signing the service report. Your org comes with one signature type, <code>Default</code>. A service report template can only contain one signature per type. If you plan to collect multiple signatures on service reports, create additional values for the Signature Type field.</p>

Field Name	Details
	<p>Create at least one value for every role that might need to sign a service report. For example, <code>Technician</code>, <code>Customer</code>, <code>Supervisor</code>, or <code>Supplier</code>. If some service reports will be signed by multiple people in one role—for example, all technicians present at an appointment—create numbered types: <code>Technician 1</code>, <code>Technician 2</code>, and so forth.</p> <p> Note: You can create up to 1,000 signature types. You can't delete signature types, but you can deactivate them so they can't be used in service report templates. When you deactivate a type, it still appears on service report templates that used it, but you can't use it on new service report templates.</p>
SignedBy	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The name of the person signing.</p>
SignedDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The date and time of the signing.</p>

Usage

Add signature blocks to service report templates to determine which signatures need to be gathered on reports that use the template. Service report templates can contain up to 20 signatures, and each signature must use a different Signature Type. For example, create a standard service report template that contains a customer signature and a technician signature.

To learn more about digital signatures, see [Guidelines for Using Signatures on Service Reports](#).

DigitalWallet

The digital wallet entity represents a customer's digital wallet service. Commerce Payments can use a digital wallet as a payment source when processing payments through a payment gateway. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access Commerce Payments entities, your org must have a Salesforce Order Management license with the Payment Platform org permission activated. Commerce Payments entities are available only in Lightning Experience.

Fields

Field	Details
AccountId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The account of the customer owns the digital wallet. This is a relationship field.</p> <p>Relationship Name Account</p> <p>Relationship Type Lookup</p> <p>Refers To Account</p>
AuditEmail	<p>Type email</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Email of the digital wallet owner. This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the DigitalWallet page layout on their own.</p>
Comments	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Users can provide additional details about the digital wallet. Supports a maximum of 1000 characters.</p>
CompanyName	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Company of the digital wallet owner.</p>
Customer	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description Customer name of the digital wallet owner.</p>
DigitalWalletNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description System-generated reference number for the digital wallet.</p>
Email	<p>Type email</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Email of the digital wallet owner.</p>
GatewayToken	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Unique token ID generated by the payment gateway for the digital wallet for future transactions. This version is not encrypted. If you try to record a GatewayToken while the digital wallet already has a GatewayToken or GatewayTokenEncrypted value, Salesforce throws an error.</p>
GatewayTokenDetails	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description Unique ID generated by the payment gateway for the card for future transactions.</p>
GatewayTokenEncrypted	<p>Type encryptedstring</p> <p>Properties Create, Nillable, Update</p> <p>Description Encrypted version of the unique token ID generated by the payment gateway to represent the digital wallet payment method for future transactions. Encrypted using Salesforce Classic Encryption for custom fields. Available in API v52.0 and later.</p>
IpAddress	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The IP address of the digital wallet owner. This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the DigitalWallet page layout on their own.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.</p>
MacAddress	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>The MAC address of the digital wallet owner.</p> <p>This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the DigitalWallet page layout on their own.</p>
NickName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>User-defined nickname for the digital wallet.</p>
PaymentGatewayId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Gateway used with transactions for the digital wallet.</p> <p>This is a relationship field.</p> <p>Relationship Name</p> <p>PaymentGateway</p> <p>Relationship Type</p> <p>Lookup</p> <p>Refers To</p> <p>PaymentGateway</p>
PaymentMethodAddress	<p>Type</p> <p>address</p> <p>Properties</p> <p>Filter, Nillable</p> <p>Description</p> <p>Part of the address for the payment method.</p>
PaymentMethodCity	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Part of the address for the payment method.</p>

Field	Details
PaymentMethodCountry	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Part of the address for the payment method.</p>
PaymentMethodGeocodeAccuracy	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Part of the address for the payment method.</p>
PaymentMethodLatitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Part of the address for the payment method.</p>
PaymentMethodLongitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Part of the address for the payment method.</p>
PaymentMethodPostalCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Part of the address for the payment method.</p>
PaymentMethodState	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Part of the address for the payment method.</p>

Field	Details
PaymentMethodStreet	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Part of the address for the payment method.</p>
Phone	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Phone number of the digital wallet owner. This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the DigitalWallet page layout on their own.</p>
ProcessingMode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description Defines whether the digital wallet is used for transactions made inside or outside the payment platform. Possible values are:</p> <ul style="list-style-type: none"> • <code>External</code>—Transactions happened outside of the Salesforce payments platform. • <code>Salesforce</code>—Salesforce made and recorded an external call to the payment platform. <p>This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the DigitalWallet page layout on their own.</p> <p> Important: <code>ProcessingMode</code> is required to create a DigitalWallet entity.</p>
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Defines the state of the digital wallet as a payment source. Possible values are:</p> <ul style="list-style-type: none"> • <code>Active</code>—Customers can make payments with the digital wallet.

Field	Details
	<ul style="list-style-type: none"> <code>Canceled</code>—The digital wallet can no longer be used for payments. This status can't be changed. <code>InActive</code>—The digital wallet can't be used for payments until a user changes its status to Active.

DirectMessage

Represents a direct message conversation between multiple users in Chatter. This object is available in API version 38.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `update()`

Special Access Rules

You must have the Manage Chatter Messages and Direct Messages permission enabled to access the DirectMessage object.

Fields

Field	Details
Name	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort, Update</p> <p>Description A default value that isn't visible to users.</p>
Subject	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description Subject of the overall direct message conversation.</p>

Usage

DirectMessage is an object used by Salesforce to control DirectMessage conversations. It represents a record of a direct message conversation, but doesn't include conversation data, such as posts or comments. It is most frequently used to moderate direct message data in order to meet data compliance regulations.

Division

A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Divisions must be enabled for your organization to access this object. To discover whether divisions have been enabled for an organization, inspect the User or Group object for the `DefaultDivision` field—if it is present, then divisions have been enabled, and this field (the field is named `Division` in objects other than User and Group) will be available in all relevant objects.
- Customer Portal users can't access this object.

Fields

Field	Details
<code>IsActive</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Update</p> <p>Description Indicates whether the division is active (<code>true</code>) or not (<code>false</code>). Label is Active.</p>
<code>IsGlobalDivision</code>	<p>Type boolean</p> <p>Properties Defaulted on createFilter</p> <p>Description Indicates whether the division is your organization's global default division (<code>true</code>) or not (<code>false</code>). Label is Global Division.</p>
<code>Name</code>	<p>Type string</p> <p>Properties Create, Filter, Update</p> <p>Description A descriptive name for the division. Limit: 80 characters.</p>

Field	Details
SortOrder	<p>Type int</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The order in which this division name appears in the Division picklist field when creating or editing users in the Salesforce user interface.</p>

Usage

The values available for that field are the global division ID for the organization, created when divisions are first enabled, and any other division IDs that have been created. The division ID associated with a user is populated in the objects owned or created by the user.

You can use the division ID to make searches, reports, and list views run more quickly and return more relevant results if an organization has very large data sets. For more information, see the Salesforce online help, in the Fields description for the object.

You can use WITH in SOSL to pre-filter results based on division. This is faster than specifying the division in a WHERE clause.

Note: The User object has a `Division` field that is unrelated to this object. The `Division` field is a standard text field similar to Company or Department that has no special properties. Do not confuse it with the `DefaultDivision` field, which does relate to this object.

SEE ALSO:

[Object Basics](#)

DivisionLocalization

When the Translation Workbench is enabled for your organization, the DivisionLocalization object provides the translation of the label for a division.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, Unlimited, or Performance Edition and be enabled for the Translation Workbench.
- To view this object, you must have the “View Setup and Configuration” permission.

Fields

Field	Details
Language	<p>Type string</p> <p>Properties Create, Filter, Nillable, Restricted picklist</p> <p>Description The language for this translated label.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Nillable</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> • In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Nillable</p> <p>Description The ID of the Division associated with the label that is being translated.</p>
Value	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The actual translated label for the division. Label is Translation.</p>

Usage

Use this object to translate the labels of your divisions into the different languages supported by Salesforce.

Document

Represents a file that a user has uploaded. Unlike Attachment records, documents are not attached to a parent object.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You must have the “Edit” permission on documents and the appropriate access to the Folder that contains a document in order to create or update a document in that Folder.

Fields

Field	Details
AuthorId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the User who is responsible for the Document. This is a relationship field.</p> <p>Relationship Name Author</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
Body	<p>Type base64</p> <p>Properties Create, Nillable, Update</p> <p>Description Required. Encoded file data. If specified, then do not specify a URL.</p>

Field	Details
BodyLength	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Size of the file (in bytes).</p>
ContentType	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Type of content. Label is Mime Type. Limit: 120 characters. If the Don't allow HTML uploads as attachments or document records security setting is enabled for your organization, you cannot upload files with the following file extensions: .htm, .html, .htt, .htx, .mhtm, .mhtml, .shtm, .shtml, .acgi, .svg.</p>
Description	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Text description of the Document. Limit: 255 characters.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is Document Unique Name.</p> <p> Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p>
FolderId	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. ID of the Folder that contains the document. This is a relationship field.</p> <p>Relationship Name Folder</p> <p>Relationship Type Lookup</p> <p>Refers To Folder, User</p>
IsBodySearchable	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the contents of the object can be searched using a SOSL <code>FIND</code> call. The <code>ALL FIELDS</code> search group includes the content as a searchable field.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
IsInternalUseOnly	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the object is only available for internal use (<code>true</code>) or not (<code>false</code>). Label is Internal Use Only.</p>
IsPublic	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description Indicates whether the object is available for external use (<code>true</code>) or not (<code>false</code>). Label is Externally Available.</p>
Keywords	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Keywords. Limit: 255 characters.</p>
LastReferencedDate	<p>Type datetime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type datetime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Required. Name of the document. Label is Document Name.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Sort, Nillable</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation.</p>

Field	Details
	<p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
Type	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description File type of the Document. In general, the values match the file extension for the type of Document (such as pdf or jpg). Label is File Extension.</p>
Url	<p>Type string</p> <p>Properties Create, Filter, Nillable, Group, Sort, Update</p> <p>Description URL reference to the file (instead of storing it in the database). If specified, do not specify the <code>Body</code> or <code>BodyLength</code>.</p>

Usage

When creating or updating a document, you can specify a value in either the `Body` or `Url` fields, but not both.

Encoded Data

The API sends and receives the binary file data encoded as a base64 data type. Prior to creating a record, clients must encode the binary file data as base64. Upon receiving an API response, clients must decode the base64 data to binary (this conversion is usually handled for you by the SOAP client).

Maximum Document Size

You can only create or update documents to a maximum size of 5 MB.

SEE ALSO:

[Object Basics](#)

DocumentAttachmentMap

Maps the relationship between an EmailTemplate and its attachment, which is stored as a Document.

Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
DocumentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the document that this object tracks.</p>
DocumentSequence	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Represents the order that the attachments will be included in the email defined by the EmailTemplate specified by the DocumentId. Label is Attachment Sequence. The first attachment is given a value of 0, and each subsequent attachment is given a value incremented by 1.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the EmailTemplate parent. The attachment identified by DocumentId is attached to the EmailTemplate specified in this field.</p>

Usage

Use this object to map the relationship of an EmailTemplate to its attachments, and to specify the order of the attachments.

SEE ALSO:

[EmailTemplate](#)

DocumentTag

Associates a word or short phrase with a Document.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ItemId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description ID of the tagged item.</p>
Name	<p>Type string</p> <p>Properties Create, Filter</p> <p>Description Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>
TagDefinitionId	<p>Type reference</p> <p>Properties Filter</p> <p>Description ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type picklist</p>

Field Name	Details
	<p>Properties Create, Filter, Restricted picklist</p> <p>Description Defines the visibility of a tag.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

DocumentTag stores the relationship between its parent TagDefinition and the Document being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

Domain

Read-only object that represents a custom Web address assigned to a site in your organization. This object is available in API version 26.0 and later.

To access this object, Salesforce Sites, Sites, or Site.com must be enabled for your organization.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

- Customer Portal users can't access this object.
- To view this object, you must have the "View Setup and Configuration" permission.
- Site.com Publisher users have read-only API access to the Domain and [DomainSite](#) objects.

Fields

Field	Description
<code>CnameTarget</code>	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p>

Field	Description
	<p>Description</p> <p>The canonical name (CNAME) of the external host or server. If you use a custom domain with a non-Salesforce provider, such as your own external server or CDN provider, to serve your domain, this field points to the CNAME of the external provider. This field is available in API version 43.0 and later.</p>
Domain	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, idLookup, Sort</p> <p>Description</p> <p>The branded custom Web address within the global namespace identified by this domain's type. In the Domain Name System (DNS) global namespace, this field is the custom Web address that you registered with a third-party domain name registrar. The custom Web address can be used to access the site of this domain.</p>
DomainType	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>The global namespace that this custom Web address belongs to. This value is set to DNS for custom Web addresses in the global DNS.</p> <p>DomainType can have the following value:</p> <ul style="list-style-type: none"> • DNS—Domain Name System (DNS)
HttpsOption	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>Current HTTPS option. Values may include:</p> <ul style="list-style-type: none"> • CdnPartner—Content Delivery Network (CDN) partner of Salesforce • Community—Experience Cloud site Force.com Subdomain • CommunityAlt—Experience Cloud site My Domain • ExternalHttps—Domain is served by an external host • NoHttps—No HTTPS • OrgDomain—My Domain • Sites—Salesforce Sites Subdomain • SitesAlt—Salesforce Sites My Domain

Field	Description
	<ul style="list-style-type: none"> • <code>SitesRuntime</code>—Salesforce Cloud <p>This field is available in API version 47.0 and higher.</p>
<code>OptionsExternalHttps</code>	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the domain supports secure connections (<code>true</code>) or not (<code>false</code>) via a non-Salesforce content delivery network (CDN) or endpoint. The value of this field is used only if the domain is not pointing to the <code>yourdomain.your18characterOrgId.live.siteforce.com</code> CNAME target. This field is deprecated in API version 47.0 and later. Use <code>HttpsOption</code> instead.</p>
<code>OptionsHstsHeaders</code>	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the HTTP Strict Transport Security (HSTS) response header is included in requests to this domain (<code>true</code>) or not (<code>false</code>). This field is available in API version 47.0 and higher.</p>
<code>OptionsHstsPreload</code>	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the <code>preload</code> directive is added to the HSTS header so that the domain is eligible for HSTS preloading registration (<code>true</code>) or not (<code>false</code>). This field is available in API version 52.0 and later.</p> <p>After this field is set to <code>true</code>, you must still register the domain at https://hstspreload.org so that HTTPS connections are always used.</p> <p>We only modify the HSTS headers of domains that are eligible for registration. Domain names can consist of a public suffix plus one additional label. For more information, see Add a Domain in Salesforce Help.</p>

Usage

Use this read-only object to query the domains that are associated with each website in your organization.

DomainSite

Read-only junction object that joins together the Site and Domain objects. This object is available in API version 26.0 and later.

To access this object, Salesforce Sites or Site.com must be enabled for your organization.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

- Customer Portal users can't access this object.
- To view this object, you must have the "View Setup and Configuration" permission.
- Site.com Publisher users have read-only API access to the [Domain](#) and DomainSite objects.

Fields

Field	Description
DomainId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the associated Domain. This is a relationship field.</p> <p>Relationship Name Domain</p> <p>Relationship Type Lookup</p> <p>Refers To Domain</p>
PathPrefix	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Shows where a site's root exists on a domain. Can only be set for custom Web addresses. Always begins with a /.</p>

Field	Description
SiteId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the associated Site. This is a relationship field.</p> <p>Relationship Name Site</p> <p>Relationship Type Lookup</p> <p>Refers To Site</p>

Usage

Use this read-only object to query or retrieve information about your Lightning Platform site.

DsarPolicy

Represents a Data Subject Access Request (DSAR) policy created in the Privacy Center managed package. DSAR policies anonymize or transfer personal data from your org at your customer's request. This object is available in API version 50.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

This object is for Privacy Center customers with the `ReadAllData` or `PrivacyDataAccess` permissions.

Fields

Field	Details
Description	<p>Type textarea</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>Description of the policy. The description is limited to 255 characters.</p>
DeveloperName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>Developer name of the policy.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
IsActive	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>Indicates whether this policy can be used (<code>true</code>) or not (<code>false</code>) for data subject (customer) requests. The default value is <code>false</code>.</p>
Language	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>The language of the MasterLabel.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • <code>da</code>—Danish • <code>de</code>—German • <code>en_US</code>—English • <code>es</code>—Spanish • <code>es_MX</code>—Spanish (Mexico) • <code>fi</code>—Finnish • <code>fr</code>—French • <code>it</code>—Italian • <code>ja</code>—Japanese • <code>ko</code>—Korean • <code>nl_NL</code>—Dutch • <code>no</code>—Norwegian • <code>pt_BR</code>—Portuguese (Brazil)

Field	Details
	<ul style="list-style-type: none"> • ru—Russian • sv—Swedish • th—Thai • zh_CN—Chinese (Simplified) • zh_TW—Chinese (Traditional)
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Label of the policy.</p>

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as the object.

DsarPolicyLog

Sharing is available for the object.

DsarPolicyLog

Represents the history of Data Subject Access Request (DSAR) policy execution requests. This log records the status and results of executed DSAR policies for a customer. This object is available in API version 50.0 and later.

Supported Calls

`describeObjects()`, `query()`, `retrieve()`

Special Access Rules

This object is for Privacy Center customers with the `ReadAllData` or `PrivacyDataAccess` permissions.

Fields

Field	Details
CompletionDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The date and time when the data subject access request was completed. Available in API version 51.0 and later.</p>
DataSubjectId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The 15–18 character ID of the data subject making the request. Available in API version 51.0 and later.</p>
DeletedDateTime	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The date and time when the file generated for the data subject's request is deleted. Available in API version 51.0 and later.</p>
DeveloperName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>Developer name of the policy.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
DownloadedDateTime	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The most recent date and time when the data subject downloaded the file generated at their request. Available in API version 51.0 and later.</p>
DsarError	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p>

Field	Details
	<p>Description</p> <p>Represents an error in generating the file for the data subject access request. Available in API version 51.0 and later.</p>
DsarPolicyId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The ID of the DSAR policy.</p>
FileURL	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The result of the DSAR policy execution. The URL links to a downloadable file that contains the customer data.</p>
Language	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>The language of the MasterLabel.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • da—Danish • de—German • en_US—English • es—Spanish • es_MX—Spanish (Mexico) • fi—Finnish • fr—French • it—Italian • ja—Japanese • ko—Korean • nl_NL—Dutch • no—Norwegian • pt_BR—Portuguese (Brazil) • ru—Russian

Field	Details
	<ul style="list-style-type: none">• sv—Swedish• th—Thai• zh_CN—Chinese (Simplified)• zh_TW—Chinese (Traditional)
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Label of the policy.</p>
RequestDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time when a data subject requested access to their data in the org. Available in API version 51.0 and later.</p>
RequestStatus	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The status of the policy execution. Possible values are:</p> <ul style="list-style-type: none">• Complete• Deleted• Downloaded• Expired• Failed• In Progress
RequestUserId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the org employee or admin making the request on behalf of the data subject. Available in API version 51.0 and later.</p>

Associated Objects

This object has the following associated objects. Unless noted, they're available in the same API version as the object.

DsarPolicy

Sharing is available for the object.

DuplicateJob

Represents an instance of a job that identifies duplicates among existing records in the system.

This object is available in API versions 42.0 and later.

A duplicate job is the parent of the DuplicateRecordSet instances that it generates. The duplicate record items in a set generated by a duplicate job are of one object type.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Special Access Rules

As of Summer '20 and later, only users with the View Setup and Configuration permission can access this object.

Fields

Field Name	Details
DuplicateJobDefinitionId	<p>Type reference</p> <p>Properties Filter, Group, Sort, Update</p> <p>Description The ID of the corresponding duplicate job definition.</p>
DuplicateJobStatus	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description The current status of a duplicate job. Valid values are Not Started, In Progress, Completed, Canceled, Failed, Results Deleted.</p>
EndDateTime	<p>Type dateTime</p>

Field Name	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description The date and time when a duplicate job was completed.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date when a duplicate job was last referenced.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date when a duplicate job was last viewed.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort, Update</p> <p>Description The name of a duplicate job.</p>
NumDuplicateRecordItems	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The total number of duplicate records identified as a result of invoking a duplicate job.</p>
NumDuplicateRecordSets	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of duplicate record sets identified as a result of invoking a duplicate job.</p>

Field Name	Details
NumRecordsScanned	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of records scanned as a result of invoking a duplicate job.</p>
ResultListViewId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description List view metadata for displaying the duplicate record sets identified as result of invoking a duplicate job.</p>
StartDateTime	<p>Type dateTime</p> <p>Properties Filter, Sort</p> <p>Description The date and time when a duplicate job was invoked.</p>

DuplicateJobDefinition

Setup object defining a job that identifies duplicate record items globally.

This object is available in API versions 42.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

As of Summer '20 and later, only users with the View Setup and Configuration permission can access this object.

Fields

Field Name	Details
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The name of the user who created a duplicate job.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
Language	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language in the user's personal settings.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The label of the duplicate job.</p>
SubjectSubtype	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description The object subtype. Valid values are <code>Person</code> <code>Account</code> or <code>None</code>.</p>
SubjectType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The object type: account, contact, or lead.</p>

DuplicateJobMatchingRule

Represents a MatchingRule to be used with a DuplicateJob sharing the corresponding DuplicateJobMatchingRuleDefinition.

This object is available in API versions 42.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

As of Summer '20 and later, only users with the View Setup and Configuration permission can access this object.

Fields

Field Name	Details
<code>DuplicateJobId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the corresponding DuplicateJob.</p>
<code>DuplicateJobMatchRuleDefId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the matching rule defined for the corresponding DuplicateJobMatchingRuleDefinition.</p>
<code>MatchingRuleBooleanFilter</code>	<p>Type textarea</p> <p>Properties Filter, Sort</p> <p>Description Boolean logic of the MatchingRule for this DuplicateJobMatchingRule.</p>
<code>MatchingRuleDescription</code>	<p>Type textarea</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name	Details
	<p>Description</p> <p>Description of the matching rule for this DuplicateJobMatchingRule.</p>
MatchingRuleName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>The name of the matching rule defined for this particular DuplicateJob invocation.</p>

DuplicateJobMatchingRuleDefinition

Setup object specifying a MatchingRule to use with DuplicateJob instances that share a DuplicateJobDefinition.

[other]: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

This object is available in API versions 42.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `search()`

Special Access Rules

As of Summer '20 and later, only users with the View Setup and Configuration permission can access this object.

Fields

Field Name	Details
DuplicateJobDefinitionId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>ID of DuplicateJobDefinition (master) for this DuplicateJobMatchingRuleDefinition (detail).</p>
MatchingRuleId	<p>Type</p> <p>reference</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the MatchingRule to be used with this DuplicateJobMatchingRuleDefinition.</p>

DuplicateRecordItem

Represents an individual record that's part of a duplicate record set. Use this object to create custom report types.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access this object, enable Duplicate Management. A Salesforce admin can grant access to any user with a Sales Cloud or CRM user license.

Fields

Field Name	Details
DuplicateRecordSetId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The duplicate record set that the duplicate record item is assigned to. This is a relationship field.</p> <p>Relationship Name DuplicateRecordSet</p> <p>Relationship Type Lookup</p> <p>Refers To DuplicateRecordSet</p>
Name	<p>Type string</p>

Field Name	Details
	<p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The autogenerated name that's given to the Duplicate Record Item. Label is Duplicate Record Item Name.</p>
RecordId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The name of the record as it appears on the record's detail page. This is a polymorphic relationship field.</p> <p>Relationship Name Record</p> <p>Relationship Type Lookup</p> <p>Refers To Account, Contact, Individual, Lead</p>

DuplicateRecordSet

Represents a group of records that have been identified as duplicates. Each duplicate record set contains one or more duplicate record items. Use this object to create custom report types and view the results of duplicate jobs.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access this object, activate duplicate rules. A Salesforce admin must give users read and write access.

Fields

Field Name	Details
DuplicateRuleId	<p>Type reference</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The duplicate rule used to identify this list of duplicate records.</p> <p>Label Duplicate Rule ID This is a relationship field.</p> <p>Relationship Name DuplicateRule</p> <p>Relationship Type Lookup</p> <p>Refers To DuplicateRule</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The autogenerated name that's given to the duplicate record set. Label is Duplicate Record Set Name.</p>
RecordCount	<p>Type int</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of record items in the set.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The <code>ParentId</code> represents the parent of a duplicate rule or duplicate job. A <code>ParentId</code> is polymorphic. The label is Parent. This field is available in API versions 42.0 and later.</p>

DuplicateRule

Represents a duplicate rule for detecting duplicate records.

Supported Calls

`describeSObjects()`, `describeLayout()`, `query()`, `retrieve()`, `search()`

Special Access Rules

As of Summer '20 and later, only users with the View Setup and Configuration permission can access this object.

Fields

Field Name	Details
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The developer name for the duplicate rule.</p> <p> Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
IsActive	<p>Type boolean</p>

Field Name	Details
	<p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether a duplicate rule is active (<code>true</code>) or not (<code>false</code>). This field is read only.</p>
Language	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language for the duplicate rule.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The label for the duplicate rule.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> • In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
sObjectType	<p>Type picklist</p>

Field Name	Details
	<p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The type of object the duplicate rule is defined for. For example, account, contact, or lead.</p>

Usage

You can use the API to view a duplicate rule's details. To create, edit, or delete duplicate rules, use the UI.

Use DuplicateRule to get the sObject type.

DuplicateRule is unavailable in some orgs.

ElectronicMediaGroup

Represents the type of media that you can associate with a product or category. This object is available in API version 49.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You must have the B2B Commerce license and a CMS workspace to access a web store.

Fields

Field	Details
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description The default value is USD.</p>
Description	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description Description of the store.</p>
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description Name of the media group.</p>
OwnerId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p>

Field	Details
	<p>Description</p> <p>The ID of the owner of the ElectronicMediaGroup object. For external routing, allows the object to be used in the Streaming API to listen to events whenever a ElectronicMediaGroup record is created, modified, or deleted.</p>
UsageType	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Attachment • Banner • Listing • Standard • Tile

ElectronicMediaUse

Represents the usage of media. This object is available in API version 49.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

You must have the B2B Commerce license and a CMS workspace to access a web store.

Fields

Field	Details
CurrencyIsoCode	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>The default value is USD. Possible values are:</p> <ul style="list-style-type: none"> • USD—U.S. Dollar

Field	Details
ElectronicMediaGroupId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the electronic media group.</p>
ElectronicMediaId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the electronic media.</p>
ImplementorType	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The type of implementor. Available implementors of ElectronicMediaUse include:</p> <ul style="list-style-type: none"> • ProductMedia • ProductCategoryMedia
SortOrder	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The order that electronic media is displayed in.</p>

EmailContent

Represents a marketing email asset for use with Pardot. This object is available in API version 50.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

EmailContent is only available for orgs that use Pardot. The Manage Email Content user permission is required. Users also need the CRM User, Sales, or Service User permission set. EmailContent isn't available for custom portal or guest users.

Fields

Field	Details
ClickThroughRate	<p>Type percent</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The percentage of visitors who click links contained in emails delivered (sent minus bounces) to them. Multiple clicks for a same link are counted.</p>
ClickToOpenRatio	<p>Type percent</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The number of unique clicks divided by unique HTML opens.</p>
DeliveryRate	<p>Type percent</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The percentage of the emails that were delivered compared to the number that bounced (soft and hard). Note: this data includes emails that were delivered to the recipient's spam folder.</p>
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Description of the email content, for example, Promotion Mass Mailing.</p>
HtmlBody	<p>Type textarea</p> <p>Properties Nillable</p>

Field	Details
	<p>Description The body of the email in HTML format. The field is read-only.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp that indicates when the current user last viewed the record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, the record could have been referenced (LastReferencedDate) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Name of the email asset.</p>
OpenRate	<p>Type percent</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The percentage of unique HTML opens compared to the total number of emails delivered (sent minus bounces).</p>
OptOutRate	<p>Type percent</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The percentage of users that have opted out compared to the total number of emails sent.</p>
SpamComplaintRate	<p>Type percent</p>

Field	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description The percentage of spam complaints compared to the total number emails sent.</p>
Subject	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Content of the subject line.</p>
TemplateId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The Email Template field is mostly read-only. You can populate the Email Template field only during record create to prevent overwriting data on the email content record.</p>
TextBody	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The body of the email in plain text format. The character limit is 384, 000.</p>
TotalDelivered	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The total number of emails minus hard and soft bounces. Note: this data includes emails that were delivered to the recipient's spam folder.</p>
TotalHardBounced	<p>Type int</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The total number of emails that permanently returned to the sender because the address is invalid. A hard bounce can occur because the domain name doesn't exist or because the recipient is unknown.</p>
TotalOpens	<p>Type</p> <p>int</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The total number of times a prospect's email client loaded the images in the HTML version of the email. We also record an open if the prospect clicks a link within the HTML or text email without downloading images. A click indicates that they viewed the message. Some email clients (Outlook, Apple Mail, Thunderbird) do not display images by default. Pardot counts an open each time the images load.</p>
TotalSent	<p>Type</p> <p>int</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Read-only field. The total number of list emails sent, including bounced, opted-out, and invalid To: addresses.</p>
TotalSoftBounced	<p>Type</p> <p>int</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Read-only field. The total number of times a recipient's mail server acknowledged the email, but returned it to the sender. Sometimes it is because the recipient's mailbox is full or the mail server is temporarily unavailable. After 5 soft bounces, Pardot opts the prospect out of emails.</p>
TotalSpamComplaints	<p>Type</p> <p>int</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Read-only field. The total number of prospects that reported the email as spam.</p>
TotalTrackedLinkClicks	<p>Type</p> <p>int</p>

Field	Details
	<p>Properties Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description Read-only field. The number of times prospects clicked a link in the email.</p>
UniqueClickThroughRate	<p>Type percent</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Read-only field. The percentage of visitors who clicked a link contained in an email</p>
UniqueOpens	<p>Type int</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description Read-only field. The number of prospects who loaded the images in the HTML version of the email. The Unique Opens category counts each recipient only one time, even if the prospect loaded images more than once.</p>
UniqueOptOuts	<p>Type int</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description Read-only field. The total number of prospects that have clicked the link to unsubscribe or opted out of all emails in the Email Preference Center. They are removed from future email sends.</p>
UniqueTrackedLinkClicks	<p>Type int</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description Read-only field. The number of times a prospect clicked a link in the email. This metric doesn't include multiple clicks of the same link.</p>

EmailDomainFilter

Represents a filter that determines whether an email relay is restricted to a specific list of domains. This object is available in API version 43.0 and later.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

You must have the “Email Administration,” “Customize Application,” and “View Setup” user permissions to use this object.

You must create an email relay in Setup or through the [EmailRelay](#) object before you can use the `EmailDomainFilter` object.

Fields

Field Name	Details
<code>EmailRelayId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the EmailRelay record. This is a relationship field.</p> <p>Relationship Name EmailRelay</p> <p>Relationship Type Lookup</p> <p>Refers To EmailRelay</p>
<code>FromDomain</code>	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Restricts the email relay to send emails based on the sender domains (<code>FromDomain</code>) listed in this field. This field is optional, accepts a list of comma-separated values, and supports the wildcard character.</p>
<code>IsActive</code>	<p>Type boolean</p>

Field Name	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the email domain filter is active (<code>true</code>) or not (<code>false</code>). Use this field to enable or disable the email domain filter.</p>
PriorityNumber	<p>Type int</p> <p>Properties Create, Filter, Group, idLookup, Nillable, Sort, Update</p> <p>Description Indicates the order in which the email domain filter is processed. Filters are evaluated in ascending order. The priority number must be unique. If this field is left blank, it is assigned the next available number and is processed last. Processing stops after the first matching filter is applied.</p>
ToDomain	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Restricts the email relay to send emails based on the recipient domains (<code>ToDomain</code>) listed in this field. This field is optional, accepts a list of comma-separated values, and supports the wildcard character.</p>

Usage

Tip: If you also plan to activate Bounce Management and Email Compliance Management, confirm with your email admin that your company allows relaying email sent from Salesforce. For more information on bounce management, see [Configure Deliverability Settings for Emails Sent from Salesforce](#).

EmailDomainKey

Represents a domain key for an organization's domain, used to authenticate outbound email that Salesforce sends on the organization's behalf. This object is available in API version 28.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only authenticated internal and external users can access this object.

We've upgraded and replaced the original DKIM (DomainKeys Identified Mail) key feature, so that you can create a DKIM key with increased email security. For more information, see [Setting Up More Secure DKIM Keys](#).

Fields

Field Name	Details
AlternatePublicKey	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description Read-only. Alternate public keys are used by Salesforce to auto-rotate domain keys. This field is available in API version 44.0 and later after activating the Critical Update.</p>
AlternateSelector	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The text used to distinguish the DKIM key from any other DKIM keys your organization uses for the specified domain. This field is available in API version 44.0 and later after activating the Critical Update.</p>
AlternateTxtRecordName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The alternate TXT record name is used to create the CNAME record. Refer to the Usage section for more information. This field is available in API version 44.0 and later after activating the Critical Update.</p>
Domain	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The organization's domain name that the DKIM key is generated for.</p>

Field Name	Details
DomainMatch	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The specificity of match required on the sending domain name before signing with this DKIM key. Valid values are:</p> <ul style="list-style-type: none"> • <code>DomainOnly</code>—Sign if sending domain matches at the domain level only (example.com but not mail.example.com) • <code>SubdomainsOnly</code>—Sign if sending domain matches at the subdomain level only (mail.example.com but not example.com) • <code>DomainAndSubdomains</code>—Sign if sending domain matches at the domain and subdomain levels (example.com and mail.example.com)
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this DKIM key is active (<code>true</code>) or not (<code>false</code>).</p>
KeySize	<p>Type int</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description Indicates the RSA key size, in bits. The possible values are:</p> <ul style="list-style-type: none"> • 1024 • 2048 <p>This field is available in API version 45.0 and later.</p>
PrivateKey	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Once you activate the Critical Update, this field is no longer visible. The private portion of the DKIM key pair used to encrypt mail headers from your domain. Salesforce generates an encrypted <code>PrivateKey</code> if you don't specify</p>

Field Name	Details
	<p>a value when creating the DKIM key. If you do specify a value, it must be an existing valid <code>PrivateKey</code> from another <code>EmailDomainKey</code> object.</p> <p>This field doesn't contain the actual private key, but a value that represents the key in our system. Therefore:</p> <ul style="list-style-type: none"> • The actual private key can't be leaked. • You can't use the value to do your own email signing.
<code>PublicKey</code>	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Part of the domain key pair that mail recipients retrieve to decrypt the DKIM header and verify your domain. Add the <code>PublicKey</code> value to your domain's DNS records before you start signing with this domain key.</p>
<code>Selector</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Text used to distinguish the DKIM key from any other DKIM keys your organization uses for the specified domain.</p>
<code>TxtRecordName</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Read-only. The TXT record name is used to create the CNAME record. Refer to the Usage section for more information. This field is available in API version 44.0 and later after activating the Critical Update.</p>
<code>TxtRecordsPublishState</code>	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The possible values are:</p> <ul style="list-style-type: none"> • Published • Publishing in progress

Field Name	Details
	<ul style="list-style-type: none"> Publishing failed <p>This field is available in API version 44.0 and later after activating the Critical Update.</p>

Usage

Create DKIM Keys with Increased Security

- If your Salesforce org was created before Winter '19, enable the Critical Update. From Setup, enter *Critical Updates* in the Quick Find box, and then select **Critical Updates**. For Enable Redesigned DomainKeys Identified Mail (DKIM) Key Feature with Increased Email Security, click **Activate**.
- Insert `Domain`, `DomainMatch`, `Selector`, and `AlternateSelector`. Salesforce publishes your TXT record to DNS.
- Retrieve the `TxtRecordName` and `AlternateTxtRecordName` and use them to create and publish the CNAME and Alternate CNAME record to your domain's DNS.
 - Create CNAME record using: `<selector>._domainkey.<domain> IN CNAME txtRecordName.`
 - Create Alternate CNAME record using: `<alternateSelector>._domainkey.<domain> IN CNAME alternateTxtRecordName.`
- Set the `IsActive` field to true.

Create DKIM Keys (pre-Winter '19 Version)

 **Note:** The critical update activates for everyone on October 15, 2019. After that date, this approach to creating DKIM keys will no longer be available.

When you create a DKIM key, Salesforce generates a public and private key pair. Publish the public key in the DNS.

For each domain key you create, we recommend this sequence:

- Insert the `Domain`, `DomainMatch`, and `Selector`.
- Update your domain's DNS records.
 - Locate the DNS record at `selector._domainkey.domain`. For example, `mail._domainkey.mail.example.com`.
 - Add the `PublicKey` value, like this: `V=DKIM1; p=public_key`.

DKIM Signing Outbound Email

- In addition, you can optionally put the record in testing mode, which instructs recipients to not make decisions based on the email signature. Add parameter `t=y` to the DNS entry: `V=DKIM1; t=y; p=public_key`.
- Update the key via the API or UI to be active.

EmailMessage

Represents an email in Salesforce.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

EmailMessage is only available for orgs that use Email-to-Case or Enhanced Email, which is automatically enabled for most customers.

To use reply and forward functionality, `FromAddress` must specify an email address that exists in EmailMessageRelation, with a `RelationType` of `FromAddress`.

Customer Portal users have read access to EmailMessage if the value for the `ParentID` field is associated with a case. Otherwise, access is determined by sharing access of the associated task.

The `Status` field is mostly read-only. You can change the status only from `New` to `Read`.

`update()` is supported when an email record is in `Draft` status, and `IsPrivateDraft` is `false`. It is also supported if `Status` and `IsPrivateDraft` are `true` and `CreatedBy` is associated with the current user. When the email record status is not in `Draft` status, the `IsExternallyVisible` field and custom fields only can be updated.

Fields

Field	Details
<code>ActivityId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description ID of the activity that is associated with the email. Usually represents an open task that is created for the case owner when a new unread email message is received. <code>ActivityId</code> can only be specified for emails on cases. It's auto-created for other entities.</p>
<code>BccAddress</code>	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A string array of email addresses for recipients who were sent a blind carbon copy of the email message. Include only email addresses that are not associated with Contact, Lead, or User records in Salesforce. If the recipient is a contact, lead, or user, add their ID to the <code>BccIds</code> field instead of adding their email address to the <code>BccAddress</code></p>

Field	Details
	<p>field. When adding their ID, the email message is automatically associated with the contact, lead, or user. For an Experience Cloud site user who is not the sender of the email, this field returns null.</p> <p>You can't send emails unless there's at least one recipient.</p>
BccIds	<p>Type JunctionIdList</p> <p>Properties Create, Update</p> <p>Description A string array of IDs for contacts, leads, and users who were sent a blind carbon copy of the email message. Each ID is linked to an <code>EmailMessageRelation</code> record, which represents the relationship between an email message and a Contact, Lead, or User record. For an Experience Cloud site user who is not the sender of the email, this list is empty.</p> <p> Warning: Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.</p>
CcAddress	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A string array of email addresses for recipients who were sent a carbon copy of the email message. Include only email addresses that are not associated with Contact, Lead, or User records in Salesforce. If the recipient is a contact, lead, or user, add their ID to the <code>CcIds</code> field instead of adding their email address to the <code>CcAddress</code> field. Then the email message is automatically associated with the contact, lead, or user.</p> <p>You can't send emails unless there's at least one recipient.</p>
CcIds	<p>Type JunctionIdList</p> <p>Properties Create, Update</p> <p>Description A string array of IDs for contacts, leads, and users who were sent a carbon copy of the email message. Each ID is linked to an <code>EmailMessageRelation</code> record, which represents the relationship between an email message and a Contact, Lead, or User record.</p>

Field	Details
	<p> Warning: Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.</p>
<code>ContentDocumentIds</code>	<p>Type JunctionIdList</p> <p>Properties Create, Update</p> <p>Description A string array of IDs for content documents, such as files and attachments, that are associated with an email. Each ID is linked to a <code>ContentDocumentLink</code> record, which represents the relationship between an email message and a content document record.</p> <p> Warning: Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.</p>
<code>Division</code>	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.</p>
<code>EmailTemplateId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The email template, if any, that was chosen for the email. This field is populated in Lightning Experience only. This is a relationship field.</p> <p>Relationship Name EmailTemplate</p> <p>Relationship Type Lookup</p> <p>Refers To EmailTemplate</p>

Field	Details
FirstOpenedDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The date the email was first opened.</p> <p> Note: To see this field, enable email tracking in your org.</p>
FromAddress	<p>Type email</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The address that originated the email. When using this field, specify an email address that exists in EmailMessageRelation, with a <code>RelationType</code> of <code>FromAddress</code>.</p>
FromName	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The sender's name. When using this field, specify an email address that exists in EmailMessageRelation, with a <code>RelationType</code> of <code>FromAddress</code>.</p>
HasAttachment	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the email was sent with an attachment (<code>true</code>) or not (<code>false</code>).</p>
Headers	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The Internet message headers of the incoming email. Used for debugging and tracing purposes. Does not apply to outgoing emails.</p>
HtmlBody	<p>Type textarea</p>

Field	Details
	<p>Properties Create, Nillable, Update</p> <p>Description The body of the email in HTML format. You can't send emails unless at least one of these fields has content.</p> <ul style="list-style-type: none"> • Subject field • HTML Body or Text Body field <p>As the sender, you can provide the content, or it can be automatically inserted using predefined values. An email template can also include the content for these fields.</p>
Incoming	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the email was received (<code>true</code>) or sent (<code>false</code>).</p>
IsBounced	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the email bounced.</p> <p> Note: To see this field, enable bounce management in your org.</p>
IsClientManaged	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description If <code>EmailMessage</code> is created with <code>IsClientManaged</code> set to <code>true</code>, users can modify <code>EmailMessage.ContentDocumentIds</code> to link file attachments even when the <code>Status</code> of the <code>EmailMessage</code> is not set to <code>Draft</code>.</p> <p> Note: To make attachments visible in the email case feed, set this field to <code>true</code>.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p>

Field	Details
	<p>Description</p> <p>Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
<code>IsExternallyVisible</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>If the Experience Cloud site case feed is enabled, <code>IsExternallyVisible</code> controls the external visibility of emails in sites. When <code>IsExternallyVisible</code> is set to <code>true</code>—its default value—external users see the email message in the case feed.</p> <p> Note:</p> <ul style="list-style-type: none"> • Emails remain visible in the Emails related list whether or not this field is set to <code>true</code>. If needed, you can remove this related list from your case page layout for external community users. • Only emails with a value in the <code>ParentId</code> field can be made externally visible in sites. • This field can't be updated if the email's <code>Status</code> is set to <code>Draft</code>.
<code>IsOpened</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>Indicates whether the email has been opened.</p> <p> Note: To see this field, enable email tracking in your org.</p>
<code>IsPrivateDraft</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>If <code>IsPrivateDraft</code> is set to <code>true</code>, then only the <code>CreatedById</code> user can view, update, and send this email draft. If <code>IsPrivateDraft</code> is set to <code>false</code>, then any user with permissions to work on the case can see these drafts. Once the email is sent (Email Status = Draft), then this field is updated to be <code>false</code>. Public drafts are loaded and visible in Salesforce Classic while Private Drafts are only used in Lightning Experience.</p>

Field	Details
IsTracked	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the email is being tracked.</p> <p> Note: To see this field, enable email tracking in your org.</p>
LastOpenedDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The date the email was last opened.</p> <p> Note: To see this field, enable email tracking in your org.</p>
MessageDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The date the email was created.</p>
MessageIdentifier	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Nillable, Sort, Update</p> <p>Description The ID of the email message.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description ID of the case that's associated with the email. This is a relationship field.</p> <p>Relationship Name Parent</p>

Field	Details
	<p>Relationship Type Lookup</p> <p>Refers To Case</p>
RelatedToId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The RelatedToId represents nonhuman objects such as accounts, opportunities, campaigns, cases, or custom objects. RelatedTolds are polymorphic. Polymorphic means a RelatedTold is equivalent to the ID of a related object.</p> <p>This is a polymorphic relationship field.</p> <p>Relationship Name RelatedTo</p> <p>Relationship Type Lookup</p> <p>Refers To Account, Accreditation, AssessmentIndicatorDefinition, AssessmentTask, AssessmentTaskContentDocument, AssessmentTaskDefinition, AssessmentTaskOrder, Asset, AssetRelationship, AssignedResource, Award, BoardCertification, BusinessLicense, BusinessMilestone, BusinessProfile, Campaign, CareBarrier, CareBarrierDeterminant, CareBarrierType, CareDeterminant, CareDeterminantType, CareDiagnosis, CareInterventionType, CareMetricTarget, CareObservation, CareObservationComponent, CarePgmProvHealthcareProvider, CarePreauth, CarePreauthItem, CareProgram, CareProgramCampaign, CareProgramEligibilityRule, CareProgramEnrollee, CareProgramEnrolleeProduct, CareProgramEnrollmentCard, CareProgramGoal, CareProgramProduct, CareProgramProvider, CareProgramTeamMember, CareProviderAdverseAction, CareProviderFacilitySpecialty, CareProviderSearchableField, CareRegisteredDevice, CareRequest, CareRequestDrug, CareRequestExtension, CareRequestItem, CareSpecialty, CareSpecialtyTaxonomy, CareTaxonomy, Case, CommSubscriptionConsent, ContactEncounter, ContactEncounterParticipant, ContactRequest, Contract, CoverageBenefit, CoverageBenefitItem, CreditMemo, DelegatedAccount, DocumentChecklistItem, EnrollmentEligibilityCriteria, HealthcareFacility, HealthcareFacilityNetwork, HealthcarePayerNetwork, HealthcarePractitionerFacility, HealthcareProvider, HealthcareProviderNpi, HealthcareProviderSpecialty, HealthcareProviderTaxonomy, IdentityDocument, Image, IndividualApplication, Invoice, ListEmail, Location, MemberPlan, Opportunity, Order, OtherComponentTask, PartyConsent, PersonLifeEvent, PlanBenefit, PlanBenefitItem, ProcessException, Product2, ProductItem, ProductRequest, ProductRequestLineItem, ProductTransfer, PurchaserPlan, ReceivedDocument, ResourceAbsence, ReturnOrder, ReturnOrderLineItem, ServiceAppointment, ServiceResource, Shift, Shipment,</p>

Field	Details
	ShipmentItem, Solution, Visit, VisitedParty, VolunteerProject, WorkOrder, WorkOrderLineItem
ReplyToEmailMessageId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description ID of the inbound or outbound email message the current email message is a reply to. It's not possible to reply to a message whose <code>Status</code> is <code>Draft</code>. This is a relationship field. This is only set for Case related Email replies at setup.</p> <p>Relationship Name ReplyToEmailMessage</p> <p>Relationship Type Lookup</p> <p>Refers To EmailMessage</p>
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The status of the email. The <code>Status</code> field is mostly read-only. You can change the status only from <code>New</code> to <code>Read</code>. Possible values are:</p> <ul style="list-style-type: none"> • 0 (New) • 1 (Read) • 2 (Replied) • 3 (Sent) • 4 (Forwarded) • 5 (Draft) <p>For emails not sent as part of a case, only the status 3 (Sent) is valid.</p>
Subject	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>The subject line of the email.</p> <p>You can't send emails unless at least one of these fields has content.</p> <ul style="list-style-type: none"> • Subject field • HTML Body or Text Body field <p>As the sender, you can provide the content, or it can be automatically inserted using predefined values. An email template can also include the content for these fields.</p>
TextBody	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Create, Nillable, Update</p> <p>Description</p> <p>The body of the email, in plain text format. If <code>TextBody</code> is not set, then it is extracted from <code>HtmlBody</code>.</p> <p>You can't send emails unless at least one of these fields has content.</p> <ul style="list-style-type: none"> • Subject field • HTML Body or Text Body field <p>As the sender, you can provide the content, or it can be automatically inserted using predefined values. An email template can also include the content for these fields</p>
ThreadIdIdentifier	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, idLookup, Nillable, Sort, Update</p> <p>Description</p> <p>The ID of the email thread the email message belongs to.</p>
ToAddress	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>A string array of email addresses for recipients who were sent the email message. Include only email addresses that are not associated with Contact, Lead, or User records in Salesforce. If the recipient is a contact, lead, or user, add their ID to the <code>ToIds</code> field instead of adding their email address to the <code>ToAddress</code> field. Then the email message is automatically associated with the contact, lead, or user.</p> <p>You can't send emails unless there's at least one recipient.</p>

Field	Details
ToId	<p>Type JunctionIdList</p> <p>Properties Create, Update</p> <p>Description A string array of IDs for contacts, leads, and users who were sent a carbon copy of the email message. Each ID is linked to an <code>EmailMessageRelation</code> record, which represents the relationship between an email message and a Contact, Lead, or User record.</p> <p> Warning: Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.</p>
ValidatedFromAddress	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description A picklist value with either the sender's address, validated org-wide email addresses that originated the email, or Email-to-Case Routing Address.</p> <p> Note: <code>ValidatedFromAddress</code> isn't suitable for use in Group By or Sort By statements. Use <code>FromAddress</code> instead.</p>

Usage

If your org uses Email-to-Case, a case is created when an email is sent to one of your company's addresses. The email, which is related to the case by the `ParentID` field, is stored as an `EmailMessage` record. When users view the email, they see the `EmailMessage` record.

If your org uses Enhanced Email, each email is stored as an `EmailMessage` record and a `Task` record. When users view an email, they see the `EmailMessage` record.

Sample Code—Apex

This sample logs email activity in Salesforce.

```
// if EnhancedEmail Perm is not enabled, continue logging the email as a task

// if EnhancedEmail Perm is enabled, create an EmailMessage object
EmailMessage emailMessage = new EmailMessage();
emailMessage.status = '3'; // email was sent
emailMessage.relatedToId = '006B0000003weZGIAY'; // related to record e.g. an opportunity
emailMessage.fromAddress = 'sender@example.com'; // from address
emailMessage.fromName = 'Dan Perkins'; // from name
emailMessage.subject = 'This is the Subject!'; // email subject
```

```
emailMessage.htmlBody = '<html><body><b>Hello</b></body></html>'; // email body
// Contact, Lead or User Ids of recipients
String[] toIds = new String[]{'003B000000AxcEjIAJ'};
emailMessage.toIds = toIds;
// additional recipients who don't have a corresponding contact, lead or user id in the
Salesforce org (optional)
emailMessage.toAddress = 'emailnotinsalesforce@toexample.com, anotherone@toexample.com';
insert emailMessage; // insert

// Add Email Message Relation for id of the sender
EmailMessageRelation emr = new EmailMessageRelation();
emr.emailMessageId = emailMessage.id;
emr.relationId = '005B0000003qHvOIAU'; // user id of the sender
emr.relationType = 'FromAddress';
insert emr;
```

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

EmailMessageChangeEvent (API version 48.0)

Change events are available for the object.

SEE ALSO:

[Case](#)

[Object Basics](#)

EmailMessageRelation

Represents the relationship between an email and contacts, leads, and users. This object is available in API version 37.0 and later.

Special Access Rules

EmailMessageRelation is only available for organizations that use Email-to-Case or Enhanced Email, which is automatically enabled for most customers.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
EmailMessageId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the <code>EmailMessage</code> record. This is a relationship field.</p> <p>Relationship Name EmailMessage</p> <p>Relationship Type Lookup</p> <p>Refers To EmailMessage</p>
RelationAddress	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The email address of the sender or recipient.</p> <p> Note: If a record relates an email to an existing contact, lead, or user record in Salesforce, the value of <code>RelationAddress</code> is the current value of the email address. If the value is not set, it is auto-populated from <code>RelationId</code>.</p>
RelationId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The <code>RecordId</code> of the sender or recipient.</p> <p> Note: If a record relates an email to an email address that's not associated with an existing contact, lead, or user record in Salesforce, the value of <code>RelationId</code> is null.</p> <p>This is a polymorphic relationship field.</p> <p>Relationship Name Relation</p>

Field Name	Details
	<p>Relationship Type Lookup</p> <p>Refers To Contact, Lead, User</p>
RelationObjectType	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The API name of the object type of the RecordId in the RelationId field. It can be a contact, lead, or user.</p>
RelationType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description The type of relationship the contact, lead, or user has with the email message. Possible values include:</p> <ul style="list-style-type: none"> • ToAddress • CcAddress • BccAddress • FromAddress • OtherAddress <p>For an Experience Cloud site user who is not the sender of the email, no BccAddress relations are returned.</p>

Usage

EmailMessageRelation allows an email to be related to contacts, leads, and users.

EmailRelay

Represents the configuration for sending an email relay. An email relay routes email sent from Salesforce through your company's email servers. This object is available in API version 43.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

You must have the Email Administration, Customize Application, and View Setup user permissions to use this object.

Fields

Field Name	Details
AuthType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted Picklist, Sort, Update</p> <p>Description Specifies which SASL mechanism Salesforce uses for SMTP authentication. This field is available when Enable SMTP Auth is selected. Select an option:</p> <ul style="list-style-type: none"> • PLAIN- Salesforce uses PLAIN SASL mechanism for SMTP authentication. Default. • LOGIN- Salesforce uses LOGIN SASL mechanism for SMTP authentication <p>This field is available in API version 52.0 and later.</p>
Host	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Indicates the host name or IP address of your company's SMTP server.</p>
IsRequireAuth	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether (true) or not (false) authentication is required. When setting this field to true, the <code>TlsSetting</code> must be set to RequiredVerify. This field is available in API version 44.0 and later.</p>
Password	<p>Type encryptedstring</p> <p>Properties Create, Nillable, Update</p>

Field Name**Details****Description**

Specifies the password for relay host STMP authentication. When `IsRequiredAuth` is set to true, this field is required. This field is available in API version 44.0 and later.

Port

Type

picklist

Properties

Create, Filter, Group, Restricted picklist, Sort, Update

Description

Indicates the port number of your company's SMTP server.

- 25
- 587
- 10025
- 11025

TlsSetting

Type

picklist

Properties

Create, Filter, Group, Restricted picklist, Sort, Update

Description

Specifies whether Salesforce uses TLS for SMTP sessions.

- `Off`: TLS is turned off. SMTP session continues through an insecure connection.
- `Preferred`: If the remote server supports TLS, Salesforce upgrades the current SMTP session to use TLS. If TLS is unavailable, Salesforce continues the session without TLS.
- `Required`: Salesforce continues the session only if the remote server supports TLS. If TLS is unavailable, Salesforce terminates the session without delivering the email.
- `PreferredVerify`: If the remote server supports TLS, Salesforce upgrades the current SMTP session to use TLS. Before the session begins, Salesforce verifies that the certificate is signed by a valid certificate authority, and that the common name presented in the certificate matches the domain or mail exchange of the current connection. If TLS is available but the certificate is not signed or the common name does not match, Salesforce disconnects the session and does not deliver the email. If TLS is unavailable, Salesforce continues the session without TLS.
- `RequiredVerify`: Salesforce continues the session only if the remote server supports TLS, the certificate is signed by a valid certificate authority, and the common name presented in the certificate matches the domain or

Field Name	Details
	mail exchange to which Salesforce is connected. If any of these criteria are not met, Salesforce terminates the session without delivering the email.
Username	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Specifies the username for relay host STMP authentication. When <code>IsRequiredAuth</code> is set to true, this field is required. This field is available in API version 44.0 and later.</p>

Usage

An email relay must be associated with an active email domain filter to take effect. If you set up multiple email relays in one org, they are processed in the priority order of their email domain filters.

Tip: If you also plan to activate Bounce Management and Email Compliance Management, confirm with your email admin that your company allows relaying email sent from Salesforce. For more information on bounce management, see [Configure Deliverability Settings for Emails Sent from Salesforce](#).

EmailServicesAddress

An email service address.

Each email service has one or more email addresses to which users can send messages for processing. An email service only processes messages it receives at one of its addresses.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only authenticated internal and external users can access this object.

Fields

Field	Details
AuthorizedSenders	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Configures the email service address to only accept messages from the email addresses or domains listed in this field. If the email service address receives a message from an unlisted email address or domain, the email service performs the action specified in the <code>AuthorizationFailureAction</code> field of its associated email service. Leave this field blank if you want the email service address to receive email from any email address.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The name of the object in the API. This name can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This 25-character field must be unique among other EmailServicesAddress records under the same EmailServiceFunction parent.</p> <p>In managed packages, this field prevents naming conflicts on package installations. This field is automatically generated, but you can supply your own value if you create the record using the API. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance might be slow while Salesforce generates one for each record.</p>
EmailDomainName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A read only field you can query that contains the system-generated domain part of this email service address. The system generates a unique domain-part for each email service address to ensure that no two email service addresses are identical.</p>
FunctionId	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the email service for which the email service address receives messages. This is a relationship field.</p> <p>Relationship Name Function</p> <p>Relationship Type Lookup</p> <p>Refers To EmailServicesFunction</p>
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this object is active (true) or not (false).</p>
LocalPart	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The local-part of the email service address. The local-part of the address is the string that comes before the @ symbol. For the local-part of a Salesforce email address, all alphanumeric characters are valid, plus the following special characters: ! # \$ % & amp; ' * / = ? ^ _ + - ` { } ~ , The dot character (.) is also valid as long as it's not the first or last character. Email addresses aren't case-sensitive.</p>
RunAsUserId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The username of the user whose permissions the email service assumes when processing messages sent to this address.</p>

Usage

This object supports the email services feature, which allows you to create automated processes that use Apex classes to process the contents, headers, and attachments of inbound email. For example, you can create an email service that automatically creates contact records based on contact information in messages.

SEE ALSO:

[EmailServicesFunction](#)

EmailServicesFunction

An email service.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only authenticated internal and external users can access this object.

Fields

Field	Details
<code>AddressInactiveAction</code>	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates what the email service does with messages received at an email address that is inactive.</p> <p>One of the following values:</p> <ul style="list-style-type: none"> <code>UseSystemDefault</code>—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is 0.) <code>Bounce</code>—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 1.) <code>Discard</code>—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is 2.) <code>Queue</code>—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message

Field	Details
	to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 3.)
ApexClassId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Required. The ID of the Apex class that the email service uses to process inbound messages. This field is required for API version 12.0 and later.</p>
AttachmentOption	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Indicates the types of attachments the email service accepts. One of the following values:</p> <ul style="list-style-type: none"> • None—The email service accepts the message but discards any attachment. (In API version 41.0 and earlier, the value specified for this choice is 0.) • NoContent—The attachment metadata (filename, MIME type, and so on) is provided to the Apex class, but the body is set to <code>null</code>. There was no previous numeric value for this choice. • TextOnly—The email service only accepts the following types of attachments: <ul style="list-style-type: none"> – Attachments with a Multipurpose Internet Mail Extension (MIME) type of text. – Attachments with a MIME type of application/octet-stream and a file name that ends with either a <code>.vcf</code> or <code>.vcs</code> extension. These are saved as <code>text/x-vcard</code> and <code>text/calendar</code> MIME types, respectively. (In API version 41.0 and earlier, the value specified for this choice is 1.) • BinaryOnly—The email service only accepts binary attachments, such as image, audio, application, and video files. (In API version 41.0 and earlier, the value specified for this choice is 2.) • All—The email service accepts any type of attachment. (In API version 41.0 and earlier, the value specified for this choice is 3.)
AuthenticationFailureAction	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates what the email service does with messages that fail or do not support any of the authentication protocols if the <code>IsAuthenticationRequired</code> field is true.</p>

Field	Details
	<p>One of the following values:</p> <ul style="list-style-type: none"> • <code>UseSystemDefault</code>—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is 0.) • <code>Bounce</code>—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 1.) • <code>Discard</code>—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is 2.) • <code>Requeue</code>—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 3.)
AuthorizationFailureAction	<p>Type picklist</p> <p>Properties Defaulted on create, Group, Sort, Create, Filter, Nillable, Restricted picklist, Update</p> <p>Description Indicates what the email service does with messages received from senders who are not listed in the <code>AuthorizedSenders</code> field on either the email service or email service address.</p> <p>One of the following values:</p> <ul style="list-style-type: none"> • <code>UseSystemDefault</code>—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is 0.) • <code>Bounce</code>—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 1.) • <code>Discard</code>—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is 2.) • <code>Requeue</code>—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 3.)
AuthorizedSenders	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Configures the email service to only accept messages from the email addresses or domains listed in this field. Field	Details
	<p><code>AuthorizationFailureAction</code> field. Leave this field blank if you want the email service to receive email from any email address.</p>
<code>ErrorRoutingAddress</code>	<p>Type email</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The destination email address for error notification email messages when <code>IsErrorRoutingEnabled</code> is true.</p>
<code>FunctionInactiveAction</code>	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates what the email service does with messages it receives when the email service itself is inactive.</p> <p>One of the following values:</p> <ul style="list-style-type: none"> • <code>UseSystemDefault</code>—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is 0.) • <code>Bounce</code>—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 1.) • <code>Discard</code>—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is 2.) • <code>Requeue</code>—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 3.)
<code>FunctionName</code>	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of the email service.</p>
<code>IsActive</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Indicates whether this object is active (<code>true</code>) or not (<code>false</code>).</p>
IsAuthenticationRequired	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Configures the email service to verify the legitimacy of the sending server before processing a message. The email service uses the SPF, SenderId, and DomainKeys protocols to verify the sender's legitimacy: If the sending server passes at least one of these protocols and does not fail any, the email service accepts the email. If the server fails a protocol or does not support any of the protocols, the email service performs the action specified in the <code>AuthenticationFailureAction</code> field.</p>
IsErrorRoutingEnabled	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>When incoming email messages can't be processed, indicates whether error notification email messages are routed to a chosen address or to the senders.</p>
IsTextAttachmentsAsBinary	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>If <code>true</code>, text attachments are supplied to the Apex code as a <code>Messaging.BinaryAttachment</code> instead of as a <code>Messaging.TextAttachment</code>. This means that the body is supplied as an Apex Blob instead of as an Apex String.</p>
IsTextTruncated	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>This field is deprecated. It is not available as of API version 23.0 and is deprecated and hidden in versions 17.0 through 22.0. In all API versions, the email service now accepts inbound email messages up to the 10 MB size limit, without truncating the text. Previously, it indicated whether the email service truncated and accepted email messages with HTML body text,</p>

Field	Details
	plain body text, and text attachments over approximately 100,000 characters (<code>true</code>) or rejected these email messages and notified the sender (<code>false</code>).
<code>IsTlsRequired</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Not currently in use.</p>
<code>OverLimitAction</code>	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates what the email service does with messages if the total number of messages processed by all email services combined has reached the daily limit for your organization. One of the following values:</p> <ul style="list-style-type: none"> <code>UseSystemDefault</code>—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is 0.) <code>Bounce</code>—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 1.) <code>Discard</code>—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is 2.) <code>Requeue</code>—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 3.) <p>The system calculates the limit by multiplying the number of user licenses by 1,000.</p>

Usage

This object supports the email services feature, which allows you to create automated processes that use Apex classes to process the contents, headers, and attachments of inbound email. For example, you can create an email service that automatically creates contact records based on contact information in messages.

EmailTemplate

Represents a template for an email, mass email, list email, or HVS email.

 **Note:** You can't send a mass email using a Visualforce email template.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
<code>ApiVersion</code>	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The API version for this class. Every class has an API version specified at creation.</p>
<code>Body</code>	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Content of the email. Limit: 384 KB.</p>
<code>BrandTemplateId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Required. ID of the BrandTemplate associated with this email template. The brand template supplies letterhead information for the email template.</p>
<code>DeliveryRate</code>	<p>Type percent</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Read-only. The percentage of the emails that were delivered compared to the number that bounced (soft and hard). Note: this data includes emails that were delivered to the recipient's spam folder.</p>

Field	Details
	<p>This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.</p>
Description	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Description of the template, for example, Promotion Mass Mailing.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is Template Unique Name.</p> <p> Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p>
Encoding	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Character set encoding for the template.</p>
EnhancedLetterheadId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the enhanced letterhead associated with the email template.</p> <p> Note: To use an enhanced letterhead, associate it with a Lightning email template that uses the HML merge language.</p>

Field	Details
	<p>This is a relationship field.</p> <p>Relationship Name EnhancedLetterhead</p> <p>Relationship Type Lookup</p> <p>Refers To EnhancedLetterhead</p>
EntityType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort,</p> <p>Description When <code>UIType</code> is 2 (Lightning Experience) or 3 (Lightning ExperienceSample), <code>EntityType</code> indicates which entities this template can be used with (for example, account or lead). Valid values are standard object ID prefixes: 001 for account, 003 for contact, 006 for opportunity, and 00Q for lead, 500 for case, and 701 for campaign. This field has been removed in API version 39.0. Use <code>RelatedEntityType</code> instead.</p>
FolderId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the folder that contains the template. This is a relationship field.</p> <p>Relationship Name Folder</p> <p>Relationship Type Lookup</p> <p>Refers To Folder, Organization, User</p>
FolderName	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The name of the folder that contains the template.</p>

Field	Details
HasSalesforceFiles	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If the email template has attachments from Salesforce Files. The default value is false.</p>
HtmlValue	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description This field contains the content of the email message, including HTML coding to render the email message. Limit: 384 KB.</p>
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates that this template is active if <code>true</code>, or inactive if <code>false</code>.</p>
IsBuilderContent	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If the email template was made in Email Template Builder. The default value is false.</p>
LastUsedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Date and time when this email template was last used. Used with Salesforce Classic templates. Not typically used with Lightning Experience templates.</p>
Markup	<p>Type textarea</p>

Field	Details
	<p>Properties Create, Nillable, Update</p> <p>Description The Visualforce markup, HTML, JavaScript, or any other Web-enabled code that defines the content of the template.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Name of the template. Label is Email Template Name.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix. <p>This field can't be accessed unless the logged-in user has the Customize Application permission.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the owner of the template. This is a relationship field.</p>

Field	Details
	<p>Relationship Name Owner</p> <p>Relationship Type Lookup</p> <p>Refers To User</p>
RelatedEntityType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description When <code>UIType</code> is 2 (Lightning Experience) or 3 (Lightning ExperienceSample), <code>RelatedEntityType</code> indicates which entities this template can be used with. Valid values are the entity API name: "Account" for account, "Contact" for contact, "Opportunity" for opportunity, "Lead" for lead, and so on. The value can be any entity the user has read access to (including custom entities) but not virtual entities, setup entities, or platform entities. No restrictions exist at the schema level.</p>
Subject	<p>Type string</p> <p>Properties Create, Nillable, Sort, Update</p> <p>Description Content of the subject line. The limit is 1,000 characters for Lightning email templates and 230 characters for Classic email templates.</p>
TemplateStyle	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description Style of the template. Possible values are:</p> <ul style="list-style-type: none"> • <code>formalLetter</code>—Formal Letter • <code>freeForm</code>—Free Form Letter • <code>newsletter</code>—Newsletter • <code>none</code>—No Email Layout • <code>products</code>—Products • <code>promotionLeft</code>—Promotion (Left)

Field	Details
	<ul style="list-style-type: none"> • <code>promotionRight</code>—Promotion (Right)
<code>TemplateType</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description Type of template. Possible values are:</p> <ul style="list-style-type: none"> • <code>custom</code>—Custom • <code>html</code>—HTML • <code>text</code>—Text • <code>visualforce</code>—Visualforce
<code>TimesUsed</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Number of times this email template has been used. Used with Salesforce Classic templates. Not typically used with Lightning Experience templates.</p>
<code>TotalDelivered</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Read-only. The total number of emails sent minus hard and soft bounces. Note: this data includes emails that were delivered to the recipient's spam folder. This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.</p>
<code>TotalHardBounced</code>	<p>Type int</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>Read-only. The total number of emails that permanently bounced back to the sender because the address is invalid. A hard bounce can occur because the domain name doesn't exist or because the recipient is unknown.</p> <p>This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.</p>
TotalOpens	<p>Type int</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Read-only. The total number of times a prospect's email client loaded the images in the HTML version of the email. We also record an open if the prospect clicks a link within the HTML or text email without downloading images. A click indicates that they viewed the message. Some email clients (Outlook, Apple Mail, Thunderbird) don't display images by default. Pardot counts an open each time the images load.</p> <p>This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.</p>
TotalSent	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Read-only. The total number of emails sent, including bounced, opted-out, and invalid To: addresses.</p> <p>This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.</p>
TotalSoftBounced	<p>Type int</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>Read-only. The total number of times a recipient's mail server acknowledged the email, but returned it to the sender. Sometimes it is because the recipient's mailbox is full or the mail server is temporarily unavailable. A soft bounce message can sometimes be delivered at another time. After 5 soft bounces, Pardot opts the prospect out of emails.</p> <p>This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.</p>
UIType	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Indicates the user interface where this template is usable.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Aloha • SFX • SFX_Sample—SFXSample

Usage

To retrieve this object, issue a describe call on an object, which returns a query result for each activity since the object was created. You can't query these records.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

EmailTemplateChangeEvent (API version 48.0)

Change events are available for the object.

SEE ALSO:

[Attachment](#)

[EmailStatus](#)

[DocumentAttachmentMap](#)

EmailTemplateMonthlyMetric

Represents the monthly engagement metrics for an email template. This object is available in API version 53.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

High Velocity Sales must be enabled.

Fields

Field	Details
AllEmailsBouncedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The total of hard and soft bounced emails for this email template in the month. This is a calculated field.</p>
AllEmailsDeliveredCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of successfully delivered emails for this email template in the month. This is a calculated field.</p>
AllEmailsHardBouncedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of hard bounced emails for this email template in the month.</p>
AllEmailsLinkClickedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The number of emails containing a link clicked by the recipient for this email template in the month.</p>
AllEmailsNotDeliveredCount	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of emails not delivered for this email template in the month. This field is available in API version 54.0 and later.</p>
AllEmailsOpenedCount	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of emails opened by the recipient for this email template in the month.</p>
AllEmailsOutOfOfficeCount	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of emails that triggered an out-of-office reply for this email template in the month.</p>
AllEmailsRepliedCount	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of emails replied to for this email template in the month.</p>
AllEmailsSentCount	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of emails sent for this email template in the month.</p> <p>This is a calculated field.</p>

Field	Details
AllEmailsSoftBouncedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails soft bounced for this email template in the month.</p>
AllEmailsTrackedSentCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails sent with engagement tracking enabled for this email template in the month.</p>
AllEmailsUntrackedSentCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails sent without engagement tracking for this email template in the month.</p>
DeliveredRecipientCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of recipients who were successfully delivered an email for this email template in the month. This field is available in API version 54.0 and later. This is a calculated field.</p>
DeliveredRecipientRate	<p>Type percent</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The percentage of unique recipients that received an email you sent. This field is available in API version 54.0 and later. This is a calculated field.</p>

Field	Details
EmailTemplateId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the related email template. This is a relationship field.</p> <p>Relationship Name EmailTemplate</p> <p>Relationship Type Lookup</p> <p>Refers To EmailTemplate</p>
HardBounceTrackableSends	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails sent with hard bounce tracking. This field is available in API version 54.0 and later.</p>
HrdBncTrackableRecipientSends	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of recipients who received an email with hard bounce tracking. This field is available in API version 54.0 and later.</p>
IsLocked	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the monthly metric record is locked or not. The default value is 'false'.</p>
LinkClickTrackableSends	<p>Type int</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of emails sent with link click tracking for the email template in the month. This field is available in API version 54.0 and later.</p>
LinkClkTrackableRecipientSends	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of recipients who received an email with link tracking for the email template in the month. This field is available in API version 54.0 and later.</p>
MayEdit	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the monthly metric record can be edited or not. The default value is 'false'.</p>
Month	<p>Type date</p> <p>Properties Filter, Group, Sort</p> <p>Description The month in which the engagement occurred.</p>
MonthInt	<p>Type int</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description The month in which the engagement occurred, in yyyyymm format.</p>
OooTrackableRecipientSends	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The number of recipients who received an email with out-of-office tracking for the email template in the month. Out-of-office tracking requires Inbox. This field is available in API version 54.0 and later.</p>
OpenTrackableRecipientSends	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of recipients who received an email with open tracking for the email template in the month. This field is available in API version 54.0 and later.</p>
OpenTrackableSends	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of emails sent with open tracking for the email template in the month. This field is available in API version 54.0 and later.</p>
OutOfOfficeTrackableSends	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of emails sent with out-of-office tracking for the email template in the month. This field is available in API version 54.0 and later.</p>
RecipientReplies	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of unique recipients who replied to an email for this email template in the month. This field is available in API version 54.0 and later.</p>
RecipientSends	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The number of unique email recipients for this email template in the month. This field is available in API version 54.0 and later.</p>
RecipientsHardBounced	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of recipients that hard-bounced an email for this email template in the month. Hard bounces can mean that the recipient's email address doesn't exist or is misspelled. This field is available in API version 54.0 and later.</p>
RecipientsOutOfOffice	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of recipients that responded with an out-of-office reply for the email template in the month. This field is available in API version 54.0 and later.</p>
RecipientsSoftBounced	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of recipients that soft-bounced an email for the email template in the month. A soft bounce often indicates a temporary issue with the recipient's email server, such as a full inbox. This field is available in API version 54.0 and later.</p>
ReplyTrackableRecipientSends	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of recipients who received an email with reply tracking for this email template in the month. This field is available in API version 54.0 and later.</p>
ReplyTrackableSends	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The number of emails sent with reply tracking for the email template in the month. This field is available in API version 54.0 and later.</p>
SftBncTrackableRecipientSends	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of recipients who received an email with soft bounce tracking for the email template in the month. This field is available in API version 54.0 and later.</p>
SoftBounceTrackableSends	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of emails sent with soft bounce tracking for the email template in the month. This field is available in API version 54.0 and later.</p>
SomeEmailsDeliveredCount	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of sent emails that were successfully delivered to at least one of its recipients for the email template in the month. This field is available in API version 54.0 and later.</p> <p>This is a calculated field.</p>
SomeEmailsDeliveredRate	<p>Type</p> <p>percent</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The percentage of sent and tracked emails that were successfully delivered to at least one of their recipients for the email template in the month. This field is available in API version 54.0 and later.</p> <p>This is a calculated field.</p>
TrackableRecipientSendHrdBncRt	<p>Type</p> <p>percent</p>

Field	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description The percentage of emails sent to unique recipients with hard bounce tracking that hard bounced for the email template in the month. This field is available in API version 54.0 and later. This is a calculated field.</p>
TrackableRecipientSendOooRate	<p>Type percent</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The percentage of emails sent with out-of-office tracking that received out-of-office replies from unique recipients for the email template in the month. This field is available in API version 54.0 and later. This is a calculated field.</p>
TrackableRecipientSendReplyRt	<p>Type percent</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The percentage of emails sent with reply tracking that received replies from unique recipients for the email template in the month. This field is available in API version 54.0 and later. This is a calculated field.</p>
TrackableRecipientSendSftBncRt	<p>Type percent</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The percentage of emails sent to unique recipients with soft bounce tracking that soft-bounced for the email template in the month. This field is available in API version 54.0 and later. This is a calculated field.</p>
TrackableSendHardBounceRate	<p>Type percent</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The percentage of emails sent with hard bounce tracking that hard bounced for the email template in the month. This field is available in API version 54.0 and later.</p> <p>This is a calculated field.</p>
TrackableSendLinkClickRate	<p>Type</p> <p>percent</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The percentage of emails sent with link tracking that had link clicks for the email template in the month. This field is available in API version 54.0 and later.</p> <p>This is a calculated field.</p>
TrackableSendOpenRate	<p>Type</p> <p>percent</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The percentage of emails sent with open tracking that were opened by the recipient for the email template in the month. This field is available in API version 54.0 and later.</p> <p>This is a calculated field.</p>
TrackableSendOutOfOfficeRate	<p>Type</p> <p>percent</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The percentage of emails sent with out-of-office tracking that received out-of-office replies for the email template in the month. This field is available in API version 54.0 and later.</p> <p>This is a calculated field.</p>
TrackableSendReplyRate	<p>Type</p> <p>percent</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The percentage of emails sent with reply tracking that received replies for the email template in the month. This field is available in API version 54.0 and later.</p> <p>This is a calculated field.</p>

Field	Details
TrackableSendSoftBounceRate	<p>Type percent</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The percentage of emails sent with soft bounce tracking that soft bounced for the email template in the month. This field is available in API version 54.0 and later. This is a calculated field.</p>
UniqueEmailsLinkClickedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of link clicks by unique recipients for the email template in the month.</p>
UniqueEmailsOpenedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of times an email you sent was opened by a unique recipient for the email template in the month. When you send a list email, this field increments each time a recipient opens the received email.</p>
UniqueEmailsRepliedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of replies from unique recipients for the email template in the month.</p>

EmbeddedServiceDetail

Represents a metadata catalog object that exposes fields from the underlying Embedded Service setup objects defined in each EmbeddedServiceConfig deployment for guest users. Guest users don't have direct access to the Embedded Service setup objects. Available in API version 39.0 and later.

Supported SOAP Calls

`describeSObjects()`, `query()`

Supported REST HTTP Methods

GET

Fields

Field	Details
AvatarImg	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description URL of the image used as the agent avatar image.</p>
ContrastInvertedColor	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Accent branding color used in the embedded component, displayed as a hexadecimal value. Changes made to this field in the API aren't reflected in the embedded component.</p>
ContrastPrimaryColor	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Value of the ContrastPrimaryColor field in the EmbeddedServiceBranding setup object.</p>
CustomMinimizedComponent	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The custom Aura component that's used for the minimized state for this Embedded Chat deployment.</p>
CustomPrechatComponent	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The custom Aura component that's used for the pre-chat page for this Embedded Chat deployment.</p>
DurableId	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Developer name for the EmbeddedServiceConfig.</p>
FieldServiceConfirmCardImg	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>URL of the image used for the confirmation card in embedded Appointment Management (beta).</p>
FieldServiceHomeImg	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>URL of the image used for the home screen in embedded Appointment Management (beta).</p>
FieldServiceLogoImg	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>URL of the logo used for the home screen in embedded Appointment Management (beta).</p>
Font	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Font used in the chat text of the Embedded Chat window.</p>
FontSize	<p>Type</p> <p>picklist</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Font size for the embedded component.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Small • Medium • Large
HeaderBackgroundImg	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description URL of the image used for the header background in Embedded Chat. This field is removed in API version 49.0 and later. The header background image is no longer supported.</p>
Height	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Height of the embedded component.</p>
IsFieldServiceEnabled	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Specifies whether Field Service is enabled for this Embedded Service deployment (<code>true</code>) or not (<code>false</code>). Embedded Appointment Management is currently beta.</p>
IsLiveAgentEnabled	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Specifies whether Chat is enabled for this Embedded Service deployment (<code>true</code>) or not (<code>false</code>).</p>

Field	Details
IsOfflineCaseEnabled	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Specifies whether offline support is enabled for this Embedded Chat deployment (<code>true</code>) or not (<code>false</code>).</p>
