APEX REFERENCE GUIDE

Apex is a strongly typed, object-oriented programming language that allows developers to execute flow and transaction control statements on the Salesforce Platform server, in conjunction with calls to the API. This reference guide includes built-in Apex classes, interfaces, enums, and exceptions, grouped by namespace. It also includes Apex DML statements to insert, update, merge, delete, and restore data in Salesforce.

For information on the Apex development process, see Apex Developer Guide.

Note: In API version 51.0 and earlier, Apex Reference information was included in the Apex Developer Guide in the **Apex Language Reference** section.

IN THIS SECTION:

Apex DML Operations

You can perform DML operations using the Apex DML statements or the methods of the `Database` class. For lead conversion, use the `convertLead` method of the `Database` class. There is no DML counterpart for it.

ApexPages Namespace

The `ApexPages` namespace provides classes used in Visualforce controllers.

AppLauncher Namespace

The `AppLauncher` namespace provides methods for managing the appearance of apps in the App Launcher, including their visibility and sort order.

Approval Namespace

The `Approval` namespace provides classes and methods for approval processes.

Auth Namespace

The `Auth` namespace provides an interface and classes for single sign-on into Salesforce and session security management.

Cache Namespace

The `Cache` namespace contains methods for managing the platform cache.

Canvas Namespace

The `Canvas` namespace provides an interface and classes for canvas apps in Salesforce.

ChatterAnswers Namespace

The `ChatterAnswers` namespace provides an interface for creating Account records.

CommercePayments Namespace

Use the `CommercePayments` namespace to provide a safe and customizable platform for managing customer payments and refunds.

ConnectApi Namespace

The `ConnectApi` namespace (also called Connect in Apex) provides classes for accessing the same data available in Connect REST API. Use Connect in Apex to create custom experiences in Salesforce.

Database Namespace

The `Database` namespace provides classes used with DML operations.

Datacloud Namespace

The `Datacloud` namespace provides classes and methods for retrieving information about duplicate rules. Duplicate rules let you control whether and when users can save duplicate records within Salesforce.

DataSource Namespace

The `DataSource` namespace provides the classes for the Apex Connector Framework. Use the Apex Connector Framework to develop a custom adapter for Salesforce Connect. Then connect your Salesforce organization to any data anywhere via the Salesforce Connect custom adapter.

DataWeave Namespace (Developer Preview)

The DataWeave namespace provides classes and methods to support the invocation of DataWeave scripts from Apex.

Dom Namespace

The `Dom` namespace provides classes and methods for parsing and creating XML content.

EventBus Namespace

The `EventBus` namespace provides classes and methods for platform events and Change Data Capture events.

ExternalService Namespace

The `ExternalService` namespace provides dynamically generated Apex service interfaces and Apex classes for complex object data types.

Flow Namespace

The `Flow` namespace provides a class for advanced Visualforce controller access to flows.

Functions Namespace

The Functions namespace provides classes and methods used to invoke and manage Salesforce Functions.

Invocable Namespace

The `Invocable` namespace provides classes for calling invocable actions from Apex.

KbManagement Namespace

The `KbManagement` namespace provides a class for managing knowledge articles.

LxScheduler Namespace

The `LxScheduler` namespace provides an interface and classes for integrating Salesforce Scheduler with external calendars.

Messaging Namespace

The `Messaging` namespace provides classes and methods for Salesforce outbound and inbound email functionality.

Metadata Namespace

The `Metadata` namespace provides classes and methods for working with custom metadata in Salesforce

Pref_center Namespace

The Pref_center namespace provides an interface, classes, and methods to create and retrieve data in forms in Preference Manager. Preference Manager, previously called Preference Center, is a feature within the Privacy Center app.

Process Namespace

The `Process` namespace provides an interface and classes for passing data between your organization and a flow.

QuickAction Namespace

The `QuickAction` namespace provides classes and methods for quick actions.

Reports Namespace

The `Reports` namespace provides classes for accessing the same data as is available in the Salesforce Reports and Dashboards REST API.

Schema Namespace

The `Schema` namespace provides classes and methods for schema metadata information.

Search Namespace

The `Search` namespace provides classes for getting search results and suggestion results.

Sfc Namespace

The Sfc namespace contains classes used in Salesforce Files.

Sfdc_Checkout Namespace

The Sfdc_Checkout namespace provides an interface and classes for B2B Commerce apps in Salesforce.

sfdc_surveys Namespace

The `sfdc_surveys` namespace provides an interface for shortening survey invitations.

Site Namespace

The `Site` namespace provides an interface for rewriting Sites URLs.

Support Namespace

The `Support` namespace provides an interface used for Case Feed.

System Namespace

The `System` namespace provides classes and methods for core Apex functionality.

TerritoryMgmt Namespace

The `TerritoryMgmt` namespace provides an interface used for territory management.

TxnSecurity Namespace

The `TxnSecurity` namespace provides an interface used for transaction security.

UserProvisioning Namespace

The `UserProvisioning` namespace provides methods for monitoring outbound user provisioning requests.

VisualEditor Namespace

The `VisualEditor` namespace provides classes and methods for interacting with the Lightning App Builder. The classes and methods in this namespace operate on Lightning components, which include Lightning web components and Aura components.

Wave Namespace

The classes in the `Wave` namespace are part of the CRM Analytics Analytics SDK, designed to facilitate querying CRM Analytics data from Apex code.

Appendices

Apex DML Operations

You can perform DML operations using the Apex DML statements or the methods of the `Database` class. For lead conversion, use the `convertLead` method of the `Database` class. There is no DML counterpart for it.

SEE ALSO:

Apex Developer Guide: Working with Data in Apex

Database Class

Apex DML Statements

Use Data Manipulation Language (DML) statements to insert, update, merge, delete, and restore data in Salesforce.

The following Apex DML statements are available:

Insert Statement

The `insert` DML operation adds one or more sObjects, such as individual accounts or contacts, to your organization's data. `insert` is analogous to the INSERT statement in SQL.

Syntax

```
insert sObject
insert sObject[]
```

Example

The following example inserts an account named 'Acme':

```
Account newAcct = new Account(name = 'Acme');
try {
   insert newAcct;
} catch (DmlException e) {
// Process exception here
}
```

Note: For more information on processing `DmlExceptions`, see Bulk DML Exception Handling.

Update Statement

The `update` DML operation modifies one or more existing sObject records, such as individual accounts or contacts, in your organization's data. `update` is analogous to the UPDATE statement in SQL.

Syntax

```
update sObject
update sObject[]
```

Example

The following example updates the `BillingCity` field on a single account named 'Acme':

```
Account a = new Account(Name='Acme2');
insert(a);

Account myAcct = [SELECT Id, Name, BillingCity FROM Account WHERE Id = :a.Id];
myAcct.BillingCity = 'San Francisco';

try {
    update myAcct;
```

```
} catch (DmlException e) {
    // Process exception here
}
```

Note: For more information on processing `DmlExceptions`, see Bulk DML Exception Handling.

Upsert Statement

The `upsert` DML operation creates new records and updates sObject records within a single statement, using a specified field to determine the presence of existing objects, or the ID field if no field is specified.

Syntax

`upsert` ***`sObject`*** `[`***`opt_field`***`]`

`upsert` ***`sObject[]`*** `[`***`opt_field`***`]`

The `upsert` statement matches the sObjects with existing records by comparing values of one field. If you don't specify a field when calling this statement, the `upsert` statement uses the sObject's ID to match the sObject with existing records in Salesforce. Alternatively, you can specify a field to use for matching. For custom objects, specify a custom field marked as external ID. For standard objects, you can specify any field that has the `idLookup` attribute set to true. For example, the Email field of Contact or User has the `idLookup` attribute set. To check a field's attribute, see the Object Reference for Salesforce.

Also, you can use foreign keys to upsert sObject records if they have been set as reference fields. For more information, see Field Types in the *Object Reference for Salesforce*.

The optional field parameter, *`opt_field`*, is a field token (of type `Schema.SObjectField`). For example, to specify the MyExternalID custom field, the statement is:

```
upsert sObjectList Account.Fields.MyExternalId__c;
```

If the field used for matching doesn't have the `Unique` attribute set, the context user must have the "View All" object-level permission for the target object or the "View All Data" permission so that `upsert` doesn't accidentally insert a duplicate record.

Note: Custom field matching is case-insensitive only if the custom field has the **Unique** and **Treat "ABC" and "abc" as duplicate values (case insensitive)** attributes selected as part of the field definition. If so, "ABC123" is matched with "abc123." For more information, see "Create Custom Fields" in the Salesforce online help.

How Upsert Chooses to Insert or Update

Upsert uses the sObject record's primary key (the ID), an idLookup field, or an external ID field to determine whether it should create a record or update an existing one:

- If the key isn't matched, a new object record is created.
- If the key is matched once, the existing object record is updated.
- If the key is matched multiple times, an error is generated and the object record isn't inserted or updated.

Example

This example performs an upsert of a list of accounts.

```
List<Account> acctList = new List<Account>();
// Fill the accounts list with some accounts
```

```
try {
    upsert acctList;
} catch (DmlException e) {

}
```

This next example performs an upsert of a list of accounts using a foreign key for matching existing records, if any.

```
List<Account> acctList = new List<Account>();
// Fill the accounts list with some accounts

try {
    // Upsert using an external ID field
    upsert acctList myExtIDField__c;
} catch (DmlException e) {

}
```

Delete Statement

The `delete` DML operation deletes one or more existing sObject records, such as individual accounts or contacts, from your organization's data. `delete` is analogous to the `delete()` statement in the SOAP API.

Syntax

```
delete sObject
delete sObject[]
```

Example

The following example deletes all accounts that are named 'DotCom':

```
Account[] doomedAccts = [SELECT Id, Name FROM Account
                         WHERE Name = 'DotCom'];
try {
    delete doomedAccts;
} catch (DmlException e) {
    // Process exception here
}
```

Note: For more information on processing `DmlExceptions`, see Bulk DML Exception Handling.

Undelete Statement

The `undelete` DML operation restores one or more existing sObject records, such as individual accounts or contacts, from your organization's Recycle Bin. `undelete` is analogous to the UNDELETE statement in SQL.

Syntax

```
undelete sObject | ID
undelete sObject[] | ID[]
```

Example

The following example undeletes an account named 'Universal Containers'. The `ALL ROWS` keyword queries all rows for both top level and aggregate relationships, including deleted records and archived activities.

```
Account[] savedAccts = [SELECT Id, Name FROM Account WHERE Name = 'Universal Containers'
ALL ROWS];
try {
    undelete savedAccts;
} catch (DmlException e) {
    // Process exception here
}
```

Note: For more information on processing `DmlExceptions`, see Bulk DML Exception Handling.

Merge Statement

The `merge` statement merges up to three records of the same sObject type into one of the records, deleting the others, and re-parenting any related records.

Note: This DML operation does not have a matching Database system method.

Syntax

```
merge sObject sObject
merge sObject sObject[]
merge sObject ID
merge sObject ID[]
```

The first parameter represents the master record into which the other records are to be merged. The second parameter represents the one or two other records that should be merged and then deleted. You can pass these other records into the `merge` statement as a single sObject record or ID, or as a list of two sObject records or IDs.

Example

The following example merges two accounts named 'Acme Inc.' and 'Acme' into a single record:

```
List<Account> ls = new List<Account>{new Account(name='Acme Inc.'),new Account(name='Acme')};
insert ls;
Account masterAcct = [SELECT Id, Name FROM Account WHERE Name = 'Acme Inc.' LIMIT 1];
Account mergeAcct = [SELECT Id, Name FROM Account WHERE Name = 'Acme' LIMIT 1];
try {
    merge masterAcct mergeAcct;
} catch (DmlException e) {
    // Process exception here
}
```

Note: For more information on processing `DmlExceptions`, see Bulk DML Exception Handling.

ApexPages Namespace

The `ApexPages` namespace provides classes used in Visualforce controllers.

The following are the classes in the `ApexPages` namespace.

IN THIS SECTION:

Action Class

You can use `ApexPages.Action` to create an action method that you can use in a Visualforce custom controller or controller extension.

Component Class

Represents a dynamic Visualforce component in Apex.

IdeaStandardController Class

`IdeaStandardController` objects offer Ideas-specific functionality in addition to what is provided by the `StandardController`.

IdeaStandardSetController Class

`IdeaStandardSetController` objects offer Ideas-specific functionality in addition to what is provided by the `StandardSetController`.

KnowledgeArticleVersionStandardController Class

`KnowledgeArticleVersionStandardController` objects offer article-specific functionality in addition to what is provided by the `StandardController`.

Message Class

Contains validation errors that occur when the user saves the page that uses a standard controller.

StandardController Class

Use a StandardController when defining an extension for a standard controller.

StandardSetController Class

`StandardSetController` objects allow you to create list controllers similar to, or as extensions of, the pre-built Visualforce list controllers provided by Salesforce.

Action Class

You can use `ApexPages.Action` to create an action method that you can use in a Visualforce custom controller or controller extension.

Namespace

ApexPages

Usage

For example, you could create a `saveOver` method on a controller extension that performs a custom save.

Instantiation

The following code snippet illustrates how to instantiate a new `ApexPages.Action` object that uses the save action:

```
ApexPages.Action saveAction = new ApexPages.Action('{!save}');
```

IN THIS SECTION:

Action Constructors

Action Methods

Action Constructors

The following are constructors for `Action`.

IN THIS SECTION:

Action(action)

Creates a new instance of the `ApexPages.Action` class using the specified action.

`Action(action)`

Creates a new instance of the `ApexPages.Action` class using the specified action.

Signature

```
public Action(String action)
```

Parameters

`action`

Type: String

The action.

Action Methods

The following are methods for `Action`. All are instance methods.

IN THIS SECTION:

getExpression()

Returns the expression that is evaluated when the action is invoked.

invoke()

Invokes the action.

`getExpression()`

Returns the expression that is evaluated when the action is invoked.

Signature

```
public String getExpression()
```

Return Value

Type: String

`invoke()`

Invokes the action.

Signature

```
public System.PageReference invoke()
```

Return Value

Type: System.PageReference

Component Class

Represents a dynamic Visualforce component in Apex.

Namespace

ApexPages

Dynamic Component Properties

The following are properties for `Component`.

IN THIS SECTION:

childComponents
Returns a reference to the child components for the component.

expressions
Sets the content of an attribute using the expression language notation. The notation for this is `expressions.name_of_attribute`.

facets
Sets the content of a facet to a dynamic component. The notation is `facet.name_of_facet`.

`childComponents`

Returns a reference to the child components for the component.

Signature

```
public List <ApexPages.Component> childComponents {get; set;}
```

Property Value

Type: List<ApexPages.Component>

Example

```
Component.Apex.PageBlock pageBlk = new Component.Apex.PageBlock();

Component.Apex.PageBlockSection pageBlkSection = new
Component.Apex.PageBlockSection(title='dummy header');

pageBlk.childComponents.add(pageBlkSection);
```

expressions

Sets the content of an attribute using the expression language notation. The notation for this is `expressions.name_of_attribute`.

Signature

```
public String expressions {get; set;}
```

Property Value

Type: String

Example

```
Component.Apex.InputField inpFld = new
Component.Apex.InputField();
inpField.expressions.value = '{!Account.Name}';
inpField.expressions.id = '{!$User.FirstName}';
```

facets

Sets the content of a facet to a dynamic component. The notation is `facet.name_of_facet`.

Signature

```
public String facets {get; set;}
```

Property Value

Type: String

Usage

Note: This property is only accessible by components that support facets.

Example

```
Component.Apex.DataTable myDT = new
Component.Apex.DataTable();
Component.Apex.OutputText footer = new
Component.Apex.OutputText(value='Footer Copyright');
myDT.facets.footer = footer;
```

IdeaStandardController Class

`IdeaStandardController` objects offer Ideas-specific functionality in addition to what is provided by the `StandardController`.

Namespace

ApexPages

Usage

A method in the IdeaStandardController object is called by and operated on a particular instance of an IdeaStandardController.

Note: The `IdeaStandardSetController` and `IdeaStandardController` classes are currently available through a limited release program. For information on enabling these classes for your organization, contact your Salesforce representative.

In addition to the methods listed in this class, the `IdeaStandardController` class inherits all the methods associated with the `StandardController` class.

Instantiation

An IdeaStandardController object cannot be instantiated. An instance can be obtained through a constructor of a custom extension controller when using the standard ideas controller.

Example

The following example shows how an IdeaStandardController object can be used in the constructor for a custom list controller. This example provides the framework for manipulating the comment list data before displaying it on a Visualforce page.

```
public class MyIdeaExtension {

    private final ApexPages.IdeaStandardController ideaController;

    public MyIdeaExtension(ApexPages.IdeaStandardController controller) {
        ideaController = (ApexPages.IdeaStandardController)controller;
    }

    public List<IdeaComment> getModifiedComments() {
        IdeaComment[] comments = ideaController.getCommentList();
        // modify comments here
        return comments;
    }

}
```

The following Visualforce markup shows how the IdeaStandardController example shown above can be used in a page. This page must be named *detailPage* for this example to work.

Note: For the Visualforce page to display the idea and its comments, in the following example you need to specify the ID of a specific idea (for example, `/apex/detailPage?id=<ideaID>`) whose comments you want to view.

```
<!-- page named detailPage -->
<apex:page standardController="Idea" extensions="MyIdeaExtension">
    <apex:pageBlock title="Idea Section">
        <ideas:detailOutputLink page="detailPage" ideaId="{!idea.id}">{!idea.title}
        </ideas:detailOutputLink>
        <br/><br/>
        <apex:outputText >{!idea.body}</apex:outputText>
    </apex:pageBlock>
    <apex:pageBlock title="Comments Section">
        <apex:dataList var="a" value="{!modifiedComments}" id="list">
            {!a.commentBody}
        </apex:dataList>
        <ideas:detailOutputLink page="detailPage" ideaId="{!idea.id}"
               pageOffset="-1">Prev</ideas:detailOutputLink>
        |
        <ideas:detailOutputLink page="detailPage" ideaId="{!idea.id}"
               pageOffset="1">Next</ideas:detailOutputLink>
    </apex:pageBlock>
</apex:page>
```

SEE ALSO:

StandardController Class

IdeaStandardController Methods

The following are instance methods for `IdeaStandardController`.

IN THIS SECTION:

getCommentList()

Returns the list of read-only comments from the current page.

`getCommentList()`

Returns the list of read-only comments from the current page.

Signature

```
public IdeaComment[] getCommentList()
```

Return Value

Type: IdeaComment[]

This method returns the following comment properties:

- `id`

- commentBody
- createdDate
- createdBy.Id
- createdBy.communityNickname

IdeaStandardSetController Class

IdeaStandardSetController objects offer Ideas-specific functionality in addition to what is provided by the StandardSetController.

Namespace

ApexPages

Usage

Note: The IdeaStandardSetController and IdeaStandardController classes are currently available through a limited release program. For information on enabling these classes for your organization, contact your Salesforce representative.

In addition to the method listed above, the IdeaStandardSetController class inherits the methods associated with the StandardSetController.

Note: The methods inherited from the StandardSetController cannot be used to affect the list of ideas returned by the getIdeaList method.

Instantiation

An IdeaStandardSetController object cannot be instantiated. An instance can be obtained through a constructor of a custom extension controller when using the standard list controller for ideas.

Example: Displaying a Profile Page

The following example shows how an IdeaStandardSetController object can be used in the constructor for a custom list controller:

```
public class MyIdeaProfileExtension {
    private final ApexPages.IdeaStandardSetController ideaSetController;

    public MyIdeaProfileExtension(ApexPages.IdeaStandardSetController controller) {
        ideaSetController = (ApexPages.IdeaStandardSetController)controller;
    }

    public List<Idea> getModifiedIdeas() {
        Idea[] ideas = ideaSetController.getIdeaList();
        // modify ideas here
        return ideas;
    }

}
```

The following Visualforce markup shows how the IdeaStandardSetController example shown above and the <ideas:profileListOutputLink> component can display a profile page that lists the recent replies, submitted ideas, and

votes associated with a user. Because this example does not identify a specific user ID, the page automatically shows the profile page for the current logged in user. This page must be named *profilePage* in order for this example to work:

```
<!-- page named profilePage -->
<apex:page standardController="Idea" extensions="MyIdeaProfileExtension"
recordSetVar="ideaSetVar">
    <apex:pageBlock >
        <ideas:profileListOutputLink sort="recentReplies" page="profilePage">
          Recent Replies</ideas:profileListOutputLink>
        |
        <ideas:profileListOutputLink sort="ideas" page="profilePage">Ideas Submitted
        </ideas:profileListOutputLink>
        |
        <ideas:profileListOutputLink sort="votes" page="profilePage">Ideas Voted
        </ideas:profileListOutputLink>
    </apex:pageBlock>
    <apex:pageBlock >
        <apex:dataList value="{!modifiedIdeas}" var="ideadata">
            <ideas:detailoutputlink ideaId="{!ideadata.id}" page="viewPage">
             {!ideadata.title}</ideas:detailoutputlink>
        </apex:dataList>
    </apex:pageBlock>
</apex:page>
```

In the previous example, the <ideas:detailoutputlink> component links to the following Visualforce markup that displays the detail page for a specific idea. This page must be named *viewPage* in order for this example to work:

```
<!-- page named viewPage -->
<apex:page standardController="Idea">
    <apex:pageBlock title="Idea Section">
        <ideas:detailOutputLink page="viewPage" ideaId="{!idea.id}">{!idea.title}
        </ideas:detailOutputLink>
        <br/><br/>
        <apex:outputText>{!idea.body}</apex:outputText>
    </apex:pageBlock>
</apex:page>
```

Example: Displaying a List of Top, Recent, and Most Popular Ideas and Comments

The following example shows how an IdeaStandardSetController object can be used in the constructor for a custom list controller:

Note: You must have created at least one idea for this example to return any ideas.

```
public class MyIdeaListExtension {
    private final ApexPages.IdeaStandardSetController ideaSetController;

    public MyIdeaListExtension (ApexPages.IdeaStandardSetController controller) {
        ideaSetController = (ApexPages.IdeaStandardSetController)controller;
    }

    public List<Idea> getModifiedIdeas() {
        Idea[] ideas = ideaSetController.getIdeaList();
        // modify ideas here
```

```
        return ideas;
    }
}
```

The following Visualforce markup shows how the IdeaStandardSetController example shown above can be used with the `<ideas:listOutputLink>` component to display a list of recent, top, and most popular ideas and comments. This page must be named *`listPage`* in order for this example to work:

```
<!-- page named listPage -->
<apex:page standardController="Idea" extensions="MyIdeaListExtension"
recordSetVar="ideaSetVar">
    <apex:pageBlock >
        <ideas:listOutputLink sort="recent" page="listPage">Recent Ideas
        </ideas:listOutputLink>
        |
        <ideas:listOutputLink sort="top" page="listPage">Top Ideas
        </ideas:listOutputLink>
        |
        <ideas:listOutputLink sort="popular" page="listPage">Popular Ideas
        </ideas:listOutputLink>
        |
        <ideas:listOutputLink sort="comments" page="listPage">Recent Comments
        </ideas:listOutputLink>
    </apex:pageBlock>
    <apex:pageBlock >
        <apex:dataList value="{!modifiedIdeas}" var="ideadata">
            <ideas:detailoutputlink ideaId="{!ideadata.id}" page="viewPage">
             {!ideadata.title}</ideas:detailoutputlink>
        </apex:dataList>
    </apex:pageBlock>
</apex:page>
```

In the previous example, the `<ideas:detailoutputlink>` component links to the following Visualforce markup that displays the detail page for a specific idea. This page must be named *`viewPage`*.

```
<!-- page named viewPage -->
<apex:page standardController="Idea">
    <apex:pageBlock title="Idea Section">
        <ideas:detailOutputLink page="viewPage" ideaId="{!idea.id}">{!idea.title}
        </ideas:detailOutputLink>
        <br/><br/>
        <apex:outputText>{!idea.body}</apex:outputText>
    </apex:pageBlock>
</apex:page>
```

SEE ALSO:

StandardSetController Class

IdeaStandardSetController Methods

The following are instance methods for `IdeaStandardSetController`.

IN THIS SECTION:

getIdeaList()
Returns the list of read-only ideas in the current page set.

`getIdeaList()`

Returns the list of read-only ideas in the current page set.

Signature

```
public Idea[] getIdeaList()
```

Return Value

Type: Idea[]

Usage

You can use the `<ideas:listOutputLink>`, `<ideas:profileListOutputLink>`, and `<ideas:detailOutputLink>` components to display profile pages as well as idea list and detail pages (see the examples below). The following is a list of properties returned by this method:

- `Body`
- `Categories`
- `Category`
- `CreatedBy.CommunityNickname`
- `CreatedBy.Id`
- `CreatedDate`
- `Id`
- `LastCommentDate`
- `LastComment.Id`
- `LastComment.CommentBody`
- `LastComment.CreatedBy.CommunityNickname`
- `LastComment.CreatedBy.Id`
- `NumComments`
- `Status`
- `Title`
- `VoteTotal`

KnowledgeArticleVersionStandardController Class

`KnowledgeArticleVersionStandardController` objects offer article-specific functionality in addition to what is provided by the `StandardController`.

Namespace

ApexPages

Usage

In addition to the method listed above, the `KnowledgeArticleVersionStandardController` class inherits all the methods associated with `StandardController`.

Note: Though inherited, the `edit`, `delete`, and `save` methods don't serve a function when used with the `KnowledgeArticleVersionStandardController` class.

Example

The following example shows how a `KnowledgeArticleVersionStandardController` object can be used to create a custom extension controller. In this example, you create a class named `AgentContributionArticleController` that allows customer-support agents to see pre-populated fields on the draft articles they create while closing cases.

Prerequisites:

1. Create an article type called *`FAQ`*. For instructions, see "Create Article Types" in the Salesforce online help.
2. Create a text custom field called `Details`. For instructions, see "Add Custom Fields to Article Types" in the Salesforce online help.
3. Create a category group called *`Geography`* and assign it to a category called *`USA`*. For instructions, see "Create and Modify Category Groups" and "Add Data Categories to Category Groups" in the Salesforce online help.
4. Create a category group called *`Topics`* and assign it a category called *`Maintenance`*.

```
/** Custom extension controller for the simplified article edit page that
    appears when an article is created on the close-case page.
*/
public class AgentContributionArticleController {
    // The constructor must take a ApexPages.KnowledgeArticleVersionStandardController as
 an argument
    public AgentContributionArticleController(
        ApexPages.KnowledgeArticleVersionStandardController ctl) {
        // This is the SObject for the new article.
        //It can optionally be cast to the proper article type.
        // For example, FAQ__kav article = (FAQ__kav) ctl.getRecord();
        SObject article = ctl.getRecord();
        // This returns the ID of the case that was closed.
        String sourceId = ctl.getSourceId();
        Case c = [SELECT Subject, Description FROM Case WHERE Id=:sourceId];

        // This overrides the default behavior of pre-filling the
        // title of the article with the subject of the closed case.
        article.put('title', 'From Case: '+c.subject);
        article.put('details__c',c.description);

        // Only one category per category group can be specified.
        ctl.selectDataCategory('Geography','USA');
        ctl.selectDataCategory('Topics','Maintenance');
```

```
    }
}
```

```
/** Test class for the custom extension controller.
*/
@isTest
private class AgentContributionArticleControllerTest {
    static testMethod void testAgentContributionArticleController() {
         String caseSubject = 'my test';
         String caseDesc = 'my test description';

         Case c = new Case();
         c.subject= caseSubject;
         c.description = caseDesc;
         insert c;
         String caseId = c.id;
         System.debug('Created Case: ' + caseId);

         ApexPages.currentPage().getParameters().put('sourceId', caseId);
         ApexPages.currentPage().getParameters().put('sfdc.override', '1');

         ApexPages.KnowledgeArticleVersionStandardController ctl =
            new ApexPages.KnowledgeArticleVersionStandardController(new FAQ__kav());

         new AgentContributionArticleController(ctl);

         System.assertEquals(caseId, ctl.getSourceId());
         System.assertEquals('From Case: '+caseSubject, ctl.getRecord().get('title'));
         System.assertEquals(caseDesc, ctl.getRecord().get('details__c'));
    }
}
```

If you created the custom extension controller for the purpose described in the previous example (that is, to modify submitted-via-case articles), complete the following steps after creating the class:

1. Log into your Salesforce organization and from Setup, enter *Knowledge Settings* in the Quick Find box, then select **Knowledge Settings**.
2. Click **Edit**.
3. Assign the class to the Use Apex customization field. This associates the article type specified in the new class with the article type assigned to closed cases.
4. Click **Save**.

IN THIS SECTION:

KnowledgeArticleVersionStandardController Constructors

KnowledgeArticleVersionStandardController Methods

SEE ALSO:

StandardController Class

KnowledgeArticleVersionStandardController Constructors

The following are constructors for `KnowledgeArticleVersionStandardController`.

IN THIS SECTION:

KnowledgeArticleVersionStandardController(article)
Creates a new instance of the `ApexPages.KnowledgeArticleVersionStandardController` class using the specified knowledge article.

`KnowledgeArticleVersionStandardController(article)`

Creates a new instance of the `ApexPages.KnowledgeArticleVersionStandardController` class using the specified knowledge article.

Signature

```
public KnowledgeArticleVersionStandardController(SObject article)
```

Parameters

`article`
Type: SObject
The knowledge article, such as `FAQ__kav`.

KnowledgeArticleVersionStandardController Methods

The following are instance methods for `KnowledgeArticleVersionStandardController`.

IN THIS SECTION:

getSourceId()
Returns the ID for the source object record when creating a new article from another object.

setDataCategory(categoryGroup, category)
Specifies a default data category for the specified data category group when creating a new article.

`getSourceId()`

Returns the ID for the source object record when creating a new article from another object.

Signature

```
public String getSourceId()
```

Return Value

Type: String

`setDataCategory(categoryGroup, category)`

Specifies a default data category for the specified data category group when creating a new article.

Signature

```
public Void setDataCategory(String categoryGroup, String category)
```

Parameters

`categoryGroup`
Type: String

`category`
Type: String

Return Value

Type: Void

Message Class

Contains validation errors that occur when the user saves the page that uses a standard controller.

Namespace

ApexPages

Usage

When using a standard controller, all validation errors, both custom and standard, that occur when the user saves the page are automatically added to the page error collections. If an `inputField` component is bound to the field with an error, the message is added to the component's error collection. All messages are added to the page's error collection. For more information, see Validation Rules and Standard Controllers in the *Visualforce Developer's Guide*.

If your application uses a custom controller or extension, you must use the `message` class for collecting errors.

Instantiation

In a custom controller or controller extension, you can instantiate a Message in one of these ways:

- ```
  ApexPages.Message myMsg = new ApexPages.Message(ApexPages.severity, summary);
  ```

  where `ApexPages.severity` is the enum that determines how severe a message is, and `summary` is the String used to summarize the message. For example:

  ```
  ApexPages.Message myMsg = new ApexPages.Message(ApexPages.Severity.FATAL, 'my error msg');
  ```

- ```
  ApexPages.Message myMsg = new ApexPages.Message(ApexPages.severity, summary, detail);
  ```

  where `ApexPages. severity` is the enum that determines how severe a message is, `summary` is the String used to summarize the message, and `detail` is the String used to provide more detailed information about the error.

ApexPages.Severity Enum

To specify the severity of the message, use the `ApexPages.Severity` enum values. The following are the valid values:

- `CONFIRM`
- `ERROR`
- `FATAL`
- `INFO`
- `WARNING`

All enums have access to standard methods, such as `name` and `value`.

IN THIS SECTION:

Message Constructors

Message Methods

Message Constructors

The following are constructors for `Message`.

IN THIS SECTION:

Message(severity, summary)

Creates a new instance of the `ApexPages.Message` class using the specified message severity and summary.

Message(severity, summary, detail)

Creates a new instance of the `ApexPages.Message` class using the specified message severity, summary, and message detail.

Message(severity, summary, detail, id)

Creates a new instance of the `ApexPages.Message` class using the specified severity, summary, detail, and component ID.

`Message(severity, summary)`

Creates a new instance of the `ApexPages.Message` class using the specified message severity and summary.

Signature

```
public Message(ApexPages.Severity severity, String summary)
```

Parameters

severity
Type: ApexPages.Severity

The severity of a Visualforce message.

summary
Type: String

The summary Visualforce message.

Message(severity, summary, detail)

Creates a new instance of the `ApexPages.Message` class using the specified message severity, summary, and message detail.

Signature

```
public Message(ApexPages.Severity severity, String summary, String detail)
```

Parameters

severity
Type: ApexPages.Severity

The severity of a Visualforce message.

summary
Type: String

The summary Visualforce message.

detail
Type: String

The detailed Visualforce message.

Message(severity, summary, detail, id)

Creates a new instance of the `ApexPages.Message` class using the specified severity, summary, detail, and component ID.

Signature

```
public Message(ApexPages.Severity severity, String summary, String detail, String id)
```

Parameters

severity
Type: ApexPages.Severity

The severity of a Visualforce message.

summary
Type: String

The summary Visualforce message.

detail
Type: String

The detailed Visualforce message.

id
Type: String

The ID of the Visualforce component to associate with the message, for example, a form field with an error.

Message Methods

The following are methods for `Message`. All are instance methods.

IN THIS SECTION:

getComponentLabel()
Returns the label of the associated `inputField` component. If no label is defined, this method returns `null`.

getDetail()
Returns the value of the detail parameter used to create the message. If no detail String was specified, this method returns `null`.

getSeverity()
Returns the severity enum used to create the message.

getSummary()
Returns the summary String used to create the message.

`getComponentLabel()`

Returns the label of the associated `inputField` component. If no label is defined, this method returns `null`.

Signature

```
public String getComponentLabel()
```

Return Value

Type: String

`getDetail()`

Returns the value of the detail parameter used to create the message. If no detail String was specified, this method returns `null`.

Signature

```
public String getDetail()
```

Return Value

Type: String

`getSeverity()`

Returns the severity enum used to create the message.

Signature

```
public ApexPages.Severity getSeverity()
```

Return Value

Type: ApexPages.Severity

`getSummary()`

Returns the summary String used to create the message.

Signature

```
public String getSummary()
```

Return Value

Type: String

StandardController Class

Use a StandardController when defining an extension for a standard controller.

Namespace

ApexPages

Usage

StandardController objects reference the pre-built Visualforce controllers provided by Salesforce. The only time it is necessary to refer to a StandardController object is when defining an extension for a standard controller. StandardController is the data type of the single argument in the extension class constructor.

Instantiation

You can instantiate a StandardController in the following way:

```
ApexPages.StandardController sc = new ApexPages.StandardController(sObject);
```

Example

The following example shows how a StandardController object can be used in the constructor for a standard controller extension:

```
public class myControllerExtension {

    private final Account acct;

    // The extension constructor initializes the private member
    // variable acct by using the getRecord method from the standard
    // controller.
    public myControllerExtension(ApexPages.StandardController stdController) {
        this.acct = (Account)stdController.getRecord();
    }

    public String getGreeting() {
        return 'Hello ' + acct.name + ' (' + acct.id + ')';
    }
}
```

The following Visualforce markup shows how the controller extension from above can be used in a page:

```
<apex:page standardController="Account" extensions="myControllerExtension">
    {!greeting} <p/>
    <apex:form>
        <apex:inputField value="{!account.name}"/> <p/>
        <apex:commandButton value="Save" action="{!save}"/>
    </apex:form>
</apex:page>
```

IN THIS SECTION:

StandardController Constructors

StandardController Methods

StandardController Constructors

The following are constructors for `StandardController`.

IN THIS SECTION:

StandardController(controllerSObject)

Creates a new instance of the `ApexPages.StandardController` class for the specified standard or custom object.

`StandardController(controllerSObject)`

Creates a new instance of the `ApexPages.StandardController` class for the specified standard or custom object.

Signature

```
public StandardController(SObject controllerSObject)
```

Parameters

controllerSObject
Type: SObject

A standard or custom object.

StandardController Methods

The following are methods for `StandardController`. All are instance methods.

IN THIS SECTION:

addFields(fieldNames)
When a Visualforce page is loaded, the fields accessible to the page are based on the fields referenced in the Visualforce markup. This method adds a reference to each field specified in `fieldNames` so that the controller can explicitly access those fields as well.

cancel()
Returns the PageReference of the cancel page.

delete()
Deletes record and returns the PageReference of the delete page.

edit()
Returns the PageReference of the standard edit page.

getId()
Returns the ID of the record that is currently in context, based on the value of the `id` query string parameter in the Visualforce page URL.

getRecord()
Returns the record that is currently in context, based on the value of the `id` query string parameter in the Visualforce page URL.

reset()
Forces the controller to reacquire access to newly referenced fields. Any changes made to the record prior to this method call are discarded.

save()
Saves changes and returns the updated PageReference.

view()
Returns the PageReference object of the standard detail page.

`addFields(fieldNames)`

When a Visualforce page is loaded, the fields accessible to the page are based on the fields referenced in the Visualforce markup. This method adds a reference to each field specified in `fieldNames` so that the controller can explicitly access those fields as well.

Signature

```
public Void addFields(List<String> fieldNames)
```

Parameters

fieldNames
Type: List<String>

Return Value

Type: Void

Usage

This method should be called before a record has been loaded—typically, it's called by the controller's constructor. If this method is called outside of the constructor, you must use the `reset()` method before calling `addFields()`.

The strings in `fieldNames` can either be the API name of a field, such as AccountId, or they can be explicit relationships to fields, such as `something__r.myField__c`.

This method is only for controllers used by dynamicVisualforce bindings.

cancel()

Returns the PageReference of the cancel page.

Signature

```
public System.PageReference cancel()
```

Return Value

Type: System.PageReference

delete()

Deletes record and returns the PageReference of the delete page.

Signature

```
public System.PageReference delete()
```

Return Value

Type: System.PageReference

edit()

Returns the PageReference of the standard edit page.

Signature

```
public System.PageReference edit()
```

Return Value

Type: System.PageReference

`getId()`

Returns the ID of the record that is currently in context, based on the value of the `id` query string parameter in the Visualforce page URL.

Signature

```
public String getId()
```

Return Value

Type: String

`getRecord()`

Returns the record that is currently in context, based on the value of the `id` query string parameter in the Visualforce page URL.

Signature

```
public SObject getRecord()
```

Return Value

Type: sObject

Usage

Note that only the fields that are referenced in the associated Visualforce markup are available for querying on this SObject. All other fields, including fields from any related objects, must be queried using a SOQL expression.

Tip: You can work around this restriction by including a hidden component that references any additional fields that you want to query. Hide the component from display by setting the component's `rendered` attribute to `false`.

Example

```
<apex:outputText
value="{!account.billingcity}
{!account.contacts}"
rendered="false"/>
```

`reset()`

Forces the controller to reacquire access to newly referenced fields. Any changes made to the record prior to this method call are discarded.

Signature

```
public Void reset()
```

Return Value

Type: Void

Usage

This method is only used if `addFields` is called outside the constructor, and it must be called directly before `addFields`.

This method is only for controllers used by dynamicVisualforce bindings.

`save()`

Saves changes and returns the updated PageReference.

Signature

```
public System.PageReference save()
```

Return Value

Type: System.PageReference

`view()`

Returns the PageReference object of the standard detail page.

Signature

```
public System.PageReference view()
```

Return Value

Type: System.PageReference

StandardSetController Class

`StandardSetController` objects allow you to create list controllers similar to, or as extensions of, the pre-built Visualforce list controllers provided by Salesforce.

Namespace

ApexPages

Usage

The `StandardSetController` class also contains a *prototype object*. This is a single `sObject` contained within the Visualforce StandardSetController class. If the prototype object's fields are set, those values are used during the save action, meaning that the values

are applied to every record in the set controller's collection. This is useful for writing pages that perform mass updates (applying identical changes to fields within a collection of objects).

Note: Fields that are required in other Salesforce objects will keep the same requiredness when used by the prototype object.

Instantiation

You can instantiate a StandardSetController in either of the following ways:

- From a list of sObjects:

```
List<account> accountList = [SELECT Name FROM Account LIMIT 20];
ApexPages.StandardSetController ssc = new ApexPages.StandardSetController(accountList);
```

- From a query locator:

```
ApexPages.StandardSetController ssc =
new ApexPages.StandardSetController(Database.getQueryLocator([SELECT Name,CloseDate FROM
 Opportunity]));
```

Note: The maximum record limit for StandardSetController is 10,000 records. Instantiating StandardSetController using a query locator returning more than 10,000 records causes a LimitException to be thrown. However, instantiating StandardSetController with a list of more than 10,000 records doesn't throw an exception, and instead truncates the records to the limit.

Example

The following example shows how a StandardSetController object can be used in the constructor for a custom list controller:

```
public class opportunityList2Con {
    // ApexPages.StandardSetController must be instantiated
    // for standard list controllers
    public ApexPages.StandardSetController setCon {
        get {
            if(setCon == null) {
                setCon = new ApexPages.StandardSetController(Database.getQueryLocator(
                    [SELECT Name, CloseDate FROM Opportunity]));
            }
            return setCon;
        }
        set;
    }

    // Initialize setCon and return a list of records
    public List<Opportunity> getOpportunities() {
        return (List<Opportunity>) setCon.getRecords();
    }
}
```

The following Visualforce markup shows how the controller above can be used in a page:

```
<apex:page controller="opportunityList2Con">
    <apex:pageBlock>
        <apex:pageBlockTable value="{!opportunities}" var="o">
            <apex:column value="{!o.Name}"/>
```

```
            <apex:column value="{!o.CloseDate}"/>
        </apex:pageBlockTable>
    </apex:pageBlock>
</apex:page>
```

IN THIS SECTION:

StandardSetController Constructors

StandardSetController Methods

StandardSetController Constructors

The following are constructors for `StandardSetController`.

IN THIS SECTION:

StandardSetController(queryLocator)

Creates an instance of the `ApexPages.StandardSetController` class for the list of objects returned by the query locator.

StandardSetController(controllerSObjects)

Creates an instance of the `ApexPages.StandardSetController` class for the specified list of standard or custom objects.

`StandardSetController(queryLocator)`

Creates an instance of the `ApexPages.StandardSetController` class for the list of objects returned by the query locator.

Signature

```
public StandardSetController(Database.QueryLocator queryLocator)
```

Parameters

`queryLocator`

Type: Database.QueryLocator

A query locator representing a list of sObjects.

`StandardSetController(controllerSObjects)`

Creates an instance of the `ApexPages.StandardSetController` class for the specified list of standard or custom objects.

Signature

```
public StandardSetController(List<sObject> controllerSObjects)
```

Parameters

`controllerSObjects`

Type: List on page 2983<sObject on page 3173>

A List of standard or custom objects.

Example

```
List<account> accountList = [SELECT Name FROM Account LIMIT 20];
ApexPages.StandardSetController ssc = new ApexPages.StandardSetController(accountList);
```

StandardSetController Methods

The following are methods for `StandardSetController`. All are instance methods.

IN THIS SECTION:

cancel()

Returns the PageReference of the original page, if known, or the home page.

first()

Returns the first page of records.

getCompleteResult()

Indicates whether there are more records in the set than the maximum record limit. If this is false, there are more records than you can process using the list controller. The maximum record limit is 10,000 records.

getFilterId()

Returns the ID of the filter that is currently in context.

getHasNext()

Indicates whether there are more records after the current page set.

getHasPrevious()

Indicates whether there are more records before the current page set.

getListViewOptions()

Returns a list of the listviews available to the current user.

getPageNumber()

Returns the page number of the current page set. Note that the first page returns 1.

getPageSize()

Returns the number of records included in each page set.

getRecord()

Returns the sObject that represents the changes to the selected records. This retrieves the prototype object contained within the class, and is used for performing mass updates.

getRecords()

Returns the list of sObjects in the current page set. This list is immutable, i.e. you can't call `clear()` on it.

getResultSize()

Returns the number of records in the set.

getSelected()

Returns the list of sObjects that have been selected.

last()

Returns the last page of records.

next()

Returns the next page of records.

previous()

Returns the previous page of records.

save()

Inserts new records or updates existing records that have been changed. After this operation is finished, it returns a PageReference to the original page, if known, or the home page.

setFilterID(filterId)

Sets the filter ID of the controller.

setpageNumber(pageNumber)

Sets the page number.

setPageSize(pageSize)

Sets the number of records in each page set.

setSelected(selectedRecords)

Set the selected records.

`cancel()`

Returns the PageReference of the original page, if known, or the home page.

Signature

```
public System.PageReference cancel()
```

Return Value

Type: System.PageReference

`first()`

Returns the first page of records.

Signature

```
public Void first()
```

Return Value

Type: Void

`getCompleteResult()`

Indicates whether there are more records in the set than the maximum record limit. If this is false, there are more records than you can process using the list controller. The maximum record limit is 10,000 records.

Signature

```
public Boolean getCompleteResult()
```

Return Value

Type: Boolean

getFilterId()

Returns the ID of the filter that is currently in context.

Signature

```
public String getFilterId()
```

Return Value

Type: String

getHasNext()

Indicates whether there are more records after the current page set.

Signature

```
public Boolean getHasNext()
```

Return Value

Type: Boolean

getHasPrevious()

Indicates whether there are more records before the current page set.

Signature

```
public Boolean getHasPrevious()
```

Return Value

Type: Boolean

getListViewOptions()

Returns a list of the listviews available to the current user.

Signature

```
public System.SelectOption getListViewOptions()
```

Return Value

Type: System.SelectOption[]

getPageNumber()

Returns the page number of the current page set. Note that the first page returns 1.

Signature

```
public Integer getPageNumber()
```

Return Value

Type: Integer

getPageSize()

Returns the number of records included in each page set.

Signature

```
public Integer getPageSize()
```

Return Value

Type: Integer

getRecord()

Returns the sObject that represents the changes to the selected records. This retrieves the prototype object contained within the class, and is used for performing mass updates.

Signature

```
public sObject getRecord()
```

Return Value

Type: sObject

getRecords()

Returns the list of sObjects in the current page set. This list is immutable, i.e. you can't call `clear()` on it.

Signature

```
public sObject[] getRecords()
```

Return Value

Type: sObject[]

getResultSize()

Returns the number of records in the set.

Signature

```
public Integer getResultSize()
```

Return Value

Type: Integer

getSelected()

Returns the list of sObjects that have been selected.

Signature

```
public sObject[] getSelected()
```

Return Value

Type: sObject[]

last()

Returns the last page of records.

Signature

```
public Void last()
```

Return Value

Type: Void

next()

Returns the next page of records.

Signature

```
public Void next()
```

Return Value

Type: Void

previous()

Returns the previous page of records.

Signature

```
public Void previous()
```

Return Value

Type: Void

save()

Inserts new records or updates existing records that have been changed. After this operation is finished, it returns a PageReference to the original page, if known, or the home page.

Signature

```
public System.PageReference save()
```

Return Value

Type: System.PageReference

setFilterID(filterId)

Sets the filter ID of the controller.

Signature

```
public Void setFilterID(String filterId)
```

Parameters

filterId
Type: String

Return Value

Type: Void

setpageNumber(pageNumber)

Sets the page number.

Signature

```
public Void setpageNumber(Integer pageNumber)
```

Parameters

pageNumber
Type: Integer

Return Value

Type: Void

`setPageSize(pageSize)`

Sets the number of records in each page set.

Signature

```
public Void setPageSize(Integer pageSize)
```

Parameters

`pageSize`
Type: Integer

Return Value

Type: Void

`setSelected(selectedRecords)`

Set the selected records.

Signature

```
public Void setSelected(sObject[] selectedRecords)
```

Parameters

`selectedRecords`
Type: sObject[]

Return Value

Type: Void

AppLauncher Namespace

The `AppLauncher` namespace provides methods for managing the appearance of apps in the App Launcher, including their visibility and sort order.

The following class is in the `AppLauncher` namespace.

IN THIS SECTION:

AppMenu Class
Contains methods to set the appearance of apps in the App Launcher.

CommunityLogoController Class
Represents the logo of the Experience Cloud site. For internal use only.

EmployeeLoginLinkController Class
Represents the link on the login form that employees can click to log in. For internal use only.

SocialLoginController Class
Represents the social authentication providers configured for the Experience Cloud site. For internal use only.

AppMenu Class

Contains methods to set the appearance of apps in the App Launcher.

Namespace

AppLauncher

IN THIS SECTION:

AppMenu Methods

AppMenu Methods

The following are methods for `AppMenu`.

IN THIS SECTION:

setAppVisibility(appMenuItemId, isVisible)
Shows or hides specific apps in the App Launcher.

setOrgSortOrder(appIds)
Sets the organization-wide default sort order for the App Launcher based on a List of app menu item IDs in the desired order.

setUserSortOrder(appIds)
Sets an individual user's default sort order for the App Launcher based on a List of app menu item IDs in the desired order.

`setAppVisibility(appMenuItemId, isVisible)`

Shows or hides specific apps in the App Launcher.

Signature

```
public static void setAppVisibility(Id appMenuItemId, Boolean isVisible)
```

Parameters

`appMenuItemId`
Type: Id

The 15-character application ID value for an app. For more information, see the `ApplicationId` field for AppMenuItem or the `AppMenuItemId` field for UserAppMenuItem in the *Salesforce Object Reference*

isVisible
Type: Boolean

If `true`, the app is visible.

Return Value

Type: void

`setOrgSortOrder(appIds)`

Sets the organization-wide default sort order for the App Launcher based on a List of app menu item IDs in the desired order.

Signature

```
public static void setOrgSortOrder(List<Id> appIds)
```

Parameters

appIds
Type: List<Id>

A list of application ID values. For more information, see the `ApplicationId` field for AppMenuItem in the *Salesforce Object Reference*.

Return Value

Type: void

`setUserSortOrder(appIds)`

Sets an individual user's default sort order for the App Launcher based on a List of app menu item IDs in the desired order.

Signature

```
public static void setUserSortOrder(List<Id> appIds)
```

Parameters

appIds
Type: List<Id>

A list of application ID values. For more information, see the `AppMenuItemId` field for UserAppMenuItem in the *Salesforce Object Reference*.

Return Value

Type: void

CommunityLogoController Class

Represents the logo of the Experience Cloud site. For internal use only.

Namespace

AppLauncher

IN THIS SECTION:

CommunityLogoController Methods

CommunityLogoController Methods

The following are methods for `CommunityLogoController`.

IN THIS SECTION:

getCommunityName()
Returns the name of the Experience Cloud site.

getLogoURL()
Returns the path to the page containing the Experience Cloud site's logo.

`getCommunityName()`

Returns the name of the Experience Cloud site.

Signature

```
public static String getCommunityName()
```

Return Value

Type: String

`getLogoURL()`

Returns the path to the page containing the Experience Cloud site's logo.

Signature

```
public static String getLogoURL()
```

Return Value

Type: String

EmployeeLoginLinkController Class

Represents the link on the login form that employees can click to log in. For internal use only.

Namespace

AppLauncher

IN THIS SECTION:

EmployeeLoginLinkController Methods

EmployeeLoginLinkController Methods

The following are methods for `EmployeeLoginLinkController`.

IN THIS SECTION:

getEmployeeLoginUrl(startUrl)
Returns the path to the page that employees see after they log in.

getIsAllowInternalUserLoginEnabled()
Indicates whether an internal user is allowed to log in to the Experience Cloud site.

`getEmployeeLoginUrl(startUrl)`

Returns the path to the page that employees see after they log in.

Signature

```
public static String getEmployeeLoginUrl(String startUrl)
```

Parameters

`startUrl`
Type: String

Path to the page that employees see after they log in.

Return Value

Type: String

`getIsAllowInternalUserLoginEnabled()`

Indicates whether an internal user is allowed to log in to the Experience Cloud site.

Signature

```
public static Boolean getIsAllowInternalUserLoginEnabled()
```

Return Value

Type: Boolean

SocialLoginController Class

Represents the social authentication providers configured for the Experience Cloud site. For internal use only.

Namespace

AppLauncher

IN THIS SECTION:

SocialLoginController Methods

SocialLoginController Methods

The following are methods for `SocialLoginController`.

IN THIS SECTION:

getCommunityDomainSsoUrl(startUrl, developerName)
Returns the single sign-on URL for an Experience Cloud site or Salesforce My Domain subdomain.

getSamlSsoUrl(startUrl, samlId)
Returns the URL to the SAML provider for the Experience Cloud site.

getSamlSsoUrlNoCache(startUrl, samlId)
Returns the URL to the SAML provider for the Experience Cloud site, without caching the URL. Calling this method also initiates a backend call.

getSsoUrl(startUrl, developerName)
Returns the single sign-on URL for the Experience Cloud site.

`getCommunityDomainSsoUrl(startUrl, developerName)`

Returns the single sign-on URL for an Experience Cloud site or Salesforce My Domain subdomain.

Note: For better performance, we recommend using this method instead of `getAuthProviderSsoUrl`. If the authentication provider has `Use Subdomain for Callback` enabled, changing the single sign-on URL also changes the callback URL to the Experience Cloud site subdomain. Before switching to this method, update the callback URL in your third-party applications to avoid getting an invalid callback URL error during single sign-on.

Signature

```
public static String getCommunityDomainSsoUrl(String startUrl, String developerName)
```

Parameters

`startUrl`
Type: String

The page that you see after successfully logging into the Experience Cloud site or My Domain subdomain.

`developerName`
Type: String

The unique name of the authentication provider.

Return Value

Type: String

getSamlSsoUrl(startUrl, samlId)

Returns the URL to the SAML provider for the Experience Cloud site.

Signature

```
public static String getSamlSsoUrl(String startUrl, String samlId)
```

Parameters

startUrl
Type: String

Path to the page that users see when they access the Experience Cloud site.

samlId
Type: String

Unique identifier of the SAML provider.

Return Value

Type: String

getSamlSsoUrlNoCache(startUrl, samlId)

Returns the URL to the SAML provider for the Experience Cloud site, without caching the URL. Calling this method also initiates a backend call.

Signature

```
public static String getSamlSsoUrlNoCache(String startUrl, String samlId)
```

Parameters

startUrl
Type: String

Path to the page that users see when they access the Experience Cloud site.

samlId
Type: String

Unique identifier of the SAML provider.

Return Value

Type: String

The URL to the site's SAML provider. Unlike the URL returned by the `getSamlSsoUrl` method, this URL isn't cached.

`getSsoUrl(startUrl, developerName)`

Returns the single sign-on URL for the Experience Cloud site.

Signature

```
public static String getSsoUrl(String startUrl, String developerName)
```

Parameters

`startUrl`
Type: String

Path to the page that users see when they access the Experience Cloud site.

`developerName`
Type: String

Unique name of the authentication provider.

Return Value

Type: String

Approval Namespace

The `Approval` namespace provides classes and methods for approval processes.

The following are the classes in the `Approval` namespace.

IN THIS SECTION:

LockResult Class
The result of a record lock returned by a `System.Approval.lock()` method.

ProcessRequest Class
The `ProcessRequest` class is the parent class for the `ProcessSubmitRequest` and `ProcessWorkitemRequest` classes. Use the `ProcessRequest` class to write generic Apex that can process objects from either class.

ProcessResult Class
After you submit a record for approval, use the `ProcessResult` class to process the results of an approval process.

ProcessSubmitRequest Class
Use the `ProcessSubmitRequest` class to submit a record for approval.

ProcessWorkitemRequest Class
Use the `ProcessWorkitemRequest` class for processing an approval request after it is submitted.

UnlockResult Class
The result of a record unlock, returned by a `System.Approval.unlock()` method.

LockResult Class

The result of a record lock returned by a `System.Approval.lock()` method.

Namespace

Approval

Usage

The `System.Approval.lock()` methods return Approval.LockResult objects. Each element in a LockResult array corresponds to an element in the ID or sObject array passed as a parameter to a `lock` method. The first element in the LockResult array corresponds to the first element in the ID or sObject array, the second element corresponds to the second element, and so on. If only one ID or sObject is passed in, the LockResult array contains a single element.

Example

The following example obtains and iterates through the returned Approval.LockResult objects. It locks some queried accounts using `Approval.lock` with a `false` second parameter to allow partial processing of records on failure. Next, it iterates through the results to determine whether the operation was successful for each record. It writes the ID of every record that was processed successfully to the debug log, or writes error messages and failed fields of the failed records.

```
// Query the accounts to lock
Account[] accts = [SELECT Id from Account WHERE Name LIKE 'Acme%'];
// Lock the accounts
Approval.LockResult[] lrList = Approval.lock(accts, false);

// Iterate through each returned result
for(Approval.LockResult lr : lrList) {
    if (lr.isSuccess()) {
        // Operation was successful, so get the ID of the record that was processed
        System.debug('Successfully locked account with ID: ' + lr.getId());
    }
    else {
        // Operation failed, so get all errors
        for(Database.Error err : lr.getErrors()) {
            System.debug('The following error has occurred.');
            System.debug(err.getStatusCode() + ': ' + err.getMessage());
            System.debug('Account fields that affected this error: ' + err.getFields());
        }
    }
}
```

IN THIS SECTION:

LockResult Methods

SEE ALSO:

Approval Class

LockResult Methods

The following are methods for `LockResult`.

IN THIS SECTION:

getErrors()
If an error occurred, returns an array of one or more database error objects, providing the error code and description.

getId()
Returns the ID of the sObject you are trying to lock.

isSuccess()
A Boolean value that is set to `true` if the lock operation is successful for this object, or `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects, providing the error code and description.

Signature

```
public List<Database.Error> getErrors()
```

Return Value

Type: List<Database.Error>

`getId()`

Returns the ID of the sObject you are trying to lock.

Signature

```
public Id getId()
```

Return Value

Type: Id

Usage

If the field contains a value, the object was locked. If the field is empty, the operation was not successful.

`isSuccess()`

A Boolean value that is set to `true` if the lock operation is successful for this object, or `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

ProcessRequest Class

The `ProcessRequest` class is the parent class for the `ProcessSubmitRequest` and `ProcessWorkitemRequest` classes. Use the `ProcessRequest` class to write generic Apex that can process objects from either class.

Namespace

Approval

Usage

The request must be instantiated via the child classes, `ProcessSubmitRequest` and `ProcessWorkItemRequest`.

ProcessRequest Methods

The following are methods for `ProcessRequest`. All are instance methods.

IN THIS SECTION:

getComments()
Returns the comments that have been added previously to the approval request.

getNextApproverIds()
Returns the list of user IDs of user specified as approvers.

setComments(comments)
Sets the comments to be added to the approval request.

setNextApproverIds(nextApproverIds)
If the next step in your approval process is another Apex approval process, you specify exactly one user ID as the next approver. If not, you cannot specify a user ID and this method must be `null`.

`getComments()`

Returns the comments that have been added previously to the approval request.

Signature

```
public String getComments()
```

Return Value

Type: String

`getNextApproverIds()`

Returns the list of user IDs of user specified as approvers.

Signature

```
public ID[] getNextApproverIds()
```

Return Value

Type: ID[]

`setComments(comments)`

Sets the comments to be added to the approval request.

Signature

```
public Void setComments(String comments)
```

Parameters

comments
Type: String

Return Value

Type: Void

`setNextApproverIds(nextApproverIds)`

If the next step in your approval process is another Apex approval process, you specify exactly one user ID as the next approver. If not, you cannot specify a user ID and this method must be `null`.

Signature

```
public Void setNextApproverIds(ID[] nextApproverIds)
```

Parameters

nextApproverIds
Type: ID[]

Must be a single-entry list.

Return Value

Type: Void

ProcessResult Class

After you submit a record for approval, use the `ProcessResult` class to process the results of an approval process.

Namespace

Approval

Usage

A ProcessResult object is returned by the `process` method. You must specify the Approval namespace when creating an instance of this class. For example:

```
Approval.ProcessResult result = Approval.process(req1);
```

ProcessResult Methods

The following are methods for `ProcessResult`. All are instance methods.

IN THIS SECTION:

getEntityId()
The ID of the record being processed.

getErrors()
If an error occurred, returns an array of one or more database error objects including the error code and description.

getInstanceId()
The ID of the approval process that has been submitted for approval.

getInstanceStatus()
The status of the current approval process. Valid values are: Approved, Rejected, Removed or Pending.

getNewWorkitemIds()
The IDs of the new items submitted to the approval process. There can be 0 or 1 approval processes.

isSuccess()
A Boolean value that is set to `true` if the approval process completed successfully; otherwise, it is set to `false`.

`getEntityId()`

The ID of the record being processed.

Signature

```
public String getEntityId()
```

Return Value

Type: String

`getErrors()`

If an error occurred, returns an array of one or more database error objects including the error code and description.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error[]

`getInstanceId()`

The ID of the approval process that has been submitted for approval.

Signature

```
public String getInstanceId()
```

Return Value

Type: String

`getInstanceStatus()`

The status of the current approval process. Valid values are: Approved, Rejected, Removed or Pending.

Signature

```
public String getInstanceStatus()
```

Return Value

Type: String

`getNewWorkitemIds()`

The IDs of the new items submitted to the approval process. There can be 0 or 1 approval processes.

Signature

```
public ID[] getNewWorkitemIds()
```

Return Value

Type: ID[]

`isSuccess()`

A Boolean value that is set to `true` if the approval process completed successfully; otherwise, it is set to `false`.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

ProcessSubmitRequest Class

Use the `ProcessSubmitRequest` class to submit a record for approval.

Namespace

Approval

Usage

You must specify the Approval namespace when creating an instance of this class. The constructor for this class takes no arguments. For example:

```
Approval.ProcessSubmitRequest psr = new Approval.ProcessSubmitRequest();
```

Inherited Methods

In addition to the methods listed, the `ProcessSubmitRequest` class has access to all the methods in its parent class, ProcessRequest Class.

- getComments()
- getNextApproverIds()
- setComments(comments)
- setNextApproverIds(nextApproverIds)

Example

To view sample code, refer to Approval Processing Example.

ProcessSubmitRequest Methods

The following are methods for `ProcessSubmitRequest`. All are instance methods.

IN THIS SECTION:

getObjectId()

Returns the ID of the record that has been submitted for approval. For example, it can return an account, contact, or custom object record.

getProcessDefinitionNameOrId()

Returns the developer name or ID of the process definition.

getSkipEntryCriteria()

If `getProcessDefinitionNameOrId()` returns a value other than `null`, `getSkipEntryCriteria()` determines whether to evaluate the entry criteria for the process (`true`) or not (`false`).

getSubmitterId()

Returns the user ID of the submitter requesting the approval record. The user must be one of the allowed submitters in the process definition setup.

setObjectId(recordId)

Sets the ID of the record to be submitted for approval. For example, it can specify an account, contact, or custom object record.

setProcessDefinitionNameOrId(nameOrId)

Sets the developer name or ID of the process definition to be evaluated.

setSkipEntryCriteria(skipEntryCriteria)

If the process definition name or ID is not null, `setSkipEntryCriteria()` determines whether to evaluate the entry criteria for the process (`true`) or not (`false`).

setSubmitterId(userID)

Sets the user ID of the submitter requesting the approval record. The user must be one of the allowed submitters in the process definition setup. If you don't set a submitter ID, the process uses the current user as the submitter.

`getObjectId()`

Returns the ID of the record that has been submitted for approval. For example, it can return an account, contact, or custom object record.

Signature

```
public String getObjectId()
```

Return Value

Type: String

`getProcessDefinitionNameOrId()`

Returns the developer name or ID of the process definition.

Signature

```
public String getProcessDefinitionNameOrId()
```

Return Value

Type: String

Usage

The default is null. If the return value is `null`, when a user submits a record for approval Salesforce evaluates the entry criteria for all processes applicable to the user.

`getSkipEntryCriteria()`

If `getProcessDefinitionNameOrId()` returns a value other than `null`, `getSkipEntryCriteria()` determines whether to evaluate the entry criteria for the process (`true`) or not (`false`).

Signature

```
public Boolean getSkipEntryCriteria()
```

Return Value

Type: Boolean

`getSubmitterId()`

Returns the user ID of the submitter requesting the approval record. The user must be one of the allowed submitters in the process definition setup.

Signature

```
public String getSubmitterId()
```

Return Value

Type: String

`setObjectId(recordId)`

Sets the ID of the record to be submitted for approval. For example, it can specify an account, contact, or custom object record.

Signature

```
public Void setObjectId(String recordId)
```

Parameters

recordId
Type: String

Return Value

Type: Void

`setProcessDefinitionNameOrId(nameOrId)`

Sets the developer name or ID of the process definition to be evaluated.

Signature

```
public Void setProcessDefinitionNameOrId(String nameOrId)
```

Parameters

nameOrId
Type: String

The process definition developer name or process definition ID. The record is submitted to this specific process. If set to `null`, submission of a record approval follows standard evaluation; that is, every entry criteria of the process definition in the process order is evaluated and the one that satisfies is picked and submitted.

Return Value

Type: Void

Usage

If the process definition name or ID is not set via this method, then by default it is null. If it is null, the submission of a record for approval evaluates entry criteria for all processes applicable to the submitter. The order of evaluation is based on the process order of the setup.

setSkipEntryCriteria(skipEntryCriteria)

If the process definition name or ID is not null, `setSkipEntryCriteria()` determines whether to evaluate the entry criteria for the process (`true`) or not (`false`).

Signature

```
public Void setSkipEntryCriteria(Boolean skipEntryCriteria)
```

Parameters

skipEntryCriteria
Type: Boolean

If set to `true`, request submission skips the evaluation of entry criteria for the process set in setProcessDefinitionNameOrId(nameOrId). If the process definition name or ID is not specified, this parameter is ignored and standard evaluation is followed based on process order. If set to `false`, or if this method isn't called, the entry criteria is not skipped.

Return Value

Type: Void

setSubmitterId(userID)

Sets the user ID of the submitter requesting the approval record. The user must be one of the allowed submitters in the process definition setup. If you don't set a submitter ID, the process uses the current user as the submitter.

Signature

```
public Void setSubmitterId(String userID)
```

Parameters

userID
Type: String

The user ID on behalf of which the record is submitted. If set to `null`, the current user is the submitter. If the submitter is not set with this method, the default submitter is null (the current user).

Return Value

Type: Void

ProcessWorkitemRequest Class

Use the `ProcessWorkitemRequest` class for processing an approval request after it is submitted.

Namespace

Approval

Usage

You must specify the Approval namespace when creating an instance of this class. The constructor for this class takes no arguments. For example:

```
Approval.ProcessWorkitemRequest pwr = new Approval.ProcessWorkitemRequest();
```

Inherited Methods

In addition to the methods listed, the `ProcessWorkitemRequest` class has access to all the methods in its parent class, ProcessRequest Class:

- getComments()
- getNextApproverIds()
- setComments(comments)
- setNextApproverIds(nextApproverIds)

ProcessWorkitemRequest Methods

The following are methods for `ProcessWorkitemRequest`. All are instance methods.

IN THIS SECTION:

getAction()
Returns the type of action already associated with the approval request. Valid values are: Approve, Reject, or Removed.

getWorkitemId()
Returns the ID of the approval request that is in the process of being approved, rejected, or removed.

setAction(actionType)
Sets the type of action to take for processing an approval request.

setWorkitemId(id)
Sets the ID of the approval request that is being approved, rejected, or removed.

`getAction()`

Returns the type of action already associated with the approval request. Valid values are: Approve, Reject, or Removed.

Signature

```
public String getAction()
```

Return Value

Type: String

getWorkitemId()

Returns the ID of the approval request that is in the process of being approved, rejected, or removed.

Signature

```
public String getWorkitemId()
```

Return Value

Type: String

setAction(actionType)

Sets the type of action to take for processing an approval request.

Signature

```
public Void setAction(String actionType)
```

Parameters

actionType
Type: String

Valid values are: Approve, Reject, or Removed. Only system administrators can specify Removed.

Return Value

Type: Void

setWorkitemId(id)

Sets the ID of the approval request that is being approved, rejected, or removed.

Signature

```
public Void setWorkitemId(String id)
```

Parameters

id
Type: String

Return Value

Type: Void

UnlockResult Class

The result of a record unlock, returned by a `System.Approval.unlock()` method.

Namespace

Approval

Usage

The `System.Approval.unlock()` methods return Approval.UnlockResult objects. Each element in an UnlockResult array corresponds to an element in the ID or sObject array passed as a parameter to an `unlock` method. The first element in the UnlockResult array corresponds to the first element in the ID or sObject array, the second element corresponds to the second element, and so on. If only one ID or sObject is passed in, the UnlockResult array contains a single element.

Example

The following example shows how to obtain and iterate through the returned Approval.UnlockResult objects. It locks some queried accounts using `Approval.unlock` with a `false` second parameter to allow partial processing of records on failure. Next, it iterates through the results to determine whether the operation was successful for each record. It writes the ID of every record that was processed successfully to the debug log, or writes error messages and failed fields of the failed records.

```
// Query the accounts to unlock
Account[] accts = [SELECT Id from Account WHERE Name LIKE 'Acme%'];

for(Account acct:accts) {
   // Create an approval request for the account
   Approval.ProcessSubmitRequest req1 =
           new Approval.ProcessSubmitRequest();
   req1.setComments('Submitting request for approval.');
   req1.setObjectId(acct.id);

   // Submit the record to specific process and skip the criteria evaluation
   req1.setProcessDefinitionNameOrId('PTO_Request_Process');
   req1.setSkipEntryCriteria(true);

   // Submit the approval request for the account
   Approval.ProcessResult result = Approval.process(req1);

   // Verify the result
   System.assert(result.isSuccess());
}

// Unlock the accounts
Approval.UnlockResult[] urList = Approval.unlock(accts, false);

// Iterate through each returned result
for(Approval.UnlockResult ur : urList) {
    if (ur.isSuccess()) {
        // Operation was successful, so get the ID of the record that was processed
        System.debug('Successfully unlocked account with ID: ' + ur.getId());
    }
```

```
    else {
        // Operation failed, so get all errors
        for(Database.Error err : ur.getErrors()) {
            System.debug('The following error has occurred.');
            System.debug(err.getStatusCode() + ': ' + err.getMessage());
            System.debug('Account fields that affected this error: ' + err.getFields());
        }
    }
}
```

IN THIS SECTION:

UnlockResult Methods

SEE ALSO:

Approval Class

UnlockResult Methods

The following are methods for `UnlockResult`.

IN THIS SECTION:

getErrors()
If an error occurred, returns an array of one or more database error objects, providing the error code and description.

getId()
Returns the ID of the sObject you are trying to unlock.

isSuccess()
A Boolean value that is set to `true` if the unlock operation is successful for this object, or `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects, providing the error code and description.

Signature

```
public List<Database.Error> getErrors()
```

Return Value

Type: List<Database.Error>

`getId()`

Returns the ID of the sObject you are trying to unlock.

Signature

```
public Id getId()
```

Return Value

Type: Id

Usage

If the field contains a value, the object was unlocked. If the field is empty, the operation was not successfult.

`isSuccess()`

A Boolean value that is set to `true` if the unlock operation is successful for this object, or `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

Auth Namespace

The `Auth` namespace provides an interface and classes for single sign-on into Salesforce and session security management.

The following is the interface in the `Auth` namespace.

IN THIS SECTION:

AuthConfiguration Class

Contains methods for configuring settings for users to log in to a Salesforce org using their authentication provider credentials instead of their Salesforce credentials. The authentication provider can be any authentication provider that supports the OpenID Connect protocol, such as Google, Facebook, or Twitter. Users log in to either an Experience Cloud site (`https://`*`MyDomainName`*`.my.site.com`) or your My Domain login URL (`https://`*`MyDomainName`*`.my.salesforce.com`).

AuthProviderCallbackState Class

Provides request HTTP headers, body, and query parameters to the `AuthProviderPlugin.handleCallback` method for user authentication. This class allows you to group the information passed in rather than passing headers, body, and query parameters individually.

AuthProviderPlugin Interface

This interface is deprecated. For new development, use the abstract class `Auth.AuthProviderPluginClass` to create a custom OAuth-based authentication provider plug-in for single sign-on in to Salesforce.

AuthProviderPluginClass Class

Contains methods to create a custom OAuth-based authentication provider plug-in for single sign-on in to Salesforce. Use this class to create a custom authentication provider plug-in if you can't use one of the authentication providers that Salesforce provides.

AuthProviderTokenResponse Class

Stores the response from the `AuthProviderPlugin.handleCallback` method.

AuthToken Class

Contains methods for providing the access token associated with an authentication provider for an authenticated user, except for the Janrain provider.

CommunitiesUtil Class

Contains methods for getting information about an Experience Cloud user.

ConfigurableSelfRegHandler Interface

Gives you more control over how customers or partners self-register for your Experience Cloud site by creating a class that implements `Auth.ConfigurableSelfRegHandler`. You choose the user information to collect, and how users identify themselves—with their email address, phone number, or another identifier. When verified, you create a customer or partner user and log in the user to your Experience Cloud site.

ConfirmUserRegistrationHandler Interface

Manages single sign-on (SSO) user mappings between Salesforce and a third-party identity provider. Use this interface to confirm user mappings before updating them.

ConnectedAppPlugin Class

Contains methods for extending the behavior of a connected app, for example, customizing how a connected app is invoked depending on the protocol used. This class gives you more control over the interaction between Salesforce and your connected app.

InvocationContext Enum

The context in which the connected app is invoked, such as the protocol flow used and the token type issued, if any. Developers can use the context information to write code that is unique to the type of invocation.

JWS Class

Contains methods that apply a digital signature to a JSON Web Token (JWT), using a JSON Web Signature (JWS) data structure. This class creates the signed JWT bearer token, which can be used to request an OAuth access token in the OAuth 2.0 JWT bearer token flow.

JWT Class

Generates the JSON Claims Set in a JSON Web Token (JWT). The resulting Base64-encoded payload can be passed as an argument to create an instance of the `Auth.JWS` class.

JWTBearerTokenExchange Class

Contains methods that POST the signed JWT bearer token to a token endpoint to request an access token, in the OAuth 2.0 JWT bearer token flow.

LightningLoginEligibility Enum

Contains a Lightning Login eligibility value used by the `Auth.SessionManagement.getLightningLoginEligibility` method.

LoginDiscoveryHandler Interface

Salesforce gives you the ability to log in users based on other verification methods than username and password. For example, it can prompt users to log in with their email, phone number, or another identifier like a Federation ID or device identifier. Login Discovery is available to these licenses: Customer Community, Customer Community Plus, External Identity, Partner Community, and Partner Community Plus.

LoginDiscoveryMethod Enum

Contains methods used to verify the user's identity when the My Domain login process uses Login Discovery.

MyDomainLoginDiscoveryHandler Interface

The handler used to implement the My Domain Login Discovery page, which is an interview-based (two-step) login process. First the user is prompted for a unique identifier such as an email address or phone number. Then the handler determines (discovers) how to authenticate the user. Either the user enters a password or is directed to an identity provider's login page.

OAuthRefreshResult Class

Stores the result of an `AuthProviderPluginClass` refresh method. OAuth authentication flow provides a refresh token that can be used to get a new access token. Access tokens have a limited lifetime as specified by the session timeout value. When an access token expires, use a refresh token to get a new access token.

RegistrationHandler Interface

Salesforce provides the ability to use an authentication provider, such as Facebook© or Janrain©, for single sign-on into Salesforce.

SamlJitHandler Interface

Use this interface to control and customize Just-in-Time user provisioning logic during SAML single sign-on.

SessionManagement Class

Contains methods for verifying users' identity, creating custom login flows, customizing security levels, and defining trusted IP ranges for a current session.

SessionLevel Enum

An `Auth.SessionLevel` enum value is used by the `SessionManagement.setSessionLevel` method.

UserData Class

Stores user information for `Auth.RegistrationHandler`.

VerificationMethod Enum

Contains the different ways users can identify themselves when logging in. You can use it to implement mobile-centric passwordless login pages and to self-register (and deregister) verification methods.

VerificationPolicy Enum

The `Auth.VerificationPolicy` enum contains an identity verification policy value used by the `SessionManagement.generateVerificationUrl` method.

VerificationResult Class

Contains the result of a verification challenge that you invoke when you create your own Verify page. The challenge can be initiated by either the `System.UserManagement.verifyPasswordlessLogin` or `System.UserManagement.verifySelfRegistration` method.

Auth Exceptions

The `Auth` namespace contains some exception classes.

AuthConfiguration Class

Contains methods for configuring settings for users to log in to a Salesforce org using their authentication provider credentials instead of their Salesforce credentials. The authentication provider can be any authentication provider that supports the OpenID Connect protocol, such as Google, Facebook, or Twitter. Users log in to either an Experience Cloud site (`https://`*`MyDomainName`*`.my.site.com`) or your My Domain login URL (`https://`*`MyDomainName`*`.my.salesforce.com`).

Namespace

Auth

Example

This example shows how to call some methods on the `Auth.AuthConfiguration` class. Before you can run this sample, you must provide valid values for the URLs and developer name.

Note: If you're not using enhanced domains, your org's My Domain URLs are different. For details, see My Domain URL Formats in Salesforce Help.

```
String communityUrl = 'MyDomainName.my.site.com';
String startUrl = '<Add URL>';
Auth.AuthConfiguration authConfig = new Auth.AuthConfiguration(communityUrl,startUrl);
List<AuthProvider> authPrvs = authConfig.getAuthProviders();
String bColor = authConfig.getBackgroundColor();
String fText = authConfig.getFooterText();

String sso = Auth.AuthConfiguration.getAuthProviderSsoUrl(communityUrl, startUrl,
'developerName');
```

AuthConfiguration Constructors

The following are constructors for `AuthConfiguration`.

Note: The `AuthConfiguration (networkId, startUrl)` constructor is deprecated in API version 56.0 and later.

`AuthConfiguration(communityOrCustomUrl, startUrl)`

Creates an instance of the `AuthConfiguration` class using the specified URL for an Experience Cloud site or a My Domain subdomain and the start URL for authenticated users.

Signature

```
public AuthConfiguration(String communityOrCustomUrl, String startUrl)
```

Parameters

`communityOrCustomUrl`
Type: String

The URL for the domain, which can be a Salesforce subdomain created with My Domain (`my.salesforce.com`) or a subdomain of an Experience Cloud site (`force.com`).

`startUrl`
Type: String

The page users see after successfully logging in to the Experience Cloud site or My Domain subdomain.

AuthConfiguration Methods

The following are methods for `AuthConfiguration`. Use these methods to manage and customize authentication for a Salesforce community.

IN THIS SECTION:

getAllowInternalUserLoginEnabled()
Indicates whether the Experience Cloud site allows internal users to log in using the Experience Cloud site login page. To enable, admins configure the setting **Allow internal users to log in directly to the experience** on the Login & Registration page in Experience Workspaces. It's disabled by default.

getAuthConfig()

Returns the AuthConfig sObject, which represents the authentication options for an Experience Cloud site or Salesforce My Domain subdomain.

getAuthConfigProviders()

Returns the list of authentication providers configured for an Experience Cloud site or Salesforce My Domain subdomain.

getAuthProviders()

Returns the list of authentication providers available for an Experience Cloud site or Salesforce My Domain subdomain.

getAuthProviderSsoDomainUrl(communityUrl, startUrl, developerName)

Returns the single sign-on URL for an Experience Cloud site subdomain.

getAuthProviderSsoUrl(communityUrl, startUrl, developerName)

Returns the single sign-on URL for an Experience Cloud site or Salesforce My Domain subdomain.

getBackgroundColor()

Returns the color for the background of the login page for a community.

getCertificateLoginEnabled(domainUrl)

Returns true if certificate-based authentication is enabled for the My Domain URL.

getCertificateLoginUrl(domainUrl, startUrl)

Returns the certificate-based authentication endpoint for the My Domain URL if the org has certificate-based authentication enabled.

getDefaultProfileForRegistration()

Returns the profile ID assigned to new community users.

getFooterText()

Returns the text at the bottom of the login page for a community.

getForgotPasswordUrl()

Returns the URL for the standard or custom Forgot Password page that is specified for an Experience Cloud site or portal by the administrator.

getLogoUrl()

Returns the location of the icon image at the bottom of the login page for a community.

getRightFrameUrl()

Returns the URL for the right-frame content to display on the right side of the Experience Cloud site login page. The admin supplies the URL.

getSamlProviders()

Returns the list of SAML-based authentication providers available for an Experience Cloud site or Salesforce My Domain subdomain.

getSamlSsoUrl(communityUrl, startURL, samlId)

Returns the single sign-on URL for an Experience Cloud site or Salesforce My Domain subdomain.

getSelfRegistrationEnabled()

Indicates whether the current community allows new users to create their own account by filling out a registration form.

getSelfRegistrationUrl()

Returns the location of the self-registration page for new users to sign up for an account with a community.

getStartUrl()

Returns the start page of an Experience Cloud site or Salesforce My Domain subdomain. This URL is the first page that users see when they log in.

getUsernamePasswordEnabled()

Indicates whether the current community is set to display a login form asking for a username and password. You can configure the community not to request a username and password if it is for unauthenticated users or users logging in with a third-party authentication provider.

isCommunityUsingSiteAsContainer()

Returns `true` if the Experience Cloud site uses Site.com pages; otherwise, returns `false`.

`getAllowInternalUserLoginEnabled()`

Indicates whether the Experience Cloud site allows internal users to log in using the Experience Cloud site login page. To enable, admins configure the setting **Allow internal users to log in directly to the experience** on the Login & Registration page in Experience Workspaces. It's disabled by default.

Signature

```
public Boolean getAllowInternalUserLoginEnabled()
```

Return Value

Type: Boolean

Usage

If true, internal users log in to an Experience Cloud site from the site's login page with their internal credentials. If they navigate to their internal org from the Experience Cloud site, they don't have to log in again.

`getAuthConfig()`

Returns the AuthConfig sObject, which represents the authentication options for an Experience Cloud site or Salesforce My Domain subdomain.

Signature

```
public AuthConfig getAuthConfig()
```

Return Value

Type: AuthConfig

The AuthConfig sObject for the Experience Cloud site or Salesforce My Domain subdomain.

`getAuthConfigProviders()`

Returns the list of authentication providers configured for an Experience Cloud site or Salesforce My Domain subdomain.

Signature

```
public List<AuthConfigProviders> getAuthConfigProviders()
```

Return Value

Type: List<AuthConfigProviders>

A list of authentication providers (AuthConfigProviders sObjects), which are children of the AuthProvider sObject.

getAuthProviders()

Returns the list of authentication providers available for an Experience Cloud site or Salesforce My Domain subdomain.

Signature

```
public List<AuthProvider> getAuthProviders()
```

Return Value

Type: List<AuthProvider>

A list of authentication providers (AuthProvider sObjects) for the Experience Cloud site or My Domain subdomain.

getAuthProviderSsoDomainUrl(communityUrl, startUrl, developerName)

Returns the single sign-on URL for an Experience Cloud site subdomain.

Note: For better performance, we recommend using this method instead of `getAuthProviderSsoUrl`. If the authentication provider has `User Subdomain for Callback` enabled, changing the single sign-on URL also changes the callback URL to use the Experience Cloud site subdomain. Before switching to this method, update the callback URL in your third-party applications to avoid getting an invalid callback URL error during single sign-on.

Signature

```
public static String getAuthProviderSsoDomainUrl(String communityUrl, String startUrl,
String developerName)
```

Parameters

communityUrl
Type: String

The URL for the Experience Cloud site subdomain. If null or specified as an empty string, you get the single sign-on URL for the org's My Domain.

startUrl
Type: String

The page that users see after logging in to the Experience Cloud site subdomain.

developerName
Type: String

The unique name of the authentication provider.

Return Value

Type: String

The Single Sign-On Initialization URL for the Experience Cloud site subdomain.

getAuthProviderSsoUrl(communityUrl, startUrl, developerName)

Returns the single sign-on URL for an Experience Cloud site or Salesforce My Domain subdomain.

Signature

```
public static String getAuthProviderSsoUrl(String communityUrl, String startUrl, String developerName)
```

Parameters

communityUrl
Type: String

The URL for the Experience Cloud site or My Domain subdomain. If not null and not specified as an empty string, you get the URL for the Experience Cloud site. If null or specified as an empty string, you get the URL for a custom domain.

startUrl
Type: String

The page that users see after logging in to the Experience Cloud site or My Domain subdomain.

developerName
Type: String

The unique name of the authentication provider.

Return Value

Type: String

The Single Sign-On Initialization URL for the Experience Cloud site or Salesforce My Domain subdomain.

getBackgroundColor()

Returns the color for the background of the login page for a community.

Signature

```
public String getBackgroundColor()
```

Return Value

Type: String

getCertificateLoginEnabled(domainUrl)

Returns true if certificate-based authentication is enabled for the My Domain URL.

Signature

```
public Boolean getCertificateLoginEnabled(String domainUrl)
```

Parameters

domainUrl
Type: String

The My Domain URL that is being checked for certificate-based authentication.

Return Value

Type: Boolean

getCertificateLoginUrl(domainUrl, startUrl)

Returns the certificate-based authentication endpoint for the My Domain URL if the org has certificate-based authentication enabled.

Signature

```
public static String getCertificateLoginUrl(String domainUrl, String startUrl)
```

Parameters

domainUrl
Type: String

The My Domain URL being checked for its certificate-based authentication endpoint .

startUrl
Type: String

The page that the user is directed to after logging in to the My Domain with certificate-based authentication.

Return Value

Type: String

The certificate-based authentication endpoint for the My Domain URL:
mydomainURL`:8443/services/certauth?startURL=`***startURLParam***

getDefaultProfileForRegistration()

Returns the profile ID assigned to new community users.

Signature

```
public String getDefaultProfileForRegistration()
```

Return Value

Type: String

The profile ID.

getFooterText()

Returns the text at the bottom of the login page for a community.

Signature

```
public String getFooterText()
```

Return Value

Type: String

The text string displayed at the bottom of the login page, for example “Log in with an existing account.”

getForgotPasswordUrl()

Returns the URL for the standard or custom Forgot Password page that is specified for an Experience Cloud site or portal by the administrator.

Signature

```
public String getForgotPasswordUrl()
```

Return Value

Type: String

URL for the standard or custom Forgot Password page.

getLogoUrl()

Returns the location of the icon image at the bottom of the login page for a community.

Signature

```
public String getLogoUrl()
```

Return Value

Type: String

The path to the icon image.

getRightFrameUrl()

Returns the URL for the right-frame content to display on the right side of the Experience Cloud site login page. The admin supplies the URL.

Signature

```
public String getLoginRightFrameUrl()
```

Return Value

Type: String

URL for the right-frame content of the Experience Cloud site login page. Salesforce creates an inline (iframe) on the right side of the login page to display the contents specified by the URL.

getSamlProviders()

Returns the list of SAML-based authentication providers available for an Experience Cloud site or Salesforce My Domain subdomain.

Signature

```
public List<SamlSsoConfig> getSamlProviders()
```

Return Value

Type: List<SamlSsoConfig>

A list of SAML-based authentication providers, which are SamlSsoConfig sObjects.

getSamlSsoUrl(communityUrl, startURL, samlId)

Returns the single sign-on URL for an Experience Cloud site or Salesforce My Domain subdomain.

Signature

```
public static String getSamlSsoUrl(String communityUrl, String startURL, String samlId)
```

Parameters

communityUrl
Type: String

The URL for the Experience Cloud site or My Domain subdomain. If not `null` and not specified as an empty string, you get the URL for the Experience Cloud site. If `null` or specified as an empty string, you get the URL for a My Domain subdomain.

startUrl
Type: String

The page users see after successfully logging in to the Experience Cloud site or My Domain subdomain

samlId
Type: String

The unique identifier of the SamlSsoConfig standard object for the Experience Cloud site or My Domain subdomain

Return Value

Type: String

The Single Sign-On Initialization URL for the Experience Cloud site or Salesforce My Domain subdomain.

getSelfRegistrationEnabled()

Indicates whether the current community allows new users to create their own account by filling out a registration form.

Signature

```
public Boolean getSelfRegistrationEnabled()
```

Return Value

Type: Boolean

`getSelfRegistrationUrl()`

Returns the location of the self-registration page for new users to sign up for an account with a community.

Signature

```
public String getSelfRegistrationUrl()
```

Return Value

Type: String

The location of the self-registration page.

`getStartUrl()`

Returns the start page of an Experience Cloud site or Salesforce My Domain subdomain. This URL is the first page that users see when they log in.

Signature

```
public String getStartUrl()
```

Return Value

Type: String

The location of the start page for the Experience Cloud site or My Domain subdomain.

`getUsernamePasswordEnabled()`

Indicates whether the current community is set to display a login form asking for a username and password. You can configure the community not to request a username and password if it is for unauthenticated users or users logging in with a third-party authentication provider.

Signature

```
public Boolean getUsernamePasswordEnabled()
```

Return Value

Type: Boolean

`isCommunityUsingSiteAsContainer()`

Returns `true` if the Experience Cloud site uses Site.com pages; otherwise, returns `false`.

Signature

```
public Boolean isCommunityUsingSiteAsContainer()
```

Return Value

Type: Boolean

AuthProviderCallbackState Class

Provides request HTTP headers, body, and query parameters to the `AuthProviderPlugin.handleCallback` method for user authentication. This class allows you to group the information passed in rather than passing headers, body, and query parameters individually.

Namespace

Auth

IN THIS SECTION:

- AuthProviderCallbackState Constructors
- AuthProviderCallbackState Properties

SEE ALSO:

- handleCallback(authProviderConfiguration, callbackState)

AuthProviderCallbackState Constructors

The following are constructors for `AuthProviderCallbackState`.

IN THIS SECTION:

- AuthProviderCallbackState(headers, body, queryParameters)
  Creates an instance of the `AuthProviderCallbackState` class using the specified HTTP headers, body, and query parameters of the authentication request.

`AuthProviderCallbackState(headers, body, queryParameters)`

Creates an instance of the `AuthProviderCallbackState` class using the specified HTTP headers, body, and query parameters of the authentication request.

Signature

```
public AuthProviderCallbackState(Map<String,String> headers, String body,
Map<String,String> queryParameters)
```

Parameters

headers
Type: Map<String,String>

The HTTP headers of the authentication request.

body
Type: String

The HTTP body of the authentication request.

queryParameters
Type: Map<String,String>

The HTTP query parameters of the authentication request.

AuthProviderCallbackState Properties

The following are properties for `AuthProviderCallbackState`.

IN THIS SECTION:

body
The HTTP body of the authentication request.

headers
The HTTP headers of the authentication request.

queryParameters
The HTTP query parameters of the authentication request.

body

The HTTP body of the authentication request.

Signature

```
public String body {get; set;}
```

Property Value

Type: String

headers

The HTTP headers of the authentication request.

Signature

```
public Map<String,String> headers {get; set;}
```

Property Value

Type: Map<String,String>

queryParameters

The HTTP query parameters of the authentication request.

Signature

```
public Map<String,String> queryParameters {get; set;}
```

Property Value

Type: Map<String,String>

AuthProviderPlugin Interface

This interface is deprecated. For new development, use the abstract class `Auth.AuthProviderPluginClass` to create a custom OAuth-based authentication provider plug-in for single sign-on in to Salesforce.

Namespace

Auth

Usage

Deprecated. Existing implementations that use `Auth.AuthProviderPlugin` still work. For new development, use `Auth.AuthProviderPluginClass`.

IN THIS SECTION:

AuthProviderPlugin Methods

AuthProviderPlugin Example Implementation

AuthProviderPlugin Methods

The following methods are for `AuthProviderPlugin`, which, as of API version 39.0, is deprecated. Use themethods in `AuthProviderPluginClass` instead.

IN THIS SECTION:

getCustomMetadataType()
Deprecated as of API version 39.0. Use the corresponding method in `Auth.AuthProviderPluginClass`.

getUserInfo(authProviderConfiguration, response)
Deprecated as of API version 39.0. Use the corresponding method in `Auth.AuthProviderPluginClass`.

handleCallback(authProviderConfiguration, callbackState)
Deprecated as of API version 39.0. Use the corresponding method in `Auth.AuthProviderPluginClass`.

initiate(authProviderConfiguration, stateToPropagate)

Deprecated as of API version 39.0. Use the corresponding method in `Auth.AuthProviderPluginClass`.

SEE ALSO:

Salesforce Help: Create a Custom External Authentication Provider

`getCustomMetadataType()`

Deprecated as of API version 39.0. Use the corresponding method in `Auth.AuthProviderPluginClass`.

Signature

```
public String getCustomMetadataType()
```

Return Value

Type: String

The custom metadata type API name for the authentication provider.

Usage

Returns the custom metadata type API name for a custom OAuth-based authentication provider for single sign-on to Salesforce. The `getCustomMetatadaType()` method returns only custom metadata type names. It does not return custom metadata record names.

`getUserInfo(authProviderConfiguration, response)`

Deprecated as of API version 39.0. Use the corresponding method in `Auth.AuthProviderPluginClass`.

Signature

```
public Auth.UserData getUserInfo(Map<String,String> authProviderConfiguration,
Auth.AuthProviderTokenResponse response)
```

Parameters

`authProviderConfiguration`

Type: Map<String,String>

The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

`response`

Type: Auth.AuthProviderTokenResponse

The OAuth access token, OAuth secret or refresh token, and state provided by the authentication provider to authenticate the current user.

Return Value

Type: Auth.UserData

Creates a new instance of the `Auth.UserData` class.

Usage

Returns information from the custom authentication provider about the current user. The registration handler and other authentication provider flows use this information.

handleCallback(authProviderConfiguration, callbackState)

Deprecated as of API version 39.0. Use the corresponding method in `Auth.AuthProviderPluginClass`.

Signature

```
public Auth.AuthProviderTokenResponse handleCallback(Map<String,String>
authProviderConfiguration, Auth.AuthProviderCallbackState callbackState)
```

Parameters

authProviderConfiguration
Type: Map<StringString>

The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

callbackState
Type: Auth.AuthProviderCallbackState

The class that contains the HTTP headers, body, and queryParams of the authentication request.

Return Value

Type: Auth.AuthProviderTokenResponse

Creates an instance of the `AuthProviderTokenResponse` class.

Usage

Uses the authentication provider's supported authentication protocol to return an OAuth access token, OAuth secret or refresh token, and the state passed in when the request for the current user was initiated.

initiate(authProviderConfiguration, stateToPropagate)

Deprecated as of API version 39.0. Use the corresponding method in `Auth.AuthProviderPluginClass`.

Signature

```
public System.PageReference initiate(Map<String,String> authProviderConfiguration,
String stateToPropagate)
```

Parameters

authProviderConfiguration
Type: Map<StringString>

The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

stateToPropagate
Type: String

The state passed in to initiate the authentication request for the user.

Return Value

Type: System.PageReference

The URL of the page where the user is redirected for authentication.

Usage

Returns the URL where the user is redirected for authentication.

AuthProviderPlugin Example Implementation

We've removed the example implementation for the `Auth.AuthProviderPlugin` interface because we've deprecated the interface and replaced it with an abstract class. See AuthProviderPluginClass Class.

AuthProviderPluginClass Class

Contains methods to create a custom OAuth-based authentication provider plug-in for single sign-on in to Salesforce. Use this class to create a custom authentication provider plug-in if you can't use one of the authentication providers that Salesforce provides.

Namespace

Auth

Usage

To create a custom authentication provider for single sign-on, create a class that extends `Auth.AuthProviderPluginClass`. This class allows you to store the custom configuration for your authentication provider and handle authentication protocols when users log in to Salesforce with their login credentials for an external service provider. In Salesforce, the class that implements this interface appears in the `Provider Type` drop-down list in Auth. Providers in Setup. Make sure that the user you specify to run the class has "Customize Application" and "Manage Auth. Providers" permissions.

As of API version 39.0, use the abstract class `AuthProviderPluginClass` to create a custom external authentication provider. This class replaces the `AuthProviderPlugin` interface. If you've already implemented a custom authentication provider plug-in using the interface, it still works. However, use `AuthProviderPluginClass` to extend your plug-in. If you haven't created an interface, create a custom authentication provider plug-in by extending this abstract class. For more information, see AuthProviderPluginClass Code Example.

IN THIS SECTION:

AuthProviderPluginClass Methods

AuthProviderPluginClass Code Example

AuthProviderPluginClass Methods

The `AuthProviderPluginClass` methods don't support DML options.

IN THIS SECTION:

getCustomMetadataType()

Returns the custom metadata type API name for a custom OAuth-based authentication provider for single sign-on to Salesforce.

getUserInfo(authProviderConfiguration, response)

Returns information from the custom authentication provider about the current user. This information is used by the registration handler and in other authentication provider flows.

handleCallback(authProviderConfiguration, callbackState)

Uses the authentication provider's supported authentication protocol to return an OAuth access token, OAuth secret or refresh token, and the state passed in when the request for the current user was initiated.

initiate(authProviderConfiguration, stateToPropagate)

Returns the URL where the user is redirected for authentication.

refresh(authProviderConfiguration, refreshToken)

Returns a new access token, which is used to update an expired access token.

`getCustomMetadataType()`

Returns the custom metadata type API name for a custom OAuth-based authentication provider for single sign-on to Salesforce.

Signature

```
public String getCustomMetadataType()
```

Return Value

Type: String

The custom metadata type API name for the authentication provider.

Usage

The `getCustomMetadataType()` method returns only custom metadata type names. It does not return custom metadata record names. As of API version 39.0, use this method when extending `Auth.AuthProviderPluginClass` to create a custom external authentication provider.

`getUserInfo(authProviderConfiguration, response)`

Returns information from the custom authentication provider about the current user. This information is used by the registration handler and in other authentication provider flows.

Signature

```
public Auth.UserData getUserInfo(Map<String,String> authProviderConfiguration,
Auth.AuthProviderTokenResponse response)
```

Parameters

authProviderConfiguration

Type: Map<String,String>

The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates it with the custom metadata type default values. Or you can set the configuration with values that you enter when you create the custom provider in Auth. Providers in Setup.

response

Type: Auth.AuthProviderTokenResponse

The OAuth access token, OAuth secret or refresh token, and state provided by the authentication provider to authenticate the current user.

Return Value

Type: Auth.UserData

Creates a new instance of the `Auth.UserData` class.

Usage

As of API version 39.0, use this method when extending `Auth.AuthProviderPluginClass` to create a custom authentication provider.

Note: You might choose to get user information in the response from the `handleCallback` method or by another method. However, you must still call `getUserInfo` in the custom authentication handler to avoid getting errors about mixing objects. For example, if you don't call `getUserInfo`, and then try to insert a contact in the `Auth.RegistrationHandler.createUser` method, you get the error, "You cannot mix EntityObjects with different UddInfos within one transaction."

To avoid this error, call `getUserInfo` with dummy user information as follows.

```
HttpRequest req = new HttpRequest();
String url = 'https://login.salesforce.com/';
req.setEndpoint(url);
req.setMethod('GET');
Http http = new Http();
HTTPResponse res = http.send(req);
```

handleCallback(authProviderConfiguration, callbackState)

Uses the authentication provider's supported authentication protocol to return an OAuth access token, OAuth secret or refresh token, and the state passed in when the request for the current user was initiated.

Signature

```
public Auth.AuthProviderTokenResponse handleCallback(Map<String,String>
authProviderConfiguration, Auth.AuthProviderCallbackState callbackState)
```

Parameters

authProviderConfiguration
Type: Map<StringString>

The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

callbackState
Type: Auth.AuthProviderCallbackState

The class that contains the HTTP headers, body, and queryParams of the authentication request.

Return Value

Type: Auth.AuthProviderTokenResponse

Creates an instance of the `AuthProviderTokenResponse` class.

Usage

As of API version 39.0, use this method when extending `Auth.AuthProviderPluginClass` to create a custom authentication provider.

`initiate(authProviderConfiguration, stateToPropagate)`

Returns the URL where the user is redirected for authentication.

Signature

```
public System.PageReference initiate(Map<String,String> authProviderConfiguration,
String stateToPropagate)
```

Parameters

authProviderConfiguration
Type: Map<StringString>

The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

stateToPropagate
Type: String

The state passed in to initiate the authentication request for the user.

Return Value

Type: System.PageReference

The URL of the page where the user is redirected for authentication.

Usage

As of API version 39.0, use this method when extending `Auth.AuthProviderPluginClass` to create a custom authentication provider.

`refresh(authProviderConfiguration, refreshToken)`

Returns a new access token, which is used to update an expired access token.

Signature

```
public Auth.OAuthRefreshResult refresh(Map<String,String> authProviderConfiguration,
String refreshToken)
```

Parameters

`authProviderConfiguration`
Type: Map<String,String>

The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

`refreshToken`
Type: String

The refresh token for the user who is logged in.

Return Value

Type: Auth.OAuthRefreshResult

Returns the new access token, or an error message if an error occurs.

Usage

A successful request returns a `Auth.OAuthRefreshResult` with the access token and refresh token in the response. If you receive an error, make sure that you set the error string to the error message. A `NULL` error string indicates no error.

The refresh method works only with named credentials; it doesn't respect the standard OAuth refresh flow. The refresh method with named credentials works only if the earlier request returns a 401.

AuthProviderPluginClass Code Example

The following example demonstrates how to implement a custom Auth. provider plug-in using the abstract class, `Auth.AuthProviderPluginClass`.

```
        global class Concur extends Auth.AuthProviderPluginClass {

        // Use this URL for the endpoint that the
        // authentication provider calls back to for configuration.
        public String redirectUrl;
        private String key;
        private String secret;
```

```
        // Application redirection to the Concur website for
        // authentication and authorization.
        private String authUrl;

        // URI to get the new access token from concur using the GET verb.
        private String accessTokenUrl;

        // Api name for the custom metadata type created for this auth provider.
        private String customMetadataTypeApiName;

        // Api URL to access the user in Concur
        private String userAPIUrl;

        // Version of the user api URL to access data from Concur
        private String userAPIVersionUrl;

        global String getCustomMetadataType() {
            return customMetadataTypeApiName;
        }

        global PageReference initiate(Map<string,string>
          authProviderConfiguration, String stateToPropagate)
          {
              authUrl = authProviderConfiguration.get('Auth_Url__c');
              key = authProviderConfiguration.get('Key__c');

              // Here the developer can build up a request of some sort.
              // Ultimately, they return a URL where we will redirect the user.
              String url = authUrl + '?client_id='+ key
+'&scope=USER,EXPRPT,LIST&redirect_uri='+ redirectUrl + '&state=' + stateToPropagate;
              return new PageReference(url);
          }

          global Auth.AuthProviderTokenResponse handleCallback(Map<string,string>
          authProviderConfiguration, Auth.AuthProviderCallbackState state )
          {
              // Here, the developer will get the callback with actual protocol.
              // Their responsibility is to return a new object called
              // AuthProviderTokenResponse.
              // This will contain an optional accessToken and refreshToken
              key = authProviderConfiguration.get('Key__c');
              secret = authProviderConfiguration.get('Secret__c');
              accessTokenUrl = authProviderConfiguration.get('Access_Token_Url__c');

              Map<String,String> queryParams = state.queryParameters;
              String code = queryParams.get('code');
              String sfdcState = queryParams.get('state');

              HttpRequest req = new HttpRequest();
              String url = accessTokenUrl+'?code=' + code + '&client_id=' + key +
              '&client_secret=' + secret;
              req.setEndpoint(url);
              req.setHeader('Content-Type','application/xml');
```

```
        req.setMethod('GET');

        Http http = new Http();
        HTTPResponse res = http.send(req);
        String responseBody = res.getBody();
        String token = getTokenValueFromResponse(responseBody, 'Token', null);

        return new Auth.AuthProviderTokenResponse('Concur', token,
        'refreshToken', sfdcState);
    }

    global Auth.UserData getUserInfo(Map<string,string>
    authProviderConfiguration,
    Auth.AuthProviderTokenResponse response)
    {
        //Here the developer is responsible for constructing an
        //Auth.UserData object
        String token = response.oauthToken;
        HttpRequest req = new HttpRequest();
        userAPIUrl = authProviderConfiguration.get('API_User_Url__c');
        userAPIVersionUrl = authProviderConfiguration.get
        ('API_User_Version_Url__c');
        req.setHeader('Authorization', 'OAuth ' + token);
        req.setEndpoint(userAPIUrl);
        req.setHeader('Content-Type','application/xml');
        req.setMethod('GET');

        Http http = new Http();
        HTTPResponse res = http.send(req);
        String responseBody = res.getBody();
        String id = getTokenValueFromResponse(responseBody,
        'LoginId',userAPIVersionUrl);
        String fname = getTokenValueFromResponse(responseBody,
        'FirstName', userAPIVersionUrl);
        String lname = getTokenValueFromResponse(responseBody,
        'LastName', userAPIVersionUrl);
        String flname = fname + ' ' + lname;
        String uname = getTokenValueFromResponse(responseBody,
        'EmailAddress', userAPIVersionUrl);
        String locale = getTokenValueFromResponse(responseBody,
        'LocaleName', userAPIVersionUrl);
        Map<String,String> provMap = new Map<String,String>();
        provMap.put('what1', 'noidea1');
        provMap.put('what2', 'noidea2');
        return new Auth.UserData(id, fname, lname, flname,
        uname, 'what', locale, null, 'Concur', null, provMap);
    }

    private String getTokenValueFromResponse(String response,
    String token, String ns)
    {
        Dom.Document docx = new Dom.Document();
        docx.load(response);
        String ret = null;
```

```
            dom.XmlNode xroot = docx.getrootelement() ;
            if(xroot != null){ ret = xroot.getChildElement(token, ns).getText();
            }
        return ret;
        }

    }
```

Sample Test Classes

The following example contains test classes for the Concur class.

```
        @IsTest
        public class ConcurTestClass {

            private static final String OAUTH_TOKEN = 'testToken';
            private static final String STATE = 'mocktestState';
            private static final String REFRESH_TOKEN = 'refreshToken';
            private static final String LOGIN_ID = 'testLoginId';
            private static final String USERNAME = 'testUsername';
            private static final String FIRST_NAME = 'testFirstName';
            private static final String LAST_NAME = 'testLastName';
            private static final String EMAIL_ADDRESS = 'testEmailAddress';
            private static final String LOCALE_NAME = 'testLocalName';
            private static final String FULL_NAME = FIRST_NAME + ' ' + LAST_NAME;
            private static final String PROVIDER = 'Concur';
            private static final String REDIRECT_URL =
            'http://localhost/services/authcallback/orgId/Concur';
            private static final String KEY = 'testKey';
            private static final String SECRET = 'testSecret';
            private static final String STATE_TO_PROPOGATE = 'testState';
            private static final String ACCESS_TOKEN_URL =
            'http://www.dummyhost.com/accessTokenUri';
            private static final String API_USER_VERSION_URL =
            'http://www.dummyhost.com/user/20/1';
            private static final String AUTH_URL =
            'http://www.dummy.com/authurl';
            private static final String API_USER_URL =
            'www.concursolutions.com/user/api';

        // In the real world scenario, the key and value would be read
        // from the (custom fields in) custom metadata type record.
        private static Map<String,String> setupAuthProviderConfig ()
        {
            Map<String,String> authProviderConfiguration = new Map<String,String>();

            authProviderConfiguration.put('Key__c', KEY);

AuthProviderTokenResponse Class

Stores the response from the `AuthProviderPlugin.handleCallback` method.

Namespace

Auth

IN THIS SECTION:

AuthProviderTokenResponse Constructors

AuthProviderTokenResponse Properties

AuthProviderTokenResponse Constructors

The following are constructors for `AuthProviderTokenResponse`.

IN THIS SECTION:

AuthProviderTokenResponse(provider, oauthToken, oauthSecretOrRefreshToken, state)

Creates an instance of the `AuthProviderTokenResponse` class using the specified authentication provider, OAuth access token, OAuth secret or refresh token, and state for a custom authentication provider plug-in.

AuthProviderTokenResponse(provider, oauthToken, oauthSecretOrRefreshToken, state)

Creates an instance of the `AuthProviderTokenResponse` class using the specified authentication provider, OAuth access token, OAuth secret or refresh token, and state for a custom authentication provider plug-in.

Signature

```
public AuthProviderTokenResponse(String provider, String oauthToken, String
oauthSecretOrRefreshToken, String state)
```

Parameters

provider
Type: String

The custom authentication provider.

oauthToken
Type: String

The OAuth access token.

oauthSecretOrRefreshToken
Type: String

The OAuth secret or refresh token for the currently logged-in user.

state
Type: String

The state passed in to initiate the authentication request for the user.

AuthProviderTokenResponse Properties

The following are properties for `AuthProviderTokenResponse`.

IN THIS SECTION:

oauthSecretOrRefreshToken
The OAuth secret or refresh token for the currently logged-in user.

oauthToken
The OAuth access token.

provider
The authentication provider.

state
The state passed in to initiate the authentication request for the user.

oauthSecretOrRefreshToken

The OAuth secret or refresh token for the currently logged-in user.

Signature

```
public String oauthSecretOrRefreshToken {get; set;}
```

Property Value

Type: String

`oauthToken`

The OAuth access token.

Signature

```
public String oauthToken {get; set;}
```

Property Value

Type: String

`provider`

The authentication provider.

Signature

```
public String provider {get; set;}
```

Property Value

Type: String

`state`

The state passed in to initiate the authentication request for the user.

Signature

```
public String state {get; set;}
```

Property Value

Type: String

AuthToken Class

Contains methods for providing the access token associated with an authentication provider for an authenticated user, except for the Janrain provider.

Namespace

Auth

AuthToken Methods

The following are methods for `AuthToken`. All methods are static.

IN THIS SECTION:

getAccessToken(authProviderId, providerName)

Returns an access token for the current user using the specified 18-character identifier of an AuthProvider definition in your org and the proper name of the third party, such as Salesforce or Facebook. Note that querying the `ProviderType` field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the AuthProvider object, but the expected `providerName` is `Open ID Connect`.

getAccessTokenMap(authProviderId, providerName)

Returns a map from the third-party identifier to the access token for the currently logged-in Salesforce user. The identifier value depends on the third party. For example, for Salesforce it would be the user ID, while for Facebook it would be the user number. Note that querying the `ProviderType` field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the AuthProvider object, but the expected `providerName` is `Open ID Connect`.

refreshAccessToken(authProviderId, providerName, oldAccessToken)

Returns a map from the third-party identifier containing a refreshed access token for the currently logged-in Salesforce user. Note that querying the `ProviderType` field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the AuthProvider object, but the expected `providerName` is `Open ID Connect`.

revokeAccess(authProviderId, providerName, userId, remoteIdentifier)

Revokes the access token for a specified social sign-on user from a third-party service such as Facebook©. You can use this method only if the `IsNotSsoUsable` field on the associated ThirdPartyAccountLink object is set to `false`. Querying the `ProviderType` field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the AuthProvider object, but the expected `providerName` is `Open ID Connect`.

`getAccessToken(authProviderId, providerName)`

Returns an access token for the current user using the specified 18-character identifier of an AuthProvider definition in your org and the proper name of the third party, such as Salesforce or Facebook. Note that querying the `ProviderType` field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the AuthProvider object, but the expected `providerName` is `Open ID Connect`.

Signature

```
public static String getAccessToken(String authProviderId, String providerName)
```

Parameters

authProviderId
Type: String

providerName
Type: String

The proper name of the third party. For all providers except Janrain, the expected values are

- `Facebook`
- `Salesforce`
- `Open ID Connect`
- `Microsoft Access Control Service`
- `LinkedIn`
- `Twitter`
- `Google`

For Janrain providers, the parameter value is the proper name of the third party used. `Yahoo!` is an example of a Janrain provider value.

Return Value

Type: String

`getAccessTokenMap(authProviderId, providerName)`

Returns a map from the third-party identifier to the access token for the currently logged-in Salesforce user. The identifier value depends on the third party. For example, for Salesforce it would be the user ID, while for Facebook it would be the user number. Note that querying the `ProviderType` field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the AuthProvider object, but the expected `providerName` is `Open ID Connect`.

Signature

```
public static Map<String, String> getAccessTokenMap(String authProviderId, String
providerName)
```

Parameters

authProviderId
Type: String

providerName
Type: String

The proper name of the third party. For all providers except Janrain, the expected values are

- `Facebook`
- `Salesforce`
- `Open ID Connect`
- `Microsoft Access Control Service`

- `LinkedIn`
- `Twitter`
- `Google`

For Janrain providers, the parameter value is the proper name of the third party used. `Yahoo!` is an example of a Janrain provider value.

Return Value

Type: Map<String, String>

`refreshAccessToken(authProviderId, providerName, oldAccessToken)`

Returns a map from the third-party identifier containing a refreshed access token for the currently logged-in Salesforce user. Note that querying the `ProviderType` field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the AuthProvider object, but the expected `providerName` is `Open ID Connect`.

Signature

```
public static Map<String, String> refreshAccessToken(String authProviderId, String
providerName, String oldAccessToken)
```

Parameters

`authProviderId`
Type: String

`providerName`
Type: String

The proper name of the third party. For all providers except Janrain, the expected values are

- `Facebook`
- `Salesforce`
- `Open ID Connect`
- `Microsoft Access Control Service`
- `LinkedIn`
- `Twitter`
- `Google`

For Janrain providers, the parameter value is the proper name of the third party used. `Yahoo!` is an example of a Janrain provider value.

`oldAccessToken`
Type: String

Return Value

Type: Map<String, String>

Usage

This method works when using Salesforce or an OpenID Connect provider, but not when using Facebook or Janrain. The returned map contains `AccessToken` and `RefreshError` keys. Evaluate the keys in the response to check if the request was successful. For a successful request, the `RefreshError` value is `null`, and `AccessToken` is a token value. For an unsuccessful request, the `RefreshError` value is an error message, and the `AccessToken` value is `null`.

When successful, this method updates the token stored in the database, which you can get using `Auth.AuthToken.getAccessToken()`.

If you are using an OpenID Connect authentication provider, an `id_token` is not required in the response from the provider. If a **Token Issuer** is specified in the **Auth. Provider** settings and an `id_token` is provided anyway, Salesforce will verify it.

Example

```
String accessToken = Auth.AuthToken.getAccessToken('0SOD000000000DeOAI', 'Open ID connect');
Map<String, String> responseMap = Auth.AuthToken.refreshAccessToken('0SOD000000000DeOAI',
 'Open ID connect', accessToken);
```

A successful request includes the access token in the response.

```
 (RefreshError,null)(AccessToken,00DD00000007BhE!AQkAQFzj...)
```

revokeAccess(authProviderId, providerName, userId, remoteIdentifier)

Revokes the access token for a specified social sign-on user from a third-party service such as Facebook©. You can use this method only if the `IsNotSsoUsable` field on the associated ThirdPartyAccountLink object is set to `false`. Querying the `ProviderType` field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the AuthProvider object, but the expected `providerName` is `Open ID Connect`.

Signature

```
public static Boolean revokeAccess(String authProviderId, String providerName, String
userId, String remoteIdentifier)
```

Parameters

`authProviderId`
Type: String

The ID of the Auth. Provider in the Salesforce organization.

`providerName`
Type: String

The proper name of the third party. For all providers except Janrain, the expected values are

- `Facebook`
- `Salesforce`
- `Open ID Connect`
- `Microsoft Access Control Service`
- `LinkedIn`
- `Twitter`

- `Google`

For Janrain providers, the parameter value is the proper name of the third party used. `Yahoo!` is an example of a Janrain provider value.

`userId`
Type: String

The 15-character ID for the user whose access is being revoked.

`remoteIdentifier`
Type: String

The unique ID for the user in the third-party system (this value is in the associated ThirdPartyAccountLink standard object).

Return Value

Type: Boolean

The return value is `true` if the `revokeAccess()` operation is successful; otherwise `false`.

Example

The following example revokes a Facebook user's access token.

```
Auth.AuthToken.revokeAccess('0SOxx00000#####', 'facebook', '005xx00000#####',
'ThirdPartyIdentifier_exist214176560#####');
```

CommunitiesUtil Class

Contains methods for getting information about an Experience Cloud user.

Namespace

Auth

Example

The following example directs a guest (unauthenticated) user to one page, and authenticated users of the Experience Cloud site's parent organization to another page.

```
if (Auth.CommunitiesUtil.isGuestUser())
    // Redirect to the login page if user is an unauthenticated user
    return new PageReference(LOGIN_URL);

if (Auth.CommunitiesUtil.isInternalUser())
    // Redirect to the home page if user is an internal user
    return new PageReference(HOME_URL);
```

CommunitiesUtil Methods

The following are methods for `CommunitiesUtil`. All methods are static.

IN THIS SECTION:

getLogoutUrl()
Returns the page to display after the current Experience Cloud user logs out.

getUserDisplayName()
Returns the current user's Experience Cloud display name.

isGuestUser()
Indicates whether the current user isn't logged in to the Experience Cloud site. Redirect the user to log in, if necessary.

isInternalUser()
Indicates whether the current user is logged in as a member of the parent Salesforce organization, such as an employee.

`getLogoutUrl()`

Returns the page to display after the current Experience Cloud user logs out.

Signature

```
public static String getLogoutUrl()
```

Return Value

Type: String

`getUserDisplayName()`

Returns the current user's Experience Cloud display name.

Signature

```
public static String getUserDisplayName()
```

Return Value

Type: String

`isGuestUser()`

Indicates whether the current user isn't logged in to the Experience Cloud site. Redirect the user to log in, if necessary.

Signature

```
public static Boolean isGuestUser()
```

Return Value

Type: Boolean

`isInternalUser()`

Indicates whether the current user is logged in as a member of the parent Salesforce organization, such as an employee.

Signature

```
public static Boolean isInternalUser()
```

Return Value

Type: Boolean

ConfigurableSelfRegHandler Interface

Gives you more control over how customers or partners self-register for your Experience Cloud site by creating a class that implements `Auth.ConfigurableSelfRegHandler`. You choose the user information to collect, and how users identify themselves—with their email address, phone number, or another identifier. When verified, you create a customer or partner user and log in the user to your Experience Cloud site.

Namespace

Auth

Usage

You set up site self-registration declaratively on the Login & Registration (L&R) page of the Administration workspace. When combined with a configurable self-registration setup, the handler class can programmatically fill in user fields, including custom fields, and determine how to create a user and log them in.

When you select the Configurable Self-Reg Page registration page, you choose the user fields to collect from the self-registration form, such as last name, first name, username, nickname, mobile, or email. You also determine the verification method that the user identifies themselves with, which can be email, mobile, or neither. Salesforce generates the `Auth.ConfigurableSelfRegHandler` handler, which contains logic on how to create an Experience Cloud site member. Modify the handler to change how users are created, and how collected user information is used.

You can add custom logic to ensure that the email or phone number is unique to the customer or partner who's registering. For example, you can add a custom unique field, and write a copy of the email or phone number to it. You can also change how the user is created. By default, the user is created as a contact associated with the account that you select on the L&R page.

The generated `ConfigurableSelfRegHandler` is located on the Setup Apex Classes page, and begins with `AutocreatedConfigSelfReg`, for example, `AutocreatedConfigSelfReg1532475901849`.

For an example, see ConfigurableSelfRegHandler Example Implementation. For more details, see Salesforce Customer Identity in *Salesforce Help*.

IN THIS SECTION:

ConfigurableSelfRegHandler Method

ConfigurableSelfRegHandler Example Implementation

This Apex code implements the `Auth.ConfigurableSelfRegHandler` interface. After the customer or partner fills out the sign-up page and submits it, the handler is invoked to create an Experience Cloud member with the supplied information. If the registration process requires email or phone verification, the verification process finishes before the `Auth.ConfigurableSelfRegHandler.createUser` is invoked. If verification isn't required, `createUser` is invoked when the customer or partner submits the page.

ConfigurableSelfRegHandler Method

The following is the method for `ConfigurableSelfRegHandler`.

IN THIS SECTION:

createUser(accountId, profileId, registrationAttributes, password)
Create a community member from the information that the visitor provided on your community's self-registration page.

createUser(accountId, profileId, registrationAttributes, password)

Create a community member from the information that the visitor provided on your community's self-registration page.

Signature

```
public Id createUser(Id accountId, Id profileId, Map<Schema.SObjectField,String>
registrationAttributes, String password)
```

Parameters

accountId
Type: Id

Default account with which the new user is associated. This value comes from the Account field setting on Login and Registration (L&R) page under Registration Page Configuration.

profileID
Type: Id

Profile to assign the new user. This value comes from the Profile field setting on the L&R page under Registration Page Configuration.

registrationAttributes
Type: Map<Schema.sObjectField,String>

A map of attributes that the registering user entered on the self-registration page. The fields that appear on the self-registration page come from the User Fields selected on the L&R page when the registration type is Configurable Self-Reg Page.

password
Type: String

The password entered by the user if "Include Password" is selected on the L&R page. (If a password isn't entered, the handler must generate one because a password is required to create a user.)

Return Value

Type: Id

Returns an identifier for the created User object. `Auth.ConfigurableSelfRegHandler` inserts a user and then returns the ID of that user.

ConfigurableSelfRegHandler Example Implementation

This Apex code implements the `Auth.ConfigurableSelfRegHandler` interface. After the customer or partner fills out the sign-up page and submits it, the handler is invoked to create an Experience Cloud member with the supplied information. If the registration process requires email or phone verification, the verification process finishes before the `Auth.ConfigurableSelfRegHandler.createUser` is invoked. If verification isn't required, `createUser` is invoked when the customer or partner submits the page.

Verification occurs by email if the admin chose Email as the verification method when setting up the Configurable Self-Reg handler on the Login & Registration (L&R) page. When a visitor clicks the sign-up link from the login page, Salesforce prompts for an email address and then sends a one-time password to the specified email address. If the visitor enters the verification code successfully on the verify page, the user is created and logged in. Likewise, if the admin chose Text Message as the verification method on the L&R page, the visitor is prompted to enter a phone number. Salesforce sends a challenge (verification code) via SMS to the user. If successful, the user is created and logged in. Requiring verification before creating a user reduces the number of dummy users cluttering your org.

The `Auth.ConfigurableSelfRegHandler` class contains logic for generating the user fields required to create a user in case the user doesn't supply them. The handler generates default values, ensuring that the values are unique by appending a timestamp. You can modify the handler to make sure that the email address and phone number of the customer or partner are also unique.

```
global class AutocreatedConfigSelfReg implements Auth.ConfigurableSelfRegHandler {

    private final Long CURRENT_TIME = Datetime.now().getTime();
    private final String[] UPPERCASE_CHARS = 'ABCDEFGHIJKLMNOPQRSTUVWXYZ'.split('');
    private final String[] LOWERCASE_CHARS = 'abcdefghijklmnopqrstuvwxyz'.split('');
    private final String[] NUMBER_CHARS = '1234567890'.split('');
    private final String[] SPECIAL_CHARS = '!#$%-_=+<>'.split('');

    // This method is called once after verification (if any was configured).
    // This method should create a user and insert it.
    // Password can be null.
    // Return null or throw an exception to fail creation.
    global Id createUser(Id accountId, Id profileId, Map<SObjectField, String>
registrationAttributes, String password) {
        User u = new User();
        u.ProfileId = profileId;
        for (SObjectField field : registrationAttributes.keySet()) {
            String value = registrationAttributes.get(field);
            u.put(field, value);
        }

        u = handleUnsetRequiredFields(u);
        generateContact(u, accountId);
        if (String.isBlank(password)) {
            password = generateRandomPassword();
        }
        Site.validatePassword(u, password, password);
        if (u.contactId == null) {
            return Site.createExternalUser(u, accountId, password);
        }
        u.languagelocalekey = UserInfo.getLocale();
        u.localesidkey = UserInfo.getLocale();
        u.emailEncodingKey = 'UTF-8';
        u.timeZoneSidKey = UserInfo.getTimezone().getID();
        insert u;
        System.setPassword(u.Id, password);
```

```
        return u.id;
    }
    // Method to autogenerate a password if one isn't passed in.
    // By setting a password for a user, we won't send a
    // welcome email to set the password.

    }
    // Default implementation to try to provide uniqueness.
    private String generateCommunityNickname() {
        return 'ExternalUser' + CURRENT_TIME;
    }
}
```

ConfirmUserRegistrationHandler Interface

Manages single sign-on (SSO) user mappings between Salesforce and a third-party identity provider. Use this interface to confirm user mappings before updating them.

Namespace

Auth

Usage

When you set up SSO with a third-party identity provider, you create a class that implements a registration handler using the `Auth.RegistrationHandler` interface. This class manages the process of creating and updating users. For advanced use cases that require you to confirm user information during the update process, implement the `Auth.ConfirmUserRegistrationHandler` interface in your class. This interface must be implemented in addition to `Auth.RegistrationHandler`.

You can use the `Auth.ConfirmUserRegistrationHandler` interface to ensure that users are mapped correctly between Salesforce and the third party. When a user who has previously logged in with an authentication provider logs in again, you can confirm that the incoming user data is consistent with the user's third-party identifier. If not, you can identify which user is supposed to be logged in.

You can also use the `Auth.ConfirmUserRegistrationHandler` interface to switch context for users with multiple records. For example, a user has two records—an admin user and a standard user. When the user logs in, the third-party identity provider confirms the account used to log in and sends the response to Salesforce via the UserInfo endpoint. You can then use this information to determine whether to log in the user as an admin or standard user.

IN THIS SECTION:

ConfirmUserRegistrationHandler Methods

ConfirmUserRegistrationHandler Example Implementation

ConfirmUserRegistrationHandler Methods

The following are methods for `ConfirmUserRegistrationHandler`.

IN THIS SECTION:

confirmUser(userId, tpalId, portalId, userdata)

Returns the ID of the user to be logged in based on their mapping to a third-party identifier. This method is called before calling the `updateUser()` method. It's called only if the incoming user has previously logged in and has a third-party account link to a Salesforce user.

`confirmUser(userId, tpalId, portalId, userdata)`

Returns the ID of the user to be logged in based on their mapping to a third-party identifier. This method is called before calling the `updateUser()` method. It's called only if the incoming user has previously logged in and has a third-party account link to a Salesforce user.

Signature

```
public Id confirmUser(Id userId, Id tpalId, Id portalId, Auth.UserData userdata)
```

Parameters

userId
Type: Id

The ID of the user who is mapped to the third-party identifier via a third-party account link.

tpalId
Type: Id

The third-party account link corresponding to the third-party identifier.

portalId
Type: Id

The portal ID the user is logging in to. If there's no portal configured, this value can be null.

userData
Type: Auth.UserData

Contains user information from the third-party identity provider.

Return Value

Type: Id

The Id of the user to be logged in. If null, login fails.

ConfirmUserRegistrationHandler Example Implementation

This example implements the `Auth.ConfirmUserRegistrationHandler` interface during the user update process to confirm that the correct user is logging in based on their email address and last name.

```
global class StandardUserRegistrationHandler implements Auth.RegistrationHandler,
Auth.ConfirmUserRegistrationHandler {
    global User createUser(Id portalId, Auth.UserData data){
        User u = new User();
        Profile p = [SELECT Id FROM profile WHERE name='Standard User'];
        u.username = data.username + '@salesforce.com';
        u.email = data.email;
        u.lastName = data.lastName;
        u.firstName = data.firstName;
        String alias = data.username;
        if(alias.length() > 8) {
            alias = alias.substring(0, 8);
        }
        u.alias = alias;
        u.languagelocalekey = data.attributeMap.get('language');
        u.localesidkey = data.locale;
        u.emailEncodingKey = 'UTF-8';
        u.timeZoneSidKey = 'America/Los_Angeles';
        u.profileId = p.Id;
        return u;
    }

    global void updateUser(Id userId, Id portalId, Auth.UserData data) {
        User u = new User(id=userId);
        u.username = data.username + '@salesforce.com';
```

```
        u.email = data.email;
        u.lastName = data.lastName;
        u.firstName = data.firstName;
        String alias = data.username;
        if(alias.length() > 8) {
            alias = alias.substring(0, 8);
        }
        u.alias = alias;
        u.languagelocalekey = data.attributeMap.get('language');
        u.localesidkey = data.locale;
        update(u);
    }

    global Id confirmUser(Id userId, Id tpalId, Id portalId, Auth.UserData data) {
        if (data.email.contains(data.lastName)) { // looks genuine
            return userId;
        } else { // find the right user
            User confirmedUser = [SELECT id FROM user WHERE email=:data.email];
            return confirmedUser.Id;
        }
    }
}
```

The following example tests the implementation:

```
@isTest
public class StandardUserRegistrationHandlerTest {
    static testMethod void testConfirmUser() {
        StandardUserRegistrationHandler handler = new StandardUserRegistrationHandler();
        Auth.UserData sampleData = new Auth.UserData('idA', 'firstName', 'A',
            'firstName A', 'userA@example.org', null, 'usernameA', 'en_US', 'facebook',
            null, new Map<String, String>{'language' => 'en_US'});
        User u = handler.createUser(null, sampleData);
        insert(u);
        String uid = u.id;

        sampleData = new Auth.UserData('idB', 'firstName', 'B',
            'firstName B', 'userA@example.org', null, 'usernameB', 'en_US', 'facebook',
            null, new Map<String, String>{}); // note that user B is using userA's email
       Id confirmedUserId = handler.confirmUser(uid, '060xx0000004Eh6', null, sampleData);

        System.assertEquals(uid, confirmedUserId); // we should see userA's id
    }
}
```

ConnectedAppPlugin Class

Contains methods for extending the behavior of a connected app, for example, customizing how a connected app is invoked depending on the protocol used. This class gives you more control over the interaction between Salesforce and your connected app.

Namespace

Auth

Usage

When you create a connected app, you specify general information about the app and settings for OAuth, web apps, mobile apps, and canvas apps. To customize how the app is invoked, create a connected app handler with this `ConnectedAppPlugin` Apex class. For example, use this class to support new authentication protocols or respond to user attributes in a way that benefits a business process.

When you create a connected app handler, you also configure the `ConnectedAppPlugin` class to run as an execution user. The execution user authorizes access for the connected app. For example, when you use the `authorize` method, the execution user authorizes the connected app to access data.

If you don't specify an execution user, the plug-in runs as an Automated Process User, which is a system user that executes tasks behind the scenes. Most `ConnectedAppPlugin` methods require that you specify an execution user, with the exception of the `customAttributes` method. For more information, see Create a Custom Connected App Handler.

Example

This example authorizes the connected app user to use the connected app if the context is SAML and the user has reached the quota tracked in a custom field. It returns the user's permission set assignments. The example uses `Auth.InvocationContext` to modify a SAML assertion before it's sent to the service provider.

```
global class ConnectedAppPluginExample extends Auth.ConnectedAppPlugin
{
    // Authorize the app if the user has achieved quota tracked in a custom field
    global override Boolean authorize(Id userId, Id connectedAppId, Boolean isAdminApproved,
 Auth.InvocationContext context)
    {
        // Create a custom boolean field HasAchievedQuota__c on the user record
        // and then uncomment the block below
        // User u = [select id, HasAchievedQuota__c from User where id =: userId].get(0);

        // return u.HasAchievedQuota__c;

        return isAdminApproved;
    }

    // Call a flow during refresh
    global override void refresh(Id userId, Id connectedAppId, Auth.InvocationContext
context)
    {
       try
       {
          Map<String, Object> inputVariables = new Map<String, Object>();
          inputVariables.put('userId', userId);
          inputVariables.put('connectedAppId', connectedAppId);

         // Create a custom trigger ready flow and uncomment the block below
         // Flow.Interview.MyCustomFlow interview = new
Flow.Interview.MyCustomFlow(inputVariables);
         // interview.start();
        } catch ( Exception e ) {
           System.debug('FLOW Exception:' + e);
        }
    }
```

```
    // Return a user's permission set assignments
    global override Map<String,String> customAttributes(Id userId, Id connectedAppId,
Map<String,String>
        formulaDefinedAttributes, Auth.InvocationContext context)
    {
        List<PermissionSetAssignment> psas = [SELECT id, PermissionSet.Name FROM
PermissionSetAssignment
        WHERE PermissionSet.IsOwnedByProfile = false AND (AssigneeId = :userId)];
        String permsets = '[';
        for (PermissionSetAssignment psa :psas)
        {
            permsets += psa.PermissionSet.Name + ';';
        }
        permsets += ']';
        formulaDefinedAttributes.put('PermissionSets', permsets);
        return formulaDefinedAttributes;
    }
}
```

IN THIS SECTION:

ConnectedAppPlugin Methods

ConnectedAppPlugin Methods

The following are methods for `ConnectedAppPlugin`.

IN THIS SECTION:

authorize(userId, connectedAppId, isAdminApproved)

Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use `authorize(userId, connectedAppId, isAdminApproved, context)` instead.

authorize(userId, connectedAppId, isAdminApproved, context)

Authorizes the specified user to access the connected app. If the connected app is set for users to self-authorize, this method isn't invoked.

customAttributes(userId, connectedAppId, formulaDefinedAttributes)

Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use `customAttributes(userId, connectedAppId, formulaDefinedAttributes, context)` instead.

customAttributes(userId, connectedAppId, formulaDefinedAttributes, context)

Sets new attributes for the specified user. When the connected app gets the user's attributes from the UserInfo endpoint or through a SAML assertion, use this method to update the attribute values.

modifySAMLResponse(authSession, connectedAppId, samlResponse)

Modifies the XML generated by the Salesforce SAML Identity Provider (IDP) before it's sent to the service provider.

refresh(userId, connectedAppId)

Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use `refresh(userId, connectedAppId, context)` instead.

refresh(userId, connectedAppId, context)

Salesforce calls this method during a refresh token exchange.

`authorize(userId, connectedAppId, isAdminApproved)`

Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use `authorize(userId, connectedAppId, isAdminApproved, context)` instead.

Signature

```
public Boolean authorize(Id userId, Id connectedAppId, Boolean isAdminApproved)
```

Parameters

userId
Type: Id

The 15-character ID of the user attempting to use the connected app.

connectedAppId
Type: String

The 15-character ID of the connected app.

isAdminApproved
Type: Boolean

The approval state of the specified user when the connected app requires approval.

Return Value

Type: Boolean

If the connected app requires admin approval, a returned value of `true` indicates that the current user is approved.

`authorize(userId, connectedAppId, isAdminApproved, context)`

Authorizes the specified user to access the connected app. If the connected app is set for users to self-authorize, this method isn't invoked.

Signature

```
public Boolean authorize(Id userId, Id connectedAppId, Boolean isAdminApproved,
Auth.InvocationContext context)
```

Parameters

userId
Type: Id

The 15-character ID of the user attempting to use the connected app.

connectedAppId
Type: Id

The 15-character ID of the connected app.

isAdminApproved
Type: Boolean

The approval state of the specified user when the connected app requires approval.

context
Type: InvocationContext

The context in which the connected app is invoked.

Return Value

Type: Boolean

If the connected app requires admin approval, a returned value of `true` indicates that the user is approved.

Usage

`ConnectedAppPlugin` runs on behalf of the current user. But the user must have permission to use the connected app for the plug-in to work. Use this method to authorize the user.

customAttributes(userId, connectedAppId, formulaDefinedAttributes)

Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use `customAttributes(userId, connectedAppId, formulaDefinedAttributes, context)` instead.

Signature

```
public Map<String,String> customAttributes(Id userId, Id connectedAppId,
Map<String,String> formulaDefinedAttributes,)
```

Parameters

userId
Type: Id

The 15-character ID of the user attempting to use the connected app.

connectedAppId
Type: Id

The 15-character ID of the connected app.

formulaDefinedAttributes
Type: Map<String,String>

A map of the new set of attributes from the UserInfo endpoint (OAuth) or from a SAML assertion. For more information, see The UserInfo Endpoint in the online help.

Return Value

Type: Map<String,String>

A map of the updated set of attributes.

customAttributes(userId, connectedAppId, formulaDefinedAttributes, context)

Sets new attributes for the specified user. When the connected app gets the user's attributes from the UserInfo endpoint or through a SAML assertion, use this method to update the attribute values.

Signature

```
public Map<String,String> customAttributes(Id userId, Id connectedAppId,
Map<String,String> formulaDefinedAttributes, Auth.InvocationContext context)
```

Parameters

userId
Type: Id

The 15-character ID of the user attempting to use the connected app.

connectedAppId
Type: Id

The 15-character ID for the connected app.

formulaDefinedAttributes
Type: Map<String,String>

A map of the current set of attributes from the UserInfo endpoint (OAuth) or from a SAML assertion. For more information, see The UserInfo Endpoint in the online help.

Type: InvocationContext

The context in which the connected app is invoked.

Return Value

Type: Map<String,String>

A map of the updated set of attributes.

modifySAMLResponse(authSession, connectedAppId, samlResponse)

Modifies the XML generated by the Salesforce SAML Identity Provider (IDP) before it's sent to the service provider.

Signature

```
public dom.XmlNode modifySAMLResponse(Map<String,String> authSession, Id connectedAppId,
dom.XmlNode samlResponse)
```

Parameters

authSession
Type: Map<String,String>

The attributes for the authorized user's session. The map includes the 15-character ID of the authorized user who's accessing the connected app.

connectedAppId
Type: Id

The 15-character ID of the connected app.

samlResponse
Type: Dom.XmlNode

Contains the SAML XML response generated by the IDP.

Return Value

Type: Dom.XmlNode

Returns an instance of Dom.XmlNode containing the modified SAML XML response.

Usage

Use this method to modify the XML SAML response to perform an action based on the context of the SAML request before it's verified, signed, and sent to the target service provider. This method enables developers to extend the connected app plug-in to meet their specific needs.

The developer assumes full responsibility for changes made within the connected app plug-in. The plug-in must include validation and error handling. If the plug-in throws an exception, catch it, log it, and stop the process. Don't send anything to the target service provider.

`refresh(userId, connectedAppId)`

Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use `refresh(userId, connectedAppId, context)` instead.

Signature

```
public void refresh(Id userId, Id connectedAppId)
```

Parameters

`userId`
Type: Id

The 15-character ID of the user requesting the refresh token.

`connectedAppId`
Type: Id

The 15-character ID of the connected app.

Return Value

Type: void

`refresh(userId, connectedAppId, context)`

Salesforce calls this method during a refresh token exchange.

Signature

```
public void refresh(Id userId, Id connectedAppId, Auth.InvocationContext context)
```

Parameters

`userId`
Type: Id

The 15-character ID of the user requesting the refresh token.

connectedAppId
Type: Id

The 15-character ID of the connected app.

context
Type: InvocationContext

The context in which the connected app is invoked.

Return Value

Type: void

InvocationContext Enum

The context in which the connected app is invoked, such as the protocol flow used and the token type issued, if any. Developers can use the context information to write code that is unique to the type of invocation.

Enum Values

The following are the values of the `Auth.InvocationContext` enum.

Value	Description
`ASSET_TOKEN`	Reserved for future use.
`OAUTH1`	Context used when authentication is through an OAuth 1.0A flow.
`OAUTH2_JWT_BEARER_TOKEN`	Context used when authentication is through a JSON-based Web Token (JWT) bearer token flow.
`OAUTH2_SAML_ASSERTION`	Context used when authentication is through an OAuth 2.0 SAML assertion flow.
`OAUTH2_SAML_BEARER_ASSERTION`	Context used when authentication is through an OAuth 2.0 SAML bearer assertion flow.
`OAUTH2_USERNAME_PASSWORD`	Context used when authentication is through an OAuth 2.0 username-password flow.
`OAUTH2_USER_AGENT_ID_TOKEN`	Context used when issuing an ID token through an OAuth 2.0 user-agent flow.
`OAUTH2_USER_AGENT_TOKEN`	Context used when authentication is through an OAuth 2.0 user agent flow.
`OAUTH2_WEB_SERVER`	Context used when authentication is through a web server authentication flow.
`OPENIDCONNECT`	Context used when authentication is through an OpenID Connect authentication flow.
`REFRESH_TOKEN`	Context used when renewing tokens issued by a web server or user-agent flow.
`SAML_ASSERTION`	Context used when authentication is through a SAML assertion flow.
`UNKNOWN`	Context is unknown.

Value	Description
`USERID_ENDPOINT`	Context used when issuing an access token through a UserInfo endpoint.

Salesforce Help: Authenticating Apps with OAuth

JWS Class

Contains methods that apply a digital signature to a JSON Web Token (JWT), using a JSON Web Signature (JWS) data structure. This class creates the signed JWT bearer token, which can be used to request an OAuth access token in the OAuth 2.0 JWT bearer token flow.

Namespace

Auth

Usage

Use the methods in this class to sign the JWT bearer token with the X509 certificate.

IN THIS SECTION:

JWS Constructors

JWS Methods

JWS Constructors

The following are constructors for `JWS`.

IN THIS SECTION:

JWS(jwt, certDevName)
Creates an instance of the `JWS` class using the specified `Auth.JWT` payload and the certificate used for signing the JWT bearer token.

JWS(payload, certDevName)
Creates an instance of the `JWS` class using the specified payload and certificate used for signing the JWT bearer token.

`JWS(jwt, certDevName)`

Creates an instance of the `JWS` class using the specified `Auth.JWT` payload and the certificate used for signing the JWT bearer token.

Signature

```
public JWS(Auth.JWT jwt, String certDevName)
```

Parameters

jwt
Type: Auth.JWT

The Base64-encoded JSON Claims Set in the JWT bearer token generated by `Auth.JWT`.

certDevName
Type: String

The `Unique Name` for a certificate stored in the Salesforce org's Certificate and Key Management page to use for signing the JWT bearer token.

Usage

Calls the `toJSONString()` method in `Auth.JWT` and sets the resulting string as the payload of the JWT bearer token. Alternatively, you can specify the payload directly using `JWS(payload, certDevName)`.

`JWS(payload, certDevName)`

Creates an instance of the `JWS` class using the specified payload and certificate used for signing the JWT bearer token.

Signature

```
public JWS(String payload, String certDevName)
```

Parameters

payload
Type: String

The Base64-encoded JSON Claims Set in the JWT bearer token.

certDevName
Type: String

The `Unique Name` for a certificate stored in the Salesforce org's Certificate and Key Management page to use for signing the JWT bearer token.

Usage

Sets the *payload* string as the payload of the JWT bearer token. Alternatively, if you generate the payload using `Auth.JWT`, you can use `JWS(jwt, certDevName)` instead.

JWS Methods

The following are methods for `JWS`. All are instance methods.

IN THIS SECTION:

clone()
Makes a duplicate copy of the JWS object.

getCompactSerialization()

Returns the compact serialization representation of the JWS as a concatenated string, with the encoded JWS header, encoded JWS payload, and encoded JWS signature strings separated by period ('.') characters.

clone()

Makes a duplicate copy of the JWS object.

Signature

```
public Object clone()
```

Return Value

Type: JWS

getCompactSerialization()

Returns the compact serialization representation of the JWS as a concatenated string, with the encoded JWS header, encoded JWS payload, and encoded JWS signature strings separated by period ('.') characters.

Signature

```
public String getCompactSerialization()
```

Return Value

Type: String

JWT Class

Generates the JSON Claims Set in a JSON Web Token (JWT). The resulting Base64-encoded payload can be passed as an argument to create an instance of the `Auth.JWS` class.

Namespace

Auth

Usage

Use the methods in this class to generate the payload in a JWT bearer token.

IN THIS SECTION:

JWT Methods

JWT Methods

The following are methods for `JWT`. All are instance methods.

IN THIS SECTION:

clone()
Makes a duplicate copy of the JWT object.

getAdditionalClaims()
Returns a map of additional claims in the JWT, where the key string contains the name of the claim, and the value contains the value of the claim.

getAud()
Returns the audience claim that identifies the intended recipients of the JWT.

getIss()
Returns the issuer claim that identifies the issuer of the JWT.

getNbfClockSkew()
Returns the not before claim that identifies the time before which the JWT must not be accepted for processing, while allowing some leeway for clock skew.

getSub()
Returns the subject claim that identifies the current user of the JWT.

getValidityLength()
Returns the length of time (in seconds) that the JWT is valid, which affects the expiration claim.

setAdditionalClaims(additionalClaims)
Sets the additional claims in the JWT. Returned by the `getAdditionalClaims()` method.

setAud(aud)
Sets the audience claim in the JWT. Returned by the `getAud()` method.

setIss(iss)
Sets the issuer claim in the JWT. Returned by the `getIss()` method.

setNbfClockSkew(nbfClockSkew)
Sets the not before claim in the JWT. Returned by the `getNbfClockSkew()` method.

setSub(sub)
Sets the subject claim in the JWT. Returned by the `getSub()` method.

setValidityLength(validityLength)
Sets the length of time (in seconds) that the JWT is valid, which affects the expiration claim. Returned by the `getValidityLength()` method.

toJSONString()
Generates the JSON object representation of the Claims Set as an encoded JWT payload.

`clone()`

Makes a duplicate copy of the JWT object.

Signature

```
public Object clone()
```

Return Value

Type: JWT

`getAdditionalClaims()`

Returns a map of additional claims in the JWT, where the key string contains the name of the claim, and the value contains the value of the claim.

Signature

```
public Map<String,ANY> getAdditionalClaims()
```

Return Value

Type: Map<String,ANY>

`getAud()`

Returns the audience claim that identifies the intended recipients of the JWT.

Signature

```
public String getAud()
```

Return Value

Type: String

`getIss()`

Returns the issuer claim that identifies the issuer of the JWT.

Signature

```
public String getIss()
```

Return Value

Type: String

`getNbfClockSkew()`

Returns the not before claim that identifies the time before which the JWT must not be accepted for processing, while allowing some leeway for clock skew.

Signature

```
public Integer getNbfClockSkew()
```

Return Value

Type: Integer

`getSub()`

Returns the subject claim that identifies the current user of the JWT.

Signature

```
public String getSub()
```

Return Value

Type: String

`getValidityLength()`

Returns the length of time (in seconds) that the JWT is valid, which affects the expiration claim.

Signature

```
public Integer getValidityLength()
```

Return Value

Type: Integer

`setAdditionalClaims(additionalClaims)`

Sets the additional claims in the JWT. Returned by the `getAdditionalClaims()` method.

Signature

```
public void setAdditionalClaims(Map<String,ANY> additionalClaims)
```

Parameters

`additionalClaims`
Type: Map<String,ANY>

Return Value

Type: void

Usage

Additional claims must not include any standard claims.

`setAud(aud)`

Sets the audience claim in the JWT. Returned by the `getAud()` method.

Signature

```
public void setAud(String aud)
```

Parameters

aud
Type: String

Return Value

Type: void

`setIss(iss)`

Sets the issuer claim in the JWT. Returned by the `getIss()` method.

Signature

```
public void setIss(String iss)
```

Parameters

iss
Type: String

Return Value

Type: void

`setNbfClockSkew(nbfClockSkew)`

Sets the not before claim in the JWT. Returned by the `getNbfClockSkew()` method.

Signature

```
public void setNbfClockSkew(Integer nbfClockSkew)
```

Parameters

nbfClockSkew
Type: Integer

Return Value

Type: void

`setSub(sub)`

Sets the subject claim in the JWT. Returned by the `getSub()` method.

Signature

```
public void setSub(String sub)
```

Parameters

sub
Type: String

Return Value

Type: void

`setValidityLength(validityLength)`

Sets the length of time (in seconds) that the JWT is valid, which affects the expiration claim. Returned by the `getValidityLength()` method.

Signature

```
public void setValidityLength(Integer validityLength)
```

Parameters

validityLength
Type: Integer

Return Value

Type: void

`toJSONString()`

Generates the JSON object representation of the Claims Set as an encoded JWT payload.

Signature

```
public String toJSONString()
```

Return Value

Type: String

JWTBearerTokenExchange Class

Contains methods that POST the signed JWT bearer token to a token endpoint to request an access token, in the OAuth 2.0 JWT bearer token flow.

Namespace

Auth

Usage

Use the methods in this class to post a signed JWT bearer token to the OAuth token endpoint, in exchange for an access token.

Example

In the following example application, the Apex controller:

1. Creates the JSON Claims Set.
2. Specifies the scope of the request with additional claims.
3. Creates the signed JWT.
4. Specifies the token endpoint and POSTs to it.
5. Gets the access token from the HTTP response.

```
public class MyController{

     public MyController() {
        Auth.JWT jwt = new Auth.JWT();
        jwt.setSub('user@salesforce.com');
        jwt.setAud('https://login.salesforce.com');
        jwt.setIss('3MVG99OxTyEMCQ3gNp2PjkqeZKxnmAiG1xV4oHh9AKL_rSK.BoSVPGZHQ
ukXnVjzRgSuQqGn75NL7yfkQcyy7');

        //Additional claims to set scope
        Map<String, Object> claims = new Map<String, Object>();
        claims.put('scope', 'scope name');

        jwt.setAdditionalClaims(claims);

        //Create the object that signs the JWT bearer token
        Auth.JWS jws = new Auth.JWS(jwt, 'CertFromCertKeyManagement');

        //Get the resulting JWS in case debugging is required
        String token = jws.getCompactSerialization();

        //Set the token endpoint that the JWT bearer token is posted to
        String tokenEndpoint = 'https://login.salesforce.com/services/oauth2/token';

        //POST the JWT bearer token
       Auth.JWTBearerTokenExchange bearer = new Auth.JWTBearerTokenExchange(tokenEndpoint,
 jws);

        //Get the access token
        String accessToken = bearer.getAccessToken();

    }
}
```

IN THIS SECTION:

JWTBearerTokenExchange Constructors

JWTBearerTokenExchange Methods

JWTBearerTokenExchange Constructors

The following are constructors for `JWTBearerTokenExchange`.

IN THIS SECTION:

JWTBearerTokenExchange(tokenEndpoint, jws)

Creates an instance of the `JWTBearerTokenExchange` class using the specified token endpoint and the signed JWT bearer token.

JWTBearerTokenExchange()

Creates an instance of the `Auth.JWTBearerTokenExchange` class.

`JWTBearerTokenExchange(tokenEndpoint, jws)`

Creates an instance of the `JWTBearerTokenExchange` class using the specified token endpoint and the signed JWT bearer token.

Signature

```
public JWTBearerTokenExchange(String tokenEndpoint, Auth.JWS jws)
```

Parameters

`tokenEndpoint`
Type: String

The token endpoint that the signed JWT bearer token is POSTed to.

`jws`
Type: Auth.JWS

The signed JWT bearer token.

`JWTBearerTokenExchange()`

Creates an instance of the `Auth.JWTBearerTokenExchange` class.

Signature

```
public JWTBearerTokenExchange()
```

JWTBearerTokenExchange Methods

The following are methods for `JWTBearerTokenExchange`. All are instance methods.

IN THIS SECTION:

clone()
Makes a duplicate copy of the JWTBearerTokenExchange object.

getAccessToken()
Returns the `access_token` in the token response to the JWT bearer token request.

getGrantType()
Returns the grant type specified in the JWT bearer token request. The grant type value defaults to `urn:ietf:params:oauth:grant-type:jwt-bearer`.

getHttpResponse()
Returns the full `System.HttpResponse` token response to the JWT bearer token request.

getJWS()
Returns the JWS specified in the JWT bearer token request.

getTokenEndpoint()
Returns the token endpoint that the JWT bearer token request is POSTed to.

setGrantType(grantType)
Sets the grant type in the JWT bearer token request. Returned by the `getGrantType()` method.

setJWS(jws)
Sets the JWS in the JWT bearer token request. Returned by the `getJWS()` method.

setTokenEndpoint(tokenEndpoint)
Sets the token endpoint that the JWT bearer token request is POSTed to. Returned by the `getTokenEndpoint()` method.

`clone()`

Makes a duplicate copy of the JWTBearerTokenExchange object.

Signature

```
public Object clone()
```

Return Value

Type: JWTBearerTokenExchange

`getAccessToken()`

Returns the `access_token` in the token response to the JWT bearer token request.

Signature

```
public String getAccessToken()
```

Return Value

Type: String

Usage

This method extracts the `access_token` from the token response. If the token response issues the access token in a different parameter, the request fails.

If you want the full HTTP token response returned, use `getHttpResponse` instead.

`getGrantType()`

Returns the grant type specified in the JWT bearer token request. The grant type value defaults to `urn:ietf:params:oauth:grant-type:jwt-bearer`.

Signature

```
public String getGrantType()
```

Return Value

Type: String

`getHttpResponse()`

Returns the full `System.HttpResponse` token response to the JWT bearer token request.

Signature

```
public System.HttpResponse getHttpResponse()
```

Return Value

Type: System.HttpResponse

Usage

You can get the access token from the full `System.HttpResponse`. If you want only the `access_token` from the token response, you can use `getAccessToken` instead.

`getJWS()`

Returns the JWS specified in the JWT bearer token request.

Signature

```
public Auth.JWS getJWS()
```

Return Value

Type: Auth.JWS

`getTokenEndpoint()`

Returns the token endpoint that the JWT bearer token request is POSTed to.

Signature

```
public String getTokenEndpoint()
```

Return Value

Type: String

setGrantType(grantType)

Sets the grant type in the JWT bearer token request. Returned by the `getGrantType()` method.

Signature

```
public void setGrantType(String grantType)
```

Parameters

grantType
Type: String

Return Value

Type: void

setJWS(jws)

Sets the JWS in the JWT bearer token request. Returned by the `getJWS()` method.

Signature

```
public void setJWS(Auth.JWS jws)
```

Parameters

jws
Type: Auth.JWS

Return Value

Type: void

setTokenEndpoint(tokenEndpoint)

Sets the token endpoint that the JWT bearer token request is POSTed to. Returned by the `getTokenEndpoint()` method.

Signature

```
public void setTokenEndpoint(String tokenEndpoint)
```

Parameters

tokenEndpoint
Type: String

Return Value

Type: void

LightningLoginEligibility Enum

Contains a Lightning Login eligibility value used by the `Auth.SessionManagement.getLightningLoginEligibility` method.

Usage

If you use the Discovery page type, users can verify themselves with Lightning Login. Lightning Login lets internal users log in with Salesforce Authenticator instead of a password. Certain conditions must be met for Lightning Login to succeed.

Call `Auth.SessionManagement.getLightningLoginEligibility` before or after a login attempt to get the eligibility status. You can call after a login attempt to determine why the login attempt failed.

Enum Values

The following are the values of the `Auth.LightningLoginEligibility` enum.

Value	Description
`ELIGIBLE`	All eligibility conditions are met. The admin has enabled Salesforce Authenticator and Lightning Login, assigned the user Lightning Login user permission, and selected **Allow only for users with the Lightning Login User permission** from the Session Settings Setup page. The user has set up Salesforce Authenticator and enrolled in Lightning Login.
`ORG_AUTHENTICATOR_NOT_ENABLED`	The admin hasn't enabled Salesforce Authenticator.
`ORG_PREF_NOT_ENABLED`	The admin hasn't enabled Lightning Login. The Admin must select **Allow Lightning Login** from the Session Settings Setup page.
`USER_AUTHENTICATOR_NOT_CONNECTED`	The user hasn't set up Salesforce Authenticator.
`USER_NOT_ALLOWED`	The admin hasn't granted the user AllowLightningLogin user permission. Allowing Lightning Login to certain users requires the OnlyLLPermUserAllowed org preference. Admins must select **Allow only for users with the Lightning Login User permission** from the Session Settings Setup page.
`USER_NOT_ENROLLED`	The user hasn't enrolled in Lightning Login.
`USER_PERM_NOT_ENABLED`	The admin hasn't granted the user the Lightning Login Eligible user permission.

LoginDiscoveryHandler Interface

Salesforce gives you the ability to log in users based on other verification methods than username and password. For example, it can prompt users to log in with their email, phone number, or another identifier like a Federation ID or device identifier. Login Discovery is available to these licenses: Customer Community, Customer Community Plus, External Identity, Partner Community, and Partner Community Plus.

Namespace

Auth

Usage

Implement a `Auth.LoginDiscoveryHandler` for an interview-based log in. The handler looks up a user from the identifier entered, and can call `Site.passwordlessLogin` to determine which credential to use, such as email or SMS. Or the handler can redirect a user to a third-party identity provider for login. With this handler, the login page doesn't show a password field. However, you can use `Site.passwordlessLogin` to then prompt for a password.

From the user perspective, the user enters an identifier at the log in prompt. Then the user completes the login by entering a PIN or password. Or, if SSO-enabled, the user bypasses login.

For an example, see LoginDiscoveryHandler Example Implementation. For more details, see Salesforce Customer Identity in *Salesforce Help*.

IN THIS SECTION:

LoginDiscoveryHandler Method

LoginDiscoveryHandler Example Implementation

LoginDiscoveryHandler Method

Here's the method for `LoginDiscoveryHandler`.

IN THIS SECTION:

login(identifier, startUrl, requestAttributes)
Log in the customer or partner given the specified identifier, such as email or phone number. If successful, redirect the user to the Experience Cloud site page specified by the start URL.

`login(identifier, startUrl, requestAttributes)`

Log in the customer or partner given the specified identifier, such as email or phone number. If successful, redirect the user to the Experience Cloud site page specified by the start URL.

Signature

```
public System.PageReference login(String identifier, String startUrl,
Map<String,String>requestAttributes)
```

Parameters

identifier
Type: String

Identifier the customer or partner entered at the login prompt, for example, an email address or phone number.

startUrl
Type: String

Path to the Experience Cloud site page requested by the customer or partner. The user is redirected to this location after successful login.

requestAttributes
Type: Map<String,String>

Information about the login request based on the user's browser state when accessing the login page. `requestAttributes` passes in the CommunityUrl, IpAddress, UserAgent, Platform, Application, City, Country, and Subdivision values. The City, Country, and Subdivision values come from IP geolocation.

Return Value

Type: System.PageReference

The URL of the page where the user is redirected.

Example

Here's a sample `requestAttributes` response.

```
CommunityUrl=http://my-developer-edition.mycompany.com:5555/discover
IpAddress=55.555.0.0
UserAgent=Mozilla/5.0 (Macintosh; Intel Mac OS X 10_13_4) AppleWebKit/605.1.15 (KHTML,
like Gecko) Version/11.1 Safari/605.1.15
Platform=Mac OSX
Application=Browser
City=San Mateo
Country=United States
Subdivision=California
```

LoginDiscoveryHandler Example Implementation

This Apex code example implements the `Auth.LoginDiscoveryHandler` interface. It checks whether the user who is logging in has a verified email or phone number, depending on which identifier was supplied on the login page. If verified, with `Auth.VerificationMethod.EMAIL` or `Auth.VerificationMethod.SMS`, we send a challenge to the identifier, either the user's email address or mobile device. If the user enters the code correctly on the verify page, the user is redirected to the Experience Cloud site's page specified by the start URL. If the user isn't verified, the user must enter a password to log in. The handler also checks that the email and phone number are unique with this code: `users.size()==1`.

Note: Passwordless login works only with verified methods. You can check the verification status on the User object, for example, with User list view, a report, or the API. Make sure that your solution handles the case where the user doesn't have a verification method. This code example falls back to a password.

The default discoverable login handler checks whether the user entered a valid email address or phone number before redirecting the user to the verification page. If an invalid entry is made, the handler returns an error. Because this behavior is vulnerable to user enumeration attack, make sure that your solution prevents this attack. For example, you can create a dummy page similar to

the verification page and redirect the user to the dummy page when invalid user identifier is entered. Also, use generic error messages to avoid providing additional information.

The `discoveryResult` function calls the `Site.passwordlessLogin` method to log the user in with the specified verification method. The `getSsoRedirect` function looks up whether the user logs in with SAML or an Auth Provider. Add the implementation-specific logic to handle the lookup.

```
global class AutocreatedDiscLoginHandler1535377170343 implements Auth.LoginDiscoveryHandler
 {

global PageReference login(String identifier, String startUrl, Map<String, String>
requestAttributes) {
    if (identifier != null && isValidEmail(identifier)) {
        // Search for user by email.
        List<User> users = [SELECT Id FROM User WHERE Email = :identifier AND IsActive =
TRUE];
        if (!users.isEmpty() && users.size() == 1) {
            // User must have a verified email before using this verification method.
            // We cannot send messages to unverified emails.
            // You can check if the user's email verified bit set and add the
            // password verification method as fallback.
            List<TwoFactorMethodsInfo> verifiedInfo = [SELECT HasUserVerifiedEmailAddress
 FROM TwoFactorMethodsInfo WHERE UserId = :users[0].Id];
            if (!verifiedInfo.isEmpty() && verifiedInfo[0].HasUserVerifiedEmailAddress ==
 true) {
                // Use email verification method if the user's email is verified.
                return discoveryResult(users[0], Auth.VerificationMethod.EMAIL, startUrl,
 requestAttributes);
            } else {
                // Use password verification method as fallback
                // if the user's email is unverified.
              return discoveryResult(users[0], Auth.VerificationMethod.PASSWORD, startUrl,
 requestAttributes);
            }
        } else {
            throw new Auth.LoginDiscoveryException('No unique user found. User count=' +
users.size());
        }
    }
    if (identifier != null) {
        String formattedSms = getFormattedSms(identifier);
        if (formattedSms != null) {

        }
    }
}
}
```

Code Example: Filter Login Discovery Users by Profile

Your production org can have multiple users with the same verified email address and mobile number. But your customers must have unique ones. To address this problem, you can add a few lines of code that filters users by profile to ensure uniqueness. This code example handles users with the External Identity User profile, but can be adapted to support other use cases. For example, you can modify the first line of code to address users with other user licenses or criteria.

Login Discovery is available with the following user licenses: Customer Community, Customer Community Plus, External Identity, Partner Community, and Partner Community Plus. It depends on which profiles have access to your Experience Cloud site.

```
global class AutocreatedDiscLoginHandler1551301979709 implements Auth.LoginDiscoveryHandler
 {

global PageReference login(String identifier, String startUrl, Map<String, String>
requestAttributes) {
    if (identifier != null && isValidEmail(identifier)) {
        // Ensure uniqueness by profile
        Profile p = [SELECT id FROM profile WHERE name = 'External Identity User'];
        List<User> users = [SELECT Id FROM User WHERE Email = :identifier AND IsActive =
TRUE AND profileId=:p.id];
        if (!users.isEmpty() && users.size() == 1) {
            // User must have verified email before using this verification method. We
```

```
cannot send messages to unverified emails.
            // You can check if the user has email verified bit on and add the password
verification method as fallback.
            List<TwoFactorMethodsInfo> verifiedInfo = [SELECT HasUserVerifiedEmailAddress
 FROM TwoFactorMethodsInfo WHERE UserId = :users[0].Id];
            if (!verifiedInfo.isEmpty() && verifiedInfo[0].HasUserVerifiedEmailAddress ==
 true) {
                // Use email verification method if the user's email is verified.
                return discoveryResult(users[0], Auth.VerificationMethod.EMAIL, startUrl,
 requestAttributes);
            } else {
                // Use password verification method as fallback if the user's email is
unverified.
              return discoveryResult(users[0], Auth.VerificationMethod.PASSWORD, startUrl,
 requestAttributes);
            }
        } else {
            throw new Auth.LoginDiscoveryException('No unique user found. User count=' +
users.size());
        }
    }
    if (identifier != null) {
        String formattedSms = getFormattedSms(identifier);
        if (formattedSms != null) {
            // Ensure uniqueness by profile
            Profile p = [SELECT id FROM profile WHERE name = 'External Identity User'];
            List<User> users = [SELECT Id FROM User WHERE MobilePhone = :formattedSms AND
 IsActive = TRUE AND profileId=:p.id];
            if (!users.isEmpty() && users.size() == 1) {
                // User must have verified SMS before using this verification method. We
cannot send messages to unverified mobile numbers.
               // You can check if the user has mobile verified bit on or add the password
 verification method as fallback.
              List<TwoFactorMethodsInfo> verifiedInfo = [SELECT HasUserVerifiedMobileNumber
 FROM TwoFactorMethodsInfo WHERE UserId = :users[0].Id];
               if (!verifiedInfo.isEmpty() && verifiedInfo[0].HasUserVerifiedMobileNumber
 == true) {
                   // Use SMS verification method if the user's mobile number is verified.

                  return discoveryResult(users[0], Auth.VerificationMethod.SMS, startUrl,
 requestAttributes);
                } else {
                    // Use password verification method as fallback if the user's mobile
number is unverified.
                    return discoveryResult(users[0], Auth.VerificationMethod.PASSWORD,
startUrl, requestAttributes);
                }
            } else {
               throw new Auth.LoginDiscoveryException('No unique user found. User count='
 + users.size());
            }
        }
    }
    if (identifier != null) {
```

```
        // You can customize the code to find user via other attributes, such as SSN or
Federation ID
    }
    throw new Auth.LoginDiscoveryException('Invalid Identifier');
}

private boolean isValidEmail(String identifier) {
    String emailRegex =
'^[a-zA-Z0-9._|\\\\%#~`=?&/$^*!}{+-]+@[a-zA-Z0-9.-]+\\.[a-zA-Z]{2,4}$';
    // source: https://www.regular-expressions.info/email.html

 returned for verification method: ' + method);
            }
        } else {
            throw new Auth.LoginDiscoveryException('No method found');
        }
    }
}
}
```

LoginDiscoveryMethod Enum

Contains methods used to verify the user's identity when the My Domain login process uses Login Discovery.

Usage

Specifies the verification method used to authenticate internal users when My Domain is set up for Login Discovery.

Enum Values

`Auth.LoginDiscoveryMethod` enum has the following values.

Value	Description
`LIGHTNING_LOGIN`	Verify identity by Lightning Login, which lets internal users log in with Salesforce Authenticator.
`PASSWORD`	Verify identity by entering a password.

MyDomainLoginDiscoveryHandler Interface

The handler used to implement the My Domain Login Discovery page, which is an interview-based (two-step) login process. First the user is prompted for a unique identifier such as an email address or phone number. Then the handler determines (discovers) how to authenticate the user. Either the user enters a password or is directed to an identity provider's login page.

Namespace

Auth

Usage

Implement `MyDomainLoginDiscoveryHandler` to let My Domain users log in with something other than their username and password. This handler contains the logic to look up the user based on the identifier value entered on the login page. The `Auth.MyDomainLoginDiscoveryHandler.login` method is invoked when the identifier page is submitted and finds the user that corresponds to the submitted identifier. The `Auth.SessionManagement.finishLoginDiscovery` method sends the user to the authentication mechanism and then logs in the user.

Register the handler from the My Domain Setup page. Under Authentication Configuration, select the **Discovery** Login Page Type. For Login Discovery Handler, select this handler from the list of Apex classes.

For an example, see MyDomainLoginDiscoveryHandler Example Implementation. For more details, search for My Domain Login Discovery in *Salesforce Help*.

IN THIS SECTION:

MyDomainLoginDiscoveryHandler Method

MyDomainLoginDiscoveryHandler Example Implementation

MyDomainLoginDiscoveryHandler Method

`MyDomainLoginDiscoveryHandler` has the following method.

IN THIS SECTION:

login(identifier, startUrl, requestAttributes)
Log in a Salesforce user given the specified identifier, such as email or phone number. If successful, redirect the user to the page specified by the start URL.

`login(identifier, startUrl, requestAttributes)`

Log in a Salesforce user given the specified identifier, such as email or phone number. If successful, redirect the user to the page specified by the start URL.

Signature

```
public System.PageReference login(String identifier, String startUrl, Map<String,String>
requestAttributes)
```

Parameters

`identifier`
Type: String

Identifier the Salesforce user entered at the login prompt, for example, an email address or phone number.

`startUrl`
Type: String

The page users see after successfully logging in to the My Domain subdomain.

`requestAttributes`
Type: Map <String, String>

Information about the login request based on the user's browser state when accessing the login page. `requestAttributes` passes in the MyDomainUrl, IpAddress, UserAgent, Platform, Application, City, Country, and Subdivision values. The City, Country, and Subdivision values come from IP address geolocation.

Return Value

Type: System.PageReference

The URL of the page where the user is redirected to complete authentication.

Example

Here's a sample `requestAttributes` response.

```
CommunityUrl=http://my-dev-ed.my.salesforce.com:5555/discover
IpAddress=55.255.0.0
UserAgent=Mozilla/5.0 (Macintosh; Intel Mac OS X 10_13_4) AppleWebKit/605.1.15 (KHTML,
like Gecko) Version/11.1 Safari/605.1.15
Platform=Mac OSX
Application=Browser
City=San Mateo
Country=United States
Subdivision=California
```

MyDomainLoginDiscoveryHandler Example Implementation

Here's an example of the `Auth.MyDomainLoginDiscoveryHandler` interface. This sample class contains the default logic for My Domain login discovery using password authentication. You can customize the code to ensure it meets your needs. The requestAttributes parameter provides additional information that you can use in the discovery logic. Attributes include MyDomainUrl, IpAddress, UserAgent, and location information (such as Country and City). Use `Auth.DiscoveryCustomErrorException` to throw custom errors to display on the login page.

To implement this interface, the My Domain login page type must be set to Discovery.

```
// This sample class contains the default logic for My Domain login discovery by password.
// You can customize the code to ensure it meets your needs. The requestAttributes parameter
// provides additional information you can use in the discovery logic. Attributes include MyDomainUrl,
// IpAddress, UserAgent, and location information (such as Country and City).
// Use Auth.DiscoveryCustomErrorException to throw custom errors which will be shown on login page.
 global class MyDomainDiscLoginDefaultHandler implements Auth.MyDomainLoginDiscoveryHandler {
 global PageReference login(String identifier, String startUrl, Map<String, String> requestAttributes)
{
   if (identifier != null) {
        // Search for user by email
       List<User> users = [SELECT Id FROM User WHERE Email = :identifier AND IsActive = TRUE];
        if (!users.isEmpty() && users.size() == 1) {
            return discoveryResult(users[0], startUrl, requestAttributes);
        } else {
          throw new Auth.LoginDiscoveryException('No unique user found. User count=' + users.size());
        }
    }
    throw new Auth.LoginDiscoveryException('Invalid Identifier');
  }
```

```
private PageReference getSsoRedirect(User user, String startUrl, Map<String, String> requestAttributes) {
   // You can look up if the user should log in with SAML or an Auth Provider and return the URL to initialize SSO. For example:
    // SamlSsoConfig SSO = [select Id from SamlSsoConfig where DeveloperName='SamlTest' limit 1];

    // To get the URL for a My Domain subdomain, you can pass null in the communityURL
parameter.
    // String ssoUrl = Auth.AuthConfiguration.getSamlSsoUrl(null, startUrl, SSO.Id);
    // return new PageReference(ssoUrl);
    return null;
  }

private PageReference discoveryResult(User user, String startUrl, Map<String, String> requestAttributes)

     {
     PageReference ssoRedirect = getSsoRedirect(user, startUrl, requestAttributes);
      if (ssoRedirect != null) {
        return ssoRedirect;
      }
      else {
      return Auth.SessionManagement.finishLoginDiscovery(Auth.LoginDiscoveryMethod.password, user.Id);
      }
   }
}
```

Test Class for MyDomainDiscLoginDefaultHandler Class

The following is the test class for MyDomainDiscoveryLoginHandler. For the test to work, your org must have the My Domain login page type set to Discovery.

```
// Test class for MyDomainDiscLoginDefaultHandler
@isTest
class MyDomainDiscLoginDefaultHandlerTest {
    /* Test Discoverable handler login.
       Create a user with specific email identifier and invoke login.
       Expected : User should be discovered and pagereference should be returned.
     */
    @isTest static void testLogin() {
        // Create user
        String identifierEmail = getUniqueName() + '@test.org';
        createTestUser(identifierEmail);
        Map<String, String> requestAttributes = new Map<String, String>();
        String startUrl = '';
      MyDomainDiscLoginDefaultHandler myDomainDiscLoginDefaultHandler = new MyDomainDiscLoginDefaultHandler();
        // Invoke login method from handler with the email of user created
     PageReference  pageReference = myDomainDiscLoginDefaultHandler.login(identifierEmail, startUrl, requestAttributes);
        // Asser page reference is returned
        System.assertNotEquals(null, pageReference, 'Page reference was not returned');
    }
    /* Test Discoverable handler login with invalid (non-existing) user.
       Expected : Auth.LoginDiscoveryException
     */
    @isTest static void testLoginWithInvalidUser() {
        try {
            Map<String, String> requestAttributes = new Map<String, String>();
```

```
            String startUrl = '';
            String uniqueName = getUniqueName();
            String email = uniqueName + '@test.org';
        MyDomainDiscLoginDefaultHandler myDomainDiscLoginDefaultHandler = new MyDomainDiscLoginDefaultHandler();
            // Invoke login method from handler with non-existing user
            myDomainDiscLoginDefaultHandler.login(email, startUrl, requestAttributes);
        }catch (Auth.LoginDiscoveryException loginDiscoveryException) {
            // Assert exception message
      System.assert(loginDiscoveryException.getMessage().contains('No unique user found'), 'message=' + loginDiscoveryException.getMessage());
        }
    }
    /*
       Generate a random name
     */
    private static String getUniqueName() {
        String orgId = UserInfo.getOrganizationId();
      String dateString = String.valueof(Datetime.now()).replace(' ','').replace(':','').replace('-','');
        Integer randomInt = Integer.valueOf(math.rint(math.random()*1000000));
        String uniqueName = orgId + dateString + randomInt;
        return uniqueName;
    }
    /*
      Create user with given email.
     */
    private static void createTestUser(String identifierEmail)
    {
        String uniqueName = getUniqueName();
        Profile pf = [SELECT Id FROM Profile WHERE Name='Standard User'];
        String profileID = pf.Id;
        String fName = 'fname';
        String lName = uniqueName + '-lname';
        User tuser = new User(  firstname = fName,
                                lastName = lName,
                                email = identifierEmail,
                                Username = uniqueName + '@test.org',
                                EmailEncodingKey = 'ISO-8859-1',
                                Alias = uniqueName.substring(18, 23),
                                TimeZoneSidKey = 'America/Los_Angeles',
                                LocaleSidKey = 'en_US',
                                LanguageLocaleKey = 'en_US',
                                ProfileId = profileID);
        insert tuser;
    }
}
```

OAuthRefreshResult Class

Stores the result of an `AuthProviderPluginClass` refresh method. OAuth authentication flow provides a refresh token that can be used to get a new access token. Access tokens have a limited lifetime as specified by the session timeout value. When an access token expires, use a refresh token to get a new access token.

Namespace

Auth

Usage

The `OAuthRefreshResult` class contains the parameters, `accessToken`, `refreshToken`, and `error`, all of which are of type `string`. For a code example, see .

IN THIS SECTION:

OAuthRefreshResult Constructors

OAuthRefreshResult Properties

OAuthRefreshResult Constructors

The following are constructors for `OAuthRefreshResult`.

IN THIS SECTION:

OAuthRefreshResult(accessToken, refreshToken, error)

Creates an instance of the `OAuthRefreshResult` class using the specified access token, refresh token, and error for a custom authentication provider plug-in.

OAuthRefreshResult(accessToken, refreshToken)

Creates an instance of the `OAuthRefreshResult` class using the specified access token and refresh token for a custom authentication provider plug-in. Use this method when you know that the refresh was successful.

`OAuthRefreshResult(accessToken, refreshToken, error)`

Creates an instance of the `OAuthRefreshResult` class using the specified access token, refresh token, and error for a custom authentication provider plug-in.

Signature

```
public OAuthRefreshResult(String accessToken, String refreshToken, String error)
```

Parameters

`accessToken`
Type: String

OAuth access token for the user who is currently logged in.

`refreshToken`
Type: String

OAuth refresh token for the user who is currently logged in.

`error`
Type: String

Error that occurred when a user attempted to authenticate with the custom authentication provider.

`OAuthRefreshResult(accessToken, refreshToken)`

Creates an instance of the `OAuthRefreshResult` class using the specified access token and refresh token for a custom authentication provider plug-in. Use this method when you know that the refresh was successful.

Signature

```
public OAuthRefreshResult(String accessToken, String refreshToken)
```

Parameters

`accessToken`
Type: String

The OAuth access token for the user who is logged in.

`refreshToken`
Type: String

The OAuth refresh token for the user who is logged in.

OAuthRefreshResult Properties

The following are properties for `OAuthRefreshResult`.

IN THIS SECTION:

accessToken
The OAuth access token for the user who is currently logged in.

error
Error that occurs when a user unsuccessfully attempts to authenticate with the custom authentication provider.

refreshToken
The OAuth refresh token for the user who is currently logged in.

`accessToken`

The OAuth access token for the user who is currently logged in.

Signature

```
public String accessToken {get; set;}
```

Property Value

Type: String

`error`

Error that occurs when a user unsuccessfully attempts to authenticate with the custom authentication provider.

Signature

```
public String error {get; set;}
```

Property Value

Type: String

`refreshToken`

The OAuth refresh token for the user who is currently logged in.

Signature

```
public String refreshToken {get; set;}
```

Property Value

Type: String

RegistrationHandler Interface

Salesforce provides the ability to use an authentication provider, such as Facebook© or Janrain©, for single sign-on into Salesforce.

Namespace

Auth

Usage

To set up single sign-on, you must create a class that implements `Auth.RegistrationHandler`. Classes implementing the `Auth.RegistrationHandler` interface are specified as the `Registration Handler` in authentication provider definitions, and enable single sign-on into Salesforce portals and organizations from third-party services such as Facebook. Using information from the authentication providers, your class must perform the logic of creating and updating user data as appropriate, including any associated account and contact records.

Note: During the user update process, you can use the `confirmUser()` method to ensure that users are correctly mapped between Salesforce and the third party. For more information, see the ConfirmUserRegistrationHandler Interface.

IN THIS SECTION:

RegistrationHandler Methods

Storing User Information and Getting Access Tokens

Auth.RegistrationHandler Example Implementation

Auth.RegistrationHandler Error Example

This example implements the `Auth.RegistrationHandler` interface and shows how to use a custom exception to display an error message in the URL of the page. If you don't use a custom exception, the error code and description appear in the URL and the error description appears on the page.

RegistrationHandler Methods

The following are methods for `RegistrationHandler`.

IN THIS SECTION:

createUser(portalId, userData)
Returns a User object using the specified portal ID and user information from the third party, such as the username and email address. The User object corresponds to the third party's user information and may be a new user that hasn't been inserted in the database or may represent an existing user record in the database.

updateUser(userId, portalId, userData)
Updates the specified user's information. This method is called if the user has logged in before with the authentication provider and then logs in again.

createUser(portalId, userData)

Returns a User object using the specified portal ID and user information from the third party, such as the username and email address. The User object corresponds to the third party's user information and may be a new user that hasn't been inserted in the database or may represent an existing user record in the database.

Signature

```
public User createUser(ID portalId, Auth.UserData userData)
```

Parameters

portalId
Type: ID

userData
Type: Auth.UserData

Return Value

Type: User

Usage

The *portalID* value may be null or an empty key if there is no portal configured with this provider.

updateUser(userId, portalId, userData)

Updates the specified user's information. This method is called if the user has logged in before with the authentication provider and then logs in again.

Signature

```
public Void updateUser(ID userId, ID portalId, Auth.UserData userData)
```

Parameters

userId
Type: ID

portalId
Type: ID

userData
Type: Auth.UserData

Return Value

Type: Void

Usage

The *portalID* value can be null or an empty key if there's no portal configured with this provider.

Storing User Information and Getting Access Tokens

The `Auth.UserData` class is used to store user information for `Auth.RegistrationHandler`. The third-party authentication provider can send back a large collection of data about the user, including their username, email address, locale, and so on. Frequently used data is converted into a common format with the `Auth.UserData` class and sent to the registration handler.

If the registration handler wants to use the rest of the data, the `Auth.UserData` class has an `attributeMap` variable. The attribute map is a map of strings (`Map<String, String>`) for the raw values of all the data from the third party. Because the map is `<String, String>`, values that the third party returns that aren't strings (like an array of URLs or a map) are converted into an appropriate string representation. The map includes everything returned by the third-party authentication provider, including the items automatically converted into the common format.

The constructor for `Auth.UserData` has the following syntax:

```
Auth.UserData(String identifier,
              String firstName,
              String lastName,
              String fullName,
              String email,
              String link,
              String userName,
              String locale,
              String provider,
              String siteLoginUrl,
              Map<String, String> attributeMap)
```

To learn about `Auth.UserData` properties, see Auth.UserData Class.

Note: You can only perform DML operations on additional sObjects in the same transaction with User objects under certain circumstances. For more information, see sObjects That Cannot Be Used Together in DML Operations.

For all authentication providers except Janrain, after a user is authenticated using a provider, the access token associated with that provider for this user can be obtained in Apex using the `Auth.AuthToken` Apex class. `Auth.AuthToken` provides two methods to retrieve access tokens. One is `getAccessToken`, which obtains a single access token. Use this method if the user ID is mapped to a single third-party user. If the user ID is mapped to multiple third-party users, use `getAccessTokenMap`, which returns a map

of access tokens for each third-party user. For more information about authentication providers, see Authentication Providers in *Salesforce Help*.

When using Janrain as an authentication provider, you must use the Janrain `accessCredentials` dictionary values to retrieve the access token or its equivalent. Only some providers supported by Janrain provide an access token, while other providers use other fields. The Janrain `accessCredentials` fields are returned in the `attributeMap` variable of the `Auth.UserData` class. See the Janrain `auth_info` documentation for more information on `accessCredentials`.

Note: Not all Janrain account types return `accessCredentials`. Sometimes you must change your account type to receive the information.

To learn about the `Auth.AuthToken` methods, see Auth.AuthToken Class.

Auth.RegistrationHandler Example Implementation

This example implements the `Auth.RegistrationHandler` interface that creates as well as updates a standard user based on data provided by the authentication provider. Error checking has been omitted to keep the example simple.

```
global class StandardUserRegistrationHandler implements Auth.RegistrationHandler{
global User createUser(Id portalId, Auth.UserData data){
    User u = new User();
    Profile p = [SELECT Id FROM profile WHERE name='Standard User'];
    u.username = data.username + '@salesforce.com';
    u.email = data.email;
    u.lastName = data.lastName;
    u.firstName = data.firstName;
    String alias = data.username;
    if(alias.length() > 8) {
        alias = alias.substring(0, 8);
    }
    u.alias = alias;
    u.languagelocalekey = data.attributeMap.get('language');
    u.localesidkey = data.locale;
    u.emailEncodingKey = 'UTF-8';
    u.timeZoneSidKey = 'America/Los_Angeles';
    u.profileId = p.Id;
    return u;
}

global void updateUser(Id userId, Id portalId, Auth.UserData data){
    User u = new User(id=userId);
    u.username = data.username + '@salesforce.com';
    u.email = data.email;
    u.lastName = data.lastName;
    u.firstName = data.firstName;
    String alias = data.username;
    if(alias.length() > 8) {
        alias = alias.substring(0, 8);
    }
    u.alias = alias;
    u.languagelocalekey = data.attributeMap.get('language');
    u.localesidkey = data.locale;
    update(u);
}
}
```

The following example tests the above code.

```
@isTest
private class StandardUserRegistrationHandlerTest {
static testMethod void testCreateAndUpdateUser() {
    StandardUserRegistrationHandler handler = new StandardUserRegistrationHandler();
    Auth.UserData sampleData = new Auth.UserData('testId', 'testFirst', 'testLast',
        'testFirst testLast', 'testuser@example.org', null, 'testuserlong', 'en_US',
'facebook',
        null, new Map<String, String>{'language' => 'en_US'});
    User u = handler.createUser(null, sampleData);
    System.assertEquals('testuserlong@salesforce.com', u.userName);
    System.assertEquals('testuser@example.org', u.email);
    System.assertEquals('testLast', u.lastName);
    System.assertEquals('testFirst', u.firstName);
    System.assertEquals('testuser', u.alias);
    insert(u);
    String uid = u.id;

    sampleData = new Auth.UserData('testNewId', 'testNewFirst', 'testNewLast',
        'testNewFirst testNewLast', 'testnewuser@example.org', null, 'testnewuserlong',
'en_US', 'facebook',
        null, new Map<String, String>{});
    handler.updateUser(uid, null, sampleData);

   User updatedUser = [SELECT userName, email, firstName, lastName, alias FROM user WHERE
 id=:uid];
    System.assertEquals('testnewuserlong@salesforce.com', updatedUser.userName);
    System.assertEquals('testnewuser@example.org', updatedUser.email);
    System.assertEquals('testNewLast', updatedUser.lastName);
    System.assertEquals('testNewFirst', updatedUser.firstName);
    System.assertEquals('testnewu', updatedUser.alias);
}
}
```

Auth.RegistrationHandler Error Example

This example implements the `Auth.RegistrationHandler` interface and shows how to use a custom exception to display an error message in the URL of the page. If you don't use a custom exception, the error code and description appear in the URL and the error description appears on the page.

To limit this example to the custom exception, some code was omitted.

```
global class RegHandler implements Auth.RegistrationHandler {

    class RegHandlerException extends Exception {}

        global User createUser(Id portalId, Auth.UserData data){
            List<Profile> profiles = [SELECT Id, Name, UserType FROM Profile WHERE Name =
 'Power User'];
            Profile profile = profiles.isEmpty() ? null : profiles[0];
            if(profile==null)
               throw new RegHandlerException('Cannot find the profile. For help, contact
your administrator.');
...
```

```
        }

        global void updateUser(Id userId, Id portalId, Auth.UserData data){
            User u = new User(id=userId);
            u.lastName = data.lastName;
            u.firstName = data.firstName;
            update(u);
        }
}
```

SamlJitHandler Interface

Use this interface to control and customize Just-in-Time user provisioning logic during SAML single sign-on.

Namespace

Auth

Usage

To use custom logic for user provisioning during SAML single sign-on, you must create a class that implements `Auth.SamlJitHandler`. This allows you to incorporate organization-specific logic (such as populating custom fields) when users log in to Salesforce with single sign-on. Keep in mind that your class must perform the logic of creating and updating user data as appropriate, including any associated account and contact records.

In Salesforce, you specify your class that implements this interface in the `SAML JIT Handler` field in SAML Single Sign-On Settings. Make sure that the user you specify to run the class has "Manage Users" permission.

The following are methods for `SamlJitHandler`.

IN THIS SECTION:

createUser(samlSsoProviderId, communityId, portalId, federationId, attributes, assertion)

Returns a User object using the specified Federation ID. The User object corresponds to the user information. This object can be a new user that hasn't been inserted in the database or an existing user record in the database.

updateUser(userId, samlSsoProviderId, communityId, portalId, federationId, attributes, assertion)

Updates the specified user's information. This method is called if the user has logged in before with SAML single sign-on and then logs in again, or if your application is using the `Existing User Linking URL`.

createUser(samlSsoProviderId, communityId, portalId, federationId, attributes, assertion)

Returns a User object using the specified Federation ID. The User object corresponds to the user information. This object can be a new user that hasn't been inserted in the database or an existing user record in the database.

Signature

```
public User createUser(Id samlSsoProviderId, Id communityId, Id portalId, String federationId, Map<String,String> attributes, String assertion)
```

Parameters

samlSsoProviderId
Type: Id

The ID of the SamlSsoConfig standard object.

communityId
Type: Id

The ID of the Experience Cloud site. This parameter can be `null` if you're not creating an Experience Cloud user.

portalId
Type: Id

The ID of the portal. This parameter can be `null` if you're not creating a portal user.

federationId
Type: String

The ID Salesforce expects to be used for this user.

attributes
Type: Map<String,String>

All attributes in the SAML assertion that were added to the default assertion; for example, custom attributes. Attributes are case-sensitive.

If the assertion is encrypted, the attribute map contains a decrypted assertion stored as a value with the key `Sfdc.SamlAssertion`.

assertion
Type: String

The default SAML assertion, base-64 encoded.

If the assertion is encrypted, this parameter is also encrypted. To access the decrypted assertion, see the `Sfdc.SamlAssertion` key in the attribute map.

Return Value

Type: User

A User sObject.

Usage

The *communityId* and *portalId* parameter values can be `null` or the associated keys can be empty if there's no Experience Cloud site or portal configured with this organization.

updateUser(userId, samlSsoProviderId, communityId, portalId, federationId, attributes, assertion)

Updates the specified user's information. This method is called if the user has logged in before with SAML single sign-on and then logs in again, or if your application is using the `Existing User Linking URL`.

Signature

```
public void updateUser(Id userId, Id samlSsoProviderId, Id communityId, Id portalId,
String federationId, Map<String,String> attributes, String assertion)
```

Parameters

userId
Type: Id

The ID of the Salesforce user.

samlSsoProviderId
Type: Id

The ID of the SamlSsoConfig object.

communityId
Type: Id

The ID of the Experience Cloud site. This type can be `null` if you're not updating an Experience Cloud user.

portalId
Type: Id

The ID of the portal. This type can be `null` if you're not updating a portal user.

federationId
Type: String

The ID Salesforce expects to be used for this user.

attributes
Type: Map<String,String>

All attributes in the SAML assertion that were added to the default assertion; for example, custom attributes. Attributes are case-sensitive.

If the assertion is encrypted, the attribute map also contains a decrypted assertion stored as a value with the key `Sfdc.SamlAssertion`.

assertion
Type: String

The default SAML assertion, base-64 encoded.

If the assertion is encrypted, this parameter is also encrypted. To access the decrypted assertion, see the `Sfdc.SamlAssertion` key in the attribute map.

Return Value

Type: void

SamlJitHandler Example Implementation

This is an example implementation of the `Auth.SamlJitHandler` interface. This code uses private methods to handle accounts and contacts (handleContact() and handleAccount()), which aren't included in this example.

```
global class StandardUserHandler implements Auth.SamlJitHandler {
    private class JitException extends Exception{}
    private void handleUser(boolean create, User u, Map<String, String> attributes,
        String federationIdentifier, boolean isStandard) {
        if(create && attributes.containsKey('User.Username')) {
            u.Username = attributes.get('User.Username');
        }
        if(create) {
            if(attributes.containsKey('User.FederationIdentifier')) {
                u.FederationIdentifier = attributes.get('User.FederationIdentifier');
            } else {
                u.FederationIdentifier = federationIdentifier;
            }
        }
        if(attributes.containsKey('User.ProfileId')) {
            String profileId = attributes.get('User.ProfileId');
            Profile p = [SELECT Id FROM Profile WHERE Id=:profileId];
            u.ProfileId = p.Id;
        }
        if(attributes.containsKey('User.UserRoleId')) {
            String userRole = attributes.get('User.UserRoleId');
            UserRole r = [SELECT Id FROM UserRole WHERE Id=:userRole];
            u.UserRoleId = r.Id;
        }
        if(attributes.containsKey('User.Phone')) {
            u.Phone = attributes.get('User.Phone');
        }
        if(attributes.containsKey('User.Email')) {
            u.Email = attributes.get('User.Email');
        }

 //More attributes here - removed for length

        //Handle custom fields here

        if(!create) {
            update(u);
        }
    }

    private void handleJit(boolean create, User u, Id samlSsoProviderId, Id communityId,
Id portalId,
        String federationIdentifier, Map<String, String> attributes, String assertion) {
        if(communityId != null || portalId != null) {
            String account = handleAccount(create, u, attributes);
```

```
            handleContact(create, account, u, attributes);
            handleUser(create, u, attributes, federationIdentifier, false);
        } else {
            handleUser(create, u, attributes, federationIdentifier, true);
        }
    }

    global User createUser(Id samlSsoProviderId, Id communityId, Id portalId,
        String federationIdentifier, Map<String, String> attributes, String assertion) {
        User u = new User();
        handleJit(true, u, samlSsoProviderId, communityId, portalId,
            federationIdentifier, attributes, assertion);
        return u;
    }

    global void updateUser(Id userId, Id samlSsoProviderId, Id communityId, Id portalId,
        String federationIdentifier, Map<String, String> attributes, String assertion) {
        User u = [SELECT Id FROM User WHERE Id=:userId];
        handleJit(false, u, samlSsoProviderId, communityId, portalId,
            federationIdentifier, attributes, assertion);
    }
}
```

SessionManagement Class

Contains methods for verifying users' identity, creating custom login flows, customizing security levels, and defining trusted IP ranges for a current session.

Namespace

Auth

IN THIS SECTION:

SessionManagement Methods

SessionManagement Methods

The following are methods for `SessionManagement`. All methods are static. Use these methods to customize your user identity verification flows, manage the use of time-based one-time password (TOTP) apps like Google Authenticator, or create custom login flows. Other methods validate a user's incoming IP address against trusted IP range settings for an organization or profile.

IN THIS SECTION:

finishLoginDiscovery(method, userId)

Finishes the My Domain Login Discovery login process.

finishLoginFlow()

Finish the Visualforce Page login flow process, and redirect the user to the default home page.

finishLoginFlow(startUrl)

Finish the Visualforce Page login flow process, and redirect the user to the specified start URL.

generateVerificationUrl(policy, description, destinationUrl)

Initiates a user identity verification flow with the verification method that the user registered with, and returns a URL to the identity verification screen. For example, if you have a custom Visualforce page that displays sensitive account details, you can prompt the user to verify identity before viewing it.

getCurrentSession()

Returns a map of attributes for the current session.

getLightningLoginEligibility(userId)

Returns the eligibility status for a user who's logging in with Lightning Login when you set up your org with My Domain and use the Login Discovery page type. Use this method to redirect the user to a custom login flow. For example, use after a login attempt to redirect the user to password flow if the user is ineligible for Lightning Login.

getQrCode()

Returns a map containing a URL to a quick response (QR) code and a time-based one-time password (TOTP) shared secret to configure authenticator apps or devices for multi-factor authentication (MFA).

getRequiredSessionLevelForProfile(profileId)

Indicates the required login security session level for the given profile.

ignoreForConcurrentSessionLimit(sessions)

This method is reserved for internal Salesforce use.

inOrgNetworkRange(ipAddress)

Indicates whether the given IP address is within the organization's trusted IP range according to the organization's Network Access settings.

isIpAllowedForProfile(profileId, ipAddress)

Indicates whether the given IP address is within the trusted IP range for the given profile.

setSessionLevel(level)

Sets the user's current session security level.

validateTotpTokenForKey(sharedKey, totpCode)

Deprecated. Use `validateTotpTokenForKey(totpSharedKey, totpCode, description)` instead.

validateTotpTokenForKey(totpSharedKey, totpCode, description)

Indicates whether a time-based one-time password (TOTP) code (token) is valid for the given shared key.

validateTotpTokenForUser(totpCode)

Deprecated. Use `validateTotpTokenForUser(totpCode, description)` instead.

validateTotpTokenForUser(totpCode, description)

Indicates whether a time-based one-time password (TOTP) code (token) is valid for the current user.

verifyDeviceFlow(userCode, startUrl)

Verifies the user code entered during the device authentication flow and redirects users to the OAuth approval page. If users aren't logged in, they must log in. After successful login, users are prompted to allow the device to access Salesforce data.

`finishLoginDiscovery(method, userId)`

Finishes the My Domain Login Discovery login process.

Signature

```
public static System.PageReference finishLoginDiscovery(Auth.LoginDiscoveryMethod
method, Id userId)
```

Parameters

method

Type: Auth.LoginDiscoveryMethod LoginDiscoveryMethod Enum

Verification method used with My Domain Login Discovery.

userId

Type: Id

ID used to log in the user. The user must be active.

Return Value

Type: System.PageReference

Usage

Include this method when implementing the `MyDomainLoginDiscoveryHandler` interface to direct users to an authentication mechanism, and then log them in. If users enter a username in the login page, they are sent to the password page for authentication. If users are enrolled in Lightning Login, they are directed to the Salesforce Authenticator to authenticate. If users are SSO-enabled, they are sent to the suitable identity provider (IdP) to authenticate.

The calling user requires Manage Users permission. If the user passed in is frozen or inactive, the method throws an exception.

After implementing the `MyDomainLoginDiscoveryHandler` interface, register the Login Discovery handler from the My Domain Setup page. Under Authentication Configuration, select this handler from the list of Apex classes.

`finishLoginFlow()`

Finish the Visualforce Page login flow process, and redirect the user to the default home page.

Signature

```
public static System.PageReference finishLoginFlow()
```

Return Value

Type: System.PageReference

Usage

Include this method in the Apex controller of the Visualforce Page login flow when creating login flows programmatically. This method indicates that the login flow is finished and redirects the user to the Experience Cloud site's default home page. The login process runs in a restricted session until users complete the process. Calling this method indicates that the login flow is complete, lifts the restriction, and gives users full access to the Experience Cloud site.

`finishLoginFlow(startUrl)`

Finish the Visualforce Page login flow process, and redirect the user to the specified start URL.

Signature

```
public static System.PageReference finishLoginFlow(String startUrl)
```

Parameters

`startUrl`
Type: String

Path to the page that users see when they access the Experience Cloud site.

Return Value

Type: System.PageReference

Usage

Include this method in the Apex controller of the Visualforce Page login flow when creating login flows programmatically. This method indicates that the login flow is finished and redirects the user to the specified location in the Experience Cloud site. The login process runs in a restricted session until users complete the process. Calling this method indicates that the login flow is complete, lifts the restriction, and gives users full access to the Experience Cloud site.

`generateVerificationUrl(policy, description, destinationUrl)`

Initiates a user identity verification flow with the verification method that the user registered with, and returns a URL to the identity verification screen. For example, if you have a custom Visualforce page that displays sensitive account details, you can prompt the user to verify identity before viewing it.

Signature

```
public static String generateVerificationUrl(Auth.VerificationPolicy policy, String
description, String destinationUrl)
```

Parameters

`policy`
Type: Auth.VerificationPolicy

The session security policy required to initiate identity verification for the user's session. For example, if the policy is set to High Assurance level of session security, and the user's current session has the standard level of session security, the user's session is raised to high assurance after successful verification of identity. In the Setup user interface, this value is shown in the Triggered By column of Identity Verification History.

`description`
Type: String

The custom description that describes the activity requiring identity verification; for example, "Complete purchase and check out". This text appears to users when they verify their identity in Salesforce and, if they use Salesforce Authenticator version 2 or later, in

the Salesforce Authenticator mobile app. In addition, in the Setup user interface, this text is shown in the Activity Message column of Identity Verification History.

destinationUrl
Type: String

The relative or absolute Salesforce URL that you want to redirect the user to after identity verification—for example, `/apex/mypage`. The user is redirected to *destinationUrl* when the identity verification flow is complete, regardless of success. For example, if a user chooses to not respond to the identity challenge and cancels it, the user is still redirected to *destinationUrl*. As a best practice, ensure that your code for this page manually checks that the security policy was satisfied (and the user didn't just manually type the URL in the browser). For example, if the *policy* is High Assurance, the target page checks that the user's session is high assurance before allowing access.

Return Value

Type: String

The URL where the user is redirected to verify identity.

Usage

- If the user is already registered to confirm identity using a time-based one-time password (TOTP), then the user is redirected to the one-time password identity verification flow and asked to provide a code.
- If the user isn't registered with any verification method (such as one-time password or Salesforce Authenticator version 2 or later), the user is prompted to download and verify identity using Salesforce Authenticator. The user can also choose a different verification method.

getCurrentSession()

Returns a map of attributes for the current session.

Signature

```
public static Map<String, String> getCurrentSession()
```

Return Value

Type: Map<String, String>

Usage

The map includes a `ParentId` value, which is the 18-character ID for the parent session, if one exists (for example, if the current session is for a canvas app). If the current session doesn't have a parent, this value is null. The map also includes the `LogoutUrl` assigned to the current session.

If you create an Apex test method that calls this method, the test fails with an error such as, "Unexpected Exception: Current session unavailable." An error occurs because there isn't a session in the context through which the test is being run.

When a session is reused, Salesforce updates the `LoginHistoryId` with the value from the most recent login.

Example

The following example shows the name-value pairs in a map returned by `getCurrentSession()`. Note that `UsersId` includes an "s" in the name to match the name of the corresponding field in the AuthSession object.

```
{
SessionId=0Ak###############,
UserType=Standard,
ParentId=0Ak###############,
NumSecondsValid=7200,
LoginType=SAML Idp Initiated SSO,
LoginDomain=null,
LoginHistoryId=0Ya###############,
Username=user@domain.com,
CreatedDate=Wed Jul 30 19:09:29 GMT 2014,
SessionType=Visualforce,
LastModifiedDate=Wed Jul 30 19:09:16 GMT 2014,
LogoutUrl=https://google.com,
SessionSecurityLevel=STANDARD,
UsersId=005###############,
SourceIp=1.1.1.1
}
```

`getLightningLoginEligibility(userId)`

Returns the eligibility status for a user who's logging in with Lightning Login when you set up your org with My Domain and use the Login Discovery page type. Use this method to redirect the user to a custom login flow. For example, use after a login attempt to redirect the user to password flow if the user is ineligible for Lightning Login.

Signature

```
public static Auth.LightningLoginEligibility getLightningLoginEligibility(Id userId)
```

Parameters

userId
Type: Id

ID of the user who is logging in.

Return Value

Type: Auth.LightningLoginEligibility

Returns the current eligibility status.

Example

```
Auth.LightningLoginEligibility eligibility =
    Auth.SessionManagement.getLightningLoginEligibility(id);
if (eligibility == Auth.LightningLoginEligibility.ELIGIBLE) {
    // success
}
```

getQrCode()

Returns a map containing a URL to a quick response (QR) code and a time-based one-time password (TOTP) shared secret to configure authenticator apps or devices for multi-factor authentication (MFA).

Signature

```
public static Map<String, String> getQrCode()
```

Return Value

Type: Map<String, String>

Usage

The QR code encodes the returned secret as well as the current user's username. The keys are `qrCodeUrl` and `secret`. Calling this method does not change any state for the user, nor does it read any state from the user. This method returns a brand new secret every time it is called, does not save that secret anywhere, and does not validate the TOTP token. The admin must explicitly save the values for the user after verifying a TOTP token with the secret.

The `secret` is a base32-encoded string of a 20-byte shared key.

Example

The following is an example of how to request the QR code.

```
public String getGetQRCode() {
        return getQRCode();
    }
    public String getQRCode() {
       Map<String, String> codeResult = Auth.SessionManagement.getQrCode();
       String result = 'URL: '+codeResult.get('qrCodeUrl') + ' SECRET:  ' +
codeResult.get('secret');
       return result;
    }
```

The following is an example of a returned map.

```
{qrCodeUrl=https://www.salesforce.com/secur/qrCode?w=200&h=200&t=tf&u=user%0000000000.com&s=AAAAA7B5BBBB5AAAAAAA66BBBB,

      secret=AAAAA7B5AAAAAA5BBBBBBBBB66AAA}
```

getRequiredSessionLevelForProfile(profileId)

Indicates the required login security session level for the given profile.

Signature

```
public static Auth.SessionLevel getRequiredSessionLevelForProfile(String profileId)
```

Parameters

profileId
Type: String

The 15-character profile ID.

Return Value

Type: Auth.SessionLevel

The session security level required at login for the profile with the ID *profileId*. You can customize the assignment of each level in Session Settings. For example, you can set the High Assurance level to apply only to users who authenticated with multi-factor authentication (MFA) or through a specific identity provider.

ignoreForConcurrentSessionLimit(sessions)

This method is reserved for internal Salesforce use.

Signature

```
public static Map<String,String> ignoreForConcurrentSessionLimit(Object sessions)
```

Parameters

sessions
Type: Object

Return Value

Type: Map<String, String>

inOrgNetworkRange(ipAddress)

Indicates whether the given IP address is within the organization's trusted IP range according to the organization's Network Access settings.

Signature

```
public static Boolean inOrgNetworkRange(String ipAddress)
```

Parameters

ipAddress
Type: String

The IP address to validate.

Return Value

Type: Boolean

Usage

If a trusted IP range is not defined, this returns `false`, and throws an exception if the IP address is not valid.

Trusted IP Range Exists?	User is in the Trusted IP Range?	Return Value
Yes	Yes	`true`
Yes	No	`false`
No	N/A	`false`

`isIpAllowedForProfile(profileId, ipAddress)`

Indicates whether the given IP address is within the trusted IP range for the given profile.

Signature

```
public static Boolean isIpAllowedForProfile(String profileId, String ipAddress)
```

Parameters

`profileId`
Type: String

The 15-character alphanumeric string for the current user's profile ID.

`ipAddress`
Type: String

The IP address to validate.

Return Value

Type: Boolean

Usage

If a trusted IP range is not defined, this returns `true`, and throws an exception if the IP address is not valid or if the profile ID is not valid.

Trusted IP Range Exists?	User is in the Trusted IP Range?	Return Value
Yes	Yes	`true`
Yes	No	`false`
No	N/A	`true`

`setSessionLevel(level)`

Sets the user's current session security level.

Signature

```
public static Void setSessionLevel(Auth.SessionLevel level)
```

Parameters

level
Type: Auth.SessionLevel

The session security level to assign to the user. The meaning of each level can be customized in the Session Settings for each organization, such as setting the High Assurance level to apply only to users who authenticated with multi-factor authentication (MFA) or through a specific identity provider.

Return Value

Type: Void

Usage

This setting affects the session level of all sessions associated with the current session, such as Visualforce or UI access.

If you create an Apex test method that calls this method, the test fails with an error such as, "Unexpected Exception: Current session unavailable." An error occurs because there isn't a session in the context through which the test is being run.

Example

The following is an example class for setting the session level.

```
public class RaiseSessionLevel{
    public void setLevelHigh() {
        Auth.SessionManagement.setSessionLevel(Auth.SessionLevel.HIGH_ASSURANCE);
    }
    public void setLevelStandard() {
        Auth.SessionManagement.setSessionLevel(Auth.SessionLevel.STANDARD);
    }
}
```

validateTotpTokenForKey(sharedKey, totpCode)

Deprecated. Use `validateTotpTokenForKey(totpSharedKey, totpCode, description)` instead.

Signature

```
public static Boolean validateTotpTokenForKey(String sharedKey, String totpCode)
```

Parameters

sharedKey
Type: String

The shared (secret) key. The *sharedKey* must be a base32-encoded string of a 20-byte shared key.

totpCode
Type: String

The time-based one-time password (TOTP) code to validate.

Return Value

Type: Boolean

Usage

If the key is invalid or doesn't exist, this method throws an invalid parameter value exception or a no data found exception, respectively. If the current user exceeds the maximum of 10 token validation attempts, this method throws a security exception.

validateTotpTokenForKey(totpSharedKey, totpCode, description)

Indicates whether a time-based one-time password (TOTP) code (token) is valid for the given shared key.

Signature

```
public static Boolean validateTotpTokenForKey(String totpSharedKey, String totpCode,
String description)
```

Parameters

totpSharedKey
Type: String

The shared (secret) key. The *totpSharedKey* must be a base32-encoded string of a 20-byte shared key.

totpCode
Type: String

The time-based one-time password (TOTP) code to validate.

description
Type: String

The custom description that describes the activity requiring identity verification; for example, "Complete purchase and check out". In the Setup user interface, this text is shown in the Activity Message column of Identity Verification History. The *description* must be 128 characters or fewer. If you provide a value that's longer, it's truncated to 128 characters.

Return Value

Type: Boolean

Usage

If the key is invalid or doesn't exist, this method throws an invalid parameter value exception or a no data found exception, respectively. If the current user exceeds the maximum of 10 token validation attempts, this method throws a security exception.

validateTotpTokenForUser(totpCode)

Deprecated. Use `validateTotpTokenForUser(totpCode, description)` instead.

Signature

```
public static Boolean validateTotpTokenForUser(String totpCode)
```

Parameters

totpCode
Type: String

The time-based one-time password (TOTP) code to validate.

Return Value

Type: Boolean

Usage

If the current user does not have a TOTP code, this method throws an exception. If the current user has attempted too many validations, this method throws an exception.

validateTotpTokenForUser(totpCode, description)

Indicates whether a time-based one-time password (TOTP) code (token) is valid for the current user.

Signature

```
public static Boolean validateTotpTokenForUser(String totpCode, String description)
```

Parameters

totpCode
Type: String

The time-based one-time password (TOTP) code to validate.

description
Type: String

The custom description that describes the activity requiring identity verification; for example, "Complete purchase and check out". This text appears to users when they verify their identity in Salesforce and, if they use Salesforce Authenticator version 2 or later, in the Salesforce Authenticator mobile app. In addition, in the Setup user interface, this text is shown in the Activity Message column of Identity Verification History. The *description* must be 128 characters or fewer. If you provide a value that's longer, it's truncated to 128 characters.

Return Value

Type: Boolean

Usage

If the current user does not have a TOTP code, or if the current user has attempted too many validations, this method throws an exception.

verifyDeviceFlow(userCode, startUrl)

Verifies the user code entered during the device authentication flow and redirects users to the OAuth approval page. If users aren't logged in, they must log in. After successful login, users are prompted to allow the device to access Salesforce data.

Signature

```
public static System.PageReference verifyDeviceFlow(String userCode, String startUrl)
```

Parameters

userCode
Type: String

Human-readable user code provided to the user by Salesforce. The user must enter this code at the verification URL to approve device access to Salesforce data.

startURL
Type: String

The URL for the page that the user is redirected to after successful login and approval of the device to access Salesforce data. If you don't specify a start URL, the user is redirected to the Home page.

Return Value

Type:System.PageReference

Usage

Include this method in the Apex controller when creating a custom Visualforce User Code Verification page for the OAuth 2.0 device authentication flow. This method verifies the user code, prompts the user to log in as needed, and prompts the user to allow the device access to Salesforce data. Upon successful verification and authentication, the user is redirected to the page defined by the start URL.

SessionLevel Enum

An `Auth.SessionLevel` enum value is used by the `SessionManagement.setSessionLevel` method.

Namespace

Auth

Enum Values

Value	Description
`LOW`	The user's security level for the current session meets the lowest requirements. Note: This low level is not available, nor used, in the Salesforce UI. User sessions through the Salesforce UI are either standard or high assurance. You can set this level using the API, but users assigned this level will experience unpredictable and reduced functionality in their Salesforce organization.
`STANDARD`	The user's security level for the current session meets the Standard requirements set in the current organization Session Security Levels.
`HIGH_ASSURANCE`	The user's security level for the current session meets the High Assurance requirements set in the current organization Session Security Levels.

Usage

With session-level security, you control user access to features that support it, such as connected apps and reporting. For example, you can customize an organization's Session Settings to require users to log in with multi-factor authentication (MFA) to get a High Assurance session. Then, you can restrict access to a specific connected app by requiring a High Assurance session level in the settings for the connected app.

UserData Class

Stores user information for `Auth.RegistrationHandler`.

Namespace

Auth

IN THIS SECTION:

UserData Constructors

UserData Properties

UserData Constructors

The following are constructors for `UserData`.

IN THIS SECTION:

UserData(identifier, firstName, lastName, fullName, email, link, userName, locale, provider, siteLoginUrl, attributeMap)
Creates a new instance of the `Auth.UserData` class using the specified arguments.

`UserData(identifier, firstName, lastName, fullName, email, link, userName, locale, provider, siteLoginUrl, attributeMap)`

Creates a new instance of the `Auth.UserData` class using the specified arguments.

Signature

```
public UserData(String identifier, String firstName, String lastName, String fullName,
String email, String link, String userName, String locale, String provider, String
siteLoginUrl, Map<String,String> attributeMap)
```

Parameters

identifier
Type: String

An identifier from the third party for the authenticated user, such as the Facebook user number or the Salesforce user ID.

firstName
Type: String

The first name of the authenticated user, according to the third party.

lastName
Type: String

The last name of the authenticated user, according to the third party.

fullName
Type: String

The full name of the authenticated user, according to the third party.

email
Type: String

The email address of the authenticated user, according to the third party.

link
Type: String

A stable link for the authenticated user such as `https://www.facebook.com/MyUsername`.

userName
Type: String

The username of the authenticated user in the third party.

locale
Type: String

The standard locale string for the authenticated user.

provider
Type: String

The service used to log in, such as Facebook or Janrain.

siteLoginUrl
Type: String

The site login page URL passed in if used with a site; `null` otherwise.

attributeMap
Type: Map<String, String>

A map of data from the third party, in case the handler has to access non-standard values. For example, when using Janrain as a provider, the fields Janrain returns in its `accessCredentials` dictionary are placed into the `attributeMap`. These fields vary by provider.

UserData Properties

The following are properties for `UserData`.

IN THIS SECTION:

identifier
An identifier from the third party for the authenticated user, such as the Facebook user number or the Salesforce user ID.

firstName
The first name of the authenticated user, according to the third party.

lastName
The last name of the authenticated user, according to the third party.

fullName
The full name of the authenticated user, according to the third party.

email
The email address of the authenticated user, according to the third party.

link
A stable link for the authenticated user such as `https://www.facebook.com/MyUsername`.

username
The username of the authenticated user in the third party.

locale
The standard locale string for the authenticated user.

provider
The service used to log in, such as Facebook or Janrain.

siteLoginUrl
The site login page URL passed in if used with a site; `null` otherwise.

attributeMap
A map of data from the third party, in case the handler has to access non-standard values. For example, when using Janrain as a provider, the fields Janrain returns in its `accessCredentials` dictionary are placed into the `attributeMap`. These fields vary by provider.

identifier

An identifier from the third party for the authenticated user, such as the Facebook user number or the Salesforce user ID.

Signature

```
public String identifier {get; set;}
```

Property Value

Type: String

firstName

The first name of the authenticated user, according to the third party.

Signature

```
public String firstName {get; set;}
```

Property Value

Type: String

lastName

The last name of the authenticated user, according to the third party.

Signature

```
public String lastName {get; set;}
```

Property Value

Type: String

`fullName`

The full name of the authenticated user, according to the third party.

Signature

```
public String fullName {get; set;}
```

Property Value

Type: String

`email`

The email address of the authenticated user, according to the third party.

Signature

```
public String email {get; set;}
```

Property Value

Type: String

`link`

A stable link for the authenticated user such as `https://www.facebook.com/MyUsername`.

Signature

```
public String link {get; set;}
```

Property Value

Type: String

`username`

The username of the authenticated user in the third party.

Signature

```
public String username {get; set;}
```

Property Value

Type: String

`locale`

The standard locale string for the authenticated user.

Signature

```
public String locale {get; set;}
```

Property Value

Type: String

`provider`

The service used to log in, such as Facebook or Janrain.

Signature

```
public String provider {get; set;}
```

Property Value

Type: String

`siteLoginUrl`

The site login page URL passed in if used with a site; `null` otherwise.

Signature

```
public String siteLoginUrl {get; set;}
```

Property Value

Type: String

`attributeMap`

A map of data from the third party, in case the handler has to access non-standard values. For example, when using Janrain as a provider, the fields Janrain returns in its `accessCredentials` dictionary are placed into the `attributeMap`. These fields vary by provider.

Signature

```
public Map<String, String> attributeMap {get; set;}
```

Property Value

Type: Map<String, String>

VerificationMethod Enum

Contains the different ways users can identify themselves when logging in. You can use it to implement mobile-centric passwordless login pages and to self-register (and deregister) verification methods.

Usage

The enum value is an argument in `System.Site.passwordlessLogin`, `System.UserManagement.registerVerificationMethod`, and `System.UserManagement.deregisterVerificationMethod` on page 3361 methods. The value indicates the method used to verify a user's identity.

Enum Values

The following are the values of the `Auth.VerificationMethod` enum.

Value	Description
`EMAIL`	Identity verified with a verification code sent in an email message.
`PASSWORD`	Identity verified with a password.
`SALESFORCE_AUTHENTICATOR`	Identity verified by Salesforce Authenticator.
`SMS`	Identity verified with a verification code sent via SMS message.
`TOTP`	Identity verified with a time-based one-time password (TOTP).
`U2F`	Identity verified by a U2F physical security key, such as a YubiKey.

VerificationPolicy Enum

The `Auth.VerificationPolicy` enum contains an identity verification policy value used by the `SessionManagement.generateVerificationUrl` method.

Usage

The enum value is an argument in the `SessionManagement.generateVerificationUrl` method. The value indicates the session security policy required to initiate identity verification for the user's session.

Enum Values

The `Auth.VerificationPolicy` enum has this value.

Value	Description
`HIGH_ASSURANCE`	The security level for the user's current session must be High Assurance.

VerificationResult Class

Contains the result of a verification challenge that you invoke when you create your own Verify page. The challenge can be initiated by either the `System.UserManagement.verifyPasswordlessLogin` or `System.UserManagement.verifySelfRegistration` method.

Namespace

Auth

Usage

When users sign up for or log in to your Experience Cloud site with an email address or phone number, Salesforce sends them a verification code. At the same time, Salesforce generates the Verify page for users to enter the code to verify their identity. You can replace the Salesforce-generated Verify page with one that you create with Visualforce. Then invoke the verification challenge and, if the verification code is entered correctly, log in the user. For sign-up, you use the `System.UserManagement.verifySelfRegistration` method. For passwordless login, you use the System.UserManagement.verifyPasswordlessLogin method. The methods return the verification result, which contains the message displayed as a result of the challenge. This message also indicates whether the challenge is successful and where to direct the user when the verification code is entered correctly.

Example

This code contains the result of a verification challenge that registers a new user.

```
String id = System.UserManagement.initSelfRegistration
          (Auth.VerificationMethod.SMS, user);
        Auth.VerificationResult res = System.UserManagement.verifySelfRegistration
          (Auth.VerificationMethod.SMS, id, '123456', null);
        if(res.success == true){
     //redirect
}
```

IN THIS SECTION:

- VerificationResult Constructor
- VerificationResult Properties
- VerificationResult Method

VerificationResult Constructor

`VerificationResult` has the following constructor.

IN THIS SECTION:

VerificationResult(redirect, success, message)

Creates an instance of the `VerificationResult` class that contains the verification result from `System.UserManagement.verifySelfRegistration`.

`VerificationResult(redirect, success, message)`

Creates an instance of the `VerificationResult` class that contains the verification result from `System.UserManagement.verifySelfRegistration`.

Signature

```
public VerificationResult(System.PageReference redirect, Boolean success, String message)
```

Parameters

`redirect`
Type: System.PageReferenceSystem.PageReference

Where user is directed upon successful verification.

`success`
Type: Boolean

Indicates whether verification succeeded.

`message`
Type: String

Message that displays as a result of a verification challenge.

VerificationResult Properties

The following are properties for `VerificationResult`.

IN THIS SECTION:

message

Message that displays as a result of a verification challenge. SUCCESS if the identity verification is successful. Other values are FAILURE, PENDING, RATE_LIMITED, or FAILURE_REPORT.

redirect

Where the user is directed after entering the verification code successfully, for example, the Experience Cloud site's home page or location specified by the start URL.

success

The verification challenge is successful.

`message`

Message that displays as a result of a verification challenge. SUCCESS if the identity verification is successful. Other values are FAILURE, PENDING, RATE_LIMITED, or FAILURE_REPORT.

Signature

```
public String message {get; set;}
```

Property Value

Type: String

redirect

Where the user is directed after entering the verification code successfully, for example, the Experience Cloud site's home page or location specified by the start URL.

Signature

```
public System.PageReference redirect {get; set;}
```

Property Value

Type: System.PageReferenceSystem.PageReference

success

The verification challenge is successful.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

VerificationResult Method

`VerificationResult` has the following method.

IN THIS SECTION:

clone()
Duplicates the Auth.VerificationResult object.

clone()

Duplicates the Auth.VerificationResult object.

Signature

```
public Object clone()
```

Return Value

Type: VerificationResult

Auth Exceptions

The `Auth` namespace contains some exception classes.

All exception classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions.

The `Auth` namespace contains the following exception.

Exception	Description
`Auth.AuthProviderPluginException`	Throw this exception to indicate that an error occurred when using the auth provider plug-in. Use to display a custom error message to the user. To get the error message and write it to debug log, use the `String getMessage()`.
`Auth.ConnectedAppPluginException`	Throw this exception to indicate that an error occurred while running the custom behavior for a connected app. To get the error message and write it to debug log, use the `String getMessage()`.
`Auth.DiscoveryCustomErrorException`	Throw this exception to customize error messages that appear on Discovery logins and Configurable Self-Registration pages. An error message can have up to 200 characters. Use custom error exceptions to localize error messages. Include this exception in: • `Auth.MyDomainLoginDiscoveryHandler` to show a custom error message on the My Domain login page • `Auth.LoginDiscoveryHandler` to show an error message on the Experience Cloud site login page • `Auth.ConfigurableSelfRegHandler` to show an error message on the Experience Cloud site self-registration Verify page The Verify page shows up if you configured self-registration with either an **Email** or **Text Message** verification method. If you didn't set up sign-up with a verification method, the error message appears on the self-registration page. To get the error message and write it to debug log, use the `String getMessage()`.
`Auth.JWTBearerTokenExchange.JWTBearerTokenExchangeException`	Throw this exception to indicate a problem with the response from the token endpoint in the JWTBearerTokenExchange class. This exception occurs during the OAuth 2.0 JWT bearer token flow when the HTTP response: • Fails to return an access token • Isn't in JSON format • Returns a response code other than a 200 "OK" success code To get the error message and write it to debug log, use the `String getMessage()`.
`Auth.LoginDiscoveryException`	Throw this exception to indicate that an error occurred when executing the Login Discovery handler. For an example, see LoginDiscoveryHandler Example Implementation. To get the error message and write it to debug log, use the `String getMessage()`.
`Auth.VerificationException`	Throw this exception to trigger verification based on the passed-in policy. You can throw this exception in an Apex trigger or Visualforce controller. The system automatically sends you to the verification endpoint, if possible. Note: You can't catch this exception. The exception immediately triggers the verification.

Examples

This example uses `AuthProviderPluginException` to throw a custom exception in a custom authentication provider implementation. Use this exception if you want the end user to see a specific message, passing in the error message as a parameter. If you use another exception, users see a standard Salesforce error message.

```
global override Auth.OAuthRefreshResult refresh(Map<string,string>
authProviderConfiguration,String refreshToken){
            HttpRequest req = new HttpRequest();
            String accessToken = null;
            String error  = null;
            try {

            // DEVELOPER TODO: Make a refresh token flow using refreshToken passed
            // in as an argument to get the new access token
            // accessToken = ...
            } catch (System.CalloutException e) {
            error = e.getMessage();
            }
            catch(Exception e) {
            error = e.getMessage();
            throw new Auth.AuthProviderPluginException('My custom error');
            }

            return new Auth.OAuthRefreshResult(accessToken,refreshToken, error);

            }
```

This example uses `Auth.VerificationException` to trigger verification if a user attempts to create an account without a high assurance session.

```
trigger testTrigger on Account (before insert) {
    Map<String, String> sessionMap = auth.SessionManagement.getCurrentSession();
    if(!sessionMap.get('SessionSecurityLevel').equals('HIGH_ASSURANCE')) {
        throw new Auth.VerificationException(
            Auth.VerificationPolicy.HIGH_ASSURANCE, 'Insert Account');
    }
}
```

Cache Namespace

The `Cache` namespace contains methods for managing the platform cache.

The following are the classes in the `Cache` namespace.

IN THIS SECTION:

CacheBuilder Interface

An interface for safely retrieving and removing values from a session or org cache. Use the interface to generate a value that you want to store in the cache. The interface checks for cache misses, which means you no longer need to check for null cache values yourself.

Org Class

Use the `Cache.Org` class to add, retrieve, and manage values in the org cache. Unlike the session cache, the org cache is not tied to any session and is available to the organization across requests and to all users.

OrgPartition Class

Contains methods to manage cache values in the org cache of a specific partition. Unlike the session cache, the org cache is not tied to any session. It's available to the organization across requests and to all users.

Partition Class

Base class of `Cache.OrgPartition` and `Cache.SessionPartition`. Use the subclasses to manage the cache partition for org caches and session caches.

Session Class

Use the `Cache.Session` class to add, retrieve, and manage values in the session cache. The session cache is active as long as the user's Salesforce session is valid (the user is logged in, and the session is not expired).

SessionPartition Class

Contains methods to manage cache values in the session cache of a specific partition.

Cache Exceptions

The `Cache` namespace contains exception classes.

Visibility Enum

Use the `Cache.Visibility` enumeration in the `Cache.Session` or `Cache.Org` methods to indicate whether a cached value is visible only in the value's namespace or in all namespaces.

SEE ALSO:

Apex Developer Guide: Platform Cache

CacheBuilder Interface

An interface for safely retrieving and removing values from a session or org cache. Use the interface to generate a value that you want to store in the cache. The interface checks for cache misses, which means you no longer need to check for null cache values yourself.

Namespace

Cache

IN THIS SECTION:

CacheBuilder Methods

CacheBuilder Example Implementation

SEE ALSO:

Apex Developer Guide: Safely Cache Values with the CacheBuilder Interface

CacheBuilder Methods

The following are methods for `CacheBuilder`.

IN THIS SECTION:

doLoad(var)
Contains the logic that builds a cached value. You don't call this method directly. Instead, it's called indirectly when you reference the class that implements the `CacheBuilder` interface.

doLoad(var)

Contains the logic that builds a cached value. You don't call this method directly. Instead, it's called indirectly when you reference the class that implements the `CacheBuilder` interface.

Signature

```
public Object doLoad(String var)
```

Parameters

var

Type: String

A case-sensitive string value used to build a cached value. This parameter is also used as part of the unique key that identifies the cached value.

Return Value

Type: Object

The value that was cached. Cast the return value to the appropriate type.

CacheBuilder Example Implementation

This example creates a class called `UserInfoCache` that implements the `CacheBuilder` interface. The class caches the results of a SOQL query run against the User object.

```
class UserInfoCache implements Cache.CacheBuilder {
    public Object doLoad(String userid) {
        User u = (User)[SELECT Id, IsActive, username FROM User WHERE id =: userid];
        return u;
    }
}
```

This example gets a cached User record based on a user ID. If the value exists in the org cache, it is returned. If the value doesn't exist, the `doLoad(String var)` method is re-executed, and the new value is cached and returned.

```
User batman = (User) Cache.Org.get(UserInfoCache.class, '00541000000ek4c');
```

Org Class

Use the `Cache.Org` class to add, retrieve, and manage values in the org cache. Unlike the session cache, the org cache is not tied to any session and is available to the organization across requests and to all users.

Namespace

Cache

Usage

Cache Key Format

This table lists the format of the key parameter that some methods in this class take, such as `put`, `get`, and `contains`.

Key Format	Description
`namespace.partition.key`	Fully qualified key name.
`key`	Refers to a partition marked as default when the *`namespace.partition`* prefix is omitted.
`local.`*`partition.key`*	Use the `local` prefix to refer to the org's namespace when the org doesn't have a namespace defined. If the org has a namespace defined, the `local` prefix also refers to that org's namespace.

Note:

- If no default partition is specified in the org, calling a cache method without fully qualifying the key name causes a `Cache.Org.OrgCacheException` to be thrown.
- The `local` prefix in an installed managed package refers to the namespace of the subscriber org and not the package's namespace. The cache `put` calls aren't allowed in a partition that the invoking class doesn't own.

Example

This class is the controller for a sample Visualforce page (shown in the subsequent code sample). The cached values are initially added to the cache by the `init()` method, which the Visualforce page invokes when it loads through the `action` attribute. The cache keys don't contain the `namespace.partition` prefix. They all refer to the default partition in your org. To run this sample, create a partition and mark it as default.

The Visualforce page contains four output components. These components call `get` methods on the controller that returns the following values from the cache: a date, data based on the `MyData` inner class, a counter, a text value, and a list. The size of the list is also returned.

The Visualforce page also contains two buttons. The Rerender button invokes the `go()` method on the controller. This method increases the values of the counter and the custom data in the cache. When you click **Rerender**, the two counters increase by one each time. The `go()` method retrieves the values of these counters from the cache, increments their values by one, and stores them again in the cache.

The Remove datetime Key button deletes the date-time value (with key `datetime`) from the cache. As a result, the value next to `Cached datetime:` is cleared on the page.

Note: If another user logs in and runs this sample, this user gets the cache values that were last added or updated by the previous user. For example, if the counter value was five, the next user sees the counter value as increased to six.

```
public class OrgCacheController {

    // Inner class.
    // Used as the data type of a cache value.
```

```
class MyData {
    public String value { get; set; }
    public Integer counter { get; set; }

    public MyData(String value) {
        this.value = value;
        this.counter = 0;
    }

    public void inc() {
        counter++;
    }

    override public String toString() {
        return this.value + ':' + this.counter;
    }
}

// Apex List.
// Used as the data type of a cached value.
private List<String> numbers =
        new List<String> { 'ONE', 'TWO', 'THREE', 'FOUR', 'FIVE' };

// Constructor of the controller for the Visualforce page.
public OrgCacheController() {
}

// Adds various values to the cache.
// This method is called when the Visualforce page loads.
public void init() {
    // All key values are not qualified by the namespace.partition
    // prefix because they use the default partition.

    // Add counter to the cache with initial value of 0
    //  or increment it if it's already there.
    if (!Cache.Org.contains('counter')) {
        Cache.Org.put('counter', 0);
    } else {
        Cache.Org.put('counter', getCounter() + 1);
    }

    // Add the datetime value to the cache only if it's not already there.
    if (!Cache.Org.contains('datetime')) {
        DateTime dt = DateTime.now();
        Cache.Org.put('datetime', dt);
    }

    // Add the custom data to the cache only if it's not already there.
    if (!Cache.Org.contains('data')) {
        Cache.Org.put('data', new MyData('Some custom value'));
    }

    // Add a list of number to the cache if not already there.
    if (!Cache.Org.contains('list')) {
```

```
            Cache.Org.put('list', numbers);
        }

        // Add a string value to the cache if not already there.
        if (!Cache.Org.contains('output')) {
            Cache.Org.put('output', 'Cached text value');
        }
    }

    // Return counter from the cache.
    public Integer getCounter() {
        return (Integer)Cache.Org.get('counter');
    }

    // Return datetime value from the cache.
    public String getCachedDatetime() {
        DateTime dt = (DateTime)Cache.Org.get('datetime');
        return dt != null ? dt.format() : null;
    }

    // Return cached value whose type is the inner class MyData.
    public String getCachedData() {
        MyData mydata = (MyData)Cache.Org.get('data');
        return mydata != null ? mydata.toString() : null;
    }

    // Return output from the cache.
    public String getOutput() {
        return (String)Cache.Org.get('output');
    }

    // Return list from the cache.
    public List<String> getList() {
        return (List<String>)Cache.Org.get('list');
    }

    // Method invoked by the Rerender button on the Visualforce page.
    // Updates the values of various cached values.
    // Increases the values of counter and the MyData counter if those
    //   cache values are still in the cache.
    public PageReference go() {
        // Increase the cached counter value or set it to 0
        //  if it's not cached.
        if (Cache.Org.contains('counter')) {
            Cache.Org.put('counter', getCounter() + 1);
        } else {
            Cache.Org.put('counter', 0);
        }

        // Get the custom data value from the cache.
        MyData d = (MyData)Cache.Org.get('data');
        // Only if the data is already in the cache, update it.
        if (Cache.Org.contains('data')) {
            d.inc();
```

```
            Cache.Org.put('data', d);
        }

        return null;
    }

    // Method invoked by the Remove button on the Visualforce page.
    // Removes the datetime cached value from the org cache.
    public PageReference remove() {
        Cache.Org.remove('datetime');

        return null;
    }
}
```

This is the Visualforce page that corresponds to the `OrgCacheController` class.

```
<apex:page controller="OrgCacheController" action="{!init}">

    <apex:outputPanel id="output">
        <br/>Cached datetime: <apex:outputText value="{!cachedDatetime}"/>
        <br/>Cached data: <apex:outputText value="{!cachedData}"/>
        <br/>Cached counter: <apex:outputText value="{!counter}"/>
        <br/>Output: <apex:outputText value="{!output}"/>
        <br/>Repeat: <apex:repeat var="item" value="{!list}">
            <apex:outputText value="{!item}"/> 
        </apex:repeat>
        <br/>List size: <apex:outputText value="{!list.size}"/>
    </apex:outputPanel>

    <br/><br/>
    <apex:form >
        <apex:commandButton id="go" action="{!go}" value="Rerender" rerender="output"/>
        <apex:commandButton id="remove" action="{!remove}" value="Remove datetime Key"
rerender="output"/>
    </apex:form>

</apex:page>
```

This is the output of the page after clicking the **Rerender** button twice. The counter value could differ in your case if a key named `counter` was already in the cache before running this sample.

```
Cached datetime:8/11/2015 1:58 PM
Cached data:Some custom value:2
Cached counter:2
Output:Cached text value
Repeat:ONE TWO THREE FOUR FIVE
List size:5
```

IN THIS SECTION:

Org Constants
The Org class provides a constant that you can use when setting the time-to-live (TTL) value.

Org Methods

SEE ALSO:

Apex Developer Guide: Platform Cache

Org Constants

The Org class provides a constant that you can use when setting the time-to-live (TTL) value.

Constant	Description
`MAX_TTL_SECS`	Represents the maximum amount of time, in seconds, to keep the cached value in the org cache.

Org Methods

The following are methods for `Org`. All methods are static.

IN THIS SECTION:

contains(key)

Returns `true` if the org cache contains a cached value corresponding to the specified key.

contains(keys)

Returns `true` if the org cache contains values for the specified key entries.

contains(setOfKeys)

Returns `true` if the org cache contains values for a specified set of keys.

get(key)

Returns the cached value corresponding to the specified key from the org cache.

get(cacheBuilder, key)

Returns the cached value corresponding to the specified key from the org cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

get(keys)

Returns the cached values corresponding to the specified set of keys from the org cache.

getAvgGetSize()

Returns the average item size of all the keys fetched from the org cache, in bytes.

getAvgGetTime()

Returns the average time taken to get a key from the org cache, in nanoseconds.

getAvgValueSize()

Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the org cache, in bytes.

getCapacity()

Returns the percentage of org cache capacity that has been used.

getKeys()

Returns a set of all keys that are stored in the org cache and visible to the invoking namespace.

getMaxGetSize()

Returns the maximum item size of all the keys fetched from the org cache, in bytes.

getMaxGetTime()

Returns the maximum time taken to get a key from the org cache, in nanoseconds.

getMaxValueSize()

Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the org cache, in bytes.

getMissRate()

Returns the miss rate in the org cache.

getName()

Returns the name of the default cache partition.

getNumKeys()

Returns the total number of keys in the org cache.

getPartition(partitionName)

Returns a partition from the org cache that corresponds to the specified partition name.

put(key, value)

Stores the specified key/value pair as a cached entry in the org cache. The `put` method can write only to the cache in your org's namespace.

put(key, value, visibility)

Stores the specified key/value pair as a cached entry in the org cache and sets the cached value's visibility.

put(key, value, ttlSecs)

Stores the specified key/value pair as a cached entry in the org cache and sets the cached value's lifetime.

put(key, value, ttlSecs, visibility, immutable)

Stores the specified key/value pair as a cached entry in the org cache. This method also sets the cached value's lifetime, visibility, and whether it can be overwritten by another namespace.

remove(key)

Deletes the cached value corresponding to the specified key from the org cache.

remove(cacheBuilder, key)

Deletes the cached value corresponding to the specified key from the org cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

`contains(key)`

Returns `true` if the org cache contains a cached value corresponding to the specified key.

Signature

```
public static Boolean contains(String key)
```

Parameters

`key`

Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

Return Value

Type: Boolean

`true` if a cache entry is found. Otherwise, `false`.

`contains(keys)`

Returns `true` if the org cache contains values for the specified key entries.

Signature

```
public static List<Boolean> contains(List<String> keys)
```

Parameters

`keys`
Type: List<String>

A list of keys that identifies cached values. For information about the format of the key name, see Usage.

Return Value

Type: List<Boolean>

`true` if the key entries are found. Otherwise, `false`.

contains(setOfKeys)

Returns `true` if the org cache contains values for a specified set of keys.

Signature

```
public static Map <String, Boolean> contains (Set<String> keys)
```

Parameters

`setOfKeys`
Type: Set <String>

A set of keys that uniquely identifies cached values. For information about the format of the key name, see Usage

Return Value

Type: Map <String, Boolean>

Returns the cache key and corresponding Boolean value indicating that the key entry exists. The Boolean value is `false` if the key entry doesn't exist.

Usage

The number of input keys cannot exceed the maximum limit of 10.

Example

In this example, the code checks for the presence of multiple keys on the default partition. It fetches the cache key and the corresponding Boolean value for the key entry from the org cache of the default partition.

```
Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Map<String,Boolean> result = Cache.Org.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('Is Key Present in the cache : ' +  result.get(key));
}
```

In this example, the code checks for the presence of multiple keys on different partitions. It fetches the cache key and the corresponding Boolean value for the key entry from the org cache of different partitions.

```
// Assuming there are three partitions p1, p2, p3 with default 'local' namespace

Set<String> keys = new Set<String>{'local.p1.key','local.p2.key', 'local.p3.key'};
Map<String,Boolean> result = Cache.Org.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('Is Key Present in the cache : +  result.get(key));
}
```

`get(key)`

Returns the cached value corresponding to the specified key from the org cache.

Signature

```
public static Object get(String key)
```

Parameters

key

Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

Return Value

Type: Object

The cached value as a generic object type. Cast the returned value to the appropriate type.

Usage

Because `Cache.Org.get()` returns an object, cast the returned value to a specific type to facilitate use of the returned value.

```
// Get a cached value
Object obj = Cache.Org.get('ns1.partition1.orderDate');
// Cast return value to a specific data type
DateTime dt2 = (DateTime)obj;
```

If a `Cache.Org.get()` call doesn't find the referenced key, it returns `null`.

get(cacheBuilder, key)

Returns the cached value corresponding to the specified key from the org cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

Signature

```
public static Object get(System.Type cacheBuilder, String key)
```

Parameters

cacheBuilder
Type: System.Type

The Apex class that implements the `CacheBuilder` interface.

key
Type: String

A case-sensitive string value that, combined with the class name corresponding to the *cacheBuilder* parameter, uniquely identifies a cached value.

Return Value

Type: Object

The cached value as a generic object type. Cast the returned value to the appropriate type.

Usage

Because `Cache.Org.get(`*cacheBuilder*`, `*key*`)` returns an object, cast the returned value to a specific type to facilitate use of the returned value.

```
return ((DateTime)Cache.Org.get(DateCache.class, 'datetime')).format();
```

get(keys)

Returns the cached values corresponding to the specified set of keys from the org cache.

Signature

```
public static Map <String, Object> get (Set <String> keys)
```

Parameters

keys
Type: Set <String>

A set of keys that uniquely identify cached values. For information about the format of the key name, see Usage.

Return Value

Type: Map <String, Object>

Returns the cache key and corresponding value. Returns null when no corresponding value is found for an input key.

Usage

The number of input keys cannot exceed the maximum limit of 10.

Examples

Fetch multiple keys from the org cache of the default partition.

```
Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Map<String,Object> result = Cache.Org.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' +  result.get(key));
}
```

Fetch multiple keys from the org cache of different partitions.

```
// Assuming there are three partitions p1, p2, p3 with default 'local' namespace

Set<String> keys = new Set<String>{'local.p1.key','local.p2.key', 'local.p3.key'};
Map<String,Object> result = Cache.Org.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' +  result.get(key));
}
```

`getAvgGetSize()`

Returns the average item size of all the keys fetched from the org cache, in bytes.

Signature

```
public static Long getAvgGetSize()
```

Return Value

Type: Long

Example

In this example the following keys and their corresponding value sizes are inserted. The code then fetches the keys: key 1, key 2, key 3 and key 4 and returns the average item size of the fetched keys.

Key	Key Value Size
key 1	42
key 2	42

Key	Key Value Size
key 3	58
key 4	36
key 5	36

```
// Inserting keys key1, key2, key3, key4, key5
Cache.Org.put('key1', 'value1');
Cache.Org.put('key2', 'value2');
Cache.Org.put('key3', 'this is a big value !!!');
Cache.Org.put('key4', 4);
Cache.Org.put('key5', 5);

// Fetching keys - key1, key2, key3, key4
Object v1 = Cache.Org.get('key1');
Object v2 = Cache.Org.get('key2');
Object v3 = Cache.Org.get('key3');
Object v4 = Cache.Org.get('key4');

// Fetching average get size
Long val = Cache.Org.getAvgGetSize();
// Avg item size returned is 44 ( average of 42(key1), 42(key2), 58(key3) and 36(key4)
keys that were fetched )
System.debug('Avg Get Size :' + val);
```

`getAvgGetTime()`

Returns the average time taken to get a key from the org cache, in nanoseconds.

Signature

```
public static Long getAvgGetTime()
```

Return Value

Type: Long

`getAvgValueSize()`

Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the org cache, in bytes.

Signature

```
public static Long getAvgValueSize()
```

Return Value

Type: Long

getCapacity()

Returns the percentage of org cache capacity that has been used.

Signature

```
public static Double getCapacity()
```

Return Value

Type: Double

Used cache as a percentage number.

getKeys()

Returns a set of all keys that are stored in the org cache and visible to the invoking namespace.

Signature

```
public static Set<String> getKeys()
```

Return Value

Type: Set<String>

A set containing all cache keys.

getMaxGetSize()

Returns the maximum item size of all the keys fetched from the org cache, in bytes.

Signature

```
public static Long getMaxGetSize()
```

Return Value

Type: Long

Example

In this example the following keys and their corresponding value sizes are inserted. The code fetches the keys: key 1, key 2 and key 4 and returns the maximum key value size from the fetched keys.

Key	Key Value Size
key 1	42
key 2	42
key 3	58
key 4	36

Key	Key Value Size
key 5	36

```
// Inserting keys key1, key2, key3, key4, key5
Cache.Org.put('key1', 'value1');
Cache.Org.put('key2', 'value2');
Cache.Org.put('key3', 'this is a big value !!!');
Cache.Org.put('key4', 4);
Cache.Org.put('key5', 5);

// Fetching keys - key1, key2, key4
Object v1 = Cache.Org.get('key1');
Object v2 = Cache.Org.get('key2');
Object v4 = Cache.Org.get('key4');

// Fetching max get size
Long val = Cache.Org.getMaxGetSize();
// Max item size returned is 42 ( max of 42(key1), 42(key2), and 36(key4) keys that were
fetched )
System.debug('Max Get Size :' + val);
```

`getMaxGetTime()`

Returns the maximum time taken to get a key from the org cache, in nanoseconds.

Signature

```
public static Long getMaxGetTime()
```

Return Value

Type: Long

`getMaxValueSize()`

Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the org cache, in bytes.

Signature

```
public static Long getMaxValueSize()
```

Return Value

Type: Long

`getMissRate()`

Returns the miss rate in the org cache.

Signature

```
public static Double getMissRate()
```

Return Value

Type: Double

`getName()`

Returns the name of the default cache partition.

Signature

```
public String getName()
```

Return Value

Type: String

The name of the default cache partition.

`getNumKeys()`

Returns the total number of keys in the org cache.

Signature

```
public static Long getNumKeys()
```

Return Value

Type: Long

`getPartition(partitionName)`

Returns a partition from the org cache that corresponds to the specified partition name.

Signature

```
public static cache.OrgPartition getPartition(String partitionName)
```

Parameters

`partitionName`
Type: String

A partition name that is qualified by the namespace, for example, *`namespace.partition`*.

Return Value

Type: Cache.OrgPartition

Example

After you get the org partition, you can add and retrieve the partition's cache values.

```
// Get partition
Cache.OrgPartition orgPart = Cache.Org.getPartition('myNs.myPartition');
// Retrieve cache value from the partition
if (orgPart.contains('BookTitle')) {
    String cachedTitle = (String)orgPart.get('BookTitle');
}

// Add cache value to the partition
orgPart.put('OrderDate', Date.today());

// Or use dot notation to call partition methods
String cachedAuthor = (String)Cache.Org.getPartition('myNs.myPartition').get('BookAuthor');
```

put(key, value)

Stores the specified key/value pair as a cached entry in the org cache. The `put` method can write only to the cache in your org's namespace.

Signature

```
public static void put(String key, Object value)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

Return Value

Type: void

put(key, value, visibility)

Stores the specified key/value pair as a cached entry in the org cache and sets the cached value's visibility.

Signature

```
public static void put(String key, Object value, Cache.Visibility visibility)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

visibility
Type: Cache.Visibility

Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

Return Value

Type: void

put(key, value, ttlSecs)

Stores the specified key/value pair as a cached entry in the org cache and sets the cached value's lifetime.

Signature

```
public static void put(String key, Object value, Integer ttlSecs)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer

The amount of time, in seconds, to keep the cached value in the org cache. The maximum is 172,800 seconds (48 hours). The minimum value is 300 seconds or 5 minutes. The default value is 86,400 seconds (24 hours).

Return Value

Type: void

put(key, value, ttlSecs, visibility, immutable)

Stores the specified key/value pair as a cached entry in the org cache. This method also sets the cached value's lifetime, visibility, and whether it can be overwritten by another namespace.

Signature

```
public static void put(String key, Object value, Integer ttlSecs, cache.Visibility
visibility, Boolean immutable)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer

The amount of time, in seconds, to keep the cached value in the org cache. The maximum is 172,800 seconds (48 hours). The minimum value is 300 seconds or 5 minutes. The default value is 86,400 seconds (24 hours).

visibility
Type: Cache.Visibility

Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

immutable
Type: Boolean

Indicates whether the cached value can be overwritten by another namespace (`false`) or not (`true`).

Return Value

Type: void

remove(key)

Deletes the cached value corresponding to the specified key from the org cache.

Signature

```
public static Boolean remove(String key)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

Return Value

Type: Boolean

`true` if the cache value was successfully removed. Otherwise, `false`.

`remove(cacheBuilder, key)`

Deletes the cached value corresponding to the specified key from the org cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

Signature

```
public static Boolean remove(System.Type cacheBuilder, String key)
```

Parameters

`cacheBuilder`
Type: System.Type

The Apex class that implements the `CacheBuilder` interface.

`key`
Type: String

A case-sensitive string value that, combined with the class name corresponding to the *`cacheBuilder`* parameter, uniquely identifies a cached value.

Return Value

Type: Boolean

`true` if the cache value was successfully removed. Otherwise, `false`.

OrgPartition Class

Contains methods to manage cache values in the org cache of a specific partition. Unlike the session cache, the org cache is not tied to any session. It's available to the organization across requests and to all users.

Namespace

Cache

Usage

This class extends Cache.Partition and inherits all its non-static methods. Utility methods for creating and validating keys aren't supported and can be called only from the `Cache.Partition` parent class. For a list of `Cache.Partition` methods, see Partition Methods.

To get an org partition, call `Cache.Org.getPartition` and pass in a fully qualified partition name, as follows.

```
Cache.OrgPartition orgPartition = Cache.Org.getPartition('namespace.myPartition');
```

See Cache Key Format for Partition Methods.

Example

This class is the controller for a sample Visualforce page (shown in the subsequent code sample). The controller shows how to use the methods of `Cache.OrgPartition` to manage a cache value on a particular partition. The controller takes inputs from the Visualforce page for the partition name, key name for a counter, and initial counter value. The controller contains default values for these inputs.

When you click **Rerender** on the Visualforce page, the `go()` method is invoked and increases the counter by one. When you click **Remove Key**, the counter key is removed from the cache. The counter value gets reset to its initial value when it's re-added to the cache.

Note: If another user logs in and runs this sample, the user gets the cache values that were last added or updated by the previous user. For example, if the counter value was five, the next user sees the counter value as increased to six.

```
public class OrgPartitionController {

    // Name of a partition
    String partitionInput = 'local.myPartition';
    // Name of the key
    String counterKeyInput = 'counter';
    // Key initial value
    Integer counterInitValue = 0;
    // Org partition object
    Cache.OrgPartition orgPartition;

    // Constructor of the controller for the Visualforce page.
    public OrgPartitionController() {
    }

    // Adds counter value to the cache.
    // This method is called when the Visualforce page loads.
    public void init() {
        // Create the partition instance based on the partition name
        orgPartition = getPartition();

        // Create the partition instance based on the partition name
        // given in the Visualforce page or the default value.
        orgPartition = Cache.Org.getPartition(partitionInput);

        // Add counter to the cache with an initial value
        //  or increment it if it's already there.
        if (!orgPartition.contains(counterKeyInput)) {
            orgPartition.put(counterKeyInput, counterInitValue);
        } else {
            orgPartition.put(counterKeyInput, getCounter() + 1);
        }
    }

    // Returns the org partition based on the partition name
    // given in the Visualforce page or the default value.
    private Cache.OrgPartition getPartition() {
       if (orgPartition == null) {
            orgPartition = Cache.Org.getPartition(partitionInput);
       }

       return orgPartition;
     }

    // Return counter from the cache.
    public Integer getCounter() {
        return (Integer)getPartition().get(counterKeyInput);
    }
```

```
// Invoked by the Submit button to save input values
//  supplied by the user.
public PageReference save() {
    // Reset the initial key value in the cache
    getPartition().put(counterKeyInput, counterInitValue);

    return null;
}

// Method invoked by the Rerender button on the Visualforce page.
// Updates the values of various cached values.
// Increases the values of counter and the MyData counter if those
//   cache values are still in the cache.
public PageReference go() {
    // Get the org partition object
    orgPartition = getPartition();
    // Increase the cached counter value or set it to 0
    //  if it's not cached.
    if (orgPartition.contains(counterKeyInput)) {
        orgPartition.put(counterKeyInput, getCounter() + 1);
    } else {
        orgPartition.put(counterKeyInput, counterInitValue);
    }

    return null;
}

// Method invoked by the Remove button on the Visualforce page.
// Removes the datetime cached value from the org cache.
public PageReference remove() {
    getPartition().remove(counterKeyInput);

    return null;
}

// Get and set methods for accessing variables
// that correspond to the input text fields on
// the Visualforce page.
public String getPartitionInput() {
    return partitionInput;
}

public String getCounterKeyInput() {
    return counterKeyInput;
}

public Integer getCounterInitValue() {
    return counterInitValue;
}

public void setPartitionInput(String partition) {
    this.partitionInput = partition;
}
```

```
    public void setCounterKeyInput(String keyName) {
        this.counterKeyInput = keyName;
    }

    public void setCounterInitValue(Integer counterValue) {
        this.counterInitValue = counterValue;
    }
}
```

This is the Visualforce page that corresponds to the `OrgPartitionController` class.

```
<apex:page controller="OrgPartitionController" action="{!init}">

    <apex:form >
        <br/>Partition with Namespace Prefix: <apex:inputText value="{!partitionInput}"/>

        <br/>Counter Key Name: <apex:inputText value="{!counterKeyInput}"/>
        <br/>Counter Initial Value: <apex:inputText value="{!counterInitValue}"/>
        <apex:commandButton action="{!save}" value="Save Key Input Values"/>
    </apex:form>

    <apex:outputPanel id="output">
        <br/>Cached Counter: <apex:outputText value="{!counter}"/>
    </apex:outputPanel>

    <br/>
    <apex:form >
        <apex:commandButton id="go" action="{!go}" value="Rerender" rerender="output"/>
        <apex:commandButton id="remove" action="{!remove}" value="Remove Key"
rerender="output"/>
    </apex:form>

</apex:page>
```

Apex Developer Guide: Platform Cache

Partition Class

Base class of `Cache.OrgPartition` and `Cache.SessionPartition`. Use the subclasses to manage the cache partition for org caches and session caches.

Namespace

Cache

Cache Key Format for Partition Methods

After you obtain the partition object (an instance of `Cache.OrgPartition` or `Cache.SessionPartition`), the methods to add, retrieve, and manage the cache values in a partition take the key name. The key name that you supply to these methods (`get()`, `put()`, `remove()`, and `contains()`) doesn't include the `namespace.partition` prefix.

IN THIS SECTION:

Partition Methods

SEE ALSO:

OrgPartition Class

SessionPartition Class

Apex Developer Guide: Platform Cache

Partition Methods

The following are methods for `Partition`.

IN THIS SECTION:

contains(key)

Returns `true` if the cache partition contains a cached value corresponding to the specified key.

contains(setOfKeys)

Returns `true` if the cache partition contains values for a specified set of keys.

createFullyQualifiedKey(namespace, partition, key)

Generates a fully qualified key from the passed-in key components. The format of the generated key string is `namespace.partition.key`.

createFullyQualifiedPartition(namespace, partition)

Generates a fully qualified partition name from the passed-in namespace and partition. The format of the generated partition string is `namespace.partition`.

get(key)

Returns the cached value corresponding to the specified key from the cache partition.

get(keys)

Returns the cached values corresponding to the specified set of keys from the cache partition.

get(cacheBuilder, key)

Returns the cached value corresponding to the specified key from the partition cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

getAvgGetSize()

Returns the average item size of all the keys fetched from the partition, in bytes.

getAvgGetTime()

Returns the average time taken to get a key from the partition, in nanoseconds.

getAvgValueSize()

Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the partition, in bytes.

getCapacity()

Returns the percentage of cache used of the total capacity for this partition.

getKeys()

Returns a set of all keys that are stored in the cache partition and visible to the invoking namespace.

getMaxGetSize()

Returns the maximum item size of all the keys fetched from the partition, in bytes.

getMaxGetTime()

Returns the maximum time taken to get a key from the partition, in nanoseconds.

getMaxValueSize()

Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the partition, in bytes.

getMissRate()

Returns the miss rate in the partition.

getName()

Returns the name of this cache partition.

getNumKeys()

Returns the total number of keys in the partition.

isAvailable()

Returns `true` if the Salesforce session is available. Only applies to `Cache.SessionPartition`. The session cache isn't available when an active session isn't present, such as in asynchronous Apex or code called by asynchronous Apex. For example, if batch Apex causes an Apex trigger to execute, the session cache isn't available in the trigger because the trigger runs in asynchronous context.

put(key, value)

Stores the specified key/value pair as a cached entry in the cache partition. The `put` method can write only to the cache in your org's namespace.

put(key, value, visibility)

Stores the specified key/value pair as a cached entry in the cache partition and sets the cached value's visibility.

put(key, value, ttlSecs)

Stores the specified key/value pair as a cached entry in the cache partition and sets the cached value's lifetime.

put(key, value, ttlSecs, visibility, immutable)

Stores the specified key/value pair as a cached entry in the cache partition. This method also sets the cached value's lifetime, visibility, and whether it can be overwritten by another namespace.

remove(key)

Deletes the cached value corresponding to the specified key from this cache partition.

remove(cacheBuilder, key)

Deletes the cached value corresponding to the specified key from the partition cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

validateCacheBuilder(cacheBuilder)

Validates that the specified class implements the `CacheBuilder` interface.

validateKey(isDefault, key)

Validates a cache key. This method throws a `Cache.InvalidParamException` if the key is not valid. A valid key is not `null` and contains alphanumeric characters.

validateKeyValue(isDefault, key, value)

Validates a cache key and ensures that the cache value is non-null. This method throws a `Cache.InvalidParamException` if the key or value is not valid. A valid key is not `null` and contains alphanumeric characters.

validateKeys(isDefault, keys)

Validates the specified cache keys. This method throws a `Cache.InvalidParamException` if the key is not valid. A valid key is not `null` and contains alphanumeric characters.

validatePartitionName(name)

Validates the partition name — for example, that it is not null.

`contains(key)`

Returns `true` if the cache partition contains a cached value corresponding to the specified key.

Signature

```
public Boolean contains(String key)
```

Parameters

key

Type: String

A case-sensitive string value that uniquely identifies a cached value.

Return Value

Type: Boolean

`true` if a cache entry is found. Othewise, `false`.

contains(setOfKeys)

Returns `true` if the cache partition contains values for a specified set of keys.

Signature

```
public Map <String, Boolean> contains (Set<String> keys)
```

Parameters

setOfKeys

Type: Set <String>

A set of keys that uniquely identifies cached values. For information about the format of the key name, see Usage.

Return Value

Type: Map <String, Boolean>

Returns the cache key and corresponding Boolean value indicating that the key entry exists. The Boolean value is `false` if the key entry doesn't exist.

Usage

The number of input keys cannot exceed the maximum limit of 10.

Example

In this example, the code checks for the presence of multiple keys on a partition. It fetches the cache key and the corresponding Boolean value for the key entry from the org cache of the partition.

```
// Assuming there is a partition p1 in the default 'local' namespace

Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Cache.OrgPartition orgPart = Cache.Org.getPartition('local.p1');
Map<String,Boolean> result = orgPart.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('Is Key Present in the cache:' +  result.get(key));
}
```

In this example, the code checks for the presence of multiple keys on a partition. It fetches the cache key and the corresponding Boolean value for the key entry from the session cache of the partition.

```
// Assuming there are three partitions p1, p2, p3 with default 'local' namespace

Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Cache.SessionPartition sessionPart = Cache.Session.getPartition('local.p1');
Map<String,Boolean> result = sessionPart.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' +  result.get(key));
}
```

`createFullyQualifiedKey(namespace, partition, key)`

Generates a fully qualified key from the passed-in key components. The format of the generated key string is `namespace.partition.key`.

Signature

```
public static String createFullyQualifiedKey(String namespace, String partition, String key)
```

Parameters

`namespace`
Type: String

The namespace of the cache key.

`partition`
Type: String

The partition of the cache key.

`key`
Type: String

The name of the cache key.

Return Value

Type: String

createFullyQualifiedPartition(namespace, partition)

Generates a fully qualified partition name from the passed-in namespace and partition. The format of the generated partition string is `namespace.partition`.

Signature

```
public static String createFullyQualifiedPartition(String namespace, String partition)
```

Parameters

namespace
Type: String

The namespace of the cache key.

partition
Type: String

The partition of the cache key.

Return Value

Type: String

get(key)

Returns the cached value corresponding to the specified key from the cache partition.

Signature

```
public Object get(String key)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value.

Return Value

Type: Object

The cached value as a generic object type. Cast the returned value to the appropriate type.

get(keys)

Returns the cached values corresponding to the specified set of keys from the cache partition.

Signature

```
public Map <String, Object> get (Set <String> keys)
```

Parameters

keys
Type: Set <String>

A set of keys that uniquely identify cached values. For information about the format of the key name, see Usage.

Return Value

Type: Map <String, Object>

Returns the cache key and corresponding value. Returns null when no corresponding value is found for an input key.

Usage

The number of input keys cannot exceed the maximum limit of 10.

Examples

Fetch multiple keys from the org cache of a partition.

```
// Assuming there is a partition p1 in the default 'local' namespace

Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Cache.OrgPartition orgPart = Cache.Org.getPartition('local.p1');
Map<String,Object> result = orgPart.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' +  result.get(key));
}
```

Fetch multiple keys from the session cache of a partition.

```
// Assuming there is a partition p1 in the default 'local' namespace

Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Cache.SessionPartition sessionPart = Cache.Session.getPartition('local.p1');
Map<String,Object> result = sessionPart.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' +  result.get(key));
}
```

get(cacheBuilder, key)

Returns the cached value corresponding to the specified key from the partition cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

Signature

```
public Object get(System.Type cacheBuilder, String key)
```

Parameters

cacheBuilder
Type: System.Type

The Apex class that implements the `CacheBuilder` interface.

key
Type: String

A case-sensitive string value that, combined with the class name corresponding to the *cacheBuilder* parameter, uniquely identifies a cached value.

Return Value

Type: Object

The cached value as a generic object type. Cast the returned value to the appropriate type.

getAvgGetSize()

Returns the average item size of all the keys fetched from the partition, in bytes.

Signature

```
public Long getAvgGetSize()
```

Return Value

Type: Long

getAvgGetTime()

Returns the average time taken to get a key from the partition, in nanoseconds.

Signature

```
public Long getAvgGetTime()
```

Return Value

Type: Long

getAvgValueSize()

Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the partition, in bytes.

Signature

```
public Long getAvgValueSize()
```

Return Value

Type: Long

getCapacity()

Returns the percentage of cache used of the total capacity for this partition.

Signature

```
public Double getCapacity()
```

Return Value

Type: Double

Used partition cache as a percentage number.

getKeys()

Returns a set of all keys that are stored in the cache partition and visible to the invoking namespace.

Signature

```
public Set<String> getKeys()
```

Return Value

Type: Set<String>

A set containing all cache keys.

getMaxGetSize()

Returns the maximum item size of all the keys fetched from the partition, in bytes.

Signature

```
public Long getMaxGetSize()
```

Return Value

Type: Long

getMaxGetTime()

Returns the maximum time taken to get a key from the partition, in nanoseconds.

Signature

```
public Long getMaxGetTime()
```

Return Value

Type: Long

getMaxValueSize()

Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the partition, in bytes.

Signature

```
public Long getMaxValueSize()
```

Return Value

Type: Long

getMissRate()

Returns the miss rate in the partition.

Signature

```
public Double getMissRate()
```

Return Value

Type: Double

getName()

Returns the name of this cache partition.

Signature

```
public String getName()
```

Return Value

Type: String

The name of this cache partition.

getNumKeys()

Returns the total number of keys in the partition.

Signature

```
public Long getNumKeys()
```

Return Value

Type: Long

isAvailable()

Returns `true` if the Salesforce session is available. Only applies to `Cache.SessionPartition`. The session cache isn't available when an active session isn't present, such as in asynchronous Apex or code called by asynchronous Apex. For example, if batch Apex causes an Apex trigger to execute, the session cache isn't available in the trigger because the trigger runs in asynchronous context.

Signature

```
public Boolean isAvailable()
```

Return Value

Type: Boolean

put(key, value)

Stores the specified key/value pair as a cached entry in the cache partition. The `put` method can write only to the cache in your org's namespace.

Signature

```
public void put(String key, Object value)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

Return Value

Type: void

put(key, value, visibility)

Stores the specified key/value pair as a cached entry in the cache partition and sets the cached value's visibility.

Signature

```
public void put(String key, Object value, cache.Visibility visibility)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

visibility
Type: Cache.Visibility

Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

Return Value

Type: void

put(key, value, ttlSecs)

Stores the specified key/value pair as a cached entry in the cache partition and sets the cached value's lifetime.

Signature

```
public void put(String key, Object value, Integer ttlSecs)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer

The amount of time, in seconds, to keep the cached value in the cache.

Return Value

Type: void

put(key, value, ttlSecs, visibility, immutable)

Stores the specified key/value pair as a cached entry in the cache partition. This method also sets the cached value's lifetime, visibility, and whether it can be overwritten by another namespace.

Signature

```
public void put(String key, Object value, Integer ttlSecs, cache.Visibility visibility,
Boolean immutable)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer

The amount of time, in seconds, to keep the cached value in the cache.

visibility
Type: Cache.Visibility

Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

immutable
Type: Boolean

Indicates whether the cached value can be overwritten by another namespace (`false`) or not (`true`).

Return Value

Type: void

remove(key)

Deletes the cached value corresponding to the specified key from this cache partition.

Signature

```
public Boolean remove(String key)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value.

Return Value

Type: Boolean

`true` if the cache value was successfully removed. Otherwise, `false`.

remove(cacheBuilder, key)

Deletes the cached value corresponding to the specified key from the partition cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

Signature

```
public Boolean remove(System.Type cacheBuilder, String key)
```

Parameters

cacheBuilder
Type: System.Type

The Apex class that implements the `CacheBuilder` interface.

key
Type: String

A case-sensitive string value that, combined with the class name corresponding to the *cacheBuilder* parameter, uniquely identifies a cached value.

Return Value

Type: Boolean

`true` if the cache value was successfully removed. Otherwise, `false`.

validateCacheBuilder(cacheBuilder)

Validates that the specified class implements the `CacheBuilder` interface.

Signature

```
public static void validateCacheBuilder(System.Type cacheBuilder)
```

Parameters

cacheBuilder
Type: System.Type

The class to validate.

Return Value

Type: void

validateKey(isDefault, key)

Validates a cache key. This method throws a `Cache.InvalidParamException` if the key is not valid. A valid key is not `null` and contains alphanumeric characters.

Signature

```
public static void validateKey(Boolean isDefault, String key)
```

Parameters

isDefault
Type: Boolean

Set to `true` if the key references a default partition. Otherwise, set to `false`.

key
Type: String

The key to validate.

Return Value

Type: void

validateKeyValue(isDefault, key, value)

Validates a cache key and ensures that the cache value is non-null. This method throws a `Cache.InvalidParamException` if the key or value is not valid. A valid key is not `null` and contains alphanumeric characters.

Signature

```
public static void validateKeyValue(Boolean isDefault, String key, Object value)
```

Parameters

isDefault
Type: Boolean

Set to `true` if the key references a default partition. Otherwise, set to `false`.

key
Type: String

The key to validate.

value
Type: Object

The cache value to validate.

Return Value

Type: void

validateKeys(isDefault, keys)

Validates the specified cache keys. This method throws a `Cache.InvalidParamException` if the key is not valid. A valid key is not `null` and contains alphanumeric characters.

Signature

```
public static void validateKeys(Boolean isDefault, Set<String> keys)
```

Parameters

isDefault
Type: Boolean

Set to `true` if the key references a default partition. Otherwise, set to `false`.

keys
Type: Set<String>

A set of key string values to validate.

Return Value

Type: void

validatePartitionName(name)

Validates the partition name — for example, that it is not null.

Signature

```
public static void validatePartitionName(String name)
```

Parameters

name
Type: String

The name of the partition to validate.

Return Value

Type: void

Session Class

Use the `Cache.Session` class to add, retrieve, and manage values in the session cache. The session cache is active as long as the user's Salesforce session is valid (the user is logged in, and the session is not expired).

Namespace

Cache

Usage

Cache Key Format

This table lists the format of the key parameter that some methods in this class take, such as `put`, `get`, and `contains`.

Key Format	Description
namespace.partition.key	Fully qualified key name.
key	Refers to a partition marked as default when the *namespace.partition* prefix is omitted.
local.*partition.key*	Use the `local` prefix to refer to the org's namespace when the org doesn't have a namespace defined. If the org has a namespace defined, the `local` prefix also refers to that org's namespace.

Note:

- If no default partition is specified in the org, calling a cache method without fully qualifying the key name causes a `Cache.Session.SessionCacheException` to be thrown.
- The `local` prefix in an installed managed package refers to the namespace of the subscriber org and not the package's namespace. The cache `put` calls are not allowed in a partition that the invoking class doesn't own.

Example

This class is the controller for a sample Visualforce page (shown in the subsequent code sample). The cached values are initially added to the cache by the `init()` method, which the Visualforce page invokes when it loads through the `action` attribute. The cache keys don't contain the `namespace.partition` prefix. They all refer to a default partition in your org. The Visualforce page expects a partition named `myPartition`. To run this sample, create a default partition in your org with the name `myPartition`.

The Visualforce page contains four output components. The first three components call `get` methods on the controller that return the following values from the cache: a date, data based on the `MyData` inner class, and a counter. The next output component uses the `$Cache.Session` global variable to get the cached string value for the key named `output`. Next, the `$Cache.Session` global variable is used again in the Visualforce page to iterate over the elements of a cached value of type `List`. The size of the list is also returned.

The Visualforce page also contains two buttons. The Rerender button invokes the `go()` method on the controller. This method increases the values of the counter and the custom data in the cache. If you click **Rerender**, the two counters increase by one each time. The `go()` method retrieves the values of these counters from the cache, increments their values by one, and stores them again in the cache.

The Remove button deletes the date-time value (with key `datetime`) from the cache. As a result, the value next to `Cached datetime:` is cleared on the page.

```
public class SessionCacheController {

    // Inner class.
    // Used as the data type of a cache value.
    class MyData {
        public String value { get; set; }
        public Integer counter { get; set; }

        public MyData(String value) {
            this.value = value;
            this.counter = 0;
        }
```

```
        public void inc() {
            counter++;
        }

        override public String toString() {
            return this.value + ':' + this.counter;
        }
    }

    // Apex List.
    // Used as the data type of a cached value.
    private List<String> numbers =
            new List<String> { 'ONE', 'TWO', 'THREE', 'FOUR', 'FIVE' };

    // Constructor of the controller for the Visualforce page.
    public SessionCacheController() {
    }

    // Adds various values to the cache.
    // This method is called when the Visualforce page loads.
    public void init() {
        // All key values are not qualified by the namespace.partition
        // prefix because they use the default partition.

        // Add counter to the cache with initial value of 0
        //  or increment it if it's already there.
        if (!Cache.Session.contains('counter')) {
            Cache.Session.put('counter', 0);
        } else {
            Cache.Session.put('counter', getCounter() + 1);
        }

        // Add the datetime value to the cache only if it's not already there.
        if (!Cache.Session.contains('datetime')) {
            DateTime dt = DateTime.now();
            Cache.Session.put('datetime', dt);
        }

        // Add the custom data to the cache only if it's not already there.
        if (!Cache.Session.contains('data')) {
            Cache.Session.put('data', new MyData('Some custom value'));
        }

        // Add a list of number to the cache if not already there.
        if (!Cache.Session.contains('list')) {
            Cache.Session.put('list', numbers);
        }

        // Add a string value to the cache if not already there.
        if (!Cache.Session.contains('output')) {
            Cache.Session.put('output', 'Cached text value');
        }
    }
```

```
    // Return counter from the cache.
    public Integer getCounter() {
        return (Integer)Cache.Session.get('counter');
    }

    // Return datetime value from the cache.
    public String getCachedDatetime() {
        DateTime dt = (DateTime)Cache.Session.get('datetime');
        return dt != null ? dt.format() : null;
    }

    // Return cached value whose type is the inner class MyData.
    public String getCachedData() {
        MyData mydata = (MyData)Cache.Session.get('data');
        return mydata != null ? mydata.toString() : null;
    }

    // Method invoked by the Rerender button on the Visualforce page.
    // Updates the values of various cached values.
    // Increases the values of counter and the MyData counter if those
    //   cache values are still in the cache.
    public PageReference go() {
        // Increase the cached counter value or set it to 0
        //  if it's not cached.
        if (Cache.Session.contains('counter')) {
            Cache.Session.put('counter', getCounter() + 1);
        } else {
            Cache.Session.put('counter', 0);
        }

        // Get the custom data value from the cache.
        MyData d = (MyData)Cache.Session.get('data');
        // Only if the data is already in the cache, update it.
        if (Cache.Session.contains('data')) {
            d.inc();
            Cache.Session.put('data', d);
        }

        return null;
    }

    // Method invoked by the Remove button on the Visualforce page.
    // Removes the datetime cached value from the session cache.
    public PageReference remove() {
        Cache.Session.remove('datetime');

        return null;
    }
}
```

This is the Visualforce page that corresponds to the `SessionCacheController` class.

```
<apex:page controller="SessionCacheController" action="{!init}">

    <apex:outputPanel id="output">
```

```
        <br/>Cached datetime: <apex:outputText value="{!cachedDatetime}"/>
        <br/>Cached data: <apex:outputText value="{!cachedData}"/>
        <br/>Cached counter: <apex:outputText value="{!counter}"/>
       <br/>Output: <apex:outputText value="{!$Cache.Session.local.myPartition.output}"/>

        <br/>Repeat: <apex:repeat var="item"
value="{!$Cache.Session.local.myPartition.list}">
            <apex:outputText value="{!item}"/> 
        </apex:repeat>
        <br/>List size: <apex:outputText
value="{!$Cache.Session.local.myPartition.list.size}"/>
    </apex:outputPanel>

    <br/><br/>
    <apex:form >
        <apex:commandButton id="go" action="{!go}" value="Rerender" rerender="output"/>
        <apex:commandButton id="remove" action="{!remove}" value="Remove datetime Key"
rerender="output"/>
    </apex:form>

</apex:page>
```

This is the output of the page after clicking the Rerender button twice. The counter value could differ in your case if a key named `counter` was already in the cache before running this sample.

```
Cached datetime:8/11/2015 1:58 PM
Cached data:Some custom value:2
Cached counter:2
Output:Cached text value
Repeat:ONE TWO THREE FOUR FIVE
List size:5
```

IN THIS SECTION:

Session Constants

The Session class provides a constant that you can use when setting the time-to-live (TTL) value.

Session Methods

SEE ALSO:

Apex Developer Guide: Platform Cache

Session Constants

The Session class provides a constant that you can use when setting the time-to-live (TTL) value.

Constant	Description
`MAX_TTL_SECS`	Represents the maximum amount of time, in seconds, to keep the cached value in the session cache.

Session Methods

The following are methods for `Session`. All methods are static.

IN THIS SECTION:

contains(key)

Returns `true` if the session cache contains a cached value corresponding to the specified key.

contains(setOfKeys)

Returns `true` if the cache contains values for a specified set of keys.

get(key)

Returns the cached value corresponding to the specified key from the session cache.

get(keys)

Returns the cached values corresponding to the specified set of keys from the session cache.

get(cacheBuilder, key)

Returns the cached value corresponding to the specified key from the session cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

getAvgGetSize()

Returns the average item size of all the keys fetched from the session cache, in bytes.

getAvgGetTime()

Returns the average time taken to get a key from the session cache, in nanoseconds.

getAvgValueSize()

Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the session cache, in bytes.

getCapacity()

Returns the percentage of session cache capacity that has been used.

getKeys()

Returns all keys that are stored in the session cache and visible to the invoking namespace.

getMaxGetSize()

Returns the maximum item size of all the keys fetched from the session cache, in bytes.

getMaxGetTime()

Returns the maximum time taken to get a key from the session cache, in nanoseconds.

getMaxValueSize()

Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the session cache, in bytes.

getMissRate()

Returns the miss rate in the session cache.

getName()

Returns the name of the default cache partition.

getNumKeys()

Returns the total number of keys in the session cache.

getPartition(partitionName)

Returns a partition from the session cache that corresponds to the specified partition name.

isAvailable()

Returns `true` if the session cache is available for use. The session cache isn't available when an active session isn't present, such as in asynchronous Apex or code called by asynchronous Apex. For example, if batch Apex causes an Apex trigger to execute, the session cache isn't available in the trigger because the trigger runs in asynchronous context.

put(key, value)

Stores the specified key/value pair as a cached entry in the session cache. The `put` method can write only to the cache in your org's namespace.

put(key, value, visibility)

Stores the specified key/value pair as a cached entry in the session cache and sets the cached value's visibility.

put(key, value, ttlSecs)

Stores the specified key/value pair as a cached entry in the session cache and sets the cached value's lifetime.

put(key, value, ttlSecs, visibility, immutable)

Stores the specified key/value pair as a cached entry in the session cache. This method also sets the cached value's lifetime, visibility, and whether it can be overwritten by another namespace.

remove(key)

Deletes the cached value corresponding to the specified key from the session cache.

remove(cacheBuilder, key)

Deletes the cached value corresponding to the specified key from the session cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

`contains(key)`

Returns `true` if the session cache contains a cached value corresponding to the specified key.

Signature

```
public static Boolean contains(String key)
```

Parameters

`key`

Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

Return Value

Type: Boolean

`true` if a cache entry is found. Othewise, `false`.

contains(setOfKeys)

Returns `true` if the cache contains values for a specified set of keys.

Signature

```
public static Map <String, Boolean> contains (Set<String> keys)
```

Parameters

setOfKeys
Type: Set <String>

A set of keys that uniquely identifies cached values. For information about the format of the key name, see Usage.

Return Value

Type: Map <String, Boolean>

Returns the cache key and corresponding Boolean value indicating that the key entry exists. The Boolean value is `false` if the key entry doesn't exist.

Usage

The number of input keys cannot exceed the maximum limit of 10.

Example

In this example, the code checks for the presence of multiple keys on the default partition. It fetches the cache key and the corresponding Boolean value for the key entry from the session cache of the default partition.

```
Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Map<String,Boolean> result = Cache.Session.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('Is Key Present in the cache : ' +  result.get(key));
}
```

In this example, the code checks for the presence of multiple keys on different partitions. It fetches the cache key and the corresponding Boolean value for the key entry from the session cache of different partitions.

```
// Assuming there are three partitions p1, p2, p3 with default 'local' namespace

Set<String> keys = new Set<String>{'local.p1.key','local.p2.key', 'local.p3.key'};
Map<String,Boolean> result = Cache.Session.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('Is Key Present in the cache : +  result.get(key));
}
```

get(key)

Returns the cached value corresponding to the specified key from the session cache.

Signature

```
public static Object get(String key)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

Return Value

Type: Object

The cached value as a generic object type. Cast the returned value to the appropriate type.

Usage

Because `Cache.Session.get()` returns an object, we recommend that you cast the returned value to a specific type to facilitate use of the returned value.

```
// Get a cached value
Object obj = Cache.Session.get('ns1.partition1.orderDate');
// Cast return value to a specific data type
DateTime dt2 = (DateTime)obj;
```

If a `Cache.Session.get()` call doesn't find the referenced key, it returns `null`.

`get(keys)`

Returns the cached values corresponding to the specified set of keys from the session cache.

Signature

```
public static Map <String, Object> get (Set <String> keys)
```

Parameters

keys
Type: Set <String>

A set of keys that uniquely identify cached values. For information about the format of the key name, see Usage.

Return Value

Type: Map <String, Object>

Returns the cache key and corresponding value. Returns null when no corresponding value is found for an input key.

Usage

The number of input keys cannot exceed the maximum limit of 10.

Example

Fetch multiple keys from the session cache of the default partition.

```
Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Map<String,Object> result = Cache.Session.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' +  result.get(key));
}
```

Fetch multiple keys from the session cache of different partitions.

```
// Assuming there are three partitions p1, p2, p3 with default 'local' namespace

Set<String> keys = new Set<String>{'local.p1.key','local.p2.key', 'local.p3.key'};
Map<String,Object> result = Cache.Session.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' +  result.get(key));
}
```

`get(cacheBuilder, key)`

Returns the cached value corresponding to the specified key from the session cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

Signature

```
public static Object get(System.Type cacheBuilder, String key)
```

Parameters

`cacheBuilder`
Type: System.Type

The Apex class that implements the `CacheBuilder` interface.

`key`
Type: String

A case-sensitive string value that, combined with the class name corresponding to the *`cacheBuilder`* parameter, uniquely identifies a cached value.

Return Value

Type: Object

The cached value as a generic object type. Cast the returned value to the appropriate type.

Usage

Because `Cache.Session.get(`*`cacheBuilder`*`, `*`key`*`)` returns an object, cast the returned value to a specific type to facilitate use of the returned value.

```
return ((DateTime)Cache.Session.get(DateCache.class, 'datetime')).format();
```

`getAvgGetSize()`

Returns the average item size of all the keys fetched from the session cache, in bytes.

Signature

```
public static Long getAvgGetSize()
```

Return Value

Type: Long

`getAvgGetTime()`

Returns the average time taken to get a key from the session cache, in nanoseconds.

Signature

```
public static Long getAvgGetTime()
```

Return Value

Type: Long

`getAvgValueSize()`

Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the session cache, in bytes.

Signature

```
public static Long getAvgValueSize()
```

Return Value

Type: Long

`getCapacity()`

Returns the percentage of session cache capacity that has been used.

Signature

```
public static Double getCapacity()
```

Return Value

Type: Double

Used cache as a percentage number.

getKeys()

Returns all keys that are stored in the session cache and visible to the invoking namespace.

Signature

```
public static Set<String> getKeys()
```

Return Value

Type: Set<String>

A set containing all cache keys.

getMaxGetSize()

Returns the maximum item size of all the keys fetched from the session cache, in bytes.

Signature

```
public static Long getMaxGetSize()
```

Return Value

Type: Long

getMaxGetTime()

Returns the maximum time taken to get a key from the session cache, in nanoseconds.

Signature

```
public static Long getMaxGetTime()
```

Return Value

Type: Long

getMaxValueSize()

Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the session cache, in bytes.

Signature

```
public static Long getMaxValueSize()
```

Return Value

Type: Long

getMissRate()

Returns the miss rate in the session cache.

Signature

```
public static Double getMissRate()
```

Return Value

Type: Double

getName()

Returns the name of the default cache partition.

Signature

```
public String getName()
```

Return Value

Type: String

The name of the default cache partition.

getNumKeys()

Returns the total number of keys in the session cache.

Signature

```
public static Long getNumKeys()
```

Return Value

Type: Long

getPartition(partitionName)

Returns a partition from the session cache that corresponds to the specified partition name.

Signature

```
public static cache.SessionPartition getPartition(String partitionName)
```

Parameters

partitionName

Type: String

A partition name that is qualified by the namespace, for example, *namespace.partition*.

Return Value

Type: Cache.SessionPartition

Example

After you get the session partition, you can add and retrieve the partition's cache values.

```
// Get partition
Cache.SessionPartition sessionPart = Cache.Session.getPartition('myNs.myPartition');
// Retrieve cache value from the partition
if (sessionPart.contains('BookTitle')) {
    String cachedTitle = (String)sessionPart.get('BookTitle');
}

// Add cache value to the partition
sessionPart.put('OrderDate', Date.today());

// Or use dot notation to call partition methods
String cachedAuthor =
(String)Cache.Session.getPartition('myNs.myPartition').get('BookAuthor');
```

isAvailable()

Returns `true` if the session cache is available for use. The session cache isn't available when an active session isn't present, such as in asynchronous Apex or code called by asynchronous Apex. For example, if batch Apex causes an Apex trigger to execute, the session cache isn't available in the trigger because the trigger runs in asynchronous context.

Signature

```
public static Boolean isAvailable()
```

Return Value

Type: Boolean

`true` if the session cache is available. Otherwise, `false`.

put(key, value)

Stores the specified key/value pair as a cached entry in the session cache. The `put` method can write only to the cache in your org's namespace.

Signature

```
public static void put(String key, Object value)
```

Parameters

key
Type: String

A string that uniquely identifies the value to be cached. For information about the format of the key name, see Usage.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

Return Value

Type: void

put(key, value, visibility)

Stores the specified key/value pair as a cached entry in the session cache and sets the cached value's visibility.

Signature

```
public static void put(String key, Object value, Cache.Visibility visibility)
```

Parameters

key
Type: String

A string that uniquely identifies the value to be cached. For information about the format of the key name, see Usage.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

visibility
Type: Cache.Visibility

Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

Return Value

Type: void

put(key, value, ttlSecs)

Stores the specified key/value pair as a cached entry in the session cache and sets the cached value's lifetime.

Signature

```
public static void put(String key, Object value, Integer ttlSecs)
```

Parameters

key
Type: String

A string that uniquely identifies the value to be cached. For information about the format of the key name, see Usage.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer

The amount of time, in seconds, to keep the cached value in the session cache. The cached values remain in the cache as long as the Salesforce session hasn't expired. The maximum value is 28,800 seconds or eight hours. The minimum value is 300 seconds or five minutes.

Return Value

Type: void

put(key, value, ttlSecs, visibility, immutable)

Stores the specified key/value pair as a cached entry in the session cache. This method also sets the cached value's lifetime, visibility, and whether it can be overwritten by another namespace.

Signature

```
public static void put(String key, Object value, Integer ttlSecs, cache.Visibility visibility, Boolean immutable)
```

Parameters

key
Type: String

A string that uniquely identifies the value to be cached. For information about the format of the key name, see Usage.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer

The amount of time, in seconds, to keep the cached value in the session cache. The cached values remain in the cache as long as the Salesforce session hasn't expired. The maximum value is 28,800 seconds or eight hours. The minimum value is 300 seconds or five minutes.

visibility
Type: Cache.Visibility

Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

immutable
Type: Boolean

Indicates whether the cached value can be overwritten by another namespace (`false`) or not (`true`).

Return Value

Type: void

`remove(key)`

Deletes the cached value corresponding to the specified key from the session cache.

Signature

```
public static Boolean remove(String key)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

Return Value

Type: Boolean

`true` if the cache value was successfully removed. Otherwise, `false`.

`remove(cacheBuilder, key)`

Deletes the cached value corresponding to the specified key from the session cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

Signature

```
public static Boolean remove(System.Type cacheBuilder, String key)
```

Parameters

cacheBuilder
Type: System.Type

The Apex class that implements the `CacheBuilder` interface.

key
Type: String

A case-sensitive string value that, combined with the class name corresponding to the *cacheBuilder* parameter, uniquely identifies a cached value.

Return Value

Type: Boolean

`true` if the cache value was successfully removed. Otherwise, `false`.

SessionPartition Class

Contains methods to manage cache values in the session cache of a specific partition.

Namespace

Cache

Usage

This class extends Cache.Partition and inherits all of its non-static methods. Utility methods for creating and validating keys are not supported and can be called only from the `Cache.Partition` parent class. For a list of `Cache.Partition` methods, see Partition Methods.

To get a session partition, call `Cache.Session.getPartition` and pass in a fully qualified partition name, as follows.

```
Cache.SessionPartition sessionPartition =
Cache.Session.getPartition('namespace.myPartition');
```

See Cache Key Format for Partition Methods.

Example

This class is the controller for a sample Visualforce page (shown in the subsequent code sample). The controller shows how to use the methods of `Cache.SessionPartition` to manage a cache value on a particular partition. The controller takes inputs from the Visualforce page for the partition name, key name for a counter, and initial counter value. The controller contains default values for these inputs. When you click **Rerender** on the Visualforce page, the `go()` method is invoked and increases the counter by one. When you click **Remove Key**, the counter key is removed from the cache. The counter value gets reset to its initial value when it's re-added to the cache.

```
public class SessionPartitionController {

   // Name of a partition in the local namespace
   String partitionInput = 'local.myPartition';
   // Name of the key
   String counterKeyInput = 'counter';
   // Key initial value
   Integer counterInitValue = 0;
   // Session partition object
   Cache.SessionPartition sessionPartition;

    // Constructor of the controller for the Visualforce page.
    public SessionPartitionController() {
    }

    // Adds counter value to the cache.
    // This method is called when the Visualforce page loads.
    public void init() {
        // Create the partition instance based on the partition name
        sessionPartition = getPartition();

        // Add counter to the cache with an initial value
        //  or increment it if it's already there.
```

```
        if (!sessionPartition.contains(counterKeyInput)) {
            sessionPartition.put(counterKeyInput, counterInitValue);
        } else {
            sessionPartition.put(counterKeyInput, getCounter() + 1);
        }
    }

    // Returns the session partition based on the partition name
    // given in the Visualforce page or the default value.
    private Cache.SessionPartition getPartition() {
       if (sessionPartition == null) {
            sessionPartition = Cache.Session.getPartition(partitionInput);
       }

       return sessionPartition;
     }

    // Return counter from the cache.
    public Integer getCounter() {
        return (Integer)getPartition().get(counterKeyInput);
    }

    // Invoked by the Submit button to save input values
    //  supplied by the user.
    public PageReference save() {
        // Reset the initial key value in the cache
        getPartition().put(counterKeyInput, counterInitValue);

        return null;
    }

    // Method invoked by the Rerender button on the Visualforce page.
    // Updates the values of various cached values.
    // Increases the values of counter and the MyData counter if those
    //   cache values are still in the cache.
    public PageReference go() {
        // Get the partition object
        sessionPartition = getPartition();
        // Increase the cached counter value or set it to 0
        //  if it's not cached.
        if (sessionPartition.contains(counterKeyInput)) {
            sessionPartition.put(counterKeyInput, getCounter() + 1);
        } else {
            sessionPartition.put(counterKeyInput, counterInitValue);
        }

        return null;
    }

    // Method invoked by the Remove button on the Visualforce page.
    // Removes the datetime cached value from the session cache.
    public PageReference remove() {
        getPartition().remove(counterKeyInput);
```

```
        return null;
    }

    // Get and set methods for accessing variables
    // that correspond to the input text fields on
    // the Visualforce page.
    public String getPartitionInput() {
        return partitionInput;
    }

    public String getCounterKeyInput() {
        return counterKeyInput;
    }

    public Integer getCounterInitValue() {
        return counterInitValue;
    }

    public void setPartitionInput(String partition) {
        this.partitionInput = partition;
    }

    public void setCounterKeyInput(String keyName) {
        this.counterKeyInput = keyName;
    }

    public void setCounterInitValue(Integer counterValue) {
        this.counterInitValue = counterValue;
    }
}
```

This is the Visualforce page that corresponds to the `SessionPartitionController` class.

```
<apex:page controller="SessionPartitionController" action="{!init}">

    <apex:form >
        <br/>Partition with Namespace Prefix: <apex:inputText value="{!partitionInput}"/>

        <br/>Counter Key Name: <apex:inputText value="{!counterKeyInput}"/>
        <br/>Counter Initial Value: <apex:inputText value="{!counterInitValue}"/>
        <apex:commandButton action="{!save}" value="Save Key Input Values"/>
    </apex:form>

    <apex:outputPanel id="output">
        <br/>Cached Counter: <apex:outputText value="{!counter}"/>
    </apex:outputPanel>

    <br/>
    <apex:form >
        <apex:commandButton id="go" action="{!go}" value="Rerender" rerender="output"/>
        <apex:commandButton id="remove" action="{!remove}" value="Remove Key"
rerender="output"/>
    </apex:form>
```

```
</apex:page>
```

Apex Developer Guide: Platform Cache

Cache Exceptions

The `Cache` namespace contains exception classes.

All exception classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions on page 2885 in the *Apex Developer Guide*.

The `Cache` namespace contains these exceptions.

Exception	Thrown when
`Cache.Session.SessionCacheException`	An error occurred while adding or retrieving a value in the session cache.
`Cache.Session.SessionCacheNoSessionException`	An attempt is made to access the cache when the session cache isn't available.
`Cache.Org.OrgCacheException`	An attempt is made to access a partition that doesn't exist or whose name is invalid.
`Cache.InvalidParamException`	An invalid parameter value is passed into a method of `Cache.Session` or `Cache.Org`. This error occurs when: • The key referenced is null or empty or is not alphanumeric. • The key isn't qualified with the namespace and partition in the format `<namespace>.<partition>.<key>`. • The key isn't qualified in the format `<key>` for the default partition, or for a key inserted through the partition object. • The namespace referenced is null or empty. • The partition name is null or empty or is not alphanumeric. • Another referenced value is null.
`Cache.ItemSizeLimitExceededException`	A cache `put` call is made with an item that exceeds the maximum size limit. To fix this error, break the item into multiple, smaller items.
`Cache.BulkApiKeysLimitExceededException`	The number of key parameters passed into a bulk method - `get(keys)` or `contains(setOfKeys)` exceeds the maximum limit of 10.
`Cache.PlatformCacheInvalidOperationException`	A cache `put` or `remove` call is made that is not allowed. For example, when calling `put` or `remove` inside a Visualforce constructor.
`Cache.CacheBuilderExecutionException`	This error occurs when the execution of the CacheBuilder fails; this could be due to an error in parsing, a permissions error while accessing records, or an issue with Apex callouts.

Exception	Thrown when
`Cache.InvalidCacheBuilderException`	A `get(CacheBuilder cb, String key)`, `remove(CacheBuilder cb, String key)`, or `validateCacheBuilder(CacheBuilder cb)` method is called but the `cb` parameter is a class that does not implement the `Cache.CacheBuilder` interface.

Visibility Enum

Use the `Cache.Visibility` enumeration in the `Cache.Session` or `Cache.Org` methods to indicate whether a cached value is visible only in the value's namespace or in all namespaces.

Enum Values

The following are the values of the `Cache.Visibility` enum.

Value	Description
`ALL`	The cached value is available to Apex code executing from any namespace. This is the default state.
`NAMESPACE`	The cached value is available to Apex code executing from the same namespace. If a key has the `Visibility.NAMESPACE` attribute, a `get` method initiated from a different namespace returns `null`.

Canvas Namespace

The `Canvas` namespace provides an interface and classes for canvas apps in Salesforce.

The following are the interfaces and classes in the `Canvas` namespace.

IN THIS SECTION:

ApplicationContext Interface

Use this interface to retrieve application context information, such as the application version or URL.

CanvasLifecycleHandler Interface

Implement this interface to control context information and add custom behavior during the application render phase.

ContextTypeEnum Enum

Describes context data that can be excluded from canvas app context data. You specify which context types to exclude in the `excludeContextTypes()` method in your `CanvasLifecycleHandler` implementation.

EnvironmentContext Interface

Use this interface to retrieve environment context information, such as the app display location or the configuration parameters.

RenderContext Interface

A wrapper interface that is used to retrieve application and environment context information.

Test Class

Contains methods for automated testing of your Canvas classes.

Canvas Exceptions

The `Canvas` namespace contains exception classes.

ApplicationContext Interface

Use this interface to retrieve application context information, such as the application version or URL.

Namespace

Canvas

Usage

The `ApplicationContext` interface provides methods to retrieve application information about the canvas app that's being rendered. Most of the methods are read-only. For this interface, you don't need to create an implementation. Use the default implementation that Salesforce provides.

IN THIS SECTION:

ApplicationContext Methods

ApplicationContext Methods

The following are methods for `ApplicationContext`.

IN THIS SECTION:

getCanvasUrl()

Retrieves the fully qualified URL of the canvas app.

getDeveloperName()

Retrieves the internal API name of the canvas app.

getName()

Retrieves the name of the canvas app.

getNamespace()

Retrieves the namespace prefix of the canvas app.

getVersion()

Retrieves the current version of the canvas app.

setCanvasUrlPath(newPath)

Overrides the URL of the canvas app for the current request.

`getCanvasUrl()`

Retrieves the fully qualified URL of the canvas app.

Signature

```
public String getCanvasUrl()
```

Return Value

Type: String

Usage

Use this method to get the URL of the canvas app, for example: `http://instance.salesforce.com:8080/canvas_app_path/canvas_app.jsp`.

`getDeveloperName()`

Retrieves the internal API name of the canvas app.

Signature

```
public String getDeveloperName()
```

Return Value

Type: String

Usage

Use this method to get the API name of the canvas app. You specify this value in the `API Name` field when you expose the canvas app by creating a connected app.

`getName()`

Retrieves the name of the canvas app.

Signature

```
public String getName()
```

Return Value

Type: String

Usage

Use this method to get the name of the canvas app.

`getNamespace()`

Retrieves the namespace prefix of the canvas app.

Signature

```
public String getNamespace()
```

Return Value

Type: String

Usage

Use this method to get the Salesforce namespace prefix that's associated with the canvas app.

`getVersion()`

Retrieves the current version of the canvas app.

Signature

```
public String getVersion()
```

Return Value

Type: String

Usage

Use this method to get the current version of the canvas app. This value changes after you update and republish a canvas app in an organization. If you are in a Developer Edition organization, using this method always returns the latest version.

`setCanvasUrlPath(newPath)`

Overrides the URL of the canvas app for the current request.

Signature

```
public void setCanvasUrlPath(String newPath)
```

Parameters

`newPath`
Type: String

The URL (not including domain) that you need to use to override the canvas app URL.

Return Value

Type: Void

Usage

Use this method to override the URL path and query string of the canvas app. Do not provide a fully qualified URL, because the provided URL string will be appended to the original canvas URL domain.

For example, if the current canvas app URL is `https://myserver.com:6000/myAppPath` and you call `setCanvasUrlPath('/alternatePath/args?arg1=1&arg2=2')`, the adjusted canvas app URL will be `https://myserver.com:6000/alternatePath/args?arg1=1&arg2=2`.

If the provided path results in a malformed URL, or a URL that exceeds 2,048 characters, a System.CanvasException will be thrown.

This method overrides the canvas app URL for the current request and does not permanently change the canvas app URL as configured in the UI for the Salesforce canvas app settings.

CanvasLifecycleHandler Interface

Implement this interface to control context information and add custom behavior during the application render phase.

Namespace

Canvas

Usage

Use this interface to specify what canvas context information is provided to your app by implementing the `excludeContextTypes()` method. Use this interface to call custom code when the app is rendered by implementing the `onRender()` method.

If you provide an implementation of this interface, you must implement `excludeContextTypes()` and `onRender()`.

Example Implementation

The following example shows a simple implementation of CanvasLifecycleHandler that specifies that organization context information will be excluded and prints a debug message when the app is rendered.

```
public class MyCanvasListener
implements Canvas.CanvasLifecycleHandler{
    public Set<Canvas.ContextTypeEnum> excludeContextTypes(){
        Set<Canvas.ContextTypeEnum> excluded = new Set<Canvas.ContextTypeEnum>();
        excluded.add(Canvas.ContextTypeEnum.ORGANIZATION);
        return excluded;
    }

    public void onRender(Canvas.RenderContext renderContext){
        System.debug('Canvas lifecycle called.');
    }
}
```

IN THIS SECTION:

CanvasLifecycleHandler Methods

CanvasLifecycleHandler Methods

The following are methods for `CanvasLifecycleHandler`.

IN THIS SECTION:

excludeContextTypes()

Lets the implementation exclude parts of the CanvasRequest context, if the application does not need it.

onRender(renderContext)

Invoked when a canvas app is rendered. Provides the ability to set and retrieve canvas application and environment context information during the application render phase.

excludeContextTypes()

Lets the implementation exclude parts of the CanvasRequest context, if the application does not need it.

Signature

```
public Set<Canvas.ContextTypeEnum> excludeContextTypes()
```

Return Value

Type: SET<Canvas.ContextTypeEnum>

This method must return `null` or a set of zero or more ContextTypeEnum values. Returning `null` enables all attributes by default. ContextTypeEnum values that can be set are:

- Canvas.ContextTypeEnum.ORGANIZATION
- Canvas.ContextTypeEnum.RECORD_DETAIL
- Canvas.ContextTypeEnum.USER

See ContextTypeEnum on page 237 for more details on these values.

Usage

Implement this method to specify which attributes to disable in the context of the canvas app. A disabled attribute will set the associated canvas context information to null.

Disabling attributes can help improve performance by reducing the size of the signed request and canvas context. Also, disabled attributes do not need to be retrieved by Salesforce, which further improves performance.

See the *Canvas Developer Guide* for more information on context information in the Context object that's provided in the CanvasRequest.

Example

This example implementation specifies that the organization information will be disabled in the canvas context.

```
public Set<Canvas.ContextTypeEnum> excludeContextTypes() {
    Set<Canvas.ContextTypeEnum> excluded = new Set<Canvas.ContextTypeEnum>();
    excluded.add(Canvas.ContextTypeEnum.ORGANIZATION);
    return excluded;
}
```

`onRender(renderContext)`

Invoked when a canvas app is rendered. Provides the ability to set and retrieve canvas application and environment context information during the application render phase.

Signature

```
public void onRender(Canvas.RenderContext renderContext)
```

Parameters

`renderContext`
Type: Canvas.RenderContext

Return Value

Type: Void

Usage

If implemented, this method is called whenever the canvas app is rendered. The implementation can set and retrieve context information by using the provided Canvas.RenderContext.

This method is called whenever signed request or context information is retrieved by the client. See the *Canvas Developer Guide* for more information on signed request authentication.

Example

This example implementation prints 'Canvas lifecycle called.' to the debug log when the canvas app is rendered.

```
public void onRender(Canvas.RenderContext renderContext) {
    System.debug('Canvas lifecycle called.');
}
```

ContextTypeEnum Enum

Describes context data that can be excluded from canvas app context data. You specify which context types to exclude in the `excludeContextTypes()` method in your `CanvasLifecycleHandler` implementation.

Namespace

Canvas

Enum Values

Value	Description
`ORGANIZATION`	Exclude context information about the organization in which the canvas app is running.

Value	Description
`RECORD_DETAIL`	Exclude context information about the object record on which the canvas app appears.
`USER`	Exclude context information about the current user.

EnvironmentContext Interface

Use this interface to retrieve environment context information, such as the app display location or the configuration parameters.

Namespace

Canvas

Usage

The `EnvironmentContext` interface provides methods to retrieve environment information about the current canvas app. For this interface, you don't need to create an implementation. Use the default implementation that Salesforce provides.

IN THIS SECTION:

EnvironmentContext Methods

EnvironmentContext Methods

The following are methods for `EnvironmentContext`.

IN THIS SECTION:

addEntityField(fieldName)
Adds a field to the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that's placed on an object.

addEntityFields(fieldNames)
Adds a set of fields to the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that's placed on an object.

getDisplayLocation()
Retrieves the display location where the canvas app is being called from. For example, a value of Visualforce page.

getEntityFields()
Retrieves the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that's placed on an object.

getLocationUrl()
Retrieves the location URL of the canvas app.

getParametersAsJSON()
Retrieves the current custom parameters for the canvas app. Parameters are returned as a JSON string.

getSublocation()

Retrieves the display sublocation where the canvas app is being called from.

setParametersAsJSON(jsonString)

Sets the custom parameters for the canvas app.

addEntityField(fieldName)

Adds a field to the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that's placed on an object.

Signature

```
public void addEntityField(String fieldName)
```

Parameters

fieldName

Type: String

The object field name that you need to add to the list of returned fields., Using '*' adds all fields that the user has permission to view.

Return Value

Type: Void

Usage

When you use the `<apex:canvasApp>` component to display a canvas app on a Visualforce page, and that page is associated with an object (placed on the page layout, for example), you can specify fields to be returned from the related object. See the Canvas Developer Guide for more information on the Record object.

Use `addEntityField()` to add a field to the list of object fields that are returned in the signed request Record object. By default the list of fields includes ID. You can add fields by name or add all fields that the user has permission to view by calling `addEntityField('*')`.

You can inspect the configured list of fields by using Canvas.EnvironmentContext.`getEntityFields()`.

Example

This example adds the Name and BillingAddress fields to the list of object fields. This example assumes the canvas app will appear in a Visualforce page that's associated with the Account page layout.

```
Canvas.EnvironmentContext env = renderContext.getEnvironmentContext();

// Add Name and BillingAddress to fields (assumes we'll run from the Account detail page)
env.addEntityField('Name');
env.addEntityField('BillingAddress');
```

addEntityFields(fieldNames)

Adds a set of fields to the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that's placed on an object.

Signature

```
public void addEntityFields(Set<String> fieldNames)
```

Parameters

fieldNames
Type: SET<String>

The set of object field names that you need to add to the list of returned fields. If an item in the set is '*', all fields that the user has permission to view are added.

Return Value

Type: Void

Usage

When you use the `<apex:canvasApp>` component to display a canvas app on a Visualforce page, and that page is associated with an object (placed on the page layout, for example), you can specify fields to be returned from the related object. See the *Canvas Developer Guide* for more information on the Record object.

Use `addEntityFields()` to add a set of one or more fields to the list of object fields that are returned in the signed request Record object. By default the list of fields includes ID. You can add fields by name or add all fields that the user has permission to view by adding a set that includes '*' as one of the strings.

You can inspect the configured list of fields by using Canvas.EnvironmentContext.`getEntityFields()`.

Example

This example adds the Name, BillingAddress, and YearStarted fields to the list of object fields. This example assumes that the canvas app will appear in a Visualforce page that's associated with the Account page layout.

```
Canvas.EnvironmentContext env = renderContext.getEnvironmentContext();

// Add Name, BillingAddress and YearStarted to fields (assumes we'll run from the Account
 detail page)
Set<String> fields = new Set<String>{'Name','BillingAddress','YearStarted'};
env.addEntityFields(fields);
```

`getDisplayLocation()`

Retrieves the display location where the canvas app is being called from. For example, a value of Visualforce page.

Signature

```
public String getDisplayLocation()
```

Return Value

Type: String

The return value can be one of the following strings:

- Chatter—The canvas app was called from the Chatter tab.

- ChatterFeed—The canvas app was called from a Chatter canvas feed item.
- MobileNav—The canvas app was called from the navigation menu.
- OpenCTI—The canvas app was called from an Open CTI component.
- PageLayout—The canvas app was called from an element within a page layout. If the displayLocation is PageLayout, one of the subLocation values might be returned.
- Publisher—The canvas app was called from a canvas custom quick action.
- ServiceDesk—The canvas app was called from a Salesforce Console component.
- Visualforce—The canvas app was called from a Visualforce page.
- None—The canvas app was called from the Canvas App Previewer.

Usage

Use this method to obtain the display location for the canvas app.

getEntityFields()

Retrieves the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that's placed on an object.

Signature

```
public List<String> getEntityFields()
```

Return Value

Type: LIST<String>

Usage

When you use the `<apex:canvasApp>` component to display a canvas app on a Visualforce page, and that page is associated with an object (placed on the page layout, for example), you can specify fields to be returned from the related object. See the *Canvas Developer Guide* for more information on the Record object.

Use getEntityFields() to retrieve the list of object fields that are returned in the signed request Record object. By default the list of fields includes ID. The list of fields can be configured by using the Canvas.EnvironmentContext.`addEntityField(fieldName)` or Canvas.EnvironmentContext.`addEntityFields(fieldNames)` methods.

Example

This example gets the current list of object fields and retrieves each item in the list, printing each field name to the debug log.

```
Canvas.EnvironmentContext env = renderContext.getEnvironmentContext();

List<String> entityFields = env.getEntityFields();
for (String fieldVal : entityFields) {
    System.debug('Environment Context entityField: ' + fieldVal);
}
```

If the canvas app that's using this lifecycle code was run from the detail page of an Account, the debug log output might look like:

```
Environment Context entityField: Id
```

getLocationUrl()

Retrieves the location URL of the canvas app.

Signature

```
public String getLocationUrl()
```

Return Value

Type: String

Usage

Use this method to obtain the URL of the page where the user accessed the canvas app. For example, if the user accessed your app by clicking a link on the Chatter tab, this method returns the URL of the Chatter tab, which would be similar to 'https://*MyDomainName*.my.salesforce.com/_ui/core/chatter/ui/ChatterPage'.

getParametersAsJSON()

Retrieves the current custom parameters for the canvas app. Parameters are returned as a JSON string.

Signature

```
public String getParametersAsJSON()
```

Return Value

Type: String

Usage

Use this method to get the current custom parameters for the canvas app. The parameters are returned in a JSON string that can be de-serialized by using the System.JSON.`deserializeUntyped(jsonString)` method.

Custom parameters can be modified by using the Canvas.EnvironmentContext.`setParametersAsJSON(jsonString)` string.

Example

This example gets the current custom parameters, de-serializes them into a map, and prints the results to the debug log.

```
Canvas.EnvironmentContext env = renderContext.getEnvironmentContext();

// Get current custom params
Map<String, Object> currentParams =
    (Map<String, Object>) JSON.deserializeUntyped(env.getParametersAsJSON());
System.debug('Environment Context custom paramters: ' + currentParams);
```

getSublocation()

Retrieves the display sublocation where the canvas app is being called from.

Signature

```
public String getSublocation()
```

Return Value

Type: String

The return value can be one of the following strings:

- S1MobileCardFullview—The canvas app was called from a mobile card.
- S1MobileCardPreview—The canvas app was called from a mobile card preview. The user must click the preview to open the app.
- S1RecordHomePreview—The canvas app was called from a record detail page preview. The user must click the preview to open the app.
- S1RecordHomeFullview—The canvas app was called from a page layout.

Usage

Use this method to obtain the display sublocation for the canvas app. Use only if the primary display location can be displayed on mobile devices.

`setParametersAsJSON(jsonString)`

Sets the custom parameters for the canvas app.

Signature

```
public void setParametersAsJSON(String jsonString)
```

Parameters

`jsonString`
Type: String

The custom parameters that you need to set, serialized into a JSON format string.

Return Value

Type: Void

Usage

Use this method to set the current custom parameters for the canvas app. The parameters must be provided in a JSON string. You can use the System.JSON.`serialize(objectToSerialize)` method to serialize a map into a JSON string.

Setting the custom parameters will overwrite the custom parameters that are set for the current request. If you need to modify the current custom parameters, first get the current set of custom parameters by using `getParametersAsJSON()`, modify the retrieved parameter set as needed, and then use this modified set in your call to setParametersAsJSON().

If the provided JSON string exceeds 32KB, a System.CanvasException will be thrown.

Example

This example gets the current custom parameters, adds a new `newCustomParam` parameter with a value of 'TESTVALUE', and sets the current custom parameters.

```
Canvas.EnvironmentContext env = renderContext.getEnvironmentContext();

// Get current custom params
Map<String, Object> previousParams =
    (Map<String, Object>) JSON.deserializeUntyped(env.getParametersAsJSON());

// Add a new custom param
previousParams.put('newCustomParam','TESTVALUE');

// Now replace the parameters with the current parameters plus our new custom param
env.setParametersAsJSON(JSON.serialize(previousParams));
```

RenderContext Interface

A wrapper interface that is used to retrieve application and environment context information.

Namespace

Canvas

Usage

Use this interface to retrieve application and environment context information for your canvas app. For this interface, you don't need to create an implementation. Use the default implementation that Salesforce provides.

IN THIS SECTION:

RenderContext Methods

RenderContext Methods

The following are methods for `RenderContext`.

IN THIS SECTION:

getApplicationContext()
Retrieves the application context information.

getEnvironmentContext()
Retrieves the environment context information.

`getApplicationContext()`

Retrieves the application context information.

Signature

```
public Canvas.ApplicationContext getApplicationContext()
```

Return Value

Type: Canvas.ApplicationContext

Usage

Use this method to get the application context information for your canvas app.

Example

The following example implementation of the CanvasLifecycleHandler onRender() method uses the provided RenderContext to retrieve the application context information and then checks the namespace, version, and app URL.

```
public void onRender(Canvas.RenderContext renderContext){
    Canvas.ApplicationContext app = renderContext.getApplicationContext();
    if (!'MyNamespace'.equals(app.getNamespace())){
        // This application is installed, add code as needed
        ...
    }

    // Check the application version
    Double currentVersion = Double.valueOf(app.getVersion());

    if (currentVersion <= 5){
        // Add version specific code as needed
        ...
        // Tell the canvas application to operate in deprecated mode
        app.setCanvasUrlPath('/canvas?deprecated=true');
    }
}
```

`getEnvironmentContext()`

Retrieves the environment context information.

Signature

```
public Canvas.EnvironmentContext getEnvironmentContext()
```

Return Value

Type: Canvas.EnvironmentContext

Usage

Use this method to get the environment context information for your canvas app.

Example

The following example implementation of the CanvasLifecycleHandler onRender() method uses the provided RenderContext to retrieve the environment context information and then modifies the custom parameters.

```
public void onRender(Canvas.RenderContext renderContext) {
   Canvas.EnvironmentContext env =
        renderContext.getEnvironmentContext();

    // Retrieve the custom params
    Map<String, Object> previousParams = (Map<String, Object>)
          JSON.deserializeUntyped(env.getParametersAsJSON());

    previousParams.put('param1',1);
    previousParams.put('param2',3.14159);

    ...

    // Now, add in some opportunity record IDs
    Opportunity[] o = [select id, name from opportunity];
    previousParams.put('opportunities',o);

    // Now, replace the parameters
    env.setParametersAsJSON(JSON.serialize(previousParams));
}
```

Test Class

Contains methods for automated testing of your Canvas classes.

Namespace

Canvas

Usage

Use this class to test your implementation of Canvas.CanvasLifecycleHandler with mock test data. You can create a test Canvas.RenderContext with mock application and environment context data and use this data to verify that your CanvasLifecycleHandler is being invoked correctly.

IN THIS SECTION:

Test Constants

The Test class provides constants that are used as keys when you set mock application and environment context data.

Test Methods

The Test class provides methods for creating test contexts and invoking your CanvasLifecycleHandler with mock data.

Test Constants

The Test class provides constants that are used as keys when you set mock application and environment context data.

When you call Canvas.Test.`mockRenderContext(applicationContextTestValues, environmentContextTestValues)`, you need to provide maps of key-value pairs to represent your mock application and environment context data. The Test class provides static constant strings that you can use as keys for various parts of the application and environment context.

Constant	Description
`KEY_CANVAS_URL`	Represents the canvas app URL key in the ApplicationContext.
`KEY_DEVELOPER_NAME`	Represents the canvas app developer or API name key in the ApplicationContext.
`KEY_DISPLAY_LOCATION`	Represents the canvas app display location key in the EnvironmentContext.
`KEY_LOCATION_URL`	Represents the canvas app location URL key in the EnvironmentContext.
`KEY_NAME`	Represents the canvas app name key in the ApplicationContext.
`KEY_NAMESPACE`	Represents the canvas app namespace key in the ApplicationContext.
`KEY_SUB_LOCATION`	Represents the canvas app sublocation key in the EnvironmentContext.
`KEY_VERSION`	Represents the canvas app version key in the ApplicationContext.

Test Methods

The Test class provides methods for creating test contexts and invoking your CanvasLifecycleHandler with mock data.

The following are methods for `Test`. All are static methods.

IN THIS SECTION:

mockRenderContext(applicationContextTestValues, environmentContextTestValues)
Creates and returns a test Canvas.RenderContext based on the provided application and environment context parameters.

testCanvasLifecycle(lifecycleHandler, mockRenderContext)
Calls the canvas test framework to invoke a CanvasLifecycleHandler with the provided RenderContext.

`mockRenderContext(applicationContextTestValues, environmentContextTestValues)`

Creates and returns a test Canvas.RenderContext based on the provided application and environment context parameters.

Signature

```
public static Canvas.RenderContext mockRenderContext(Map<String,String>
applicationContextTestValues, Map<String,String> environmentContextTestValues)
```

Parameters

`applicationContextTestValues`
Type: Map<String,String>

Specifies a map of key-value pairs that provide mock application context data. Use constants that are provided by Canvas.Test as keys. If `null` is provided for this parameter, the canvas framework generates some default mock application context values.

environmentContextTestValues
Type: Map<String,String>

Specifies a map of key-value pairs that provide mock environment context data. Use constants provided by Canvas.Test as keys. If `null` is provided for this parameter, the canvas framework generates some default mock environment context values.

Return Value

Type: Canvas.RenderContext

Usage

Use this method to create a mock Canvas.RenderContext. Use the returned RenderContext in calls to Canvas.Test.`testCanvasLifecycle(lifecycleHandler, mockRenderContext)` for testing Canvas.CanvasLifecycleHandler implementations.

Example

The following example creates maps to represent mock application and environment context data and generates a test Canvas.RenderContext. This test RenderContext can be used in a call to Canvas.Test.`testCanvasLifecycle(lifecycleHandler, mockRenderContext)`.

```
Map<String,String> appValues = new Map<String,String>();
appValues.put(Canvas.Test.KEY_NAMESPACE,'alternateNamespace');
appValues.put(Canvas.Test.KEY_VERSION,'3.0');

Map<String,String> envValues = new Map<String,String>();
envValues.put(Canvas.Test.KEY_DISPLAY_LOCATION,'Chatter');
envValues.put(Canvas.Test.KEY_LOCATION_URL,'https://MyDomainName.my.salesforce.com/_ui/core/chatter/ui/ChatterPage');

Canvas.RenderContext mock = Canvas.Test.mockRenderContext(appValues,envValues);
```

testCanvasLifecycle(lifecycleHandler, mockRenderContext)

Calls the canvas test framework to invoke a CanvasLifecycleHandler with the provided RenderContext.

Signature

```
public static Void testCanvasLifecycle(Canvas.CanvasLifecycleHandler
lifecycleHandler,Canvas.RenderContext mockRenderContext)
```

Parameters

lifecycleHandler
Type: Canvas.CanvasLifecycleHandler

Specifies the CanvasLifecycleHandler implementation that you need to invoke.

mockRenderContext
Type: Canvas.RenderContext

Specifies the RenderContext information that you need to provide to the invoked CanvasLifecycleHandler. If `null` is provided for this parameter, the canvas framework generates and uses a default mock RenderContext.

Return Value

Type: Void

Usage

Use this method to invoke an implementation of Canvas.CanvasLifecycleHandler.onRender(renderContext) with a mock Canvas.RenderContext that you provide.

Example

The following example creates maps to represent mock application and environment context data and generates a test Canvas.RenderContext. This test RenderContext is then used to invoke a Canvas.CanvasLifecycleHandler.

```
// Set some application context data in a Map
Map<String,String> appValues = new Map<String,String>();
appValues.put(Canvas.Test.KEY_NAMESPACE,'alternateNamespace');
appValues.put(Canvas.Test.KEY_VERSION,'3.0');

// Set some environment context data in a MAp
Map<String,String> envValues = new Map<String,String>();
envValues.put(Canvas.Test.KEY_DISPLAY_LOCATION,'Chatter');
envValues.put(Canvas.Test.KEY_LOCATION_URL,'https://MyDomainName.my.salesforce.com/_ui/core/chatter/ui/ChatterPage');

// Create a mock RenderContext using the test application and environment context data
Maps
Canvas.RenderContext mock = Canvas.Test.mockRenderContext(appValues,envValues);

// Set some custom params on the mock RenderContext
mock.getEnvironmentContext().setParametersAsJSON('{\"param1\":1,\"boolParam\":true,\"stringParam\":\"test
 string\"}');

// Use the mock RenderContext to invoke a CanvasLifecycleHandler
Canvas.Test.testCanvasLifecycle(handler,mock)
```

Canvas Exceptions

The Canvas namespace contains exception classes.

All exception classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions.

The Canvas namespace contains this exception:

Exception	Description
Canvas.CanvasRenderException	Use this class in your implementation of Canvas.CanvasLifecycleHandler.onRender(renderContext). To show an error to the user in your onRender() implementation, throw a Canvas.CanvasRenderException, and the canvas framework will render the error message to the user. This exception will be managed only within the onRender() method.

Example

The following example implementation of `onRender()` catches a CanvasException that was thrown because a canvas URL was set with a string that exceeded the maximum length. A CanvasRenderException is created and thrown to display the error to the user.

```
public class MyCanvasListener
implements Canvas.CanvasLifecycleHandler {

    public void onRender(Canvas.RenderContext renderContext) {
        Canvas.ApplicationContext app = renderContext.getApplicationContext();

        // Code to generate a URL string that is too long

        // ...

        // Try to set the canvas app URL using the invalid URL string
        try {
            app.setCanvasUrlPath(aUrlPathThatIsTooLong);
        } catch (CanvasException e) {
            // Display error to user by throwing a new CanvasRenderException
            throw new Canvas.CanvasRenderException(e.getMessage());
        }
    }
}
```

See the *Canvas Developer Guide* for additional examples that use CanvasRenderException.

ChatterAnswers Namespace

The `ChatterAnswers` namespace provides an interface for creating Account records.

The following is the interface in the `ChatterAnswers` namespace.

IN THIS SECTION:

AccountCreator Interface
Creates Account records that will be associated with Chatter Answers users.

AccountCreator Interface

Creates Account records that will be associated with Chatter Answers users.

Namespace

ChatterAnswers

Usage

The `ChatterAnswers.AccountCreator` is specified in the `registrationClassName` attribute of a `chatteranswers:registration` Visualforce component. This interface is called by Chatter Answers and allows for custom creation of Account records used for portal users.

To implement the `ChatterAnswers.AccountCreator` interface, you must first declare a class with the `implements` keyword as follows:

```
public class ChatterAnswersRegistration implements ChatterAnswers.AccountCreator {
```

Next, your class must provide an implementation for the following method:

```
public String createAccount(String firstname, String lastname, Id siteAdminId) {
    // Your code here
}
```

The implemented method must be declared as `global` or `public`.

IN THIS SECTION:

AccountCreator Methods

AccountCreator Example Implementation

AccountCreator Methods

The following are methods for `AccountCreator`.

IN THIS SECTION:

createAccount(firstName, lastName, siteAdminId)

Accepts basic user information and creates an Account record. The implementation of this method returns the account ID.

`createAccount(firstName, lastName, siteAdminId)`

Accepts basic user information and creates an Account record. The implementation of this method returns the account ID.

Signature

```
public String createAccount(String firstName, String lastName, Id siteAdminId)
```

Parameters

`firstName`
Type: String

The first name of the user who is registering.

`lastName`
Type: String

The last name of the user who is registering.

`siteAdminId`
Type: ID

The user ID of the Site administrator, used for notification if any exceptions occur.

Return Value

Type: String

AccountCreator Example Implementation

This is an example implementation of the `ChatterAnswers.AccountCreator` interface. The `createAccount` method implementation accepts user information and creates an Account record. The method returns a String value for the Account ID.

```
public class ChatterAnswersRegistration implements ChatterAnswers.AccountCreator {
    public String createAccount(String firstname, String lastname, Id siteAdminId) {
        Account a = new Account(name = firstname + ' ' + lastname, ownerId = siteAdminId);

         insert a;
         return a.Id;
    }
}
```

This example tests the code above.

```
@isTest
private class ChatterAnswersCreateAccountTest {
    static testMethod void validateAccountCreation() {
        User[] user = [SELECT Id, Firstname, Lastname from User];
        if (user.size() == 0) { return; }
        String firstName = user[0].FirstName;
        String lastName = user[0].LastName;
        String userId = user[0].Id;
        String accountId = new ChatterAnswersRegistration().createAccount(firstName,
lastName, userId);
        Account acct = [SELECT name, ownerId from Account where Id =: accountId];
        System.assertEquals(firstName + ' ' + lastName, acct.name);
        System.assertEquals(userId, acct.ownerId);
  }
}
```

CommercePayments Namespace

Use the `CommercePayments` namespace to provide a safe and customizable platform for managing customer payments and refunds.

To review `CommercePayments` use cases and walkthroughs, go to Use Cases for the CommercePayments Namespace.

The following are the classes in the `CommercePayments` namespace.

IN THIS SECTION:

AbstractResponse Class

Contains the normalized response fields from payment gateways that are common to all the other gateway responses.

AddressRequest Class

Contains address request data that is sent to a gateway adapter during a service call.

AuditParamsRequest

`AuditParamsRequest` is used for audit parameters in a transaction request. This is an abstract request class that is extended by the `BaseRequest` class.

AbstractTransactionResponse Class

Abstract class for storing normalized information sent from payment gateways about a payment transaction. Holds the common response fields sent from payment gateways for authorization, sale, capture, and refund transactions.

AuthApiPaymentMethodRequest Class

Sends information about a payment method to a gateway adapter during an authorization service call.

AuthorizationReversalRequest Class

Sends information about an authorization reversal request to a gateway adapter during a service call.

AuthorizationReversalResponse Class

Response sent by the payment gateway following a payment authorization reversal service.

AuthorizationRequest Class

Sends information about an authorization request to a gateway adapter during a service call.

AuthorizationResponse Class

Response sent by the payment gateway adapter for an authorization service.

BaseApiPaymentMethodRequest Class

Abstract class used to send information about a payment method to a gateway adapter during a service call.

BaseNotification Class

Abstract class for storing notification information sent from payment gateways.

BasePaymentMethodRequest Class

Abstract class for storing information about payment methods.

BaseRequest Class

`BaseRequest` is extended by all the request classes.

CaptureNotification Class

When a payment gateway sends a notification for a capture transaction, the payment gateway adapter creates the `CaptureNotification` object to store information about the notification.

CaptureRequest Class

Represents a capture request. This class extends the `BaseRequest` class and inherits all its methods.

CaptureResponse Class

The payment gateway adapter sends this response for the capture request type. This class extends `AbstractResponse` and inherits its methods.

CardCategory Enum

Defines whether the payment method represents a credit card or a debit card.

CardPaymentMethodRequest Class

Sends data related to a card payment method to a gateway adapter during a service call.

CustomMetadataTypeInfo Class

Access information about custom metadata. The `PaymentGatewayAdapter` can send `CustomMetadataTypeInfo` to transaction requests through the response object's `SalesforceResultCodeInfo`.

GatewayErrorResponse Class

Use to respond with an error indication following errors from the `PaymentGateway` adapter, such as request-forbidden responses, custom validation errors, or expired API tokens.

GatewayNotificationResponse Class

When the payment gateway sends a notification to the payments platform, the platform responds with a `GatewayNotificationResponse` indicating whether the platform succeeded or failed at receiving the notification.

GatewayResponse Interface

Generic payment gateway response interface. This class extends the `CaptureResponse` on page 308, `AbstractTransactionResponse` on page 264, and `AbstractResponse` on page 255 classes and inherits all their properties. It has no unique methods or parameters.

NotificationClient Class

Communicates with the payment platform regarding the gateway's notification.

NotificationSaveResult Class

Contains the result of the payment platform's attempt to record data from the gateway's notification.

NotificationStatus Enum

Shows whether the payments platform successfully received the notification from the gateway.

PaymentGatewayAdapter Interface

`PaymentGatewayAdapters` can implement this interface in order to process requests.

PaymentGatewayAsyncAdapter Interface

Implement the interface to allow customers to process payments asynchronously.

PaymentGatewayContext Class

Wraps the information related to a payment request.

PaymentGatewayNotificationContext Class

Wraps the information related to a gateway notification.

PaymentMethodTokenizationRequest Class

Stores data about a request to tokenize a card payment method. The tokenization process occurs in the payment gateway. This process replaces sensitive customer data, such as a card number or CVV, with unique identification symbols. The symbols are used while the data is handled by Salesforce, the payment gateway, and the customer bank, allowing Salesforce to store the token without storing sensitive customer data.

PaymentMethodTokenizationResponse Class

Gateway response sent by payment gateway adapters for the payment method tokenization request. The response includes the payment method's token ID value.

PaymentGatewayNotificationRequest Class

Contains the notification request data from the gateway.

PaymentsHttp Class

Makes an HTTP request to start the interaction with the payment gateway.

RefundRequest Class

Sends data related to a refund to the payment gateway adapter.

ReferencedRefundNotification Class

When a payment gateway sends a notification for a refund transaction, the payment gateway adapter creates the `ReferencedRefundNotification` object to store information about notification.

ReferencedRefundRequest

Access information about the referenced refund requests. Extends the `RefundRequest` class.

ReferencedRefundResponse Class

The payment gateway adapter sends this response for the `ReferencedRefund` request type.

RequestType Enum

Defines the type of payment transaction request made to the payment gateway.

SaleApiPaymentMethodRequest Class

Sends data related to a card payment method to a gateway adapter during a sale service call.

SaleRequest Class

Stores information about a sales request.

SaleResponse Class

Response sent by payment gateway adapters for a sales service.

SalesforceResultCode Enum

Defines the gateway call status values in Salesforce based on the call status values that the payment gateway returned.

SalesforceResultCodeInfo

Stores Salesforce result code information from payment gateway adapters.

AbstractResponse Class

Contains the normalized response fields from payment gateways that are common to all the other gateway responses.

Namespace

CommercePayments

Usage

You must specify the `CommercePayments` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```
CommercePayments.AbstractResponse abr = new CommercePayments.AbstractResponse();
```

This class can't be instantiated on its own. This class implements the GatewayResponse class. Other GatewayResponse classes extend this class to inherit common properties.

IN THIS SECTION:

AbstractResponse Methods

AbstractResponse Methods

The following are methods for `AbstractResponse`.

IN THIS SECTION:

setGatewayAvsCode(gatewayAvsCode)

Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)

Sets the date that the transaction occurred. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the payment request. Maximum length of 255 characters.

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

`setGatewayAvsCode(gatewayAvsCode)`

Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

Signature

```
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

gatewayAvsCode

Type: String

Code sent by gateways that use an address verification system.

Return Value

Type: void

`setGatewayDate(gatewayDate)`

Sets the date that the transaction occurred. Some gateways don't send this value.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate

Type: Datetime

Date and time of the gateway communication.

Return Value

Type: void

`setGatewayMessage(gatewayMessage)`

Sets error messages that the gateway returned for the payment request. Maximum length of 255 characters.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Information on error messages sent from the gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Must be used to map a Salesforce-specific result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the gateway's result code. Use this field to learn more about why the gateway returned a certain result code.

Return Value

Type: void

`setSalesforceResultCodeInfo(salesforceResultCodeInfo)`

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

`salesforceResultCodeInfo`
Type: commercepayments.SalesforceResultCodeInfo on page 376

Description of the Salesforce result code value.

Return Value

Type: void

AddressRequest Class

Contains address request data that is sent to a gateway adapter during a service call.

Namespace

CommercePayments

Usage

Contains information about the payment method's address. Use this information in authorization, sale, and tokenization requests. The payment gateway adapter uses information in an AddressRequest object to construct a JSON request to send to the payment gateway.

The constructor of this class takes no arguments. For example:

```
CommercePayments.AddressRequest adr = new CommercePayments.AddressRequest();
```

IN THIS SECTION:

AddressRequest Constructors

AddressRequest Properties

AddressRequest Methods

AddressRequest Constructors

The following are constructors for `AddressRequest`.

IN THIS SECTION:

AddressRequest(street, city, state, country, postalCode)
Constructs a sample address. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

AddressRequest(street, city, state, country, postalCode)

Constructs a sample address. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global AddressRequest(String street, String city, String state, String country, String postalCode)
```

Parameters

street
Type: String

Street for the payment method's address.

city
Type: String

City for the payment method's address.

state
Type: String

State for the payment method's address.

country
Type: String

Country for the payment method's address.

postalCode
Type: String

Postal code for the payment method's address.

AddressRequest Properties

The following are properties for `AddressRequest`.

IN THIS SECTION:

city
City of the payment method address.

companyName
Company name of the payment method address.

country
Country for the payment method address.

postalCode
Postal code for the payment method address.

state
State for the payment method address.

street
Street for the payment method address.

city

City of the payment method address.

Signature

```
global String city {get; set;}
```

Property Value

Type: String

companyName

Company name of the payment method address.

Signature

```
global String companyName {get; set;}
```

Property Value

Type: String

country

Country for the payment method address.

Signature

```
global String country {get; set;}
```

Property Value

Type: String

postalCode

Postal code for the payment method address.

Signature

```
global String postalCode {get; set;}
```

Property Value

Type: String

`state`

State for the payment method address.

Signature

```
global String state {get; set;}
```

Property Value

Type: String

`street`

Street for the payment method address.

Signature

```
global String street {get; set;}
```

Property Value

Type: String

AddressRequest Methods

The following are methods for `AddressRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `AddressRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type `AddressRequest`.

toString()
Converts a date to a string.

`equals(obj)`

Maintains the integrity of lists of type `AddressRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `AddressRequest`.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

AuditParamsRequest

`AuditParamsRequest` is used for audit parameters in a transaction request. This is an abstract request class that is extended by the `BaseRequest` class.

Namespace

CommercePayments

Usage

`AuditParamsRequest` is an abstract class that holds attributes related to audit parameters such as email, IP address, MAC address, and phone number. This class can't be instantiated on its own. All `CommercePayments` request classes extend this class.

IN THIS SECTION:

AuditParamsRequest Constructors

AuditParamsRequest Properties

AuditParamsRequest Constructors

The following are constructors for `AuditParamsRequest`.

IN THIS SECTION:

AuditParamsRequest(email, macAddress, ipAddress, phone)
This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`AuditParamsRequest(email, macAddress, ipAddress, phone)`

This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
AuditParamsRequest(String email, String macAddress, String ipAddress, String phone)
```

Parameters

email
Type: String

Email of the client that initiated the request.

macAddress
Type: String

Mac address of the customer's device. Gateways often use this data in risk checks.

ipAddress
Type: String

The customer's IP address. Gateways often use this data in risk checks.

phone
Type: String

Phone number of the client that initiated the request.

AuditParamsRequest Properties

The following are properties for `AuditParamsRequest`.

IN THIS SECTION:

email
Email of the client that initiated the request.

ipAddress
The customer's IP address. Gateways often use this data in risk checks.

macAddress
Mac address of the customer's device. Gateways often use this data in risk checks.

phone
Phone number of the client that initiated the request.

email

Email of the client that initiated the request.

Property Value

Type: String

ipAddress

The customer's IP address. Gateways often use this data in risk checks.

Property Value

Type: String

macAddress

Mac address of the customer's device. Gateways often use this data in risk checks.

Property Value

Type: String

phone

Phone number of the client that initiated the request.

Property Value

Type: String

AbstractTransactionResponse Class

Abstract class for storing normalized information sent from payment gateways about a payment transaction. Holds the common response fields sent from payment gateways for authorization, sale, capture, and refund transactions.

Namespace

CommercePayments

Usage

Specify the `CommercePayments` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```
CommercePayments.AbstractTransactionResponse atr = new
CommercePayments.AbstractTransactionResponse();
```

IN THIS SECTION:

AbstractTransactionResponse Methods

AbstractTransactionResponse Methods

The following are methods for `AbstractTransactionResponse`.

IN THIS SECTION:

setAmount(amount)
Sets the transaction amount. Must be a non-negative value.

setGatewayAvsCode(gatewayAvsCode)
Sets the AVS (address verification system) result code that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)
Sets the date that the notification occurred. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)
Sets error messages that the gateway returned for the notification request. Maximum length of 255 characters.

setGatewayReferenceDetails(gatewayReferenceDetails)
Sets the payment gateway's reference details.

setGatewayReferenceNumber(gatewayReferenceNumber)
Sets the payment gateway's reference number.

setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. You can map the result code to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the Salesforce-specific result code information.

`setAmount(amount)`

Sets the transaction amount. Must be a non-negative value.

Signature

```
global void setAmount(Double amount)
```

Parameters

amount
Type: Double

The amount of the transaction.

Return Value

Type: void

setGatewayAvsCode(gatewayAvsCode)

Sets the AVS (address verification system) result code that the gateway returned. Maximum length of 64 characters.

Signature

```
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

gatewayAvsCode
Type: String

Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.

Return Value

Type: void

setGatewayDate(gatewayDate)

Sets the date that the notification occurred. Some gateways don't send this value.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

The date that the transaction occurred.

Return Value

Type: void

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the notification request. Maximum length of 255 characters.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

The message that the gateway returned with the transaction request. Contains additional information about the transaction.

Return Value

Type: void

setGatewayReferenceDetails(gatewayReferenceDetails)

Sets the payment gateway's reference details.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

gatewayReferenceDetails
Type: String

Provides information about the gateway communication.

Return Value

Type: void

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the payment gateway's reference number.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique transaction ID created by the payment gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. You can map the result code to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Must be mapped to a Salesforce-specific result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Provides additional information about the result code and why the gateway returned the specific code. Descriptions vary between different gateways.

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
Type: commercepayments.SalesforceResultCodeInfo on page 376

Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Return Value

Type: void

AuthApiPaymentMethodRequest Class

Sends information about a payment method to a gateway adapter during an authorization service call.

Namespace

CommercePayments

Usage

Contains information about the payment method that is used for an authorization request. It contains all available payment methods as fields, but populates only one field for each request. The gateway adapter uses this class when constructing an authorization request. An object of this class is available through the `paymentMethod` field on the `AuthorizationRequest Class` object.

IN THIS SECTION:

AuthApiPaymentMethodRequest Constructors

AuthApiPaymentMethodRequest Properties

AuthApiPaymentMethodRequest Constructors

The following are constructors for `AuthApiPaymentMethodRequest`.

IN THIS SECTION:

AuthApiPaymentMethodRequest(cardPaymentMethodRequest)

Constructs a sample `cardPaymentMethodRequest`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

AuthApiPaymentMethodRequest()

Constructor for `AuthApiPaymentMethodRequest`.

`AuthApiPaymentMethodRequest(cardPaymentMethodRequest)`

Constructs a sample `cardPaymentMethodRequest`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global AuthApiPaymentMethodRequest(commercepayments.CardPaymentMethodRequest
cardPaymentMethodRequest)
```

Parameters

cardPaymentMethodRequest
Type: commercepayments.CardPaymentMethodRequest on page 314

Contains information about the card payment method. Used to send information to a gateway adapter during a service call.

AuthApiPaymentMethodRequest()

Constructor for AuthApiPaymentMethodRequest.

Signature

```
global AuthApiPaymentMethodRequest()
```

AuthApiPaymentMethodRequest Properties

The following are properties for AuthApiPaymentMethodRequest.

IN THIS SECTION:

cardPaymentMethod
The card payment method object used in a payment method request.

cardPaymentMethod

The card payment method object used in a payment method request.

Signature

```
global commercepayments.CardPaymentMethodRequest cardPaymentMethod {get; set;}
```

Property Value

Type: commercepayments.CardPaymentMethodRequest on page 314

AuthorizationReversalRequest Class

Sends information about an authorization reversal request to a gateway adapter during a service call.

Namespace

CommercePayments on page 252

Example

Add your reversal classes to your payment gateway adapter. We recommend adding AuthorizationReversal as a possible requestType value when calling processRequest on the gateway's response.

```
global commercepayments.GatewayResponse processRequest(commercepayments.paymentGatewayContext
 gatewayContext) {
```

```
        commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();

         commercepayments.GatewayResponse response;

         try {
         //add other requestType values here
         //..
         else if (requestType == commercepayments.RequestType.AuthorizationReversal) {
                 response =
createAuthReversalResponse((commercepayments.AuthorizationReversalRequest)gatewayContext.getPaymentRequest());}

         return response;
```

Then, add a class that sets the amount of the authorization reversal request, as well as gateway information and the Salesforce result code.

```
global commercepayments.GatewayResponse
createAuthReversalResponse(commercepayments.AuthorizationReversalRequest authReversalRequest)
 {
         commercepayments.AuthorizationReversalResponse authReversalResponse = new
commercepayments.AuthorizationReversalResponse();
         if(authReversalRequest.amount!=null )
         {
             authReversalResponse.setAmount(authReversalRequest.amount);
         }
         else
         {
              throw new SalesforceValidationException('Required Field Missing : Amount');

         }

         system.debug('Response - success');
         authReversalResponse.setGatewayDate(system.now());
         authReversalResponse.setGatewayResultCode('00');
         authReversalResponse.setGatewayResultCodeDescription('Transaction Normal');
         authReversalResponse.setGatewayReferenceNumber('SF'+getRandomNumber(6));

authReversalResponse.setSalesforceResultCodeInfo(SUCCESS_SALESFORCE_RESULT_CODE_INFO);
         return authReversalResponse;
     }
```

IN THIS SECTION:

AuthorizationReversalRequest Constructors

AuthorizationReversalRequest Properties

AuthorizationReversalRequest Methods

AuthorizationReversalRequest Constructors

The following are constructors for `AuthorizationReversalRequest`.

IN THIS SECTION:

AuthorizationReversalRequest(amount, authorizationId)
Constructor for building the amount in an authorization reversal request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

AuthorizationReversalRequest(amount, authorizationId)

Constructor for building the amount in an authorization reversal request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global AuthorizationReversalRequest(Double amount, String authorizationId)
```

Parameters

amount
Type: Double

The amount of the authorization reversal request.

authorizationId
Type: String

The authorization request to be reversed.

AuthorizationReversalRequest Properties

The following are properties for `AuthorizationReversalRequest`.

IN THIS SECTION:

accountId
References the customer account for the transaction where the authorization reversal was performed.

amount
The total amount of the authorization reversal request. Can be positive or negative.

paymentAuthorizationId
References the payment authorization to be reversed.

accountId

References the customer account for the transaction where the authorization reversal was performed.

Signature

```
global String accountId {get; set;}
```

Property Value

Type: String

amount

The total amount of the authorization reversal request. Can be positive or negative.

Signature

```
global Double amount {get; set;}
```

Property Value

Type: Double

paymentAuthorizationId

References the payment authorization to be reversed.

Signature

```
global String paymentAuthorizationId {get; set;}
```

Property Value

Type: String

AuthorizationReversalRequest Methods

The following are methods for `AuthorizationReversalRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `AuthorizationReversalRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type `AuthorizationReversalRequest` by determining the uniqueness of the external object in a list.

toString()
Converts a date to a string.

equals(obj)

Maintains the integrity of lists of type `AuthorizationReversalRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

hashCode()

Maintains the integrity of lists of type `AuthorizationReversalRequest` by determining the uniqueness of the external object in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

toString()

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

AuthorizationReversalResponse Class

Response sent by the payment gateway following a payment authorization reversal service.

Namespace

CommercePayments

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.AuthorizationReversalResponse authRevRes = new
CommercePayments.AuthorizationResponse();
```

Contains information about the payment gateway's response following an authorization reversal transaction. The gateway adapter uses the payment gateway's response to populate the `AuthorizationReversalResponse` fields. The payments platform uses the information from this class to construct the authorization gateway response shown to the user.

Example

This class builds an authorization reversal response that contains the amount of the original reversal request, gateway information, and the Salesforce result code.

```
global commercepayments.GatewayResponse
createAuthReversalResponse(commercepayments.AuthorizationReversalRequest authReversalRequest)
 {
        commercepayments.AuthorizationReversalResponse authReversalResponse = new
commercepayments.AuthorizationReversalResponse();
        if(authReversalRequest.amount!=null )
        {
            authReversalResponse.setAmount(authReversalRequest.amount);
        }
        else
        {
             throw new SalesforceValidationException('Required Field Missing : Amount');

        }

        system.debug('Response - success');
        authReversalResponse.setGatewayDate(system.now());
        authReversalResponse.setGatewayResultCode('00');
        authReversalResponse.setGatewayResultCodeDescription('Transaction Normal');
        authReversalResponse.setGatewayReferenceNumber('SF'+getRandomNumber(6));

authReversalResponse.setSalesforceResultCodeInfo(SUCCESS_SALESFORCE_RESULT_CODE_INFO);
        return authReversalResponse;
    }
```

IN THIS SECTION:

AuthorizationReversalResponse Methods

AuthorizationReversalResponse Methods

The following are methods for `AuthorizationReversalResponse`.

IN THIS SECTION:

setAmount(amount)

Contains the amount of the authorization reversal. Must be a non-zero value.

setGatewayAvsCode(gatewayAvsCode)

Sets the AVS (Address Verification System) result code that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)

Sets the date that the authorization reversal request occurred in the payment gateway. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the authorization reversal request. Maximum length of 255 characters.

setGatewayReferenceDetails(gatewayReferenceDetails)

Stores data that you can use for subsequent authorizations. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets a unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

`setAmount(amount)`

Contains the amount of the authorization reversal. Must be a non-zero value.

Signature

```
global void setAmount(Double amount)
```

Parameters

amount
Type: Double

Return Value

Type: void

`setGatewayAvsCode(gatewayAvsCode)`

Sets the AVS (Address Verification System) result code that the gateway returned. Maximum length of 64 characters.

Signature

```
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

gatewayAvsCode
Type: String

Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.

Return Value

Type: void

`setGatewayDate(gatewayDate)`

Sets the date that the authorization reversal request occurred in the payment gateway. Some gateways don't send this value.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

Return Value

Type: void

`setGatewayMessage(gatewayMessage)`

Sets error messages that the gateway returned for the authorization reversal request. Maximum length of 255 characters.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Return Value

Type: void

`setGatewayReferenceDetails(gatewayReferenceDetails)`

Stores data that you can use for subsequent authorizations. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

gatewayReferenceDetails
Type: String

Return Value

Type: void

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets a unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique reference ID created by the payment gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Must be used to map a Salesforce-specific result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the gateway's result code. Use this field to learn more about why the gateway returned a certain result code.

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
Type: SalesforceResultCodeInfo

Description of the Salesforce result code value.

Return Value

Type: void

AuthorizationRequest Class

Sends information about an authorization request to a gateway adapter during a service call.

Namespace

CommercePayments

Usage

This class contains information about a transaction authorization request. The gateway adapter reads fields from this class while constructing an authorization JSON request to send to the payment gateway. An object of this class is available by calling `getPaymentRequest()` in the `PaymentGatewayContext Class`.

Example

Creating a `buildAuthRequest` class to store information about the authorization request.

```
private String buildAuthRequest(commercepayments.AuthorizationRequest authRequest) {
        // Multiply amount by 100.0 to convert to cents
        String requestBody =
createRequestBody(String.ValueOf((authRequest.amount*100.0).intValue()), authRequest);
        return requestBody;

       private String createRequestBody(String amount, commercepayments.AuthorizationRequest
 authRequest) {
        JSONGenerator jsonGeneratorInstance = JSON.createGenerator(true);
        String currencyIso = authRequest.currencyIsoCode;
        commercepayments.AuthApiPaymentMethodRequest paymentMethod =
authRequest.paymentMethod;
        commercepayments.GatewayErrorResponse error;
        // Write data to the JSON string.
        jsonGeneratorInstance.writeStartObject();
       jsonGeneratorInstance.writeStringField('merchantAccount', '{!$Credential.Username}');

        jsonGeneratorInstance.writeStringField('reference', authRequest.comments == null
? 'randomstring' : authRequest.comments);

        if(currencyIso == null) {
            currencyIso = UserInfo.getDefaultCurrency();
        }

        jsonGeneratorInstance.writeFieldName('amount');
        jsonGeneratorInstance.writeStartObject();
        jsonGeneratorInstance.writeStringField('value', amount);
        jsonGeneratorInstance.writeStringField('currency', currencyIso);
        jsonGeneratorInstance.writeEndObject();

        commercepayments.CardPaymentMethodRequest cardPaymentMethod;
        if(paymentMethod != null) {
            cardPaymentMethod = paymentMethod.cardPaymentMethod;
            if (cardPaymentMethod != null) {
                if (cardPaymentMethod.CardCategory != null) {
                    if (commercepayments.CardCategory.CreditCard ==
cardPaymentMethod.CardCategory) {
                        jsonGeneratorInstance.writeFieldName('card');
                        jsonGeneratorInstance.writeStartObject();
                        if (cardPaymentMethod.cvv != null)
                            jsonGeneratorInstance.writeStringField('cvc',
String.ValueOf(cardPaymentMethod.cvv));
                        if (cardPaymentMethod.cardholdername != null)
                            jsonGeneratorInstance.writeStringField('holderName',
cardPaymentMethod.cardholdername);
                        if (cardPaymentMethod.cardnumber != null)
                            jsonGeneratorInstance.writeStringField('number',
cardPaymentMethod.cardnumber);
                        if (cardPaymentMethod.expiryMonth != null &&
cardPaymentMethod.expiryYear != null ) {
                            String expMonth =
```

```
((String.ValueOf(cardPaymentMethod.expiryMonth)).length() == 1 ? '0' : '') +
String.ValueOf(cardPaymentMethod.expiryMonth);
                        jsonGeneratorInstance.writeStringField('expiryMonth', expMonth);

                           jsonGeneratorInstance.writeStringField('expiryYear',
String.ValueOf(cardPaymentMethod.expiryYear));
                        }
                        jsonGeneratorInstance.writeEndObject();
                    } else {
                    //Support for other card type
                    }
                } else {
                    throw new SampleValidationException('Required Field Missing :
CardCategory');
                }
            } else {
                throw new SampleValidationException('Required Field Missing :
CardPaymentMethod');
            }
        } else {
           throw new SampleValidationException('Required Field Missing : PaymentMethod');

        }
        jsonGeneratorInstance.writeEndObject();
        return jsonGeneratorInstance.getAsString();
    }
```

IN THIS SECTION:

AuthorizationRequest Constructors

AuthorizationRequest Properties

AuthorizationRequest Methods

AuthorizationRequest Constructors

The following are constructors for `AuthorizationRequest`.

IN THIS SECTION:

AuthorizationRequest(amount)

Constructor for building the amount in an authorization request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`AuthorizationRequest(amount)`

Constructor for building the amount in an authorization request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global AuthorizationRequest(Double amount)
```

Parameters

amount
Type: Double

The amount of the authorization.

AuthorizationRequest Properties

The following are properties for `AuthorizationRequest`.

IN THIS SECTION:

accountId
The customer account where the authorization is performed.

amount
The total amount of the authorization. Can be positive or negative.

comments
Comments about the authorization. Users can enter comments to provide additional information.

currencyIsoCode
The ISO currency code for the authorization request.

paymentMethod
The payment method used to process the authorization in the authorization request.

`accountId`

The customer account where the authorization is performed.

Signature

```
global String accountId {get; set;}
```

Property Value

Type: String

`amount`

The total amount of the authorization. Can be positive or negative.

Signature

```
global Double amount {get; set;}
```

Property Value

Type: Double

comments

Comments about the authorization. Users can enter comments to provide additional information.

Signature

```
global String comments {get; set;}
```

Property Value

Type: String

currencyIsoCode

The ISO currency code for the authorization request.

Signature

```
global String currencyIsoCode {get; set;}
```

Property Value

Type: String

paymentMethod

The payment method used to process the authorization in the authorization request.

Signature

```
global AuthApiPaymentMethodRequest paymentMethod {get; set;}
```

Property Value

Type: AuthApiPaymentMethodRequest on page 269

AuthorizationRequest Methods

The following are methods for `AuthorizationRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `AuthorizationRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type `AuthorizationRequest` by determining the uniqueness of the external object in a list.

toString()
Converts a date to a string.

`equals(obj)`

Maintains the integrity of lists of type `AuthorizationRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `AuthorizationRequest` by determining the uniqueness of the external object in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

AuthorizationResponse Class

Response sent by the payment gateway adapter for an authorization service.

Namespace

CommercePayments

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.AuthorizationResponse authr = new
CommercePayments.AuthorizationResponse();
```

Contains information about the payment gateway's response following an authorization transaction. The gateway adapter uses the payment gateway's response to populate the `AuthorizationResponse` fields. The payments platform uses the information from this class to construct the authorization gateway response shown to the user.

Example

```
private commercepayments.GatewayResponse createAuthResponse(HttpResponse response, Double
 amount) {
        Map<String, Object> mapOfResponseValues = (Map
                            <String, Object>) JSON.deserializeUntyped(response.getBody());

        commercepayments.AuthorizationResponse authResponse = new
commercepayments.AuthorizationResponse();

        String resultCode = (String)mapOfResponseValues.get('resultCode');

        if(resultCode != null){
            system.debug('Response - success');
            if(resultCode.equals('Authorised')){
                system.debug('status - authorised');
              authResponse.setGatewayAuthCode((String)mapOfResponseValues.get('authCode'));

                authResponse.setSalesforceResultCodeInfo(new
commercepayments.SalesforceResultCodeInfo(commercepayments.SalesforceResultCode.Success));

            } else {
                //Sample returns 200 with refused status in some cases
                system.debug('status - refused');

authResponse.setGatewayResultCodeDescription((String)mapOfResponseValues.get('refusalReason'));

                authResponse.setSalesforceResultCodeInfo(new
commercepayments.SalesforceResultCodeInfo(commercepayments.SalesforceResultCode.Decline));

            }

authResponse.setGatewayReferenceNumber((String)mapOfResponseValues.get('pspReference'));
            authResponse.setAmount(amount);
            authResponse.setGatewayDate(system.now());
            return authResponse;
        } else {
            system.debug('Response - failed');
            system.debug('Validation error');
            String statusCode = (String)mapOfResponseValues.get('errorType');
            String message = (String)mapOfResponseValues.get('message');
            commercepayments.GatewayErrorResponse error = new
```

```
commercepayments.GatewayErrorResponse(statusCode, message);
            return error;
        }
    }
```

IN THIS SECTION:

AuthorizationResponse Methods

AuthorizationResponse Methods

The following are methods for `AuthorizationResponse`.

IN THIS SECTION:

setAmount(amount)
Sets the amount of the authorization. Must be a non-zero value.

setAuthorizationExpirationDate(authExpDate)
Sets the expiration date of the authorization request.

setGatewayAuthCode(gatewayAuthCode)
Sets the authorization code that the gateway returned. Maximum length of 64 characters.

setGatewayAvsCode(gatewayAvsCode)
Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)
Sets the date that the authorization occurred. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)
Sets error messages that the gateway returned for the authorization request. Maximum length of 255 characters.

setGatewayReferenceDetails(gatewayReferenceDetails)
Stores data that you can use for subsequent authorizations. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

setGatewayReferenceNumber(gatewayReferenceNumber)
Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse)
Sets information from the gateway about the tokenized payment method.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

setAmount(amount)

Sets the amount of the authorization. Must be a non-zero value.

Signature

```
global void setAmount(Double amount)
```

Parameters

amount
Type: Double

Return Value

Type: void

setAuthorizationExpirationDate(authExpDate)

Sets the expiration date of the authorization request.

Signature

```
global void setAuthorizationExpirationDate(Datetime authExpDate)
```

Parameters

authExpDate
Type: Datetime

Return Value

Type: void

setGatewayAuthCode(gatewayAuthCode)

Sets the authorization code that the gateway returned. Maximum length of 64 characters.

Signature

```
global void setGatewayAuthCode(String gatewayAuthCode)
```

Parameters

gatewayAuthCode
Type: String

The authorization code returned by the gateway.

Return Value

Type: void

setGatewayAvsCode(gatewayAvsCode)

Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

Signature

```
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

gatewayAvsCode
Type: String

Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.

Return Value

Type: void

setGatewayDate(gatewayDate)

Sets the date that the authorization occurred. Some gateways don't send this value.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

Return Value

Type: void

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the authorization request. Maximum length of 255 characters.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Return Value

Type: void

setGatewayReferenceDetails(gatewayReferenceDetails)

Stores data that you can use for subsequent authorizations. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

gatewayReferenceDetails
Type: String

Return Value

Type: void

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique authorization ID created by the payment gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Must be used to map a Salesforce-specific result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the gateway's result code. Use this field to learn more about why the gateway returned a certain result code.

Return Value

Type: void

setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse)

Sets information from the gateway about the tokenized payment method.

Signature

```
global void
setPaymentMethodTokenizationResponse(commercepayments.PaymentMethodTokenizationResponse
paymentMethodTokenizationResponse)
```

Parameters

paymentMethodTokenizationResponse
PaymentMethodTokenizationResponse on page 341

Gateway response sent by payment gateway adapters for the payment method tokenization request.

Return Value

Type: void

`setSalesforceResultCodeInfo(salesforceResultCodeInfo)`

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

`salesforceResultCodeInfo`
Type: SalesforceResultCodeInfo on page 376

Description of the Salesforce result code value.

Return Value

Type: void

BaseApiPaymentMethodRequest Class

Abstract class used to send information about a payment method to a gateway adapter during a service call.

Namespace

CommercePayments

Usage

`BaseApiPaymentMethodRequest` is the base class for `SaleApiPaymentMethodRequest` and `AuthApiPaymentMethodRequest`.

IN THIS SECTION:

BaseApiPaymentMethodRequest Constructors

BaseApiPaymentMethodRequest Properties

BaseApiPaymentMethodRequest Methods

BaseApiPaymentMethodRequest Constructors

The following are constructors for `BaseApiPaymentMethodRequest`.

IN THIS SECTION:

BaseApiPaymentMethodRequest(address, id, saveForFuture)
Constructs a payment method. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

BaseApiPaymentMethodRequest(address, id, saveForFuture)

Constructs a payment method. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global BaseApiPaymentMethodRequest(commercepayments.AddressRequest address, String id,
Boolean saveForFuture)
```

Parameters

address
Type: commercepayments.AddressRequest on page 258

Sends data related on address request to a gateway adapter during a service call.

id
Type: String

saveForFuture
Type: Boolean

Indicates whether Salesforce saves the payment method for future use.

BaseApiPaymentMethodRequest Properties

The following are properties for `BaseApiPaymentMethodRequest`.

IN THIS SECTION:

address
The payment method's address.

id
ID of the payment method request.

saveForFuture
Indicates whether the payment method is saved as a record in Salesforce for future use.

address

The payment method's address.

Signature

```
global commercepayments.AddressRequest address {get; set;}
```

Property Value

Type: AddressRequest on page 258

id

ID of the payment method request.

Signature

```
global String id {get; set;}
```

Property Value

Type: String

saveForFuture

Indicates whether the payment method is saved as a record in Salesforce for future use.

Signature

```
global Boolean saveForFuture {get; set;}
```

Property Value

Type: Boolean

BaseApiPaymentMethodRequest Methods

The following are methods for `BaseApiPaymentMethodRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `BaseApiPaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type `BaseApiPaymentMethodRequest` by determining the uniqueness of the external object records in a list.

toString()
Converts a date to a string.

equals(obj)

Maintains the integrity of lists of type `BaseApiPaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `BaseApiPaymentMethodRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

BaseNotification Class

Abstract class for storing notification information sent from payment gateways.

Namespace

CommercePayments

Usage

An abstract class that contains the common fields from payment gateways. `BaseNotification` can't be instantiated on its own.

The constructor of this class takes no arguments. For example:

```
CommercePayments.BaseNotification bnt = new CommercePayments.BaseNotification();
```

Example

```
commercepayments.BaseNotification notification = null;
        if ('CAPTURE'.equals(eventCode)) {
            notification = new commercepayments.CaptureNotification();
        } else if ('REFUND'.equals(eventCode)) {
            notification = new commercepayments.ReferencedRefundNotification();
        }
```

IN THIS SECTION:

BaseNotification Methods

BaseNotification Methods

The following are methods for `BaseNotification`.

IN THIS SECTION:

setAmount(amount)
Sets the transaction amount. Must be a non-negative value.

setGatewayDate(gatewayDate)
Sets the date that the notification occurred. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)
Sets error messages that the gateway returned for the notification request. Maximum length of 255 characters.

setGatewayReferenceDetails(gatewayReferenceDetails)
Sets the payment gateway's reference details.

setGatewayReferenceNumber(gatewayReferenceNumber)
Sets the payment gateway's reference number.

setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setId(id)
Sets the ID of the notification sent by the gateway.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the information about the Salesforce-specific result code used to match a result code from a payment gateway.

setStatus(status)
Sets the status of the notification sent by the gateway.

`setAmount(amount)`

Sets the transaction amount. Must be a non-negative value.

Signature

```
global void setAmount(Double amount)
```

Parameters

amount
Type: Double

The amount of the transaction.

Return Value

Type: void

setGatewayDate(gatewayDate)

Sets the date that the notification occurred. Some gateways don't send this value.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

The date that the notification occurred.

Return Value

Type: void

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the notification request. Maximum length of 255 characters.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

The message that the gateway returned with the notification request. Contains additional information about the notification.

Return Value

Type: void

setGatewayReferenceDetails(gatewayReferenceDetails)

Sets the payment gateway's reference details.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

gatewayReferenceDetails
Type: String

Provides information about the gateway communication.

Return Value

Type: void

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the payment gateway's reference number.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique transaction ID created by the payment gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Must be used to map a Salesforce-specific result code.

Return Value

Type: void

`setGatewayResultCodeDescription(gatewayResultCodeDescription)`

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Provides additional information about the result code and why the gateway returned the code. Descriptions vary between different gateways.

Return Value

Type: void

`setId(id)`

Sets the ID of the notification sent by the gateway.

Signature

```
global void setId(String id)
```

Parameters

id
Type: String

Return Value

Type: void

`setSalesforceResultCodeInfo(salesforceResultCodeInfo)`

Sets the information about the Salesforce-specific result code used to match a result code from a payment gateway.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
Type: commercepayments.SalesforceResultCodeInfo on page 376

Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Return Value

Type: void

setStatus(status)

Sets the status of the notification sent by the gateway.

Signature

```
global void setStatus(commercepayments.NotificationStatus status)
```

Parameters

status
Type: commercepayments.NotificationStatus on page 329

Shows whether the payments platform successfully received the notification from the gateway.

Return Value

Type: void

BasePaymentMethodRequest Class

Abstract class for storing information about payment methods.

Namespace

CommercePayments

Usage

The `BasePaymentMethodRequest` class contains fields common to `CardPaymentMethodRequest` on page 314

.

IN THIS SECTION:

BasePaymentMethodRequest Methods

BasePaymentMethodRequest Methods

The following are methods for `BasePaymentMethodRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `BasePaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type `BasePaymentMethodRequest` by determining the uniqueness of the external object records in a list.

toString()
Converts a date to a string.

equals(obj)

Maintains the integrity of lists of type `BasePaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

hashCode()

Maintains the integrity of lists of type `BasePaymentMethodRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

toString()

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

BaseRequest Class

`BaseRequest` is extended by all the request classes.

Namespace

CommercePayments

IN THIS SECTION:

BaseRequest Methods

BaseRequest Methods

The following are methods for `BaseRequest`.

IN THIS SECTION:

BaseRequest(AdditionalData, IdempotencyKey)
Used for testing.

`BaseRequest(AdditionalData, IdempotencyKey)`

Used for testing.

Signature

```
global Void BaseRequest(String AdditionalData, Map<String, String> IdempotencyKey)
```

Parameters

`AdditionalData`
Type: String

Contains additional data that may be required for a payment request. The `additionalData` object consists of key-value pairs. You can retrieve the `additionalData` object from the request object: `Map<String, String> additionalData=request.additionalData`

`IdempotencyKey`
Type: Map<String, String>

Unique value that's generated by a client and sent to the server in the request. The server stores the value and uses the it to keep track of the request status.

Return Value

Type: Void

CaptureNotification Class

When a payment gateway sends a notification for a capture transaction, the payment gateway adapter creates the `CaptureNotification` object to store information about the notification.

Namespace

CommercePayments

Usage

`CaptureNotification` is used in asynchronous payment gateway adapters.

Specify the `CommercePayments` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```
CommercePayments.CaptureNotification crn = new CommercePayments.CaptureNotification();
```

Example

```
commercepayments.BaseNotification notification = null;
        if ('CAPTURE'.equals(eventCode)) {
            notification = new commercepayments.CaptureNotification();
        } else if ('REFUND'.equals(eventCode)) {
            notification = new commercepayments.ReferencedRefundNotification();
        }
```

IN THIS SECTION:

CaptureNotification Methods

CaptureNotification Methods

The following are methods for `CaptureNotification`.

IN THIS SECTION:

setAmount(amount)

Sets the transaction amount. Must be a non-negative value.

setGatewayDate(gatewayDate)

Sets the date that the transaction occurred. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the payment request. Maximum length of 255 characters.

setGatewayReferenceDetails(gatewayReferenceDetails)

Sets additional data that you can use for subsequent transactions. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a gateway returned. Maximum length of 1000 characters.

setId(id)

Sets the ID of a notification sent by the payment gateway.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

setStatus(status)

Sets the notification status to the same value that was sent by the gateway.

`setAmount(amount)`

Sets the transaction amount. Must be a non-negative value.

Signature

```
global void setAmount(Double amount)
```

Parameters

amount

Type: Double

The amount to be debited or captured.

Return Value

Type: void

`setGatewayDate(gatewayDate)`

Sets the date that the transaction occurred. Some gateways don't send this value.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate

Type: Datetime

Date and time of the gateway communication.

Return Value

Type: void

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the payment request. Maximum length of 255 characters.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Information on error messages sent from the gateway.

Return Value

Type: void

setGatewayReferenceDetails(gatewayReferenceDetails)

Sets additional data that you can use for subsequent transactions. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

gatewayReferenceDetails
Type: String

Return Value

Type: void

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique transaction ID created by the payment gateway.

Return Value

Type: void

`setGatewayResultCode(gatewayResultCode)`

Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Map this value to a Salesforce-specific result code.

Return Value

Type: void

`setGatewayResultCodeDescription(gatewayResultCodeDescription)`

Sets a description of the gateway-specific result code that a gateway returned. Maximum length of 1000 characters.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the gateway's result code. Use this field to learn more about why the gateway returned a certain result code.

Return Value

Type: void

`setId(id)`

Sets the ID of a notification sent by the payment gateway.

Signature

```
global void setId(String id)
```

Parameters

id
Type: String

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
Type: commercepayments.SalesforceResultCodeInfo on page 376

Description of the Salesforce result code value.

Return Value

Type: void

setStatus(status)

Sets the notification status to the same value that was sent by the gateway.

Signature

```
global void setStatus(commercepayments.NotificationStatus status)
```

Parameters

status
Type: NotificationStatus on page 329

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Return Value

Type: void

CaptureRequest Class

Represents a capture request. This class extends the `BaseRequest` class and inherits all its methods.

Namespace

CommercePayments on page 252

Usage

The `CaptureRequest` class's `buildCaptureRequest` method creates a CaptureRequest object to store payment information, such as value and currency, as JSON strings.

Example

Builds a CaptureRequest object for a multicurrency org.

```
    private String buildCaptureRequest(commercepayments.CaptureRequest captureRequest) {
        Boolean IS_MULTICURRENCY_ORG = UserInfo.isMultiCurrencyOrganization();
        QueryUtils qBuilderForAuth = new QueryUtils(PaymentAuthorization.SObjectType);
        // Add required fields
        qBuilderForAuth.getSelectClause().addField('GatewayRefNumber', false);
        if (IS_MULTICURRENCY_ORG) {
            // addField also takes a boolean to enable translation (uses label instead of
actual value)
            qBuilderForAuth.getSelectClause().addField('CurrencyIsoCode', false);
        }
```

IN THIS SECTION:

CaptureRequest Constructors

CaptureRequest Properties

CaptureRequest Constructors

The following are constructors for `CaptureRequest`.

IN THIS SECTION:

CaptureRequest(amount, authorizationId)
This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`CaptureRequest(amount, authorizationId)`

This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Parameters

`amount`
Type: Double

The amount to be debited or captured.

authorizationId
Type: String

Represents a payment authorization record.

CaptureRequest Properties

The following are properties for `CaptureRequest`.

IN THIS SECTION:

accountId
Account ID value. References an account record.

amount
Amount of currency that needs to be captured.

paymentAuthorizationId
ID value that references a PaymentAuthorization.

accountId

Account ID value. References an account record.

Property Value

Type: String

amount

Amount of currency that needs to be captured.

Property Value

Type: Double

paymentAuthorizationId

ID value that references a PaymentAuthorization.

Property Value

Type: String

CaptureResponse Class

The payment gateway adapter sends this response for the capture request type. This class extends `AbstractResponse` and inherits its methods.

Namespace

CommercePayments on page 252

Usage

You must specify the `CommercePayments` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```
CommercePayments.Capture Response ctr = new CommercePayments.CaptureResponse();
```

IN THIS SECTION:

CaptureResponse Methods

CaptureResponse Methods

The following are methods for `CaptureResponse`.

IN THIS SECTION:

setAmount(amount)
Sets the transaction amount.

setAsync(async)
Indicates whether the payment gateway adapter used in the payment capture was asynchronous (`True`) or synchronous (`False`).

setGatewayAvsCode(gatewayAvsCode)
Sets the payment gateway's AVS (address verification system) code.

setGatewayDate(gatewayDate)
Sets the payment gateway's date.

setGatewayMessage(gatewayMessage)
Sets information or messages that the gateway returned.

setGatewayReferenceDetails(gatewayReferenceDetails)
Sets the payment gateway's reference details.

setGatewayReferenceNumber(gatewayReferenceNumber)
Sets the payment gateway's reference number.

setGatewayResultCode(gatewayResultCode)
Sets the payment gateway's result code.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets the payment gateway's result code description.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets Salesforce result code information.

`setAmount(amount)`

Sets the transaction amount.

Signature

```
global void setAmount(Double amount)
```

Parameters

amount
Type: Double

The amount to be debited or captured.

Return Value

Type: void

setAsync(async)

Indicates whether the payment gateway adapter used in the payment capture was asynchronous (`True`) or synchronous (`False`).

Signature

```
global void setAsync(Boolean async)
```

Parameters

async
Type: Boolean

Return Value

Type: void

setGatewayAvsCode(gatewayAvsCode)

Sets the payment gateway's AVS (address verification system) code.

Signature

```
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

gatewayAvsCode
Type: String

Payment gateways that use an AVS system return this code.

Return Value

Type: void

setGatewayDate(gatewayDate)

Sets the payment gateway's date.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

The date that communication happened with the gateway.

Return Value

Type: void

setGatewayMessage(gatewayMessage)

Sets information or messages that the gateway returned.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Information or error messages returned by the gateway.

Return Value

Type: void

setGatewayReferenceDetails(gatewayReferenceDetails)

Sets the payment gateway's reference details.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

gatewayReferenceDetails
Type: String

Provides information about the gateway communication.

Return Value

Type: void

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the payment gateway's reference number.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique transaction ID created by the payment gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets the payment gateway's result code.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

The gateway result code. You must map this to a Salesforce result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets the payment gateway's result code description.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the GatewayResultCode. Provides additional context about the result code that the gateway returned.

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets Salesforce result code information.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
SalesforceResultCodeInfoType: commercepayments.SalesforceResultCodeInfo

Description of the Salesforce result code value.

Return Value

Type: void

CardCategory Enum

Defines whether the payment method represents a credit card or a debit card.

Namespace

CommercePayments on page 252

Enum Values

The following are the values of the `commercepayments.CardCategory` enum.

Value	Description
`CreditCard`	Shows that the payment method is a credit card.
`DebitCard`	Shows that the payment method is a debit card.

CardPaymentMethodRequest Class

Sends data related to a card payment method to a gateway adapter during a service call.

Namespace

CommercePayments on page 252

Usage

This class contains details about the card used as a payment method for authorization, sale, or tokenization transaction requests. The gateway adapter reads the fields of this class object while constructing a transaction JSON request to send to the payment gateway. The object of this class is available as the `cardPaymentMethod` field in the `SaleApiPaymentMethodRequest Class`, `AuthApiPaymentMethodRequest Class`, and `PaymentMethodTokenizationRequest Class`.

Example: This code sample retrieves the `cardPaymentMethodRequest` object from the `paymentMethod` class.

```
commercepayments.CardPaymentMethodRequest cardPaymentMethod =
paymentMethod.cardPaymentMethod;
```

IN THIS SECTION:

CardPaymentMethodRequest Constructors

CardPaymentMethodRequest Properties

CardPaymentMethodRequest Methods

CardPaymentMethodRequest Constructors

The following are constructors for `CardPaymentMethodRequest`.

IN THIS SECTION:

CardPaymentMethodRequest(cardCategory)
Sets the `cardCategory` value for the card payment method request.

`CardPaymentMethodRequest(cardCategory)`

Sets the `cardCategory` value for the card payment method request.

Signature

```
global CardPaymentMethodRequest(commercepayments.CardCategory cardCategory)
```

Parameters

`cardCategory`
Type: CardCategory on page 313

Defines whether the card payment method is a credit card or a debit card.

CardPaymentMethodRequest Properties

The following are properties for `CardPaymentMethodRequest`.

IN THIS SECTION:

accountId
Customer account for this payment method.

autoPay
Indicates whether a token is being requested so that the payment method can be used for recurring payments.

cardCategory
Indicates whether a card payment method is for a credit card or debit card.

cardHolderFirstName
The first name of the cardholder for the card payment method.

cardHolderLastName
The last name of the cardholder for the card payment method.

cardHolderName
Full name of the cardholder on the card payment method.

cardNumber
System-defined unique ID for the card payment method.

cardType
Defines the credit card bank. Possible values are `AmericanExpress`, `DinersClub`, `JCB`, `Maestro`, `MasterCard`, and`Visa`.

cvv
The card security code for the credit or debit card on a card payment method.

email
Email address of the cardholder for the credit or debit card on a card payment method.

expiryMonth
Expiration month for the credit or debit card on a card payment method.

expiryYear
Expiration year of the credit or debit card for the card payment method.

inputCardType
Input field for the card type. This field doesn't store the card type directly, but instead populates CardBin, LastFour, and DisplayCardNumber based on the value entered in `inputCardType`.

startMonth
The credit or debit card becomes valid on the first day of the `startMonth` in the `startYear`

startYear
Year during which the credit or debit card becomes valid.

`accountId`

Customer account for this payment method.

Signature

```
global String accountId {get; set;}
```

Property Value

Type: String

autoPay

Indicates whether a token is being requested so that the payment method can be used for recurring payments.

Signature

```
global Boolean autoPay {get; set;}
```

Property Value

Type: Boolean

cardCategory

Indicates whether a card payment method is for a credit card or debit card.

Signature

```
global commercepayments.CardCategory cardCategory {get; set;}
```

Property Value

Type: CardCategory on page 313

cardHolderFirstName

The first name of the cardholder for the card payment method.

Signature

```
global String cardHolderFirstName {get; set;}
```

Property Value

Type: String

cardHolderLastName

The last name of the cardholder for the card payment method.

Signature

```
global String cardHolderLastName {get; set;}
```

Property Value

Type: String

cardHolderName

Full name of the cardholder on the card payment method.

Signature

```
global String cardHolderName {get; set;}
```

Property Value

Type: String

cardNumber

System-defined unique ID for the card payment method.

Signature

```
global String cardNumber {get; set;}
```

Property Value

Type: String

cardType

Defines the credit card bank. Possible values are `AmericanExpress`, `DinersClub`, `JCB`, `Maestro`, `MasterCard`, and `Visa`.

Signature

```
global commercepayments.CardType cardType {get; set;}
```

Property Value

Type: CardType

cvv

The card security code for the credit or debit card on a card payment method.

Signature

```
global String cvv {get; set;}
```

Property Value

Type: String

email

Email address of the cardholder for the credit or debit card on a card payment method.

Signature

```
global String email {get; set;}
```

Property Value

Type: String

expiryMonth

Expiration month for the credit or debit card on a card payment method.

Signature

```
global Integer expiryMonth {get; set;}
```

Property Value

Type: Integer

expiryYear

Expiration year of the credit or debit card for the card payment method.

Signature

```
global Integer expiryYear {get; set;}
```

Property Value

Type: Integer

inputCardType

Input field for the card type. This field doesn't store the card type directly, but instead populates CardBin, LastFour, and DisplayCardNumber based on the value entered in `inputCardType`.

Signature

```
global String inputCardType {get; set;}
```

Property Value

Type: String

`startMonth`

The credit or debit card becomes valid on the first day of the `startMonth` in the `startYear`

Signature

```
global Integer startMonth {get; set;}
```

Property Value

Type: Integer

`startYear`

Year during which the credit or debit card becomes valid.

Signature

```
global Integer startYear {get; set;}
```

Property Value

Type: Integer

CardPaymentMethodRequest Methods

The following are methods for `CardPaymentMethodRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `CardPaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type `CardPaymentMethodRequest`.

toString()
Converts a date to a string.

`equals(obj)`

Maintains the integrity of lists of type `CardPaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `CardPaymentMethodRequest`.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

CustomMetadataTypeInfo Class

Access information about custom metadata. The `PaymentGatewayAdapter` can send `CustomMetadataTypeInfo` to transaction requests through the response object's `SalesforceResultCodeInfo`.

Namespace

CommercePayments on page 252

IN THIS SECTION:

CustomMetadataTypeInfo Constructors

CustomMetadataTypeInfo Methods

CustomMetadataTypeInfo Constructors

The following are constructors for `CustomMetadataTypeInfo`.

IN THIS SECTION:

CustomMetadataTypeInfo(cmtRecordId, cmtSfResultCodeFieldName)
Constructor for providing custom metadata type information.

`CustomMetadataTypeInfo(cmtRecordId, cmtSfResultCodeFieldName)`

Constructor for providing custom metadata type information.

Signature

```
global CustomMetadataTypeInfo(String cmtRecordId, String cmtSfResultCodeFieldName)
```

Parameters

`cmtRecordId`
Type: String

ID of the matchedcustom metadata type record

`cmtSfResultCodeFieldName`
Type: String

Field that contains the Salesforce result code values. Belongs to the custom metadata type.

CustomMetadataTypeInfo Methods

The following are methods for `CustomMetadataTypeInfo`.

GatewayErrorResponse Class

Use to respond with an error indication following errors from the `PaymentGateway` adapter, such as request-forbidden responses, custom validation errors, or expired API tokens.

Namespace

CommercePayments on page 252

Usage

Use `GatewayErrorResponse` to create an object that stores information about error responses sent by the payment gateway adapter.

Example

If `GatewayResponse` receives an exception rather than a valid request, it calls `GatewayErrorResponse` to create an error object with information about the exception.

```
global commercepayments.GatewayResponse processRequest(commercepayments.paymentGatewayContext
 gatewayContext) {
       commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();

        commercepayments.GatewayResponse response;
        try {
            if (requestType == commercepayments.RequestType.Authorize) {
                response =
createAuthResponse((commercepayments.AuthorizationRequest)gatewayContext.getPaymentRequest());

            } else if (requestType == commercepayments.RequestType.Capture) {
                response =
createCaptureResponse((commercepayments.CaptureRequest)gatewayContext.getPaymentRequest())
 ;
            } else if (requestType == commercepayments.RequestType.ReferencedRefund) {
                response =
createRefundResponse((commercepayments.ReferencedRefundRequest)gatewayContext.getPaymentRequest());

            }
            return response;
        } catch(SalesforceValidationException e) {
             commercepayments.GatewayErrorResponse error = new
commercepayments.GatewayErrorResponse('400', e.getMessage());
             return error;
        }
    }
```

IN THIS SECTION:

GatewayErrorResponse Constructors

GatewayErrorResponse Constructors

The following are constructors for `GatewayErrorResponse`.

IN THIS SECTION:

GatewayErrorResponse(errorCode, errorMessage)

Constructor to create a GatewayErrorResponse object that accepts `errorCode` and `errorMessage`.

`GatewayErrorResponse(errorCode, errorMessage)`

Constructor to create a GatewayErrorResponse object that accepts `errorCode` and `errorMessage`.

Signature

```
global GatewayErrorResponse(String errorCode, String errorMessage)
```

Parameters

errorCode
Type: String

Should match with the HTTP status code to be returned to the user. Here are a few examples.

- If the status code is for a bad request, the errorCode should be 400.
- If the status code is for a forbidden request, errorCode should be 403.
- If errorCode isn't a valid HTTP status code, a 500 internal server error is returned.

Note: *errorCode* must have a value, otherwise the platform throws an error.

errorMessage
Type: String

The message response to users following an error.

Note: *errorMessage* must have a value, otherwise the platform throws an error.

GatewayNotificationResponse Class

When the payment gateway sends a notification to the payments platform, the platform responds with a `GatewayNotificationResponse` indicating whether the platform succeeded or failed at receiving the notification.

Namespace

CommercePayments on page 252

Usage

You must specify the `CommercePayments` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```
CommercePayments.GatewayNotificationResponse gnr = new
CommercePayments.GatewayNotificationResponse();
```

When an asynchronous payment gateway sends a notification, the gateway requires the platform to acknowledge that it has either succeeded or failed in receiving the notification. Payment gateway adapters use this class to construct the acknowledgment response, which gateways expect for a notification. `GatewayNotificationResponse` is the return type of the `processNotification` method.

Example

```
commercepayments.GatewayNotificationResponse gnr = new
commercepayments.GatewayNotificationResponse();
if (saveResult.isSuccess()) {
    system.debug('Notification accepted by platform');
} else {
    system.debug('Errors in the result '+ Blob.valueOf(saveResult.getErrorMessage()));
}
gnr.setStatusCode(200);
```

```
gnr.setResponseBody(Blob.valueOf('[accepted]'));
return gnr;
```

IN THIS SECTION:

GatewayNotificationResponse Methods

GatewayNotificationResponse Methods

The following are methods for `GatewayNotificationResponse`.

IN THIS SECTION:

setResponseBody(responseBody)

Sets the body of the response to the gateway. Some gateways expect the payments platform to acknowledge the notification with a response regardless of whether the notification was accepted.

setStatusCode(statusCode)

Sets the HTTP status code sent to the gateway as part of the payments platform's response notification.

`setResponseBody(responseBody)`

Sets the body of the response to the gateway. Some gateways expect the payments platform to acknowledge the notification with a response regardless of whether the notification was accepted.

Signature

```
global void setResponseBody(Blob responseBody)
```

Parameters

`responseBody`
Type: Blob

Common response values include `accepted` for successfully receiving the response. For example:

```
commercepayments.GatewayNotificationResponse gnr = new
commercepayments.GatewayNotificationResponse();
if (saveResult.isSuccess()) {
    system.debug('Notification accepted by platform');
} else {
    system.debug('Errors in the result '+ Blob.valueOf(saveResult.getErrorMessage()));
}
gnr.setStatusCode(200);
gnr.setResponseBody(Blob.valueOf('[accepted]'));
return gnr;
```

Return Value

Type: void

`setStatusCode(statusCode)`

Sets the HTTP status code sent to the gateway as part of the payments platform's response notification.

Signature

```
global void setStatusCode(Integer statusCode)
```

Parameters

`statusCode`
Type: Integer

The status code will vary based on the type of payments platform response. Users should configure their `GatewayNotificationResponse` class to account for all values that their payments platform can possibly return. For example:

```
commercepayments.GatewayNotificationResponse gnr = new
commercepayments.GatewayNotificationResponse();
if (saveResult.isSuccess()) {
    system.debug('Notification accepted by platform');
} else {
    system.debug('Errors in the result '+ Blob.valueOf(saveResult.getErrorMessage()));
}
gnr.setStatusCode(200);
gnr.setResponseBody(Blob.valueOf('[accepted]'));
return gnr;
```

Return Value

Type: void

GatewayResponse Interface

Generic payment gateway response interface. This class extends the `CaptureResponse` on page 308, `AbstractTransactionResponse` on page 264, and `AbstractResponse` on page 255 classes and inherits all their properties. It has no unique methods or parameters.

Namespace

CommercePayments on page 252

IN THIS SECTION:

GatewayResponse Example Implementation

GatewayResponse Example Implementation

This is an example implementation of the `commercepayments.GatewayResponse` interface.

```
/**
     * Abstract function to build gateway response for a Transaction
```

```
     * The input is the response from gateway
     * It creates and returns GatewayResponse from the HttpResponse
     */
    public abstract commercepayments.GatewayResponse buildResponse(HttpResponse response);

    /**
     * Function to process transaction requests
     * Steps involved are:
     * 1. Build HttpRequest with the input Request from gateway context
     * 2. Send request and get the response from gateway
     * 3. Parse the response from gateway and return GatewayResponse
     */
    public commercepayments.GatewayResponse execute(){
                HttpRequest req;
        try{
            //Building a new request
            req = buildRequest();
        } catch(PayeezeValidationException e) {
            return getValidationExceptionError(e);
        }
        commercepayments.PaymentsHttp http = new commercepayments.PaymentsHttp();
        HttpResponse res = null;
        try{
            //Sending the request
            res = http.send(req);
        } catch(CalloutException ce) {
            return getCalloutExceptionError(ce);
        }
        try{
            //Parsing the response from gateway
            return buildResponse(res);
        } catch(Exception e) {
            return getParseExceptionError(e);
        }
    }
```

For additional context, review the complete Sample Gateway Adapter in the CommercePayments Gateway Reference Implementation.

NotificationClient Class

Communicates with the payment platform regarding the gateway's notification.

Namespace

CommercePayments on page 252

Usage

Specify the `CommercePayments` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```
CommercePayments.NotificationClient ntc = new CommercePayments.NotificationClient();
```

This class is used in asynchronous payment gateway adapters. The notification client contains API for communicating with the payments platform regarding the gateway's notification. When the gateway sends a notification, the gateway adapter invokes the `record` method in `NotificationClient` to request that the platform updates notification details.

Example

The `NotificationSaveResult` class creates a saveResult object to store the result of the save request made to the payment gateway.

```
commercepayments.NotificationSaveResult saveResult =
commercepayments.NotificationClient.record(notification);
```

IN THIS SECTION:

NotificationClient Methods

NotificationClient Methods

The following are methods for `NotificationClient`.

IN THIS SECTION:

record(notification)
Stores the results of a notification request.

`record(notification)`

Stores the results of a notification request.

Signature

```
global static commercepayments.NotificationSaveResult
record(commercepayments.BaseNotification notification)
```

Parameters

`notification`
Type: BaseNotification on page 294

Return Value

Type: NotificationSaveResult on page 327

NotificationSaveResult Class

Contains the result of the payment platform's attempt to record data from the gateway's notification.

Namespace

CommercePayments on page 252

Usage

This class is used with asynchronous payments. It is the return type of the `NotificiationClient.record` operation and contains the result of the payment platform's attempt to save notification details.

The constructor of this class takes no arguments. For example:

```
CommercePayments.NotificationSaveResult nsr = new
CommercePayments.NotificationSaveResult();
```

Example

```
commercepayments.NotificationSaveResult saveResult =
commercepayments.NotificationClient.record(notification);
```

IN THIS SECTION:

NotificationSaveResult Methods

NotificationSaveResult Methods

The following are methods for `NotificationSaveResult`.

IN THIS SECTION:

getErrorMessage()

Gets the error message, if any, from the payment platform regarding its attempt to save the notification sent from the payment gateway.

getStatusCode()

Gets the status code from the payment platform's attempt to save the notification sent from the payment gateway.

isSuccess()

Gets the status of whether the payment platform successfully saved the notification sent from the payment gateway.

`getErrorMessage()`

Gets the error message, if any, from the payment platform regarding its attempt to save the notification sent from the payment gateway.

Signature

```
global String getErrorMessage()
```

Return Value

Type: String

`getStatusCode()`

Gets the status code from the payment platform's attempt to save the notification sent from the payment gateway.

Signature

```
global Integer getStatusCode()
```

Return Value

Type: Integer

`isSuccess()`

Gets the status of whether the payment platform successfully saved the notification sent from the payment gateway.

Signature

```
global Boolean isSuccess()
```

Return Value

Type: Boolean

NotificationStatus Enum

Shows whether the payments platform successfully received the notification from the gateway.

Usage

When the gateway sends a notification for a payment request, the payments platform delegates the notification request to the gateway adapter. First, the adapter evaluates the signature from the notification request. If the signature is valid, the adapter builds a notification object to store information about the notification. During this process, the adapter sets the `NotificationStatus` to `Failed` or `Success` based on information from the notification request.

Enum Values

The following are the values of the `commercepayments.NotificationStatus` enum.

Value	Description
`Failed`	The payments platform couldn't receive the notification due to an error.
`Success`	The payments platform received the notification.

PaymentGatewayAdapter Interface

`PaymentGatewayAdapters` can implement this interface in order to process requests.

Namespace

CommercePayments on page 252

IN THIS SECTION:

PaymentGatewayAdapter Methods

PaymentGatewayAdapter Methods

The following are methods for `PaymentGatewayAdapter`.

IN THIS SECTION:

processRequest(var1)
The entry point for processing payment requests. Returns the response from the payment gateway.

`processRequest(var1)`

The entry point for processing payment requests. Returns the response from the payment gateway.

Signature

```
global commercepayments.GatewayResponse
processRequest(commercepayments.PaymentGatewayContext var1)
```

Parameters

var1

Type: commercepayments.PaymentGatewayContext

You can retrieve the request type and the request from the Context object.

Return Value

Type: commercepayments.GatewayResponse

The response from the payment gateway.

PaymentGatewayAsyncAdapter Interface

Implement the interface to allow customers to process payments asynchronously.

Namespace

CommercePayments on page 252

Usage

Implementing an asynchronous adapter also requires the `processNotification` method from the GatewayNotificationResponse on page 323 class.

Example

```
global with sharing class SampleAsyncAdapter implements
commercepayments.PaymentGatewayAsyncAdapter, commercepayments.PaymentGatewayAdapter {
    global SampleAsyncAdapter() {}

    global commercepayments.GatewayResponse
processRequest(commercepayments.paymentGatewayContext gatewayContext) {
    }

    global commercepayments.GatewayNotificationResponse
processNotification(commercepayments.PaymentGatewayNotificationContext
gatewayNotificationContext) {
    }
}
```

IN THIS SECTION:

PaymentGatewayAsyncAdapter Methods

PaymentGatewayAsyncAdapter Example Implementation

PaymentGatewayAsyncAdapter Methods

The following are methods for `PaymentGatewayAsyncAdapter`.

IN THIS SECTION:

processNotification(paymentGatewayNotificationContext)
Entry point for processing notifications from payment gateways.

`processNotification(paymentGatewayNotificationContext)`

Entry point for processing notifications from payment gateways.

Signature

```
global commercepayments.GatewayNotificationResponse
processNotification(commercepayments.PaymentGatewayNotificationContext var1)
```

Parameters

`paymentGatewayNotificationContext`
Type: PaymentGatewayNotificationContext on page 335

The `PaymentGatewayNotificationContext` object wraps all the information related to a gateway notification.

Return Value

Type: GatewayNotificationResponse on page 323

When the payment gateway sends a notification to the payments platform, the platform responds with a `GatewayNotificationResponse` indicating whether the platform succeeded or failed at receiving the notification.

PaymentGatewayAsyncAdapter Example Implementation

This is a sample implementation of the `commercepayments.PaymentGatewayAsyncAdapter` interface.

```
global with sharing class AdyenAdapter implements
commercepayments.PaymentGatewayAsyncAdapter, commercepayments.PaymentGatewayAdapter {
    global AdyenAdapter() {}

    global commercepayments.GatewayResponse
processRequest(commercepayments.paymentGatewayContext gatewayContext) {
    }

    global commercepayments.GatewayNotificationResponse
processNotification(commercepayments.PaymentGatewayNotificationContext
gatewayNotificationContext) {
    }
}

commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();
if (requestType == commercepayments.RequestType.Capture) {
   req.setEndpoint('/pal/servlet/Payment/v52/capture');
   // Refer to the end of this doc for sample buildCaptureRequest implementation
    body =
buildCaptureRequest((commercepayments.CaptureRequest)gatewayContext.getPaymentRequest());
} else if (requestType == commercepayments.RequestType.ReferencedRefund) {
    req.setEndpoint('/pal/servlet/Payment/v52/refund');
    body =
buildRefundRequest((commercepayments.ReferencedRefundRequest)gatewayContext.getPaymentRequest());
}

req.setBody(body);
req.setMethod('POST');
commercepayments.PaymentsHttp http = new commercepayments.PaymentsHttp();
HttpResponse res = null;
try {
    res = http.send(req);
} catch(CalloutException ce) {
    commercepayments.GatewayErrorResponse error = new
commercepayments.GatewayErrorResponse('500', ce.getMessage());
    return error;
}

if ( requestType == commercepayments.RequestType.Capture) {
   // Refer to the end of this doc for sample createCaptureResponse implementation
    response =  createCaptureResponse(res);
} else if ( requestType == commercepayments.RequestType.ReferencedRefund) {
    response =  createRefundResponse(res);
}
return response;

commercepayments.PaymentGatewayNotificationRequest notificationRequest =
gatewayNotificationContext.getPaymentGatewayNotificationRequest();
Blob request = notificationRequest.getRequestBody();
Map<String, Object> jsonReq = (Map<String,
Object>)JSON.deserializeUntyped(request.toString());
```

```
List<Object> notificationItems = (List<Object>)jsonReq.get('notificationItems');
Map<String, Object> notificationRequestItem =
    (Map<String, Object>)((Map<String,
Object>)notificationItems[0]).get('NotificationRequestItem');
Boolean success = Boolean.valueOf(notificationRequestItem.get('success'));
String pspReference = (String)notificationRequestItem.get('pspReference');
String eventCode = (String)notificationRequestItem.get('eventCode');
Double amount = (Double)((Map<String,
Object>)notificationRequestItem.get('amount')).get('value');

commercepayments.NotificationStatus notificationStatus = null;
if (success) {
    notificationStatus = commercepayments.NotificationStatus.Success;
} else {
    notificationStatus = commercepayments.NotificationStatus.Failed;
}
commercepayments.BaseNotification notification = null;
if ('CAPTURE'.equals(eventCode)) {
    notification = new commercepayments.CaptureNotification();
} else if ('REFUND'.equals(eventCode)) {
    notification = new commercepayments.ReferencedRefundNotification();
}
notification.setStatus(notificationStatus);
notification.setGatewayReferenceNumber(pspReference);
notification.setAmount(amount);

commercepayments.NotificationSaveResult saveResult =
commercepayments.NotificationClient.record(notification);

commercepayments.GatewayNotificationResponse gnr = new
commercepayments.GatewayNotificationResponse();
if (saveResult.isSuccess()) {
    system.debug('Notification accepted by platform');
} else {
    system.debug('Errors in the result '+ Blob.valueOf(saveResult.getErrorMessage()));
}
gnr.setStatusCode(200);
gnr.setResponseBody(Blob.valueOf('[accepted]'));
return gnr;
```

PaymentGatewayContext Class

Wraps the information related to a payment request.

Namespace

CommercePayments on page 252

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.PaymentGatewayContext pgc = new
CommercePayments.PaymentGatewayContext();
```

Example

```
global commercepayments.GatewayResponse processRequest(commercepayments.PaymentGatewayContext
 gatewayContext) {
    commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();
    if (requestType == commercepayments.RequestType.Capture) {
       commercepayments.CaptureRequest captureRequest = (commercepayments.CaptureRequest)
 gatewayContext.getPaymentRequest();
    }
}
```

IN THIS SECTION:

PaymentGatewayContext Constructors

PaymentGatewayContext Methods

PaymentGatewayContext Constructors

The following are constructors for `PaymentGatewayContext`.

IN THIS SECTION:

PaymentGatewayContext(request, requestType)
Constructor to enable instance creation. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`PaymentGatewayContext(request, requestType)`

Constructor to enable instance creation. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global PaymentGatewayContext(commercepayments.PaymentGatewayRequest request, String
requestType)
```

Parameters

request
Type: commercepayments.PaymentGatewayRequest

Raw payload. Sensitive attributes are masked to ensure PCI compliance.

requestType
Type: String

Defines the type of request made to the gateway

PaymentGatewayContext Methods

The following are methods for `PaymentGatewayContext`.

IN THIS SECTION:

getPaymentRequest()
Returns the payment request object.

getPaymentRequestType()
Returns the payment request type.

`getPaymentRequest()`

Returns the payment request object.

Signature

```
global commercepayments.PaymentGatewayRequest getPaymentRequest()
```

Return Value

Type: PaymentGatewayRequest

`getPaymentRequestType()`

Returns the payment request type.

Signature

```
global String getPaymentRequestType()
```

Return Value

Type: String

PaymentGatewayNotificationContext Class

Wraps the information related to a gateway notification.

Namespace

CommercePayments on page 252

Usage

This class is used with asynchronous payments. It wraps all of the information related to a notification from the payment gateway. The payments platform provides its context to the payment gateway adapters.

The constructor of this class takes no arguments. For example:

```
CommercePayments.PaymentGatewayNotificationContext pgnc = new
CommercePayments.PaymentGatewayNotificationContext();
```

Example

```
global commercepayments.GatewayNotificationResponse
processNotification(commercepayments.PaymentGatewayNotificationContext
gatewayNotificationContext) {
commercepayments.PaymentGatewayNotificationRequest notificationRequest =
gatewayNotificationContext.getPaymentGatewayNotificationRequest();
}
```

IN THIS SECTION:

PaymentGatewayNotificationContext Methods

PaymentGatewayNotificationContext Methods

The following are methods for `PaymentGatewayNotificationContext`.

IN THIS SECTION:

getPaymentGatewayNotificationRequest()
Returns the payment gateway's notification request.

`getPaymentGatewayNotificationRequest()`

Returns the payment gateway's notification request.

Signature

```
global commercepayments.PaymentGatewayNotificationRequest
getPaymentGatewayNotificationRequest()
```

Return Value

Type: PaymentGatewayNotificationRequest on page 347

PaymentMethodTokenizationRequest Class

Stores data about a request to tokenize a card payment method. The tokenization process occurs in the payment gateway. This process replaces sensitive customer data, such as a card number or CVV, with unique identification symbols. The symbols are used while the data is handled by Salesforce, the payment gateway, and the customer bank, allowing Salesforce to store the token without storing sensitive customer data.

Namespace

CommercePayments on page 252

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.PaymentMethodTokenizationRequest pmtr = new
CommercePayments.PaymentMethodTokenizationRequest();
```

This class holds all the required details about the tokenize request. Gateway adapters read the information in this class while constructing a tokenization JSON request, which is sent to the payment gateway.

Example

The following code is used within your payment gateway adapter Apex class.

Use the `GatewayResponse` class's `processRequest` method to build responses based on the request type that it receives from an instance of `PaymentGatewayContext` `on page 333`. If the request type is Tokenize, `GatewayResponse` `on page 325` calls the `createTokenizeResponse` method and passes an instance of the `PaymentMethodTokenizationRequest` class. The passed `PaymentMethodTokenizationRequest` object contains the address and cardPaymentMethod information that the payment gateway needs to manage the tokenization process. For example:

```
global commercepayments.GatewayResponse processRequest(commercepayments.paymentGatewayContext
 gatewayContext) {
        commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();

         commercepayments.GatewayResponse response;
         try
         {
             if (requestType == commercepayments.RequestType.Tokenize) {
                    response =
createTokenizeResponse((commercepayments.PaymentMethodTokenizationRequest)gatewayContext.getPaymentRequest());

             }
             //Add other else if statements for different request types as needed.
             return response;
         }
         catch(SalesforceValidationException e)
         {
              commercepayments.GatewayErrorResponse error = new
commercepayments.GatewayErrorResponse('400', e.getMessage());
              return error;
         }
     }
```

Configure the `createTokenizeResponse` method to accept an instance of `PaymentMethodTokenizationRequest`. Then, build an instance of `PaymentMethodTokenizationResponse` based on the values received from the payment gateway.

```
     public commercepayments.GatewayResponse
createTokenizeResponse(commercepayments.PaymentMethodTokenizationRequest tokenizeRequest)
 {
         commercepayments.PaymentMethodTokenizationResponse tokenizeResponse = new
commercepayments.PaymentMethodTokenizationResponse();
         tokenizeResponse.setGatewayTokenEncrypted(encryptedValue);
         tokenizeResponse.setGatewayTokenDetails(tokenDetails);
         tokenizeResponse.setGatewayAvsCode(avsCode);
```

```
        tokenizeResponse.setGatewayMessage(gatewayMessage);
        tokenizeResponse.setGatewayResultCode(resultcode);
        tokenizeResponse.setGatewayResultCodeDescription(resultCodeDescription);
        tokenizeResponse.setSalesforceResultCodeInfo(resultCodeInfo);
        tokenizeResponse.setGatewayDate(system.now());
        return tokenizeResponse;
    }
```

The `tokenizeResponse` contains the results of the gateway's tokenization process, and if successful, the tokenized value.

PaymentMethodTokenizationRequest Constructors

PaymentMethodTokenizationRequest Properties

PaymentMethodTokenizationRequest Methods

PaymentMethodTokenizationRequest Constructors

The following are constructors for `PaymentMethodTokenizationRequest`.

IN THIS SECTION:

PaymentMethodTokenizationRequest(paymentGatewayId)

Payment gateway ID constructor used with `paymentMethodTokenizationRequest`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

PaymentMethodTokenizationRequest()

The following are constructors for `PaymentMethodTokenizationRequest`.

`PaymentMethodTokenizationRequest(paymentGatewayId)`

Payment gateway ID constructor used with `paymentMethodTokenizationRequest`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global PaymentMethodTokenizationRequest(String paymentGatewayId)
```

Parameters

`paymentGatewayId`

Type: String

The payment method's payment gateway ID that will be tokenized.

`PaymentMethodTokenizationRequest()`

The following are constructors for `PaymentMethodTokenizationRequest`.

Signature

```
global PaymentMethodTokenizationRequest()
```

PaymentMethodTokenizationRequest Properties

The following are properties for `PaymentMethodTokenizationRequest`.

IN THIS SECTION:

address
The card payment method address to be tokenized.

cardPaymentMethod
The card payment method containing data to be tokenized.

`address`

The card payment method address to be tokenized.

Signature

```
global commercepayments.AddressRequest address {get; set;}
```

Property Value

Type: AddressRequest on page 258

`cardPaymentMethod`

The card payment method containing data to be tokenized.

Signature

```
global commercepayments.CardPaymentMethodRequest cardPaymentMethod {get; set;}
```

Property Value

Type: CardPaymentMethodRequest on page 314

PaymentMethodTokenizationRequest Methods

The following are methods for `PaymentMethodTokenizationRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `PaymentMethodTokenizationRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

hashCode()

Maintains the integrity of lists of type `PaymentMethodTokenizationRequest` by determining the uniquness of the external object records in a list.

toString()

Converts a date to a string.

equals(obj)

Maintains the integrity of lists of type `PaymentMethodTokenizationRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj

Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

hashCode()

Maintains the integrity of lists of type `PaymentMethodTokenizationRequest` by determining the uniquness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

toString()

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

PaymentMethodTokenizationResponse Class

Gateway response sent by payment gateway adapters for the payment method tokenization request. The response includes the payment method's token ID value.

Namespace

CommercePayments on page 252

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.PaymentMethodTokenizationResponse pmtr = new
CommercePayments.PaymentMethodTokenizationResponse();
```

After the payment gateway processes a tokenization request, the fields of `PaymentMethodTokenizationResponse` receive and store information from the gateway's response. The gateway's response shows whether the tokenization request was successful, the token value, and any additional messages or information about the tokenization process. You can then pass an instance of `PaymentMethodTokenizationResponse` to an authorization response or a sale response. This class is mapped to a response class in the Java layer.

Example

This constructor builds a new instance of the `PaymentMethodTokenizationResponse` class.

```
commercepayments.PaymentMethodTokenizationResponse tokenizeResponse = new
commercepayments.PaymentMethodTokenizationResponse();
```

`PaymentMethodTokenizationResponse` contains only setter methods. Each setter accepts a value from the payment gateway and use it to set an attribute of `PaymentMethodTokenizationResponse`.

The most important method in `PaymentMethodTokenizationResponse` is `setGatewayTokenEncrypted`, which uses Salesforce encryption to set an encrypted token value for a payment method. The `setGatewayTokenEncrypted` method is available in Salesforce API v52.0 and later. We recommend using it to ensure your tokenized payment method values are encrypted and secure. While the `setGatewayToken` method (available in earlier API versions) also returns a payment method token, the tokenized value isn't encrypted.

If the instantiated class already has a gateway token, `setGatewayTokenEncrypted` throws an error.

```
    /** @description Method to set Gateway token to persist in Encrypted Text */
    global void setGatewayTokenEncrypted(String gatewayTokenEncrypted) {
        if (gatewayTokenSet)  {
            throwTokenError();
        }
        this.delegate.setGatewayTokenEncrypted(gatewayTokenEncrypted);
        gatewayTokenEncryptedSet = true;
    }
```

A typical instantiation of `PaymentMethodTokenizationResponse` sets the encrypted gateway token alongside the other tokenization response values sent by the gateway.

```
    public commercepayments.GatewayResponse
createTokenizeResponse(commercepayments.PaymentMethodTokenizationRequest tokenizeRequest)
```

```
 {
         commercepayments.PaymentMethodTokenizationResponse tokenizeResponse = new
commercepayments.PaymentMethodTokenizationResponse();
         tokenizeResponse.setGatewayTokenEncrypted(gatewayTokenEncrypted);
         tokenizeResponse.setGatewayTokenDetails(gatewayTokenDetails);
         tokenizeResponse.setGatewayAvsCode(gatewayAvsCode);
         tokenizeResponse.setGatewayMessage(gatewayMessage);
         tokenizeResponse.setGatewayResultCode(gatewayResultCode);
         tokenizeResponse.setGatewayResultCodeDescription(gatewayResultCodeDescription);
        tokenizeResponse.setSalesforceResultCodeInfo(SUCCESS_SALESFORCE_RESULT_CODE_INFO);

         tokenizeResponse.setGatewayDate(system.now());
         return tokenizeResponse;
     }
```

After you've built a PaymentMethodTokenizationResponse object and set the encrypted gateway token, pass the object to the `setPaymentMethodTokenizationResponse` method of an authorization response or a sale response.

Authorization Response

```
     public commercepayments.GatewayResponse
createAuthResponse(commercepayments.AuthorizationRequest authRequest) {
         commercepayments.AuthorizationResponse authResponse = new
commercepayments.AuthorizationResponse();
         commercepayments.PaymentMethodTokenizationResponse
paymentMethodTokenizationResponse = new
commercepayments.PaymentMethodTokenizationResponse();
         if(authRequest.amount!=null )
         {
             authResponse.setAmount(authRequest.amount);
         }
         else
         {
            throw new SalesforceValidationException('Required Field Missing : Amount');

         }

         authResponse.setGatewayResultCode('00');
         authResponse.setGatewayResultCodeDescription('Transaction Normal');
         authResponse.setGatewayAuthCode('SF'+getRandomNumber(6));
         authResponse.setGatewayReferenceNumber(getRandomNumber(10));
        authResponse.setSalesforceResultCodeInfo(SUCCESS_SALESFORCE_RESULT_CODE_INFO);

         authResponse.setGatewayDate(system.now());

paymentMethodTokenizationResponse.setGatewayTokenEncrypted(gatewayTokenEncrypted);

authResponse.setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse);
         return authResponse;
     }
```

Sale Response

```
     public commercepayments.GatewayResponse
createSaleResponse(commercepayments.SaleRequest saleRequest) {
        commercepayments.SaleResponse saleResponse = new commercepayments.SaleResponse();
```

```
        commercepayments.PaymentMethodTokenizationResponse
paymentMethodTokenizationResponse = new
commercepayments.PaymentMethodTokenizationResponse();
        if(saleRequest.amount!=null )
        {
            saleResponse.setAmount(saleRequest.amount);
        }
        else
        {
           throw new SalesforceValidationException('Required Field Missing : Amount');

        }

        system.debug('Response - success');
        saleResponse.setGatewayDate(system.now());
        saleResponse.setGatewayResultCode('00');
        saleResponse.setGatewayResultCodeDescription('Transaction Normal');
        saleResponse.setGatewayReferenceNumber('SF'+getRandomNumber(6));
       saleResponse.setSalesforceResultCodeInfo(SUCCESS_SALESFORCE_RESULT_CODE_INFO);

paymentMethodTokenizationResponse.setGatewayTokenEncrypted(gatewayTokenEncrypted);

saleResponse.setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse);
        return saleResponse;
    }
```

IN THIS SECTION:

PaymentMethodTokenizationResponse Methods

PaymentMethodTokenizationResponse Methods

The following are methods for `PaymentMethodTokenizationResponse`.

IN THIS SECTION:

setGatewayAvsCode(gatewayAvsCode)

Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)

Sets the date that the tokenization occurred. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the tokenization request. Maximum length of 255 characters.

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setGatewayToken(gatewayToken)
Sets the gateway token value that the gateway returned.

setGatewayTokenDetails(gatewayTokenDetails)
Sets any additional information that the gateway returned about the payment token.

setGatewayTokenEncrypted(gatewayTokenEncrypted)
Sets the value of the `gatewayTokenEncrypted` field on a CardPaymentMethod or DigitalWallet object.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

setGatewayAvsCode(gatewayAvsCode)

Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

Signature

```
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

gatewayAvsCode
Type: String

Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.

Return Value

Type: void

setGatewayDate(gatewayDate)

Sets the date that the tokenization occurred. Some gateways don't send this value.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

Return Value

Type: void

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the tokenization request. Maximum length of 255 characters.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Must be used to map a Salesforce-specific result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Provides additional information about the result code and why the gateway returned the specific code. Descriptions will vary between different gateways.

Return Value

Type: void

`setGatewayToken(gatewayToken)`

Sets the gateway token value that the gateway returned.

Signature

```
global void setGatewayToken(String gatewayToken)
```

Parameters

`gatewayToken`
Type: String

The gateway token that the payment gateway sends following a tokenization request.

For the CardPaymentMethod and DigitalWallet objects, use the *`gatewyTokenEncrypted`* parameter, which encrypts the token value.

Return Value

Type: void

`setGatewayTokenDetails(gatewayTokenDetails)`

Sets any additional information that the gateway returned about the payment token.

Signature

```
global void setGatewayTokenDetails(String gatewayTokenDetails)
```

Parameters

`gatewayTokenDetails`
Type: String

Return Value

Type: void

`setGatewayTokenEncrypted(gatewayTokenEncrypted)`

Sets the value of the `gatewayTokenEncrypted` field on a CardPaymentMethod or DigitalWallet object.

Signature

```
global void setGatewayTokenEncrypted(String gatewayTokenEncrypted)
```

Parameters

`gatewayTokenEncrypted`
Type: String

The gateway token that the payment gateway sends following a tokenization request. Salesforce Payments uses Salesforce encryption to encrypt the token value.

Return Value

Type: void

`setSalesforceResultCodeInfo(salesforceResultCodeInfo)`

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

`salesforceResultCodeInfo`
Type: SalesforceResultCodeInfo on page 376

Description of the Salesforce result code value.

Return Value

Type: void

PaymentGatewayNotificationRequest Class

Contains the notification request data from the gateway.

Namespace

CommercePayments on page 252

Usage

When the payment gateway sends a notification for a payment request, the payments platform sends the notification request to the gateway adapter. If the notification payload contains an `eventCode` of `CAPTURE`, the adapter constructs a `CaptureNotification`. If the notification payload contains an `eventCode` of `REFUND`, the adapter constructs a `ReferencedRefundNotification`. If the notification payload contains `eventCode` of `AUTHORISATION`, the adapter constructs a `GatewayNotificationResponse`.

You can obtain a notification request from `PaymentGatewayNotificationContext` on page 335 by invoking its `getPaymentGatewayNotificationRequest` method.

Example

```
global commercepayments.GatewayNotificationResponse
    processNotification(commercepayments.PaymentGatewayNotificationContext
gatewayNotificationContext) {
        commercepayments.PaymentGatewayNotificationRequest notificationRequest =
gatewayNotificationContext.getPaymentGatewayNotificationRequest();
}
```

IN THIS SECTION:

PaymentGatewayNotificationRequest Properties

PaymentGatewayNotificationRequest Methods

PaymentGatewayNotificationRequest Properties

The following are properties for `PaymentGatewayNotificationRequest`.

IN THIS SECTION:

requestBody
Body of the notification request sent by the payment gateway.

`requestBody`

Body of the notification request sent by the payment gateway.

Signature

```
global Blob requestBody {get; set;}
```

Property Value

Type: Blob

PaymentGatewayNotificationRequest Methods

The following are methods for `PaymentGatewayNotificationRequest`.

IN THIS SECTION:

getHeaders()
Gets HTTP headers from the notification request sent by the payment gateway.

getRequestBody()
Stores the notification request body information from the payment gateway's notification request.

`getHeaders()`

Gets HTTP headers from the notification request sent by the payment gateway.

Signature

```
global Map<String,String> getHeaders()
```

Return Value

Type: Map<String,String>

`getRequestBody()`

Stores the notification request body information from the payment gateway's notification request.

Signature

```
global Blob getRequestBody()
```

Return Value

Type: Blob

PaymentsHttp Class

Makes an HTTP request to start the interaction with the payment gateway.

Namespace

CommercePayments on page 252

Usage

You must specify the `CommercePayments` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```
CommercePayments.PaymentsHttp payhttp = new CommercePayments.PaymentsHttp();
```

IN THIS SECTION:

PaymentsHttp Methods

PaymentsHttp Constructors

PaymentsHttp Methods

The following are methods for `PaymentsHttp`. All methods are instance methods.

IN THIS SECTION:

send(Request)
Sends an HttpRequest and returns the response.

`send(Request)`

Sends an HttpRequest and returns the response.

Signature

```
global HttpResponse send(HttpRequest request)
```

Parameters

`request`
Type: System.HttpRequest

Return Value

Type: System.HttpResponse

PaymentsHttp Constructors

The following are constructors for `PaymentsHttp`.

IN THIS SECTION:

PaymentsHttp()
Initiates an HTTP request and response.

`PaymentsHttp()`

Initiates an HTTP request and response.

Signature

```
global PaymentsHttp()
```

RefundRequest Class

Sends data related to a refund to the payment gateway adapter.

Namespace

CommercePayments on page 350

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.RefundRequest rrq = new CommercePayments.RefundRequest();
```

Example

```
commercepayments.ReferencedRefundRequest refundRequest = new
commercepayments.ReferencedRefundRequest(80, pmt.id);
```

IN THIS SECTION:

RefundRequest Methods

RefundRequest Methods

The following are methods for `RefundRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `RefundRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type `RefundRequest` by determining the uniqueness of the external object records in a list.

`equals(obj)`

Maintains the integrity of lists of type `RefundRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `RefundRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

ReferencedRefundNotification Class

When a payment gateway sends a notification for a refund transaction, the payment gateway adapter creates the `ReferencedRefundNotification` object to store information about notification.

Namespace

CommercePayments on page 252

Usage

This class is used with asynchronous payments. When a payment gateway sends a notification for a refund transcation, the gateway adapter creates an object of type `ReferencedRefundNotification` to populate the respective values.

The constructor of this class takes no arguments. For example:

```
CommercePayments.ReferencedRefundNotification rrn = new
CommercePayments.ReferencedRefundNotification();
```

Example

```
commercepayments.NotificationStatus notificationStatus = null;
        if (success) {
            notificationStatus = commercepayments.NotificationStatus.Success;
        } else {
            notificationStatus = commercepayments.NotificationStatus.Failed;
        }
        commercepayments.BaseNotification notification = null;
        if ('CAPTURE'.equals(eventCode)) {
            notification = new commercepayments.CaptureNotification();
        } else if ('REFUND'.equals(eventCode)) {
            notification = new commercepayments.ReferencedRefundNotification();
        }
```

IN THIS SECTION:

ReferencedRefundNotification Methods

ReferencedRefundNotification Methods

The following are methods for `ReferencedRefundNotification`.

IN THIS SECTION:

setAmount(amount)
Sets the transaction amount. Can be positive, negative, or zero.

setGatewayDate(gatewayDate)
Sets the date that communication for the refund notification occurred with the payment gateway.

setGatewayMessage(gatewayMessage)
Sets information or messages that the gateway returned.

setGatewayReferenceDetails(gatewayReferenceDetails)
Sets the payment gateway's reference details.

setGatewayReferenceNumber(gatewayReferenceNumber)
Sets the payment gateway's reference number.

setGatewayResultCode(gatewayResultCode)
Sets the payment gateway's result code.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets the payment gateway's result code description.

setId(id)
Sets the ID of a notification sent by the payment gateway.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets Salesforce result code information.

setStatus(status)
Sets the notification status value on the notification object.

`setAmount(amount)`

Sets the transaction amount. Can be positive, negative, or zero.

Signature

```
global void setAmount(Double amount)
```

Parameters

amount
Type: Double

The amount to be debited or captured.

Return Value

Type: void

`setGatewayDate(gatewayDate)`

Sets the date that communication for the refund notification occurred with the payment gateway.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

The date that communication happened with the gateway.

Return Value

Type: void

setGatewayMessage(gatewayMessage)

Sets information or messages that the gateway returned.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Return Value

Type: void

setGatewayReferenceDetails(gatewayReferenceDetails)

Sets the payment gateway's reference details.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

gatewayReferenceDetails
Type: String

Provides information about the gateway communication.

Return Value

Type: void

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the payment gateway's reference number.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique transaction ID created by the payment gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets the payment gateway's result code.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

The gateway result code. You must map this to a Salesforce-specific result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets the payment gateway's result code description.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the gateway result code. Provides additional context about the result code .

Return Value

Type: void

setId(id)

Sets the ID of a notification sent by the payment gateway.

Signature

```
global void setId(String id)
```

Parameters

id
Type: String

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets Salesforce result code information.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
Type: SalesforceResultCodeInfo on page 376

Description of the Salesforce result code value.

Return Value

Type: void

setStatus(status)

Sets the notification status value on the notification object.

Signature

```
global void setStatus(commercepayments.NotificationStatus status)
```

Parameters

status
Type: NotificationStatus on page 329

Indicates whether the payments platform successfully received the notification from the payment gateway.

Return Value

Type: void

ReferencedRefundRequest

Access information about the referenced refund requests. Extends the `RefundRequest` class.

Namespace

CommercePayments on page 252

Example

```
global commercepayments.GatewayResponse processRequest(commercepayments.PaymentGatewayContext
 gatewayContext) {
    commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();
    if (requestType == commercepayments.RequestType.ReferencedRefund) {
        commercepayments.*ReferencedRefundRequest* refundRequest =
(commercepayments.*ReferencedRefundRequest*) gatewayContext.getPaymentRequest();
    }
}
```

ReferencedRefundRequest Constructors

The following are constructors for `ReferencedRefundRequest`.

IN THIS SECTION:

ReferencedRefundRequest(amount, paymentId)
This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`ReferencedRefundRequest(amount, paymentId)`

This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Parameters

`amount`
Type: Double

The amount to be debited or captured.

`paymentId`
Type: String

The payment record.

ReferencedRefundRequest Properties

The following are properties for `ReferencedRefundRequest`.

IN THIS SECTION:

PaymentId
References a payment object.

accountId
References an account.

amount
References an amount.

`PaymentId`

References a payment object.

Property Value

Type: String

`accountId`

References an account.

Property Value

Type: String

`amount`

References an amount.

Property Value

Type: Double

ReferencedRefundRequest Methods

The following are methods for `ReferencedRefundRequest`.

ReferencedRefundResponse Class

The payment gateway adapter sends this response for the `ReferencedRefund` request type.

Namespace

CommercePayments on page 252

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.ReferencedRefundResponse refr = new
CommercePayments.ReferencedRefundResponse();
```

IN THIS SECTION:

ReferencedRefundResponse Methods

ReferencedRefundResponse Methods

The following are methods for `ReferencedRefundResponse`.

IN THIS SECTION:

setAmount(amount)
Sets the transaction amount. The value must be a postive number.

setGatewayAvsCode(gatewayAvsCode)
Sets the payment gateway's address verification system (AVS) code.

setGatewayDate(gatewayDate)
Sets the payment gateway's date.

setGatewayMessage(gatewayMessage)
Sets information or messages that the gateway returned.

setGatewayReferenceDetails(gatewayReferenceDetails)
Sets the payment gateway's reference details.

setGatewayReferenceNumber(gatewayReferenceNumber)
Sets the payment gateway's reference number.

setGatewayResultCode(gatewayResultCode)
Sets the payment gateway's result code.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets the payment gateway's result code description.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Set the Salesforce result code info.

`setAmount(amount)`

Sets the transaction amount. The value must be a postive number.

Signature

```
global void setAmount(Double amount)
```

Parameters

`amount`
Type: Double

The amount to be debited or captured.

Return Value

Type: void

`setGatewayAvsCode(gatewayAvsCode)`

Sets the payment gateway's address verification system (AVS) code.

Signature

```
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

gatewayAvsCode
Type: String

Code sent by gateways that use an address verification system.

Return Value

Type: void

`setGatewayDate(gatewayDate)`

Sets the payment gateway's date.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

Date and time of the gateway communication.

Return Value

Type: void

`setGatewayMessage(gatewayMessage)`

Sets information or messages that the gateway returned.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Information or error messages returned by the gateway.

Return Value

Type: void

setGatewayReferenceDetails(gatewayReferenceDetails)

Sets the payment gateway's reference details.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

gatewayReferenceDetails
Type: String

Information about the gateway communication.

Return Value

Type: void

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the payment gateway's reference number.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique transaction ID created by the payment gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets the payment gateway's result code.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

The gateway result code. Must be mapped to a Salesforce result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets the payment gateway's result code description.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the `GatewayResultCode`. Provides more information about the result code returned by the gateway.

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Set the Salesforce result code info.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
Type: commercepayments.SalesforceResultCodeInfo on page 376

Describes the Salesforce result code value.

Return Value

Type: void

RequestType Enum

Defines the type of payment transaction request made to the payment gateway.

Enum Values

The following are the values of the `commercepayments.RequestType` enum.

Value	Description
`Authorize`	Payment authorization request
`Capture`	Payment capture request
`ReferencedRefund`	Payment refund request
`Sale` `commercepayments.RequestType, Sale`	Sale request
`Tokenization` `commercepayments.RequestType, Tokenization`	Payment tokenization request

SaleApiPaymentMethodRequest Class

Sends data related to a card payment method to a gateway adapter during a sale service call.

Namespace

CommercePayments on page 252

Usage

This class holds information about a payment method that was used for a Sale request. `SaleApiPaymentMethodRequest` contains all the possible payment methods as fields, but only one value is populated for a given request. Gateway adapters use this class when constructing a sale request. The object of this class is obtained through the `paymentMethod` field on the `SaleRequest` object.

Example: This code sample retrieves the `SaleApiPaymentMethodRequest` object from the `SaleRequest` class.

```
commercepayments.SaleApiPaymentMethodRequest paymentMethod = saleRequest.paymentMethod;
```

IN THIS SECTION:

SaleApiPaymentMethodRequest Constructors
SaleApiPaymentMethodRequest Properties
SaleApiPaymentMethodRequest Methods

SaleApiPaymentMethodRequest Constructors

The following are constructors for `SaleApiPaymentMethodRequest`.

IN THIS SECTION:

SaleApiPaymentMethodRequest(cardPaymentMethodRequest)
Sends data related to a card payment method to a gateway adapter during a sale service call.

SaleApiPaymentMethodRequest()
Constructor for building a sale payment method request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`SaleApiPaymentMethodRequest(cardPaymentMethodRequest)`

Sends data related to a card payment method to a gateway adapter during a sale service call.

Signature

```
global SaleApiPaymentMethodRequest(commercepayments.CardPaymentMethodRequest
cardPaymentMethodRequest)
```

Parameters

`cardPaymentMethodRequest`
Type: CardPaymentMethodRequest on page 314

`SaleApiPaymentMethodRequest()`

Constructor for building a sale payment method request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global SaleApiPaymentMethodRequest()
```

SaleApiPaymentMethodRequest Properties

The following are properties for `SaleApiPaymentMethodRequest`.

IN THIS SECTION:

cardPaymentMethod
Contains details of the card used in a payment method.

`cardPaymentMethod`

Contains details of the card used in a payment method.

Signature

```
global commercepayments.CardPaymentMethodRequest cardPaymentMethod {get; set;}
```

Property Value

Type: CardPaymentMethodRequest on page 314

SaleApiPaymentMethodRequest Methods

The following are methods for `SaleApiPaymentMethodRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `SaleApiPaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type `SaleApiPaymentMethodRequest` by determining the uniqueness of the external object records in a list.

toString()
Converts a date to a string.

`equals(obj)`

Maintains the integrity of lists of type `SaleApiPaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `SaleApiPaymentMethodRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

SaleRequest Class

Stores information about a sales request.

Namespace

CommercePayments on page 252

Usage

This class holds all the required details about a sale request. Gateway adapters read the fields of this class object while constructing a sale JSON request thatis sent to the payment gateway. The object of this class is made available through `commercepayments.paymentGatewayContext` by calling `getPaymentRequest()`.

Example

This code sample retrieves the SaleRequest object from the `PaymentGatewayContext` class.

```
commercepayments.SaleRequest =
(commercepayments.SaleRequest)gatewayContext.getPaymentRequest()
```

IN THIS SECTION:

SaleRequest Constructors

SaleRequest Properties

SaleRequest Methods

SaleRequest Constructors

The following are constructors for `SaleRequest`.

IN THIS SECTION:

SaleRequest(amount)
Constructor for defining an amount for the sale request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

SaleRequest(amount)

Constructor for defining an amount for the sale request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global SaleRequest(Double amount)
```

Parameters

amount
Type: Double

Amount of the sale request.

SaleRequest Properties

The following are properties for `SaleRequest`.

IN THIS SECTION:

accountId
Customer account ID for the sale request.

amount
Amount of the sale request. Can be positive only.

comments
Additional information about the sale request.

currencyIsoCode
Currency code for the sale request.

paymentMethod
Payment method used in the sale request.

accountId

Customer account ID for the sale request.

Signature

```
global String accountId {get; set;}
```

Property Value

Type: String

amount

Amount of the sale request. Can be positive only.

Signature

```
global Double amount {get; set;}
```

Property Value

Type: Double

comments

Additional information about the sale request.

Signature

```
global String comments {get; set;}
```

Property Value

Type: String

currencyIsoCode

Currency code for the sale request.

Signature

```
global String currencyIsoCode {get; set;}
```

Property Value

Type: String

paymentMethod

Payment method used in the sale request.

Signature

```
global commercepayments.SaleApiPaymentMethodRequest paymentMethod {get; set;}
```

Property Value

Type: SaleApiPaymentMethodRequest on page 363

SaleRequest Methods

The following are methods for `SaleRequest`.

IN THIS SECTION:

equals(obj)
Compares this object with the specified object and returns `true` if both objects are equal; otherwise, returns `false`.

hashCode()
Maintains the integrity of lists of type `SaleRequest` by determining the uniqueness of the external object records in a list.

toString()
Converts a date to a string.

`equals(obj)`

Compares this object with the specified object and returns `true` if both objects are equal; otherwise, returns `false`.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `SaleRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

SaleResponse Class

Response sent by payment gateway adapters for a sales service.

Namespace

CommercePayments on page 252

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.SaleResponse slr CommercePayments.SaleResponse();
```

This class contains details about a customer card that was used as a payment method for Authorization, Sale, or Tokenization request. The gateway adapter reads the fields of this class while constructing a transaction JSON request, which it then sends to the payment gateway. The object of this class is made available by the `cardPaymentMethod` field in `SaleApiPaymentMethodRequest on page 363` and `AuthApiPaymentMethodRequest on page 269`.

Example

This code sample builds a `SaleResponse` object.

```
commercepayments.SaleResponse saleResponse = new commercepayments.SaleResponse();
saleResponse.setGatewayReferenceDetails("refDetailString");
saleResponse.setGatewayResultCode("res_code");
saleResponse.setGatewayResultCodeDescription("");
saleResponse.setGatewayReferenceNumber("");
saleResponse.setSalesforceResultCodeInfo(getSalesforceResultCodeInfo(commercepayments.SalesforceResultCode.SUCCESS.name()));
```

IN THIS SECTION:

SaleResponse Methods

SaleResponse Methods

The following are methods for `SaleResponse`.

IN THIS SECTION:

setAmount(amount)

Sets the transaction amount. Must be a non-negative value.

setGatewayAvsCode(gatewayAvsCode)

Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)

Sets the date that the sale occurred. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the sale request. Maximum length of 255 characters.

setGatewayReferenceDetails(gatewayReferenceDetails)

Sets additional data that you can use for subsequent sales. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse)

Sets information from the gateway about the tokenized payment method.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

`setAmount(amount)`

Sets the transaction amount. Must be a non-negative value.

Signature

```
global void setAmount(Double amount)
```

Parameters

amount

Type: Double

The amount of the transaction.

Return Value

Type: void

`setGatewayAvsCode(gatewayAvsCode)`

Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

Signature

```
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

gatewayAvsCode

Type: String

Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.

Return Value

Type: void

setGatewayDate(gatewayDate)

Sets the date that the sale occurred. Some gateways don't send this value.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

Return Value

Type: void

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the sale request. Maximum length of 255 characters.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Return Value

Type: void

setGatewayReferenceDetails(gatewayReferenceDetails)

Sets additional data that you can use for subsequent sales. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

gatewayReferenceDetails
Type: String

Return Value

Type: void

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique authorization ID created by the payment gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Must be used to map a Salesforce-specific result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the gateway's result code. Use this field to learn more about why the gateway returned a certain result code.

Return Value

Type: void

setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse)

Sets information from the gateway about the tokenized payment method.

Signature

```
global void
setPaymentMethodTokenizationResponse(commercepayments.PaymentMethodTokenizationResponse
paymentMethodTokenizationResponse)
```

Parameters

paymentMethodTokenizationResponse
Type: PaymentMethodTokenizationResponse on page 341

Gateway response sent by payment gateway adapters for the payment method tokenization request. The response includes the payment method's token ID value.

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
Type: SalesforceResultCodeInfo on page 376

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Return Value

Type: void

SalesforceResultCode Enum

Defines the gateway call status values in Salesforce based on the call status values that the payment gateway returned.

Usage

Payment gateways can return many different responses. Salesforce maps these responses into one of seven possible Salesforce response values.

Enum Values

The following are the values of the `commercepayments.SalesforceResultCode` enum.

Value	Description
`Decline`	The gateway call failed, but it may still work if you try again. For example, the customer had insufficient funds or briefly lost their connection to the internet. This is also known as a "soft decline."
`Indeterminate`	The gateway didn't respond to the call and the user has to check the transaction request's status. Indeterminate responses often occur following server timeouts, system failure, or any action that interrupts the gateway's ability to process the payment.
`PermanentFail`	The customer's bank recognized the payment account as closed, terminated, or fraudulent. The gateway won't further calls from the payment method associate with the transaction. After a permanent fail response, the transaction changes its gateway status to Permanent Fail.
`RequiresReview`	The gateway call initially failed, but the payment method may still work after further evaluation. This response often happens when the customer bank requires more information about the payment request. In this case, the bank provides an authorization code manually when the payment manager calls the processor.
`Success`	The gateway processed the transaction successfully.
`SystemError`	Salesforce ended the payment request call before receiving a gateway response. System error responses often occur due to gateway server errors, invalid customer credentials, or anytime the request times out before receiving a gateway response. The failure occurs before the request reaches the gateway, so there's no risk of an unaccounted payment remaining in the gateway. You can continue with the transaction by manually creating a payment.
`ValidationError`	The gateway received incorrect customer payment information, such as misspelled credit card names or a CVV with missing numbers.

SalesforceResultCodeInfo

Stores Salesforce result code information from payment gateway adapters.

Namespace

CommercePayments on page 252

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.SalesforceResultCodeInfo srci = new
CommercePayments.SalesforceResultCodeInfo();
```

Gateways can return the transaction result as either `CustomMetadata` or `SalesforceResultCode`.

IN THIS SECTION:

SalesforceResultCodeInfo Constructors

SalesforceResultCodeInfo Constructors

The following are constructors for `SalesforceResultCodeInfo`.

IN THIS SECTION:

SalesforceResultCodeInfo(customMetadataTypeInfo)
Constructor for providing the `customMetadataTypeInfo` for the result of the transaction.

SalesforceResultCodeInfo(salesforceResultCode)
Constructor that provides the `salesforceResultCode` for the transaction result.

`SalesforceResultCodeInfo(customMetadataTypeInfo)`

Constructor for providing the `customMetadataTypeInfo` for the result of the transaction.

Signature

```
global SalesforceResultCodeInfo(commercepayments.CustomMetadataTypeInfo
customMetadataTypeInfo)
```

Parameters

`customMetadataTypeInfo`
Type: CustomMetadataTypeInfo on page 320

Information about the metadata type.

`SalesforceResultCodeInfo(salesforceResultCode)`

Constructor that provides the `salesforceResultCode` for the transaction result.

Signature

```
global SalesforceResultCodeInfo(commercepayments.SalesforceResultCode
salesforceResultCode)
```

Parameters

salesforceResultCode

Type: SalesforceResultCode on page 375

The enum value for the result code.

ConnectApi Namespace

The ConnectApi namespace (also called Connect in Apex) provides classes for accessing the same data available in Connect REST API. Use Connect in Apex to create custom experiences in Salesforce.

For information about working with the ConnectApi classes, see Connect in Apex.

IN THIS SECTION:

ActionLinks Class

Create, delete, and get information about an action link group definition; get information about an action link group; get action link diagnostic information.

Announcements Class

Access information about announcements and post announcements.

BotVersionActivation Class

Access and update activation information of a bot version.

CdpQuery Class

Get Customer Data Platform metadata and query Customer Data Platform data.

CdpSegment Class

Create, delete, get, and update Customer Data Platform segments.

Chatter Class

Access information about followers and subscriptions for records.

ChatterFavorites Class

Chatter favorites give you easy access to topics, list views, and feed searches.

ChatterFeeds Class

Get, post, and delete feed elements, likes, comments, and bookmarks. You can also search feed elements, share feed elements, and vote on polls.

ChatterGroups Class

Information about groups, such as the group's members, photo, and the groups the specified user is a member of. Add members to a group, remove members, and change the group photo.

ChatterMessages Class

Get, send, search, and reply to private messages. You can also get and search private conversations, mark conversations as read, and get a count of unread private messages.

ChatterUsers Class

Access information about users, such as activity, followers, subscriptions, files, and groups.

Clm Class

Create and update Contract Lifecycle Management (CLM) contracts using object ID.

CommerceBuyerExperience Class

Create, delete, or get commerce addresses. Get order delivery group, order item, order shipments, shipment items, and order summaries. Get adjustments for order items and order summaries.

CommerceCart Class

Get, create, update, and delete carts. Get cart items, add items to carts, update and delete cart items.

CommerceCatalog Class

Get products, product categories, and product category paths.

CommerceSearch Class

Get sort rules for the live search index. Get product search suggestions. Search products.

CommerceSearchSettings Class

Get indexes and create an index of a product catalog.

CommerceStorePricing Class

Get product prices.

CommerceWishlist Class

Get, create, update, and delete wishlists. Add wishlists to carts. Get wishlist items, add items to wishlists, and delete wishlist items.

Communities Class

Get information about Experience Cloud sites in your org.

CommunityModeration Class

Get information about flagged feed items and comments in an Experience Cloud site. Add and remove flags from comments and feed items.

ContentHub Class

Access Files Connect repositories and their files and folders.

ConversationApplicationDefinition Class

Access information about a conversation application definition.

Datacloud Class

Purchase Data.com contact or company records, and retrieve purchase information.

EmailMergeFieldService Class

Extract a list of merge fields for an object. A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

EmployeeProfiles Class

Get, set and crop, and delete employee banner photos and photos.

ExternalEmailServices Class

Access information about integration with external email services, such as sending email within Salesforce through an external email account.

ExternalManagedAccount Class

Get externally managed accounts.

FieldService Class

Preview and create shifts from a pattern or filter fields on recordset filter criteria.

FulfillmentOrder Class

Fulfill orders in Order Management.

Knowledge Class

Get information about trending articles in Experience Cloud sites.

LightningScheduler Class

Create and update service appointments.

ManagedContent Class

Get managed content versions. Get a managed content space.

ManagedContentDelivery Class

Get collection items. Get collection metadata. Get a managed content channel. Get managed content.

ManagedTopics Class

Get managed topics in an Experience Cloud site. Create, delete, and reorder managed topics.

MarketingIntegration Class

Get, save, and submit a microsites marketing integration form for an Experience Cloud site.

Mentions Class

Access information about mentions. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.

Missions Class

Export and purge mission activity for users. Get a user's mission progress. Update mission activity counts for users.

NamedCredentials Class

Create, get, update, and delete credentials. Get external credentials. Get the URL for the OAuth token flow for an external credential.

NavigationMenu Class

Get navigation menu items for an Experience Cloud site.

NextBestAction Class

Execute recommendation strategies, get recommendations, manage recommendation reactions.

OmnichannelInventoryService Class

Route orders to inventory locations in Order Management.

Orchestration Class

Get orchestration instances.

OrderPaymentSummary Class

Work with payments in Order Management.

OrderSummary Class

Work with orders in Order Management.

OrderSummaryCreation Class

Create Order Summaries in Order Management.

Organization Class

Access information about an org.

PardotBusinessUnitContext Class

Get the Pardot business units the context user has access to.

Payments Methods

Authorize a payment, capture an authorized payment, and refund an authorized payment.

Personalization Class

Get assigned personalization audiences that match the user context. Create, get, update, and delete an audience. Get personalization targets that match the user context, based on the assigned audiences that include the user. Create and update targets. Get and delete a target.

QuestionAndAnswers Class

Access question and answers suggestions.

Recommendations Class

Get and reject Chatter, custom, and static recommendations. Create, get, update, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Records Class

Access information about record motifs, which are small icons used to distinguish record types in the Salesforce UI.

Repricing Class

Perform functions related to repricing orders in Order Management.

ReturnOrder Class

Process ReturnOrders in Order Management.

Routing Class

Route orders to inventory locations in Order Management.

SalesforceInbox Class

Access information about Automated Activity Capture, which is available in Einstein and Salesforce Inbox.

Sites Class

Search an Experience Cloud site.

SmartDataDiscovery Class

Get predictions on Salesforce objects.

SocialEngagement Class

Manage information about social accounts or fan pages for social networks.

Surveys Class

Send survey invitations by email.

TaxPlatform Class

Apply or cancel tax.

Topics Class

Access information about topics, such as their descriptions, the number of people talking about them, related topics, and information about groups contributing to the topic. Update a topic's name or description, merge topics, and add and remove topics from records and feed items.

UserProfiles Class

Access user profile data. The user profile data populates the profile page (also called the Chatter profile page). This data includes user information (such as address, manager, and phone number), some user capabilities (permissions), and a set of subtab apps, which are custom tabs on the profile page.

Zones Class

Access information about Chatter Answers zones in your organization. Zones organize questions into logical groups, with each zone having its own focus and unique questions.

ConnectApi Input Classes

Some `ConnectApi` methods take arguments that are instances of `ConnectApi` input classes.

ConnectApi Output Classes

Most `ConnectApi` methods return instances of `ConnectApi` output classes.

ConnectApi Enums

Enums specific to the `ConnectApi` namespace.

ConnectApi Exceptions

The `ConnectApi` namespace contains exception classes.

ActionLinks Class

Create, delete, and get information about an action link group definition; get information about an action link group; get action link diagnostic information.

Namespace

ConnectApi

Usage

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can drive productivity and accelerate innovation.

There are two views of an action link and an action link group: the definition, and the context user's view. The definition includes potentially sensitive information, such as authentication information. The context user's view is filtered by visibility options and the values reflect the state of the context user.

Action link definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission. Use these methods to operate on action link group definitions (which contain action link definitions):

- createActionLinkGroupDefinition(communityId, actionLinkGroup)
- deleteActionLinkGroupDefinition(communityId, actionLinkGroupId)
- getActionLinkGroupDefinition(communityId, actionLinkGroupId)

Use these methods to operate on a context user's view of an action link or an action link group:

- getActionLink(communityId, actionLinkId)
- getActionLinkGroup(communityId, actionLinkGroupId)
- getActionLinkDiagnosticInfo(communityId, actionLinkId)

For information about how to use action links, see Working with Action Links.

ActionLinks Methods

The following are methods for `ActionLinks`. All methods are static.

IN THIS SECTION:

createActionLinkGroupDefinition(communityId, actionLinkGroup)
Create an action link group definition. To associate an action link group with a feed element, first create an action link group definition. Then post a feed element with an associated actions capability.

deleteActionLinkGroupDefinition(communityId, actionLinkGroupId)
Delete an action link group definition. Deleting an action link group definition removes all references to it from feed elements.

getActionLink(communityId, actionLinkId)
Get information about an action link, including state for the context user.

getActionLinkDiagnosticInfo(communityId, actionLinkId)
Get diagnostic information returned when an action link executes. Diagnostic information is given only for users who can access the action link.

getActionLinkGroup(communityId, actionLinkGroupId)
Get information about an action link group including state for the context user.

getActionLinkGroupDefinition(communityId, actionLinkGroupId)
Get information about an action link group definition.

createActionLinkGroupDefinition(communityId, actionLinkGroup)

Create an action link group definition. To associate an action link group with a feed element, first create an action link group definition. Then post a feed element with an associated actions capability.

API Version

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.ActionLinkGroupDefinition createActionLinkGroupDefinition(String communityId, ConnectApi.ActionLinkGroupDefinitionInput actionLinkGroup)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

actionLinkGroup
Type: `ConnectApi.ActionLinkGroupDefinitionInput`

A `ConnectApi.ActionLinkGroupDefinitionInput` object that defines the action link group.

Return Value

Type: `ConnectApi.ActionLinkGroupDefinition`

Usage

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can drive productivity and accelerate innovation.

All action links must belong to a group. Action links in a group are mutually exclusive and share some properties. Define standalone actions in their own action group.

Information in the action link group definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link group definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

Note: Invoking `ApiAsync` action links from an app requires a call to set the status. However, there isn't currently a way to set the status of an action link using Apex. To set the status, use Connect REST API. See the Action Link resource in the *Connect REST API Developer Guide* for more information.

Example for Defining an Action Link and Posting with a Feed Element

For more information about this example, see Define an Action Link and Post with a Feed Element.

```
ConnectApi.ActionLinkGroupDefinitionInput actionLinkGroupDefinitionInput = new
ConnectApi.ActionLinkGroupDefinitionInput();
ConnectApi.ActionLinkDefinitionInput actionLinkDefinitionInput = new
ConnectApi.ActionLinkDefinitionInput();
ConnectApi.RequestHeaderInput requestHeaderInput1 = new ConnectApi.RequestHeaderInput();
ConnectApi.RequestHeaderInput requestHeaderInput2 = new ConnectApi.RequestHeaderInput();

// Create the action link group definition.
actionLinkGroupDefinitionInput.actionLinks = New
List<ConnectApi.ActionLinkDefinitionInput>();
actionLinkGroupDefinitionInput.executionsAllowed =
ConnectApi.ActionLinkExecutionsAllowed.OncePerUser;
actionLinkGroupDefinitionInput.category = ConnectApi.PlatformActionGroupCategory.Primary;
// To Do: Verify that the date is in the future.
// Action link groups are removed from feed elements on the expiration date.
datetime myDate = datetime.newInstance(2016, 3, 1);
actionLinkGroupDefinitionInput.expirationDate = myDate;

// Create the action link definition.
actionLinkDefinitionInput.actionType = ConnectApi.ActionLinkType.Api;
actionLinkDefinitionInput.actionUrl = '/services/data/v33.0/chatter/feed-elements';
actionLinkDefinitionInput.headers = new List<ConnectApi.RequestHeaderInput>();
actionLinkDefinitionInput.labelKey = 'Post';
actionLinkDefinitionInput.method = ConnectApi.HttpRequestMethod.HttpPost;
actionLinkDefinitionInput.requestBody = '{\"subjectId\": \"me\",\"feedElementType\":
\"FeedItem\",\"body\": {\"messageSegments\": [{\"type\": \"Text\",\"text\": \"This is a
test post created via an API action link.\"}]}}';
actionLinkDefinitionInput.requiresConfirmation = true;

// To Do: Substitute an OAuth value for your Salesforce org.
requestHeaderInput1.name = 'Authorization';
requestHeaderInput1.value = 'OAuth
00DD00000007WNP!ARsAQCwoeV0zzAV847FTl4zF.85w.EwsPbUgXR4SAjsp';
```

```
actionLinkDefinitionInput.headers.add(requestHeaderInput1);

requestHeaderInput2.name = 'Content-Type';
requestHeaderInput2.value = 'application/json';
actionLinkDefinitionInput.headers.add(requestHeaderInput2);

// Add the action link definition to the action link group definition.
actionLinkGroupDefinitionInput.actionLinks.add(actionLinkDefinitionInput);

// Instantiate the action link group definition.
ConnectApi.ActionLinkGroupDefinition actionLinkGroupDefinition =
ConnectApi.ActionLinks.createActionLinkGroupDefinition(Network.getNetworkId(),
actionLinkGroupDefinitionInput);

ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
ConnectApi.AssociatedActionsCapabilityInput associatedActionsCapabilityInput = new
ConnectApi.AssociatedActionsCapabilityInput();
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

// Set the properties of the feedItemInput object.
feedItemInput.body = messageBodyInput;
feedItemInput.capabilities = feedElementCapabilitiesInput;
feedItemInput.subjectId = 'me';

// Create the text for the post.
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
textSegmentInput.text = 'Click to post a feed item.';
messageBodyInput.messageSegments.add(textSegmentInput);

// The feedElementCapabilitiesInput object holds the capabilities of the feed item.
// Define an associated actions capability to hold the action link group.
// The action link group ID is returned from the call to create the action link group
definition.
feedElementCapabilitiesInput.associatedActions = associatedActionsCapabilityInput;
associatedActionsCapabilityInput.actionLinkGroupIds = new List<String>();
associatedActionsCapabilityInput.actionLinkGroupIds.add(actionLinkGroupDefinition.id);

// Post the feed item.
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);
```

Example for Defining an Action Link in a Template and Posting with a Feed Element

For more information about this example, see Define an Action Link in a Template and Post with a Feed Element.

```
// Get the action link group template Id.
ActionLinkGroupTemplate template = [SELECT Id FROM ActionLinkGroupTemplate WHERE
DeveloperName='Doc_Example'];

// Add binding name-value pairs to a map.
```

```
// The names are defined in the action link template(s) associated with the action link
group template.
// Get them from Setup UI or SOQL.
Map<String, String> bindingMap = new Map<String, String>();
bindingMap.put('ApiVersion', 'v33.0');
bindingMap.put('Text', 'This post was created by an API action link.');
bindingMap.put('SubjectId', 'me');

// Create ActionLinkTemplateBindingInput objects from the map elements.
List<ConnectApi.ActionLinkTemplateBindingInput> bindingInputs = new
List<ConnectApi.ActionLinkTemplateBindingInput>();

for (String key : bindingMap.keySet()) {
    ConnectApi.ActionLinkTemplateBindingInput bindingInput = new
ConnectApi.ActionLinkTemplateBindingInput();
    bindingInput.key = key;
    bindingInput.value = bindingMap.get(key);
    bindingInputs.add(bindingInput);
}

// Set the template Id and template binding values in the action link group definition.
ConnectApi.ActionLinkGroupDefinitionInput actionLinkGroupDefinitionInput = new
ConnectApi.ActionLinkGroupDefinitionInput();
actionLinkGroupDefinitionInput.templateId = template.id;
actionLinkGroupDefinitionInput.templateBindings = bindingInputs;

// Instantiate the action link group definition.
ConnectApi.ActionLinkGroupDefinition actionLinkGroupDefinition =
 ConnectApi.ActionLinks.createActionLinkGroupDefinition(Network.getNetworkId(),
actionLinkGroupDefinitionInput);

ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
ConnectApi.AssociatedActionsCapabilityInput associatedActionsCapabilityInput = new
ConnectApi.AssociatedActionsCapabilityInput();
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

// Define the FeedItemInput object to pass to postFeedElement
feedItemInput.body = messageBodyInput;
feedItemInput.capabilities = feedElementCapabilitiesInput;
feedItemInput.subjectId = 'me';

// The MessageBodyInput object holds the text in the post
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

textSegmentInput.text = 'Click to post a feed item.';
messageBodyInput.messageSegments.add(textSegmentInput);

// The FeedElementCapabilitiesInput object holds the capabilities of the feed item.
// For this feed item, we define an associated actions capability to hold the action link
 group.
```

```
// The action link group ID is returned from the call to create the action link group
definition.
feedElementCapabilitiesInput.associatedActions = associatedActionsCapabilityInput;
associatedActionsCapabilityInput.actionLinkGroupIds = new List<String>();
associatedActionsCapabilityInput.actionLinkGroupIds.add(actionLinkGroupDefinition.id);

// Post the feed item.
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);
```

`deleteActionLinkGroupDefinition(communityId, actionLinkGroupId)`

Delete an action link group definition. Deleting an action link group definition removes all references to it from feed elements.

API Version

33.0

Requires Chatter

No

Signature

```
public static void deleteActionLinkGroupDefinition(String communityId, String
actionLinkGroupId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`actionLinkGroupId`
Type: String

The ID of the action link group.

Return Value

Type: Void

Usage

Information in the action link group definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link group definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

`getActionLink(communityId, actionLinkId)`

Get information about an action link, including state for the context user.

API Version

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.PlatformAction getActionLink(String communityId, String actionLinkId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

actionLinkId
Type: String

The ID of the action link.

Return Value

Type: `ConnectApi.PlatformAction`

getActionLinkDiagnosticInfo(communityId, actionLinkId)

Get diagnostic information returned when an action link executes. Diagnostic information is given only for users who can access the action link.

API Version

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.ActionLinkDiagnosticInfo getActionLinkDiagnosticInfo(String communityId, String actionLinkId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

actionLinkId
Type: String

The ID of the action link.

Return Value

Type: ConnectApi.ActionLinkDiagnosticInfo

getActionLinkGroup(communityId, actionLinkGroupId)

Get information about an action link group including state for the context user.

API Version

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.PlatformActionGroup getActionLinkGroup(String communityId,
String actionLinkGroupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

actionLinkGroupId
Type: String

The ID of the action link group.

Return Value

Type: ConnectApi.PlatformActionGroup

Usage

All action links must belong to a group. Action links in a group are mutually exclusive and share some properties. Action link groups are accessible by clients, unlike action link group definitions.

getActionLinkGroupDefinition(communityId, actionLinkGroupId)

Get information about an action link group definition.

API Version

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.ActionLinkGroupDefinition getActionLinkGroupDefinition(String communityId, String actionLinkGroupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

actionLinkGroupId
Type: String

The ID of the action link group.

Return Value

Type: `ConnectApi.ActionLinkGroupDefinition`

Usage

Information in the action link group definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link group definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

Announcements Class

Access information about announcements and post announcements.

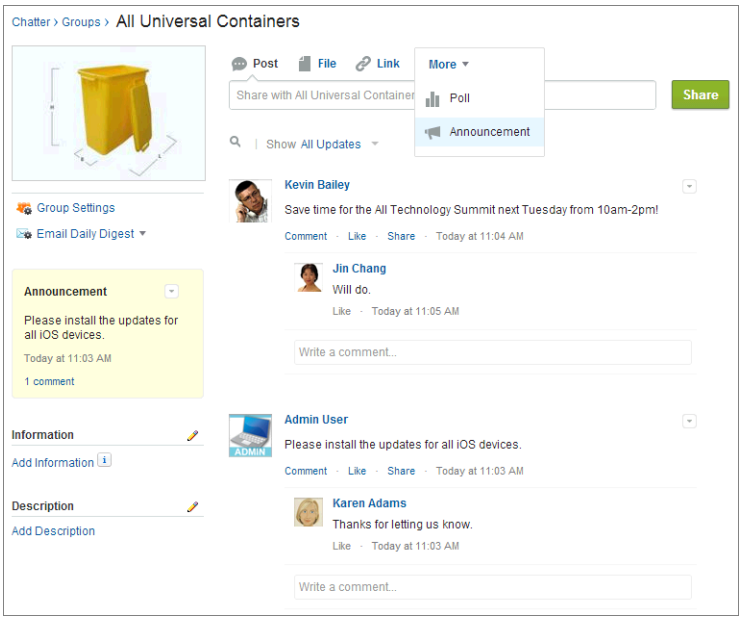
Namespace

ConnectApi

Usage

Use the `ConnectApi.Announcements` class to get, create, update, and delete announcements. Use an announcement to highlight information. Users can discuss, like, and post comments on announcements. Deleting the feed post deletes the announcement.

This image shows an announcement displayed in a group. Creating an announcement also creates a feed item with the announcement text.



An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.

Announcements Methods

The following are methods for `Announcements`. All methods are static.

IN THIS SECTION:

deleteAnnouncement(communityId, announcementId)
Delete an announcement.

getAnnouncement(communityId, announcementId)
Get an announcement.

getAnnouncements(communityId, parentId)
Get the first page of announcements.

getAnnouncements(communityId, parentId, pageParam, pageSize)
Get a page of announcements.

postAnnouncement(communityId, announcement)
Post an announcement.

updateAnnouncement(communityId, announcementId, expirationDate)
Update the expiration date of an announcement.

`deleteAnnouncement(communityId, announcementId)`

Delete an announcement.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static void deleteAnnouncement(String communityId, String announcementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

announcementId
Type: String

An announcement ID, which has a prefix of 0BT.

Return Value

Type: Void

Usage

To get a list of announcements in a group, call `getAnnouncements(communityId, parentId)` or `getAnnouncements(communityId, parentId, pageParam, pageSize)`.

To post an announcement to a group, call `postAnnouncement(communityId, announcement)` .

getAnnouncement(communityId, announcementId)

Get an announcement.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Announcement getAnnouncement(String communityId, String
announcementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

announcementId
Type: String

An announcement ID, which has a prefix of 0BT.

Return Value

Type: `ConnectApi.Announcement`

Usage

To get a list of announcements in a group, call `getAnnouncements(communityId, parentId)` or `getAnnouncements(communityId, parentId, pageParam, pageSize)`.

To post an announcement to a group, call `postAnnouncement(communityId, announcement)` .

`getAnnouncements(communityId, parentId)`

Get the first page of announcements.

API Version

36.0

Available to Guest Users

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.AnnouncementPage getAnnouncements(String communityId, String parentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

parentId
Type: String

ID of the parent entity for the announcement, that is, a group ID when the announcement appears in a group.

Return Value

Type: ConnectApi.AnnouncementPage

getAnnouncements(communityId, parentId, pageParam, pageSize)

Get a page of announcements.

API Version

36.0

Available to Guest Users

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.AnnouncementPage getAnnouncements(String communityId, String parentId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

parentId
Type: String

ID of the parent entity for the announcement, that is, a group ID when the announcement appears in a group.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of announcements per page.

Return Value

Type: ConnectApi.AnnouncementPage

postAnnouncement(communityId, announcement)

Post an announcement.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Announcement postAnnouncement(String communityId,
ConnectApi.AnnouncementInput announcement)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

announcement
Type: `ConnectApi.AnnouncementInput`

A `ConnectApi.AnnouncementInput` object.

Return Value

Type: `ConnectApi.Announcement`

updateAnnouncement(communityId, announcementId, expirationDate)

Update the expiration date of an announcement.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Announcement updateAnnouncement(String communityId, String
announcementId, Datetime expirationDate)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

announcementId
Type: String

An announcement ID, which has a prefix of 0BT.

expirationDate
Type: Datetime

The Salesforce UI displays an announcement until 11:59 p.m. on this date unless another announcement is posted first. The Salesforce UI ignores the time value in the `expirationDate`. However, you can use the time value to create your own display logic in your own UI.

Return Value

Type: `ConnectApi.Announcement`

Usage

To get a list of announcements in a group, call `getAnnouncements(communityId, parentId)` or `getAnnouncements(communityId, parentId, pageParam, pageSize)`.

To post an announcement to a group, call `postAnnouncement(communityId, announcement)` .

BotVersionActivation Class

Access and update activation information of a bot version.

Namespace

ConnectApi

BotVersionActivation Methods

The following are methods for `BotVersionActivation`. All methods are static.

IN THIS SECTION:

getVersionActivationInfo(botVersionId)
Get the active or inactive status of the bot version.

updateVersionStatus(botVersionId, status, postBody)
Update the status of the specified bot version.

`getVersionActivationInfo(botVersionId)`

Get the active or inactive status of the bot version.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.BotVersionActivationInfo getVersionActivationInfo(String
botVersionId)
```

Parameters

botVersionId
Type: String

ID of the bot version.

Return Value

Type: ConnectApi.BotVersionActivationInfo

Usage

To access this method, enable the bot feature, and the user must be an admin or have the Manage Bots or Manage Bots Training Data user permissions.

updateVersionStatus(botVersionId, status, postBody)

Update the status of the specified bot version.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.BotVersionActivationInfo updateVersionStatus(String
botVersionId, ConnectApi.BotVersionActivationStatus status,
ConnectApi.BotVersionActivationInput postBody)
```

Parameters

botVersionId
Type: String

ID of the bot version.

status
Type: ConnectApi.BotVersionActivationStatus

Activation status of the bot version. Values are:

- `Active`
- `Inactive`

Activation status must be specified in the *`status`* or *`postBody`* parameter.

`postBody`
Type: `ConnectApi.BotVersionActivationInput`

Parameters to update for the bot version. Activation status must be specified in the *`status`* or *`postBody`* parameter.

Return Value

Type: `ConnectApi.BotVersionActivationInfo`

Usage

To access this method, enable the bot feature, and the user must be an admin or have the Manage Bots or Manage Bots Training Data user permissions.

CdpQuery Class

Get Customer Data Platform metadata and query Customer Data Platform data.

Namespace

ConnectApi

CdpQuery Methods

The following are methods for `CdpQuery`. All methods are static.

IN THIS SECTION:

getAllMetadata()
Get all Customer Data Platform metadata, including Calculated Insights, Engagement, Profile, and other objects, as well as their relationships to other objects.

getAllMetadata(entityType, entityCategory, entityName)
Get all Customer Data Platform metadata, filtering for entity type, category, and name.

getInsightsMetadata()
Get Customer Data Platform Insight metadata, including Calculated Insight objects, their dimensions and measures.

getInsightsMetadata(ciName)
Get metadata for a Customer Data Platform Calculated Insight object. Metadata includes dimensions and measures.

getProfileMetadata()
Get Customer Data Platform metadata for data model objects in the profile category, including Individual, Contact Point Email, Unified Individual, and Contact Point Address objects. Metadata includes the objects, their fields, and category.

getProfileMetadata(dataModelName)
Get Customer Data Platform metadata for a data model object in the profile category, such as Individual, Contact Point Email, Unified Individual, and Contact Point Address. Metadata includes the list of fields, data types, and indexes available for lookup.

nextBatchAnsiSqlV2(nextBatchId)

Get the next batch of Customer Data Platform data across data model, lake, unified, and linked objects.

queryANSISql(input)

Synchronously query Customer Data Platform data across data model, lake, unified, and linked objects. This query returns up to 4,999 rows.

queryANSISql(input, batchSize, offset, orderby)

Synchronously query Customer Data Platform data across data model, lake, unified, and linked objects. Specify batch size, offset, and order of the results. This query returns up to 4,999 rows.

queryAnsiSqlV2(input)

Query up to 8 MB of Customer Data Platform data across data model, lake, unified, and linked objects.

queryCalculatedInsights(ciName, dimensions, measures, orderby, filters, batchSize, offset)

Query a Customer Data Platform Calculated Insight object.

queryCalculatedInsights(ciName, dimensions, measures, orderby, filters, batchSize, offset, timeGranularity)

Query a Customer Data Platform Calculated Insight object within a specified time range.

queryProfileApi(dataModelName, filters, fields, batchSize, offset, orderby)

Query a Customer Data Platform Profile data model object using filters.

queryProfileApi(dataModelName, id, searchKey, filters, fields, batchSize, offset, orderby)

Query a Customer Data Platform Profile data model object using filters and a search key.

queryProfileApi(dataModelName, id, childDataModelName, searchKey, filters, fields, batchSize, offset, orderby)

Query a Customer Data Platform Profile data model object and a child object using filters and a search key.

queryProfileApi(dataModelName, id, ciName, searchKey, dimensions, measures, filters, fields, batchSize, offset, orderby)

Query a Customer Data Platform Profile data model object and a Calculated Insight object using filters and a search key.

queryProfileApi(dataModelName, id, ciName, searchKey, dimensions, measures, filters, fields, batchSize, offset, orderby, timeGranularity)

Query a Customer Data Platform Profile data model object and a Calculated Insight object using filters, a search key, and a time range.

universalIdLookupBySourceId(entityName, dataSourceId, dataSourceObjectId, sourceRecordId)

Look up Customer Data Platform objects by source ID.

`getAllMetadata()`

Get all Customer Data Platform metadata, including Calculated Insights, Engagement, Profile, and other objects, as well as their relationships to other objects.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryMetadataOutput getAllMetadata()
```

Return Value

Type: ConnectApi.CdpQueryMetadataOutput

getAllMetadata(entityType, entityCategory, entityName)

Get all Customer Data Platform metadata, filtering for entity type, category, and name.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryMetadataOutput getAllMetadata(String entityType, String entityCategory, String entityName)
```

Parameters

entityType
Type: String

Type of metadata entity requested. Valid values are `DataLakeObject`, `DataModelObject`, and `CalculatedInsight`. If unspecified, all types are returned.

entityCategory
Type: String

Category of the metadata entity. Valid values are `Profile`, `Engagement`, and `Related`. If unspecified, all category entities are returned.

entityName
Type: String

Metadata name of the entity, for example `UnifiedIndividual__dlm`. If unspecified, a complete list of entities is returned.

Return Value

Type: ConnectApi.CdpQueryMetadataOutput

getInsightsMetadata()

Get Customer Data Platform Insight metadata, including Calculated Insight objects, their dimensions and measures.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryMetadataOutput getInsightsMetadata()
```

Return Value

Type: `ConnectApi.CdpQueryMetadataOutput`

`getInsightsMetadata(ciName)`

Get metadata for a Customer Data Platform Calculated Insight object. Metadata includes dimensions and measures.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryMetadataOutput getInsightsMetadata(String ciName)
```

Parameters

ciName
Type: String

Name of the Calculated Insight object, for example, `IndividualChildrenCount__cio`.

Return Value

Type: `ConnectApi.CdpQueryMetadataOutput`

`getProfileMetadata()`

Get Customer Data Platform metadata for data model objects in the profile category, including Individual, Contact Point Email, Unified Individual, and Contact Point Address objects. Metadata includes the objects, their fields, and category.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryMetadataOutput getProfileMetadata()
```

Return Value

Type: ConnectApi.CdpQueryMetadataOutput

getProfileMetadata(dataModelName)

Get Customer Data Platform metadata for a data model object in the profile category, such as Individual, Contact Point Email, Unified Individual, and Contact Point Address. Metadata includes the list of fields, data types, and indexes available for lookup.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryMetadataOutput getProfileMetadata(String dataModelName)
```

Parameters

dataModelName
Type: String

Name of the data model object, for example, `UnifiedIndividual__dlm`.

Return Value

Type: ConnectApi.CdpQueryMetadataOutput

nextBatchAnsiSqlV2(nextBatchId)

Get the next batch of Customer Data Platform data across data model, lake, unified, and linked objects.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutputV2 nextBatchAnsiSqlV2(String nextBatchId)
```

Parameters

nextBatchId
Type: String

ID of the next batch. See the Usage section for more information.

Return Value

Type: `ConnectApi.CdpQueryOutputV2`

Usage

Initially, use the `queryAnsiSqlV2(input)` method to query up to 8 MB of Customer Data Platform data. Use the `nextBatchId` from the `ConnectApi.CdpQueryOutputV2` output class as the *`nextBatchId`* parameter in this method to get the next batch of data. You can continue using subsequent next batch IDs for up to an hour.

`queryANSISql(input)`

Synchronously query Customer Data Platform data across data model, lake, unified, and linked objects. This query returns up to 4,999 rows.

Note: A newer version of the Query API is available. We recommend using `queryAnsiSqlV2(input)` and `nextBatchAnsiSqlV2(nextBatchId)` to take advantage of subsequent requests and larger response sizes.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryANSISql(ConnectApi.CdpQueryInput input)
```

Parameters

input
Type: `ConnectApi.CdpQueryInput`

A `ConnectApi.CdpQueryInput` body with the SQL query.

Return Value

Type: `ConnectApi.CdpQueryOutput`

`queryANSISql(input, batchSize, offset, orderby)`

Synchronously query Customer Data Platform data across data model, lake, unified, and linked objects. Specify batch size, offset, and order of the results. This query returns up to 4,999 rows.

Note: A newer version of the Query API is available. We recommend using `queryAnsiSqlV2(input)` and `nextBatchAnsiSqlV2(nextBatchId)` to take advantage of subsequent requests and larger response sizes.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryANSISql(ConnectApi.CdpQueryInput input,
Integer batchSize, Integer offset, String orderby)
```

Parameters

input
Type: `ConnectApi.CdpQueryInput`

A `ConnectApi.CdpQueryInput` body with the SQL query.

batchSize
Type: Integer

Number of records to return. Values are from 1–4999. The default value is 4999.

offset
Type: Integer

Number of rows to skip before returning results. The sum of *offset* and *batchSize* must be less than 2147483647. The default value is 0.

orderby
Type: String

Comma-separated values to sort the results in ascending or descending order, for example, `GenderId__c ASC,Occupation__c DESC`.

Return Value

Type: `ConnectApi.CdpQueryOutput`

queryAnsiSqlV2(input)

Query up to 8 MB of Customer Data Platform data across data model, lake, unified, and linked objects.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutputV2 queryAnsiSqlV2(ConnectApi.CdpQueryInput input)
```

Parameters

input
Type: ConnectApi.CdpQueryInput

A ConnectApi.CdpQueryInput body with the SQL query.

Return Value

Type: ConnectApi.CdpQueryOutputV2

Usage

Use the nextBatchId in the ConnectApi.CdpQueryOutputV2 output class as the *nextBatchId* parameter in the nextBatchAnsiSqlV2(nextBatchId) method to continue getting batches of data for up to an hour.

queryCalculatedInsights(ciName, dimensions, measures, orderby, filters, batchSize, offset)

Query a Customer Data Platform Calculated Insight object.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryCalculatedInsights(String ciName, String dimensions, String measures, String orderby, String filters, Integer batchSize, Integer offset)
```

Parameters

ciName
Type: String

Name of the Calculated Insight object, for example, IndividualChildrenCount__cio.

dimensions
Type: String

Comma-separated list of up to 10 dimensions, such as GenderId__c, to project. If unspecified, this parameter includes all of the available dimensions.

measures
Type: String

Comma-separated list of up to 5 measures, such as `TotalSales__c`, to project. If unspecified, this parameter includes all of the available measures.

orderby
Type: String

Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

filters
Type: String

Filter the result set to a more narrow scope or specific type, such as `[GenderId__c=Male,FirstName__c=Angel]`.

batchSize
Type: Integer

Number of items to return. Values are from 1–4,999. If unspecified, the default value is `4999`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

Return Value

Type: `ConnectApi.CdpQueryOutput`

queryCalculatedInsights(ciName, dimensions, measures, orderby, filters, batchSize, offset, timeGranularity)

Query a Customer Data Platform Calculated Insight object within a specified time range.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryCalculatedInsights(String ciName, String dimensions, String measures, String orderby, String filters, Integer batchSize, Integer offset, String timeGranularity)
```

Parameters

ciName
Type: String

Name of the Calculated Insight object, for example, `IndividualChildrenCount__cio`.

dimensions
Type: String

Comma-separated list of up to 10 dimensions, such as `GenderId__c`, to project. If unspecified, this parameter includes all of the available dimensions.

measures
Type: String

Comma-separated list of up to 5 measures, such as `TotalSales__c`, to project. If unspecified, this parameter includes all of the available measures.

orderby
Type: String

Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

filters
Type: String

Filter the result set to a more narrow scope or specific type, such as `[GenderId__c=Male,FirstName__c=Angel]`.

batchSize
Type: Integer

Number of items to return. Values are from 1–4,999. If unspecified, the default value is `4999`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

timeGranularity
Type: String

Time range for the measures. Values are:

- `HOUR`
- `DAY`
- `MONTH`
- `QUARTER`
- `YEAR`

If unspecified, no time range is applied.

Return Value

Type: `ConnectApi.CdpQueryOutput`

`queryProfileApi(dataModelName, filters, fields, batchSize, offset, orderby)`

Query a Customer Data Platform Profile data model object using filters.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryProfileApi(String dataModelName, String filters, String fields, Integer batchSize, Integer offset, String orderby)
```

Parameters

dataModelName
Type: String

Name of the data model object, for example, `UnifiedIndividual__dlm`.

filters
Type: String

Comma-separated list of equality expressions within square brackets, for example, `[FirstName__c=DON]`.

fields
Type: String

Comma-separated list of up to 50 field names that you want to include in the result, for example, `Id__c,FirstName__c, GenderId__c,Occupation__c`. If unspecified, an arbitrary set of fields is returned.

batchSize
Type: Integer

Number of items to return. Values are from 1–4,999. If unspecified, the default value is `100`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderby
Type: String

Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

Return Value

Type: `ConnectApi.CdpQueryOutput`

queryProfileApi(dataModelName, id, searchKey, filters, fields, batchSize, offset, orderby)

Query a Customer Data Platform Profile data model object using filters and a search key.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryProfileApi(String dataModelName, String id, String searchKey, String filters, String fields, Integer batchSize, Integer offset, String orderby)
```

Parameters

dataModelName
Type: String

Name of the data model object, for example, `UnifiedIndividual__dlm`.

id
Type: String

Value of the primary or secondary key field, for example, `John`. If unspecified, defaults to the value of the primary key field.

searchKey
Type: String

If a field other than the primary key is used, name of the key field, for example, `FirstName__c`.

filters
Type: String

Comma-separated list of equality expressions within square brackets, for example, `[FirstName__c=DON]`.

fields
Type: String

Comma-separated list of up to 50 field names that you want to include in the result, for example, `Id__c,FirstName__c, GenderId__c,Occupation__c`. If unspecified, an arbitrary set of fields is returned.

batchSize
Type: Integer

Number of items to return. Values are from 1–4,999. If unspecified, the default value is `100`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderby
Type: String

Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

Return Value

Type: `ConnectApi.CdpQueryOutput`

queryProfileApi(dataModelName, id, childDataModelName, searchKey, filters, fields, batchSize, offset, orderby)

Query a Customer Data Platform Profile data model object and a child object using filters and a search key.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryProfileApi(String dataModelName, String id, String childDataModelName, String searchKey, String filters, String fields, Integer batchSize, Integer offset, String orderby)
```

Parameters

dataModelName
Type: String

Name of the data model object, for example, `UnifiedIndividual__dlm`.

id
Type: String

Value of the primary or secondary key field, for example, `John`. If unspecified, defaults to the value of the primary key field.

childDataModelName
Type: String

Name of the child data model object, for example, `UnifiedContactPointEmail__dlm`.

searchKey
Type: String

If a field other than the primary key is used, name of the key field, for example, `FirstName__c`.

filters
Type: String

Comma-separated list of equality expressions within square brackets, for example, `[FirstName__c=DON]`. Filters are applied to the parent object only.

fields
Type: String

Comma-separated list of child object field names that you want to include in the result, for example, `Id__c,EmailAddress__c`. If unspecified, the first 10 alphabetically sorted fields are returned.

batchSize
Type: Integer

Number of items to return. Values are from 1–4,999. If unspecified, the default value is `100`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderby
Type: String

Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

Return Value

Type: `ConnectApi.CdpQueryOutput`

queryProfileApi(dataModelName, id, ciName, searchKey, dimensions, measures, filters, fields, batchSize, offset, orderby)

Query a Customer Data Platform Profile data model object and a Calculated Insight object using filters and a search key.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryProfileApi(String dataModelName, String id, String ciName, String searchKey, String dimensions, String measures, String filters, String fields, Integer batchSize, Integer offset, String orderby)
```

Parameters

dataModelName
Type: String

Name of the data model object, for example, `UnifiedIndividual__dlm`.

id
Type: String

Value of the primary or secondary key field, for example, `John`. If unspecified, defaults to the value of the primary key field.

ciName
Type: String

Name of the Calculated Insight object, for example, `IndividualChildrenCount__cio`.

searchKey
Type: String

If a field other than the primary key is used, name of the key field, for example, `FirstName__c`.

dimensions
Type: String

Comma-separated list of up to 10 dimensions, such as `GenderId__c`, to project. If unspecified, this parameter includes all of the available dimensions.

measures
Type: String

Comma-separated list of up to 5 measures, such as `TotalSales__c`, to project. If unspecified, this parameter includes all of the available measures.

`filters`
Type: String

Comma-separated list of equality expressions within square brackets, for example, `[FirstName__c=DON]`.

`fields`
Type: String

Comma-separated list of up to 50 field names that you want to include in the result, for example, `Id__c,FirstName__c, GenderId__c,Occupation__c`. If unspecified, an arbitrary set of fields is returned.

`batchSize`
Type: Integer

Number of items to return. Values are from 1–4,999. If unspecified, the default value is `100`.

`offset`
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

`orderby`
Type: String

Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

Return Value

Type: `ConnectApi.CdpQueryOutput`

`queryProfileApi(dataModelName, id, ciName, searchKey, dimensions, measures, filters, fields, batchSize, offset, orderby, timeGranularity)`

Query a Customer Data Platform Profile data model object and a Calculated Insight object using filters, a search key, and a time range.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryProfileApi(String dataModelName, String id, String ciName, String searchKey, String dimensions, String measures, String filters, String fields, Integer batchSize, Integer offset, String orderby, String timeGranularity)
```

Parameters

dataModelName
Type: String

Name of the data model object, for example, `UnifiedIndividual__dlm`.

id
Type: String

Value of the primary or secondary key field, for example, `John`. If unspecified, defaults to the value of the primary key field.

ciName
Type: String

Name of the Calculated Insight object, for example, `IndividualChildrenCount__cio`.

searchKey
Type: String

If a field other than the primary key is used, name of the key field, for example, `FirstName__c`.

dimensions
Type: String

Comma-separated list of up to 10 dimensions, such as `GenderId__c`, to project. If unspecified, this parameter includes all of the available dimensions.

measures
Type: String

Comma-separated list of up to 5 measures, such as `TotalSales__c`, to project. If unspecified, this parameter includes all of the available measures.

filters
Type: String

Comma-separated list of equality expressions within square brackets, for example, `[FirstName__c=DON]`.

fields
Type: String

Comma-separated list of up to 50 field names that you want to include in the result, for example, `Id__c,FirstName__c, GenderId__c,Occupation__c`. If unspecified, an arbitrary set of fields is returned.

batchSize
Type: Integer

Number of items to return. Values are from 1–4,999. If unspecified, the default value is `100`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderby
Type: String

Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

timeGranularity
Type: String

Time range for the measures. Values are:

- `HOUR`
- `DAY`
- `MONTH`
- `QUARTER`
- `YEAR`

If unspecified, no time range is applied.

Return Value

Type: `ConnectApi.CdpQueryOutput`

`universalIdLookupBySourceId(entityName, dataSourceId, dataSourceObjectId, sourceRecordId)`

Look up Customer Data Platform objects by source ID.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryDataOutput universalIdLookupBySourceId(String
entityName, String dataSourceId, String dataSourceObjectId, String sourceRecordId)
```

Parameters

`entityName`
Type: String

Entity name.

`dataSourceId`
Type: String

Data source ID.

`dataSourceObjectId`
Type: String

Data source object ID.

`sourceRecordId`
Type: String

Source record ID.

Return Value

Type: `ConnectApi.CdpQueryDataOutput`

CdpSegment Class

Create, delete, get, and update Customer Data Platform segments.

Namespace

ConnectApi

CdpSegment Methods

The following are methods for `CdpSegment`. All methods are static.

IN THIS SECTION:

createSegment(input)
Create a segment.

deleteSegment(segmentApiName)
Delete a segment.

getSegment(segmentApiName)
Get a segment.

getSegments()
Get segments.

getSegmentsPaginated(batchSize, offset, orderBy)
Get an ordered batch of segments.

updateSegment(segmentApiName, input)
Update a segment.

`createSegment(input)`

Create a segment.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpSegmentOutput createSegment(ConnectApi.CdpSegmentInput
input)
```

Parameters

input
Type: ConnectApi.CdpSegmentInput

A ConnectApi.CdpSegmentInput class.

Return Value

Type: ConnectApi.CdpSegmentOutput

deleteSegment(segmentApiName)

Delete a segment.

API Version

56.0

Requires Chatter

No

Signature

```
public static Void deleteSegment(String segmentApiName)
```

Parameters

segmentApiName
Type: String

API name of the segment.

Return Value

Type: Void

getSegment(segmentApiName)

Get a segment.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpSegmentContainerOutput getSegment(String segmentApiName)
```

Parameters

segmentApiName
Type: String

API name of the segment.

Return Value

Type: ConnectApi.CdpSegmentContainerOutput

getSegments()

Get segments.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpSegmentContainerOutput getSegments()
```

Return Value

Type: ConnectApi.CdpSegmentContainerOutput

getSegmentsPaginated(batchSize, offset, orderBy)

Get an ordered batch of segments.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpSegmentContainerOutput getSegmentsPaginated(Integer
batchSize, Integer offset, String orderBy)
```

Parameters

batchSize
Type: Integer

Number of items to return. Values are from 1–200. If unspecified, the default value is `20`.

`offset`
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

`orderBy`
Type: String

Sort order for the result set, such as `Name ASC` or `MarketSegmentType DESC`. If unspecified, items are returned by name in ascending order.

Return Value

Type: `ConnectApi.CdpSegmentContainerOutput`

`updateSegment(segmentApiName, input)`

Update a segment.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpSegmentOutput updateSegment(String segmentApiName,
ConnectApi.CdpSegmentInput input)
```

Parameters

`segmentApiName`
Type: String

API name of the segment.

`input`
Type: `ConnectApi.CdpSegmentInput`

A `ConnectApi.CdpSegmentInput` class with the updates.

Return Value

Type: `ConnectApi.CdpSegmentOutput`

Chatter Class

Access information about followers and subscriptions for records.

Namespace

ConnectApi

Chatter Methods

The following are methods for `Chatter`. All methods are static.

IN THIS SECTION:

deleteSubscription(communityId, subscriptionId)
Delete a subscription. Use this method to stop following a record, a user, or a file.

getFollowers(communityId, recordId)
Get the first page of followers for a record.

getFollowers(communityId, recordId, pageParam, pageSize)
Get a page of followers for a record.

getSubscription(communityId, subscriptionId)
Get information about a subscription.

submitDigestJob(period)
Submit a daily or weekly Chatter email digest job.

`deleteSubscription(communityId, subscriptionId)`

Delete a subscription. Use this method to stop following a record, a user, or a file.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static void deleteSubscription(String communityId, String subscriptionId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`subscriptionId`
Type: String

The ID for a subscription.

Return Value

Type: Void

Usage

"Following" a user, group, or record is the same as "subscribing" to a user, group, or record. A "follower" is the user who followed the user, group, or record. A "subscription" is an object describing the relationship between the follower and the user, group, or record they followed.

To leave a group, call `deleteMember(communityId, membershipId)`.

Example

When you follow a user, the call to `ConnectApi.ChatterUsers.follow` returns a `ConnectApi.Subscription` object. To stop following the user, pass the `id` property of that object to this method.

```
ConnectApi.Chatter.deleteSubscription(null, '0E8RR0000004CnK0AU');
```

SEE ALSO:

- Follow a Record
- follow(communityId, userId, subjectId)

`getFollowers(communityId, recordId)`

Get the first page of followers for a record.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowerPage getFollowers(String communityId, String recordId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`recordId`
Type: String

ID for a record or the keyword `me`.

Return Value

Type: `ConnectApi.FollowerPage`

Usage

"Following" a user, group, or record is the same as "subscribing" to a user, group, or record. A "follower" is the user who followed the user, group, or record. A "subscription" is an object describing the relationship between the follower and the user, group, or record they followed.

SEE ALSO:

Follow a Record

`getFollowers(communityId, recordId, pageParam, pageSize)`

Get a page of followers for a record.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowerPage getFollowers(String communityId, String recordId,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID for a record or the keyword `me`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.FollowerPage`

Usage

"Following" a user, group, or record is the same as "subscribing" to a user, group, or record. A "follower" is the user who followed the user, group, or record. A "subscription" is an object describing the relationship between the follower and the user, group, or record they followed.

SEE ALSO:

Follow a Record

`getSubscription(communityId, subscriptionId)`

Get information about a subscription.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Subscription getSubscription(String communityId, String subscriptionId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`subscriptionId`
Type: String

The ID for a subscription.

Return Value

Type: `ConnectApi.Subscription`

Usage

"Following" a user, group, or record is the same as "subscribing" to a user, group, or record. A "follower" is the user who followed the user, group, or record. A "subscription" is an object describing the relationship between the follower and the user, group, or record they followed.

SEE ALSO:

Follow a Record

`submitDigestJob(period)`

Submit a daily or weekly Chatter email digest job.

API Version

37.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.DigestJobRepresentation submitDigestJob(ConnectApi.DigestPeriod
period)
```

Parameters

period
Type: `ConnectApi.DigestPeriod`

Time period that's included in a Chatter email digest. Values are:

- `DailyDigest`—The email includes up to the 50 latest posts from the previous day.
- `WeeklyDigest`—The email includes up to the 50 latest posts from the previous week.

Return Value

Type: `ConnectApi.DigestJob`

Usage

The times when Chatter sends email digests are not configurable in the UI. To control when email digests are sent and to use this method, contact Salesforce to enable API-only Chatter Digests.

Warning: Enabling API-only Chatter Digests disables the scheduled digests for your org. You must call the API for your users to receive their digests.

We recommend scheduling digest jobs by implementing the Apex `Schedulable` interface with this method. To monitor your digest jobs from Setup, enter *`Background Jobs`* in the `Quick Find` box, then select **Background Jobs**.

Example

Schedule daily digests:

```
global class ExampleDigestJob1 implements Schedulable {
   global void execute(SchedulableContext context) {
      ConnectApi.Chatter.submitDigestJob(ConnectApi.DigestPeriod.DailyDigest);
   }
}
```

Schedule weekly digests:

```
global class ExampleDigestJob2 implements Schedulable {
   global void execute(SchedulableContext context) {
      ConnectApi.Chatter.submitDigestJob(ConnectApi.DigestPeriod.WeeklyDigest);
   }
}
```

SEE ALSO:

Apex Scheduler

ChatterFavorites Class

Chatter favorites give you easy access to topics, list views, and feed searches.

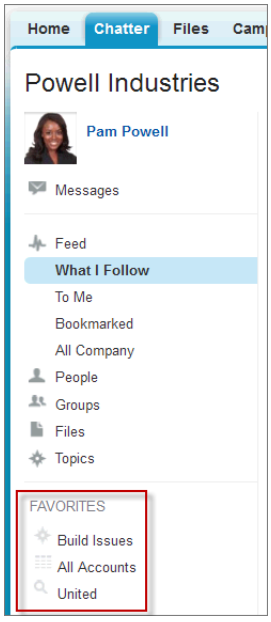
Namespace

ConnectApi

Usage

Use Connect in Apex to get and delete topics, list views, and feed searches that have been added as favorites. Add topics and feed searches as favorites, and update the last view date of a feed search or list view feed to the current system time.

In this image of Salesforce, "Build Issues" is a topic, "All Accounts" is a list view, and "United" is a feed search:



ChatterFavorites Methods

The following are methods for `ChatterFavorites`. All methods are static.

IN THIS SECTION:

addFavorite(communityId, subjectId, searchText)
Add a feed search favorite for a user.

addRecordFavorite(communityId, subjectId, targetId)
Add a topic as a favorite.

deleteFavorite(communityId, subjectId, favoriteId)
Delete a favorite.

getFavorite(communityId, subjectId, favoriteId)
Get information about a favorite.

getFavorites(communityId, subjectId)
Get a list of favorites for a user.

getFeedElements(communityId, subjectId, favoriteId)
Get the first page of feed elements for a favorite.

getFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)
Get a page of sorted feed elements for a favorite.

getFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam)
Get a page of sorted feed elements for a favorite. Include no more than the specified number of comments per feed element.

updateFavorite(communityId, subjectId, favoriteId, updateLastViewDate)
Update the last view date of the saved search or list view feed to the current system time.

`addFavorite(communityId, subjectId, searchText)`

Add a feed search favorite for a user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedFavorite addFavorite(String communityId, String subjectId,
String searchText)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`subjectId`
Type: String

ID of the context user or the alias `me`.

searchText
Type: String

Specify the text of the search to be saved as a favorite. This method can only create a feed search favorite, not a list view favorite or a topic.

Return Value

Type: ConnectApi.FeedFavorite

addRecordFavorite(communityId, subjectId, targetId)

Add a topic as a favorite.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedFavorite addRecordFavorite(String communityId, String subjectId, String targetId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

targetId
Type: String

The ID of the topic to add as a favorite.

Return Value

Type: ConnectApi.FeedFavorite

deleteFavorite(communityId, subjectId, favoriteId)

Delete a favorite.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static Void deleteFavorite(String communityId, String subjectId, String
favoriteId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

Return Value

Type: Void

getFavorite(communityId, subjectId, favoriteId)

Get information about a favorite.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedFavorite getFavorite(String communityId, String subjectId,
String favoriteId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

Return Value

Type: `ConnectApi.FeedFavorite`

`getFavorites(communityId, subjectId)`

Get a list of favorites for a user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedFavorites getFavorites(String communityId, String subjectId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

Return Value

Type: `ConnectApi.FeedFavorites`

`getFeedElements(communityId, subjectId, favoriteId)`

Get the first page of feed elements for a favorite.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElements(String communityId, String subjectId, String favoriteId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElements(communityId, subjectId, favoriteId, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)`

Get a page of sorted feed elements for a favorite.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElements(String communityId, String
subjectId, String favoriteId, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam)`

Get a page of sorted feed elements for a favorite. Include no more than the specified number of comments per feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElements(String communityId, String subjectId, String favoriteId, Integer recentCommentCount, Integer elementsPerBundle, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`updateFavorite(communityId, subjectId, favoriteId, updateLastViewDate)`

Update the last view date of the saved search or list view feed to the current system time.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedFavorite updateFavorite(String communityId, String
subjectId, String favoriteId, Boolean updateLastViewDate)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

updateLastViewDate
Type: Boolean

Specify whether to update the last view date of the specified favorite to the current system time (`true`) or not (`false`).

Return Value

Type: `ConnectApi.FeedFavorite`

ChatterFavorites Test Methods

The following are the test methods for `ChatterFavorites`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

IN THIS SECTION:

setTestGetFeedElements(communityId, subjectId, favoriteId, result)
Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)
Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam, result)
Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

`setTestGetFeedElements(communityId, subjectId, favoriteId, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElements(String communityId, String subjectId, String favoriteId, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElements(communityId, subjectId, favoriteId)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElements(String communityId, String subjectId, String favoriteId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElements(String communityId, String subjectId, String favoriteId, Integer recentCommentCount, Integer elementsPerBundle, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`result`
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

Retired ChatterFavorites Methods

The following methods for `ChatterFavorites` are retired.

IN THIS SECTION:

getFeedItems(communityId, subjectId, favoriteId)
Get the first page of feed items for a favorite.

getFeedItems(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)
Get a page of sorted feed items for a favorite.

getFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam)
Get a page of sorted feed items for a favorite. Include no more than the specified number of comments per feed item.

setTestGetFeedItems(communityId, subjectId, favoriteId, result)
Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItems` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItems(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)
Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItems` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam, result)
Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItems` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

`getFeedItems(communityId, subjectId, favoriteId)`

Get the first page of feed items for a favorite.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElements(communityId, subjectId, favoriteId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItems(String communityId, String subjectId,
String favoriteId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedItems(communityId, subjectId, favoriteId, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedItems(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)`

Get a page of sorted feed items for a favorite.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItems(String communityId, String subjectId,
String favoriteId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder
sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedItems(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam)`

Get a page of sorted feed items for a favorite. Include no more than the specified number of comments per feed item.

API Version

29.0–31.0

Important: In version 32.0 and later, use getFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItems(String communityId, String subjectId,
String favoriteId, Integer recentCommentCount, String pageParam, Integer pageSize,
FeedSortOrder sortParam)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`subjectId`
Type: String

ID of the context user or the alias `me`.

`favoriteId`
Type: String

ID of a favorite.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedItems(communityId, subjectId, favoriteId, result)`

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItems` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItems(String communityId, String subjectId, String favoriteId, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItems(communityId, subjectId, favoriteId)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedItems(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)`

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItems` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItems(String communityId, String subjectId, String favoriteId, String pageParam, Integer pageSize, FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

`setTestGetFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam, result)`

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItems` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

29.0–31.0

Signature

```
public static Void setTestGetFeedItems(String communityId, String subjectId, String favoriteId, Integer recentCommentCount, String pageParam, Integer pageSize, FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`subjectId`
Type: String

ID of the context user or the alias `me`.

`favoriteId`
Type: String

ID of a favorite.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

`result`
Type: `ConnectApi.FeedItemPage`

Object containing test data.

getFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

ChatterFeeds Class

Get, post, and delete feed elements, likes, comments, and bookmarks. You can also search feed elements, share feed elements, and vote on polls.

Namespace

ConnectApi

Usage

The Chatter feed is a container of feed elements. The abstract class `ConnectApi.FeedElement` is a parent class to the `ConnectApi.FeedItem` class, representing feed posts, and the `ConnectApi.GenericFeedElement` class, representing bundles and recommendations in the feed. For detailed information, see Working with Feeds and Feed Elements.

Important: Feed item methods aren't available in version 32.0. In version 32.0 and later, use feed element methods.

Message segments in a feed item are typed as `ConnectApi.MessageSegment`. Feed item capabilities are typed as `ConnectApi.FeedItemCapability`. Record fields are typed as `ConnectApi.AbstractRecordField`. These classes are all abstract and have several concrete subclasses. At runtime you can use `instanceof` to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

Important: The composition of a feed can change between releases. Write your code to handle instances of unknown subclasses.

ChatterFeeds Methods

The following are methods for `ChatterFeeds`. All methods are static.

IN THIS SECTION:

createStream(communityId, streamInput)
Create a Chatter feed stream.

deleteComment(communityId, commentId)
Delete a comment.

deleteFeedElement(communityId, feedElementId)
Delete a feed element.

deleteLike(communityId, likeId)
Delete a like on a comment or post.

deleteStream(communityId, streamId)
Delete a Chatter feed stream.

getComment(communityId, commentId)
Get a comment.

getCommentBatch(communityId, commentIds)
Get a list of comments.

getCommentInContext(communityId, commentId, pageSize)
Get a threaded comment in the context of its parent comments and post.

getCommentsForFeedElement(communityId, feedElementId)
Get comments for a feed element.

getCommentsForFeedElement(communityId, feedElementId, threadedCommentsCollapsed)
Get comments in a threaded style for a feed element.

getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize)
Get a page of comments for a feed element.

getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize, threadedCommentsCollapsed)
Get a page of comments in a threaded style for a feed element.

getCommentsForFeedElement(communityId, feedElementId, threadedCommentsCollapsed, sortParam)
Get sorted comments in a threaded style for a feed element.

getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize, threadedCommentsCollapsed, sortParam)
Get a page of sorted comments in a threaded style for a feed element.

getCommentsForFeedElement(communityId, feedElementId, sortParam)
Get sorted comments for a feed element.

getCommentsForFeedElement(communityId, feedElementId, sortParam, threadedCommentsCollapsed)
Get sorted comments in a threaded style for a feed element.

getExtensions(communityId, pageParam, pageSize)
Get extensions.

getFeed(communityId, feedType)
Get a feed.

getFeed(communityId, feedType, sortParam)
Get a sorted feed.

getFeed(communityId, feedType, subjectId)

Get a feed for a record or user.

getFeed(communityId, feedType, subjectId, sortParam)

Get a sorted feed for a record or user.

getFeedDirectory(String)

Get a list of all feeds available to the context user.

getFeedElement(communityId, feedElementId)

Get a feed element.

getFeedElement(communityId, feedElementId, commentSort)

Get a feed element with sorted comments.

getFeedElement(communityId, feedElementId, threadedCommentsCollapsed)

Get a feed element and its comments in a threaded style.

getFeedElement(communityId, feedElementId, threadedCommentsCollapsed, commentSort)

Get a feed element and its sorted comments in a threaded style.

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle)

Get a feed element with the specified number of elements per bundle including no more than the specified number of comments per feed element.

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, threadedCommentsCollapsed)

Get a feed element with its comments in a threaded style with the specified number of elements per bundle and comments per feed element.

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, threadedCommentsCollapsed, commentSort)

Get a feed element with its sorted comments in a threaded style with the specified number of elements per bundle and comments per feed element.

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, commentSort)

Get a feed element with the specified number of elements per bundle including no more than the specified number of sorted comments per feed element.

getFeedElementBatch(communityId, feedElementIds)

Get a list of feed elements.

getFeedElementPoll(communityId, feedElementId)

Get the poll associated with a feed element.

getFeedElementsFromBundle(communityId, feedElementId)

Get feed elements from a bundle.

getFeedElementsFromBundle(communityId, feedElementId, pageParam, pageSize, elementsPerBundle, recentCommentCount)

Get a page of feed elements from a bundle. Specify the number of elements per bundle and include no more than the specified number of comments per feed element.

getFeedElementsFromFeed(communityId, feedType)

Get feed elements from the `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview` feeds.

getFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from the `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview` feeds.

getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from the `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview` feeds. Each feed element contains no more than the specified number of comments.

getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter)

Get a page of sorted and filtered feed elements from the `Home` feed. Each feed element contains no more than the specified number of comments.

getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed)

Get a page of filtered and sorted feed elements with comments in a threaded style from the `Home` feed. Each feed element contains no more than the specified number of comments.

getFeedElementsFromFeed(communityId, feedType, subjectId)

Get feed elements from any feed other than `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview` for a user or record.

getFeedElementsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from any feed other than `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from any feed other than `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`. Each feed element includes no more than the specified number of comments.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)

Get a page of sorted feed elements from a record feed. Each feed element includes no more than the specified number of comments. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter)

Get a page of sorted and filtered feed elements from the `UserProfile` feed.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed)

Get a page of feed elements with comments in a threaded style from the `UserProfile` feed.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, customFilter)

Get a page of sorted and filtered feed elements from the case feed.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly)

Get a page of sorted feed elements from a record feed. Specify the number of elements per bundle and include no more than the specified number of comments per feed element. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter)

Get a page of sorted and filtered feed elements from a record feed. Specify the number of elements per bundle and include no more than the specified number of comments per feed element. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter, threadedCommentsCollapsed)

Get a page of sorted and filtered feed elements with comments in a threaded style for a record feed. Specify the number of elements per bundle and include no more than the specified number of comments per feed element. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, customFilter)

Get a page of sorted and filtered feed elements from a case feed.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, customFilter, threadedCommentsCollapsed)

Get a page of filtered and sorted feed elements with comments in a threaded style from a case feed.

getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix)

Get feed elements from a feed filtered by a key prefix for a user.

getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from a feed filtered by a key prefix for a user.

getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from a feed filtered by a key prefix for a user. Each feed element contains no more than the specified number of comments.

getFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince)

Get a page of feed elements from a feed filtered by a key prefix for a user. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter.

getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince)

Get a page of feed elements from the `Company`, `DirectMessageModeration`, `Home`, and `Moderation` feeds. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter. Each feed element contains no more than the specified number of comments.

getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, filter)

Get a page of filtered feed elements from the `Home` feed. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter. Each feed element contains no more than the specified number of comments.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince)

Get a page of feed elements from the `Files`, `Groups`, `News`, `People`, and `Record` feeds. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter. Each feed element contains no more than the specified number of comments.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly)

Get a page of feed elements from a record feed. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, filter)

Get a page of filtered feed elements from a `UserProfile` feed. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, customFilter)

Get a page of filtered feed elements from a case feed. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly)

Get a page of feed elements from a record feed. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter. Specify the maximum number of feed elements in a bundle and whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, filter)

Get a page of filtered feed elements from a record feed. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter. Specify the maximum number of feed elements in a bundle and whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, customFilter)

Get a page of filtered feed elements from a case feed. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter.

getFeedWithFeedElements(communityId, feedType, pageSize)

Get information about a feed and a page of feed elements from the feed.

getFeedWithFeedElements(communityId, feedType, pageSize, recentCommentCount)

Get a page of information about the feed and the feed elements with the specified number of comments per feed element from the feed.

getFilterFeed(communityId, subjectId, keyPrefix)

Get a feed filtered by a key prefix for a user.

getFilterFeed(communityId, subjectId, keyPrefix, sortParam)

Get a sorted feed filtered by a key prefix for a user.

getFilterFeedDirectory(communityId, subjectId)

Get a feed directory of filter feeds available to the context user.

getLike(communityId, likeId)

Get a like on a post or comment.

getLikesForComment(communityId, commentId)

Get likes for a comment.

getLikesForComment(communityId, commentId, pageParam, pageSize)

Get a page of likes for a comment.

getLikesForFeedElement(communityId, feedElementId)

Get likes for a feed element.

getLikesForFeedElement(communityId, feedElementId, pageParam, pageSize)

Get a page of likes for a feed element.

getLinkMetadata(communityId, urls)

Get link metadata for URLs.

getPinnedFeedElementsFromFeed(communityId, feedType, subjectId)
Get pinned feed elements from a group or topic feed.

getReadByForFeedElement(communityId, feedElementId)
Get information about who read a feed element and when.

getReadByForFeedElement(communityId, feedElementId, pageParam, pageSize)
Get a page of information about who read a feed element and when.

getRelatedPosts(communityId, feedElementId, filter, maxResults)
Get posts related to the context feed element.

getStream(communityId, streamId)
Get information about a Chatter feed stream.

getStream(communityId, streamId, globalScope)
Get information about a Chatter feed stream, regardless of Experience Cloud site.

getStreams(communityId)
Get the Chatter feed streams for the context user.

getStreams(communityId, sortParam)
Get and sort the Chatter feed streams for the context user.

getStreams(communityId, pageParam, pageSize)
Get a page of Chatter feed streams for the context user.

getStreams(communityId, pageParam, pageSize, sortParam)
Get a sorted page of Chatter feed streams for the context user.

getStreams(communityId, pageParam, pageSize, sortParam, globalScope)
Get a sorted page of Chatter feed streams from all Enterprise Cloud sites for the context user.

getSupportedEmojis()
Get supported emojis for the org.

getThreadsForFeedComment(communityId, commentId)
Get threaded comments for a comment.

getThreadsForFeedComment(communityId, commentId, pageParam, pageSize)
Get a page of threaded comments for a comment.

getThreadsForFeedComment(communityId, commentId, threadedCommentsCollapsed)
Access the comments capability for a comment.

getTopUnansweredQuestions(communityId) (Pilot)
Get top unanswered questions for the context user in aExperience Cloud site.

getTopUnansweredQuestions(communityId, filter) (Pilot)
Get filtered top unanswered questions for the context user in an Experience Cloud site.

getTopUnansweredQuestions(communityId, pageSize) (Pilot)
Get a page of top unanswered questions for the context user in an Experience Cloud site.

getTopUnansweredQuestions(communityId, filter, pageSize) (Pilot)
Get a page of filtered top unanswered questions for the context user in an Experience Cloud site.

getVotesForComment(communityId, commentId, vote)
Get the first page of users who upvoted or downvoted a comment.

getVotesForComment(communityId, commentId, vote, pageParam, pageSize)
Get a page of users who upvoted or downvoted a comment.

getVotesForFeedElement(communityId, feedElementId, vote)
Get the first page of users who upvoted or downvoted a feed element.

getVotesForFeedElement(communityId, feedElementId, vote, pageParam, pageSize)
Get a page of users who upvoted or downvoted a feed element.

isCommentEditableByMe(communityId, commentId)
Discover whether the context user can edit a comment.

isFeedElementEditableByMe(communityId, feedElementId)
Discover whether the context user can edit a feed element.

isModified(communityId, feedType, subjectId, since)
Discover whether a news feed has been updated or changed. Use this method to poll a news feed for updates.

likeComment(communityId, commentId)
Like a comment for the context user.

likeFeedElement(communityId, feedElementId)
Like a feed element.

postCommentToFeedElement(communityId, feedElementId, text)
Post a plain-text comment to a feed element.

postCommentToFeedElement(communityId, feedElementId, comment, feedElementFileUpload)
Post a rich-text comment to a feed element. Use this method to include mentions and to attach a file.

postFeedElement(communityId, subjectId, feedElementType, text)
Post a plain-text feed element.

postFeedElement(communityId, feedElement)
Post a rich-text feed element. Include mentions and hashtag topics, attach already uploaded files to a feed element, and associate action link groups with a feed element. You can also use this method to share a feed element and add a comment.

postFeedElementBatch(communityId, feedElements)
Post a list of feed elements.

publishDraftFeedElement(communityId, feedElementId, feedElement)
Publish a draft feed element.

searchFeedElements(communityId, q)
Get the first page of feed elements that match the search criteria.

searchFeedElements(communityId, q, sortParam)
Get the first page of sorted feed elements that match the search criteria.

searchFeedElements(communityId, q, threadedCommentsCollapsed)
Get the feed elements and comments that match the search criteria.

searchFeedElements(communityId, q, pageParam, pageSize)
Get a page of feed elements that match the search criteria.

searchFeedElements(communityId, q, pageParam, pageSize, sortParam)
Get a page of sorted feed elements that match the search criteria.

searchFeedElements(communityId, q, pageParam, pageSize, threadedCommentsCollapsed)
Get a page of feed elements with comments in a threaded style that match the search criteria.

searchFeedElements(communityId, q, recentCommentCount, pageParam, pageSize, sortParam)

Get a page of sorted feed elements that match the search criteria. Each feed element includes no more than the specified number of comments.

searchFeedElementsInFeed(communityId, feedType, q)

Get the feed elements from the `Company`, `DirectMessageModeration`, `Home`, `Moderation`, and `PendingReview` feeds that match the search criteria.

searchFeedElementsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q)

Get a page of sorted feed elements from the `Company`, `DirectMessageModeration`, `Home`, `Moderation`, and `PendingReview` feeds that match the search criteria.

searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Get a page of sorted feed elements from the `Company`, `DirectMessageModeration`, `Home`, `Moderation`, and `PendingReview` feeds that match the search criteria. Each feed element includes no more than the specified number of comments.

searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)

Get a page of sorted and filtered feed elements from the `Home` feed that match the search criteria. Each feed element includes no more than the specified number of comments.

searchFeedElementsInFeed(communityId, feedType, subjectId, q)

Get the feed elements from a feed that match the search criteria.

searchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)

Get a page of sorted feed elements from a feed for a record or user that match the search criteria.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Get a page of sorted feed elements from a feed that match the search criteria. Each feed element includes no more than the specified number of comments.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)

Get a page of sorted and filtered feed elements from a `UserProfile` feed that match the search criteria.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, customFilter)

Get a page of sorted and filtered feed elements from a case feed that match the search criteria.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly)

Get a page of sorted feed elements from a feed for a record or user that match the search criteria. Each feed element includes no more than the specified number of comments. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, filter)

Get a page of sorted and filtered feed elements from a feed for a record or user that match the search criteria. Each feed element includes no more than the specified number of comments. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, customFilter)

Get a page of sorted and filtered feed elements from a case feed that match the search criteria.

searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q)

Get the feed elements from a feed filtered by a key prefix that match the search criteria.

searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q)

Get a page of sorted feed elements from a feed filtered by a key prefix that match the search criteria.

searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Get a page of sorted feed elements from a feed filtered by a key prefix that match the search criteria. Each feed element includes no more than the specified number of comments.

searchStreams(communityId, q)

Search the Chatter feed streams for the context user.

searchStreams(communityId, q, sortParam)

Search and sort the Chatter feed streams for the context user.

searchStreams(communityId, q, pageParam, pageSize)

Search the Chatter feed streams for the context user and return a page of results.

searchStreams(communityId, q, pageParam, pageSize, sortParam)

Search the Chatter feed streams for the context user and return a sorted page of results.

searchStreams(communityId, q, pageParam, pageSize, sortParam, globalScope)

Search the Chatter feed streams from all Experience Cloud sites for the context user and return a sorted page of results.

setCommentIsVerified(communityId, commentId, isVerified)

Mark a comment as verified or unverified.

setCommentIsVerifiedByAnonymized(communityId, commentId, isVerified, isVerifiedByAnonymized)

Mark a comment as verified by an anonymous user.

setCommentVote(communityId, commentId, upDownVote)

Upvote or downvote a comment.

setFeedCommentStatus(communityId, commentId, status)

Set the status of a comment.

setFeedElementIsClosed(communityId, feedElementId, isClosed)

Set a feed element to closed.

setFeedElementVote(communityId, feedElementId, upDownVote)

Upvote or downvote a feed element.

setFeedEntityStatus(communityId, feedElementId, status)

Set the status of a feed post.

setIsMutedByMe(communityId, feedElementId, isMutedByMe)

Mute or unmute a feed element.

setIsReadByMe(communityId, feedElementId, readBy)

Mark a feed element as read for the context user using an input class.

setIsReadByMe(communityId, feedElementId, isReadByMe)

Mark a feed element as read for the context user.

updateComment(communityId, commentId, comment)

Edit a comment.

updateDirectMessage(communityId, feedElementId, directMessage)
Update the members of a direct message.

updateFeedElement(communityId, feedElementId, feedElement)
Edit a feed element.

updateFeedElementBookmarks(communityId, feedElementId, bookmarks)
Bookmark a feed element or remove a bookmark from a feed element using an input class.

updateFeedElementBookmarks(communityId, feedElementId, isBookmarkedByCurrentUser)
Bookmark a feed element or remove a bookmark from a feed element.

updateFeedElementReadByCapabilityBatch(communityId, feedElementIds, readBy)
Mark multiple feed elements as read by the context user at the same time using an input class.

updateFeedElementReadByCapabilityBatch(communityId, feedElementIds, isReadByMe)
Mark multiple feed elements as read by the context user at the same time.

updateLikeForComment(communityId, commentId, isLikedByCurrentUser)
Like or unlike a comment.

updateLikeForFeedElement(communityId, feedElementId, isLikedByCurrentUser)
Like or unlike a feed element.

updatePinnedFeedElements(communityId, feedType, subjectId, pin)
Pin or unpin feed elements to a group or topic feed.

updateStream(communityId, streamId, streamInput)
Update a Chatter feed stream.

voteOnFeedElementPoll(communityId, feedElementId, myChoiceId)
Vote on a poll or change your vote on a poll.

`createStream(communityId, streamInput)`

Create a Chatter feed stream.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStream createStream(String communityId,
ConnectApi.ChatterStreamInput streamInput)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

streamInput
Type: ConnectApi.ChatterStreamInput

A ConnectApi.ChatterStreamInput body.

Return Value

Type: ConnectApi.ChatterStream

deleteComment(communityId, commentId)

Delete a comment.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static Void deleteComment(String communityId, String commentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, internal, or null.

commentId
Type: String

ID for a comment.

Return Value

Type: Void

deleteFeedElement(communityId, feedElementId)

Delete a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static deleteFeedElement(String communityId, String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: Void

deleteLike(communityId, likeId)

Delete a like on a comment or post.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static Void deleteLike(String communityId, String likeId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

likeId
Type: String

ID for a like.

Return Value

Type: Void

deleteStream(communityId, streamId)

Delete a Chatter feed stream.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static Void deleteStream(String communityId, String streamId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

streamId
Type: String

ID of the Chatter feed stream.

Return Value

Type: Void

`getComment(communityId, commentId)`

Get a comment.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment getComment(String communityId, String commentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

Return Value

Type: `ConnectApi.Comment`

getCommentBatch(communityId, commentIds)

Get a list of comments.

API Version

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getCommentBatch(String communityId, List<String>
commentIds)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentIds
Type: List<String>

A list of up to 100 comment IDs.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.Comment` object and errors for comments that didn't load.

getCommentInContext(communityId, commentId, pageSize)

Get a threaded comment in the context of its parent comments and post.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getCommentInContext(String communityId, String commentId, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID of the comment.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 25.

Return Value

Type: `ConnectApi.FeedElement`

If the comment doesn't support the `comments` capability, the return value is `ConnectApi.NotFoundException`.

`getCommentsForFeedElement(communityId, feedElementId)`

Get comments for a feed element.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getCommentsForFeedElement(String communityId,
String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: `ConnectApi.CommentPage`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

`getCommentsForFeedElement(communityId, feedElementId, threadedCommentsCollapsed)`

Get comments in a threaded style for a feed element.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getCommentsForFeedElement(String communityId,
String feedElementId, Boolean threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.CommentPage`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize)

Get a page of comments for a feed element.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getCommentsForFeedElement(String communityId,
String feedElementId, String pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of comments per page. Valid values are from 1 through 100. If you pass `null`, the default size is 25.

Return Value

Type: `ConnectApi.CommentPage`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

`getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize, threadedCommentsCollapsed)`

Get a page of comments in a threaded style for a feed element.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getCommentsForFeedElement(String communityId,
String feedElementId, String pageParam, Integer pageSize, Boolean
threadedCommentsCollapsed)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`
Type: String

ID of the feed element.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of comments per page. Valid values are from 1 through 100. If you pass `null`, the default size is 25.

`threadedCommentsCollapsed`
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.CommentPage`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

`getCommentsForFeedElement(communityId, feedElementId, threadedCommentsCollapsed, sortParam)`

Get sorted comments in a threaded style for a feed element.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentsCapability getCommentsForFeedElement(String communityId, String feedElementId, Boolean threadedCommentsCollapsed, ConnectApi.FeedCommentSortOrder sortParam)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`
Type: String

ID of the feed element.

`threadedCommentsCollapsed`
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

`sortParam`
Type: `ConnectApi.FeedCommentSortOrder`

Order of comments. Values are:

- `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order.
- `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order.
- `Relevance`—Sorts by most relevant content.

Sorting in descending order isn't supported.

Return Value

Type: `ConnectApi.CommentPage`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

`getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize, threadedCommentsCollapsed, sortParam)`

Get a page of sorted comments in a threaded style for a feed element.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getCommentsForFeedElement(String communityId,
String feedElementId, String pageParam, Integer pageSize, Boolean
threadedCommentsCollapsed, ConnectApi.FeedCommentSortOrder sortParam)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`
Type: String

ID of the feed element.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of comments per page. Valid values are from 1 through 100. If you pass `null`, the default size is 25.

`threadedCommentsCollapsed`
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

sortParam
Type: `ConnectApi.FeedCommentSortOrder`

Order of comments. Values are:

- `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order.
- `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order.
- `Relevance`—Sorts by most relevant content.

Sorting in descending order isn't supported.

Return Value

Type: `ConnectApi.CommentPage`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

`getCommentsForFeedElement(communityId, feedElementId, sortParam)`

Get sorted comments for a feed element.

API Version

41.0

Available to Guest Users

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentsCapability getCommentsForFeedElement(String communityId,
String feedElementId, ConnectApi.FeedCommentSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

sortParam
Type: `ConnectApi.FeedCommentSortOrder`

Order of comments. Values are:

- `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order.
- `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order.
- `Relevance`—Sorts by most relevant content.

Sorting in descending order isn't supported.

Return Value

Type: `ConnectApi.CommentsCapability`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

getCommentsForFeedElement(communityId, feedElementId, sortParam, threadedCommentsCollapsed)

Get sorted comments in a threaded style for a feed element.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentsCapability getCommentsForFeedElement(String communityId,
String feedElementId, ConnectApi.FeedCommentSortOrder sortParam, Boolean
threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

sortParam
Type: `ConnectApi.FeedCommentSortOrder`

Order of comments. Values are:

- `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order.

- `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order.
- `Relevance`—Sorts by most relevant content.

Sorting in descending order isn't supported.

`threadedCommentsCollapsed`
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.CommentsCapability`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

`getExtensions(communityId, pageParam, pageSize)`

Get extensions.

API Version

40.0

Available to Guest Users

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ExtensionDefinitions getExtensions(String communityId, String pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`pageParam`
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 15.

Return Value

Type: ConnectApi.ExtensionDefinitions

getFeed(communityId, feedType)

Get a feed.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFeed(String communityId, ConnectApi.FeedType feedType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

Return Value

Type: ConnectApi.Feed

getFeed(communityId, feedType, sortParam)

Get a sorted feed.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFeed(String communityId, ConnectApi.FeedType feedType,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

If *feedType* is `DirectMessages`, *sortParam* must be `LastModifiedDateDesc`.

Return Value

Type: `ConnectApi.Feed`

getFeed(communityId, feedType, subjectId)

Get a feed for a record or user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFeed(String communityId, ConnectApi.FeedType feedType,
String subjectId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

Return Value

Type: `ConnectApi.Feed`

getFeed(communityId, feedType, subjectId, sortParam)

Get a sorted feed for a record or user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFeed(String communityId, ConnectApi.FeedType feedType,
String subjectId, ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.Feed`

getFeedDirectory(String)

Get a list of all feeds available to the context user.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedDirectory getFeedDirectory(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.FeedDirectory`

getFeedElement(communityId, feedElementId)

Get a feed element.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: `ConnectApi.FeedElement`

getFeedElement(communityId, feedElementId, commentSort)

Get a feed element with sorted comments.

API Version

41.0

Available to Guest Users

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String
feedElementId, ConnectApi.FeedCommentSortOrder commentSort)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

commentSort
Type: `ConnectApi.FeedCommentSortOrder`

Order of comments.

- `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order.
- `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order.
- `Relevance`—Sorts by most relevant content.

The default value is `CreatedDateLatestAsc`.

Sorting in descending order isn't supported.

Return Value

Type: `ConnectApi.FeedElement`

`getFeedElement(communityId, feedElementId, threadedCommentsCollapsed)`

Get a feed element and its comments in a threaded style.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String feedElementId, Boolean threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.FeedElement`

getFeedElement(communityId, feedElementId, threadedCommentsCollapsed, commentSort)

Get a feed element and its sorted comments in a threaded style.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String feedElementId, Boolean threadedCommentsCollapsed, ConnectApi.FeedCommentSortOrder commentSort)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

commentSort
Type: `ConnectApi.FeedCommentSortOrder`

Order of comments.

- `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order.
- `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order.
- `Relevance`—Sorts by most relevant content.

Sorting in descending order isn't supported.

Return Value

Type: `ConnectApi.FeedElement`

`getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle)`

Get a feed element with the specified number of elements per bundle including no more than the specified number of comments per feed element.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String
feedElementId, Integer recentCommentCount, Integer elementsPerBundle)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

Return Value

Type: `ConnectApi.FeedElement`

`getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, threadedCommentsCollapsed)`

Get a feed element with its comments in a threaded style with the specified number of elements per bundle and comments per feed element.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String
feedElementId, Integer recentCommentCount, Integer elementsPerBundle, Boolean
threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.FeedElement`

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, threadedCommentsCollapsed, commentSort)

Get a feed element with its sorted comments in a threaded style with the specified number of elements per bundle and comments per feed element.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String feedElementId, Integer recentCommentCount, Integer elementsPerBundle, Boolean threadedCommentsCollapsed, ConnectApi.FeedCommentSortOrder commentSort)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

commentSort
Type: `ConnectApi.FeedCommentSortOrder`

Order of comments.

- `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order.
- `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order.
- `Relevance`—Sorts by most relevant content.

Sorting in descending order isn't supported.

Return Value

Type: `ConnectApi.FeedElement`

`getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, commentSort)`

Get a feed element with the specified number of elements per bundle including no more than the specified number of sorted comments per feed element.

API Version

41.0

Available to Guest Users

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String
feedElementId, Integer recentCommentCount, Integer elementsPerBundle,
ConnectApi.FeedCommentSortOrder commentSort)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

commentSort
Type: `ConnectApi.FeedCommentSortOrder`

Order of comments.

- `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order.
- `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order.
- `Relevance`—Sorts by most relevant content.

The default value is `CreatedDateLatestAsc`.

Sorting in descending order isn't supported.

Return Value

Type: `ConnectApi.FeedElement`

`getFeedElementBatch(communityId, feedElementIds)`

Get a list of feed elements.

API Version

31.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getFeedElementBatch(String communityId,
List<String> feedElementIds)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementIds
Type: List<String>

A list of up to 500 feed element IDs.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.FeedElement` object and errors for feed elements that didn't load.

getFeedElementPoll(communityId, feedElementId)

Get the poll associated with a feed element.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.PollCapability getFeedElementPoll(String communityId, String
feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: `ConnectApi.PollCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Note: Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that `ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information may not be available in the trigger.

`getFeedElementsFromBundle(communityId, feedElementId)`

Get feed elements from a bundle.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromBundle(String communityId,
String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: `ConnectApi.FeedElementPage`

`getFeedElementsFromBundle(communityId, feedElementId, pageParam, pageSize, elementsPerBundle, recentCommentCount)`

Get a page of feed elements from a bundle. Specify the number of elements per bundle and include no more than the specified number of comments per feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromBundle(String communityId,
String feedElementId, String pageParam, Integer pageSize, Integer elementsPerBundle,
Integer recentCommentCount)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

Return Value

Type: `ConnectApi.FeedElementPage`

getFeedElementsFromFeed(communityId, feedType)

Get feed elements from the `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview` feeds.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElementsFromFeed(communityId, feedType, result)

Apex Developer Guide: Testing ConnectApi Code

getFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from the `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview` feeds.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

If *feedType* is `DirectMessages`, *sortParam* must be `LastModifiedDateDesc`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from the `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview` feeds. Each feed element contains no more than the specified number of comments.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

If *feedType* is `DirectMessages`, *sortParam* must be `LastModifiedDateDesc`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter)`

Get a page of sorted and filtered feed elements from the `Home` feed. Each feed element contains no more than the specified number of comments.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam,
ConnectApi.FeedFilter filter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. The only valid value is `Home`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

When the *sortParam* is `MostViewed`, you must pass in `null` for the *pageParam*.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

When the *sortParam* is `MostViewed`, the *pageSize* must be a value from 1 to 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed)`

Get a page of filtered and sorted feed elements with comments in a threaded style from the `Home` feed. Each feed element contains no more than the specified number of comments.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam,
ConnectApi.FeedFilter filter, Boolean threadedCommentsCollapsed)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

The type of feed. The only valid value is `Home`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

When the *sortParam* is `MostViewed`, you must pass in `null` for the *pageParam*.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

When the *sortParam* is `MostViewed`, the *pageSize* must be a value from 1 to 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.

- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

`threadedCommentsCollapsed`

Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, subjectId)`

Get feed elements from any feed other than `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview` for a user or record.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example for Getting the Context User's News Feed

```
ConnectApi.FeedElementPage fep =
ConnectApi.ChatterFeeds.getFeedElementsFromFeed(Network.getNetworkId(),
ConnectApi.FeedType.News, 'me');
```

Example for Getting Another User's Profile Feed

```
ConnectApi.FeedElementPage fep =
ConnectApi.ChatterFeeds.getFeedElementsFromFeed(Network.getNetworkId(),
ConnectApi.FeedType.UserProfile, '005R0000000HwMA');
```

Example for Getting Another User's Record Feed

```
ConnectApi.FeedElementPage fep =
ConnectApi.ChatterFeeds.getFeedElementsFromFeed(Network.getNetworkId(),
ConnectApi.FeedType.Record, '005R0000000HwMA');
```

SEE ALSO:

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, result)

Apex Developer Guide: Testing ConnectApi Code

getFeedElementsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from any feed other than `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

`subjectId`
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

The number of feed elements per page.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam)`

Get a page of sorted feed elements from any feed other than `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`. Each feed element includes no more than the specified number of comments.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)`

Get a page of sorted feed elements from a record feed. Each feed element includes no more than the specified number of comments. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter)`

Get a page of sorted and filtered feed elements from the `UserProfile` feed.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped` or `ConnectApi.FeedFilter.AuthoredBy`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets only community-specific feed elements.

```
ConnectApi.FeedElementPage fep =
ConnectApi.ChatterFeeds.getFeedElementsFromFeed(Network.getNetworkId(),
ConnectApi.FeedType.UserProfile, 'me', 3, ConnectApi.FeedDensity.FewerUpdates, null, null,
 ConnectApi.FeedSortOrder.LastModifiedDateDesc, ConnectApi.FeedFilter.CommunityScoped);
```

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed)`

Get a page of feed elements with comments in a threaded style from the `UserProfile` feed.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter, Boolean
threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped` or `ConnectApi.FeedFilter.AuthoredBy`.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, customFilter)

Get a page of sorted and filtered feed elements from the case feed.

API Version

40.0

Available to Guest Users

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String customFilter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

customFilter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, customFilter, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly)`

Get a page of sorted feed elements from a record feed. Specify the number of elements per bundle and include no more than the specified number of comments per feed element. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedFilter
filter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter, threadedCommentsCollapsed)`

Get a page of sorted and filtered feed elements with comments in a threaded style for a record feed. Specify the number of elements per bundle and include no more than the specified number of comments per feed element. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedFilter
filter, Boolean threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

`filter`
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.

- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

`threadedCommentsCollapsed`
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, String customFilter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

`customFilter`
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, String customFilter,
Boolean threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

`customFilter`
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

`threadedCommentsCollapsed`
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix)`

Get feed elements from a feed filtered by a key prefix for a user.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFilterFeed(String
communityId, String subjectId, String keyPrefix)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince)`

Get a page of feed elements from a feed filtered by a key prefix for a user. Include only feed elements that have been updated since the time specified in the *`updatedSince`* parameter.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFilterFeedUpdatedSince(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

Opaque token defining the modification timestamp of the feed and the sort order.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

Return Value

Type: ConnectApi.FeedElementPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, result)

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `Home`, and `Moderation`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

```
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedFilter filter)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

The type of feed. The only valid value is `Home`.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

```
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

One of these values:

- `Files`
- `Groups`
- `News`
- `People`

- `Record`

`subjectId`
Type: String

If *`feedType`* is `ConnectApi.Record`, *`subjectId`* can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`updatedSince`
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *`updatedSince`* parameter doesn't return feed elements that are created in the same second as the call.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
Boolean showInternalOnly)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.

- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`updatedSince`
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *`updatedSince`* parameter doesn't return feed elements that are created in the same second as the call.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, filter)`

Get a page of filtered feed elements from a `UserProfile` feed. Include only feed elements that have been updated since the time specified in the *`updatedSince`* parameter.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, ConnectApi.FeedFilter filter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`updatedSince`
Type: String

Opaque token defining the modification timestamp of the feed and the sort order.

The *`updatedSince`* parameter doesn't return feed elements that are created in the same second as the call.

`filter`
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

```
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
```

```
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, String customFilter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

Opaque token defining the modification timestamp of the feed and the sort order.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

customFilter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, Boolean showInternalOnly)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, Boolean showInternalOnly, ConnectApi.FeedFilter filter)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

`subjectId`
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.

- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

Available to Guest Users

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFeedWithFeedElements(String communityId,
ConnectApi.FeedType feedType, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Landing`, `Moderation`, and `PendingReview`. `Landing` is valid only when *communityId* is `internal`.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in 0, feed elements aren't returned with the feed.

Return Value

Type: ConnectApi.Feed

getFeedWithFeedElements(communityId, feedType, pageSize, recentCommentCount)

Get a page of information about the feed and the feed elements with the specified number of comments per feed element from the feed.

API Version

40.0

Available to Guest Users

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFeedWithFeedElements(String communityId,
ConnectApi.FeedType feedType, Integer pageSize, Integer recentCommentCount)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Landing`, `Moderation`, and `PendingReview`. `Landing` is valid only when *communityId* is `internal`.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in 0, feed elements aren't returned with the feed.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

Return Value

Type: `ConnectApi.Feed`

getFilterFeed(communityId, subjectId, keyPrefix)

Get a feed filtered by a key prefix for a user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFilterFeed(String communityId, String subjectId, String keyPrefix)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A *key prefix* is the first three characters of a record ID, which specifies the object type.

Return Value

Type: `ConnectApi.Feed`

getFilterFeed(communityId, subjectId, keyPrefix, sortParam)

Get a sorted feed filtered by a key prefix for a user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFilterFeed(String communityId, String subjectId, String keyPrefix, ConnectApi.FeedType sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

sortParam
Type: `ConnectApi.FeedType`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.Feed`

`getFilterFeedDirectory(communityId, subjectId)`

Get a feed directory of filter feeds available to the context user.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedDirectory getFilterFeedDirectory(String communityId, String subjectId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

Return Value

Type: `ConnectApi.FeedDirectory`

This feed directory contains a list of filter feeds, which are the news feed filtered to include feed items whose parent is a specific entity type.

Usage

Call this method to return a directory containing a list of `ConnectApi.FeedDirectoryItem` objects. Each object contains a key prefix associated with an entity type the context user is following. A *key prefix* is the first three characters of a record ID, which specifies the object type.

Use key prefixes to filter the news feed so that it contains only feed items whose parent is the entity type associated with the key prefix. For example, get all the feed items whose parent is an Account. To get the feed items, pass a key prefix to the `ConnectApi.getFeedItemsFromFilterFeed` method.

The information about filter feeds never contains the key prefixes for users (`005`) or groups (`0F9`), but all users can use those key prefixes as filters.

The `ConnectApi.FeedDirectory.favorites` property is always empty when returned by a call to `getFilterFeedDirectory` because you can't filter a news feed by favorites.

Example

This example calls `getFilterFeedDirectory` and loops through the returned `FeedDirectoryItem` objects to find the key prefixes the context user can use to filter their news feed. It then copies each `keyPrefix` value to a list. Finally, it passes one of

the key prefixes from the list to the `getFeedItemsFromFilterFeed` method. The returned feed items include every feed item from the news feed whose parent is the entity type specified by the passed key prefix.

```
String communityId = null;
String subjectId = 'me';

// Create a list to populate with key prefixes.
List<String> keyPrefixList = new List<String>();

// Prepopulate with User and Group record types
// which are available to all users.
keyPrefixList.add('005');
keyPrefixList.add('0F9');

System.debug(keyPrefixList);

// Get the key prefixes available to the context user.
ConnectApi.FeedDirectory myFeedDirectory =
   ConnectApi.ChatterFeeds.getFilterFeedDirectory(null, 'me');

// Loop through the returned feeds list.
for (ConnectApi.FeedDirectoryItem i : myFeedDirectory.feeds) {

   // Grab each key prefix and add it to the list.
   keyPrefixList.add(i.keyPrefix);
}
System.debug(keyPrefixList);

// Use a key prefix from the list to filter the feed items in the news feed.
ConnectApi.FeedItemPage myFeedItemPage =
   ConnectApi.ChatterFeeds.getFeedItemsFromFilterFeed(communityId, subjectId,
keyPrefixList[0]);
System.debug(myFeedItemPage);
```

`getLike(communityId, likeId)`

Get a like on a post or comment.

API Version

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForComment(String communityId, String commentId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterLikePage`

getLikesForFeedElement(communityId, feedElementId)

Get likes for a feed element.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForFeedElement(String communityId,
String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: `ConnectApi.ChatterLikePage`

If the feed element doesn't support the `ChatterLikes` capability, the return value is `ConnectApi.NotFoundException`.

getLikesForFeedElement(communityId, feedElementId, pageParam, pageSize)

Get a page of likes for a feed element.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForFeedElement(String communityId,
String feedElementId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterLikePage`

If the feed element doesn't support the `ChatterLikes` capability, the return value is `ConnectApi.NotFoundException`.

`getLinkMetadata(communityId, urls)`

Get link metadata for URLs.

API Version

42.0

Available to Guest Users

42.0

Requires Chatter

No

Signature

```
public static ConnectApi.LinkMetadataCollection getLinkMetadata(String communityId,
String urls)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

urls
Type: String

Comma-separated list of URL-encoded URLs.

Return Value

Type: ConnectApi.LinkMetadataCollection

getPinnedFeedElementsFromFeed(communityId, feedType, subjectId)

Get pinned feed elements from a group or topic feed.

API Version

41.0

Available to Guest Users

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.PinnedFeedElements getPinnedFeedElementsFromFeed(String
communityId, ConnectApi.FeedType feedType, String subjectId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

The type of feed. Valid values are `Record` and `Topics`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* must be a group ID. If *feedType* is `Topics`, *subjectId* must be a topic ID.

Return Value

Type: ConnectApi.PinnedFeedElements

If the feed doesn't support this capability, the return value is ConnectApi.NotFoundException.

Usage

In the UI, pinned feed elements don't show all auxiliary information, such as comments, likes, interaction counts, or read by information. As a result, the `ConnectApi.PinnedFeedElements` output class doesn't include all the information for these capabilities.

`getReadByForFeedElement(communityId, feedElementId)`

Get information about who read a feed element and when.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ReadByPage getReadByForFeedElement(String communityId, String feedElementId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`
Type: String

ID of the feed element.

Return Value

Type: `ConnectApi.ReadByPage`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`getReadByForFeedElement(communityId, feedElementId, pageParam, pageSize)`

Get a page of information about who read a feed element and when.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ReadByPage getReadByForFeedElement(String communityId, String feedElementId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ReadByPage`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`getRelatedPosts(communityId, feedElementId, filter, maxResults)`

Get posts related to the context feed element.

API Version

37.0

Available to Guest Users

37.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RelatedFeedPosts getRelatedPosts(String communityId, String feedElementId, ConnectApi.RelatedFeedPostType filter, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element. The feed element must be a question.

filter
Type: `ConnectApi.RelatedFeedPostType`

Specifies the type of related post. Values are:

- `Answered`—Related questions that have at least one answer.
- `BestAnswer`—Related questions that have a best answer.
- `Generic`—All types of related questions, including answered, with a best answer, and unanswered.
- `Unanswered`—Related questions that don't have answers.

`Generic` is the default value.

maxResults
Type: Integer

The maximum number of results to return. You can return up to 25 results; 5 is the default.

Return Value

Type: `ConnectApi.RelatedFeedPosts`

In version 37.0 and later, related feed posts are questions.

Each related feed post has a score indicating how closely it's related to the context feed post. We return related feed posts sorted by score, with the highest score first.

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`getStream(communityId, streamId)`

Get information about a Chatter feed stream.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStream getStream(String communityId, String streamId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

streamId
Type: String

ID of the Chatter feed stream.

Return Value

Type: `ConnectApi.ChatterStream`

getStream(communityId, streamId, globalScope)

Get information about a Chatter feed stream, regardless of Experience Cloud site.

API Version

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStream getStream(String communityId, String streamId,
Boolean globalScope)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

streamId
Type: String

ID of the Chatter feed stream.

globalScope
Type: Boolean

Specifies whether to get streams from all the context user's Experience Cloud sites, regardless of the *communityId* value.

Tip: If you know the *communityId* for the stream, we recommend setting *globalScope* to `false`.

Return Value

Type: ConnectApi.ChatterStream

getStreams(communityId)

Get the Chatter feed streams for the context user.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage getStreams(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: ConnectApi.ChatterStreamPage

getStreams(communityId, sortParam)

Get and sort the Chatter feed streams for the context user.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage getStreams(String communityId,
ConnectApi.SortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

sortParam
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

Return Value

Type: `ConnectApi.ChatterStreamPage`

getStreams(communityId, pageParam, pageSize)

Get a page of Chatter feed streams for the context user.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage getStreams(String communityId, Integer
pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

Return Value

Type: `ConnectApi.ChatterStreamPage`

getStreams(communityId, pageParam, pageSize, sortParam)

Get a sorted page of Chatter feed streams for the context user.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage getStreams(String communityId, Integer pageParam, Integer pageSize, ConnectApi.SortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

Return Value

Type: `ConnectApi.ChatterStreamPage`

getStreams(communityId, pageParam, pageSize, sortParam, globalScope)

Get a sorted page of Chatter feed streams from all Enterprise Cloud sites for the context user.

API Version

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage getStreams(String communityId, Integer
pageParam, Integer pageSize, ConnectApi.SortOrder sortParam, Boolean globalScope)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

globalScope
Type: Boolean

Specifies whether to get streams from all the context user's Experience Cloud sites, regardless of the *communityId* value.

Tip: If you know the *communityId* for the streams, we recommend setting *globalScope* to `false`.

Return Value

Type: `ConnectApi.ChatterStreamPage`

getSupportedEmojis()

Get supported emojis for the org.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.SupportedEmojis getSupportedEmojis()
```

Return Value

Type: `ConnectApi.SupportedEmojis`

Usage

To get the list, emojis must be enabled in your org.

`getThreadsForFeedComment(communityId, commentId)`

Get threaded comments for a comment.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getThreadsForFeedComment(String communityId, String commentId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`commentId`
Type: String

ID of the comment.

Return Value

Type: `ConnectApi.CommentPage`

If the comment doesn't support the `comments` capability, the return value is `ConnectApi.NotFoundException`.

`getThreadsForFeedComment(communityId, commentId, pageParam, pageSize)`

Get a page of threaded comments for a comment.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getThreadsForFeedComment(String communityId, String commentId, String pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`commentId`
Type: String

ID of the comment.

`pageParam`
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.CommentPage`

If the comment doesn't support the `comments` capability, the return value is `ConnectApi.NotFoundException`.

`getThreadsForFeedComment(communityId, commentId, threadedCommentsCollapsed)`

Access the comments capability for a comment.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentsCapability getThreadsForFeedComment(String communityId,
String commentId, Boolean threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID of the comment.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.CommentsCapability`

If the comment doesn't support the `comments` capability, the return value is `ConnectApi.NotFoundException`.

`getTopUnansweredQuestions(communityId)` (Pilot)

Get top unanswered questions for the context user in aExperience Cloud site.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getTopUnansweredQuestions(String communityId)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTopUnansweredQuestions(communityId, result) (Pilot)

Apex Developer Guide: Testing ConnectApi Code

`getTopUnansweredQuestions(communityId, filter)` (Pilot)

Get filtered top unanswered questions for the context user in an Experience Cloud site.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getTopUnansweredQuestions(String communityId,
ConnectApi.TopUnansweredQuestionsFilterType filter)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

filter
Type: `ConnectApi.FeedFilter`

Specifies the filter for the feed. `UnansweredQuestionsWithCandidateAnswers` is the only valid value.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTopUnansweredQuestions(communityId, filter, result) (Pilot)

Apex Developer Guide: Testing ConnectApi Code

`getTopUnansweredQuestions(communityId, pageSize)` (Pilot)

Get a page of top unanswered questions for the context user in an Experience Cloud site.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getTopUnansweredQuestions(String communityId,
Integer pageSize)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 0 through 10. If you pass in `null`, the default size is 5.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTopUnansweredQuestions(communityId, pageSize, result) (Pilot)

Apex Developer Guide: Testing ConnectApi Code

`getTopUnansweredQuestions(communityId, filter, pageSize)` (Pilot)

Get a page of filtered top unanswered questions for the context user in an Experience Cloud site.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getTopUnansweredQuestions(String communityId,
ConnectApi.FeedFilter filter, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID of the Experience Cloud site.

`filter`
Type: `ConnectApi.FeedFilter`

Specifies the filter for the feed. `UnansweredQuestionsWithCandidateAnswers` is the only valid value.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 0 through 10. If you pass in `null`, the default size is 5.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`getVotesForComment(communityId, commentId, vote)`

Get the first page of users who upvoted or downvoted a comment.

API Version

42.0

Available to Guest Users

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.VotePage getVotesForComment(String communityId, String
commentId, ConnectApi.UpDownVoteValue vote)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`commentId`
Type: String

ID of the comment.

`vote`
Type: `ConnectApi.UpDownVoteValue`

Specifies the value of the vote for the feed element. Values are:

- `Down`
- `Up`

You can't specify `None`.

Return Value

Type: `ConnectApi.VotePage`

If the comment doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`getVotesForComment(communityId, commentId, vote, pageParam, pageSize)`

Get a page of users who upvoted or downvoted a comment.

API Version

42.0

Available to Guest Users

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.VotePage getVotesForComment(String communityId, String
commentId, ConnectApi.UpDownVoteValue vote, Integer pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`commentId`
Type: String

ID of the comment.

`vote`
Type: `ConnectApi.UpDownVoteValue`

Specifies the value of the vote for the feed element. Values are:

- `Down`
- `Up`

You can't specify `None`.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.VotePage`

If the comment doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`getVotesForFeedElement(communityId, feedElementId, vote)`

Get the first page of users who upvoted or downvoted a feed element.

API Version

42.0

Available to Guest Users

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.VotePage getVotesForFeedElement(String communityId, String feedElementId, ConnectApi.UpDownVoteValue vote)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

vote
Type: `ConnectApi.UpDownVoteValue`

Specifies the value of the vote for the feed element. Values are:

- `Down`
- `Up`

You can't specify `None`.

Return Value

Type: `ConnectApi.VotePage`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`getVotesForFeedElement(communityId, feedElementId, vote, pageParam, pageSize)`

Get a page of users who upvoted or downvoted a feed element.

API Version

42.0

Available to Guest Users

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.VotePage getVotesForFeedElement(String communityId, String
feedElementId, ConnectApi.UpDownVoteValue vote, Integer pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`
Type: String

ID of the feed element.

`vote`
Type: `ConnectApi.UpDownVoteValue`

Specifies the value of the vote for the feed element. Values are:

- `Down`
- `Up`

You can't specify `None`.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.VotePage`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`isCommentEditableByMe(communityId, commentId)`

Discover whether the context user can edit a comment.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedEntityIsEditable isCommentEditableByMe(String communityId,
String commentId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`commentId`
Type: String

ID of the comment.

Return Value

Type: `ConnectApi.FeedEntityIsEditable`

If the comment doesn't support the `edit` capability, the return value is `ConnectApi.NotFoundException`.

SEE ALSO:

Edit a Comment

`isFeedElementEditableByMe(communityId, feedElementId)`

Discover whether the context user can edit a feed element.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedEntityIsEditable isFeedElementEditableByMe(String
communityId, String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element. Feed items are the only type of feed element that can be edited.

Return Value

Type: `ConnectApi.FeedEntityIsEditable`

If the feed element doesn't support the `edit` capability, the return value is `ConnectApi.NotFoundException`.

SEE ALSO:

Edit a Feed Element

Edit a Question Title and Post

isModified(communityId, feedType, subjectId, since)

Discover whether a news feed has been updated or changed. Use this method to poll a news feed for updates.

Important: This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedModifiedInfo isModified(String communityId,
ConnectApi.FeedType feedType, String subjectId, String since)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Specifies the type of feed. The only supported type is `News`

subjectId
Type: String

ID of the context user or the alias `me`.

since
Type: String

An opaque token containing information about the last modified date of the feed. Retrieve this token from the `FeedElementPage.isModifiedToken` property.

Return Value

Type: `ConnectApi.FeedModifiedInfo`

`likeComment(communityId, commentId)`

Like a comment for the context user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLike likeComment(String communityId, String commentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

Return Value

Type: ConnectApi.ChatterLike

If the context user has already liked the comment, this method is a non-operation and returns the existing like.

likeFeedElement(communityId, feedElementId)

Like a feed element.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLike likeFeedElement(String communityId, String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: ConnectApi.ChatterLike

If the feed element doesn't support the `ChatterLikes` capability, the return value is ConnectApi.NotFoundException.

Example

```
ConnectApi.ChatterLike chatterLike = ConnectApi.ChatterFeeds.likeFeedElement(null, '0D5D0000000KuGh');
```

postCommentToFeedElement(communityId, feedElementId, text)

Post a plain-text comment to a feed element.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment postCommentToFeedElement(String communityId, String feedElementId, String text)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

text
Type: String

Text of the comment. A comment can contain up to 10,000 characters.

Return Value

Type: `ConnectApi.Comment`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

Example

```
ConnectApi.Comment comment = ConnectApi.ChatterFeeds.postCommentToFeedElement(null, '0D5D0000000KuGh', 'I agree with the proposal.' );
```

postCommentToFeedElement(communityId, feedElementId, comment, feedElementFileUpload)

Post a rich-text comment to a feed element. Use this method to include mentions and to attach a file.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment postCommentToFeedElement(String communityId, String
feedElementId, ConnectApi.CommentInput comment, ConnectApi.BinaryInput
feedElementFileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

comment
Type: `ConnectApi.CommentInput`

The comment body, including text and mentions, and capabilities, such as information about an attached file. A comment can contain up to 10,000 characters.

feedElementFileUpload
Type: `ConnectApi.BinaryInput`

A new binary file to attach to the comment, or `null`. If you specify a binary file, specify the title and description of the file in the *comment* parameter.

Return Value

Type: `ConnectApi.Comment`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

Example for Posting a Comment with Mentions

You can post comments with mentions two ways. Use the ConnectApiHelper repository on GitHub to write a single line of code, or use this method example.

```
String communityId = null;
String feedElementId = '0D5D0000000KtW3';

ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput();
ConnectApi.MentionSegmentInput mentionSegmentInput = new ConnectApi.MentionSegmentInput();
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

textSegmentInput.text = 'Does anyone in this group have an idea? ';
messageBodyInput.messageSegments.add(textSegmentInput);

mentionSegmentInput.id = '005D00000000oOT';
messageBodyInput.messageSegments.add(mentionSegmentInput);
```

```
commentInput.body = messageBodyInput;

ConnectApi.Comment commentRep = ConnectApi.ChatterFeeds.postCommentToFeedElement(communityId,
 feedElementId, commentInput, null);
```

Example for Posting a Comment with an Existing File

```
String feedElementId = '0D5D0000000KtW3';

ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput();

ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

textSegmentInput.text = 'I attached this file from Salesforce Files.';

messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageBodyInput.messageSegments.add(textSegmentInput);
commentInput.body = messageBodyInput;

ConnectApi.CommentCapabilitiesInput commentCapabilitiesInput = new
ConnectApi.CommentCapabilitiesInput();
ConnectApi.ContentCapabilityInput contentCapabilityInput = new
ConnectApi.ContentCapabilityInput();

commentCapabilitiesInput.content = contentCapabilityInput;
contentCapabilityInput.contentDocumentId = '069D00000001rNJ';

commentInput.capabilities = commentCapabilitiesInput;

ConnectApi.Comment commentRep =
ConnectApi.ChatterFeeds.postCommentToFeedElement(Network.getNetworkId(), feedElementId,
commentInput, null);
```

Example for Posting a Comment with a New File

```
String feedElementId = '0D5D0000000KtW3';

ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput();

ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

textSegmentInput.text = 'Enjoy this new file.';

messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageBodyInput.messageSegments.add(textSegmentInput);
commentInput.body = messageBodyInput;

ConnectApi.CommentCapabilitiesInput commentCapabilitiesInput = new
ConnectApi.CommentCapabilitiesInput();
ConnectApi.ContentCapabilityInput contentCapabilityInput = new
```

```
ConnectApi.ContentCapabilityInput();

commentCapabilitiesInput.content = contentCapabilityInput;
contentCapabilityInput.title = 'Title';

commentInput.capabilities = commentCapabilitiesInput;

String text = 'These are the contents of the new file.';
Blob myBlob = Blob.valueOf(text);
ConnectApi.BinaryInput binInput = new ConnectApi.BinaryInput(myBlob, 'text/plain',
'fileName');

ConnectApi.Comment commentRep =
ConnectApi.ChatterFeeds.postCommentToFeedElement(Network.getNetworkId(), feedElementId,
commentInput, binInput);
```

Example for Posting a Rich-Text Comment with an Inline Image

You can post rich-text comments with inline images and mentions two ways. Use the ConnectApiHelper repository on GitHub to write a single line of code, or use this method example. In this example, the image file is existing content that has already been uploaded to Salesforce.

```
String communityId = null;
String feedElementId = '0D5R0000000SBEr';
String imageId = '069R00000000IgQ';
String mentionedUserId = '005R0000000DiMz';

ConnectApi.CommentInput input = new ConnectApi.CommentInput();
ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MentionSegmentInput mentionSegment;
ConnectApi.MarkupBeginSegmentInput markupBeginSegment;
ConnectApi.MarkupEndSegmentInput markupEndSegment;
ConnectApi.InlineImageSegmentInput inlineImageSegment;

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

markupBeginSegment = new ConnectApi.MarkupBeginSegmentInput();
markupBeginSegment.markupType = ConnectApi.MarkupType.Bold;
messageInput.messageSegments.add(markupBeginSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'Hello ';
messageInput.messageSegments.add(textSegment);

mentionSegment = new ConnectApi.MentionSegmentInput();
mentionSegment.id = mentionedUserId;
messageInput.messageSegments.add(mentionSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = '!';
messageInput.messageSegments.add(textSegment);
```

```
markupEndSegment = new ConnectApi.MarkupEndSegmentInput();
markupEndSegment.markupType = ConnectApi.MarkupType.Bold;
messageInput.messageSegments.add(markupEndSegment);

inlineImageSegment = new ConnectApi.InlineImageSegmentInput();
inlineImageSegment.altText = 'image one';
inlineImageSegment.fileId = imageId;
messageInput.messageSegments.add(inlineImageSegment);

input.body = messageInput;

ConnectApi.ChatterFeeds.postCommentToFeedElement(communityId, feedElementId, input, null);
```

Example for Posting a Rich-Text Comment with a Code Block

```
String communityId = null;
String feedElementId = '0D5R0000000SBEr';
String codeSnippet = '<html>\n\t<body>\n\t\tHello, world!\n\t</body>\n</html>';

ConnectApi.CommentInput input = new ConnectApi.CommentInput();
ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MarkupBeginSegmentInput markupBeginSegment;
ConnectApi.MarkupEndSegmentInput markupEndSegment;

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

markupBeginSegment = new ConnectApi.MarkupBeginSegmentInput();
markupBeginSegment.markupType = ConnectApi.MarkupType.Code;
messageInput.messageSegments.add(markupBeginSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = codeSnippet;
messageInput.messageSegments.add(textSegment);

markupEndSegment = new ConnectApi.MarkupEndSegmentInput();
markupEndSegment.markupType = ConnectApi.MarkupType.Code;
messageInput.messageSegments.add(markupEndSegment);

input.body = messageInput;

ConnectApi.ChatterFeeds.postCommentToFeedElement(communityId, feedElementId, input, null);
```

postFeedElement(communityId, subjectId, feedElementType, text)

Post a plain-text feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement postFeedElement(String communityId, String
subjectId, ConnectApi.FeedElementType feedElementType, String text)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

The ID of the parent this feed element is being posted to. This value can be the ID of a user, group, or record, or the string `me` to indicate the context user.

feedElementType
Type: `ConnectApi.FeedElementType`

The only possible value is `FeedItem`.

text
Type: String

The text of the feed element. A feed element can contain up to 10,000 characters.

Return Value

Type: `ConnectApi.FeedElement`

Example

```
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), '0F9d0000000TreH',
ConnectApi.FeedElementType.FeedItem, 'On vacation this week.');
```

postFeedElement(communityId, feedElement)

Post a rich-text feed element. Include mentions and hashtag topics, attach already uploaded files to a feed element, and associate action link groups with a feed element. You can also use this method to share a feed element and add a comment.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement postFeedElement(String communityId,
ConnectApi.FeedElementInput feedElement)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElement
Type: `ConnectApi.FeedElementInput`

Specify rich text, including mentions. Optionally, specify a link, a poll, or up to 10 existing files.

Return Value

Type: `ConnectApi.FeedElement`

Example for Posting a Feed Element with a Mention

You can post feed elements with mentions two ways. Use the ConnectApiHelper repository on GitHub to write a single line of code, or use this method example.

```
ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
ConnectApi.MentionSegmentInput mentionSegmentInput = new ConnectApi.MentionSegmentInput();
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

mentionSegmentInput.id = '005RR000000Dme9';
messageBodyInput.messageSegments.add(mentionSegmentInput);

textSegmentInput.text = 'Could you take a look?';
messageBodyInput.messageSegments.add(textSegmentInput);

feedItemInput.body = messageBodyInput;
feedItemInput.feedElementType = ConnectApi.FeedElementType.FeedItem;
feedItemInput.subjectId = '0F9RR0000004CPw';

ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);
```

Example for Posting a Feed Element with Existing Content

```
// Define the FeedItemInput object to pass to postFeedElement
ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
feedItemInput.subjectId = 'me';

ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();
textSegmentInput.text = 'Would you please review these docs?';
```

```
// The MessageBodyInput object holds the text in the post
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageBodyInput.messageSegments.add(textSegmentInput);
feedItemInput.body = messageBodyInput;

// The FeedElementCapabilitiesInput object holds the capabilities of the feed item.
// For this feed item, we define a files capability to hold the file(s).

List<String> fileIds = new List<String>();
fileIds.add('069xx00000000QO');
fileIds.add('069xx00000000QT');
fileIds.add('069xx00000000Qn');
fileIds.add('069xx00000000Qi');
fileIds.add('069xx00000000Qd');

ConnectApi.FilesCapabilityInput filesInput = new ConnectApi.FilesCapabilityInput();
filesInput.items = new List<ConnectApi.FileIdInput>();

for (String fileId : fileIds) {
    ConnectApi.FileIdInput idInput = new ConnectApi.FileIdInput();
    idInput.id = fileId;
    filesInput.items.add(idInput);
}

ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
feedElementCapabilitiesInput.files = filesInput;

feedItemInput.capabilities = feedElementCapabilitiesInput;

// Post the feed item.
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);
```

Example for Posting a Rich-Text Feed Element with an Inline Image

You can post rich-text feed elements with inline images and mentions two ways. Use the ConnectApiHelper repository on GitHub to write a single line of code, or use this method example. In this example, the image file is existing content that has already been uploaded to Salesforce. The post also includes text and a mention.

```
String communityId = null;
String imageId = '069D00000001INA';
String mentionedUserId = '005D0000001QNpr';
String targetUserOrGroupOrRecordId  = '005D0000001Gif0';
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.subjectId = targetUserOrGroupOrRecordId;
input.feedElementType = ConnectApi.FeedElementType.FeedItem;

ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MentionSegmentInput mentionSegment;
ConnectApi.MarkupBeginSegmentInput markupBeginSegment;
ConnectApi.MarkupEndSegmentInput markupEndSegment;
```

```
ConnectApi.InlineImageSegmentInput inlineImageSegment;

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

markupBeginSegment = new ConnectApi.MarkupBeginSegmentInput();
markupBeginSegment.markupType = ConnectApi.MarkupType.Bold;
messageInput.messageSegments.add(markupBeginSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'Hello ';
messageInput.messageSegments.add(textSegment);

mentionSegment = new ConnectApi.MentionSegmentInput();
mentionSegment.id = mentionedUserId;
messageInput.messageSegments.add(mentionSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = '!';
messageInput.messageSegments.add(textSegment);

markupEndSegment = new ConnectApi.MarkupEndSegmentInput();
markupEndSegment.markupType = ConnectApi.MarkupType.Bold;
messageInput.messageSegments.add(markupEndSegment);

inlineImageSegment = new ConnectApi.InlineImageSegmentInput();
inlineImageSegment.altText = 'image one';
inlineImageSegment.fileId = imageId;
messageInput.messageSegments.add(inlineImageSegment);

input.body = messageInput;

ConnectApi.ChatterFeeds.postFeedElement(communityId, input);
```

Example for Posting a Rich-Text Feed Element with a Code Block

```
String communityId = null;
String targetUserOrGroupOrRecordId  = 'me';
String codeSnippet = '<html>\n\t<body>\n\t\tHello, world!\n\t</body>\n</html>';
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.subjectId = targetUserOrGroupOrRecordId;
input.feedElementType = ConnectApi.FeedElementType.FeedItem;

ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MarkupBeginSegmentInput markupBeginSegment;
ConnectApi.MarkupEndSegmentInput markupEndSegment;

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

markupBeginSegment = new ConnectApi.MarkupBeginSegmentInput();
markupBeginSegment.markupType = ConnectApi.MarkupType.Code;
messageInput.messageSegments.add(markupBeginSegment);

textSegment = new ConnectApi.TextSegmentInput();
```

```
textSegment.text = codeSnippet;
messageInput.messageSegments.add(textSegment);

markupEndSegment = new ConnectApi.MarkupEndSegmentInput();
markupEndSegment.markupType = ConnectApi.MarkupType.Code;
messageInput.messageSegments.add(markupEndSegment);

input.body = messageInput;

ConnectApi.ChatterFeeds.postFeedElement(communityId, input);
```

Example for Sharing a Feed Element (in Version 39.0 and Later)

```
// Define the FeedItemInput object to pass to postFeedElement
ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
feedItemInput.subjectId = 'me';
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();
textSegmentInput.text = 'Look at this post I'm sharing.';
// The MessageBodyInput object holds the text in the post
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageBodyInput.messageSegments.add(textSegmentInput);
feedItemInput.body = messageBodyInput;

ConnectApi.FeedEntityShareCapabilityInput shareInput = new
ConnectApi.FeedEntityShareCapabilityInput();
shareInput.feedEntityId = '0D5R0000000SEbc';
ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
feedElementCapabilitiesInput.feedEntityShare = shareInput;
feedItemInput.capabilities = feedElementCapabilitiesInput;
// Post the feed item.
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);
```

Example for Sending a Direct Message

```
// Define the FeedItemInput object to pass to postFeedElement
ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();

ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();
textSegmentInput.text = 'Thanks for attending my presentation test run this morning. Send
 me any feedback.';

// The MessageBodyInput object holds the text in the post
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageBodyInput.messageSegments.add(textSegmentInput);
feedItemInput.body = messageBodyInput;

// The FeedElementCapabilitiesInput object holds the capabilities of the feed item.
// For this feed item, we define a direct message capability to hold the member(s) and the
 subject.
```

```
List<String> memberIds = new List<String>();
memberIds.add('005B00000016OUQ');
memberIds.add('005B0000001rIN6');

ConnectApi.DirectMessageCapabilityInput dmInput = new
ConnectApi.DirectMessageCapabilityInput();
dmInput.subject = 'Thank you!';
dmInput.membersToAdd = memberIds;

ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
feedElementCapabilitiesInput.directMessage = dmInput;

feedItemInput.capabilities = feedElementCapabilitiesInput;

// Post the feed item.
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);
```

postFeedElementBatch(communityId, feedElements)

Post a list of feed elements.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] postFeedElementBatch(String communityId,
List<ConnectApi.BatchInput> feedElements)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElements
Type: List<`ConnectApi.BatchInput`>

The list can contain up to 500 `ConnectApi.BatchInput` objects. In the `ConnectApi.BatchInput` constructor, the input object must be a concrete instance of the abstract `ConnectApi.FeedElementInput` class.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.FeedElement` object.

The returned objects correspond to each of the input objects and are returned in the same order as the input objects.

The method call fails only if an error occurs that affects the entire operation (such as a parsing failure). If an individual object causes an error, the error is embedded within the `ConnectApi.BatchResult` list.

Usage

Use this method to post a list of feed elements efficiently. Create a list containing up to 500 objects and insert them all for the cost of one DML statement.

In version 36.0 and later, you can attach only one already uploaded file to each post. The `ConnectApi.BatchInput` has three constructors, but the `postFeedElementBatch` method supports only `ConnectApi.BatchInput(Object input)` in version 35.0 and later. This constructor doesn't support a binary input.

In version 32.0–35.0, this method supports both `ConnectApi.BatchInput(Object input)` and `ConnectApi.BatchInput(Object input, ConnectApi.BinaryInput binary)` constructors. The `ConnectApi.BatchInput(Object input, ConnectApi.BinaryInput binary)` constructor allows for a single binary input.

In each constructor, the input object must be an instance of `ConnectApi.FeedElementInput`.

Example

This trigger bulk posts to the feeds of newly inserted accounts.

```
trigger postFeedItemToAccount on Account (after insert) {
    Account[] accounts = Trigger.new;

    // Bulk post to the account feeds.

    List<ConnectApi.BatchInput> batchInputs = new List<ConnectApi.BatchInput>();

    for (Account a : accounts) {
        ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();

        input.subjectId = a.id;

        ConnectApi.MessageBodyInput body = new ConnectApi.MessageBodyInput();
        body.messageSegments = new List<ConnectApi.MessageSegmentInput>();

        ConnectApi.TextSegmentInput textSegment = new ConnectApi.TextSegmentInput();
        textSegment.text = 'Let\'s win the ' + a.name + ' account.';

        body.messageSegments.add(textSegment);
        input.body = body;

        ConnectApi.BatchInput batchInput = new ConnectApi.BatchInput(input);
        batchInputs.add(batchInput);
    }

    ConnectApi.ChatterFeeds.postFeedElementBatch(Network.getNetworkId(), batchInputs);
}
```

`publishDraftFeedElement(communityId, feedElementId, feedElement)`

Publish a draft feed element.

API Version

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement publishDraftFeedElement(String communityId, String feedElementId, ConnectApi.FeedElementInput feedElement)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element to publish.

feedElement
Type: `ConnectApi.FeedElementInput`

Use this optional parameter to edit your draft before publishing.

Return Value

Type: `ConnectApi.FeedElement`

The published feed element has a new ID.

`searchFeedElements(communityId, q)`

Get the first page of feed elements that match the search criteria.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String
q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElements(communityId, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElements(communityId, q, sortParam)`

Get the first page of sorted feed elements that match the search criteria.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String
q, ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElements(communityId, q, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElements(communityId, q, threadedCommentsCollapsed)`

Get the feed elements and comments that match the search criteria.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String q, Boolean threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElements(communityId, q, threadedCommentsCollapsed, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElements(communityId, q, pageParam, pageSize)`

Get a page of feed elements that match the search criteria.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String q, String pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElements(communityId, q, pageParam, pageSize, threadedCommentsCollapsed, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElements(communityId, q, recentCommentCount, pageParam, pageSize, sortParam)`

Get a page of sorted feed elements that match the search criteria. Each feed element includes no more than the specified number of comments.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String
q, Integer recentCommentCount, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElements(communityId, q, recentCommentCount, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElementsInFeed(communityId, feedType, q)`

Get the feed elements from the `Company`, `DirectMessageModeration`, `Home`, `Moderation`, and `PendingReview` feeds that match the search criteria.

API Version

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `Home`, `Moderation`, and `PendingReview`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

Type of feed. Valid values are Company, DirectMessageModeration, Home, Moderation, and PendingReview.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

q
Type: String

Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: ConnectApi.FeedElementPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)`

Get a page of sorted and filtered feed elements from the `Home` feed that match the search criteria. Each feed element includes no more than the specified number of comments.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q,
ConnectApi.FeedFilter filter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. The only valid value is `Home`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

When the *sortParam* is MostViewed, you must pass in null for the *pageParam*.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

When the *sortParam* is MostViewed, the *pageSize* must be a value from 1 to 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

q
Type: String

Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: ConnectApi.FeedFilter

Specifies the feed filters.

- AllQuestions—Feed elements that are questions.
- AuthoredBy—Feed elements authored by the user profile owner. This value is valid only for the UserProfile feed.
- CommunityScoped—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the UserProfile feed.
- QuestionsWithCandidateAnswers—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.

- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElementsInFeed(communityId, feedType, subjectId, q)`

Get the feed elements from a feed that match the search criteria.

API Version

31.0

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, `Streams`, and `Topics`.

subjectId
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)`

Get a page of sorted feed elements from a feed for a record or user that match the search criteria.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, `Streams`, and `Topics`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Order of feed items in the feed.

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Search term. Searches keywords in the user or group name. A minimum of one character is required. This parameter doesn't support wildcards. This parameter is required.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

Get a page of sorted feed elements from a feed that match the search criteria. Each feed element includes no more than the specified number of comments.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, `Streams`, and `Topics`.

`subjectId`
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`q`
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)`

Get a page of sorted and filtered feed elements from a `UserProfile` feed that match the search criteria.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedFilter filter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren't wildcards. See Wildcards.

filter
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, customFilter)

Get a page of sorted and filtered feed elements from a case feed that match the search criteria.

API Version

40.0

Available to Guest Users

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, String customFilter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren't wildcards. See Wildcards.

customFilter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, result)

Apex Developer Guide: Testing ConnectApi Code

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, filter)

Get a page of sorted and filtered feed elements from a feed for a record or user that match the search criteria. Each feed element includes no more than the specified number of comments. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly,
ConnectApi.FeedFilter filter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.

- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, customFilter)`

Get a page of sorted and filtered feed elements from a case feed that match the search criteria.

API Version

40.0

Available to Guest Users

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly, String
customFilter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

filter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q)`

Get the feed elements from a feed filtered by a key prefix that match the search criteria.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFilterFeed(String
communityId, String subjectId, String keyPrefix, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q)`

Get a page of sorted feed elements from a feed filtered by a key prefix that match the search criteria.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFilterFeed(String
communityId, String subjectId, String keyPrefix, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Get a page of sorted feed elements from a feed filtered by a key prefix that match the search criteria. Each feed element includes no more than the specified number of comments.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFilterFeed(String
communityId, String subjectId, String keyPrefix, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

Apex Developer Guide: Testing ConnectApi Code

`searchStreams(communityId, q)`

Search the Chatter feed streams for the context user.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q)
```

Parameters

communityId
: Type: String

  ID for an Experience Cloud site, `internal`, or `null`.

q
: Type: String

  Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterStreamPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- setTestSearchStreams(communityId, q, result)
- *Apex Developer Guide*: Testing ConnectApi Code

`searchStreams(communityId, q, sortParam)`

Search and sort the Chatter feed streams for the context user.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q,
ConnectApi.SortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

Return Value

Type: `ConnectApi.ChatterStreamPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchStreams(communityId, q, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`searchStreams(communityId, q, pageParam, pageSize)`

Search the Chatter feed streams for the context user and return a page of results.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

Return Value

Type: `ConnectApi.ChatterStreamPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchStreams(communityId, q, pageParam, pageSize, result)

`searchStreams(communityId, q, pageParam, pageSize, sortParam)`

Search the Chatter feed streams for the context user and return a sorted page of results.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q,
Integer pageParam, Integer pageSize, ConnectApi.SortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

Return Value

Type: `ConnectApi.ChatterStreamPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchStreams(communityId, q, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`searchStreams(communityId, q, pageParam, pageSize, sortParam, globalScope)`

Search the Chatter feed streams from all Experience Cloud sites for the context user and return a sorted page of results.

API Version

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q,
Integer pageParam, Integer pageSize, ConnectApi.SortOrder sortParam, Boolean globalScope)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

globalScope
Type: Boolean

Specifies whether to get streams from all the context user's Experience Cloud sites, regardless of the *communityId* value.

Tip: If you know the *communityId* for the streams, we recommend setting *globalScope* to `false`.

Return Value

Type: `ConnectApi.ChatterStreamPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`setCommentIsVerified(communityId, commentId, isVerified)`

Mark a comment as verified or unverified.

API Version

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.VerifiedCapability setCommentIsVerified(String communityId,
String commentId, Boolean isVerified)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`commentId`
Type: String

ID of the comment on a question post. Only one comment on a question post can be marked as verified.

`isVerified`
Type: Boolean

Specifies whether to mark the comment as verified (`true`) or unverified (`false`).

Only verified comments can be marked as unverified, and only unverified comments can be marked as verified.

Return Value

Type: `ConnectApi.VerifiedCapability`

If the comment doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`setCommentIsVerifiedByAnonymized(communityId, commentId, isVerified, isVerifiedByAnonymized)`

Mark a comment as verified by an anonymous user.

API Version

43.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.VerifiedCapability setCommentIsVerifiedByAnonymized(String communityId, String commentId, Boolean isVerified, Boolean isVerifiedByAnonymized)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID of the comment on a question post. Only one comment on a question post can be marked as verified.

isVerified
Type: Boolean

Specifies whether to mark the comment as verified (`true`) or unverified (`false`).

Only verified comments can be marked as unverified, and only unverified comments can be marked as verified.

isVerifiedByAnonymized
Type: Boolean

Specifies whether to mark the comment as verified by an anonymous user (`true`).

If a user previously verified a comment and then requested the activity to be deleted, use `isVerifiedByAnonymized` to maintain the verification and anonymize the value of `lastVerifiedByUser`.

You can't set `isVerified` and `isVerifiedByAnonymized` to `true` at the same time. `isVerifiedByAnonymized` can be set to `true` only if `isVerified` is already set to `true`.

You can't set `isVerifiedByAnonymized` to `false`. After `isVerifiedByAnonymized` is set to `true`, it can be undone only when another user marks the comment as unverified and then reverifies the comment.

Return Value

Type: `ConnectApi.VerifiedCapability`

If the comment doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

setCommentVote(communityId, commentId, upDownVote)

Upvote or downvote a comment.

API Version

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UpDownVoteCapability setCommentVote(String communityId, String commentId, ConnectApi.UpDownVoteCapabilityInput upDownVote)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID of the comment.

upDownVote
Type: `ConnectApi.UpDownVoteCapabilityInput`

A `ConnectApi.UpDownVoteCapabilityInput` object that includes your vote.

Return Value

Type: `ConnectApi.UpDownVoteCapability`

If the comment doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`setFeedCommentStatus(communityId, commentId, status)`

Set the status of a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.StatusCapability setFeedCommentStatus(String communityId, String commentId, ConnectApi.StatusCapabilityInput status)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID of the comment.

status
Type: `ConnectApi.StatusCapabilityInput`

A `ConnectApi.StatusCapabilityInput` object that includes the status you want to set.

Return Value

Type: `ConnectApi.StatusCapability`

If the comment doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

Only users with the Can Approve Feed Post and Comment permission can set the status of a feed post or comment.

`setFeedElementIsClosed(communityId, feedElementId, isClosed)`

Set a feed element to closed.

Users can't edit (specifically the feed item body or title), comment on, or delete a closed feed element. If the closed feed element is a poll, users can't vote on it. Users can't edit (specifically the comment body) or delete a comment on a closed feed element or select or remove it as best answer.

Admins and moderators can edit and delete closed feed elements and comments on closed feed elements. Admins and moderators can select or remove the best answer status on comments on closed feed elements.

API Version

43.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CloseCapability setFeedElementIsClosed(String communityId,
String feedElementId, Boolean isClosed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

isClosed
Type: Boolean

Specifies whether to set the feed element to closed (`true`) or not (`false`).

Return Value

Type: `ConnectApi.CloseCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

setFeedElementVote(communityId, feedElementId, upDownVote)

Upvote or downvote a feed element.

API Version

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UpDownVoteCapability setFeedElementVote(String communityId,
String feedElementId, ConnectApi.UpDownVoteCapabilityInput upDownVote)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

upDownVote
Type: `ConnectApi.UpDownVoteCapabilityInput`

A `ConnectApi.UpDownVoteCapabilityInput` object that includes your vote.

Return Value

Type: `ConnectApi.UpDownVoteCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`setFeedEntityStatus(communityId, feedElementId, status)`

Set the status of a feed post.

API Version

37.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.StatusCapability setFeedEntityStatus(String communityId, String feedElementId, ConnectApi.StatusCapabilityInput status)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

status
Type: `ConnectApi.StatusCapabilityInput`

A `ConnectApi.StatusCapabilityInput` object that includes the status you want to set.

Return Value

Type: `ConnectApi.StatusCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

Only users with the Can Approve Feed Post and Comment permission can set the status of a feed post or comment.

`setIsMutedByMe(communityId, feedElementId, isMutedByMe)`

Mute or unmute a feed element.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.MuteCapability setIsMutedByMe(String communityId, String feedElementId, Boolean isMutedByMe)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

isMutedByMe
Type: Boolean

Indicates whether the feed element is muted for the context user. Default value is `false`.

Return Value

Type: `ConnectApi.MuteCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

setIsReadByMe(communityId, feedElementId, readBy)

Mark a feed element as read for the context user using an input class.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ReadByCapability setIsReadByMe(String communityId, String feedElementId, ConnectApi.ReadByCapabilityInput readBy)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element to mark as read.

readBy
Type: ConnectApi.ReadByCapabilityInput

A ConnectApi.ReadByCapabilityInput body indicating to mark the feed elements as read.

Return Value

Type: ConnectApi.ReadByCapability

If the feed element doesn't support this capability, the return value is ConnectApi.NotFoundException.

setIsReadByMe(communityId, feedElementId, isReadByMe)

Mark a feed element as read for the context user.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ReadByCapability setIsReadByMe(String communityId, String feedElementId, Boolean isReadByMe)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String

ID of the feed element to mark as read.

isReadByMe
Type: Boolean

Specifies to mark the feed element as read (true) for the context user.

Return Value

Type: ConnectApi.ReadByCapability

If the feed element doesn't support this capability, the return value is ConnectApi.NotFoundException.

updateComment(communityId, commentId, comment)

Edit a comment.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment updateComment(String communityId, String commentId,
ConnectApi.CommentInput comment)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID of the comment to be edited.

comment
Type: `ConnectApi.CommentInput`

Information about the comment to be edited.

Return Value

Type: `ConnectApi.Comment`

If the comment doesn't support the `edit` capability, the return value is `ConnectApi.NotFoundException`.

Example

```
String commentId;
String communityId = Network.getNetworkId();

// Get the last feed item created by the context user.
List<FeedItem> feedItems = [SELECT Id FROM FeedItem WHERE CreatedById = :UserInfo.getUserId()
 ORDER BY CreatedDate DESC];
if (feedItems.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
String feedElementId = feedItems[0].id;

ConnectApi.CommentPage commentPage =
ConnectApi.ChatterFeeds.getCommentsForFeedElement(communityId, feedElementId);
if (commentPage.items.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
```

```
commentId = commentPage.items[0].id;

ConnectApi.FeedEntityIsEditable isEditable =
ConnectApi.ChatterFeeds.isCommentEditableByMe(communityId, commentId);

if (isEditable.isEditableByMe == true){
    ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput();
    ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
    ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

    messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

    textSegmentInput.text = 'This is my edited comment.';
    messageBodyInput.messageSegments.add(textSegmentInput);

    commentInput.body = messageBodyInput;

    ConnectApi.Comment editedComment = ConnectApi.ChatterFeeds.updateComment(communityId,
 commentId, commentInput);
}
```

`updateDirectMessage(communityId, feedElementId, directMessage)`

Update the members of a direct message.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.DirectMessageCapability updateDirectMessage(String communityId,
String feedElementId, ConnectApi.DirectMessageCapabilityInput directMessage)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

directMessage
Type: `ConnectApi.DirectMessageCapabilityInput`

A `ConnectApi.DirectMessageCapabilityInput` body that includes the members to add and remove.

Return Value

Type: ConnectApi.DirectMessageCapability

If the feed element doesn't support this capability, the return value is ConnectApi.NotFoundException.

updateFeedElement(communityId, feedElementId, feedElement)

Edit a feed element.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement updateFeedElement(String communityId, String
feedElementId, ConnectApi.FeedElementInput feedElement)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element to be edited. Feed items are the only type of feed element that can be edited.

feedElement
Type: ConnectApi.FeedElementInput

Information about the feed item to be edited.

Return Value

Type: ConnectApi.FeedElement

If the feed element doesn't support the `edit` capability, the return value is ConnectApi.NotFoundException.

Example for Editing a Feed Post

```
String communityId = Network.getNetworkId();

// Get the last feed item created by the context user.
List<FeedItem> feedItems = [SELECT Id FROM FeedItem WHERE CreatedById = :UserInfo.getUserId()
 ORDER BY CreatedDate DESC];
if (feedItems.isEmpty()) {
    // Return null within anonymous apex.
    return null;
```

```
}
String feedElementId = feedItems[0].id;

ConnectApi.FeedEntityIsEditable isEditable =
ConnectApi.ChatterFeeds.isFeedElementEditableByMe(communityId, feedElementId);

if (isEditable.isEditableByMe == true){
    ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
    ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
    ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

    messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

    textSegmentInput.text = 'This is my edited post.';
    messageBodyInput.messageSegments.add(textSegmentInput);

    feedItemInput.body = messageBodyInput;

    ConnectApi.FeedElement editedFeedElement =
ConnectApi.ChatterFeeds.updateFeedElement(communityId, feedElementId, feedItemInput);
}
```

Example for Editing a Question Title and Post

```
String communityId = Network.getNetworkId();

// Get the last feed item created by the context user.
List<FeedItem> feedItems = [SELECT Id FROM FeedItem WHERE CreatedById = :UserInfo.getUserId()
 ORDER BY CreatedDate DESC];
if (feedItems.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
String feedElementId = feedItems[0].id;

ConnectApi.FeedEntityIsEditable isEditable =
ConnectApi.ChatterFeeds.isFeedElementEditableByMe(communityId, feedElementId);

if (isEditable.isEditableByMe == true){

    ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
    ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
    ConnectApi.QuestionAndAnswersCapabilityInput questionAndAnswersCapabilityInput = new
ConnectApi.QuestionAndAnswersCapabilityInput();
    ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
    ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

    messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

    textSegmentInput.text = 'This is my edited question.';
    messageBodyInput.messageSegments.add(textSegmentInput);

    feedItemInput.body = messageBodyInput;
```

```
    feedItemInput.capabilities = feedElementCapabilitiesInput;

    feedElementCapabilitiesInput.questionAndAnswers = questionAndAnswersCapabilityInput;
    questionAndAnswersCapabilityInput.questionTitle = 'Where is my edited question?';

    ConnectApi.FeedElement editedFeedElement =
ConnectApi.ChatterFeeds.updateFeedElement(communityId, feedElementId, feedItemInput);
}
```

updateFeedElementBookmarks(communityId, feedElementId, bookmarks)

Bookmark a feed element or remove a bookmark from a feed element using an input class.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BookmarksCapability updateFeedElementBookmarks(String
communityId, String feedElementId, ConnectApi.BookmarksCapabilityInput bookmarks)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

bookmarks
Type: `ConnectApi.BookmarksCapabilityInput`

Information about a bookmark.

Return Value

Type: ConnectApi.BookmarksCapability

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

updateFeedElementBookmarks(communityId, feedElementId, isBookmarkedByCurrentUser)

Bookmark a feed element or remove a bookmark from a feed element.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BookmarksCapability updateFeedElementBookmarks(String
communityId, String feedElementId, Boolean isBookmarkedByCurrentUser)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

isBookmarkedByCurrentUser
Type: Boolean

Specify whether to bookmark the feed element (`true`) or not (`false`).

Return Value

Type: `ConnectApi.BookmarksCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Example

```
ConnectApi.BookmarksCapability bookmark =
ConnectApi.ChatterFeeds.updateFeedElementBookmarks(null, '0D5D0000000KuGh', true);
```

updateFeedElementReadByCapabilityBatch(communityId, feedElementIds, readBy)

Mark multiple feed elements as read by the context user at the same time using an input class.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] updateFeedElementReadByCapabilityBatch(String
communityId, List<String> feedElementIds, ConnectApi.ReadByCapabilityInput readBy)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementIds
Type: List<String>

Up to 500 feed element IDs to mark as read.

readBy
Type: `ConnectApi.ReadByCapabilityInput`

A `ConnectApi.ReadByCapabilityInput` body indicating to mark the feed elements as read.

Return Value

Type: `ConnectApi.BatchResult`[]

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

The returned objects correspond to each of the input objects and are returned in the same order as the input objects.

The method call fails only if an error occurs that affects the entire operation (such as a parsing failure). If an individual object causes an error, the error is embedded within the `ConnectApi.BatchResult` list.

updateFeedElementReadByCapabilityBatch(communityId, feedElementIds, isReadByMe)

Mark multiple feed elements as read by the context user at the same time.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] updateFeedElementReadByCapabilityBatch(String
communityId, List<String> feedElementIds, Boolean isReadByMe)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementIds
Type: List<String>

Up to 500 feed element IDs to mark as read.

isReadByMe
Type: Boolean

Specifies to mark the feed element as read (`true`) for the context user.

Return Value

Type: `ConnectApi.BatchResult`[]

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

updateLikeForComment(communityId, commentId, isLikedByCurrentUser)

Like or unlike a comment.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage updateLikeForComment(String communityId, String commentId, Boolean isLikedByCurrentUser)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID of the comment.

isLikedByCurrentUser
Type: Boolean

Specifies if the context user likes (`true`) or unlikes (`false`) the comment.

Return Value

Type: `ConnectApi.ChatterLikePage`

updateLikeForFeedElement(communityId, feedElementId, isLikedByCurrentUser)

Like or unlike a feed element.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage updateLikeForFeedElement(String communityId,
String feedElementId, Boolean isLikedByCurrentUser)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

isLikedByCurrentUser
Type: Boolean

Specifies if the context user likes (`true`) or unlikes (`false`) the feed element.

Return Value

Type: `ConnectApi.ChatterLikePage`

If the feed element doesn't support the `ChatterLikes` capability, the return value is `ConnectApi.NotFoundException`.

updatePinnedFeedElements(communityId, feedType, subjectId, pin)

Pin or unpin feed elements to a group or topic feed.

API Version

41.0

Available to Guest Users

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.PinCapability updatePinnedFeedElements(String communityId,
ConnectApi.FeedType feedType, String subjectId, ConnectApi.PinCapabilityInput pin)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Record` and `Topics`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* must be a group ID. If *feedType* is `Topics`, *subjectId* must be a topic ID.

pin
Type: `ConnectApi.PinCapabilityInput`

A `ConnectApi.PinCapabilityInput` object indicating the feed element to pin or unpin.

Return Value

Type: `ConnectApi.PinCapability`

If the feed doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

updateStream(communityId, streamId, streamInput)

Update a Chatter feed stream.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStream updateStream(String communityId, String streamId,
ConnectApi.ChatterStreamInput streamInput)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

streamId
Type: String

ID of the Chatter feed stream.

streamInput
Type: ConnectApi.ChatterStreamInput

A ConnectApi.ChatterStreamInput object.

Return Value

Type: ConnectApi.ChatterStream

voteOnFeedElementPoll(communityId, feedElementId, myChoiceId)

Vote on a poll or change your vote on a poll.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.PollCapability voteOnFeedElementPoll(String communityId, String feedElementId, String myChoiceId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String

ID of the feed element.

myChoiceId
Type: String

ID of the poll item you're voting for. The key prefix for poll items is 09A.

Return Value

Type: ConnectApi.PollCapability

If the feed element doesn't support this capability, the return value is ConnectApi.NotFoundException.

Example

```
ConnectApi.PollCapability poll = ConnectApi.ChatterFeeds.voteOnFeedElementPoll(null,
'0D5D0000000XZaUKAW', '09AD000000000TKMAY');
```

ChatterFeeds Test Methods

The following are the test methods for `ChatterFeeds`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

IN THIS SECTION:

setTestGetFeedElementsFromFeed(communityId, feedType, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getFeedElementsFromFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getFeedElementsFromFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, customFilter, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getFeedElementsFromFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `getFeedElements FromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `getFeedElements FromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `getFeedElements FromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the `getFeedElementsFromFilterFeedUpdatedSince` method is called in a test context.

setTestGetFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRelatedPosts(communityId, feedElementId, filter, maxResults, result)

Register a `ConnectApi.RelatedFeedPosts` object to be returned when the matching `ConnectApi.getRelatedPosts(communityId, feedElementId, filter, maxResults)` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestGetTopUnansweredQuestions(communityId, result) (Pilot)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getTopUnansweredQuestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestGetTopUnansweredQuestions(communityId, filter, result) (Pilot)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getTopUnansweredQuestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestGetTopUnansweredQuestions(communityId, pageSize, result) (Pilot)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getTopUnansweredQuestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestGetTopUnansweredQuestions(communityId, filter, pageSize, result) (Pilot)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getTopUnansweredQuestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElements(communityId, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElements(communityId, q, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElements(communityId, q, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElements(communityId, q, pageParam, pageSize, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElements(communityId, q, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElements(communityId, q, pageParam, pageSize, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElements(communityId, q, recentCommentCount, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `searchFeedElementsInFeed` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchStreams(communityId, q, result)

Register a `ConnectApi.ChatterStreamPage` object to be returned when the matching `ConnectApi.searchStream(communityId, q)` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchStreams(communityId, q, sortParam, result)

Register a `ConnectApi.ChatterStreamPage` object to be returned when the matching `ConnectApi.searchStream(communityId, q, sortParam)` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchStreams(communityId, q, pageParam, pageSize, result)

Register a `ConnectApi.ChatterStreamPage` object to be returned when the matching `ConnectApi.searchStreams(communityId, q, pageParam, pageSize)` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchStreams(communityId, q, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.ChatterStreamPage` object to be returned when the matching `ConnectApi.searchStreams(communityId, q, pageParam, pageSize, sortParam)` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchStreams(communityId, q, pageParam, pageSize, sortParam, globalScope, result)

Register a `ConnectApi.ChatterStreamPage` object to be returned when the matching `ConnectApi.searchStreams(communityId, q, pageParam, pageSize, sortParam, globalScope)` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType
feedType, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The only valid value for this parameter is `Company`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. The only valid value is `Home`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.

- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

`result`
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getFeedElementsFromFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

44.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter, Boolean threadedCommentsCollapsed, ConnectApi.FeedElementPage result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

The type of feed. The only valid value is Home.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

filter
Type: ConnectApi.FeedFilter

Specifies the feed filters.

- AllQuestions—Feed elements that are questions.
- AuthoredBy—Feed elements authored by the user profile owner. This value is valid only for the UserProfile feed.
- CommunityScoped—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the UserProfile feed.
- QuestionsWithCandidateAnswers—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.

- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

`threadedCommentsCollapsed`
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

`result`
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed)

`setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The feed type.

subjectId
Type: String

ID of the context user or the alias `me`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, subjectId)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

`subjectId`
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

getFeedElementsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType
feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedElementPage`

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

- getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)
- *Apex Developer Guide*: Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

35.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.

- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out. Currently, feed elements scoped to sites have a User or a Group parent record. However, other parent record types could be scoped to sites in the future.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getFeedElementsFromFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

44.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter, Boolean threadedCommentsCollapsed, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out. Currently, feed elements scoped to sites have a User or a Group parent record. However, other parent record types could be scoped to sites in the future.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`customFilter`
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

`result`
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

result
Type: ConnectApi.FeedElementPage

Object containing test data.

Return Value

Type: Void

```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.

- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter)

filter, Boolean threadedCommentsCollapsed, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, String customFilter,
ConnectApi.FeedElementPage result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

`subjectId`
Type: String

The ID of a case.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

`elementsPerBundle`
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

customFilter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

result
Type: ConnectApi.FeedElementPage

Object containing test data.

```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, customFilter, threadedCommentsCollapsed)

setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `getFeedElements FromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFilterFeed(String communityId, String subjectId, String keyPrefix, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `getFeedElements FromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFilterFeed(String communityId, String subjectId, String keyPrefix, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `getFeedElements FromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFilterFeed(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the `getFeedElementsFromFilterFeedUpdatedSince` method is called in a test context.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFilterFeedUpdatedSince(String communityId,
String subjectId, String keyPrefix, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

Opaque token defining the modification timestamp of the feed and the sort order.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedElementPage
result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

result

getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedFilter filter,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, filter)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

One of these values:

- `Files`
- `Groups`
- `News`
- `People`
- `Record`

subjectId
Type: String

If *feedType* is `ConnectApi.Record`, *subjectId* can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

result

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
Boolean showInternalOnly, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

35.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

Opaque token defining the modification timestamp of the feed and the sort order.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

filter
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out. Currently, feed elements scoped to sites have a User or a Group parent record. However, other parent record types could be scoped to sites in the future.

result
Type: `ConnectApi.FeedElementPage`

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

40.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, String customFilter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`updatedSince`
Type: String

Opaque token defining the modification timestamp of the feed and the sort order.

The *`updatedSince`* parameter doesn't return feed elements that are created in the same second as the call.

`customFilter`
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

`result`
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, customFilter)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, Boolean showInternalOnly, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.

- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, filter)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

40.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, Boolean showInternalOnly, String customFilter,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

customFilter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, customFilter)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRelatedPosts(communityId, feedElementId, filter, maxResults, result)`

Register a `ConnectApi.RelatedFeedPosts` object to be returned when the matching `ConnectApi.getRelatedPosts(communityId, feedElementId, filter, maxResults)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

37.0

Signature

```
public static Void setTestGetRelatedPosts(String communityId, String feedElementId,
ConnectApi.RelatedFeedPostType filter, Integer maxResults, ConnectApi.RelatedFeedPosts
result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`
Type: String

ID of the feed element. The feed element must be a question.

`filter`
Type: `ConnectApi.RelatedFeedPostType`

Specifies the type of related feed post. Values are:

- `Answered`—Related questions that have at least one answer.
- `BestAnswer`—Related questions that have a best answer.
- `Generic`—All types of related questions, including answered, with a best answer, and unanswered.
- `Unanswered`—Related questions that don't have answers.

`Generic` is the default value.

`maxResults`
Type: Integer

The maximum number of results to return. You can return up to 25 results; 5 is the default.

result
Type: ConnectApi.RelatedFeedPosts

Object containing test data.

In version 37.0 and later, related feed posts are questions.

Return Value

Type: Void

setTestGetTopUnansweredQuestions(communityId, result) (Pilot)

Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.getTopUnansweredQuestions method is called in a test context. Use the method with the same parameters or you receive an exception.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version

42.0

Signature

```
public static Void setTestGetTopUnansweredQuestions(String communityId,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

result
Type: ConnectApi.FeedElementPage

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getTopUnansweredQuestions(communityId) (Pilot)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetTopUnansweredQuestions(communityId, filter, result)` (Pilot)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getTopUnansweredQuestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version

42.0

Signature

```
public static Void setTestGetTopUnansweredQuestions(String communityId,
ConnectApi.TopUnansweredQuestionsFilterType filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

filter
Type: `ConnectApi.FeedFilter`

Specifies the filter for the feed. `UnansweredQuestionsWithCandidateAnswers` is the only valid value.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getTopUnansweredQuestions(communityId, filter) (Pilot)

`setTestSearchFeedElements(communityId, q, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElements(communityId, q)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedElements(communityId, q, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q,
ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. The only valid value is `Home`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

`result`

Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)

Apex Developer Guide: Testing ConnectApi Code

`setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, q, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String q, ConnectApi.FeedElementPage
result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, `Streams`, and `Topics`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If feed type is `UserProfile`, *subjectId* can be any user ID. If *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElementsInFeed(communityId, feedType, subjectId, q)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, `Streams`, and `Topics`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Order of feed items in the feed.

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Search term. Searches keywords in the user or group name. A minimum of one character is required. This parameter doesn't support wildcards. This parameter is required.

result
Type: ConnectApi.FeedElementPage

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, `Streams`, and `Topics`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `searchFeedElementsInFeed` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

35.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedFilter filter,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

The amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren't wildcards. See Wildcards.

filter
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out. Currently, feed elements scoped to sites have a User or a Group parent record. However, other parent record types could be scoped to sites in the future.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

ConnectApi.FeedSortOrder sortParam, String q, String customFilter,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

The amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren't wildcards. See Wildcards.

customFilter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

```

```
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

32.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly,
ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

Value must be ConnectApi.FeedType.Record.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

q
Type: String

Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

`filter`
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

`result`

customFilter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

cusotmFilter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, customFilter)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFilterFeed(String communityId, String subjectId, String keyPrefix, String q, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result

Signature

```
public static Void setTestSearchFeedElementsInFilterFeed(String communityId, String subjectId, String keyPrefix, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.

- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFilterFeed(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

`setTestSearchStreams(communityId, q, sortParam, result)`

Register a `ConnectApi.ChatterStreamPage` object to be returned when the matching `ConnectApi.searchStream(communityId, q, sortParam)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestSearchStreams(String communityId, String q,
ConnectApi.SortOrder sortParam, ConnectApi.ChatterStreamPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

result
Type: `ConnectApi.ChatterStreamPage`

Object containing test data.

Return Value

Type: Void

Signature

```
public static Void setTestSearchStreams(String communityId, String q, Integer pageParam,
Integer pageSize, ConnectApi.SortOrder sortParam, ConnectApi.ChatterStreamPage result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`q`
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

`sortParam`
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

`result`
Type: `ConnectApi.ChatterStreamPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchStreams(communityId, q, pageParam, pageSize, sortParam)

setTestSearchStreams(communityId, q, pageParam, pageSize, sortParam, globalScope, result)

Register a `ConnectApi.ChatterStreamPage` object to be returned when the matching `ConnectApi.searchStreams(communityId, q, pageParam, pageSize, sortParam, globalScope)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

41.0

Signature

```
public static Void setTestSearchStreams(String communityId, String q, Integer pageParam,
Integer pageSize, ConnectApi.SortOrder sortParam, Boolean globalScope,
ConnectApi.ChatterStreamPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).

- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

`globalScope`
Type: Boolean

Specifies whether to get streams from all the context user's Experience Cloud sites, regardless of the *`communityId`* value.

`result`
Type: `ConnectApi.ChatterStreamPage`

Object containing test data.

Return Value

Type: Void

Retired ChatterFeeds Methods

The following methods for `ChatterFeeds` are retired.

IN THIS SECTION:

deleteFeedItem(communityId, feedItemId)
Delete a feed item.

getCommentsForFeedItem(communityId, feedItemId)
Get comments for a feed item.

getCommentsForFeedItem(communityId, feedItemId, pageParam, pageSize)
Get a page of comments for a feed item.

getFeedItem(communityId, feedItemId)
Get a feed item.

getFeedItemBatch(communityId, feedItemIds)
Get a list of feed items.

getFeedItemsFromFeed(communityId, feedType)
Get feed items from the `Company`, `Home`, and `Moderation` feeds.

getFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)
Get a page of sorted feed items from the `Company`, `Home`, and `Moderation` feeds.

getFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)
Get a page of sorted feed items from the `Company`, `Home`, and `Moderation` feeds. Each feed item contains no more than the specified number of comments.

getFeedItemsFromFeed(communityId, feedType, subjectId)
Get feed items from a feed for a user or record.

getFeedItemsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam)
Get a page of sorted feed items from a feed for a user or record.

getFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam)

Get a page of sorted feed items from a feed for a user or record. Each feed item includes no more than the specified number of comments.

getFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)

Get a page of sorted feed items from a record feed for a user or record. Each feed item includes no more than the specified number of comments. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.

getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix)

Get feed items from a feed filtered by a key prefix for a user.

getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam)

Get a page of sorted feed items from a feed filtered by a key prefix for a user.

getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam)

Get a page of sorted feed items from a feed filtered by a key prefix for a user. Each feed item contains no more than the specified number of comments.

getFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, updatedSince)

Get a page of feed items from a feed filtered by a key prefix for a user. Include only feed items that have been updated since the time specified in the *`updatedSince`* parameter.

getFeedItemsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince)

Get a page of feed items from the `Company`, `Home`, and `Moderation` feeds. Include only feed items that have been updated since the time specified in the *`updatedSince`* parameter. Each feed item contains no more than the specified number of comments.

getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince)

Get a page of feed items from the `Files`, `Groups`, `News`, `People`, and `Record` feeds. Include only feed items that have been updated since the time specified in the *`updatedSince`* parameter. Each feed item contains no more than the specified number of comments.

getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly)

Get a page of feed items from a record feed. Include only feed items that have been updated since the time specified in the *`updatedSince`* parameter. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.

getFeedPoll(communityId, feedItemId)

Get the poll associated with a feed item.

getLikesForFeedItem(communityId, feedItemId)

Get likes for a feed item.

getLikesForFeedItem(communityId, feedItemId, pageParam, pageSize)

Get a page of likes for a feed item.

likeFeedItem(communityId, feedItemId)

Like a feed item for the context user.

postComment(communityId, feedItemId, text)

Post a plain-text comment to a feed item.

postComment(communityId, feedItemId, comment, feedItemFileUpload)

Post a rich-text comment to a feed item. Use this method to include mentions and to attach a file to a comment.

postFeedElement(communityId, feedElement, feedElementFileUpload)

Post a rich-text feed element. Include mentions and hashtag topics, attach a file to a feed element, and associate action link groups with a feed element. You can also use this method to share a feed element and add a comment.

postFeedItem(communityId, feedType, subjectId, text)

Post a plain-text feed item.

postFeedItem(communityId, feedType, subjectId, feedItemInput, feedItemFileUpload)

Post a rich-text feed item to a feed. Use this method to include mentions and hashtag topics and to attach a file to a feed item. You can also use this method to share a feed item and add a comment.

searchFeedItems(communityId, q)

Get the feed items that match the search criteria.

searchFeedItems(communityId, q, sortParam)

Get the sorted feed items that match the search criteria.

searchFeedItems(communityId, q, pageParam, pageSize)

Get a page of feed items that match the search criteria.

searchFeedItems(communityId, q, pageParam, pageSize, sortParam)

Get a page of sorted feed items that match the search criteria.

searchFeedItems(communityId, q, recentCommentCount, pageParam, pageSize, sortParam)

Get a page of sorted feed items that match the search criteria.

searchFeedItemsInFeed(communityId, feedType, q)

Get the feed items from the `Company`, `Home`, and `Moderation` feeds that match the search criteria.

searchFeedItemsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items from the `Company`, `Home`, and `Moderation` feeds that match the search criteria.

searchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items from the `Company`, `Home`, and `Moderation` feeds that match the search criteria. Each feed item includes no more than the specified number of comments.

searchFeedItemsInFeed(communityId, feedType, subjectId, q)

Get the feed items from a feed that match the search criteria.

searchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items from a feed for a user or record that match the search criteria.

searchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items from a feed that match the search criteria. Each feed item includes no more than the specified number of comments.

searchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly)

Get a page of sorted feed items from a feed for a user or record that match the search criteria. Each feed item includes no more than the specified number of comments. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.

searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q)

Get the feed items that match the search criteria from a feed filtered by a key prefix for a user.

searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items that match the search criteria from a feed filtered by a key prefix for a user.

searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items that match the search criteria from a feed filtered by a key prefix for a user. Each feed item includes no more than the specified number of comments.

shareFeedElement(communityId, subjectId, feedElementType, originalFeedElementId)

Share the *originalFeedElementId* as the context user.

shareFeedItem(communityId, feedType, subjectId, originalFeedItemId)

Share the *originalFeedItemId* to the feed specified by the *feedType*.

updateBookmark(communityId, feedItemId, isBookmarkedByCurrentUser)

Bookmark a feed item or remove a bookmark from a feed item.

voteOnFeedPoll(communityId, feedItemId, myChoiceId)

Vote or change your vote on a feed poll.

setTestGetFeedItemsFromFeed(communityId, feedType, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `getFeedItemsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `getFeedItemsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `getFeedItemsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, updatedSince, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the `getFeedItemsFromFilterFeedUpdatedSince` method is called in a test context.

setTestGetFeedItemsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, ConnectApi.FeedItemPage, results)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestSearchFeedItems(communityId, q, result)

Register a test feed item page to be returned when `searchFeedItems(communityId, q)` is called during a test.

setTestSearchFeedItems(communityId, q, sortParam, result)

Register a test feed item page to be returned when `searchFeedItems(String, String, ConnectApi.FeedSortOrder)` is called during a test.

setTestSearchFeedItems(communityId, q, pageParam, pageSize, result)

Register a test feed item page to be returned when `searchFeedItems(String, String, String, Integer)` is called during a test.

setTestSearchFeedItems(communityId, q, pageParam, pageSize, sortParam, result)

Register a test feed item page to be returned when `searchFeedItems(String, String, String, Integer, ConnectApi.FeedSortOrder)` is called during a test.

setTestSearchFeedItems(communityId, q, recentCommentCount, pageParam, pageSize, sortParam, result)

Register a test feed item page to be returned when `searchFeedItems(communityId, q, recentCommentCount, pageParam, pageSize, sortParam)` is called during a test.

setTestSearchFeedItemsInFeed(communityId, feedType, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

`deleteFeedItem(communityId, feedItemId)`

Delete a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use deleteFeedElement(communityId, feedElementId).

Requires Chatter

Yes

Signature

```
public static Void deleteFeedItem(String communityId, String feedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

Return Value

Type: Void

getCommentsForFeedItem(communityId, feedItemId)

Get comments for a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use getCommentsForFeedElement(communityId, feedElementId).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getCommentsForFeedItem(String communityId, String
feedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

Return Value

Type: `ConnectApi.CommentPage`

getCommentsForFeedItem(communityId, feedItemId, pageParam, pageSize)

Get a page of comments for a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getCommentsForFeedItem(String communityId, String feedItemId, String pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.CommentPage`

getFeedItem(communityId, feedItemId)

Get a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElement(communityId, feedElementId).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem getFeedItem(String communityId, String feedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

Return Value

Type: `ConnectApi.FeedItem`

Note: Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that `ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information may not be available in the trigger.

getFeedItemBatch(communityId, feedItemIds)

Get a list of feed items.

API Version

31.0–31.0

Important: In version 32.0 and later, use getFeedElementBatch(communityId, feedElementIds).

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getFeedItemBatch(String communityId, List<String>
feedItemIds)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemIds
Type: List<String>

A list of up to 500 feed item IDs.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.FeedItem` object and errors for feed items that didn't load.

Example

```
// Create a list of feed items.
ConnectApi.FeedItemPage feedItemPage = ConnectApi.ChatterFeeds.getFeedItemsFromFeed(null,
 ConnectApi.FeedType.Company);
System.debug(feedItemPage);

// Create a list of feed item IDs.
List<String> feedItemIds = new List<String>();
for (ConnectApi.FeedItem aFeedItem : feedItemPage.items){
    feedItemIds.add(aFeedItem.id);
}

// Get info about the feed items in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterFeeds.getFeedItemBatch(null,
feedItemIds);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the header for each feed item.
        ConnectApi.FeedItem aFeedItem;
        if(batchResult.getResult() instanceof ConnectApi.FeedItem) {
           aFeedItem = (ConnectApi.FeedItem) batchResult.getResult();
```

```
        }
        System.debug('SUCCESS');
        System.debug(aFeedItem.header.text);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

getFeedItemsFromFeed(communityId, feedType)

Get feed items from the `Company`, `Home`, and `Moderation` feeds.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFeed(communityId, feedType).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId,
ConnectApi.FeedType feedType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)`

Get a page of sorted feed items from the `Company`, `Home`, and `Moderation` feeds.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId,
ConnectApi.FeedType feedType, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)`

Get a page of sorted feed items from the `Company`, `Home`, and `Moderation` feeds. Each feed item contains no more than the specified number of comments.

API Version

29.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

`getFeedItemsFromFeed(communityId, feedType, subjectId)`

Get feed items from a feed for a user or record.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFeed(communityId, feedType, subjectId).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`getFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)`

Get a page of sorted feed items from a record feed for a user or record. Each feed item includes no more than the specified number of comments. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.

API Version

30.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix)`

Get feed items from a feed filtered by a key prefix for a user.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFilterFeed(String communityId,
String subjectId, String keyPrefix)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, result)

```
public static ConnectApi.FeedItemPage getFeedItemsFromFilterFeed(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`subjectId`
Type: String

ID of the context user or the alias `me`.

`keyPrefix`
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFilterFeedUpdatedSince(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

Opaque token containing information about the last modified date of the feed. Do not construct this token. To retrieve this token, call `getFeedItemsFromFilterFeed` and take the value from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

This method returns only feed items that have been updated since the time specified in the *updatedSince* argument. A feed item is considered to be updated if it was created since the last feed request, or if `sort=LastModifiedDateDesc` and a comment was added to the feed item since the last feed request. Adding likes and topics doesn't update a feed item.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, updatedSince, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedItemsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince)`

Get a page of feed items from the `Company`, `Home`, and `Moderation` feeds. Include only feed items that have been updated since the time specified in the *updatedSince* parameter. Each feed item contains no more than the specified number of comments.

API Version

30.0–31.0

Important: In version 32.0 and later, use getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

This method returns only feed items that have been updated since the time specified in the *updatedSince* argument. A feed item is considered to be updated if it was created since the last feed request, or if `sort=LastModifiedDateDesc` and a comment was added to the feed item since the last feed request. Adding likes and topics doesn't update a feed item.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets the feed items in the company feed and grabs the `updatesToken` property from the returned object. It then passes the value of `updatesToken` to the `getFeedItemsUpdatedSince` method to get the feed items updated since the first call:

```
// Get the feed items in the company feed and return the updatesToken
String communityId = null;

// Get the feed and extract the update token
ConnectApi.FeedItemPage page = ConnectApi.ChatterFeeds.getFeedItemsFromFeed(communityId,
ConnectApi.FeedType.Company);

// page.updatesToken is opaque and has a value like '2:1384549034000'

// Get the feed items that changed since the provided updatesToken
ConnectApi.FeedItemPage feedItems= ConnectApi.ChatterFeeds.getFeedItemsUpdatedSince
  (communityId, ConnectApi.FeedType.Company, 1, ConnectApi.FeedDensity.AllUpdates, null,
1, page.updatesToken);
```

SEE ALSO:

setTestGetFeedItemsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, ConnectApi.FeedItemPage, results)

Apex Developer Guide: Testing ConnectApi Code

`getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince)`

Get a page of feed items from the `Files`, `Groups`, `News`, `People`, and `Record` feeds. Include only feed items that have been updated since the time specified in the *updatedSince* parameter. Each feed item contains no more than the specified number of comments.

API Version

30.0–31.0

Important: In version 32.0 and later, use getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

One of these values:

- `Files`
- `Groups`
- `News`
- `People`
- `Record`

subjectId
Type: String

If *feedType* is `ConnectApi.Record`, *subjectId* can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

This method returns only feed items that have been updated since the time specified in the *updatedSince* argument. A feed item is considered to be updated if it was created since the last feed request, or if `sort=LastModifiedDateDesc` and a comment was added to the feed item since the last feed request. Adding likes and topics doesn't update a feed item.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets the feed items in the news feed and grabs the `updatesToken` property from the returned object. It then passes the value of `updatesToken` to the `getFeedItemsUpdatedSince` method to get the feed items updated since the first call:

```
// Get the feed items in the news feed and return the updatesToken
String communityId = null;
String subjectId = 'me';

// Get the feed and extract the update token
ConnectApi.FeedItemPage page = ConnectApi.ChatterFeeds.getFeedItemsFromFeed(communityId,
ConnectApi.FeedType.News, subjectId);

// page.updatesToken is opaque and has a value like '2:1384549034000'

// Get the feed items that changed since the provided updatesToken
ConnectApi.FeedItemPage feedItems= ConnectApi.ChatterFeeds.getFeedItemsUpdatedSince
  (communityId, ConnectApi.FeedType.News, subjectId, 1, ConnectApi.FeedDensity.AllUpdates,
 null, 1, page.updatesToken);
```

SEE ALSO:

setTestGetFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, result)

Apex Developer Guide: Testing ConnectApi Code

getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly)

Get a page of feed items from a record feed. Include only feed items that have been updated since the time specified in the *updatedSince* parameter. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.

API Version

30.0–31.0

Important: In version 32.0 and later, use getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
Boolean showInternalOnly)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`updatedSince`
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

This method returns only feed items that have been updated since the time specified in the *`updatedSince`* argument. A feed item is considered to be updated if it was created since the last feed request, or if `sort=LastModifiedDateDesc` and a comment was added to the feed item since the last feed request. Adding likes and topics doesn't update a feed item.

If *`showInternalOnly`* is `true` and digital experiences is enabled, feed items from Experience Cloud sites are included. Otherwise, only feed items from the internal site are included.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets the feed items in the news feed and grabs the `updatesToken` property from the returned object. It then passes the value of `updatesToken` to the `getFeedItemsUpdatedSince` method to get the feed items updated since the first call:

```
// Get the feed items in the news feed and return the updatesToken
String communityId = null;
String subjectId = 'me';

// Get the feed and extract the update token
ConnectApi.FeedItemPage page = ConnectApi.ChatterFeeds.getFeedItemsFromFeed(communityId,
ConnectApi.FeedType.News, subjectId);

// page.updatesToken is opaque and has a value like '2:1384549034000'

// Get the feed items that changed since the provided updatesToken
ConnectApi.FeedItemPage feedItems= ConnectApi.ChatterFeeds.getFeedItemsUpdatedSince
```

```
  (communityId, ConnectApi.FeedType.News, subjectId, 1, ConnectApi.FeedDensity.AllUpdates,
null, 1, page.updatesToken, true);
```

SEE ALSO:

setTestGetFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedPoll(communityId, feedItemId)`

Get the poll associated with a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElementPoll(communityId, feedElementId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedPoll getFeedPoll(String communityId, String feedItemId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedItemId`
Type: String

ID for a feed item.

Return Value

Type: `ConnectApi.FeedPoll`

Note: Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that `ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information may not be available in the trigger.

`getLikesForFeedItem(communityId, feedItemId)`

Get likes for a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use getLikesForFeedElement(communityId, feedElementId).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForFeedItem(String communityId, String feedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

Return Value

Type: `ConnectApi.ChatterLikePage`

getLikesForFeedItem(communityId, feedItemId, pageParam, pageSize)

Get a page of likes for a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use getLikesForFeedElement(communityId, feedElementId, pageParam, pageSize).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForFeedItem(String communityId, String feedItemId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterLikePage`

`likeFeedItem(communityId, feedItemId)`

Like a feed item for the context user.

API Version

28.0–31.0

Important: In version 32.0 and later, use likeFeedElement(communityId, feedElementId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLike likeFeedItem(String communityId, String feedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

Return Value

Type: `ConnectApi.ChatterLike`

If the context user already liked the feed item, this method is a non-operation and returns the existing like.

postComment(communityId, feedItemId, text)

Post a plain-text comment to a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use postCommentToFeedElement(communityId, feedElementId, text).

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment postComment(String communityId, String feedItemId,
String text)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

text
Type: String

The text of the comment. Mentions are downgraded to plain text. To include a mention that links to a user, call `postComment(communityId, feedItemId, comment, feedItemFileUpload)` and pass the mention in a `ConnectApi.CommentInput` object.

Return Value

Type: `ConnectApi.Comment`

Usage

If hashtags or links are detected in *text*, they're included in the comment as hashtag and link segments. Mentions aren't detected in *text* and aren't separated out of the text.

Feed items and comments can contain up to 10,000 characters.

postComment(communityId, feedItemId, comment, feedItemFileUpload)

Post a rich-text comment to a feed item. Use this method to include mentions and to attach a file to a comment.

API Version

28.0–31.0

Important: In version 32.0 and later, use postCommentToFeedElement(communityId, feedElementId, comment, feedElementFileUpload).

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment postComment(String communityId, String feedItemId,
ConnectApi.CommentInput comment, ConnectApi.BinaryInput feedItemFileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

comment
Type: `ConnectApi.CommentInput`

In the `CommentInput` object, specify rich text, including @mentions. Optionally, in the `CommentInput.attachment` property, specify an existing file or a new file

feedItemFileUpload
Type: `ConnectApi.BinaryInput`

If you specify a `NewFileAttachmentInput` object in the `CommentInput.attachment` property, specify the new binary file to attach in this argument. Otherwise, do not specify a value.

Return Value

Type: `ConnectApi.Comment`

Usage

Feed items and comments can contain up to 10,000 characters.

Sample: Posting a Comment with a New File Attachment

To post a comment and upload and attach a new file to the comment, create a `ConnectApi.CommentInput` object and a `ConnectApi.BinaryInput` object to pass to the `ConnectApi.ChatterFeeds.postComment` method.

```
String communityId = null;
String feedItemId = '0D5D0000000Kcd1';

ConnectApi.CommentInput input = new ConnectApi.CommentInput();
ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'Comment Text Body';

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageInput.messageSegments.add(textSegment);

input.body = messageInput;

ConnectApi.NewFileAttachmentInput attachmentInput = new ConnectApi.NewFileAttachmentInput();
attachmentInput.description = 'The description of the file';
attachmentInput.title = 'contentFile.txt';
input.attachment = attachmentInput;

String fileContents = 'This is the content of the file.';
Blob fileBlob = Blob.valueOf(fileContents);
ConnectApi.BinaryInput binaryInput = new ConnectApi.BinaryInput(fileBlob, 'text/plain',
'contentFile.txt');

ConnectApi.Comment commentRep = ConnectApi.ChatterFeeds.postComment(communityId, feedItemId,
 input, binaryInput);
```

`postFeedElement(communityId, feedElement, feedElementFileUpload)`

Post a rich-text feed element. Include mentions and hashtag topics, attach a file to a feed element, and associate action link groups with a feed element. You can also use this method to share a feed element and add a comment.

API Version

31.0–35.0

Important: In version 36.0 and later, this method is no longer available because you can't create a feed post and upload a binary file in the same call. Upload files to Salesforce first, and then use `postFeedElement(communityId, feedElement)` to create the feed post and attach the files.

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement postFeedElement(String communityId,
ConnectApi.FeedElementInput feedElement, ConnectApi.BinaryInput feedElementFileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElement
Type: `ConnectApi.FeedElementInput`

Specify rich text, including mentions. Optionally, specify a link, a poll, an existing file, or a new file.

feedElementFileUpload
Type: `ConnectApi.BinaryInput`

Specify the new binary file to attach to the post only if you also specify a `NewFileAttachmentInput` object in the *feedElement* parameter. Otherwise, pass `null`.

Return Value

Type: `ConnectApi.FeedElement`

Example for Posting a Feed Element with a New (Binary) File

```
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.subjectId = 'me';

ConnectApi.ContentCapabilityInput contentInput = new ConnectApi.ContentCapabilityInput();
contentInput.title = 'Title';

ConnectApi.FeedElementCapabilitiesInput capabilities = new
ConnectApi.FeedElementCapabilitiesInput();
capabilities.content = contentInput;

input.capabilities = capabilities;

String text = 'These are the contents of the new file.';
Blob myBlob = Blob.valueOf(text);
ConnectApi.BinaryInput binInput = new ConnectApi.BinaryInput(myBlob, 'text/plain',
'fileName');

ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), input, binInput);
```

postFeedItem(communityId, feedType, subjectId, text)

Post a plain-text feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use postFeedElement(communityId, subjectId, feedElementType, text).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem postFeedItem(String communityId, ConnectApi.FeedType feedType, String subjectId, String text)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

One of the following:

- `News`
- `Record`
- `UserProfile`

Use `Record` to post to a group.

subjectId
Type: String

The value depends on the *feedType*:

- `News`—ID of the context user or the keyword `me`.
- `Record`—ID of any record with a feed, including groups.
- `UserProfile`—ID of any user.

text
Type: String

Text of the feed item. Mentions are downgraded to plain text. To include a mention that links to the user, call the `postFeedItem(communityId, feedType, subjectId, feedItemInput, feedItemFileUpload)` method and pass the mention in a `ConnectApi.FeedItemInput` object.

Return Value

Type: `ConnectApi.FeedItem`

Note: Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that `ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information may not be available in the trigger.

Usage

Feed items and comments can contain up to 10,000 characters.

Posts to `ConnectApi.FeedType.UserProfile` in API versions 23.0 and 24.0 created user status updates, not feed items. For posts to the User Profile Feed in those API versions, the character limit is 1,000 characters.

`postFeedItem(communityId, feedType, subjectId, feedItemInput, feedItemFileUpload)`

Post a rich-text feed item to a feed. Use this method to include mentions and hashtag topics and to attach a file to a feed item. You can also use this method to share a feed item and add a comment.

API Version

28.0–31.0

Important: In version 32.0 and later, use postFeedElement(communityId, feedElement, feedElementFileUpload).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem postFeedItem(String communityId, ConnectApi.FeedType
feedType, String subjectId, ConnectApi.FeedItemInput feedItemInput,
ConnectApi.BinaryInput feedItemFileUpload)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

One of the following:

- `News`
- `Record`
- `UserProfile`

To post a feed item to a group, use `Record` and use a group ID as the *`subjectId`*.

`subjectId`
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

`feedItemInput`
Type: `ConnectApi.FeedItemInput`

In the `FeedItemInput` object, specify rich text. Optionally, in the `FeedItemInput.attachment` property, specify a link, a poll, an existing file, or a new file.

`feedItemFileUpload`
Type: `ConnectApi.BinaryInput`

If you specify a `NewFileAttachmentInput` object in the `FeedItemInput.attachment` property, specify the new binary file to attach in this argument. Otherwise, do not specify a value.

Return Value

Type: `ConnectApi.FeedItem`

Note: Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that `ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information may not be available in the trigger.

Usage

Feed items and comments can contain up to 10,000 characters. Posts to `ConnectApi.FeedType.UserProfile` in API versions 23.0 and 24.0 created user status updates, not feed items. For posts to the User Profile Feed in those API versions, the character limit is 1,000 characters.

Example for Sharing a Feed Item and Adding a Comment

To share a feed item and add a comment, create a `ConnectApi.FeedItemInput` object containing the comment and the feed item to share. Then pass the object to `ConnectApi.ChatterFeeds.postFeeditem` in the *`feedItemInput`* argument. The message segments in the message body input are used as the comment.

```
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.originalFeedItemId = '0D5D0000000JuAG';

ConnectApi.MessageBodyInput body = new ConnectApi.MessageBodyInput();
List<ConnectApi.MessageSegmentInput> segmentList = new
List<ConnectApi.MessageSegmentInput>();
ConnectApi.TextSegmentInput textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'I hope you enjoy this post I found in another group.';
segmentList.add((ConnectApi.MessageSegmentInput)textSegment);
body.messageSegments = segmentList;
input.body = body;

ConnectApi.ChatterFeeds.postFeedItem(null, ConnectApi.FeedType.UserProfile, 'me', input,
null);
```

Example for Posting a Mention to a User Profile Feed

To post to a user profile feed and include an @mention, call the `ConnectApi.ChatterFeeds.postFeedItem` method.

```
String communityId = null;
ConnectApi.FeedType feedType = ConnectApi.FeedType.UserProfile;

ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;
```

```
ConnectApi.MentionSegmentInput mentionSegment = new ConnectApi.MentionSegmentInput();

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'Hey there ';
messageInput.messageSegments.add(textSegment);

mentionSegment.id = '005D0000001LLO1';
messageInput.messageSegments.add(mentionSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = '. How are you?';
messageInput.messageSegments.add(textSegment);

input.body = messageInput;

ConnectApi.FeedItem feedItemRep = ConnectApi.ChatterFeeds.postFeedItem(communityId, feedType,
 'me', input, null);
```

`searchFeedItems(communityId, q)`

Get the feed items that match the search criteria.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElements(communityId, q).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItems(String communityId, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItems(communityId, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedItems(communityId, q, sortParam)`

Get the sorted feed items that match the search criteria.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElements(communityId, q, sortParam).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItems(String communityId, String q,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q

Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

`searchFeedItems(communityId, q, pageParam, pageSize)`

Get a page of feed items that match the search criteria.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElements(communityId, q, pageParam, pageSize).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItems(String communityId, String q,
String pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`searchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

Get a page of sorted feed items from the `Company`, `Home`, and `Moderation` feeds that match the search criteria. Each feed item includes no more than the specified number of comments.

API Version

29.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`searchFeedItemsInFeed(communityId, feedType, subjectId, q)`

Get the feed items from a feed that match the search criteria.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFeed(communityId, feedType, subjectId, q).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String q)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

`subjectId`
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If feed type is `UserProfile`, *`subjectId`* can be any user ID. If *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

`q`
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

`subjectId`
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Order of feed items in the feed.

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

`q`
Type: String

Search term. Searches keywords in the user or group name. A minimum of one character is required. This parameter doesn't support wildcards. This parameter is required.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`searchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly)`

Get a page of sorted feed items from a feed for a user or record that match the search criteria. Each feed item includes no more than the specified number of comments. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.

API Version

30.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.

- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

`q`
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Apex Developer Guide: Testing ConnectApi Code

searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items that match the search criteria from a feed filtered by a key prefix for a user.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFilterFeed(String communityId,
String subjectId, String keyPrefix, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, pageParam, pageSize, sortParam, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

Get a page of sorted feed items that match the search criteria from a feed filtered by a key prefix for a user. Each feed item includes no more than the specified number of comments.

API Version

29.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFilterFeed(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Apex Developer Guide: Testing ConnectApi Code

`shareFeedElement(communityId, subjectId, feedElementType, originalFeedElementId)`

Share the *`originalFeedElementId`* as the context user.

API Version

31.0–38.0

Important: In version 39.0 and later, use `postFeedElement(communityId, feedElement)` or `updateFeedElement(communityId, feedElementId, feedElement)` with the `ConnectApi.FeedEntityShareCapabilityInput` to share a feed entity with a feed element.

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement shareFeedElement(String communityId, String
subjectId, ConnectApi.FeedElementType feedElementType, String originalFeedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

The ID of the user or group with whom to share the feed element.

feedElementType
Type: `ConnectApi.FeedElementType`

Values are:

- `Bundle`—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values.
- `FeedItem`—A feed item has a single parent and is scoped to oneExperience Cloud site or across all Experience Cloud sites. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values.
- `Recommendation`—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user.

originalFeedElementId
Type: String

The ID of the feed element to share.

Return Value

Type: `ConnectApi.FeedElement`

Example

```
ConnectApi.ChatterFeeds.shareFeedElement(null, '0F9RR0000004CPw',
ConnectApi.FeedElementType.FeedItem, '0D5RR0000004Gxc');
```

shareFeedItem(communityId, feedType, subjectId, originalFeedItemId)

Share the *originalFeedItemId* to the feed specified by the *feedType*.

API Version

28.0–31.0

Important:

- In version 32.0–38.0, use `shareFeedElement(communityId, subjectId, feedElementType, originalFeedElementId)`.

- In version 39.0 and later, use `postFeedElement(communityId, feedElement)` or `updateFeedElement(communityId, feedElementId, feedElement)` with the `ConnectApi.FeedEntityShareCapabilityInput`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem shareFeedItem(String communityId, ConnectApi.FeedType feedType, String subjectId, String originalFeedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

One of the following:

- `News`
- `Record`
- `UserProfile`

To share a feed item with a group, use `Record` and use a group ID as the *subjectId*.

subjectId
Type: String

The value depends on the value of *feedType*:

- `News`—*subjectId* must be the ID of the context user or the keyword `me`.
- `Record`—*subjectId* can be a group ID or the ID of the context user (or `me`).
- `UserProfile`—*subjectId* can be any user ID.

originalFeedItemId
Type: String

The ID of the feed item to share.

Return Value

Type: `ConnectApi.FeedItem`

Example

To share a feed item with a group, pass in the Experience Cloud site ID (or `null`), the feed type `Record`, the group ID, and the ID of the feed item to share.

```
ConnectApi.ChatterFeeds.shareFeedItem(null, ConnectApi.FeedType.Record, '0F9D00000000izf',
 '0D5D0000000JuAG');
```

updateBookmark(communityId, feedItemId, isBookmarkedByCurrentUser)

Bookmark a feed item or remove a bookmark from a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use updateFeedElementBookmarks(communityId, feedElementId, bookmarks) or updateFeedElementBookmarks(communityId, feedElementId, isBookmarkedByCurrentUser).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem updateBookmark(String communityId, String feedItemId,
Boolean isBookmarkedByCurrentUser)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

isBookmarkedByCurrentUser
Type: Boolean

—Specifying `true` adds the feed item to the list of bookmarks for the context user. Specify `false` to remove a bookmark.

Return Value

Type: `ConnectApi.FeedItem`

voteOnFeedPoll(communityId, feedItemId, myChoiceId)

Vote or change your vote on a feed poll.

API Version

28.0–31.0

Important: In version 32.0 and later, use voteOnFeedElementPoll(communityId, feedElementId, myChoiceId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedPoll voteOnFeedPoll(String communityId, String feedItemId,
String myChoiceId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID of the feed item that is associated with the poll.

myChoiceId
Type: String

ID of the item in the poll you're voting for.

Return Value

Type: `ConnectApi.FeedPoll`

setTestGetFeedItemsFromFeed(communityId, feedType, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType
feedType, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsFromFeed(communityId, feedType)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)

API Version

29.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `getFeedItemsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFilterFeed(String communityId, String subjectId, String keyPrefix, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `getFeedItemsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFilterFeed(String communityId, String subjectId, String keyPrefix, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

- getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam)
- *Apex Developer Guide*: Testing ConnectApi Code

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `getFeedItemsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version

29.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFilterFeed(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.

- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

`result`
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, updatedSince, result)`

Register a `ConnectApi.FeedItemPage` object to be returned when the `getFeedItemsFromFilterFeedUpdatedSince` method is called in a test context.

API Version

30.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFilterFeedUpdatedSince(String communityId,
String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity
density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String
updatedSince, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

`updatedSince`
Type: String

Opaque token containing information about the last modified date of the feed. Do not construct this token. To retrieve this token, call `getFeedItemsFromFilterFeed` and take the value from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

`result`
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, updatedSince)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedItemsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, ConnectApi.FeedItemPage, results)`

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

30.0–31.0

Signature

```
public static Void setTestGetFeedItemsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedItemPage results)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`updatedSince`
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

`result`
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

30.0–31.0

Signature

```
public static Void setTestGetFeedItemsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

One of these values:

- `Files`
- `Groups`
- `News`
- `People`
- `Record`

subjectId
Type: String

If *feedType* is `ConnectApi.Record`, *subjectId* can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

30.0–31.0

Signature

```
public static Void setTestGetFeedItemsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
Boolean showInternalOnly, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

One of these values:

- `Files`
- `Groups`
- `News`
- `People`
- `Record`

subjectId
Type: String

If *feedType* is `ConnectApi.Record`, *subjectId* can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedItems(communityId, q, result)

Register a test feed item page to be returned when `searchFeedItems(communityId, q)` is called during a test.

API Version

28.0–31.0

Signature

```
public static Void searchFeedItems(String communityId, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedItems(communityId, q)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedItems(communityId, q, sortParam, result)

Register a test feed item page to be returned when `searchFeedItems(String, String, ConnectApi.FeedSortOrder)` is called during a test.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItems(String communityId, String q, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

The feed item test page.

Return Value

Type: Void

SEE ALSO:

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

setTestSearchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

q
Type: String

Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: ConnectApi.FeedItemPage

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedItemsInFeed(communityId, feedType, subjectId, q)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId

Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

pageParam

Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

q
Type: String

Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: ConnectApi.FeedItemPage

Object containing test data.

Return Value

Type: Void

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a ConnectApi.FeedItemPage object to be returned when the matching ConnectApi.searchFeedItemsInFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType
feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q,
ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result

Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly, ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFilterFeed(String communityId, String subjectId, String keyPrefix, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedItemPage`

Specify the test feed item page.

Return Value

Type: Void

SEE ALSO:

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFilterFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String keyPrefix, String pageParam,
Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage
result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedItemPage`

Specify the test feed item page.

Return Value

Apex Developer Guide: Testing ConnectApi Code

ChatterGroups Class

Information about groups, such as the group's members, photo, and the groups the specified user is a member of. Add members to a group, remove members, and change the group photo.

Namespace

ConnectApi

ChatterGroups Methods

The following are methods for `ChatterGroups`. All methods are static.

IN THIS SECTION:

addMember(communityId, groupId, userId)
Add a user to a group as a standard member.

addMemberWithRole(communityId, groupId, userId, role)
Add a user with a role to a group.

addRecord(communityId, groupId, recordId)
Associate a record with a group.

createGroup(communityId, groupInput)
Create a group.

deleteBannerPhoto(communityId, groupId)
Delete the group banner photo.

deleteGroup(communityId, groupId)
Delete a group.

deleteMember(communityId, membershipId)
Remove a member from a group.

deletePhoto(communityId, groupId)
Delete the group photo.

getAnnouncements(communityId, groupId)
Get the first page of announcements in a group.

getAnnouncements(communityId, groupId, pageParam, pageSize)
Get a page of announcements in a group.

getBannerPhoto(communityId, groupId)
Get the group banner photo.

getGroup(communityId, groupId)
Get information about a group.

getGroupBatch(communityId, groupIds)
Get information about a list of groups.

getGroupMembershipRequest(communityId, requestId)
Get information about a request to join a private group.

getGroupMembershipRequests(communityId, groupId)
Get information about every request to join a private group.

getGroupMembershipRequests(communityId, groupId, status)
Get information about every request to join a private group that has a specified status.

getGroups(communityId)
Get the first page of groups.

getGroups(communityId, pageParam, pageSize)
Get a page of groups.

getGroups(communityId, pageParam, pageSize, archiveStatus)
Get a page of groups with an archive status.

getMember(communityId, membershipId)
Get information about a group member.

getMembers(communityId, groupId)
Get the first page of information about the members of a group.

getMembers(communityId, groupId, pageParam, pageSize)
Get a page of information about the members of a group.

getMembershipBatch(communityId, membershipIds)
Get information about a list of group memberships.

getMyChatterSettings(communityId, groupId)
Get the context user's Chatter settings for a group.

getPhoto(communityId, groupId)
Get the photo for a group.

getRecord(communityId, groupRecordId)
Get a record associated with a group.

getRecords(communityId, groupId)
Get the first page of records associated with a group.

getRecords(communityId, groupId, pageParam, pageSize)
Get a page of records associated with a group.

inviteUsers(groupId, invite)
Invite internal and external users to join a group.

postAnnouncement(communityId, groupId, announcement)
Post an announcement to a group.

removeRecord(communityId, groupRecordId)
Remove the association of a record with a group.

requestGroupMembership(communityId, groupId)
Request membership in a private group.

searchGroups(communityId, q)
Get the first page of groups that match the search criteria.

searchGroups(communityId, q, pageParam, pageSize)
Get a page of groups that match the search criteria.

searchGroups(communityId, q, archiveStatus, pageParam, pageSize)
Get a page of groups with the archive status that match the search criteria.

setBannerPhoto(communityId, groupId, fileId, versionNumber)
Set an uploaded file as the group banner photo.

setBannerPhoto(communityId, groupId, fileUpload)
Set a file that hasn't been uploaded as the group banner photo.

setBannerPhotoWithAttributes(communityId, groupId, bannerPhoto)
Set and crop an uploaded file as the group banner photo.

setBannerPhotoWithAttributes(communityId, groupId, bannerPhoto, fileUpload)
Set and crop a file that hasn't been uploaded as the group banner photo.

setPhoto(communityId, groupId, fileId, versionNumber)
Set an uploaded file as the group photo.

setPhoto(communityId, groupId, fileUpload)
Set a file that hasn't been uploaded as the group photo.

setPhotoWithAttributes(communityId, groupId, photo)
Set and crop an uploaded file as the group photo.

setPhotoWithAttributes(communityId, groupId, photo, fileUpload)
Set and crop a file that hasn't been uploaded as the group photo.

updateGroup(communityId, groupId, groupInput)
Update the settings of a group.

updateGroupMember(communityId, membershipId, role)
Update the role of a group member.

updateMyChatterSettings(communityId, groupId, emailFrequency)
Update the context user's email frequency for a group.

updateRequestStatus(communityId, requestId, status)
Update a request to join a private group.

updateRequestStatus(communityId, requestId, status, responseMessage)
Update a request to join a private group and optionally provide a message when the request is denied.

`addMember(communityId, groupId, userId)`

Add a user to a group as a standard member.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMember addMember(String communityId, String groupId,
String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.GroupMember`

Usage

To execute this method, the context user must be the group owner or moderator.

addMemberWithRole(communityId, groupId, userId, role)

Add a user with a role to a group.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMember addMemberWithRole(String communityId, String
groupId, String userId, ConnectApi.GroupMembershipType role)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

userId
Type: String

ID for a user.

role
Type: ConnectApi.GroupMembershipType

The group membership type. One of these values:

- GroupManager
- StandardMember

Return Value

Type: ConnectApi.GroupMember

Usage

To execute this method, the context user must be the group owner or moderator.

addRecord(communityId, groupId, recordId)

Associate a record with a group.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupRecord addRecord(String communityId, String groupId,
String recordId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, internal, or null.

groupId
Type: String

ID of the group with which to associate the record.

recordId
Type: String

ID of the record to associate with the group.

Return Value

Type: ConnectApi.GroupRecord

createGroup(communityId, groupInput)

Create a group.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupDetail createGroup(String, communityId,
ConnectApi.ChatterGroupInput groupInput)
```

Parameters

communityId
Type: String,

ID for an Experience Cloud site, `internal`, or `null`.

groupInput
Type: `ConnectApi.ChatterGroupInput`

The properties of the group.

Return Value

Type: `ConnectApi.ChatterGroupDetail`

deleteBannerPhoto(communityId, groupId)

Delete the group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void deleteBannerPhoto(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID of the group.

Return Value

Type: Void

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

deleteGroup(communityId, groupId)

Delete a group.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static Void deleteGroup(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: Void

deleteMember(communityId, membershipId)

Remove a member from a group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static Void deleteMember(String communityId, String membershipId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

membershipId
Type: String

ID for a membership.

Return Value

Type: Void

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

`deletePhoto(communityId, groupId)`

Delete the group photo.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static Void deletePhoto(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: Void

Usage

This method is only successful when the context user is the group manager or owner, or has Modify All Data permission.

getAnnouncements(communityId, groupId)

Get the first page of announcements in a group.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.AnnouncementPage getAnnouncements(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: `ConnectApi.AnnouncementPage`

Usage

To post an announcement, get information about an announcement, update the expiration date of an announcement, or delete an announcement, use the methods of the `ConnectApi.Announcements` class.

getAnnouncements(communityId, groupId, pageParam, pageSize)

Get a page of announcements in a group.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.AnnouncementPage getAnnouncements(String communityId, String groupId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.AnnouncementPage`

Usage

To post an announcement, get information about an announcement, update the expiration date of an announcement, or delete an announcement, use the methods of the `ConnectApi.Announcements` class.

`getBannerPhoto(communityId, groupId)`

Get the group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto getBannerPhoto(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

The ID of the group.

Return Value

Type: `ConnectApi.BannerPhoto`

getGroup(communityId, groupId)

Get information about a group.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupDetail getGroup(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: `ConnectApi.ChatterGroupDetail`

getGroupBatch(communityId, groupIds)

Get information about a list of groups.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getGroupBatch(String communityId, List<String>
groupIds)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupIds
Type: List<String>

A list of up to 500 group IDs.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.ChatterGroup` object and errors embedded in the results for groups that didn't load.

Example

```
// Create a list of groups.
ConnectApi.ChatterGroupPage groupPage = ConnectApi.ChatterGroups.getGroups(null);

// Create a list of group IDs.
List<String> groupIds = new List<String>();
for (ConnectApi.ChatterGroup aGroup : groupPage.groups){
    groupIds.add(aGroup.id);
}

// Get info about all the groups in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterGroups.getGroupBatch(null,
groupIds);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the number of members in each group.
        ConnectApi.ChatterGroup aGroup;
        if(batchResult.getResult() instanceof ConnectApi.ChatterGroup) {
           aGroup = (ConnectApi.ChatterGroup) batchResult.getResult();
        }
```

```
        System.debug('SUCCESS');
        System.debug(aGroup.memberCount);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

SEE ALSO:

getMembershipBatch(communityId, membershipIds)

`getGroupMembershipRequest(communityId, requestId)`

Get information about a request to join a private group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequest getGroupMembershipRequest(String
communityId, String requestId)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

requestId

Type: String

The ID of a request to join a private group.

Return Value

Type: `ConnectApi.GroupMembershipRequest`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

getGroupMembershipRequests(communityId, groupId)

Get information about every request to join a private group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequests getGroupMembershipRequests(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: `ConnectApi.GroupMembershipRequests`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

getGroupMembershipRequests(communityId, groupId, status)

Get information about every request to join a private group that has a specified status.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequests getGroupMembershipRequests(String communityId, String groupId, ConnectApi.GroupMembershipRequestStatus status)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

status
Type: `ConnectApi.GroupMembershipRequestStatus`

status—Status of a request to join a private group.

- `Accepted`
- `Declined`
- `Pending`

Return Value

Type: `ConnectApi.GroupMembershipRequests`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

`getGroups(communityId)`

Get the first page of groups.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage getGroups(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.ChatterGroupPage`

getGroups(communityId, pageParam, pageSize)

Get a page of groups.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage getGroups(String communityId, Integer
pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterGroupPage`

getGroups(communityId, pageParam, pageSize, archiveStatus)

Get a page of groups with an archive status.

API Version

29.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage getGroups(String communityId, Integer
pageParam, Integer pageSize, ConnectApi.GroupArchiveStatus archiveStatus)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

archiveStatus
Type: `ConnectApi.GroupArchiveStatus`

Archive status of groups.

- `All`—All groups, including groups that are archived and groups that aren't archived.
- `Archived`—Groups that are archived.
- `NotArchived`—Groups that aren't archived.

If you pass in `null`, the default value is `All`.

Return Value

Type: `ConnectApi.ChatterGroupPage`

`getMember(communityId, membershipId)`

Get information about a group member.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMember getMember(String communityId, String membershipId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

membershipId
Type: String

ID for a membership.

Return Value

Type: `ConnectApi.GroupMember`

`getMembers(communityId, groupId)`

Get the first page of information about the members of a group.

API Version

28.0

Available to Guest Users

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMemberPage getMembers(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: `ConnectApi.GroupMemberPage`

getMembers(communityId, groupId, pageParam, pageSize)

Get a page of information about the members of a group.

API Version

28.0

Available to Guest Users

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMemberPage getMembers(String communityId, String groupId,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.GroupMemberPage`

getMembershipBatch(communityId, membershipIds)

Get information about a list of group memberships.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getMembershipBatch(String communityId,
List<String> membershipIds)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

membershipIds
Type: List<String>

A list of up to 500 group membership IDs.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.GroupMember` object and errors embedded in the results for group memberships that didn't load.

Example

```
// Get members of a group.
ConnectApi.GroupMemberPage membersPage = ConnectApi.ChatterGroups.getMembers(null,
'0F9D00000000oOT');

// Create a list of membership IDs.
List<String> membersList = new List<String>();
for (ConnectApi.GroupMember groupMember : membersPage.members){
    membersList.add(groupMember.id);
}

// Get info about all group memberships in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterGroups.getMembershipBatch(null,
 membersList);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the first name of each member.
        ConnectApi.GroupMember groupMember;
        if(batchResult.getResult() instanceof ConnectApi.GroupMember) {
            groupMember = (ConnectApi.GroupMember) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(groupMember.user.firstName);
    }
```

```
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

SEE ALSO:

getGroupBatch(communityId, groupIds)

getMyChatterSettings(communityId, groupId)

Get the context user's Chatter settings for a group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupChatterSettings getMyChatterSettings(String communityId,
String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: `ConnectApi.GroupChatterSettings`

getPhoto(communityId, groupId)

Get the photo for a group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo getPhoto(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: `ConnectApi.Photo`

getRecord(communityId, groupRecordId)

Get a record associated with a group.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupRecord getRecord(String communityId, String groupRecordId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupRecordId
Type: String

ID of the group record.

Return Value

Type: `ConnectApi.GroupRecord`

`getRecords(communityId, groupId)`

Get the first page of records associated with a group.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupRecordPage getRecords(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: `ConnectApi.GroupRecordPage`

`getRecords(communityId, groupId, pageParam, pageSize)`

Get a page of records associated with a group.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupRecordPage getRecords(String communityId, String groupId,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.GroupRecordPage`

`inviteUsers(groupId, invite)`

Invite internal and external users to join a group.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Invitations inviteUsers(String groupId, ConnectApi.InviteInput
invite)
```

Parameters

groupId
Type: String

ID of the group.

invite
Type: `ConnectApi.InviteInput`

A `ConnectApi.InviteInput` body.

Return Value

Type: `ConnectApi.Invitations`

postAnnouncement(communityId, groupId, announcement)

Post an announcement to a group.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Announcement postAnnouncement(String communityId, String groupId, ConnectApi.AnnouncementInput announcement)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

announcement
Type: `ConnectApi.AnnouncementInput`

A `ConnectApi.AnnouncementInput` object.

Return Value

Type: `ConnectApi.Announcement`

Usage

Use an announcement to highlight information. Users can discuss, like, and post comments on announcements. Deleting the feed post deletes the announcement.

To post an announcement, get information about an announcement, update the expiration date of an announcement, or delete an announcement, use the methods of the `ConnectApi.Announcements` class.

removeRecord(communityId, groupRecordId)

Remove the association of a record with a group.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static Void removeRecord(String communityId, String groupRecordId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupRecordId
Type: String

ID of the group record.

Return Value

Type: Void

requestGroupMembership(communityId, groupId)

Request membership in a private group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequest requestGroupMembership(String
communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: ConnectApi.GroupMembershipRequest

Sample: Requesting to Join a Private Group

This sample code calls `ConnectApi.ChatterGroups.requestGroupMembership` to request to join a private group.

```
String communityId = null;
ID groupId = '0F9x00000000hAZ';

ConnectApi.GroupMembershipRequest membershipRequest =
ConnectApi.ChatterGroups.requestGroupMembership(communityId, groupId);
```

searchGroups(communityId, q)

Get the first page of groups that match the search criteria.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage searchGroups(String communityId, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

Return Value

Type: ConnectApi.ChatterGroupPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchGroups(communityId, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchGroups(communityId, q, pageParam, pageSize)`

Get a page of groups that match the search criteria.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage searchGroups(String communityId, String q,
Integer pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`q`
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterGroupPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchGroups(communityId, q, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

`searchGroups(communityId, q, archiveStatus, pageParam, pageSize)`

Get a page of groups with the archive status that match the search criteria.

API Version

29.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage searchGroups(String communityId, String q,
ConnectApi.GroupArchiveStatus archiveStatus, Integer pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`q`
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

`archiveStatus`
Type: `ConnectApi.GroupArchiveStatus`

Archive status of groups.

- `All`—All groups, including groups that are archived and groups that aren't archived.
- `Archived`—Groups that are archived.

- `NotArchived`—Groups that aren't archived.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterGroupPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchGroups(communityId, q, archiveStatus, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

`setBannerPhoto(communityId, groupId, fileId, versionNumber)`

Set an uploaded file as the group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String groupId,
String fileId, Integer versionNumber)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`groupId`
Type: String

The ID of the group.

fileId
Type: String

The ID of the already uploaded file. The key prefix must be 069, and the image must be smaller than 8 MB.

versionNumber
Type: Integer

Version number of the existing file. Specify either an existing version number or, to get the latest version, specify `null`.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

setBannerPhoto(communityId, groupId, fileUpload)

Set a file that hasn't been uploaded as the group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String groupId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

The ID of the group.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.BannerPhoto

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

setBannerPhotoWithAttributes(communityId, groupId, bannerPhoto)

Set and crop an uploaded file as the group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,
String groupId, ConnectApi.BannerPhotoInput bannerPhoto)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

The ID of the group.

bannerPhoto
Type: ConnectApi.BannerPhotoInput

A `ConnectApi.BannerPhotoInput` object that specifies the ID and version of the file, and how to crop the file.

Return Value

Type: ConnectApi.BannerPhoto

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

setBannerPhotoWithAttributes(communityId, groupId, bannerPhoto, fileUpload)

Set and crop a file that hasn't been uploaded as the group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,
String groupId, ConnectApi.BannerPhotoInput bannerPhoto, ConnectApi.BinaryInput
fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

The ID of the group.

bannerPhoto
Type: `ConnectApi.BannerPhotoInput`

A `ConnectApi.BannerPhotoInput` object specifying the cropping parameters.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

setPhoto(communityId, groupId, fileId, versionNumber)

Set an uploaded file as the group photo.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String groupId, String
fileId, Integer versionNumber)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

fileId
Type: String

ID of a file already uploaded. The key prefix must be 069, and the file must be an image that is smaller than 2 GB.

versionNumber
Type: Integer

Version number of the existing file. Specify either an existing version number or, to get the latest version, specify `null`.

Return Value

Type: `ConnectApi.Photo`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

Sample: Updating a Group Photo with an Existing File

When a group is created, it doesn't have a group photo. You can set an existing photo that has already been uploaded to Salesforce as the group photo. The key prefix must be 069 and the file size must be less than 2 GB.

```
String communityId = null;
ID groupId = '0F9x00000000hAK';
ID fileId = '069x00000001Ion';

// Set photo
ConnectApi.Photo photo = ConnectApi.ChatterGroups.setPhoto(communityId, groupId, fileId,
null);
```

setPhoto(communityId, groupId, fileUpload)

Set a file that hasn't been uploaded as the group photo.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String groupId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

Sample: Uploading a New File and Using It as a Group Photo

When a group is created, it doesn't have a group photo. You can upload a photo and set it as the group photo.

```
String communityId = null;
ID groupId = '0F9x00000000hAP';
ID photoId = '069x00000001Ioo';

// Set photo
List<ContentVersion> groupPhoto = [Select c.VersionData From ContentVersion c where
ContentDocumentId=:photoId];
ConnectApi.BinaryInput binary = new ConnectApi.BinaryInput(groupPhoto.get(0).VersionData,
```

```
 'image/png', 'image.png');
ConnectApi.Photo photo = ConnectApi.ChatterGroups.setPhoto(communityId, groupId, binary);
```

setPhotoWithAttributes(communityId, groupId, photo)

Set and crop an uploaded file as the group photo.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String groupId,
ConnectApi.PhotoInput photo)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object that specifies the ID and version of the file, and how to crop the file.

Return Value

Type: `ConnectApi.Photo`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

setPhotoWithAttributes(communityId, groupId, photo, fileUpload)

Set and crop a file that hasn't been uploaded as the group photo.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String groupId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object that specifies how to crop the file specified in *`fileUpload`*.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

`updateGroup(communityId, groupId, groupInput)`

Update the settings of a group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroup updateGroup(String communityId, String groupId,
ConnectApi.ChatterGroupInput groupInput)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

groupInput
Type: `ConnectApi.ChatterGroupInput`

A `ConnectApi.ChatterGroupInput` object.

Return Value

Type: `ConnectApi.ChatterGroup`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission. Use this method to update any settings in the `ConnectApi.ChatterGroupInput` class. These settings include the group title and text in the "Information" section, whether the group is public or private, and whether the group is archived.

Example

This example archives a group.

```
String groupId = '0F9D00000000qSz';
String communityId = null;

ConnectApi.ChatterGroupInput groupInput = new ConnectApi.ChatterGroupInput();
groupInput.isArchived = true;

ConnectApi.ChatterGroups.updateGroup(communityId, groupId, groupInput);
```

updateGroupMember(communityId, membershipId, role)

Update the role of a group member.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroup updateGroupMember(String communityId, String
membershipId, ConnectApi.GroupMembershipType role)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

membershipId
Type: String

ID for a membership.

role
Type: `ConnectApi.GroupMembershipType`

The group membership type. One of these values:

- `GroupManager`
- `StandardMember`

Return Value

Type: `ConnectApi.ChatterGroup`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

updateMyChatterSettings(communityId, groupId, emailFrequency)

Update the context user's email frequency for a group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupChatterSettings updateMyChatterSettings(String communityId,
String groupId, ConnectApi.GroupEmailFrequency emailFrequency)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

emailFrequency
Type: `ConnectApi.GroupEmailFrequency`

Frequency with which a user receives email.

- `EachPost`
- `DailyDigest`
- `WeeklyDigest`
- `Never`
- `UseDefault`

The value `UseDefault` uses the value set in a call to `updateChatterSettings(communityId, userId, defaultGroupEmailFrequency)`.

Return Value

Type: `ConnectApi.GroupChatterSettings`

updateRequestStatus(communityId, requestId, status)

Update a request to join a private group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequest updateRequestStatus(String communityId,
String requestId, ConnectApi.GroupMembershipRequestStatus status)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

requestId
Type: String

ID for a request to join a private group.

status
Type: `ConnectApi.GroupMembershipRequestStatus`

Status of the request:

- `Accepted`
- `Declined`

The `Pending` value of the enum is not valid in this method.

Return Value

Type: `ConnectApi.GroupMembershipRequest`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Sample: Accepting or Declining a Request to Join a Private Group

This sample code calls `ConnectApi.ChatterGroups.updateRequestStatus` and passes it the membership request ID and an `ConnectApi.GroupMembershipRequestStatus.Accepted` status. You can also pass `ConnectApi.GroupMembershipRequestStatus.Declined`.

```
String communityId = null;
ID groupId = '0F9x00000000hAZ';
String requestId = '0I5x000000001snCAA';

ConnectApi.GroupMembershipRequest membershipRequestRep =
ConnectApi.ChatterGroups.updateRequestStatus(communityId, requestId,
ConnectApi.GroupMembershipRequestStatus.Accepted);
```

updateRequestStatus(communityId, requestId, status, responseMessage)

Update a request to join a private group and optionally provide a message when the request is denied.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequest updateRequestStatus(String communityId,
String requestId, ConnectApi.GroupMembershipRequestStatus status, String responseMessage)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

requestId
Type: String

ID for a request to join a private group.

status
Type: `ConnectApi.GroupMembershipRequestStatus`

Status of the request:

- `Accepted`
- `Declined`

The `Pending` value of the enum is not valid in this method.

responseMessage
Type: String

Provide a message to the user if their membership request is declined. The value of this property is used only when the value of the `status` property is `Declined`.

The maximum length is 756 characters.

Return Value

Type: `ConnectApi.GroupMembershipRequest`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

ChatterGroups Test Methods

The following are the test methods for `ChatterGroups`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestSearchGroups(communityId, q, result)`

Register a `ConnectApi.ChatterGroupPage` object to be returned when the matching `ConnectApi.searchGroups` method is called in a test context. Use the test method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestSearchGroups(String communityId, String q,
ConnectApi.ChatterGroupPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

result
Type: `ConnectApi.ChatterGroupPage`

Test `ConnectApi.ChatterGroupPage` object.

Return Value

Type: Void

SEE ALSO:

searchGroups(communityId, q)

Apex Developer Guide: Testing ConnectApi Code

`setTestSearchGroups(communityId, q, pageParam, pageSize, result)`

Register a `ConnectApi.ChatterGroupPage` object to be returned when the matching `ConnectApi.searchGroups` method is called in a test context. Use the test method with the same parameters or you receive an exception.

API Version

28.0

Signature

```
public static Void setTestSearchGroups(String communityId, String q, Integer pageParam,
Integer pageSize, ConnectApi.ChatterGroupPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.ChatterGroupPage`

Test `ConnectApi.ChatterGroupPage` object.

Return Value

Type: Void

SEE ALSO:

searchGroups(communityId, q, pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchGroups(communityId, q, archiveStatus, pageParam, pageSize, result)

Register a `ConnectApi.ChatterGroupPage` object to be returned when the matching `ConnectApi.searchGroups` method is called in a test context. Use the test method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestSearchGroups(String communityId, String q,
ConnectApi.GroupArchiveStatus, archiveStatus, Integer pageParam, Integer pageSize,
ConnectApi.ChatterGroupPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

archiveStatus
Type: `ConnectApi.GroupArchiveStatus`

Archive status of groups.

- `All`—All groups, including groups that are archived and groups that aren't archived.
- `Archived`—Groups that are archived.
- `NotArchived`—Groups that aren't archived.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.ChatterGroupPage`

Test `ConnectApi.ChatterGroupPage` object.

Return Value

Type: Void

SEE ALSO:

searchGroups(communityId, q, archiveStatus, pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

ChatterMessages Class

Get, send, search, and reply to private messages. You can also get and search private conversations, mark conversations as read, and get a count of unread private messages.

Namespace

ConnectApi

Usage

Private messages and direct messages are different features. Direct messages are newer and offer a richer feature set for private communication in Experience Cloud sites. Direct messages are a capability within Chatter feeds. To work with direct messages, use the ChatterFeeds Class.

ChatterMessages Methods

The following are methods for `ChatterMessages`. All methods are static.

IN THIS SECTION:

getConversation(conversationId)
Get a conversation.

getConversation(conversationId, pageParam, pageSize)
Get a page of a conversation.

getConversation(communityId, conversationId)
Get a conversation from an Experience Cloud site.

getConversation(communityId, conversationId, pageParam, pageSize)
Get a page of a conversation from an Experience Cloud site.

getConversations()
Get the most recent conversations.

getConversations(pageParam, pageSize)
Get a page of conversations.

getConversations(communityId)
Get the most recent conversations from an Experience Cloud site.

getConversations(communityId, pageParam, pageSize)
Get a page of conversations from an Experience Cloud site.

getMessage(messageId)
Get a message.

getMessage(communityId, messageId)
Get a message from an Experience Cloud site.

getMessages()
Get the most recent messages.

getMessages(pageParam, pageSize)
Get a page of messages.

getMessages(communityId)
Get the most recent messages from an Experience Cloud site.

getMessages(communityId, pageParam, pageSize)
Get a page of messages from an Experience Cloud site.

getUnreadCount()
Get the number of conversations that are marked unread.

getUnreadCount(communityId)
Get the number of conversations that are marked unread in an Experience Cloud site.

markConversationRead(conversationId, read)
Mark a conversation as read or unread.

markConversationRead(communityId, conversationID, read)
Mark a conversation as read or unread in an Experience Cloud site.

replyToMessage(text, inReplyTo)
Reply to a message.

replyToMessage(communityId, text, inReplyTo)
Reply to a message in an Experience Cloud site.

searchConversation(conversationId, q)
Get a conversation that matches the search criteria.

searchConversation(conversationId, pageParam, pageSize, q)
Get a conversation with a page of messages that match the search criteria.

searchConversation(communityId, conversationId, q)
Get a conversation with messages that match the search criteria in an Experience Cloud site.

searchConversation(communityId, conversationId, pageParam, pageSize, q)
Get a conversation with a page of messages that match the search criteria in an Experience Cloud site.

searchConversations(q)
Get conversations in which member names and messages match the search criteria.

searchConversations(pageParam, pageSize, q)
Get a page of conversations in which member names and messages match the search criteria.

searchConversations(communityId, q)
Get conversations in which member names and messages match the search criteria in an Experience Cloud site.

searchConversations(communityId, pageParam, pageSize, q)
Get a page of conversations in which member names and messages match the search criteria in an Experience Cloud site.

searchMessages(q)
Get messages that match the search criteria.

searchMessages(pageParam, pageSize, q)
Get a page of messages that match the search criteria.

searchMessages(communityId, q)
Get messages that match the search criteria in an Experience Cloud site.

searchMessages(communityId, pageParam, pageSize, q)
Get a page of messages that match the search criteria in an Experience Cloud site.

sendMessage(text, recipients)
Send a message to a list of recipients.

sendMessage(communityId, text, recipients)
Send a message to a list of recipients in an Experience Cloud site.

`getConversation(conversationId)`

Get a conversation.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation getConversation(String conversationId)
```

Parameters

`conversationId`
Type: String

ID for the conversation.

Return Value

Type: ConnectApi.ChatterConversation

getConversation(conversationId, pageParam, pageSize)

Get a page of a conversation.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation getConversation(String conversationId,
String pageParam, Integer pageSize)
```

Parameters

conversationId
Type: String

ID for the conversation.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: ConnectApi.ChatterConversation

getConversation(communityId, conversationId)

Get a conversation from an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation getConversation(String communityId, String conversationId)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

conversationId
Type: String

ID for the conversation.

Return Value

Type: `ConnectApi.ChatterConversation`

getConversation(communityId, conversationId, pageParam, pageSize)

Get a page of a conversation from an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation getConversation(String communityId, String conversationId, String pageParam, String pageSize)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

conversationId
Type: String

ID for the conversation.

pageParam
Type:String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterConversation`

getConversations()

Get the most recent conversations.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage getConversations()
```

Return Value

Type: `ConnectApi.ChatterConversationPage`

getConversations(pageParam, pageSize)

Get a page of conversations.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage getConversations(String pageParam,
Integer pageSize)
```

Parameters

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterConversationPage`

getConversations(communityId)

Get the most recent conversations from an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage getConversations(String communityId)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.ChatterConversationPage`

getConversations(communityId, pageParam, pageSize)

Get a page of conversations from an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage getConversations(String communityId,
String pageParam, Integer pageSize)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type:String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterConversationPage`

`getMessage(messageId)`

Get a message.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage getMessage(String messageId)
```

Parameters

messageId
Type: String

ID for the message.

Return Value

Type: `ConnectApi.ChatterMessage`

`getMessage(communityId, messageId)`

Get a message from an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage getMessage(String communityId, String messageId)
```

Parameters

`communityId`
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

`messageId`
Type: String

ID for the message.

Return Value

Type:`ConnectApi.ChatterMessage`

`getMessages()`

Get the most recent messages.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage getMessages()
```

Return Value

Type: `ConnectApi.ChatterMessagePage`

getMessages(pageParam, pageSize)

Get a page of messages.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage getMessages(String pageParam, Integer pageSize)
```

Parameters

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterMessagePage`

getMessages(communityId)

Get the most recent messages from an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage getMessages(String communityId)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.ChatterMessagePage`

getMessages(communityId, pageParam, pageSize)

Get a page of messages from an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage getMessages(String communityId, String pageParam, Integer pageSize)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterMessagePage`

getUnreadCount()

Get the number of conversations that are marked unread.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UnreadConversationCount getUnreadCount()
```

Return Value

Type: `ConnectApi.UnreadConversationCount`

If there are fewer than 50 unread conversations, `ConnectApi.UreadConversationCount` returns the exact number of unread conversations and the `hasMore` property is `false`. If there are more than 50 unread conversations, `ConnectApi.UreadConversationCount` returns 50 unread conversations and the `hasMore` property is `true`.

Example

```
ConnectApi.UnreadConversationCount unread = ConnectApi.ChatterMessages.getUnreadCount();
```

`getUnreadCount(communityId)`

Get the number of conversations that are marked unread in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UnreadConversationCount getUnreadCount(String communityId)
```

Parameters

`communityId`
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.UnreadConversationCount`

If there are fewer than 50 unread conversations, `ConnectApi.UreadConversationCount` returns the exact number of unread conversations and the `hasMore` property is `false`. If there are more than 50 unread conversations, `ConnectApi.UreadConversationCount` returns 50 unread conversations and the `hasMore` property is `true`.

markConversationRead(conversationId, read)

Mark a conversation as read or unread.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationSummary markConversationRead(String conversationId, Boolean read)
```

Parameters

conversationId
: Type: String

  ID for the conversation.

read
: Type: Boolean

  Specify whether the conversation is read (`true`) or not (`false`).

Return Value

Type: `ConnectApi.ChatterConversationSummary`

markConversationRead(communityId, conversationID, read)

Mark a conversation as read or unread in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationSummary markConversationRead(String communityId, String conversationID, Boolean read)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

conversationId
Type: String

ID for the conversation.

read
Type: Boolean

Specify whether the conversation is read (`true`) or not (`false`).

Return Value

Type: `ConnectApi.ChatterConversationSummary`

replyToMessage(text, inReplyTo)

Reply to a message.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage replyToMessage(String text, String inReplyTo)
```

Parameters

text
Type: String

Text of the message. Can't be empty or over 10,000 characters.

inReplyTo
Type: String

ID of the message that is being responded to.

Return Value

Type: `ConnectApi.ChatterMessage`

replyToMessage(communityId, text, inReplyTo)

Reply to a message in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage replyToMessage(String communityId, String text,
String inReplyTo)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

text
Type: String

Text of the message. Can't be empty or over 10,000 characters.

inReplyTo
Type: String

ID of the message that is being responded to.

Return Value

Type: `ConnectApi.ChatterMessage`

searchConversation(conversationId, q)

Get a conversation that matches the search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation searchConversation(String conversationId,
String q)
```

Parameters

conversationId
Type: String

ID for the conversation.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversation`

searchConversation(conversationId, pageParam, pageSize, q)

Get a conversation with a page of messages that match the search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation searchConversation(String conversationId,
String pageParam, Integer pageSize, String q)
```

Parameters

conversationId
Type: String

ID for the conversation.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: ConnectApi.ChatterConversation

searchConversation(communityId, conversationId, q)

Get a conversation with messages that match the search criteria in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation searchConversation(String communityId,
String conversationId, String q)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

conversationId
Type: String

ID for the conversation.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: ConnectApi.ChatterConversation

searchConversation(communityId, conversationId, pageParam, pageSize, q)

Get a conversation with a page of messages that match the search criteria in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation searchConversation(String communityId,
String conversationId, String pageParam, Integer pageSize, String q)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

conversationId
Type: String

ID for the conversation.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversation`

searchConversations(q)

Get conversations in which member names and messages match the search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage searchConversations(String q)
```

Parameters

q

Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversationPage`

searchConversations(pageParam, pageSize, q)

Get a page of conversations in which member names and messages match the search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage searchConversations(String pageParam,
Integer pageSize, String q)
```

Parameters

pageParam

Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q

Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversationPage`

searchConversations(communityId, q)

Get conversations in which member names and messages match the search criteria in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage searchConversations(String communityId,
String q)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversationPage`

searchConversations(communityId, pageParam, pageSize, q)

Get a page of conversations in which member names and messages match the search criteria in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage searchConversations(String communityId,
String pageParam, Integer pageSize, String q)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversationPage`

searchMessages(q)

Get messages that match the search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String q)
```

Parameters

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterMessagePage`

searchMessages(pageParam, pageSize, q)

Get a page of messages that match the search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String pageParam, Integer pageSize, String q)
```

Parameters

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterMessagePage`

`searchMessages(communityId, q)`

Get messages that match the search criteria in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String communityId, String q)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterMessagePage`

searchMessages(communityId, pageParam, pageSize, q)

Get a page of messages that match the search criteria in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String communityId, String pageParam, Integer pageSize, String q)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: ConnectApi.ChatterMessagePage

sendMessage(text, recipients)

Send a message to a list of recipients.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage sendMessage(String text, String recipients)
```

Parameters

text
Type: String

Text of the message. Can't be empty or over 10,000 characters.

recipients
Type: String

Up to nine comma-separated IDs of the users receiving the message.

Return Value

Type: ConnectApi.ChatterMessage

sendMessage(communityId, text, recipients)

Send a message to a list of recipients in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage sendMessage(String communityId, String text,
String recipients)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

text
Type: String

Text of the message. Can't be empty or over 10,000 characters.

recipients
Type: String

Up to nine comma-separated IDs of users to receive the message.

Return Value

Type: `ConnectApi.ChatterMessage`

ChatterUsers Class

Access information about users, such as activity, followers, subscriptions, files, and groups.

Namespace

ConnectApi

ChatterUsers Methods

The following are methods for `ChatterUsers`. All methods are static.

IN THIS SECTION:

exportUserActivities(communityId, userId)
Export Chatter-related user activity, such as bookmarks, topic endorsements, and votes.

follow(communityId, userId, subjectId)
Follow a user or record.

getChatterSettings(communityId, userId)
Get the default Chatter settings for a user.

getFollowers(communityId, userId)
Get the first page of followers for a user.

getFollowers(communityId, userId, pageParam, pageSize)
Get a page of followers for a user.

getFollowings(communityId, userId)
Get the first page of users and records that a user follows.

getFollowings(communityId, userId, pageParam)
Get a page of users and records that a user follows.

getFollowings(communityId, userId, pageParam, pageSize)
Get a page with the specified number of users and records that a user follows.

getFollowings(communityId, userId, filterType)
Get the first page of records, filtered by key prefix, that a user follows.

getFollowings(communityId, userId, filterType, pageParam)
Get a page of records, filtered by key prefix, that a user follows.

getFollowings(communityId, userId, filterType, pageParam, pageSize)
Get a page with the specified number of records, filtered by key prefix, that a user follows.

getReputation(communityId, userId)
Get a user's reputation.

getUser(communityId, userId)
Get information about a user.

getUserBatch(communityId, userIds)
Get information about a list of users.

getUserGroups(communityId, userId)
Get a user's groups.

getUserGroups(communityId, userId, pageParam, pageSize)
Get a page of a user's groups.

getUsers(communityId)
Get the first page of users.

getUsers(communityId, pageParam, pageSize)
Get a page of users.

purgeUserActivities(communityId, userId)
Start a job to purge Chatter-related user activity, such as bookmarks, topic endorsements, and votes.

searchUserGroupDetails(communityId, userId, q)
Get the user's groups that match the search criteria.

searchUserGroupDetails(communityId, userId, q, pageParam, pageSize)
Get a page of a user's groups that match the search criteria.

searchUsers(communityId, q)
Get the first page of users that match the search criteria.

searchUsers(communityId, q, pageParam, pageSize)
Get a page of users that match the search criteria.

searchUsers(communityId, q, searchContextId, pageParam, pageSize)
Get a page of users that match the search criteria.

updateChatterSettings(communityId, userId, defaultGroupEmailFrequency)
Update the default Chatter settings for a user.

updateUser(communityId, userId, userInput)
Update the About Me section for a user.

`exportUserActivities(communityId, userId)`

Export Chatter-related user activity, such as bookmarks, topic endorsements, and votes.

API Version

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserActivitiesJob exportUserActivities(String communityId,
String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.UserActivitiesJob`

Usage

The following activities can be exported.

- `Bookmark`—User bookmarked a post.
- `ChatterActivity`—Total counts of posts and comments made and likes and comments received for a user.
- `ChatterLike`—User liked a post or comment.
- `Comment`—User commented on a post.
- `CompanyVerify`—User verified comment.
- `DownVote`—User downvoted a post or comment.
- `FeedEntityRead`—User read a post.
- `FeedRead`—User read a feed.
- `Mute`—User muted a post.
- `Post`—User made a post.
- `TopicEndorsement`—User endorsed another user on a topic or received endorsement on a topic.
- `UpVote`—User upvoted a post or comment.

follow(communityId, userId, subjectId)

Follow a user or record.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Subscription follow(String communityId, String userId, String subjectId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

subjectId
Type: String

ID of the user or record to follow.

Return Value

Type: `ConnectApi.Subscription`

Example

```
ChatterUsers.ConnectApi.Subscription subscriptionToRecord =
ConnectApi.ChatterUsers.follow(null, 'me', '001RR000002G4Y0');
```

SEE ALSO:

Unfollow a Record

getChatterSettings(communityId, userId)

Get the default Chatter settings for a user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserChatterSettings getChatterSettings(String communityId,
String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

Return Value

Type: `ConnectApi.UserChatterSettings`

getFollowers(communityId, userId)

Get the first page of followers for a user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowerPage getFollowers(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.FollowerPage`

`getFollowers(communityId, userId, pageParam, pageSize)`

Get a page of followers for a user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowerPage getFollowers(String communityId, String userId,
Integer pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID for a user.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.FollowerPage`

getFollowings(communityId, userId)

Get the first page of users and records that a user follows.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.FollowingPage`

getFollowings(communityId, userId, pageParam)

Get a page of users and records that a user follows.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId,
Integer pageParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

Return Value

Type: `ConnectApi.FollowingPage`

`getFollowings(communityId, userId, pageParam, pageSize)`

Get a page with the specified number of users and records that a user follows.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.FollowingPage`

getFollowings(communityId, userId, filterType)

Get the first page of records, filtered by key prefix, that a user follows.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId,
String filterType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

filterType
Type: String

Specifies the key prefix to filter the type of objects returned. A key prefix is the first three characters of the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

Return Value

Type: ConnectApi.FollowingPage

getFollowings(communityId, userId, filterType, pageParam)

Get a page of records, filtered by key prefix, that a user follows.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId,
String filterType, Integer pageParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

filterType
Type: String

Specifies the key prefix to filter the type of objects returned. A key prefix is the first three characters of the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

Return Value

Type: ConnectApi.FollowingPage

getFollowings(communityId, userId, filterType, pageParam, pageSize)

Get a page with the specified number of records, filtered by key prefix, that a user follows.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId,
String filterType, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

filterType
Type: String

Specifies the key prefix to filter the type of objects returned. A key prefix is the first three characters of the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.FollowingPage`

`getReputation(communityId, userId)`

Get a user's reputation.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Reputation getReputation(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.Reputation`

getUser(communityId, userId)

Get information about a user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserSummary getUser(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.UserDetail`

Usage

If the user is external, the properties that the `ConnectApi.UserDetail` output class shares with the `ConnectApi.UserSummary` output class can have non-null values. Other properties are always `null`.

getUserBatch(communityId, userIds)

Get information about a list of users.

API Version

31.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getUserBatch(String communityId, List<String>
userIds)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userIds
Type: List<String>

A list of up to 500 user IDs.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.User` object and errors for users that didn't load.

Example

```
// Get users in an organization.
ConnectApi.UserPage userPage = ConnectApi.ChatterUsers.getUsers(null);

// Create a list of user IDs.
List<String> userList = new List<String>();
for (ConnectApi.User user : userPage.users){
    userList.add(user.id);
}

// Get info about all users in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterUsers.getUserBatch(null, userList);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print each user's username.
        ConnectApi.UserDetail user;
        if(batchResult.getResult() instanceof ConnectApi.UserDetail) {
            user = (ConnectApi.UserDetail) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(user.username);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

`getUserGroups(communityId, userId)`

Get a user's groups.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupDetailPage getUserGroups(String communityId, String
userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.UserGroupDetailPage`

getUserGroups(communityId, userId, pageParam, pageSize)

Get a page of a user's groups.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupDetailPage getUserGroups(String communityId, String
userId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserGroupDetailPage`

`getUsers(communityId)`

Get the first page of users.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage getUsers(String communityId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.UserPage`

`getUsers(communityId, pageParam, pageSize)`

Get a page of users.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage getUsers(String communityId, Integer pageParam,
Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserPage`

purgeUserActivities(communityId, userId)

Start a job to purge Chatter-related user activity, such as bookmarks, topic endorsements, and votes.

API Version

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserActivitiesJob purgeUserActivities(String communityId,
String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.UserActivitiesJob`

Usage

The following activities can be purged with this method.

- `Bookmark`—User bookmarked a post.
- `ChatterActivity`—Total counts of posts and comments made and likes and comments received for a user.
- `ChatterLike`—User liked a post or comment.
- `CompanyVerify`—User verified comment.
- `DownVote`—User downvoted a post or comment.
- `FeedEntityRead`—User read a post.
- `FeedRead`—User read a feed.
- `Mute`—User muted a post.
- `TopicEndorsement`—User endorsed another user on a topic or received endorsement on a topic.
- `UpVote`—User upvoted a post or comment.

To delete a user's posts and comments, use these methods, respectively.

- deleteFeedElement(communityId, feedElementId)
- deleteComment(communityId, commentId)

`searchUserGroupDetails(communityId, userId, q)`

Get the user's groups that match the search criteria.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupDetailPage searchUserGroupDetails(String communityId,
String userId, String q)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.UserGroupDetailPage`

searchUserGroupDetails(communityId, userId, q, pageParam, pageSize)

Get a page of a user's groups that match the search criteria.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupDetailPage searchUserGroupDetails(String communityId,
String userId, String q, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserGroupDetailPage`

searchUsers(communityId, q)

Get the first page of users that match the search criteria.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage searchUsers(String communityId, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.UserPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchUsers(communityId, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchUsers(communityId, q, pageParam, pageSize)`

Get a page of users that match the search criteria.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage searchUsers(String communityId, String q, Integer pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`q`
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchUsers(communityId, q, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

`searchUsers(communityId, q, searchContextId, pageParam, pageSize)`

Get a page of users that match the search criteria.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage searchUsers(String communityId, String q, String
searchContextId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

searchContextId
Type: String

A feed item ID that filters search results for feed @mentions. More useful results are listed first. When you specify this argument, you cannot query more than 500 results and you cannot use wildcards in the search term.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchUsers(communityId, q, searchContextId, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

`updateChatterSettings(communityId, userId, defaultGroupEmailFrequency)`

Update the default Chatter settings for a user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserChatterSettings updateChatterSettings(String communityId,
String userId, ConnectApi.GroupEmailFrequency defaultGroupEmailFrequency)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

defaultGroupEmailFrequency
Type: `ConnectApi.GroupEmailFrequency`

Frequency with which a user receives email. Values are:

- `EachPost`
- `DailyDigest`
- `WeeklyDigest`
- `Never`
- `UseDefault`

Don't pass the value `UseDefault` for the *`defaultGroupEmailFrequency`* parameter because calling `updateChatterSettings` sets the default value.

Return Value

Type: `ConnectApi.UserChatterSettings`

`updateUser(communityId, userId, userInput)`

Update the About Me section for a user.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserDetail updateUser(String communityId, String userId,
ConnectApi.UserInput userInput)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID for the context user or the keyword `me`.

`userInput`
Type: `ConnectApi.UserInput`

Specifies the updated information.

Return Value

Type: `ConnectApi.UserDetail`

ChatterUsers Test Methods

The following are the test methods for `ChatterUsers`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

IN THIS SECTION:

setTestSearchUsers(communityId, q, result)

Register a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchUsers(communityId, q, pageParam, pageSize, result)

Register a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchUsers(communityId, q, searchContextId, pageParam, pageSize, result)

Register a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

`setTestSearchUsers(communityId, q, result)`

Register a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0

Signature

```
public static Void setTestSearchUsers(String communityId, String q, ConnectApi.UserPage result)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q

Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result

Type: `ConnectApi.UserPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchUsers(communityId, q)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchUsers(communityId, q, pageParam, pageSize, result)

Register a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0

Signature

```
public static Void setTestSearchUsers(String communityId, String q, Integer pageParam,
Integer pageSize, ConnectApi.UserPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.UserPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchUsers(communityId, q, pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchUsers(communityId, q, searchContextId, pageParam, pageSize, result)

Register a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0

Signature

```
public static Void setTestSearchUsers(String communityId, String q, String
searchContextId, Integer pageParam, Integer pageSize, ConnectApi.UserPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

searchContextId
Type: String

A feed item ID that filters search results for feed @mentions. More useful results are listed first. When you specify this argument, you cannot query more than 500 results and you cannot use wildcards in the search term.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.UserPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchUsers(communityId, q, searchContextId, pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

Retired ChatterUsers Methods

The following methods for `ChatterUsers` are retired.

IN THIS SECTION:

deletePhoto(communityId, userId)
Delete a user's photo.

getGroups(communityId, userId)
Get the groups that a user is a member of.

getGroups(communityId, userId, pageParam, pageSize)
Get a page of groups that a user is a member of.

getPhoto(communityId, userId)
Get a user's photo.

searchUserGroups(communityId, userId, q)
Get the user's groups that match the search criteria.

searchUserGroups(communityId, userId, q, pageParam, pageSize)
Get a page of a user's groups that match the search criteria.

setPhoto(communityId, userId, fileId, versionNumber)
Set an uploaded file as a user's photo.

setPhoto(communityId, userId, fileUpload)
Set a file that hasn't been uploaded as the user's photo.

setPhotoWithAttributes(communityId, userId, photo)
Set and crop an uploaded file as a user's photo.

setPhotoWithAttributes(communityId, userId, photo, fileUpload)
Set and crop a file that hasn't been uploaded as a user's photo.

`deletePhoto(communityId, userId)`

Delete a user's photo.

API Version

28.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.deletePhoto(communityId, userId)`

Signature

```
public static Void deletePhoto(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

Return Value

Type: Void

getGroups(communityId, userId)

Get the groups that a user is a member of.

API Version

28.0–44.0

Important: In version 45.0 and later, use `getUserGroups(communityId, userId)`.

Available to Guest Users

32.0–44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage getGroups(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.UserGroupPage`

getGroups(communityId, userId, pageParam, pageSize)

Get a page of groups that a user is a member of.

API Version

28.0–44.0

Important: In version 45.0 and later, use `getUserGroups(communityId, userId, pageParam, pageSize)`.

Available to Guest Users

32.0–44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage getGroups(String communityId, String userId,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserGroupPage`

getPhoto(communityId, userId)

Get a user's photo.

API Version

28.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.getPhoto(communityId, userId)`.

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo getPhoto(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.Photo`

searchUserGroups(communityId, userId, q)

Get the user's groups that match the search criteria.

API Version

30.0–44.0

Important: In version 45.0 and later, use `searchUserGroupDetails(communityId, userId, q)`.

Available to Guest Users

32.0–44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage searchUserGroups(String communityId, String
userId, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.UserGroupPage`

searchUserGroups(communityId, userId, q, pageParam, pageSize)

Get a page of a user's groups that match the search criteria.

API Version

30.0–44.0

Important: In version 45.0 and later, use `searchUserGroupDetails(communityId, userId, q, pageParam, pageSize)`.

Available to Guest Users

32.0–44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage searchUserGroups(String communityId, String
userId, String q, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserGroupPage`

setPhoto(communityId, userId, fileId, versionNumber)

Set an uploaded file as a user's photo.

API Version

28.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.setPhoto(communityId, userId, fileId, versionNumber)`

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String userId, String fileId, Integer versionNumber)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

fileId
Type: String

ID of a file already uploaded. The file must be an image, and be smaller than 2 GB.

versionNumber
Type: Integer

Version number of the existing file. Specify either an existing version number, or `null` to get the latest version.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

setPhoto(communityId, userId, fileUpload)

Set a file that hasn't been uploaded as the user's photo.

API Version

28.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.setPhoto(communityId, userId, fileUpload)`

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String userId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

`setPhotoWithAttributes(communityId, userId, photo)`

Set and crop an uploaded file as a user's photo.

API Version

29.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.setPhotoWithAttributes(communityId, userId, photo)`

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

`setPhotoWithAttributes(communityId, userId, photo, fileUpload)`

Set and crop a file that hasn't been uploaded as a user's photo.

API Version

29.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.setPhotoWithAttributes(communityId, userId, photo, fileUpload)`

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the cropping parameters.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

Clm Class

Create and update Contract Lifecycle Management (CLM) contracts using object ID.

Namespace

ConnectApi

Clm Methods

The following are methods for `Clm`. All methods are static.

IN THIS SECTION:

createContract(contractInputPayload)
Create contracts using the object ID.

updateContract(contractInputPayload)
Update contracts using the object ID.

createContract(contractInputPayload)

Create contracts using the object ID.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContractOutputRepresentation
createContract(ConnectApi.ContractInputRepresentation contractInputPayload)
```

Parameters

contractInputPayload
Type: `ConnectApi.ContractInputRepresentation` on page 1507

Input payload to create contract.

Return Value

Type: `ConnectApi.ContractOutputRepresentation` on page 1667

updateContract(contractInputPayload)

Update contracts using the object ID.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContractOutputRepresentation
updateContract(ConnectApi.ContractInputRepresentation contractInputPayload)
```

Parameters

contractInputPayload
Type: ConnectApi.ContractInputRepresentation on page 1507

Input payload to update contract.

Return Value

Type: ConnectApi.ContractOutputRepresentation on page 1667

CommerceBuyerExperience Class

Create, delete, or get commerce addresses. Get order delivery group, order item, order shipments, shipment items, and order summaries. Get adjustments for order items and order summaries.

Namespace

ConnectApi

CommerceBuyerExperience Methods

These methods are for `CommerceBuyerExperience`. All methods are static.

IN THIS SECTION:

calculateAdjustmentAggregates(webstoreId, orderSummaryIds)
Submit a job to calculate adjustment aggregates for a list of order summary IDs.

createCommerceAccountAddress(webstoreId, accountId, addressInput)
Create a Commerce account address for a webstore account.

deleteCommerceAccountAddress(webstoreId, accountId, addressId)
Delete a Commerce account address for a webstore.

getCommerceAccountAddress(webstoreId, accountId)
Get a Commerce account address for a webstore.

getCommerceAccountAddress(webstoreId, accountId, defaultOnly)
Get Commerce account addresses for a webstore and account.

getCommerceAccountAddress(webstoreId, accountId, defaultOnly, addressType, fields, pageToken, pageSize, sortOrder)
Get Commerce account addresses for a webstore and account.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId)
Get order delivery group summaries.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageSize)
Get order delivery group summaries.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageParam)
Get a page of order delivery group summaries.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields)
Get order delivery group summaries with specific fields.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageParam, fields)
Get a page of order delivery group summaries with specific fields.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, pageSize)
Get order delivery group summaries with specific fields.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, sortParam)
Get a sorted list of order delivery group summaries with specific fields.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, pageSize, sortParam)
Get a sorted list of order delivery group summaries with specific fields.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId)
Get order item summaries.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageSize)
Get order item summaries.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId)
Get order item summaries for a delivery group summary.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, pageSize)
Get order item summaries for a delivery group summary.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, pageParam)
Get a page of order item summaries for a delivery group summary.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields)
Get order item summaries for a delivery group summary with specific fields.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageSize)
Get order item summaries for a delivery group summary with specific fields.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageParam)
Get a page of order item summaries for a delivery group summary with specific fields.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, sortParam)
Get a sorted list of order item summaries for a delivery group summary with specific fields.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageSize, sortParam)
Get a sorted page of order item summaries for a delivery group summary with specific fields.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageParam, pageSize, sortParam, includeAdjustmentDetails)
Get a sorted page of order item summaries for a delivery group summary with specific fields and include adjustment details.

getOrderItemSummaryAdjustments(webstoreId, orderSummaryId, orderItemSummaryAdjustmentCollectionInput)
Get adjustments for order items.

getOrderItemSummaryAdjustments(webstoreId, orderSummaryId, orderItemSummaryAdjustmentCollectionInput, effectiveAccountId)
Get adjustments for order items.

getOrderShipmentItems(webstoreId, shipmentId)
Get order shipment items.

getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId)
Get order shipment items.

getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields)
Get order shipment items with specific fields.

getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields, pageToken, pageSize)
Get a page of order shipment items with specific fields.

getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields, pageToken, pageSize, sortOrder)
Get a sorted page of order shipment items.

getOrderShipments(webstoreId, orderSummaryId)
Get order shipments.

getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId)
Get order shipments.

getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields)
Get order shipments with specific fields.

getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields, pageSize, pageToken)
Get a page of order shipments with specific fields.

getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields, pageSize, pageToken, sortOrder)
Get a sorted page of order shipments with specific fields.

getOrderSummaries(webstoreId)
Get order summaries.

getOrderSummaries(webstoreId, effectiveAccountId)
Get order summaries.

getOrderSummaries(webstoreId, effectiveAccountId, fields)
Get order summaries with specific fields.

getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken)
Get a page of order summaries with specific fields.

getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder)
Get a sorted page of order summaries with specific fields.

getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate)
Get a sorted page of order summaries with specific fields within a specific date range.

getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate, ownerScoped)
Get a sorted page of order summaries with specific fields within a specific date range and scoped to orders owned by the context user.

getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate, ownerScoped, includeAdjustmentDetails)
Get a sorted page of order summaries with specific fields within a specific date range and scoped to orders owned by the context user.

getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId)
Get an order summary.

getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId, fields)
Get an order summary with fields.

getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId, fields, includeAdjustmentDetails)
Get an order summary with fields and include adjustment details.

getOrderSummaryAdjustments(webstoreId, orderSummaryId)
Get adjustments for an order summary.

getOrderSummaryAdjustments(webstoreId, orderSummaryId, effectiveAccountId)
Get adjustments for an order summary.

updateCommerceAccountAddress(webstoreId, accountId, addressId, addressInput)
Update a Commerce account address for a webstore.

`calculateAdjustmentAggregates(webstoreId, orderSummaryIds)`

Submit a job to calculate adjustment aggregates for a list of order summary IDs.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryAdjustmentAggregatesAsyncOutput
calculateAdjustmentAggregates(String webstoreId,
ConnectApi.OrderSummaryAdjustmentAggregatesAsyncInput orderSummaryIds)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryIds
Type: `ConnectApi.OrderSummaryAdjustmentAggregatesAsyncInput`

A `ConnectApi.OrderSummaryAdjustmentAggregatesAsyncInput` class with a list of order summary IDs.

Return Value

Type: `ConnectApi.OrderSummaryAdjustmentAggregatesAsyncOutput`

`createCommerceAccountAddress(webstoreId, accountId, addressInput)`

Create a Commerce account address for a webstore account.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommerceAddressOutput createCommerceAccountAddress(String
webstoreId, String accountId, ConnectApi.commerceAddressInput addressInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account.

addressInput
Type: ConnectApi.commerceAddressInput

Information about the address you want to create.

Return Value

Type: ConnectApi.CommerceAddressOutput

deleteCommerceAccountAddress(webstoreId, accountId, addressId)

Delete a Commerce account address for a webstore.

API Version

54.0

Requires Chatter

No

Signature

```
public static Void deleteCommerceAccountAddress(String webstoreId, String accountId,
String addressId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account.

addressId
Type: String

ID of the address.

Return Value

Type: Void

getCommerceAccountAddress(webstoreId, accountId)

Get a Commerce account address for a webstore.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommerceAddressCollection getCommerceAccountAddress(String
webstoreId, String accountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account.

Return Value

Type: ConnectApi.CommerceAddressCollection

getCommerceAccountAddress(webstoreId, accountId, defaultOnly)

Get Commerce account addresses for a webstore and account.

You can get the default address by itself, or you can get all of the addresses for the account.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommerceAddressCollection getCommerceAccountAddress(String webstoreId, String accountId, Boolean defaultOnly)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account.

defaultOnly
Type: Boolean

Indicate if you only want the default address (`true`) or all addresses for the account (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.CommerceAddressCollection`

getCommerceAccountAddress(webstoreId, accountId, defaultOnly, addressType, fields, pageToken, pageSize, sortOrder)

Get Commerce account addresses for a webstore and account.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommerceAddressCollection getCommerceAccountAddress(String
webstoreId, String accountId, Boolean defaultOnly, List<String> addressType, List<String>
fields, String pageToken, Integer pageSize, ConnectApi.CommerceAddressSort sortOrder)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account.

defaultOnly
Type: Boolean

Indicate if you want only the default address (`true`) or all addresses for the account (`false`). The default value is `false`.

addressType
Type: List<string>

Type of address, for example, `Billing` or `Shipping`.

fields
Type: List<string>

A list of custom fields for the address.

pageToken
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortOrder
Type: `ConnectApi.CommerceAddressSort`

Sort order for Commerce addresses.

- `CreatedDateAsc`—Sort in ascending order of created date.
- `CreatedDateDesc`—Sort in descending order of created date.
- `NameAsc`—Sort in ascending order of name.
- `NameDesc`—Sort in descending order of name.

Return Value

Type: `ConnectApi.CommerceAddressCollection`

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId)

Get order delivery group summaries.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String
orderSummaryId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

Return Value

Type: `ConnectApi.OrderDeliveryGroupSummaryCollection`

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageSize)

Get order delivery group summaries.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String
orderSummaryId, Integer pageSize)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.OrderDeliveryGroupSummaryCollection`

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageParam)

Get a page of order delivery group summaries.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String
orderSummaryId, String pageParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: `ConnectApi.OrderDeliveryGroupSummaryCollection`

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields)

Get order delivery group summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String
orderSummaryId, List<String> fields)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

fields
Type: List<String>

List of up to 15 order delivery group summary or order delivery method fields to display in the UI in each item row.

Return Value

Type: ConnectApi.OrderDeliveryGroupSummaryCollection

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageParam, fields)

Get a page of order delivery group summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String
orderSummaryId, String pageParam, List<String> fields)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

fields
Type: List<String>

List of up to 15 order delivery group summary or order delivery method fields to display in the UI in each item row.

Return Value

Type: ConnectApi.OrderDeliveryGroupSummaryCollection

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, pageSize)

Get order delivery group summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String
orderSummaryId, List<String> fields, Integer pageSize)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

fields
Type: List<String>

List of up to 15 order delivery group summary or order delivery method fields to display in the UI in each item row.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: ConnectApi.OrderDeliveryGroupSummaryCollection

`getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, sortParam)`

Get a sorted list of order delivery group summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String
orderSummaryId, List<String> fields, ConnectApi.OrderDeliveryGroupSummarySort sortParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

fields
Type: List<String>

List of up to 15 order delivery group summary or order delivery method fields to display in the UI in each item row.

sortParam
Type: `ConnectApi.OrderDeliveryGroupSummarySort`

Sort order for order delivery group summaries. Values are:

- `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
- `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).

If `null`, `IdAsc` is the default sort order.

Return Value

Type: `ConnectApi.OrderDeliveryGroupSummaryCollection`

`getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, pageSize, sortParam)`

Get a sorted list of order delivery group summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String
orderSummaryId, List<String> fields, Integer pageSize,
ConnectApi.OrderDeliveryGroupSummarySort sortParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

fields
Type: List<String>

List of up to 15 order delivery group summary or order delivery method fields to display in the UI in each item row.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.OrderDeliveryGroupSummarySort`

Sort order for order delivery group summaries. Values are:

- `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
- `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).

If `null`, `IdAsc` is the default sort order.

Return Value

Type: ConnectApi.OrderDeliveryGroupSummaryCollection

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId)

Get order item summaries.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

Return Value

Type: ConnectApi.OrderItemSummaryCollection

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageSize)

Get order item summaries.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String
webstoreId, String effectiveAccountId, String orderSummaryId, Integer pageSize)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.OrderItemSummaryCollection`

`getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId)`

Get order item summaries for a delivery group summary.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String
webstoreId, String effectiveAccountId, String orderSummaryId, String
orderDeliveryGroupSummaryId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

Return Value

Type: `ConnectApi.OrderItemSummaryCollection`

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, pageSize)

Get order item summaries for a delivery group summary.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String
webstoreId, String effectiveAccountId, String orderSummaryId, String
orderDeliveryGroupSummaryId, Integer pageSize)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.OrderItemSummaryCollection`

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, pageParam)

Get a page of order item summaries for a delivery group summary.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, String pageParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: ConnectApi.OrderItemSummaryCollection

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields)

Get order item summaries for a delivery group summary with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

fields
Type: List<String>

List of up to 15 order item summary or product fields to display in the UI in each item row.

Return Value

Type: ConnectApi.OrderItemSummaryCollection

`getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageSize)`

Get order item summaries for a delivery group summary with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields, Integer pageSize)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

fields
Type: List<String>

List of up to 15 order item summary or product fields to display in the UI in each item row.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.OrderItemSummaryCollection`

`getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageParam)`

Get a page of order item summaries for a delivery group summary with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields, String pageParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

fields
Type: List<String>

List of up to 15 order item summary or product fields to display in the UI in each item row.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: `ConnectApi.OrderItemSummaryCollection`

`getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, sortParam)`

Get a sorted list of order item summaries for a delivery group summary with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields, ConnectApi.OrderItemSummarySort sortParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

fields
Type: List<String>

List of up to 15 order item summary or product fields to display in the UI in each item row.

sortParam
Type: `ConnectApi.OrderItemSummarySort`

Sort order for order item summaries. Values are:

- `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
- `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).

If `null`, `IdAsc` is the default sort order.

Return Value

Type: ConnectApi.OrderItemSummaryCollection

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageSize, sortParam)

Get a sorted page of order item summaries for a delivery group summary with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields, Integer pageSize, ConnectApi.OrderItemSummarySort sortParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

fields
Type: List<String>

List of up to 15 order item summary or product fields to display in the UI in each item row.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: ConnectApi.OrderItemSummarySort

Sort order for order item summaries. Values are:

- `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
- `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).

If `null`, `IdAsc` is the default sort order.

Return Value

Type: `ConnectApi.OrderItemSummaryCollection`

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageParam, pageSize, sortParam, includeAdjustmentDetails)

Get a sorted page of order item summaries for a delivery group summary with specific fields and include adjustment details.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields, String pageParam, Integer pageSize, ConnectApi.OrderItemSummarySort sortParam, Boolean includeAdjustmentDetails)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

fields
Type: List<String>

List of up to 15 order item summary or product fields to display in the UI in each item row.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.OrderItemSummarySort`

Sort order for order item summaries. Values are:

- `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
- `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).

If `null`, `IdAsc` is the default sort order.

includeAdjustmentDetails
Type: Boolean

Specifies whether to return adjustment details (`true`) or not (`false`).

Return Value

Type: `ConnectApi.OrderItemSummaryCollection`

getOrderItemSummaryAdjustments(webstoreId, orderSummaryId, orderItemSummaryAdjustmentCollectionInput)

Get adjustments for order items.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryAdjustmentCollection
getOrderItemSummaryAdjustments(String webstoreId, String orderSummaryId,
ConnectApi.OrderItemSummaryAdjustmentCollectionInput
orderItemSummaryAdjustmentCollectionInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

orderItemSummaryAdjustmentCollectionInput
Type: ConnectApi.OrderItemSummaryAdjustmentCollectionInput

Collection of order item summaries to get adjustments for.

Return Value

Type: ConnectApi.OrderItemSummaryAdjustmentCollection

getOrderItemSummaryAdjustments(webstoreId, orderSummaryId, orderItemSummaryAdjustmentCollectionInput, effectiveAccountId)

Get adjustments for order items.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryAdjustmentCollection
getOrderItemSummaryAdjustments(String webstoreId, String orderSummaryId,
ConnectApi.OrderItemSummaryAdjustmentCollectionInput
orderItemSummaryAdjustmentCollectionInput, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

orderItemSummaryAdjustmentCollectionInput
Type: ConnectApi.OrderItemSummaryAdjustmentCollectionInput

Collection of order item summaries to get adjustments for.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: ConnectApi.OrderItemSummaryAdjustmentCollection

getOrderShipmentItems(webstoreId, shipmentId)

Get order shipment items.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentItemCollection getOrderShipmentItems(String webstoreId, String shipmentId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

shipmentId
Type: String

ID of the shipment.

Return Value

Type: ConnectApi.OrderShipmentItemCollection

getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId)

Get order shipment items.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentItemCollection getOrderShipmentItems(String webstoreId, String shipmentId, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

shipmentId
Type: String

ID of the shipment.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: `ConnectApi.OrderShipmentItemCollection`

getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields)

Get order shipment items with specific fields.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentItemCollection getOrderShipmentItems(String
webstoreId, String shipmentId, String effectiveAccountId, List<String> fields)
```

Parameters

webstoreId
Type: String

ID of the webstore.

shipmentId
Type: String

ID of the shipment.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 15 additional shipment items, order item summary, and product fields to display in the UI in each item row.

Return Value

Type: ConnectApi.OrderShipmentItemCollection

getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields, pageToken, pageSize)

Get a page of order shipment items with specific fields.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentItemCollection getOrderShipmentItems(String webstoreId, String shipmentId, String effectiveAccountId, List<String> fields, String pageToken, Integer pageSize)
```

Parameters

webstoreId
Type: String

ID of the webstore.

shipmentId
Type: String

ID of the shipment.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 15 additional shipment items, order item summary, and product fields to display in the UI in each item row.

pageToken
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: ConnectApi.OrderShipmentItemCollection

`getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields, pageToken, pageSize, sortOrder)`

Get a sorted page of order shipment items.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentItemCollection getOrderShipmentItems(String webstoreId, String shipmentId, String effectiveAccountId, List<String> fields, String pageToken, Integer pageSize, ConnectApi.OrderShipmentItemSort sortOrder)
```

Parameters

webstoreId
Type: String

ID of the webstore.

shipmentId
Type: String

ID of the shipment.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 15 additional shipment items, order item summary, and product fields to display in the UI in each item row.

pageToken
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortOrder
Type: `ConnectApi.OrderShipmentItemSort`

Sort order for order shipment items. Values are:

- `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
- `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).

If unspecified, defaults to `IdAsc`.

Return Value

Type: ConnectApi.OrderShipmentItemCollection

getOrderShipments(webstoreId, orderSummaryId)

Get order shipments.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentCollection getOrderShipments(String webstoreId,
String orderSummaryId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

Return Value

Type: ConnectApi.OrderShipmentCollection

getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId)

Get order shipments.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentCollection getOrderShipments(String webstoreId,
String orderSummaryId, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: `ConnectApi.OrderShipmentCollection`

getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields)

Get order shipments with specific fields.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentCollection getOrderShipments(String webstoreId,
String orderSummaryId, String effectiveAccountId, List<String> fields)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 15 additional shipment and order delivery method fields to display in the UI in each item row.

Return Value

Type: ConnectApi.OrderShipmentCollection

getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields, pageSize, pageToken)

Get a page of order shipments with specific fields.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentCollection getOrderShipments(String webstoreId, String orderSummaryId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 15 additional shipment and order delivery method fields to display in the UI in each item row.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

pageToken
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

Return Value

Type: ConnectApi.OrderShipmentCollection

`getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields, pageSize, pageToken, sortOrder)`

Get a sorted page of order shipments with specific fields.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentCollection getOrderShipments(String webstoreId, String orderSummaryId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken, ConnectApi.OrderShipmentSort sortOrder)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 15 additional shipment and order delivery method fields to display in the UI in each item row.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

pageToken
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

sortOrder
Type: `ConnectApi.OrderShipmentSort`

Sort order for order shipments. Values are:

- `ExpectedDeliveryDateAsc`—Sorts by the oldest expected delivery date.
- `ExpectedDeliveryDateDesc`—Sorts by the most recent expected delivery date.
- `ShipmentNumberAsc`—Sorts by shipment number in ascending order (0–9).

- `ShipmentNumberDesc`—Sorts by shipment number in descending order (9–0).

If unspecified, defaults to `ShipmentNumberAsc`.

If you're sorting by expected delivery date, make sure the expected delivery date is populated on your shipment records. A `null` value isn't supported and results in an error.

Return Value

Type: `ConnectApi.OrderShipmentCollection`

getOrderSummaries(webstoreId)

Get order summaries.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

Return Value

Type: `ConnectApi.OrderSummaryCollectionRepresentation`

getOrderSummaries(webstoreId, effectiveAccountId)

Get order summaries.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: `ConnectApi.OrderSummaryCollectionRepresentation`

getOrderSummaries(webstoreId, effectiveAccountId, fields)

Get order summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- `createdDate`
- `orderSummaryId`
- `orderNumber`
- `orderedDate`
- `ownerId`
- `status`
- `totalAmount`

Return Value

Type: `ConnectApi.OrderSummaryCollectionRepresentation`

`getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken)`

Get a page of order summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

`effectiveAccountId`
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

`fields`
Type: List<String>

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- `createdDate`
- `orderSummaryId`
- `orderNumber`

- `orderedDate`
- `ownerId`
- `status`
- `totalAmount`

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`pageToken`
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

Return Value

Type: `ConnectApi.OrderSummaryCollectionRepresentation`

`getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder)`

Get a sorted page of order summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken, ConnectApi.OrderSummarySortOrder sortOrder)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

`effectiveAccountId`
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

`fields`
Type: List<String>

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- `createdDate`
- `orderSummaryId`
- `orderNumber`
- `orderedDate`
- `ownerId`
- `status`
- `totalAmount`

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`pageToken`
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

`sortOrder`
Type: `ConnectApi.OrderSummarySortOrder`

Sort order for order summaries. Values are:

- `CreatedDateAsc`—Sorts by the oldest created date.
- `CreatedDateDesc`—Sorts by the most recent created date.
- `OrderedDateAsc`—Sorts by the oldest ordered date.
- `OrderedDateDesc`—Sorts by the most recent ordered date.

If unspecified, defaults to `OrderedDateDesc`.

If you're sorting by ordered date, make sure the ordered date is populated on your order summary records. A `null` value isn't supported and results in an error.

Return Value

Type: `ConnectApi.OrderSummaryCollectionRepresentation`

`getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate)`

Get a sorted page of order summaries with specific fields within a specific date range.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken, ConnectApi.OrderSummarySortOrder sortOrder, String earliestDate, String latestDate)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- `createdDate`
- `orderSummaryId`
- `orderNumber`
- `orderedDate`
- `ownerId`
- `status`
- `totalAmount`

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

pageToken
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

sortOrder
Type: `ConnectApi.OrderSummarySortOrder`

Sort order for order summaries. Values are:

- `CreatedDateAsc`—Sorts by the oldest created date.
- `CreatedDateDesc`—Sorts by the most recent created date.
- `OrderedDateAsc`—Sorts by the oldest ordered date.
- `OrderedDateDesc`—Sorts by the most recent ordered date.

If unspecified, defaults to `OrderedDateDesc`.

If you're sorting by ordered date, make sure the ordered date is populated on your order summary records. A `null` value isn't supported and results in an error.

earliestDate
Type: String

Oldest created or ordered date, depending on the `sortOrder` value, for order summaries to return. Results include any orders on and after this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

latestDate
Type: String

Most recent created or ordered date, depending on the `sortOrder` value, for order summaries to return. Results include any orders before this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

Return Value

Type: `ConnectApi.OrderSummaryCollectionRepresentation`

getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate, ownerScoped)

Get a sorted page of order summaries with specific fields within a specific date range and scoped to orders owned by the context user.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken, ConnectApi.OrderSummarySortOrder sortOrder, String earliestDate, String latestDate, Boolean ownerScoped)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- `createdDate`

- `orderSummaryId`
- `orderNumber`
- `orderedDate`
- `ownerId`
- `status`
- `totalAmount`

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`pageToken`
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

`sortOrder`
Type: `ConnectApi.OrderSummarySortOrder`

Sort order for order summaries. Values are:

- `CreatedDateAsc`—Sorts by the oldest created date.
- `CreatedDateDesc`—Sorts by the most recent created date.
- `OrderedDateAsc`—Sorts by the oldest ordered date.
- `OrderedDateDesc`—Sorts by the most recent ordered date.

If unspecified, defaults to `OrderedDateDesc`.

If you're sorting by ordered date, make sure the ordered date is populated on your order summary records. A `null` value isn't supported and results in an error.

`earliestDate`
Type: String

Oldest created or ordered date, depending on the `sortOrder` value, for order summaries to return. Results include any orders on and after this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

`latestDate`
Type: String

Most recent created or ordered date, depending on the `sortOrder` value, for order summaries to return. Results include any orders before this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

`ownerScoped`
Type: Boolean

Specifies whether the results are scoped to orders owned by the context user (`true`) or to orders owned by and shared with the context user (`false`). If unspecified, defaults to `true`.

Return Value

Type: `ConnectApi.OrderSummaryCollectionRepresentation`

`getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate, ownerScoped, includeAdjustmentDetails)`

Get a sorted page of order summaries with specific fields within a specific date range and scoped to orders owned by the context user.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken, ConnectApi.OrderSummarySortOrder sortOrder, String earliestDate, String latestDate, Boolean ownerScoped, Boolean includeAdjustmentDetails)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- `createdDate`
- `orderSummaryId`
- `orderNumber`
- `orderedDate`
- `ownerId`
- `status`
- `totalAmount`

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

pageToken
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

sortOrder
Type: ConnectApi.OrderSummarySortOrder

Sort order for order summaries. Values are:

- `CreatedDateAsc`—Sorts by the oldest created date.
- `CreatedDateDesc`—Sorts by the most recent created date.
- `OrderedDateAsc`—Sorts by the oldest ordered date.
- `OrderedDateDesc`—Sorts by the most recent ordered date.

If unspecified, defaults to `OrderedDateDesc`.

If you're sorting by ordered date, make sure the ordered date is populated on your order summary records. A `null` value isn't supported and results in an error.

earliestDate
Type: String

Oldest created or ordered date, depending on the `sortOrder` value, for order summaries to return. Results include any orders on and after this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

latestDate
Type: String

Most recent created or ordered date, depending on the `sortOrder` value, for order summaries to return. Results include any orders before this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

ownerScoped
Type: Boolean

Specifies whether the results are scoped to orders owned by the context user (`true`) or to orders owned by and shared with the context user (`false`). If unspecified, defaults to `true`.

includeAdjustmentDetails
Type: Boolean

Specifies whether to fetch price adjustment details based on their type (`true`). If unspecified, defaults to `false`.

Return Value

Type: ConnectApi.OrderSummaryCollectionRepresentation

getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId)

Get an order summary.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryRepresentation getOrderSummary(String webstoreId,
String orderSummaryId, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: `ConnectApi.OrderSummaryRepresentation`

getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId, fields)

Get an order summary with fields.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryRepresentation getOrderSummary(String webstoreId,
String orderSummaryId, String effectiveAccountId, List<String> fields)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- `createdDate`
- `orderSummaryId`
- `orderNumber`
- `orderedDate`
- `ownerId`
- `status`
- `totalAmount`

Return Value

Type: `ConnectApi.OrderSummaryRepresentation`

`getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId, fields, includeAdjustmentDetails)`

Get an order summary with fields and include adjustment details.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryRepresentation getOrderSummary(String webstoreId,
String orderSummaryId, String effectiveAccountId, List<String> fields, Boolean
includeAdjustmentDetails)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

`fields`
Type: List<String>

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- `createdDate`
- `orderSummaryId`
- `orderNumber`
- `orderedDate`
- `ownerId`
- `status`
- `totalAmount`

`includeAdjustmentDetails`
Type: Boolean

Specifies whether to return adjustment details (`true`) or not (`false`). If unspecified, the default value is `false`.

Return Value

Type: `ConnectApi.OrderSummaryRepresentation`

`getOrderSummaryAdjustments(webstoreId, orderSummaryId)`

Get adjustments for an order summary.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryAdjustmentCollection
getOrderSummaryAdjustments(String webstoreId, String orderSummaryId)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

`orderSummaryId`
Type: String

ID of the order summary.

Return Value

Type: ConnectApi.OrderSummaryAdjustmentCollection

getOrderSummaryAdjustments(webstoreId, orderSummaryId, effectiveAccountId)

Get adjustments for an order summary.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryAdjustmentCollection
getOrderSummaryAdjustments(String webstoreId, String orderSummaryId, String
effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: ConnectApi.OrderSummaryAdjustmentCollection

updateCommerceAccountAddress(webstoreId, accountId, addressId, addressInput)

Update a Commerce account address for a webstore.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommerceAddressOutput updateCommerceAccountAddress(String
webstoreId, String accountId, String addressId, ConnectApi.commerceAddressInput
addressInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account.

addressId
Type: String

ID of the address.

addressInput
Type: ConnectApi.commerceAddressInput

Information about the address fields you want to update.

Return Value

Type: ConnectApi.CommerceAddressOutput

CommerceCart Class

Get, create, update, and delete carts. Get cart items, add items to carts, update and delete cart items.

Namespace

ConnectApi

CommerceCart Methods

These methods are for `CommerceCart`. All methods are static.

IN THIS SECTION:

addItemsToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItems)
Add a batch of up to 100 items to a cart.

addItemToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItemInput)
Add an item to a cart.

applyCartCoupon(webstoreId, effectiveAccountId, activeCartOrId, cartCouponInput)
Apply a coupon to a cart.

copyCartToWishlist(webstoreId, effectiveAccountId, activeCartOrId, cartToWishlistInput)
Copy the products from a cart to a wishlist.

createCart(webstoreId, cart)
Create a cart.

deleteCart(webstoreId, effectiveAccountId, activeCartOrId)
Delete a cart.

deleteCartCoupon(webstoreId, effectiveAccountId, activeCartOrId, cartCouponId)
Delete a coupon from a cart.

deleteCartItem(webstoreId, effectiveAccountId, activeCartOrId, cartItemId)
Delete an item from a cart.

getCartCoupons(webstoreId, effectiveAccountId, activeCartOrId)
Get coupons for a cart.

getCartItems(webstoreId, effectiveAccountId, activeCartOrId)
Get items in a cart.

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam)
Get a page of items in a cart.

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, sortParam)
Get a sorted page of items in a cart.

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, pageSize)
Get a specified size page of items in a cart.

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, pageSize, sortParam)
Get a specified size, sorted page of items in a cart.

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, productFields, pageParam, pageSize, sortParam)
Get a specified size, sorted page of items filtered by product fields in a cart.

getCartSummary(webstoreId, effectiveAccountId, activeCartOrId)
Get a cart.

getOrCreateActiveCartSummary(webstoreId, effectiveAccountId, activeCartOrId)
Get a cart or create an active cart if one doesn't exist.

makeCartPrimary(webstoreId, activeCartOrId, effectiveAccountId)
Make a secondary cart a primary cart.

setCartMessagesVisibility(webstoreId, activeCartOrId, effectiveAccountId, messageVisibility)
Set the visibility for cart messages.

updateCartItem(webstoreId, effectiveAccountId, activeCartOrId, cartItemId, cartItem)
Update an item in a cart.

`addItemsToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItems)`

Add a batch of up to 100 items to a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.BatchResult[] addItemsToCart(String webstoreId, String
effectiveAccountId, String activeCartOrId, List<ConnectApi.BatchInput> cartItems)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

cartItems
Type: List<`ConnectApi.BatchInput`>

The list can contain up to 100 `ConnectApi.BatchInput` objects. In the `ConnectApi.BatchInput` constructor, the input object must be `ConnectApi.CartItemInput`.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.CartItem` object.

The returned objects correspond to each of the input objects and are returned in the same order as the input objects.

The method call fails only if an error occurs that affects the entire operation (such as a parsing failure). If an individual object causes an error, the error is embedded within the `ConnectApi.BatchResult` list.

Usage

Buyers with read access to carts can add, update, and delete items in carts.

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

addItemToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItemInput)

Add an item to a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItem addItemToCart(String webstoreId, String
effectiveAccountId, String activeCartOrId, ConnectApi.CartItemInput cartItemInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

cartItemInput
Type: `ConnectApi.CartItemInput`

A `ConnectApi.CartItemInput` object representing an item to add to the cart.

Return Value

Type: `ConnectApi.CartItem`

Usage

Buyers with read access to carts can add, update, and delete items in carts.

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

applyCartCoupon(webstoreId, effectiveAccountId, activeCartOrId, cartCouponInput)

Apply a coupon to a cart.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartCouponCollection applyCartCoupon(String webstoreId, String effectiveAccountId, String activeCartOrId, ConnectApi.cartCouponInput cartCouponInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

cartCouponInput
Type: `ConnectApi.cartCouponInput`

Coupon code for the coupon.

Return Value

Type: `ConnectApi.CartCouponCollection`

copyCartToWishlist(webstoreId, effectiveAccountId, activeCartOrId, cartToWishlistInput)

Copy the products from a cart to a wishlist.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartToWishlistResult copyCartToWishlist(String webstoreId, String effectiveAccountId, String activeCartOrId, ConnectApi.CartToWishlistInput cartToWishlistInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

cartToWishlistInput
Type: `ConnectApi.CartToWishlistInput`

A `ConnectApi.CartToWishlistInput` object indicating the wishlist to copy products to.

Return Value

Type: `ConnectApi.CartToWishlistResult`

createCart(webstoreId, cart)

Create a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartSummary createCart(String webstoreId, ConnectApi.CartInput
cart)
```

Parameters

webstoreId
Type: String

ID of the webstore.

cart
Type: `ConnectApi.CartInput`

A `ConnectApi.CartInput` object representing a cart.

Return Value

Type: `ConnectApi.CartSummary`

Usage

Buyers with read access to carts can create and delete carts.

deleteCart(webstoreId, effectiveAccountId, activeCartOrId)

Delete a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static Void deleteCart(String webstoreId, String effectiveAccountId, String activeCartOrId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

Return Value

Type: Void

Usage

Buyers with read access to carts can create and delete carts.

deleteCartCoupon(webstoreId, effectiveAccountId, activeCartOrId, cartCouponId)

Delete a coupon from a cart.

API Version

54.0

Requires Chatter

No

Signature

```
public static Void deleteCartCoupon(String webstoreId, String effectiveAccountId, String activeCartOrId, String cartCouponId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

cartCouponId
Type: String

ID of the cart coupon.

Return Value

Type: Void

deleteCartItem(webstoreId, effectiveAccountId, activeCartOrId, cartItemId)

Delete an item from a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static Void deleteCartItem(String webstoreId, String effectiveAccountId, String activeCartOrId, String cartItemId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

cartItemId
Type: String

ID of the cart item.

Return Value

Type: Void

Usage

Buyers with read access to carts can add, update, and delete items in carts.

`getCartCoupons(webstoreId, effectiveAccountId, activeCartOrId)`

Get coupons for a cart.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartCouponCollection getCartCoupons(String webstoreId, String
effectiveAccountId, String activeCartOrId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

Return Value

Type: `ConnectApi.CartCouponCollection`

getCartItems(webstoreId, effectiveAccountId, activeCartOrId)

Get items in a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

Return Value

Type: `ConnectApi.CartItemCollection`

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam)

Get a page of items in a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String pageParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: `ConnectApi.CartItemCollection`

`getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, sortParam)`

Get a sorted page of items in a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String pageParam, ConnectApi.CartItemSortOrder sortParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

sortParam
Type: `ConnectApi.CartItemSortOrder`

Sort order for items in a cart. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `NameAsc`—Sorts by name in ascending alphabetical order (A–Z).
- `NameDesc`—Sorts by name in descending alphabetical order (Z–A).
- `SalesPriceAsc`—Sorts from lowest to highest negotiated price.
- `SalesPriceDesc`—Sorts from highest to lowest negotiated price.

If `null`, the default is `CreatedDateDesc`.

Return Value

Type: `ConnectApi.CartItemCollection`

`getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, pageSize)`

Get a specified size page of items in a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String pageParam, Integer pageSize)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.CartItemCollection`

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, pageSize, sortParam)

Get a specified size, sorted page of items in a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String pageParam, Integer pageSize, ConnectApi.CartItemSortOrder sortParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.CartItemSortOrder`

Sort order for items in a cart. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `NameAsc`—Sorts by name in ascending alphabetical order (A–Z).
- `NameDesc`—Sorts by name in descending alphabetical order (Z–A).
- `SalesPriceAsc`—Sorts from lowest to highest negotiated price.
- `SalesPriceDesc`—Sorts from highest to lowest negotiated price.

If `null`, the default is `CreatedDateDesc`.

Return Value

Type: `ConnectApi.CartItemCollection`

`getCartItems(webstoreId, effectiveAccountId, activeCartOrId, productFields, pageParam, pageSize, sortParam)`

Get a specified size, sorted page of items filtered by product fields in a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String productFields, String pageParam, Integer pageSize, ConnectApi.CartItemSortOrder sortParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

productFields
Type: String

Comma-separated list of up to five product fields. Results include fields that you have access to. Some product fields (such as `productName` and `sku`) are returned even when not included in the *`productFields`* parameter.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.CartItemSortOrder`

Sort order for items in a cart. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `NameAsc`—Sorts by name in ascending alphabetical order (A–Z).
- `NameDesc`—Sorts by name in descending alphabetical order (Z–A).

- `SalesPriceAsc`—Sorts from lowest to highest negotiated price.
- `SalesPriceDesc`—Sorts from highest to lowest negotiated price.

If `null`, the default is `CreatedDateDesc`.

Return Value

Type: `ConnectApi.CartItemCollection`

`getCartSummary(webstoreId, effectiveAccountId, activeCartOrId)`

Get a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartSummary getCartSummary(String webstoreId, String
effectiveAccountId, String activeCartOrId)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

`effectiveAccountId`
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

`activeCartOrId`
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`. If you specify `active` and there isn't an active cart, you get an error.

Return Value

Type: `ConnectApi.CartSummary`

`getOrCreateActiveCartSummary(webstoreId, effectiveAccountId, activeCartOrId)`

Get a cart or create an active cart if one doesn't exist.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartSummary getOrCreateActiveCartSummary(String webstoreId,
String effectiveAccountId, String activeCartOrId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`. If you specify `active` and there isn't an active cart, one is created.

Return Value

Type: `ConnectApi.CartSummary`

Usage

Buyers with read access to carts can create and delete carts.

`makeCartPrimary(webstoreId, activeCartOrId, effectiveAccountId)`

Make a secondary cart a primary cart.

API Version

53.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommerceActionResult makeCartPrimary(String webstoreId, String activeCartOrId, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: `ConnectApi.CommerceActionResult`

setCartMessagesVisibility(webstoreId, activeCartOrId, effectiveAccountId, messageVisibility)

Set the visibility for cart messages.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartMessagesVisibilityResult setCartMessagesVisibility(String webstoreId, String activeCartOrId, String effectiveAccountId, ConnectApi.CartMessagesVisibilityInput messageVisibility)
```

Parameters

webstoreId
Type: String

ID of the webstore.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

`effectiveAccountId`
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

`messageVisibility`
Type: `ConnectApi.CartMessagesVisibilityInput`

A `ConnectApi.CartMessagesVisibilityInput` object specifying the visibility setting.

Return Value

Type: `ConnectApi.CartMessagesVisibilityResult`

`updateCartItem(webstoreId, effectiveAccountId, activeCartOrId, cartItemId, cartItem)`

Update an item in a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItem updateCartItem(String webstoreId, String effectiveAccountId, String activeCartOrId, String cartItemId, ConnectApi.CartItemInput cartItem)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

`effectiveAccountId`
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

`activeCartOrId`
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

`cartItemId`
Type: String

ID of the cart item.

cartItem
Type: ConnectApi.CartItemInput

A ConnectApi.CartItemInput object representing a cart item to update.

Return Value

Type: ConnectApi.CartItem

Usage

Buyers with read access to carts can add, update, and delete items in carts.

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

CommerceCatalog Class

Get products, product categories, and product category paths.

Namespace

ConnectApi

CommerceCatalog Methods

These methods are for CommerceCatalog. All methods are static.

IN THIS SECTION:

getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory)
Get a product.

getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo)
Get a product with variation and attribute information.

getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo, excludeQuantityRule)
Get a product with quantity rule information.

getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo, excludeQuantityRule, excludeProductSellingModels)
Get detailed information for a product, optionally including information about its product selling models.

getProductCategory(webstoreId, productCategoryId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia)
Get a product category.

getProductCategoryChildren(webstoreId, effectiveAccountId, parentProductCategoryId, fields, excludeFields, mediaGroups, excludeMedia)
Get product categories.

getProductCategoryPath(webstoreId, productCategoryId)

Get the product category path from the root category to the current category.

getProducts(webstoreId, effectiveAccountId, ids, skus, fields, excludeMedia, excludePrices)

Get fields, prices, and default images for a list of products.

getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory)

Get a product.

API Version

49.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductDetail getProduct(String webstoreId, String productId, String effectiveAccountId, List<String> fields, Boolean excludeFields, List<String> mediaGroups, Boolean excludeMedia, Boolean excludeEntitlementDetails, Boolean excludePrimaryProductCategory)
```

Parameters

webstoreId

Type: String

ID of the webstore.

productId

Type: String

ID of the product.

effectiveAccountId

Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

fields

Type: List<String>

Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

`excludeFields`
Type: Boolean

Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

`mediaGroups`
Type: List<String>

Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

`excludeMedia`
Type: Boolean

Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

`excludeEntitlementDetails`
Type: Boolean

Specifies whether the entitlement details of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

`excludePrimaryProductCategory`
Type: Boolean

Specifies whether the primary category path of the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

Return Value

Type: `ConnectApi.ProductDetail`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

`getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo)`

Get a product with variation and attribute information.

API Version

50.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductDetail getProduct(String webstoreId, String productId,
String effectiveAccountId, List<String> fields, Boolean excludeFields, List<String>
mediaGroups, Boolean excludeMedia, Boolean excludeEntitlementDetails, Boolean
excludePrimaryProductCategory, Boolean excludeVariationInfo, Boolean
excludeAttributeSetInfo)
```

Parameters

webstoreId
Type: String

ID of the webstore.

productId
Type: String

ID of the product.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

fields
Type: List<String>

Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

excludeFields
Type: Boolean

Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

mediaGroups
Type: List<String>

Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

excludeMedia
Type: Boolean

Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeEntitlementDetails
Type: Boolean

Specifies whether the entitlement details of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludePrimaryProductCategory
Type: Boolean

Specifies whether the primary category path of the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeVariationInfo
Type: Boolean

Specifies whether the variation information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeAttributeSetInfo
Type: Boolean

Specifies whether the attribute set information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

Return Value

Type: `ConnectApi.ProductDetail`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

`getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo, excludeQuantityRule)`

Get a product with quantity rule information.

API Version

52.0

Available to Guest Users

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductDetail getProduct(String webstoreId, String productId,
String effectiveAccountId, List<String> fields, Boolean excludeFields, List<String>
mediaGroups, Boolean excludeMedia, Boolean excludeEntitlementDetails, Boolean
excludePrimaryProductCategory, Boolean excludeVariationInfo, Boolean
excludeAttributeSetInfo, Boolean excludeQuantityRule)
```

Parameters

webstoreId
Type: String

ID of the webstore.

productId
Type: String

ID of the product.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

fields
Type: List<String>

Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

excludeFields
Type: Boolean

Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

mediaGroups
Type: List<String>

Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

excludeMedia
Type: Boolean

Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeEntitlementDetails
Type: Boolean

Specifies whether the entitlement details of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludePrimaryProductCategory
Type: Boolean

Specifies whether the primary category path of the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeVariationInfo
Type: Boolean

Specifies whether the variation information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeAttributeSetInfo
Type: Boolean

Specifies whether the attribute set information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeQuantityRule
Type: Boolean

Specifies whether the quantity rule information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

Return Value

Type: `ConnectApi.ProductDetail`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo, excludeQuantityRule, excludeProductSellingModels)

Get detailed information for a product, optionally including information about its product selling models.

API Version

56.0

Available to Guest Users

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductDetail getProduct(String webstoreId, String productId,
String effectiveAccountId, List<String> fields, Boolean excludeFields, List<String>
mediaGroups, Boolean excludeMedia, Boolean excludeEntitlementDetails, Boolean
excludePrimaryProductCategory, Boolean excludeVariationInfo, Boolean
excludeAttributeSetInfo, Boolean excludeQuantityRule, Boolean
excludeProductSellingModels)
```

Parameters

webstoreId
Type: String

ID of the webstore.

productId
Type: String

ID of the product.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

fields
Type: List<String>

Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

excludeFields
Type: Boolean

Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

mediaGroups
Type: List<String>

Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

excludeMedia
Type: Boolean

Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeEntitlementDetails
Type: Boolean

Specifies whether the entitlement details of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludePrimaryProductCategory
Type: Boolean

Specifies whether the primary category path of the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeVariationInfo
Type: Boolean

Specifies whether the variation information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeAttributeSetInfo
Type: Boolean

Specifies whether the attribute set information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeQuantityRule
Type: Boolean

Specifies whether the quantity rule information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeProductSellingModels
Type: Boolean

Specifies whether product selling models are returned or not. The behavior of this parameter depends on whether you turn on the CommerceSubscription permission. If the permission is on, and if you set the parameter to `false` (or if you omit the parameter), product selling models are returned. If the permission is on, and if you set the parameter to `true`, product selling models are not

returned. If the permission is off, product selling models are not returned, regardless of whether you omit the parameter or provide a value.

Return Value

Type: `ConnectApi.ProductDetail`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

getProductCategory(webstoreId, productCategoryId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia)

Get a product category.

API Version

49.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductCategoryDetail getProductCategory(String webstoreId, String productCategoryId, String effectiveAccountId, List<String> fields, Boolean excludeFields, List<String> mediaGroups, Boolean excludeMedia)
```

Parameters

webstoreId
Type: String

ID of the webstore.

productCategoryId
Type: String

ID of the product category.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

fields
Type: List<String>

Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

`excludeFields`
Type: Boolean

Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

`mediaGroups`
Type: List<String>

Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

`excludeMedia`
Type: Boolean

Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

Return Value

Type: `ConnectApi.ProductCategoryDetail`

`getProductCategoryChildren(webstoreId, effectiveAccountId, parentProductCategoryId, fields, excludeFields, mediaGroups, excludeMedia)`

Get product categories.

API Version

52.0

Available to Guest Users

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductCategoryDetailCollection
getProductCategoryChildren(String webstoreId, String effectiveAccountId, String
parentProductCategoryId, List<String> fields, Boolean excludeFields, List<String>
mediaGroups, Boolean excludeMedia)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

parentProductCategoryId
Type: String

ID of the product category for which you want to get all the children product categories. If `null`, returns all the top-level product categories for the store.

fields
Type: List<String>

Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

excludeFields
Type: Boolean

Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

mediaGroups
Type: List<String>

Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

excludeMedia
Type: Boolean

Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

Return Value

Type: `ConnectApi.ProductCategoryDetailCollection`

`getProductCategoryPath(webstoreId, productCategoryId)`

Get the product category path from the root category to the current category.

API Version

49.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductCategoryPath getProductCategoryPath(String webstoreId,
String productCategoryId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

productCategoryId
Type: String

ID of the product category.

Return Value

Type: ConnectApi.ProductCategoryPath

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

getProducts(webstoreId, effectiveAccountId, ids, skus, fields, excludeMedia, excludePrices)

Get fields, prices, and default images for a list of products.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductOverviewCollection getProducts(String webstoreId, String
effectiveAccountId, List<String> ids, List<String> skus, List<String> fields, Boolean
excludeMedia, Boolean excludePrices)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.

ids
Type: List<>

List of product IDs. Specify either a list of up to 20 product IDs or SKUs, but not both.

skus
Type: List<>

List of SKUs. Specify either a list of up to 20 SKUs or product IDs, but not both.

fields
Type: List<>

Comma-separated list of field names to return for each product. If the list is empty or not specified, all fields are returned. You can specify any number of fields.

excludeMedia
Type: Boolean

Specifies whether default images are returned for the products (`false`) or not (`true`). The default is `false`.

excludePrices
Type: Boolean

Specifies whether prices are returned for the products (`false`) or not (`true`). The default is `false`.

Return Value

Type: `ConnectApi.ProductOverviewCollection`

CommerceSearch Class

Namespace

ConnectApi

CommerceSearch Methods

These methods are for `CommerceSearch`. All methods are static.

IN THIS SECTION:

getSortRules(webstoreId)
Get sort rules for the live index.

getSuggestions(webstoreId, effectiveAccountId, searchTerm, maxResults)
Get suggestions for product searches.

searchProducts(webstoreId, effectiveAccountId, productSearchInput)
Search products.

`getSortRules(webstoreId)`

Get sort rules for the live index.

API Version

52.0

Available to Guest Users

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.SortRulesCollection getSortRules(String webstoreId)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

Return Value

Type: `ConnectApi.SortRulesCollection`

`getSuggestions(webstoreId, effectiveAccountId, searchTerm, maxResults)`

Get suggestions for product searches.

API Version

52.0

Available to Guest Users

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductSearchSuggestionsResults getSuggestions(String
webstoreId, String effectiveAccountId, String searchTerm, Integer maxResults)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

searchTerm
Type: String

Search term with up to 10 characters. If specified, the service returns autocomplete suggestions from the user's recent searches. If unspecified, the service returns suggestions from the user's recent searches.

maxResults
Type: Integer

Maximum number of suggestions. Values are from 1 through 10. If unspecified, defaults to 10.

Return Value

Type: `ConnectApi.ProductSearchSuggestionsResults`

searchProducts(webstoreId, effectiveAccountId, productSearchInput)

Search products.

API Version

52.0

Available to Guest Users

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductSearchResults searchProducts(String webstoreId, String
effectiveAccountId, ConnectApi.ProductSearchInput productSearchInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

productSearchInput
Type: `ConnectApi.ProductSearchInput`

A `ConnectApi.ProductSearchInput` body with either a category ID or search terms.

Return Value

Type: `ConnectApi.ProductSearchResults`

Usage

Searching products respects buyer View Product entitlements and only users entitled to view product data can access this resource.

CommerceSearchSettings Class

Get indexes and create an index of a product catalog.

Namespace

ConnectApi

CommerceSearchSettings Methods

These methods are for `CommerceSearchSettings`. All methods are static.

IN THIS SECTION:

createCommerceSearchIndex(webstoreId)
Create an index of a product catalog.

getCommerceSearchIndex(webstoreId, indexId)
Get a Commerce search index.

getCommerceSearchIndexes(webstoreId)
Get Commerce search indexes.

`createCommerceSearchIndex(webstoreId)`

Create an index of a product catalog.

API Version

52.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommerceSearchIndex postCommerceSearchIndex(String webstoreId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

Return Value

Type: ConnectApi.CommerceSearchIndex

Usage

This method creates a live index that replaces the current live index. Any indexes that are in progress are removed when you manually create an index with this method.

getCommerceSearchIndex(webstoreId, indexId)

Get a Commerce search index.

API Version

52.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommerceSearchIndex getSingleCommerceSearchIndex(String
webstoreId, String indexId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

indexId
Type: String

ID of the index.

Return Value

Type: `ConnectApi.CommerceSearchIndex`

`getCommerceSearchIndexes(webstoreId)`

Get Commerce search indexes.

API Version

52.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommerceSearchIndexCollection getCommerceSearchIndexes(String webstoreId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

Return Value

Type: `ConnectApi.CommerceSearchIndexCollection`

CommerceStorePricing Class

Get product prices.

Namespace

ConnectApi

CommerceStorePricing Methods

These methods are for `CommerceStorePricing`. All methods are static.

IN THIS SECTION:

getProductPrice(webstoreId, productId, effectiveAccountId)
Get the list and buyer price for a product.

getProductPrice(webstoreId, productId, effectiveAccountId, productSellingModelIds)
Get a product's list and buyer price for specified product selling models.

getProductPrices(webstoreId, effectiveAccountId, pricingInput)
Get the prices for multiple products.

getProductPrices(webstoreId, effectiveAccountId, productIds)
Get the prices for multiple products.

`getProductPrice(webstoreId, productId, effectiveAccountId)`

Get the list and buyer price for a product.

API Version

49.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductPrice getProductPrice(String webstoreId, String
productId, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

productId
Type: String

ID of the product.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made.

Return Value

Type: `ConnectApi.ProductPrice`

Usage

This method respects buyer entitlements and only users entitled to view product and price data can access it.

To get price information, the context store and account must have 25 or fewer price books associated with them. To reduce the number of active price books for the account within the store, you can change the active status, modify valid dates, or remove assignments of price books.

`getProductPrice(webstoreId, productId, effectiveAccountId, productSellingModelIds)`

Get a product's list and buyer price for specified product selling models.

API Version

56.0

Available to Guest Users

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductPrice getProductPrice(String webstoreId, String
productId, String effectiveAccountId, List<String> productSellingModelIds)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

`productId`
Type: String

ID of the product.

`effectiveAccountId`
Type: String

ID of the buyer account or guest buyer profile for which the request is made.

`productSellingModelIds`
Type: List<String>

List of product selling model IDs for the product.

Return Value

Type: `ConnectApi.ProductPrice`

`getProductPrices(webstoreId, effectiveAccountId, pricingInput)`

Get the prices for multiple products.

API Version

49.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.PricingResult getProductPrices(String webstoreId, String effectiveAccountId, ConnectApi.PricingInput pricingInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

pricingInput
Type: `ConnectApi.PricingInput`

A `ConnectApi.PricingInput` body with the list of line items to price.

Return Value

Type: `ConnectApi.PricingResult`

Usage

This method respects buyer entitlements and only users entitled to view product and price data can access it.

To get price information, the context store and account must have 25 or fewer price books associated with them. To reduce the number of active price books for the account within the store, you can change the active status, modify valid dates, or remove assignments of price books.

`getProductPrices(webstoreId, effectiveAccountId, productIds)`

Get the prices for multiple products.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.PricingResult getProductPrices(String webstoreId, String
effectiveAccountId, List<String> productIds)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

productIds
Type: List<String>

List of product IDs for which you want to get prices.

Return Value

Type: `ConnectApi.PricingResult`

Usage

This method respects buyer entitlements and only users entitled to view product and price data can access it.

To get price information, the context store and account must have 25 or fewer price books associated with them. To reduce the number of active price books for the account within the store, you can change the active status, modify valid dates, or remove assignments of price books.

CommerceWishlist Class

Get, create, update, and delete wishlists. Add wishlists to carts. Get wishlist items, add items to wishlists, and delete wishlist items.

Namespace

ConnectApi

CommerceWishlist Methods

These methods are for `CommerceWishlist`. All methods are static.

IN THIS SECTION:

addItemToWishlist(webstoreId, wishlistId, wishlistItemInput)
Add an item to a wishlist for the context user.

addItemToWishlist(webstoreId, effectiveAccountId, wishlistId, wishlistItemInput)
Add an item to a wishlist.

addWishlistToCart(webstoreId, wishlistId)
Add a wishlist to the active cart for the context user.

addWishlistToCart(webstoreId, wishlistId, effectiveAccountId)
Add a wishlist to the active cart.

addWishlistToCartWithCartId(webstoreId, wishlistId, cartId)
Add a wishlist to a cart.

addWishlistToCartWithCartId(webstoreId, wishlistId, cartId, effectiveAccountId)
Add a wishlist to a cart.

createWishlist(webstoreId, wishlistInput)
Create a wishlist for the context user.

createWishlist(webstoreId, effectiveAccountId, wishlistInput)
Create a wishlist.

deleteWishlist(webstoreId, wishlistId)
Delete a wishlist for the context user.

deleteWishlist(webstoreId, effectiveAccountId, wishlistId)
Delete a wishlist.

getWishlist(webstoreId, effectiveAccountId, wishlistId, productFields, sortItemsBy)
Get a wishlist with product fields sorted by items.

getWishlist(webstoreId, effectiveAccountId, wishlistId, productFields, pageSize, sortItemsBy)
Get a wishlist with product fields sorted by items with a specified number of items per page.

getWishlistItems(webstoreId, effectiveAccountId, wishlistId, productFields, pageParam, sortItemsBy)
Get a page of sorted wishlist items with product fields.

getWishlistItems(webstoreId, effectiveAccountId, wishlistId, productFields, pageParam, pageSize, sortItemsBy)
Get a page of specified size of sorted wishlist items with product fields.

getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList)
Get wishlist summaries.

getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList, productFields, sortItemsBy)
Get wishlist summaries with product fields sorted by items.

getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList, productFields, pageSize, sortItemsBy)
Get wishlist summaries with product fields sorted by items with a specified number of items per page.

removeWishlistItem(webstoreId, effectiveAccountId, wishlistId, wishlistItemId)
Remove an item from a wishlist.

updateWishlist(webstoreId, wishlistId, wishlistUpdateInput)
Update the name of a wishlist for the context user.

updateWishlist(webstoreId, effectiveAccountId, wishlistId, wishlistUpdateInput)
Update the name of a wishlist.

addItemToWishlist(webstoreId, wishlistId, wishlistItemInput)

Add an item to a wishlist for the context user.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistItem addItemToWishlist(String webstoreId, String wishlistId, ConnectApi.WishlistItemInput wishlistItemInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

wishlistId
Type: String

ID of the wishlist.

wishlistItemInput
Type: `ConnectApi.WishlistItemInput`

A `ConnectApi.WishlistItemInput` body with the item to add to the wishlist.

Return Value

Type: `ConnectApi.WishlistItem`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

addItemToWishlist(webstoreId, effectiveAccountId, wishlistId, wishlistItemInput)

Add an item to a wishlist.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistItem addItemToWishlist(String webstoreId, String
effectiveAccountId, String wishlistId, ConnectApi.WishlistItemInput wishlistItemInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

wishlistId
Type: String

ID of the wishlist.

wishlistItemInput
Type: `ConnectApi.WishlistItemInput`

A `ConnectApi.WishlistItemInput` body with the item to add to the wishlist.

Return Value

Type: `ConnectApi.WishlistItem`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

addWishlistToCart(webstoreId, wishlistId)

Add a wishlist to the active cart for the context user.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistToCartResult addWishlistToCart(String webstoreId,
String wishlistId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

wishlistId
Type: String

ID of the wishlist.

Return Value

Type: ConnectApi.WishlistToCartResult

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

addWishlistToCart(webstoreId, wishlistId, effectiveAccountId)

Add a wishlist to the active cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistToCartResult addWishlistToCart(String webstoreId,
String wishlistId, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

wishlistId
Type: String

ID of the wishlist.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: `ConnectApi.WishlistToCartResult`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

addWishlistToCartWithCartId(webstoreId, wishlistId, cartId)

Add a wishlist to a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistToCartResult addWishlistToCartWithCartId(String
webstoreId, String wishlistId, String cartId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

wishlistId
Type: String

ID of the wishlist.

cartId
Type: String

ID of the cart. If `null`, wishlist items are added to the active cart.

Return Value

Type: `ConnectApi.WishlistToCartResult`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

addWishlistToCartWithCartId(webstoreId, wishlistId, cartId, effectiveAccountId)

Add a wishlist to a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistToCartResult addWishlistToCartWithCartId(String webstoreId, String wishlistId, String cartId, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

wishlistId
Type: String

ID of the wishlist.

cartId
Type: String

ID of the cart. If `null`, wishlist items are added to the active cart.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: `ConnectApi.WishlistToCartResult`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

createWishlist(webstoreId, wishlistInput)

Create a wishlist for the context user.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.Wishlist createWishlist(String webstoreId,
ConnectApi.WishlistInput wishlistInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

wishlistInput
Type: ConnectApi.WishlistInput

A ConnectApi.WishlistInput body that includes the wishlist name and items.

Return Value

Type: ConnectApi.Wishlist

createWishlist(webstoreId, effectiveAccountId, wishlistInput)

Create a wishlist.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.Wishlist createWishlist(String webstoreId, String
effectiveAccountId, ConnectApi.WishlistInput wishlistInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If null, defaults to the account ID for the context user.

wishlistInput
Type: ConnectApi.WishlistInput

A `ConnectApi.WishlistInput` body that includes the wishlist name and items.

Return Value

Type: `ConnectApi.Wishlist`

deleteWishlist(webstoreId, wishlistId)

Delete a wishlist for the context user.

API Version

49.0

Requires Chatter

No

Signature

```
public static Void deleteWishlist(String webstoreId, String wishlistId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

wishlistId
Type: String

ID of the wishlist.

Return Value

Type: Void

deleteWishlist(webstoreId, effectiveAccountId, wishlistId)

Delete a wishlist.

API Version

51.0

Requires Chatter

No

Signature

```
public static Void deleteWishlist(String webstoreId, String effectiveAccountId, String
wishlistId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

wishlistId
Type: String

ID of the wishlist.

Return Value

Type: Void

getWishlist(webstoreId, effectiveAccountId, wishlistId, productFields, sortItemsBy)

Get a wishlist with product fields sorted by items.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Wishlist getWishlist(String webstoreId, String
effectiveAccountId, String wishlistId, String productFields,
ConnectApi.WishlistItemSortOrder sortItemsBy)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

wishlistId
Type: String

ID of the wishlist.

productFields
Type: String

Comma-separated list of custom product fields. Fields aren't case-sensitive. For example, `ProductCode` and `productcode` return the same results.

sortItemsBy
Type: `ConnectApi.WishlistItemSortOrder`

Sort order for wishlist items. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.

The default sort order is `CreatedDateDesc`.

Return Value

Type: `ConnectApi.Wishlist`

getWishlist(webstoreId, effectiveAccountId, wishlistId, productFields, pageSize, sortItemsBy)

Get a wishlist with product fields sorted by items with a specified number of items per page.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Wishlist getWishlist(String webstoreId, String
effectiveAccountId, String wishlistId, String productFields, Integer pageSize,
ConnectApi.WishlistItemSortOrder sortItemsBy)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

wishlistId
Type: String

ID of the wishlist.

productFields
Type: String

Comma-separated list of custom product fields. Fields aren't case-sensitive. For example, `ProductCode` and `productcode` return the same results.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortItemsBy
Type: `ConnectApi.WishlistItemSortOrder`

Sort order for wishlist items. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.

The default sort order is `CreatedDateDesc`.

Return Value

Type: `ConnectApi.Wishlist`

getWishlistItems(webstoreId, effectiveAccountId, wishlistId, productFields, pageParam, sortItemsBy)

Get a page of sorted wishlist items with product fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistItemCollection getWishlistItems(String webstoreId,
String effectiveAccountId, String wishlistId, String productFields, String pageParam,
ConnectApi.WishlistItemSortOrder sortItemsBy)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

wishlistId
Type: String

ID of the wishlist.

productFields
Type: String

Comma-separated list of custom product fields. Fields aren't case-sensitive. For example, `ProductCode` and `productcode` return the same results.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

sortItemsBy
Type: `ConnectApi.WishlistItemSortOrder`

Sort order for wishlist items. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.

The default sort order is `CreatedDateDesc`.

Return Value

Type: `ConnectApi.WishlistItemCollection`

`getWishlistItems(webstoreId, effectiveAccountId, wishlistId, productFields, pageParam, pageSize, sortItemsBy)`

Get a page of specified size of sorted wishlist items with product fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistItemCollection getWishlistItems(String webstoreId,
String effectiveAccountId, String wishlistId, String productFields, String pageParam,
Integer pageSize, ConnectApi.WishlistItemSortOrder sortItemsBy)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

wishlistId
Type: String

ID of the wishlist.

productFields
Type: String

Comma-separated list of custom product fields. Fields aren't case-sensitive. For example, `ProductCode` and `productcode` return the same results.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 200. If you pass in `null`, the default size is 25.

sortItemsBy
Type: `ConnectApi.WishlistItemSortOrder`

Sort order for wishlist items. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.

The default sort order is `CreatedDateDesc`.

Return Value

Type: `ConnectApi.WishlistItemCollection`

`getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList)`

Get wishlist summaries.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistsSummary getWishlistSummaries(String webstoreId, String effectiveAccountId, Boolean includeDisplayedList)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

includeDisplayedList
Type: Boolean

Specifies whether to include the displayed list (`true`) or not (`false`). If `null`, defaults to `false`.

Return Value

Type: `ConnectApi.WishlistsSummary`

`getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList, productFields, sortItemsBy)`

Get wishlist summaries with product fields sorted by items.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistsSummary getWishlistSummaries(String webstoreId, String effectiveAccountId, Boolean includeDisplayedList, String productFields, ConnectApi.WishlistItemSortOrder sortItemsBy)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

includeDisplayedList
Type: Boolean

Specifies whether to include the displayed list (`true`) or not (`false`).

productFields
Type: String

Comma-separated list of custom product fields. Fields aren't case-sensitive. For example, `ProductCode` and `productcode` return the same results.

If *includeDisplayedList* is `false`, *productFields* is ignored.

sortItemsBy
Type: `ConnectApi.WishlistItemSortOrder`

Sort order for wishlist items. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.

The default sort order is `CreatedDateDesc`.

If *includeDisplayedList* is `false`, *sortItemsBy* is ignored.

Return Value

Type: `ConnectApi.WishlistsSummary`

getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList, productFields, pageSize, sortItemsBy)

Get wishlist summaries with product fields sorted by items with a specified number of items per page.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistsSummary getWishlistSummaries(String webstoreId, String effectiveAccountId, Boolean includeDisplayedList, Integer pageSize, String productFields, pageSize, ConnectApi.WishlistItemSortOrder sortItemsBy)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

includeDisplayedList
Type: Boolean

Specifies whether to include the displayed list (`true`) or not (`false`).

productFields
Type: String

Comma-separated list of custom product fields. Fields aren't case-sensitive. For example, `ProductCode` and `productcode` return the same results.

If *includeDisplayedList* is `false`, *productFields* is ignored.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortItemsBy
Type: `ConnectApi.WishlistItemSortOrder`

Sort order for wishlist items. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.

The default sort order is `CreatedDateDesc`.

If *includeDisplayedList* is `false`, *sortItemsBy* is ignored.

Return Value

Type: `ConnectApi.WishlistsSummary`

removeWishlistItem(webstoreId, effectiveAccountId, wishlistId, wishlistItemId)

Remove an item from a wishlist.

API Version

49.0

Requires Chatter

No

Signature

```
public static Void removeWishlistItem(String webstoreId, String effectiveAccountId,
String wishlistId, String wishlistItemId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

wishlistId
Type: String

ID of the wishlist.

wishlistItemId
Type: String

ID of the wishlist item to remove.

Return Value

Type: Void

updateWishlist(webstoreId, wishlistId, wishlistUpdateInput)

Update the name of a wishlist for the context user.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistSummary updateWishlist(String webstoreId, String
wishlistId, ConnectApi.WishlistUpdateInput wishlistUpdateInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

wishlistId
Type: String

ID of the wishlist.

wishlistUpdateInput
Type: `ConnectApi.WishlistUpdateInput`

A `ConnectApi.WishlistUpdateInput` body with the wishlist name to update.

Return Value

Type: ConnectApi.WishlistSummary

updateWishlist(webstoreId, effectiveAccountId, wishlistId, wishlistUpdateInput)

Update the name of a wishlist.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistSummary updateWishlist(String webstoreId, String effectiveAccountId, String wishlistId, ConnectApi.WishlistUpdateInput wishlistUpdateInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

wishlistId
Type: String

ID of the wishlist.

wishlistUpdateInput
Type: ConnectApi.WishlistUpdateInput

A `ConnectApi.WishlistUpdateInput` body with the wishlist name to update.

Return Value

Type: ConnectApi.WishlistSummary

Communities Class

Get information about Experience Cloud sites in your org.

Namespace

ConnectApi

Communities Methods

The following are methods for `Communities`. All methods are static.

IN THIS SECTION:

getCommunities()
Get a list of Experience Cloud sites that the context user has access to.

getCommunities(communityStatus)
Get a list of Experience Cloud sites with the specified status that the context user has access to.

getCommunity(communityId)
Get information about an Experience Cloud site.

`getCommunities()`

Get a list of Experience Cloud sites that the context user has access to.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommunityPage getCommunities()
```

Return Value

Type: `ConnectApi.CommunityPage`

`getCommunities(communityStatus)`

Get a list of Experience Cloud sites with the specified status that the context user has access to.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommunityPage getCommunities(ConnectApi.CommunityStatus
communityStatus)
```

Parameters

communityStatus
Type: `ConnectApi.CommunityStatus`

communityStatus—Status of the Experience Cloud site. Values are:

- `Live`
- `Inactive`
- `UnderConstruction`

Return Value

Type: `ConnectApi.CommunityPage`

getCommunity(communityId)

Get information about an Experience Cloud site.

API Version

28.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.Community getCommunity(String communityId)
```

Parameters

communityId
Type: String

ID of an Experience Cloud site. You can't specify `null` or `internal`.

Return Value

Type: `ConnectApi.Community`

CommunityModeration Class

Get information about flagged feed items and comments in an Experience Cloud site. Add and remove flags from comments and feed items.

Namespace

ConnectApi

CommunityModeration Methods

The following are methods for `CommunityModeration`. All methods are static.

IN THIS SECTION:

addFlagToComment(communityId, commentId)
Add a moderation flag to a comment.

addFlagToComment(communityId, commentId, visibility)
Add a moderation flag of the specified visibility to a comment.

addFlagToComment(communityId, commentId, type)
Add a moderation flag of the specified type to a comment.

addFlagToComment(communityId, commentId, note)
Add a moderation flag with a note to a comment.

addFlagToComment(communityId, commentId, type, note)
Add a moderation flag of the specified type with a note to a comment.

addFlagToComment(communityId, commentId, type, visibility)
Add a moderation flag of the specified type and visibility to a comment.

addFlagToComment(communityId, commentId, visibility, note)
Add a moderation flag of the specified visibility with a note to a comment.

addFlagToComment(communityId, commentId, type, visibility, note)
Add a moderation flag of the specified type and visibility with a note to a comment.

addFlagToFeedElement(communityId, feedElementId)
Add a moderation flag to a feed element.

addFlagToFeedElement(communityId, feedElementId, visibility)
Add a moderation flag of the specified visibility to a feed element.

addFlagToFeedElement(communityId, feedElementId, type)
Add a moderation flag of the specified type to a feed element.

addFlagToFeedElement(communityId, feedElementId, note)
Add a moderation flag with a note to a feed element.

addFlagToFeedElement(communityId, feedElementId, type, note)
Add a moderation flag of the specified type with a note to a feed element.

addFlagToFeedElement(communityId, feedElementId, type, visibility)
Add a moderation flag of the specified type and visibility to a feed element.

addFlagToFeedElement(communityId, feedElementId, visibility, note)
Add a moderation flag of the specified visibility with a note to a feed element.

addFlagToFeedElement(communityId, feedElementId, type, visibility, note)
Add a moderation flag of the specified type and visibility with a note to a feed element.

getFlagsOnComment(communityId, commentId)
Get the moderation flags on a comment.

getFlagsOnComment(communityId, commentId, visibility)
Get the moderation flags with specified visibility on a comment.

getFlagsOnComment(communityId, commentId, pageSize, pageParam)
Get a page of moderation flags on a comment.

getFlagsOnComment(communityId, commentId, visibility, pageSize, pageParam)
Get a page of moderation flags with specified visibility on a comment.

getFlagsOnFeedElement(communityId, feedElementId)
Get the moderation flags on a feed element.

getFlagsOnFeedElement(communityId, feedElementId, visibility)
Get the moderation flags with specified visibility on a feed element.

getFlagsOnFeedElement(communityId, feedElementId, pageParam, pageSize)
Get a page of moderation flags on a feed element.

getFlagsOnFeedElement(communityId, feedElementId, visibility, pageSize, pageParam)
Get a page of moderation flags with specified visibility on a feed element.

removeFlagFromComment(communityId, commentId, userId)
Remove a moderation flag from a comment.

removeFlagFromFeedElement(communityId, feedElementId, userId)
Remove a moderation flag from a feed element.

`addFlagToComment(communityId, commentId)`

Add a moderation flag to a comment.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

`addFlagToComment(communityId, commentId, visibility)`

Add a moderation flag of the specified visibility to a comment.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String
commentId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.

- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToComment(communityId, commentId, type)

Add a moderation flag of the specified type to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagType type)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

type
Type: `ConnectApi.CommunityFlagType`

Type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToComment(communityId, commentId, note)

Add a moderation flag with a note to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, String note)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToComment(communityId, commentId, type, note)

Add a moderation flag of the specified type with a note to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagType type, String note)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

type
Type: `ConnectApi.CommunityFlagType`

Type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

`addFlagToComment(communityId, commentId, type, visibility)`

Add a moderation flag of the specified type and visibility to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagType type, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

type
Type: `ConnectApi.CommunityFlagType`

Type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

`addFlagToComment(communityId, commentId, visibility, note)`

Add a moderation flag of the specified visibility with a note to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagVisibility visibility, String note)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToComment(communityId, commentId, type, visibility, note)

Add a moderation flag of the specified type and visibility with a note to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagType type, ConnectApi.CommunityFlagVisibility visibility, String note)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

type
Type: `ConnectApi.CommunityFlagType`

Type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

`addFlagToFeedElement(communityId, feedElementId)`

Add a moderation flag to a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: `ConnectApi.ModerationCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedElement(communityId, feedElementId, visibility)

Add a moderation flag of the specified visibility to a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

visibility
Type: ConnectApi.CommunityFlagVisibility

Visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: ConnectApi.ModerationCapability

If the feed element doesn't support this capability, the return value is ConnectApi.NotFoundException.

Usage

To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedElement(communityId, feedElementId, type)

Add a moderation flag of the specified type to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagType type)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

type
Type: ConnectApi.CommunityFlagType

Type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedElement(communityId, feedElementId, note)

Add a moderation flag with a note to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, String note)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedElement(communityId, feedElementId, type, note)

Add a moderation flag of the specified type with a note to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagType type, String note)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

type
Type: `ConnectApi.CommunityFlagType`

Type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedElement(communityId, feedElementId, type, visibility)

Add a moderation flag of the specified type and visibility to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagType type,
ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

type
Type: `ConnectApi.CommunityFlagType`

Type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

`addFlagToFeedElement(communityId, feedElementId, visibility, note)`

Add a moderation flag of the specified visibility with a note to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility, String note)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

`addFlagToFeedElement(communityId, feedElementId, type, visibility, note)`

Add a moderation flag of the specified type and visibility with a note to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagType type,
ConnectApi.CommunityFlagVisibility visibility, String note)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

type
Type: `ConnectApi.CommunityFlagType`

Type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

`getFlagsOnComment(communityId, commentId)`

Get the moderation flags on a comment.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String commentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

getFlagsOnComment(communityId, commentId, visibility)

Get the moderation flags with specified visibility on a comment.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String commentId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`getFlagsOnComment(communityId, commentId, pageSize, pageParam)`

Get a page of moderation flags on a comment.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String
commentId, Integer pageSize, String pageParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`getFlagsOnComment(communityId, commentId, visibility, pageSize, pageParam)`

Get a page of moderation flags with specified visibility on a comment.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String commentId, ConnectApi.CommunityFlagVisibility visibility, Integer pageSize, String pageParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.

- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`getFlagsOnFeedElement(communityId, feedElementId)`

Get the moderation flags on a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`
Type: String

ID of the feed element.

Return Value

Type: ConnectApi.ModerationCapability

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

getFlagsOnFeedElement(communityId, feedElementId, visibility)

Get the moderation flags with specified visibility on a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

visibility
Type: ConnectApi.CommunityFlagVisibility

Visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: ConnectApi.ModerationCapability

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

getFlagsOnFeedElement(communityId, feedElementId, pageParam, pageSize)

Get a page of moderation flags on a feed element.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId, String pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

Return Value

Type: ConnectApi.ModerationCapability

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`getFlagsOnFeedElement(communityId, feedElementId, visibility, pageSize, pageParam)`

Get a page of moderation flags with specified visibility on a feed element.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility, Integer pageSize,
String pageParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: ConnectApi.ModerationCapability

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

removeFlagFromComment(communityId, commentId, userId)

Remove a moderation flag from a comment.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags removeFlagFromComment(String communityId,
String commentId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

userId
Type: String

ID of the context user for whom the flag is removed. Specify `null` to remove the flag for all users.

Return Value

Type: Void

Usage

To remove a moderation flag, the context user must have added the flag or must have the Moderate Experiences Feeds permission.

removeFlagFromFeedElement(communityId, feedElementId, userId)

Remove a moderation flag from a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static void removeFlagFromFeedElement(String communityId, String feedElementId,
String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

userId
Type: String

ID of the context user for whom the flag is removed. Specify `null` to remove the flag for all users.

Return Value

Type: ConnectApi.ModerationCapability

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To remove a moderation flag, the context user must have added the flag or must have the Moderate Experiences Feeds permission.

Retired CommunityModeration Methods

The following methods for `CommunityModeration` are retired.

IN THIS SECTION:

addFlagToFeedItem(communityId, feedItemId)
Add a moderation flag to a feed item.

addFlagToFeedItem(communityId, feedItemId, visibility)
Add a moderation flag with specified visibility to a feed item.

getFlagsOnFeedItem(communityId, feedItemId)
Get the moderation flags on a feed item.

getFlagsOnFeedItem(communityId, feedItemId, visibility)
Get the moderation flags with specified visibility on a feed item.

removeFlagsOnFeedItem(communityId, feedItemId, userId)
Remove a moderation flag from a feed item.

`addFlagToFeedItem(communityId, feedItemId)`

Add a moderation flag to a feed item.

API Version

29.0–31.0

Important: In version 32.0 and later, use addFlagToFeedElement(communityId, feedElementId).

Requires Chatter

Yes

Signature

```
public static ConnectApi. moderationFlags addFlagToFeedItem(String communityId, String feedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a feed item, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedItem(communityId, feedItemId, visibility)

Add a moderation flag with specified visibility to a feed item.

API Version

30.0–31.0

Important: In version 32.0 and later, use addFlagToFeedElement(communityId, feedElementId, visibility).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToFeedItem(String communityId, String feedItemId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a feed item, Allow members to flag content must be selected for an Experience Cloud site.

`getFlagsOnFeedItem(communityId, feedItemId)`

Get the moderation flags on a feed item.

API Version

29.0–31.0

Important: In version 32.0 and later, use getFlagsOnFeedElement(communityId, feedElementId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnFeedItem(String communityId, String feedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

getFlagsOnFeedItem(communityId, feedItemId, visibility)

Get the moderation flags with specified visibility on a feed item.

API Version

30.0–31.0

Important: In version 32.0 and later, use getFlagsOnFeedElement(communityId, feedElementId, visibility).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnFeedItem(String communityId, String feedItemId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

removeFlagsOnFeedItem(communityId, feedItemId, userId)

Remove a moderation flag from a feed item.

API Version

29.0–31.0

Important: In version 32.0 and later, use removeFlagFromFeedElement(communityId, feedElementId, userId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags removeFlagsOnFeedItem(String communityId,
String feedItemId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

userId
Type: String

ID of the context user for whom the flag is removed. Specify `null` to remove the flag for all users.

Return Value

Type: Void

Usage

To remove a moderation flag, the context user must have added the flag or must have the Moderate Experiences Feeds permission.

ContentHub Class

Access Files Connect repositories and their files and folders.

Namespace

ConnectApi

ContentHub Methods

The following are methods for `ContentHub`. All methods are static.

Use `ContentHub` methods to work with Files Connect repositories.

IN THIS SECTION:

addRepositoryItem(repositoryId, repositoryFolderId, file)
Add a repository item.

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)
Add a repository item in an Experience Cloud site.

addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)
Add a repository item, including the binary file.

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)
Add a repository item, including the binary file, in an Experience Cloud site.

getAllowedItemTypes(repositoryId, repositoryFolderId)
Get the item types that the context user is allowed to create in the repository folder.

getAllowedItemTypes(repositoryId, repositoryFolderId, filter)
Get the item types, filtered by type, that the context user is allowed to create in the repository folder.

getAllowedItemTypes(communityId, repositoryId, repositoryFolderId)
Get the item types that the context user is allowed to create in the repository folder in an Experience Cloud site.

getAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter)
Get the item types, filtered by type, that the context user is allowed to create in the repository folder in an Experience Cloud site.

getFilePreview(repositoryId, repositoryFileId, formatType)
Get a repository file preview.

getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)
Get a page or page range of a repository file preview.

getFilePreview(communityId, repositoryId, repositoryFileId, formatType)
Get a repository file preview in an Experience Cloud site.

getFilePreview(communityId, repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)
Get a page or page range of a repository file preview in an Experience Cloud site.

getItemType(repositoryId, repositoryItemTypeId)
Get information about an item type associated with a repository.

getItemType(communityId, repositoryId, repositoryItemTypeId)
Get information about an item type associated with a repository in an Experience Cloud site.

getPreviews(repositoryId, repositoryFileId)
Get information about a repository file's supported previews.

getPreviews(communityId, repositoryId, repositoryFileId)
Get information about a repository file's supported previews in an Experience Cloud site.

getRepositories()
Get a list of repositories.

getRepositories(communityId)
Get a list of repositories in an Experience Cloud site.

getRepositories(pageParam, pageSize)
Get a page of repositories.

getRepositories(communityId, pageParam, pageSize)
Get a page of repositories in an Experience Cloud site.

getRepository(repositoryId)
Get a repository.

getRepository(communityId, repositoryId)
Get a repository in an Experience Cloud site.

getRepositoryFile(repositoryId, repositoryFileId)
Get a repository file.

getRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)
Get a repository file with or without permissions information.

getRepositoryFile(communityId, repositoryId, repositoryFileId)
Get a repository file in an Experience Cloud site.

getRepositoryFile(communityId, repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)
Get a repository file with or without permissions information in an Experience Cloud site.

getRepositoryFolder(repositoryId, repositoryFolderId)
Get a repository folder.

getRepositoryFolder(communityId, repositoryId, repositoryFolderId)
Get a repository folder in an Experience Cloud site.

getRepositoryFolderItems(repositoryId, repositoryFolderId)
Get repository folder items.

getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId)
Get repository folder items in an Experience Cloud site.

getRepositoryFolderItems(repositoryId, repositoryFolderId, pageParam, pageSize)
Get a page of repository folder items.

getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize)
Get a page of repository folder items in an Experience Cloud site.

updateRepositoryFile(repositoryId, repositoryFileId, file)
Update the name of a repository file.

updateRepositoryFile(repositoryId, repositoryFileId, file, fileData)
Update the content of a repository file.

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file)
Update the name of a repository file in an Experience Cloud site.

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData)
Update the content of a repository file in an Experience Cloud site.

addRepositoryItem(repositoryId, repositoryFolderId, file)

Add a repository item.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

Return Value

Type: `ConnectApi.RepositoryFolderItem`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example creates a file without binary content (metadata only) in a Google Drive repository folder. After the file is created, we show the file's ID, name, description, external URL, and download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs';

final ConnectApi.ContentHubItemInput newItem = new ConnectApi.ContentHubItemInput();
newItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
for creation/update
newItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
final ConnectApi.ContentHubFieldValueInput fieldValueInput = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInput.name = 'name';
fieldValueInput.value = 'new folder item name.txt';
newItem.fields.add(fieldValueInput);

//Metadata: description field
final ConnectApi.ContentHubFieldValueInput fieldValueInputDesc = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputDesc.name = 'description';
fieldValueInputDesc.value = 'It does describe it';
newItem.fields.add(fieldValueInputDesc);

final ConnectApi.RepositoryFolderItem newFolderItem =
ConnectApi.ContentHub.addRepositoryItem(gDriveRepositoryId, gDriveFolderId, newItem);
final ConnectApi.RepositoryFileSummary newFile = newFolderItem.file;
System.debug(String.format('New file - id: \'\'{0}\'\', name: \'\'{1}\'\', description:
\'\'{2}\'\' \n external URL: \'\'{3}\'\', download URL: \'\'{4}\'\'', new String[]{
newFile.id, newFile.name, newFile.description, newFile.externalDocumentUrl,
newFile.downloadUrl}));
```

SEE ALSO:

setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, result)

Apex Developer Guide: Testing ConnectApi Code

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)

Add a repository item in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String communityId,
String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

Return Value

Type: `ConnectApi.RepositoryFolderItem`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, result)

Apex Developer Guide: Testing ConnectApi Code

`addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)`

Add a repository item, including the binary file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput
fileData)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: ConnectApi.ContentHubItemInput

The item type ID and fields of the item type.

fileData
Type: ConnectApi.BinaryInput

The binary file.

Return Value

Type: ConnectApi.RepositoryFolderItem

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example creates a file with binary content and metadata in a Google Drive repository folder. After the file is created, we show the file's ID, name, description, external URL, and download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs';

final ConnectApi.ContentHubItemInput newItem = new ConnectApi.ContentHubItemInput();
newItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
for creation/update
newItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
Final String newFileName = 'new folder item name.txt';
final ConnectApi.ContentHubFieldValueInput fieldValueInput = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInput.name = 'name';
fieldValueInput.value = newFileName;
newItem.fields.add(fieldValueInput);
```

```
//Metadata: description field
final ConnectApi.ContentHubFieldValueInput fieldValueInputDesc = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputDesc.name = 'description';
fieldValueInputDesc.value = 'It does describe it';
newItem.fields.add(fieldValueInputDesc);

//Binary content
final Blob newFileBlob = Blob.valueOf('awesome content for brand new file');
final String newFileMimeType = 'text/plain';
final ConnectApi.BinaryInput fileBinaryInput = new ConnectApi.BinaryInput(newFileBlob,
newFileMimeType, newFileName);

final ConnectApi.RepositoryFolderItem newFolderItem =
ConnectApi.ContentHub.addRepositoryItem(gDriveRepositoryId, gDriveFolderId, newItem,
fileBinaryInput);
final ConnectApi.RepositoryFileSummary newFile = newFolderItem.file;
System.debug(String.format('New file - id: \'\'{0}\'\', name: \'\'{1}\'\', description:
\'\'{2}\'\' \n external URL: \'\'{3}\'\', download URL: \'\'{4}\'\'', new String[]{
newFile.id, newFile.name, newFile.description, newFile.externalDocumentUrl,
newFile.downloadUrl}));
```

SEE ALSO:

setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, fileData, result)

Apex Developer Guide: Testing ConnectApi Code

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)

Add a repository item, including the binary file, in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String communityId,
String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file,
ConnectApi.BinaryInput fileData)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

fileData
Type: `ConnectApi.BinaryInput`

The binary file.

Return Value

Type: `ConnectApi.RepositoryFolderItem`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData, result)

Apex Developer Guide: Testing ConnectApi Code

`getAllowedItemTypes(repositoryId, repositoryFolderId)`

Get the item types that the context user is allowed to create in the repository folder.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String repositoryId, String repositoryFolderId)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, result)

Apex Developer Guide: Testing ConnectApi Code

`getAllowedItemTypes(repositoryId, repositoryFolderId, filter)`

Get the item types, filtered by type, that the context user is allowed to create in the repository folder.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String
repositoryId, String repositoryFolderId, ConnectApi.ConnectContentHubItemType filter)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

filter
Type: ConnectApi.ContentHubItemType

Item types. Values are:

- Any—Includes files and folders.
- FilesOnly—Includes files only.
- FoldersOnly—Includes folders only.

Return Value

Type: ConnectApi.ContentHubAllowedItemTypeCollection

Usage

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

Example

This example calls getAllowedItemTypes(repositoryId, repositoryFolderId, ConnectApi.ContentHubItemType.FilesOnly) to get the first ConnectApi.ContentHubItemTypeSummary.id of a file. The context user can create allowed files in a repository folder in the external system.

```
final ConnectApi.ContentHubAllowedItemTypeCollection allowedItemTypesColl =
ConnectApi.ContentHub.getAllowedItemTypes(repositoryId, repositoryFolderId,
ConnectApi.ContentHubItemType.FilesOnly);
final List<ConnectApi.ContentHubItemTypeSummary> allowedItemTypes =
allowedItemTypesColl.allowedItemTypes;
string allowedFileItemTypeId = null;
if(allowedItemTypes.size() > 0){
   ConnectApi.ContentHubItemTypeSummary allowedItemTypeSummary = allowedItemTypes.get(0);

   allowedFileItemTypeId = allowedItemTypeSummary.id;
}
```

SEE ALSO:

setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, filter, result)

Apex Developer Guide: Testing ConnectApi Code

getAllowedItemTypes(communityId, repositoryId, repositoryFolderId)

Get the item types that the context user is allowed to create in the repository folder in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String communityId, String repositoryId, String repositoryFolderId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetAllowedItemTypes(communityId, repositoryId, repositoryFolderId, result)

Apex Developer Guide: Testing ConnectApi Code

`getAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter)`

Get the item types, filtered by type, that the context user is allowed to create in the repository folder in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String communityId, String repositoryId, String repositoryFolderId, ConnectApi.ConnectContentHubItemType filter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

filter
Type: `ConnectApi.ContentHubItemType`

Item types. Values are:

- `Any`—Includes files and folders.
- `FilesOnly`—Includes files only.
- `FoldersOnly`—Includes folders only.

Return Value

Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter, result)

Apex Developer Guide: Testing ConnectApi Code

`getFilePreview(repositoryId, repositoryFileId, formatType)`

Get a repository file preview.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String repositoryId, String
repositoryFileId, ConnectApi.FilePreviewFormat formatType)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: ConnectApi.FilePreviewFormat

Specifies the format of the file preview. Values are:

- `Jpg`—Preview format is JPG.
- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you're concerned that feature-rich SVG previews don't work in your org, choose alternative file previews. To use JPG file previews, enter *general* in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.

Return Value

Type: ConnectApi.FilePreview

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example calls `getFilePreview(repositoryId, repositoryFileId, ConnectApi.FilePreviewFormat.Thumbnail)` to get the thumbnail format preview along with its respective URL and number of thumbnail renditions. For each thumbnail format, we show every rendition URL available.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'document:1-zcA1BaeoQbo2_yNFiHCcK6QJTPmOke-kHFC4TYg3rk';final ConnectApi.FilePreview
filePreview =
ConnectApi.ContentHub.getFilePreview(gDriveRepositoryId, gDriveFileId,
ConnectApi.FilePreviewFormat.Thumbnail);System.debug(String.format('Preview - URL:
\'\'{0}\'\', format: \'\'{1}\'\', nbr of
renditions for this format: {2}', new String[]{ filePreview.url,
filePreview.format.name(),String.valueOf(filePreview.previewUrls.size())}));for(ConnectApi.FilePreviewUrl
 filePreviewUrl : filePreview.previewUrls){
```

```
    System.debug('-----> Rendition URL: ' + filePreviewUrl.previewUrl);
}
```

SEE ALSO:

setTestGetFilePreview(repositoryId, repositoryFileId, formatType, result)

Apex Developer Guide: Testing ConnectApi Code

`getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)`

Get a page or page range of a repository file preview.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType, Integer startPageNumber, Integer endPageNumber)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: `ConnectApi.FilePreviewFormat`

Specifies the format of the file preview. Values are:

- `Jpg`—Preview format is JPG.
- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you're concerned that feature-rich SVG previews don't work in your org, choose alternative file previews. To use JPG file previews, enter *general* in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.

startPageNumber
Type: Integer

The starting page number in the range of file preview URLs.

endPageNumber
Type: Integer

The ending page number in the range of file preview URLs.

Return Value

Type: `ConnectApi.FilePreview`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber, result)

`getFilePreview(communityId, repositoryId, repositoryFileId, formatType)`

Get a repository file preview in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String communityId, String
repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: `ConnectApi.FilePreviewFormat`

Specifies the format of the file preview. Values are:

- `Jpg`—Preview format is JPG.
- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you're concerned that feature-rich SVG previews don't work in your org, choose alternative file previews. To use JPG file previews, enter *general* in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.

`getFilePreview(communityId, repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)`

Get a page or page range of a repository file preview in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String communityId, String
repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType, Integer
startPageNumber, Integer endPageNumber)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: `ConnectApi.FilePreviewFormat`

Specifies the format of the file preview. Values are:

- `Jpg`—Preview format is JPG.
- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you're concerned that feature-rich SVG previews don't work in your org, choose alternative file previews. To use JPG file previews, enter *general* in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.

startPageNumber
Type: Integer

The starting page number in the range of file preview URLs.

endPageNumber
Type: Integer

The ending page number in the range of file preview URLs.

Return Value

Type: `ConnectApi.FilePreview`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`getItemType(repositoryId, repositoryItemTypeId)`

Get information about an item type associated with a repository.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubItemTypeDetail getItemType(String repositoryId,
String repositoryItemTypeId)
```

Parameters

`repositoryId`
Type: String

The ID of the repository.

`repositoryItemTypeId`
Type: String

The ID of the repository item type.

Return Value

Type: `ConnectApi.ContentHubItemTypeDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetItemType(repositoryId, repositoryItemTypeId, result)

Apex Developer Guide: Testing ConnectApi Code

`getItemType(communityId, repositoryId, repositoryItemTypeId)`

Get information about an item type associated with a repository in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubItemTypeDetail getItemType(String communityId, String repositoryId, String repositoryItemTypeId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`repositoryId`
Type: String

The ID of the repository.

`repositoryItemTypeId`
Type: String

The ID of the repository item type.

Return Value

Type: `ConnectApi.ContentHubItemTypeDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetItemType(communityId, repositoryId, repositoryItemTypeId, result)

Apex Developer Guide: Testing ConnectApi Code

`getPreviews(repositoryId, repositoryFileId)`

Get information about a repository file's supported previews.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreviewCollection getPreviews(String repositoryId, String
repositoryFileId)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

Return Value

Type: `ConnectApi.FilePreviewCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets all supported preview formats and their respective URLs and number of renditions. For each supported preview format, we show every rendition URL available.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'document:1-zcA1BaeoQbo2_yNFiHCcK6QJTPmOke-kHFC4TYg3rk';
final ConnectApi.FilePreviewCollection previewsCollection =
ConnectApi.ContentHub.getPreviews(gDriveRepositoryId, gDriveFileId);
for(ConnectApi.FilePreview filePreview : previewsCollection.previews){
   System.debug(String.format('Preview - URL: \'\'{0}\'\', format: \'\'{1}\'\', nbr of
renditions for this format: {2}', new String[]{ filePreview.url,
filePreview.format.name(),String.valueOf(filePreview.previewUrls.size())}));
   for(ConnectApi.FilePreviewUrl filePreviewUrl : filePreview.previewUrls){
      System.debug('-----> Rendition URL: ' + filePreviewUrl.previewUrl);
```

```
        }
}
```

SEE ALSO:

setTestGetPreviews(repositoryId, repositoryFileId, result)

Apex Developer Guide: Testing ConnectApi Code

`getPreviews(communityId, repositoryId, repositoryFileId)`

Get information about a repository file's supported previews in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreviewCollection getPreviews(String communityId, String repositoryId, String repositoryFileId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

Return Value

Type: `ConnectApi.FilePreviewCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetPreviews(communityId, repositoryId, repositoryFileId, result)

`getRepositories()`

Get a list of repositories.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepositoryCollection getRepositories()
```

Return Value

Type: `ConnectApi.ContentHubRepositoryCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets all repositories and gets the first SharePoint online repository found.

```
final string sharePointOnlineProviderType ='ContentHubSharepointOffice365';
final ConnectApi.ContentHubRepositoryCollection repositoryCollection =
ConnectApi.ContentHub.getRepositories();
ConnectApi.ContentHubRepository sharePointOnlineRepository = null;
for(ConnectApi.ContentHubRepository repository : repositoryCollection.repositories){
   if(sharePointOnlineProviderType.equalsIgnoreCase(repository.providerType.type)){
      sharePointOnlineRepository = repository;
      break;
```

```
    }
}
```

SEE ALSO:

setTestGetRepositories(result)

`getRepositories(communityId)`

Get a list of repositories in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepositoryCollection getRepositories(String communityId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.ContentHubRepositoryCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

`getRepositories(pageParam, pageSize)`

Get a page of repositories.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepositoryCollection getRepositories(Integer pageParam, Integer pageSize)
```

Parameters

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

Return Value

Type: `ConnectApi.ContentHubRepositoryCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

`getRepository(communityId, repositoryId)`

Get a repository in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepository getRepository(String communityId, String
repositoryId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

Return Value

Type: `ConnectApi.ContentHubRepository`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRepository(communityId, repositoryId, result)

`getRepositoryFile(repositoryId, repositoryFileId)`

Get a repository file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail getRepositoryFile(String repositoryId,
String repositoryFileId)
```

Parameters

`repositoryId`
Type: String

The ID of the repository.

`repositoryFileId`
Type: String

The ID of the repository file.

Return Value

Type: `ConnectApi.RepositoryFileDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'file:0B0lTys1KmM3sTmxKNjVJbWZja00';
final ConnectApi.RepositoryFileDetail file =
ConnectApi.ContentHub.getRepositoryFile(gDriveRepositoryId, gDriveFileId);
System.debug(String.format('File - name: \'\'{0}\'\', size: {1}, external URL: \'\'{2}\'\',
 download URL: \'\'{3}\'\'',
   new String[]{ file.name, String.valueOf(file.contentSize), file.externalDocumentUrl,
file.downloadUrl}));
```

SEE ALSO:

setTestGetRepositoryFile(repositoryId, repositoryFileId, result)

Apex Developer Guide: Testing ConnectApi Code

`getRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)`

Get a repository file with or without permissions information.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail getRepositoryFile(String repositoryId,
String repositoryFileId, Boolean includeExternalFilePermissionsInfo)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

includeExternalFilePermissionsInfo
Type: Boolean

Specifies whether to include permission information, such as whether the file is shared and what are the available permission types.

Managing external file permissions is supported for Google Drive, SharePoint Online, and OneDrive for Business.

Return Value

Type: ConnectApi.RepositoryFileDetail

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'file:0B0lTys1KmM3sTmxKNjVJbWZja00';

final ConnectApi.RepositoryFileDetail file =
ConnectApi.ContentHub.getRepositoryFile(gDriveRepositoryId, gDriveFileId, true);
System.debug(String.format('File - name: \'\'{0}\'\', size: {1}, external URL: \'\'{2}\'\',
 download URL: \'\'{3}\'\'', new String[]{ file.name, String.valueOf(file.contentSize),
file.externalDocumentUrl, file.downloadUrl}));
final ConnectApi.ExternalFilePermissionInformation externalFilePermInfo =
file.externalFilePermissionInformation;

//permission types
final List<ConnectApi.ContentHubPermissionType> permissionTypes =
externalFilePermInfo.externalFilePermissionTypes;
for(ConnectApi.ContentHubPermissionType permissionType : permissionTypes){
   System.debug(String.format('Permission type - id: \'\'{0}\'\', label: \'\'{1}\'\'', new
 String[]{ permissionType.id, permissionType.label}));
}

//permission groups
final List<ConnectApi.RepositoryGroupSummary> groups =
externalFilePermInfo.repositoryPublicGroups;
for(ConnectApi.RepositoryGroupSummary ggroup : groups){
   System.debug(String.format('Group - id: \'\'{0}\'\', name: \'\'{1}\'\', type:
\'\'{2}\'\'', new String[]{ ggroup.id, ggroup.name, ggroup.type.name()}));
}
```

```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: `ConnectApi.RepositoryFolderDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs';
final ConnectApi.RepositoryFolderDetail folder =
ConnectApi.ContentHub.getRepositoryFolder(gDriveRepositoryId, gDriveFolderId);
System.debug(String.format('Folder - name: \'\'{0}\'\', description: \'\'{1}\'\', external
 URL: \'\'{2}\'\', folder items URL: \'\'{3}\'\'',
   new String[]{ folder.name, folder.description, folder.externalFolderUrl,

`getRepositoryFolder(communityId, repositoryId, repositoryFolderId)`

Get a repository folder in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderDetail getRepositoryFolder(String communityId,
String repositoryId, String repositoryFolderId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: `ConnectApi.RepositoryFolderDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

`getRepositoryFolderItems(repositoryId, repositoryFolderId)`

Get repository folder items.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItemsCollection getRepositoryFolderItems(String
repositoryId, String repositoryFolderId)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: ConnectApi.RepositoryFolderItemsCollection

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets the collection of items in a repository folder. For files, we show the file's name, size, external URL, and download URL. For folders, we show the folder's name, description, and external URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs';
final ConnectApi.RepositoryFolderItemsCollection folderItemsColl =
ConnectApi.ContentHub.getRepositoryFolderItems(gDriveRepositoryId,gDriveFolderId);
final List<ConnectApi.RepositoryFolderItem> folderItems = folderItemsColl.items;
System.debug('Number of items in repository folder: ' + folderItems.size());
for(ConnectApi.RepositoryFolderItem item : folderItems){
   ConnectApi.RepositoryFileSummary fileSummary = item.file;
   if(fileSummary != null){
      System.debug(String.format('File item - name: \'\'{0}\'\', size: {1}, external URL:
 \'\'{2}\'\', download URL: \'\'{3}\'\'', new String[]{ fileSummary.name,
String.valueOf(fileSummary.contentSize), fileSummary.externalDocumentUrl,
fileSummary.downloadUrl}));
      }else{
         ConnectApi.RepositoryFolderSummary folderSummary = item.folder;
         System.debug(String.format('Folder item - name: \'\'{0}\'\', description:
\'\'{1}\'\'',  new String[]{ folderSummary.name, folderSummary.description}));
      }
}
```

setTestGetRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

updateRepositoryFile(repositoryId, repositoryFileId, file)

Update the name of a repository file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String repositoryId,
String repositoryFileId, ConnectApi.ContentHubItemInput file)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file
Type: ConnectApi.ContentHubItemInput

The item type ID and fields of the item type.

When updating the metadata of a repository file, only the name field can be updated.

Return Value

Type: ConnectApi.RepositoryFileDetail

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example updates the name of a file in a Google Drive repository. After the file is updated, we show the file's ID, name, description, external URL, download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs', gDriveFileId =
'document:1q9OatVpcyYBK-JWzp_PhR75ulQghwFP15zhkamKrRcQ';

final ConnectApi.ContentHubItemInput updatedItem = new ConnectApi.ContentHubItemInput();
updatedItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
 for creation/update
updatedItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
```

```
final ConnectApi.ContentHubFieldValueInput fieldValueInputName = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputName.name = 'name';
fieldValueInputName.value =  'updated file name.txt';
updatedItem.fields.add(fieldValueInputName);

final ConnectApi.RepositoryFileDetail updatedFile =
ConnectApi.ContentHub.updateRepositoryFile(gDriveRepositoryId, gDriveFileId, updatedItem);
System.debug(String.format('Updated file - id: \'\'{0}\'\', name: \'\'{1}\'\', description:
 \'\'{2}\'\',\n external URL: \'\'{3}\'\', download URL: \'\'{4}\'\'',  new String[]{
updatedFile.id, updatedFile.name, updatedFile.description, updatedFile.externalDocumentUrl,
 updatedFile.downloadUrl}));
```

SEE ALSO:

setTestUpdateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData, result)

Apex Developer Guide: Testing ConnectApi Code

updateRepositoryFile(repositoryId, repositoryFileId, file, fileData)

Update the content of a repository file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String repositoryId,
String repositoryFileId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput
fileData)
```

Parameters

repositoryId

Type: String

The ID of the repository.

repositoryFileId

Type: String

The ID of the repository file.

file

Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

When updating the metadata of a repository file, only the name field can be updated.

fileData
Type: ConnectApi.BinaryInput

The binary file.

Return Value

Type: ConnectApi.RepositoryFileDetail

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example updates the content and name of a file in a Google Drive repository. After the file is updated, we show the file's ID, name, description, external URL, and download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs', gDriveFileId =
'document:1q9OatVpcyYBK-JWzp_PhR75ulQghwFP15zhkamKrRcQ';

final ConnectApi.ContentHubItemInput updatedItem = new ConnectApi.ContentHubItemInput();
updatedItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
 for creation/update
updatedItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
final ConnectApi.ContentHubFieldValueInput fieldValueInputName = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputName.name = 'name';
fieldValueInputName.value =  'updated file name.txt';
updatedItem.fields.add(fieldValueInputName);

//Binary content
final Blob updatedFileBlob = Blob.valueOf('even more awesome content for updated file');
final String updatedFileMimeType = 'text/plain';
final ConnectApi.BinaryInput fileBinaryInput = new ConnectApi.BinaryInput(updatedFileBlob,
 updatedFileMimeType, updatedFileName);

final ConnectApi.RepositoryFileDetail updatedFile =
ConnectApi.ContentHub.updateRepositoryFile(gDriveRepositoryId, gDriveFileId, updatedItem);
System.debug(String.format('Updated file - id: \'\'{0}\'\', name: \'\'{1}\'\', description:
 \'\'{2}\'\',\n external URL: \'\'{3}\'\', download URL: \'\'{4}\'\'',  new String[]{
updatedFile.id, updatedFile.name, updatedFile.description, updatedFile.externalDocumentUrl,
 updatedFile.downloadUrl}));
```

SEE ALSO:

setTestUpdateRepositoryFile(repositoryId, repositoryFileId, file, result)

`updateRepositoryFile(communityId, repositoryId, repositoryFileId, file)`

Update the name of a repository file in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String communityId,
String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

When updating the metadata of a repository file, only the name field can be updated.

Return Value

Type: `ConnectApi.RepositoryFileDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestUpdateRepositoryFile(repositoryId, repositoryFileId, file, fileData, result)

Apex Developer Guide: Testing ConnectApi Code

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData)

Update the content of a repository file in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String communityId,
String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file,
ConnectApi.BinaryInput fileData)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

When updating the metadata of a repository file, only the name field can be updated.

fileData
Type: `ConnectApi.BinaryInput`

The binary file.

Return Value

Type: `ConnectApi.RepositoryFileDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestUpdateRepositoryFile(communityId, repositoryId, repositoryFileId, file, result)

Apex Developer Guide: Testing ConnectApi Code

ContentHub Test Methods

The following are the test methods for `ContentHub`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, result)`

Register a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(repositoryId, repositoryFolderId, file)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestAddRepositoryItem(String repositoryId, String
repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.RepositoryFolderItem
result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

result
Type: `ConnectApi.RepositoryFolderItem`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

addRepositoryItem(repositoryId, repositoryFolderId, file)

Apex Developer Guide: Testing ConnectApi Code

setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, result)

Register a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestAddRepositoryItem(String communityId, String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file,
ConnectApi.RepositoryFolderItem result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

result
Type: `ConnectApi.RepositoryFolderItem`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)

Apex Developer Guide: Testing ConnectApi Code

setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, fileData, result)

Register a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestAddRepositoryItem(String repositoryId, String
repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput fileData,
ConnectApi.RepositoryFolderItem result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

fileData
Type: `ConnectApi.BinaryInput`

The binary file.

result
Type: `ConnectApi.RepositoryFolderItem`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)

setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData, result)

Register a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestAddRepositoryItem(String communityId, String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput fileData, ConnectApi.RepositoryFolderItem result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

fileData
Type: `ConnectApi.BinaryInput`

The binary file.

result
Type: `ConnectApi.RepositoryFolderItem`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)

`setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, result)`

Register a `ConnectApi.ContentHubAllowedItemTypeCollection` object to be returned when the matching `getAllowedItemTypes(repositoryId, repositoryFolderId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetAllowedItemTypes(String repositoryId, String
repositoryFolderId, ConnectApi.ContentHubAllowedItemTypeCollection result)
```

Parameters

`repositoryId`
Type: String

The ID of the repository.

`repositoryFolderId`
Type: String

The ID of the repository folder.

`result`
Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getAllowedItemTypes(repositoryId, repositoryFolderId)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, filter, result)`

Register a `ConnectApi.ContentHubAllowedItemTypeCollection` object to be returned when the matching `getAllowedItemTypes(repositoryId, repositoryFolderId, filter)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetAllowedItemTypes(String repositoryId, String
repositoryFolderId, ConnectApi.ContentHubItemType filter,
ConnectApi.ContentHubAllowedItemTypeCollection result)
```

Parameters

`repositoryId`
Type: String

The ID of the repository.

`repositoryFolderId`
Type: String

The ID of the repository folder.

`filter`
Type: `ConnectApi.ContentHubItemType`

Item types. Values are:

- `Any`—Includes files and folders.
- `FilesOnly`—Includes files only.
- `FoldersOnly`—Includes folders only.

`result`
Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getAllowedItemTypes(repositoryId, repositoryFolderId, filter)

`setTestGetAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter, result)`

Register a `ConnectApi.ContentHubAllowedItemTypeCollection` object to be returned when the matching `getAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetAllowedItemTypes(String communityId, String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemType filter,
ConnectApi.ContentHubAllowedItemTypeCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

filter
Type: `ConnectApi.ContentHubItemType`

Item types. Values are:

- `Any`—Includes files and folders.
- `FilesOnly`—Includes files only.
- `FoldersOnly`—Includes folders only.

result
Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter)

setTestGetFilePreview(repositoryId, repositoryFileId, formatType, result)

Register a `ConnectApi.FilePreview` object to be returned when the matching `getFilePreview(repositoryId, repositoryFileId, formatType)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetFilePreview(String repositoryId, String repositoryFileId,
ConnectApi.FilePreviewFormat formatType, ConnectApi.FilePreview result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: ConnectApi.FilePreviewFormat

Specifies the format of the file preview. Values are:

- Jpg—Preview format is JPG.
- Pdf—Preview format is PDF.
- Svg—Preview format is compressed SVG.
- Thumbnail—Preview format is 240 x 180 PNG.
- ThumbnailBig—Preview format is 720 x 480 PNG.
- ThumbnailTiny—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you're concerned that feature-rich SVG previews don't work in your org, choose alternative file previews. To use JPG file previews, enter *general* in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.

result
Type: ConnectApi.FilePreview

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFilePreview(repositoryId, repositoryFileId, formatType)

`setTestGetFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber, result)`

Register a `ConnectApi.FilePreview` object to be returned when the matching `getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetFilePreview(String repositoryId, String repositoryFileId,
ConnectApi.FilePreviewFormat formatType, Integer startPageNumber, Integer endPageNumber,
ConnectApi.FilePreview result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: `ConnectApi.FilePreviewFormat`

Specifies the format of the file preview. Values are:

- `Jpg`—Preview format is JPG.
- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you're concerned that feature-rich SVG previews don't work in your org, choose alternative file previews. To use JPG file previews, enter *general* in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.

startPageNumber
Type: Integer

The starting page number in the range of file preview URLs.

endPageNumber
Type: Integer

The ending page number in the range of file preview URLs.

result
Type: ConnectApi.FilePreview

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)

API Version

40.0

Signature

```
public static Void setTestGetRepositories(String communityId, ConnectApi.ContentHubRepositoryCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

result
Type: ConnectApi.ContentHubRepositoryCollection

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepositories(communityId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetRepositories(pageParam, pageSize, result)

Register a `ConnectApi.ContentHubRepositoryCollection` object to be returned when the matching `getRepositories(pageParam, pageSize)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositories(Integer pageParam, Integer pageSize,
ConnectApi.ContentHubRepositoryCollection result)
```

Parameters

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

result
Type: ConnectApi.ContentHubRepositoryCollection

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepositories(pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

setTestGetRepositoryFolder(repositoryId, repositoryFolderId, result)

Register a `ConnectApi.RepositoryFolderDetail` object to be returned when the matching `getRepositoryFolder(repositoryId, repositoryFolderId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFolder(String repositoryId, String
repositoryFolderId, ConnectApi.RepositoryFolderDetail result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

result
Type: `ConnectApi.RepositoryFolderDetail`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepositoryFolder(repositoryId, repositoryFolderId)

`setTestGetRepositoryFolder(communityId, repositoryId, repositoryFolderId, result)`

Register a `ConnectApi.RepositoryFolderDetail` object to be returned when the matching `getRepositoryFolder(communityId, repositoryId, repositoryFolderId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFolder(String communityId, String repositoryId,
String repositoryFolderId, ConnectApi.RepositoryFolderDetail result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

result
Type: `ConnectApi.RepositoryFolderDetail`

Object containing test data.

Return Value

Type: Void

setTestGetRepositoryFolderItems(repositoryId, repositoryFolderId, pageParam, pageSize, result)

Register a `ConnectApi.RepositoryFolderItemsCollection` object to be returned when the matching `getRepositoryFolderItems(repositoryId, repositoryFolderId, pageParam, pageSize)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFolderItems(String repositoryId, String
repositoryFolderId, Integer pageParam, Integer pageSize,
ConnectApi.RepositoryFolderItemsCollection result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

result
Type: `ConnectApi.RepositoryFolderItemsCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

setTestUpdateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData, result)

Register a `ConnectApi.RepositoryFileDetail` object to be returned when the matching `updateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestUpdateRepositoryFile(String communityId, String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput fileData, ConnectApi.RepositoryFileDetail result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

fileData
Type: `ConnectApi.BinaryInput`

The binary file.

result
Type: `ConnectApi.RepositoryFileDetail`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

ConversationApplicationDefinition Class

Access information about a conversation application definition.

Namespace

ConnectApi

ConversationApplicationDefinition Methods

The following are methods for `ConversationApplicationDefinition`. All methods are static.

IN THIS SECTION:

getConversationApplicationDefinition(integrationName)
Get information about an integration's conversation application definition and the associated bot.

`getConversationApplicationDefinition(integrationName)`

Get information about an integration's conversation application definition and the associated bot.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ConversationApplicationDefinitionDetailRespresentation
getConversationApplicationDefinition(String integrationName)
```

Parameters

`integrationName`
Type: String

Name of the conversation application.

Return Value

Type: `ConnectApi.ConversationApplicationDefinitionDetailRespresentation`

Usage

To access this method, enable the bot feature, and the user must be an admin or have the Manage Bots or Manage Bots Training Data user permissions.

Datacloud Class

Purchase Data.com contact or company records, and retrieve purchase information.

Namespace

ConnectApi

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

IN THIS SECTION:

Datacloud Methods

Datacloud Methods

The following are methods for `Datacloud`. All methods are static.

IN THIS SECTION:

getCompaniesFromOrder(orderId, pageSize, page)
Get a list of purchased company records for an order.

getCompany(companyId)
Get a company record.

getContact(contactId)
Get a contact.

getContactsFromOrder(orderId, page, pageSize)
Get a list of purchased contacts for an order.

getOrder(orderId)
Get an order.

getUsage(userId)
Get purchase usage information for a user.

postOrder(orderInput)
Purchase records that are listed in an input file.

`getCompaniesFromOrder(orderId, pageSize, page)`

Get a list of purchased company records for an order.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudCcompanies getCompaniesFromOrder(String orderId, String
pageSize, String page)
```

Parameters

orderId
Type: String

ID of an order.

page
Type: Integer

Number of the page that you want returned.

pageSize
Type: Integer

Number of companies to show on a page. The default *pageSize* is 25.

Return Value

Type: ConnectApi.DatacloudCompanies

getCompany(companyId)

Get a company record.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudCompany getCompany(String companyId)
```

Parameters

companyId
Type: String

ID of a company in the Data.com database.

Return Value

Type: ConnectApi.DatacloudCompany

getContact(contactId)

Get a contact.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudContact getContact(String contactId)
```

Parameters

contactId
Type: String

ID of a contact in the Data.com database.

Return Value

Type: ConnectApi.DatacloudContact

getContactsFromOrder(orderId, page, pageSize)

Get a list of purchased contacts for an order.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudContacts getContactsFromOrder(String orderId, String
page, String pageSize)
```

Parameters

orderId
Type: String

ID of an order.

page
Type: Integer

Number of the page that you want returned.

pageSize
Type: Integer

Number of contacts to show on a page. The default *pageSize* is 25.

Return Value

Type: ConnectApi.DataCloudContacts

getOrder(orderId)

Get an order.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudOrder getOrder(String orderId)
```

Parameters

orderId
Type: String

ID of an order.

Return Value

Type: ConnectApi.DatacloudOrder

getUsage(userId)

Get purchase usage information for a user.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudPurchaseUsage getUsage(String userId)
```

Parameters

userId
Type: String

ID of a user.

Return Value

Type: ConnectApi.DatacloudPurchaseUsage

postOrder(orderInput)

Purchase records that are listed in an input file.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudOrder postOrder(ConnectApi.DatacloudOrderInput
orderInput)
```

Parameters

orderInput
Type: ConnectApi.DatacloudOrderInput

A list that contains IDs for the contacts or companies that you want to see.

Return Value

Type: ConnectApi.DatacloudOrder

Example

```
ConnectApi.DatacloudOrderInput inputOrder=new ConnectApi.DatacloudOrderInput();
List<String> ids=new List<String>();
ids.add('1234');
inputOrder.companyIds=ids;
ConnectApi.DatacloudOrder datacloudOrderRep = ConnectApi.Datacloud.postOrder(inputOrder);
```

EmailMergeFieldService Class

Extract a list of merge fields for an object. A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Namespace

ConnectApi

EmailMergeFieldService Methods

The following are methods for `EmailMergeFieldService`. All methods are static.

IN THIS SECTION:

getMergeFields(objectApiNames)
Extract the merge fields for a specific object.

`getMergeFields(objectApiNames)`

Extract the merge fields for a specific object.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.EmailMergeFieldInfo getMergeFields(List<String> objectApiNames)
```

Parameters

`objectApiNames`
Type: List<String>

The API names for the objects being referenced.

Return Value

Type: `ConnectApi.EmailMergeFieldInfo`

EmployeeProfiles Class

Get, set and crop, and delete employee banner photos and photos.

Namespace

ConnectApi

EmployeeProfiles Methods

These methods are for `EmployeeProfiles`. All methods are static.

IN THIS SECTION:

deleteBannerPhoto(employeeId)
Delete an employee's banner photo.

deletePhoto(employeeId)
Delete an employee's photo.

getBannerPhoto(employeeId)
Get an employee's banner photo.

getPhoto(employeeId)
Get an employee's photo.

setBannerPhoto(employeeId, fileId, versionNumber)
Set an uploaded file as an employee's banner photo.

setBannerPhoto(employeeId, fileUpload)
Set a file that hasn't been uploaded as an employee's banner photo.

setBannerPhotoWithAttributes(employeeId, bannerPhoto)
Set and crop an uploaded file as an employee's banner photo.

setBannerPhotoWithAttributes(employeeId, bannerPhoto, fileUpload)
Set and crop a file that hasn't been uploaded as an employee's banner photo.

setPhoto(employeeId, fileId, versionNumber)
Set an uploaded file as an employee's photo.

setPhoto(employeeId, fileUpload)
Set a file that hasn't been uploaded as an employee's photo.

setPhotoWithAttributes(employeeId, photo)
Set and crop an uploaded file as an employee's photo.

setPhotoWithAttributes(employeeId, photo, fileUpload)
Set and crop a file that hasn't been uploaded as an employee's photo.

`deleteBannerPhoto(employeeId)`

Delete an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static Void deleteBannerPhoto(String employeeId)
```

Parameters

employeeId
Type: String

ID of the employee.

Return Value

Type: Void

deletePhoto(employeeId)

Delete an employee's photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static Void deletePhoto(String employeeId)
```

Parameters

employeeId
Type: String

ID of the employee.

Return Value

Type: Void

getBannerPhoto(employeeId)

Get an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto getBannerPhoto(String employeeId)
```

Parameters

employeeId
Type: String

ID of the employee.

Return Value

Type: ConnectApi.BannerPhoto

getPhoto(employeeId)

Get an employee's photo.

API Version

51.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo getPhoto(String employeeId)
```

Parameters

employeeId
Type: String

ID of the employee.

Return Value

Type: ConnectApi.Photo

setBannerPhoto(employeeId, fileId, versionNumber)

Set an uploaded file as an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String employeeId, String fileId,
Integer versionNumber)
```

Parameters

employeeId
Type: String

ID of the employee.

fileId
Type: String

ID of the uploaded file to use as the employee banner photo. The file must be an image and be smaller than 2 GB.

versionNumber
Type: Integer

Version number of the file. Specify an existing version number or, to get the latest version, specify `null`.

Return Value

Type: `ConnectApi.BannerPhoto`

setBannerPhoto(employeeId, fileUpload)

Set a file that hasn't been uploaded as an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String employeeId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

employeeId
Type: String

ID of the employee.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

Photos are processed asynchronously and might not be visible right away.

`setBannerPhotoWithAttributes(employeeId, bannerPhoto)`

Set and crop an uploaded file as an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String employeeId,
ConnectApi.BannerPhotoInput bannerPhoto)
```

Parameters

employeeId
Type: String

ID of the employee.

bannerPhoto
Type: `ConnectApi.BannerPhotoInput`

A `ConnectApi.BannerPhotoInput` object that specifies the ID and version of the file, and how to crop the file.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

Photos are processed asynchronously and might not be visible right away.

`setBannerPhotoWithAttributes(employeeId, bannerPhoto, fileUpload)`

Set and crop a file that hasn't been uploaded as an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String employeeId,
ConnectApi.BannerPhotoInput bannerPhoto, ConnectApi.BinaryInput fileUpload)
```

Parameters

employeeId
Type: String

ID of the employee.

bannerPhoto
Type: ConnectApi.BannerPhotoInput

A `ConnectApi.BannerPhotoInput` object specifying the cropping parameters.

fileUpload
Type: ConnectApi.BinaryInput

File to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.BannerPhoto

Usage

Photos are processed asynchronously and might not be visible right away.

setPhoto(employeeId, fileId, versionNumber)

Set an uploaded file as an employee's photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhoto(String employeeId, String fileId, Integer
versionNumber)
```

Parameters

employeeId
Type: String

ID of the employee.

fileId
Type: String

ID of the uploaded file to use as the employee photo. The file must be an image and be smaller than 2 GB.

versionNumber
Type: Integer

Version number of the file. Specify an existing version number or, to get the latest version, specify `null`.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

setPhoto(employeeId, fileUpload)

Set a file that hasn't been uploaded as an employee's photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhoto(String employeeId, ConnectApi.BinaryInput
fileUpload)
```

Parameters

employeeId
Type: String

ID of the employee.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.Photo

Usage

Photos are processed asynchronously and might not be visible right away.

setPhotoWithAttributes(employeeId, photo)

Set and crop an uploaded file as an employee's photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String employeeId,
ConnectApi.PhotoInput photo)
```

Parameters

employeeId
Type: String

ID of the employee.

photo
Type: ConnectApi.PhotoInput

A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

Return Value

Type: ConnectApi.Photo

Usage

Photos are processed asynchronously and might not be visible right away.

setPhotoWithAttributes(employeeId, photo, fileUpload)

Set and crop a file that hasn't been uploaded as an employee's photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String employeeId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

employeeId
Type: String

ID of the employee.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the cropping parameters.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

ExternalEmailServices Class

Access information about integration with external email services, such as sending email within Salesforce through an external email account.

Namespace

ConnectApi

External Email Services Methods

The following are methods for `ExternalEmailService`. All methods are static.

IN THIS SECTION:

getUserOauthInfo(landingPage)
Get information about whether an external email service has been authorized to send email on behalf of a user.

`getUserOauthInfo(landingPage)`

Get information about whether an external email service has been authorized to send email on behalf of a user.

API Version

37.0

Requires Chatter

No

Signature

```
public static getUserOauthInfo(String landingPage)
```

Parameters

`landingPage`
Type: String

The landing page that the user starts on when they are finished with the OAuth authorization process.

Return Value

Type: `ConnectApi.UserOauthInfo`

SEE ALSO:

Apex Developer Guide: Testing ConnectApi Code

ExternalManagedAccount Class

Get externally managed accounts.

Namespace

ConnectApi

ExternalManagedAccount Methods

These methods are for `ExternalManagedAccount`. All methods are static.

IN THIS SECTION:

getCommunitiesExternalManagedAccounts(communityId)

Get externally managed accounts available to the context user across all Experience Cloud sites.

getCommunitiesExternalManagedAccounts(communityId, includeMyAccount)

Get externally managed accounts available to the context user, including the context user's account, across all Experience Cloud sites.

getExternalManagedAccounts(webstoreId)

Get externally managed accounts for a store.

getExternalManagedAccounts(webstoreId, includeMyAccount)

Get externally managed accounts, including the context user's account, for a store.

`getCommunitiesExternalManagedAccounts(communityId)`

Get externally managed accounts available to the context user across all Experience Cloud sites.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalManagedAccountCollectionOutput
getCommunitiesExternalManagedAccounts(String communityId)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Note: Regardless of the ID specified, this method returns externally managed accounts available to the context user across all Experience Cloud sites.

Return Value

Type: `ConnectApi.ExternalManagedAccountCollectionOutput`

`getCommunitiesExternalManagedAccounts(communityId, includeMyAccount)`

Get externally managed accounts available to the context user, including the context user's account, across all Experience Cloud sites.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalManagedAccountCollectionOutput
getCommunitiesExternalManagedAccounts(String communityId, Boolean includeMyAccount)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

> **Note:** Regardless of the ID specified, this method returns externally managed accounts available to the context user across all Experience Cloud sites.

includeMyAccount
Type: Boolean

Specifies whether to return the context user's account (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ExternalManagedAccountCollectionOutput`

getExternalManagedAccounts(webstoreId)

Get externally managed accounts for a store.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalManagedAccountCollectionOutput
getExternalManagedAccounts(String webstoreId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

Return Value

Type: `ConnectApi.ExternalManagedAccountCollectionOutput`

`getExternalManagedAccounts(webstoreId, includeMyAccount)`

Get externally managed accounts, including the context user's account, for a store.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalManagedAccountCollectionOutput
getExternalManagedAccounts(String webstoreId, Boolean includeMyAccount)
```

Parameters

webstoreId
Type: String

ID of the webstore.

includeMyAccount
Type: Boolean

Specifies whether to return the context user's account (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ExternalManagedAccountCollectionOutput`

FieldService Class

Preview and create shifts from a pattern or filter fields on recordset filter criteria.

Namespace

ConnectApi

FieldService Methods

These methods are for `FieldService`. All methods are static.

IN THIS SECTION:

createShiftsFromPattern(shiftsFromPatternInput, shiftPatternId)
Create up to 2,000 shifts from a pattern.

evaluateRecordsetFilterCriteria(recordsetFilterCriteriaInput)
Filter records on recordset filter criteria.

previewShiftsFromPattern(shiftsFromPatternInput, shiftPatternId)

Preview up to 2,000 shifts from a pattern.

createShiftsFromPattern(shiftsFromPatternInput, shiftPatternId)

Create up to 2,000 shifts from a pattern.

API Version

51.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ShiftsFromPattern
createShiftsFromPattern(ConnectApi.ShiftsFromPatternInput shiftsFromPatternInput, String
shiftPatternId)
```

Parameters

shiftsFromPatternInput

Type: ConnectApi.ShiftsFromPatternInput

A `ConnectApi.ShiftsFromPatternInput` object providing the pattern.

shiftPatternId

Type: String

ID of the shift pattern.

Return Value

Type: ConnectApi.ShiftsFromPattern

evaluateRecordsetFilterCriteria(recordsetFilterCriteriaInput)

Filter records on recordset filter criteria.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecordsetFilterCriteriaOutput
evaluateRecordsetFilterCriteria(ConnectApi.RecordsetFilterCriteriaInput
recordsetFilterCriteriaInput)
```

Parameters

recordsetFilterCriteriaInput
Type: ConnectApi.RecordsetFilterCriteriaInput

An ConnectApi.RecordsetFilterCriteriaInput object providing a set of recordset filter criteria and records.

Return Value

Type: ConnectApi.RecordsetFilterCriteriaOutput

Usage

Field service must be enabled.

previewShiftsFromPattern(shiftsFromPatternInput, shiftPatternId)

Preview up to 2,000 shifts from a pattern.

API Version

51.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ShiftsFromPattern
previewShiftsFromPattern(ConnectApi.ShiftsFromPatternInput shiftsFromPatternInput,
String shiftPatternId)
```

Parameters

shiftsFromPatternInput
Type: ConnectApi.ShiftsFromPatternInput

A ConnectApi.ShiftsFromPatternInput object providing the pattern.

shiftPatternId
Type: String

ID of the shift pattern.

Return Value

Type: ConnectApi.ShiftsFromPattern

FulfillmentOrder Class

Fulfill orders in Order Management.

Namespace

ConnectApi

FulfillmentOrder Methods

The following are methods for `FulfillmentOrder`. All methods are static.

IN THIS SECTION:

cancelFulfillmentOrderLineItems(fulfillmentOrderId, cancelFulfillmentOrderLineItemsInput)
Cancel FulfillmentOrderLineItems from a FulfillmentOrder. This action doesn't cancel the associated OrderItemSummaries, so reallocate the canceled quantities to a new FulfillmentOrder.

createFulfillmentOrders(fulfillmentOrderInput)
Create one or more FulfillmentOrders and FulfillmentOrderLineItems for an OrderDeliveryGroupSummary, which defines a delivery method and recipient for an OrderSummary. You specify the OrderItemSummaries to allocate, which can be fulfilled from different locations. Specifying multiple fulfillment groups creates one FulfillmentOrder for each location. For each OrderItemSummary, a FulfillmentOrderLineItem is created and assigned to the corresponding FulfillmentOrder.

createInvoice(fulfillmentOrderId, invoiceInput)
Create an invoice for a FulfillmentOrder that doesn't have one.

createMultipleFulfillmentOrder(multipleFulfillmentOrderInput)
Create FulfillmentOrders for multiple OrderDeliveryGroups in a single request.

createMultipleInvoices(invoicesInput)
Create Invoices for multiple FulfillmentOrders.

`cancelFulfillmentOrderLineItems(fulfillmentOrderId, cancelFulfillmentOrderLineItemsInput)`

Cancel FulfillmentOrderLineItems from a FulfillmentOrder. This action doesn't cancel the associated OrderItemSummaries, so reallocate the canceled quantities to a new FulfillmentOrder.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.FulfillmentOrderCancelLineItemsOutputRepresentation
cancelFulfillmentOrderLineItems(String fulfillmentOrderId,
```

```
ConnectApi.FulfillmentOrderLineItemsToCancelInputRepresentation
cancelFulfillmentOrderLineItemsInput)
```

Parameters

fulfillmentOrderId
Type: String

ID of the FulfillmentOrder.

cancelFulfillmentOrderLineItemsInput
Type: ConnectApi.FulfillmentOrderLineItemsToCancelInputRepresentation

List of FulfillmentOrderLineItems to cancel.

Return Value

Type: ConnectApi.FulfillmentOrderCancelLineItemsOutputRepresentation

Example

```
String fulfillmentOrderId = '0a3xx0000000085AAA';
List<ConnectApi.FulfillmentOrderLineItemInputRepresentation> itemToCancelList = new
List<ConnectApi.FulfillmentOrderLineItemInputRepresentation>();

for(FulfillmentOrderLineItem fulfillmentOrderLineItem :
fulfillmentOrder.FulfillmentOrderLineItems){
  ConnectApi.FulfillmentOrderLineItemInputRepresentation itemToCancel = new
ConnectApi.FulfillmentOrderLineItemInputRepresentation();
  itemToCancel.fulfillmentOrderLineItemId = fulfillmentOrderLineItem.Id;
  itemToCancel.quantity = 1;
  itemToCancelList.add(itemToCancel);
}

ConnectAPI.FulfillmentOrderLineItemsToCancelInputRepresentation input = new
ConnectAPI.FulfillmentOrderLineItemsToCancelInputRepresentation();
input.fulfillmentOrderLineItemsToCancel = itemToCancelList;

ConnectAPI.FulfillmentOrderCancelLineItemsOutputRepresentation result =
ConnectAPI.FulfillmentOrder.cancelFulfillmentOrderLineItems(fulfillmentOrderId, input);
```

createFulfillmentOrders(fulfillmentOrderInput)

Create one or more FulfillmentOrders and FulfillmentOrderLineItems for an OrderDeliveryGroupSummary, which defines a delivery method and recipient for an OrderSummary. You specify the OrderItemSummaries to allocate, which can be fulfilled from different locations. Specifying multiple fulfillment groups creates one FulfillmentOrder for each location. For each OrderItemSummary, a FulfillmentOrderLineItem is created and assigned to the corresponding FulfillmentOrder.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.FulfillmentOrderOutputRepresentation
createFulfillmentOrders(ConnectApi.FulfillmentOrderInputRepresentation
fulfillmentOrderInput)
```

Parameters

fulfillmentOrderInput
Type: ConnectApi.FulfillmentOrderInputRepresentation

OrderItemSummaries to allocate, with location and delivery information.

Return Value

Type: ConnectApi.FulfillmentOrderOutputRepresentation

Example

```
String orderSummaryId = '1Osxx0000004CCG';
String fulfillmentType = 'warehouse';

String warehouseFromLocationId = [SELECT Id from Location WHERE LocationType='Warehouse'
LIMIT 1].Id;

ConnectApi.FulfillmentOrderInputRepresentation fulfillmentOrderInput = new
ConnectApi.FulfillmentOrderInputRepresentation();
fulfillmentOrderInput.orderSummaryId = orderSummaryId;

List<OrderDeliveryGroupSummary> orderDeliveryGroupSummaryList = [SELECT Id FROM
OrderDeliveryGroupSummary WHERE OrderSummaryId =: orderSummaryId];

for (OrderDeliveryGroupSummary orderDeliveryGroupSummary: orderDeliveryGroupSummaryList){

  fulfillmentOrderInput.orderDeliveryGroupSummaryId = orderDeliveryGroupSummary.Id;
  List<ConnectApi.FulfillmentGroupInputRepresentation> fulfillmentGroups = new
List<ConnectApi.FulfillmentGroupInputRepresentation>();
  ConnectApi.FulfillmentGroupInputRepresentation fulfillmentGroup = new
ConnectApi.FulfillmentGroupInputRepresentation();
  fulfillmentGroup.fulfilledFromLocationId = warehouseFromLocationId;
  fulfillmentGroup.fulfillmentType = fulfillmentType;

  List<ConnectApi.OrderItemSummaryInputRepresentation> orderItemSummaries = new
List<ConnectApi.OrderItemSummaryInputRepresentation>();

  List<OrderItemSummary> orderItemSummaryList = [Select Id, quantity FROM OrderItemSummary
 WHERE OrderSummaryId =: orderSummaryId AND OrderDeliveryGroupSummaryId =:
orderDeliveryGroupSummary.Id];
  for(OrderItemSummary orderItemSummary : orderItemSummaryList){
```

```
    ConnectApi.OrderItemSummaryInputRepresentation oisInputRepresentation = new
ConnectApi.OrderItemSummaryInputRepresentation();
    oisInputRepresentation.orderItemSummaryId = orderItemSummary.Id;
    oisInputRepresentation.quantity = orderItemSummary.quantity;
    orderItemSummaries.add(oisInputRepresentation);
  }

  fulfillmentGroup.orderItemSummaries = orderItemSummaries;
  fulfillmentGroups.add(fulfillmentGroup);
  fulfillmentOrderInput.fulfillmentGroups = fulfillmentGroups;

}

ConnectApi.FulfillmentOrderOutputRepresentation result =
ConnectAPI.FulfillmentOrder.createFulfillmentOrders(fulfillmentOrderInput);
```

`createInvoice(fulfillmentOrderId, invoiceInput)`

Create an invoice for a FulfillmentOrder that doesn't have one.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.FulfillmentOrderInvoiceOutputRepresentation createInvoice(String
fulfillmentOrderId, ConnectApi.FulfillmentOrderInvoiceInputRepresentation invoiceInput)
```

Parameters

fulfillmentOrderId
Type: String

ID of the FulfillmentOrder.

invoiceInput
Type: `ConnectApi.FulfillmentOrderInvoiceInputRepresentation`

Required input with no data.

Return Value

Type: `ConnectApi.FulfillmentOrderInvoiceOutputRepresentation`

Example

```
String fulfillmentOrderId = '0a3xx0000000085AAA';
```

```
ConnectApi.FulfillmentOrderInvoiceInputRepresentation input = new
ConnectApi.FulfillmentOrderInvoiceInputRepresentation();
ConnectAPI.FulfillmentOrderInvoiceOutputRepresentation result =
ConnectApi.FulfillmentOrder.createInvoice(fulfillmentOrderId, input);
```

createMultipleFulfillmentOrder(multipleFulfillmentOrderInput)

Create FulfillmentOrders for multiple OrderDeliveryGroups in a single request.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.MultipleFulfillmentOrderOutputRepresentation
createMultipleFulfillmentOrder(ConnectApi.MultipleFulfillmentOrderInputRepresentation
multipleFulfillmentOrderInput)
```

Parameters

multipleFulfillmentOrderInput
Type: ConnectApi.MultipleFulfillmentOrderInputRepresentation

Wraps a list of inputs for creating fulfillment orders.

Return Value

Type: ConnectApi.MultipleFulfillmentOrderOutputRepresentation

createMultipleInvoices(invoicesInput)

Create Invoices for multiple FulfillmentOrders.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.MultipleFulfillmentOrderInvoicesOutputRepresentation
createMultipleInvoices(ConnectApi.MultipleFulfillmentOrderInvoicesInputRepresentation
invoicesInput)
```

Parameters

invoicesInput
Type: ConnectApi.MultipleFulfillmentOrderInvoicesInputRepresentation

The FulfillmentOrders to create Invoices for.

Return Value

Type: ConnectApi.MultipleFulfillmentOrderInvoicesOutputRepresentation

Knowledge Class

Get information about trending articles in Experience Cloud sites.

Namespace

ConnectApi

Knowledge Methods

The following are methods for `Knowledge`. All methods are static.

IN THIS SECTION:

getTopViewedArticlesForTopic(communityId, topicId, maxResults)
Get the top viewed articles for a topic.

getTrendingArticles(communityId, maxResults)
Get trending articles for an Experience Cloud site.

getTrendingArticlesForTopic(communityId, topicId, maxResults)
Get the trending articles for a topic in an Experience Cloud site.

`getTopViewedArticlesForTopic(communityId, topicId, maxResults)`

Get the top viewed articles for a topic.

API Version

41.0

Available to Guest Users

41.0

Requires Chatter

No

Signature

```
public static ConnectApi.KnowledgeArticleVersionCollection
getTopViewedArticlesForTopic(String communityId, String topicId, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

ID of the topic.

maxResults
Type: Integer

The maximum number of articles returned for each topic ID. Values can be from 1 to 25. The default value is 5.

Return Value

Type: `ConnectApi.KnowledgeArticleVersionCollection`

getTrendingArticles(communityId, maxResults)

Get trending articles for an Experience Cloud site.

API Version

36.0

Available to Guest Users

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.KnowledgeArticleVersionCollection getTrendingArticles(String
communityId, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

maxResults
Type: Integer

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

Return Value

Type: `ConnectApi.KnowledgeArticleVersionCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTrendingArticles(communityId, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getTrendingArticlesForTopic(communityId, topicId, maxResults)`

Get the trending articles for a topic in an Experience Cloud site.

API Version

36.0

Available to Guest Users

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.KnowledgeArticleVersionCollection
getTrendingArticlesForTopic(String communityId, String topicId, Integer maxResults)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`topicId`
Type: String

ID of the topic.

`maxResults`
Type: Integer

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

Return Value

Type: `ConnectApi.KnowledgeArticleVersionCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTrendingArticlesForTopic(communityId, topicId, maxResults, result)

Knowledge Test Methods

The following are the test methods for `Knowledge`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestGetTrendingArticles(communityId, maxResults, result)`

Register a `ConnectApi.KnowledgeVersionArticleCollection` object to be returned when the matching `ConnectApi.getTrendingArticles` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

36.0

Signature

```
public static Void setTestGetTrendingArticles(String communityId, Integer maxResults,
ConnectApi.KnowledgeArticleVersionCollection result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`maxResults`
Type: Integer

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

`result`
Type: `ConnectApi.KnowledgeArticleVersionCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getTrendingArticles(communityId, maxResults)

Apex Developer Guide: Testing ConnectApi Code

setTestGetTrendingArticlesForTopic(communityId, topicId, maxResults, result)

Register a `ConnectApi.KnowledgeVersionArticleCollection` object to be returned when the matching `ConnectApi.getTrendingArticlesForTopic` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

36.0

Signature

```
public static Void setTestGetTrendingArticlesForTopic(String communityId, String topicId,
Integer maxResults, ConnectApi.KnowledgeArticleVersionCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

ID of the topic.

maxResults
Type: Integer

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

result
Type: `ConnectApi.KnowledgeArticleVersionCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getTrendingArticlesForTopic(communityId, topicId, maxResults)

Apex Developer Guide: Testing ConnectApi Code

LightningScheduler Class

Create and update service appointments.

Namespace

ConnectApi

LightningScheduler Methods

The following are methods for `LightningScheduler`. All methods are static.

IN THIS SECTION:

createServiceAppointment(createServiceAppointmentInput)
Create a service appointment.

updateServiceAppointment(updateServiceAppointmentInput)
Update a service appointment.

`createServiceAppointment(createServiceAppointmentInput)`

Create a service appointment.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.ServiceAppointmentOutput
createServiceAppointment(ConnectApi.CreateServiceAppointmentInput
createServiceAppointmentInput)
```

Parameters

`createServiceAppointmentInput`
Type: `ConnectApi.CreateServiceAppointmentInput`

Input parameters to create a service appointment.

Return Value

Type: `ConnectApi.ServiceAppointmentOutput`

Usage

Considerations for using engagement channel types with the `service-appointments` resource:

- Enable **Schedule Appointments Using Engagement Channels** in Salesforce Scheduler Settings in your Salesforce org.
- When you create or modify appointments, shifts must be defined in the scheduling policy. For more information on setting up shifts in the scheduling policy, see Define Shift Rules in Scheduling Policy.

  Note: Engagement channel types are not supported with operating hours rules in the scheduling policy.

- When you use engagement channel type and shifts to create a service appointment, Salesforce Scheduler considers the default value for the Appointment Type (if not specified). However, Salesforce Scheduler only considers the engagement channel type and Appointment Type is ignored.

Example

For an account (existing user):

```
ConnectApi.ExtendedFieldInput extendedFieldEmail = new ConnectApi.ExtendedFieldInput();
extendedFieldEmail.name = 'Email';
extendedFieldEmail.value = 'rachael.adams@salesforce.com';

ConnectApi.ExtendedFieldInput extendedFieldPhone = new ConnectApi.ExtendedFieldInput();
extendedFieldPhone.name = 'Phone';
extendedFieldPhone.value = '1234567890';

List<ConnectApi.ExtendedFieldInput> extendedFieldList = new
List<ConnectApi.ExtendedFieldInput>();
extendedFieldList.add(extendedFieldEmail);
extendedFieldList.add(extendedFieldPhone);

ConnectApi.ServiceAppointmentInput serviceAppInput = new
ConnectApi.ServiceAppointmentInput();
serviceAppInput.extendedFields = extendedFieldList;
serviceAppInput.engagementChannelTypeId = '0eFRM00000000Bv2AI';
serviceAppInput.serviceTerritoryId = '0Hhxx0000004C92CAE';
serviceAppInput.workTypeId = '08qxx0000004C92AAE';
serviceAppInput.parentRecordId = '001xx000003GYR1AAO';
serviceAppInput.schedStartTime = DateTime.valueOf('2021-05-28 12:15:00');
serviceAppInput.schedEndTime = DateTime.valueOf('2021-05-28 12:45:00');

ConnectApi.AssignedResourcesInput asResourceInput = new ConnectApi.AssignedResourcesInput();
asResourceInput.serviceResourceId = '0Hnxx0000004CAiCAM';
asResourceInput.isRequiredResource = true;
asResourceInput.isPrimaryResource = true;

List<ConnectApi.AssignedResourcesInput> asResourceInputList = new
List<ConnectApi.AssignedResourcesInput>();
asResourceInputList.add(asResourceInput);

ConnectApi.CreateServiceAppointmentInput createInput = new
ConnectApi.CreateServiceAppointmentInput();
createInput.serviceAppointment = serviceAppInput;
createInput.assignedResources = asResourceInputList;
```

```
try{
   ConnectApi.ServiceAppointmentOutput appointmentResult =
ConnectApi.LightningScheduler.createServiceAppointment(createInput);
   String serviceAppointmentId = appointmentResult.result.serviceAppointmentId;
   List<String> assignedResourceIds = appointmentResult.result.assignedResourceIds;
}catch(ConnectApi.ConnectApiException ex){
   //Handle Exception
}
```

For a lead (authenticated guest user):

```
ConnectApi.LeadInput leadInput = new ConnectApi.LeadInput();
leadInput.firstName = 'Rachel';
leadInput.lastName = 'Adams';
leadInput.phone = '012-345-6789';
leadInput.email = 'rachel.adams@salesforce.com';
leadInput.company = 'Salesforce';

ConnectApi.ExtendedFieldInput extendedFieldEmail = new ConnectApi.ExtendedFieldInput();
extendedFieldEmail.name = 'Email';
extendedFieldEmail.value = 'rachael.adams@salesforce.com';

ConnectApi.ExtendedFieldInput extendedFieldPhone = new ConnectApi.ExtendedFieldInput();
extendedFieldPhone.name = 'Phone';
extendedFieldPhone.value = '1234567890';

List<ConnectApi.ExtendedFieldInput> extendedFieldList = new
List<ConnectApi.ExtendedFieldInput>();
extendedFieldList.add(extendedFieldEmail);
extendedFieldList.add(extendedFieldPhone);

ConnectApi.ServiceAppointmentInput serviceAppInput = new
ConnectApi.ServiceAppointmentInput();
serviceAppInput.extendedFields = extendedFieldList;
serviceAppInput.engagementChannelTypeId = '0eFRM00000000Bv2AI';
serviceAppInput.serviceTerritoryId = '0Hhxx0000004C92CAE';
serviceAppInput.workTypeId = '08qxx0000004C92AAE';
serviceAppInput.schedStartTime = DateTime.valueOf('2021-05-28 12:15:00');
serviceAppInput.schedEndTime = DateTime.valueOf('2021-05-28 12:45:00');

ConnectApi.AssignedResourcesInput asResourceInput = new ConnectApi.AssignedResourcesInput();
asResourceInput.serviceResourceId = '0Hnxx0000004CAiCAM';
asResourceInput.isRequiredResource = true;
asResourceInput.isPrimaryResource = true;

List<ConnectApi.AssignedResourcesInput> asResourceInputList = new
List<ConnectApi.AssignedResourcesInput>();
asResourceInputList.add(asResourceInput);

ConnectApi.CreateServiceAppointmentInput createInput = new
ConnectApi.CreateServiceAppointmentInput();
createInput.serviceAppointment = serviceAppInput;
createInput.assignedResources = asResourceInputList;
```

```
createInput.lead = leadInput;

try{
   ConnectApi.ServiceAppointmentOutput appointmentResult =
ConnectApi.LightningScheduler.createServiceAppointment(createInput);
   String serviceAppointmentId = appointmentResult.result.serviceAppointmentId;
   List<String> assignedResourceIds = appointmentResult.result.assignedResourceIds;
}catch(ConnectApi.ConnectApiException ex){
   //Handle Exception
}
```

SEE ALSO:

Service Appointments

`updateServiceAppointment(updateServiceAppointmentInput)`

Update a service appointment.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.ServiceAppointmentOutput
updateServiceAppointment(ConnectApi.UpdateServiceAppointmentInput
updateServiceAppointmentInput)
```

Parameters

`updateServiceAppointmentInput`

Type: `ConnectApi.UpdateServiceAppointmentInput`

Input parameters to update a service appointment.

Return Value

Type: `ConnectApi.ServiceAppointmentOutput`

Usage

Considerations for using engagement channel types with the `service-appointments` resource:

- Enable **Schedule Appointments Using Engagement Channels** in Salesforce Scheduler Settings in your Salesforce org.
- When you create or modify appointments, shifts must be defined in the scheduling policy. For more information on setting up shifts in the scheduling policy, see Define Shift Rules in Scheduling Policy.

Note: Engagement channel types are not supported with operating hours rules in the scheduling policy.

- When you use engagement channel type and shifts to modify an appointment, Salesforce Scheduler considers the default value for the Appointment Type (if not specified). However, Salesforce Scheduler only considers the engagement channel type and Appointment Type is ignored.

Example

```
ConnectApi.ExtendedFieldInput extendedFieldEmail = new ConnectApi.ExtendedFieldInput();
extendedFieldEmail.name = 'Email';
extendedFieldEmail.value = 'rachel.adams@salesforce.com.example';

ConnectApi.ExtendedFieldInput extendedFieldPhone = new ConnectApi.ExtendedFieldInput();
extendedFieldPhone.name = 'Phone';
extendedFieldPhone.value = '0123456789';

ConnectApi.ExtendedFieldInput extendedFieldStatus = new ConnectApi.ExtendedFieldInput();
extendedFieldStatus.name = 'Status';
extendedFieldStatus.value = 'None';

List<ConnectApi.ExtendedFieldInput> extendedFieldList = new
List<ConnectApi.ExtendedFieldInput>();
extendedFieldList.add(extendedFieldEmail);
extendedFieldList.add(extendedFieldPhone);
extendedFieldList.add(extendedFieldStatus);

ConnectApi.ServiceAppointmentInput serviceAppInput = new
ConnectApi.ServiceAppointmentInput();
serviceAppInput.extendedFields = extendedFieldList;
serviceAppInput.serviceTerritoryId = '0Hhxx0000004C92CAE';
serviceAppInput.workTypeId = '08qxx0000004C92AAE';
serviceAppInput.schedStartTime = DateTime.valueOf('2021-05-28 12:15:00');
serviceAppInput.schedEndTime = DateTime.valueOf('2021-05-28 12:45:00');

ConnectApi.AssignedResourcesInput asResourceInput = new ConnectApi.AssignedResourcesInput();
asResourceInput.serviceResourceId = '0Hnxx0000004CAiCAM';
asResourceInput.isRequiredResource = true;
asResourceInput.isPrimaryResource = true;

//Multi-resource
ConnectApi.AssignedResourcesInput asResourceInputReq = new
ConnectApi.AssignedResourcesInput();
asResourceInputReq.serviceResourceId = '0Hnxx0000004CAgCAM';
asResourceInputReq.isRequiredResource = true;
asResourceInputReq.isPrimaryResource = false;

List<ConnectApi.AssignedResourcesInput> asResourceInputList = new
List<ConnectApi.AssignedResourcesInput>();
asResourceInputList.add(asResourceInput);
asResourceInputList.add(asResourceInputReq);

ConnectApi.UpdateServiceAppointmentInput updateInput = new
```

```
ConnectApi.UpdateServiceAppointmentInput();
updateInput.serviceAppointment = serviceAppInput;
updateInput.assignedResources = asResourceInputList;
updateInput.serviceAppointmentId = '08pxx0000004CYqAAM';

try{
   ConnectApi.ServiceAppointmentOutput appointmentResult =
ConnectApi.LightningScheduler.updateServiceAppointment(updateInput);
   String serviceAppointmentId = appointmentResult.result.serviceAppointmentId;
   List<String> assignedResourceIds = appointmentResult.result.assignedResourceIds;
}catch(ConnectApi.ConnectApiException ex){
   //Handle Exception
}
```

Service Appointments

ManagedContent Class

Get managed content versions. Get a managed content space.

Namespace

ConnectApi

ManagedContent Methods

The following are methods for `ManagedContent`. All methods are static.

IN THIS SECTION:

getAllContent(channelId, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate)

Get all managed content versions for a channel.

getAllContent(channelId, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)

Get all managed content versions for a channel with absolute URLs.

getAllDeliveryChannels(pageParam, pageSize)

Get managed content delivery channels for the context user.

getAllManagedContent(communityId, pageParam, pageSize, language, managedContentType)

Get all managed content versions for an Experience Cloud site.

getAllManagedContent(communityId, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get all managed content versions for an Experience Cloud site with absolute URLs.

getContentByContentKeys(channelId, contentKeys, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)

Get managed content versions for a channel using a list of content keys.

getContentByIds(channelId, managedContentIds, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate)

Get managed content versions for a channel using a list of managed content IDs.

getContentByIds(channelId, managedContentIds, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)

Get managed content versions for a channel with absolute URLs using a list of managed content IDs.

getManagedContentByContentKeys(communityId, contentKeys, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions for an Experience Cloud site using a list of content keys.

getManagedContentByIds(communityId, managedContentIds, pageParam, pageSize, language, managedContentType)

Get managed content versions for an Experience Cloud site using a list of managed content IDs.

getManagedContentByIds(communityId, managedContentIds, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions for an Experience Cloud site with absolute URLs using a list of managed content IDs.

getManagedContentByTopics(communityId, topics, pageParam, pageSize, language, managedContentType)

Get managed content versions using a list of content topic names.

getManagedContentByTopics(communityId, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions with absolute URLs using a list of content topic names.

getManagedContentByTopicsAndContentKeys(communityId, contentKeys, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions using a list of content keys and content topic names.

getManagedContentByTopicsAndIds(communityId, managedContentIds, topics, pageParam, pageSize, language, managedContentType)

Get managed content versions using a list of managed content IDs and content topic names.

getManagedContentByTopicsAndIds(communityId, managedContentIds, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions with absolute URLs using a list of managed content IDs and content topic names.

getManagedContentSpace(contentSpaceId)

Get a managed content space.

`getAllContent(channelId, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate)`

Get all managed content versions for a channel.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getAllContent(String channelId,
Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean
includeMetadata, String startDate, String endDate)
```

Parameters

channelId
Type: String

ID of the channel.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

The developer name of the content version.

includeMetadata
Type: Boolean

Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

startDate
Type: String

Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

endDate
Type: String

Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

`getAllContent(channelId, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)`

Get all managed content versions for a channel with absolute URLs.

API Version

50.0

Available to Guest Users

50.0

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getAllContent(String channelId, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean includeMetadata, String startDate, String endDate, Boolean showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

The developer name of the content version.

includeMetadata
Type: Boolean

Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

startDate
Type: String

Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

endDate
Type: String

Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getAllDeliveryChannels(pageParam, pageSize)

Get managed content delivery channels for the context user.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentChannelCollection getAllDeliveryChannels(Integer
pageParam, Integer pageSize)
```

Parameters

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ManagedContentChannelCollection`

`getAllManagedContent(communityId, pageParam, pageSize, language, managedContentType)`

Get all managed content versions for an Experience Cloud site.

API Version

47.0

Available to Guest Users

47.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getAllManagedContent(String communityId, Integer pageParam, Integer pageSize, String language, String managedContentType)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

The developer name of the content version.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

`getAllManagedContent(communityId, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)`

Get all managed content versions for an Experience Cloud site with absolute URLs.

API Version

50.0

Available to Guest Users

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getAllManagedContent(String communityId, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

The developer name of the content version.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: ConnectApi.ManagedContentVersionCollection

getContentByContentKeys(channelId, contentKeys, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)

Get managed content versions for a channel using a list of content keys.

API Version

51.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getContentByContentKeys(String channelId, List<String> contentKeys, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean includeMetadata, String startDate, String endDate, Boolean showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

contentKeys
Type: List<String>

List of up to 50 content keys for the managed content. A content key is a universally unique identifier (UUID) such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

The developer name of the content version.

includeMetadata
Type: Boolean

Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

startDate
Type: String

Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

endDate
Type: String

Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getContentByIds(channelId, managedContentIds, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate)

Get managed content versions for a channel using a list of managed content IDs.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getContentByIds(String
channelId, List<String> managedContentIds, Integer pageParam, Integer pageSize, String
language, String managedContentType, Boolean includeMetadata, String startDate, String
endDate)
```

Parameters

channelId
Type: String

ID of the channel.

managedContentIds
Type: List<String>

Comma-separated list of managed content IDs.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

The developer name of the content version.

includeMetadata
Type: Boolean

Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

startDate
Type: String

Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

endDate
Type: String

Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getContentByIds(channelId, managedContentIds, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)

Get managed content versions for a channel with absolute URLs using a list of managed content IDs.

API Version

50.0

Available to Guest Users

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getContentByIds(String channelId, List<String> managedContentIds, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean includeMetadata, String startDate, String endDate, Boolean showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

managedContentIds
Type: List<String>

Comma-separated list of managed content IDs.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

The developer name of the content version.

includeMetadata
Type: Boolean

Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

startDate
Type: String

Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

endDate
Type: String

Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByContentKeys(communityId, contentKeys, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions for an Experience Cloud site using a list of content keys.

API Version

51.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection
getManagedContentByContentKeys(String communityId, List<String> contentKeys, Integer
pageParam, Integer pageSize, String language, String managedContentType, Boolean
showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

contentKeys
Type: List<String>

List of up to 50 content keys for the managed content. A content key is a universally unique identifier (UUID) such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

The developer name of the content version.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByIds(communityId, managedContentIds, pageParam, pageSize, language, managedContentType)

Get managed content versions for an Experience Cloud site using a list of managed content IDs.

API Version

47.0

Available to Guest Users

47.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getManagedContentByIds(String communityId, List<String> managedContentIds, Integer pageParam, Integer pageSize, String language, String managedContentType)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

managedContentIds
Type: List<String>

Comma-separated list of managed content IDs.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

The developer name of the content version.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByIds(communityId, managedContentIds, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions for an Experience Cloud site with absolute URLs using a list of managed content IDs.

API Version

50.0

Available to Guest Users

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getManagedContentByIds(String communityId, List<String> managedContentIds, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

managedContentIds
Type: List<String>

Comma-separated list of managed content IDs.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

The developer name of the content version.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByTopics(communityId, topics, pageParam, pageSize, language, managedContentType)

Get managed content versions using a list of content topic names.

API Version

47.0

Available to Guest Users

47.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getManagedContentByTopics(String communityId, List<String> topics, Integer pageParam, Integer pageSize, String language, String managedContentType)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

topics
Type: List<String>

Comma-separated list of up to 15 content topic names.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

The developer name of the content version.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByTopics(communityId, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions with absolute URLs using a list of content topic names.

API Version

50.0

Available to Guest Users

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getManagedContentByTopics(String communityId, List<String> topics, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

topics
Type: List<String>

Comma-separated list of up to 15 content topic names.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

The developer name of the content version.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: ConnectApi.ManagedContentVersionCollection

getManagedContentByTopicsAndContentKeys(communityId, contentKeys, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions using a list of content keys and content topic names.

API Version

managedContentType, Boolean showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

contentKeys
Type: List<String>

List of up to 50 content keys for the managed content. A content key is a universally unique identifier (UUID) such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

topics
Type: List<String>

Comma-separated list of up to 15 content topic names.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

The developer name of the content version.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByTopicsAndIds(communityId, managedContentIds, topics, pageParam, pageSize, language, managedContentType)

Get managed content versions using a list of managed content IDs and content topic names.

managedContentType, Boolean showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

managedContentIds
Type: List<String>

Comma-separated list of managed content IDs.

topics
Type: List<String>

Comma-separated list of up to 15 content topic names.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

The developer name of the content version.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentSpace(contentSpaceId)

Get a managed content space.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentSpace getManagedContentSpace(String
contentSpaceId)
```

Parameters

contentSpaceId
Type: String

ID of the managed content space.

Return Value

Type: `ConnectApi.ManagedContentSpace`

ManagedContentDelivery Class

Get collection items. Get collection metadata. Get a managed content channel. Get managed content.

Namespace

ConnectApi

ManagedContentDelivery Methods

The following are methods for `ManagedContentDelivery`. All methods are static.

IN THIS SECTION:

getCollectionItemsForChannel(channelId, collectionKeyOrId, language)
Get collection items for a channel.

getCollectionItemsForSite(siteId, collectionKeyOrId, language)
Get collection items for an Experience Cloud site.

getManagedContentChannel(channelId)
Get a managed content channel.

getManagedContentForChannel(channelId, contentKeyOrId, showAbsoluteUrl)
Get a piece of published content for a channel.

getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl)
Get a piece of published content in a specified language for a channel.

getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)
Get a piece of published content in a specified language with references for a channel.

getManagedContentForSite(siteId, contentKeyOrId, showAbsoluteUrl)

Get a piece of published content for an Experience Cloud site.

getManagedContentForSite(siteId, contentKeyOrId, language, showAbsoluteUrl)

Get a piece of published content in a specified language for an Experience Cloud site.

getManagedContentForSite(siteId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)

Get a piece of published content in a specified language with references for an Experience Cloud site.

getManagedContentsForChannel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize)

Get a collection of published contents for a channel.

getManagedContentsForSite(siteId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize)

Get a collection of published contents for an Experience Cloud site.

`getCollectionItemsForChannel(channelId, collectionKeyOrId, language)`

Get collection items for a channel.

API Version

56.0

Available to Guest Users

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentCollectionItems
getCollectionItemsForChannel(String channelId, String collectionKeyOrId, String language)
```

Parameters

channelId

Type: String

ID of the channel.

collectionKeyOrId

Type: String

Collection key or ID of the collection. A collection key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language

Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

Return Value

Type: `ConnectApi.ManagedContentCollectionItems`

`getCollectionItemsForSite(siteId, collectionKeyOrId, language)`

Get collection items for an Experience Cloud site.

API Version

56.0

Available to Guest Users

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentCollectionItems getCollectionItemsForSite(String siteId, String collectionKeyOrId, String language)
```

Parameters

`siteId`
Type: String

ID for the Experience Cloud site.

`collectionKeyOrId`
Type: String

Collection key or ID of the collection. A collection key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

`language`
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

Return Value

Type: `ConnectApi.ManagedContentCollectionItems`

getManagedContentChannel(channelId)

Get a managed content channel.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentChannelDetail getManagedContentChannel(String channelId)
```

Parameters

channelId
Type: String

ID of the channel.

Return Value

Type: ConnectApi.ManagedContentChannelDetail

getManagedContentForChannel(channelId, contentKeyOrId, showAbsoluteUrl)

Get a piece of published content for a channel.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument
getManagedContentForChannel(String channelId, String contentKeyOrId, Boolean
showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl)

Get a piece of published content in a specified language for a channel.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument
getManagedContentForChannel(String channelId, String contentKeyOrId, String language,
Boolean showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)

Get a piece of published content in a specified language with references for a channel.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument
getManagedContentForChannel(String channelId, String contentKeyOrId, String language,
Boolean showAbsoluteUrl, Integer referenceDepth, Boolean expandReferences, Boolean
referencesAsList)
```

Parameters

channelId
Type: String

ID of the channel.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

referenceDepth
Type: Integer

An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocument` output class is null. If unspecified, the default value is 0.

expandReferences
Type: Boolean

Specifies whether to include details of references (`true`) or summaries of references (`false`) in the output class. If unspecified, the default value is `false`.

referencesAsList
Type: Boolean

Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocument` output class (`true`). If you specify `false`, the references are returned as key value pairs in the `references` property. If unspecified, the default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

getManagedContentForSite(siteId, contentKeyOrId, showAbsoluteUrl)

Get a piece of published content for an Experience Cloud site.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument getManagedContentForSite(String siteId, String contentKeyOrId, Boolean showAbsoluteUrl)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

getManagedContentForSite(siteId, contentKeyOrId, language, showAbsoluteUrl)

Get a piece of published content in a specified language for an Experience Cloud site.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument getManagedContentForSite(String siteId, String contentKeyOrId, String language, Boolean showAbsoluteUrl)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

getManagedContentForSite(siteId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)

Get a piece of published content in a specified language with references for an Experience Cloud site.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument getManagedContentForSite(String siteId, String contentKeyOrId, String language, Boolean showAbsoluteUrl, Integer referenceDepth, Boolean expandReferences, Boolean referencesAsList)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

referenceDepth
Type: Integer

An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocument` output class is null. If unspecified, the default value is 0.

expandReferences
Type: Boolean

Specifies whether to include details of references (`true`) or summaries of references (`false`) in the output class. If unspecified, the default value is `false`.

referencesAsList
Type: Boolean

Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocument` output class (`true`). If you specify `false`, the references are returned as key value pairs in the `references` property. If unspecified, the default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

getManagedContentsForChannel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize)

Get a collection of published contents for a channel.

API Version

55.0

Available to Guest Users

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocumentCollection
getManagedContentsForChannel(String channelId, List<String> managedContentIds,
List<String> contentKeys, String contentTypeFQN, String language, String
publishStartDate, String publishEndDate, Boolean includeContentBody, Integer
referenceDepth, Boolean expandReferences, Boolean referencesAsList, Integer pageParam,
Integer pageSize)
```

Parameters

channelId
Type: String

ID of the channel.

managedContentIds
Type: List<String>

Comma-separated list of up to 100 managed content IDs. Specify either managed content IDs or content keys.

contentKeys
Type: List<String>

Comma-separated list of up to 50 content keys. Specify either managed content IDs or content keys.

contentTypeFQN
Type: String

Fully qualified name of the managed content type.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the configured fallback language or the channel's default language. If the content isn't available in the fallback language and the channel's default language, we return an error.

publishStartDate
Type: String

ISO 8601 formatted publish start date.

publishEndDate
Type: String

ISO 8601 formatted publish end date.

includeContentBody
Type: Boolean

Specifies whether to return the content body (`true`) or the content summary (`false`). If unspecified, the default value is `false`.

referenceDepth
Type: Integer

An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class is null. If unspecified, the default value is 0.

expandReferences
Type: Boolean

Specifies whether to include details of references (`true`) or summaries of references (`false`) in the output class. If unspecified, the default value is `false`.

referencesAsList
Type: Boolean

Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class (`true`). If you specify `false`, the references are returned as key value pairs in the `references` property. If unspecified, the default value is `false`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25. If you specify `true` for *expandReferences* or *includeContentBody*, the maximum page size you can specify is 25.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocumentCollection`

getManagedContentsForSite(siteId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize)

Get a collection of published contents for an Experience Cloud site.

API Version

55.0

Available to Guest Users

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocumentCollection
getManagedContentsForSite(String siteId, List<String> managedContentIds, List<String>
contentKeys, String contentTypeFQN, String language, String publishStartDate, String
publishEndDate, Boolean includeContentBody, Integer referenceDepth, Boolean
expandReferences, Boolean referencesAsList, Integer pageParam, Integer pageSize)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

managedContentIds
Type: List<String>

Comma-separated list of up to 100 managed content IDs. Specify either managed content IDs or content keys.

contentKeys
Type: List<String>

Comma-separated list of up to 50 content keys. Specify either managed content IDs or content keys.

contentTypeFQN
Type: String

Fully qualified name of the managed content type.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the configured fallback language or the channel's default language. If the content isn't available in the fallback language and the channel's default language, we return an error.

publishStartDate
Type: String

ISO 8601 formatted publish start date.

publishEndDate
Type: String

ISO 8601 formatted publish end date.

includeContentBody
Type: Boolean

Specifies whether to return the content body (`true`) or the content summary (`false`). If unspecified, the default value is `false`.

referenceDepth
Type: Integer

An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class is null. If unspecified, the default value is 0.

expandReferences
Type: Boolean

Specifies whether to include details of references (`true`) or summaries of references (`false`) in the output class. If unspecified, the default value is `false`.

`referencesAsList`
Type: Boolean

Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class (`true`). If you specify `false`, the references are returned as key value pairs in the `references` property. If unspecified, the default value is `false`.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25. If you specify `true` for *`expandReferences`* or *`includeContentBody`*, the maximum page size you can specify is 25.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocumentCollection`

ManagedTopics Class

Get managed topics in an Experience Cloud site. Create, delete, and reorder managed topics.

Namespace

ConnectApi

ManagedTopics Methods

The following are methods for `ManagedTopics`. All methods are static.

IN THIS SECTION:

createManagedTopic(communityId, recordId, managedTopicType)
Create a managed topic of a specific type for an Experience Cloud site.

createManagedTopic(communityId, recordId, managedTopicType, parentId)
Create a child managed topic for an Experience Cloud site.

createManagedTopicByName(communityId, name, managedTopicType)
Create a managed topic of a specific type by name for an Experience Cloud site.

createManagedTopicByName(communityId, name, managedTopicType, parentId)
Create a child managed topic by name for an Experience Cloud site.

deleteManagedTopic(communityId, managedTopicId)
Delete a managed topic from an Experience Cloud site.

getManagedTopic(communityId, managedTopicId)
Get a managed topic in an Experience Cloud site.

getManagedTopic(communityId, managedTopicId, depth)
Get a managed topic, including its parent and children managed topics, in an Experience Cloud site.

getManagedTopics(communityId)
Get the featured and navigational managed topics for an Experience Cloud site.

getManagedTopics(communityId, managedTopicType)
Get managed topics of the specified type for an Experience Cloud site.

getManagedTopics(communityId, managedTopicType, depth)
Get managed topics of the specified type, including their parent and children managed topics, in an Experience Cloud site.

getManagedTopics(communityId, managedTopicType, recordIds, depth)
Get managed topics of the specified type, including their parent and children managed topics, that are associated with topics in an Experience Cloud site.

getManagedTopics(communityId, managedTopicType, pageParam, pageSize)
Get a page of managed topics.

reorderManagedTopics(communityId, managedTopicPositionCollection)
Reorder the relative positions of managed topics in an Experience Cloud site.

`createManagedTopic(communityId, recordId, managedTopicType)`

Create a managed topic of a specific type for an Experience Cloud site.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopic(String communityId, String
recordId, ConnectApi.ManagedTopicType managedTopicType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID of the topic.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Specify the type of managed topic.

- `Content`—Topics that are associated with native content.

- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

You can create up to 25 `Featured` and 5,000 `Content` topics. You can create up to eight levels of `Navigational` managed topics with 25 top-level topics and 10 children topics per level for a maximum of 2,775 `Navigational` topics.

Return Value

Type: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

createManagedTopic(communityId, recordId, managedTopicType, parentId)

Create a child managed topic for an Experience Cloud site.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopic(String communityId, String recordId, ConnectApi.ManagedTopicType managedTopicType, String parentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID of the topic.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Specify `Navigational` for the type of managed topic to create a child managed topic.

You can create up to 25 `Featured` and 5,000 `Content` topics. You can create up to eight levels of `Navigational` managed topics with 25 top-level topics and 10 children topics per level for a maximum of 2,775 `Navigational` topics.

parentId
Type: String

ID of the parent managed topic.

You can create up to eight levels (parent, direct children, their children, etc.) of managed topics and up to 10 children managed topics per managed topic.

Return Value

Type: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

createManagedTopicByName(communityId, name, managedTopicType)

Create a managed topic of a specific type by name for an Experience Cloud site.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopicByName(String communityId,
String name, ConnectApi.ManagedTopicType managedTopicType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

name
Type: String

Name of the topic.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Specify the type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

You can create up to 25 `Featured` and 5,000 `Content` topics. You can create up to eight levels of `Navigational` managed topics with 25 top-level topics and 10 children topics per level for a maximum of 2,775 `Navigational` topics.

Return Value

Type: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

createManagedTopicByName(communityId, name, managedTopicType, parentId)

Create a child managed topic by name for an Experience Cloud site.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopicByName(String communityId,
String name, ConnectApi.ManagedTopicType managedTopicType, String parentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

name
Type: String

Name of the topic.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Specify `Navigational` for the type of managed topic to create a child managed topic.

You can create up to 25 `Featured` and 5,000 `Content` topics. You can create up to eight levels of `Navigational` managed topics with 25 top-level topics and 10 children topics per level for a maximum of 2,775 `Navigational` topics.

parentId
Type: String

ID of the parent managed topic.

You can create up to eight levels (parent, direct children, their children, etc.) of managed topics and up to 10 children managed topics per managed topic.

Return Value

Type: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

`deleteManagedTopic(communityId, managedTopicId)`

Delete a managed topic from an Experience Cloud site.

API Version

32.0

Requires Chatter

No

Signature

```
public static deleteManagedTopic(String communityId, String managedTopicId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`managedTopicId`
Type: String

ID of managed topic.

Return Value

Type: Void

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can delete managed topics.

`getManagedTopic(communityId, managedTopicId)`

Get a managed topic in an Experience Cloud site.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic getManagedTopic(String communityId, String
managedTopicId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicId
Type: String

ID of managed topic.

Return Value

Type: `ConnectApi.ManagedTopic`

getManagedTopic(communityId, managedTopicId, depth)

Get a managed topic, including its parent and children managed topics, in an Experience Cloud site.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic getManagedTopic(String communityId, String
managedTopicId, Integer depth)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicId
Type: String

ID of managed topic.

depth
Type: Integer

Specify an integer 1–8. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopic`

`getManagedTopics(communityId)`

Get the featured and navigational managed topics for an Experience Cloud site.

To get the content topics for an Experience Cloud site, use `getManagedTopics(communityId, managedTopicType)`.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

getManagedTopics(communityId, managedTopicType)

Get managed topics of the specified type for an Experience Cloud site.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

If you specify `Content`, up to 50 topics are returned. If you want more than 50 `Content` topics, use `getManagedTopics(communityId, managedTopicType, pageParam, pageSize)`.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

getManagedTopics(communityId, managedTopicType, depth)

Get managed topics of the specified type, including their parent and children managed topics, in an Experience Cloud site.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType, Integer depth)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

depth
Type: Integer

Specify an integer 1–8. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

`getManagedTopics(communityId, managedTopicType, recordIds, depth)`

Get managed topics of the specified type, including their parent and children managed topics, that are associated with topics in an Experience Cloud site.

API Version

38.0

Available to Guest Users

38.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType, List<String> recordIds, Integer depth)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

recordIds
Type: List<String>

A list of up to 100 topic IDs associated with the managed topics.

If you list more than 10 topic IDs, you can't specify 2–8 for *depth*.

depth
Type: Integer

Specify an integer 1–8. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

`getManagedTopics(communityId, managedTopicType, pageParam, pageSize)`

Get a page of managed topics.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 50.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

`reorderManagedTopics(communityId, managedTopicPositionCollection)`

Reorder the relative positions of managed topics in an Experience Cloud site.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection reorderManagedTopics(String communityId,
ConnectApi.ManagedTopicPositionCollectionInput managedTopicPositionCollection)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicPositionCollection
Type: `ConnectApi.ManagedTopicPositionCollectionInput`

A collection of relative positions of managed topics. This collection can include only `Featured` and `Navigational` topics and doesn't have to include all managed topics.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can reorder managed topics.

You can reorder parent managed topics or children managed topics with the same parent. If you don't include all managed topics in the `ConnectApi.ManagedTopicPositionCollectionInput`, the managed topics are reordered by respecting the positions indicated in the `ConnectApi.ManagedTopicPositionCollectionInput` and then by pushing down any managed topics that aren't included in the `ConnectApi.ManagedTopicPositionCollectionInput` to the next available position.

Example

If you have these managed topics:

Managed Topic	Position
ManagedTopicA	0
ManagedTopicB	1
ManagedTopicC	2
ManagedTopicD	3

Managed Topic	Position
ManagedTopicE	4

And you reorder managed topics by including this information in `ConnectApi.ManagedTopicPositionCollectionInput`:

Managed Topic	Position
ManagedTopicD	0
ManagedTopicE	2

The result is:

Managed Topic	Position
ManagedTopicD	0
ManagedTopicA	1
ManagedTopicE	2
ManagedTopicB	3
ManagedTopicC	4

Retired ManagedTopics Methods

The following methods for `ManagedTopics` are retired.

IN THIS SECTION:

getManagedTopics(communityId, managedTopicType, recordId, depth)
Get managed topics of the specified type, including their parent and children managed topics, that are associated with a given topic in an Experience Cloud site.

`getManagedTopics(communityId, managedTopicType, recordId, depth)`

Get managed topics of the specified type, including their parent and children managed topics, that are associated with a given topic in an Experience Cloud site.

API Version

35.0–37.0

Important: In version 38.0 and later, use `getManagedTopics(communityId, managedTopicType, recordIds, depth)`.

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType, String recordId, Integer depth)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

recordId
Type: String

ID of the topic associated with the managed topics.

depth
Type: Integer

Specify an integer 1–8. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

MarketingIntegration Class

Get, save, and submit a microsites marketing integration form for an Experience Cloud site.

Namespace

ConnectApi

MarketingIntegration Methods

The following are methods for `MarketingIntegration`. All methods are static.

`MarketingIntegration` methods make calls to Marketing Cloud REST APIs to create, query, and insert data to the data extension object. If Marketing Cloud REST APIs return errors, ConnectinApex error messages include the error code and message from Marketing Cloud.

IN THIS SECTION:

getForm(siteId, formId)
Get a marketing integration form for an Experience Cloud site.

saveForm(siteId, formInput)
Save a marketing integration form for an Experience Cloud site.

submitForm(siteId, formId, formSubmissionInput)
Submit a marketing integration form for an Experience Cloud site.

`getForm(siteId, formId)`

Get a marketing integration form for an Experience Cloud site.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.Form getForm(String siteId, String formId)
```

Parameters

`siteId`
Type: String

ID for the Experience Cloud site.

`formId`
Type: String

ID of the form.

Return Value

Type: `ConnectApi.Form`

saveForm(siteId, formInput)

Save a marketing integration form for an Experience Cloud site.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.Form saveForm(String siteId, ConnectApi.FormInput formInput)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

formInput
Type: ConnectApi.FormInput

A `ConnectApi.FormInput` object to save.

Return Value

Type: ConnectApi.Form

Usage

This method attempts to create a read-only data extension in Marketing Cloud. A Marketing Cloud admin can change the read-only setting. We recommend keeping the data extension as read-only to maintain schema consistency with the form.

submitForm(siteId, formId, formSubmissionInput)

Submit a marketing integration form for an Experience Cloud site.

API Version

53.0

Available to Guest Users

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.FormSubmission submitForm(String siteId, String formId,
ConnectApi.FormSubmissionInput formSubmissionInput)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

formId
Type: String

ID of the form.

formSubmissionInput
Type: `ConnectApi.FormSubmissionInput`

A `ConnectApi.FormSubmissionInput` object to submit.

Return Value

Type: `ConnectApi.FormSubmission`

Mentions Class

Access information about mentions. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.

Namespace

ConnectApi

Mentions Methods

The following are methods for `Mentions`. All methods are static.

IN THIS SECTION:

getMentionCompletions(communityId, q, contextId)
Get the first page of possible users and groups to mention in a feed item body or comment body.

getMentionCompletions(communityId, q, contextId, type, pageParam, pageSize)
Get a page of possible mention proposals of the specified type.

getMentionValidations(communityId, parentId, recordIds, visibility)
Get information about whether the mentions are valid for the context user.

`getMentionCompletions(communityId, q, contextId)`

Get the first page of possible users and groups to mention in a feed item body or comment body.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.MentionCompletionPage getMentionCompletions (String communityId,
String q, String contextId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

contextId
Type: String

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

Return Value

Type: `ConnectApi.MentionCompletionPage`

Usage

Call this method to generate a page of proposed mentions that a user can choose from when they enter characters after @ in a feed item body or a comment body.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetMentionCompletions(communityId, q, contextId, result)

Apex Developer Guide: Testing ConnectApi Code

`getMentionCompletions(communityId, q, contextId, type, pageParam, pageSize)`

Get a page of possible mention proposals of the specified type.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Mentions getMentionCompletions (String communityId, String q,
String contextId, ConnectApi.MentionCompletionType type, Integer pageParam, Integer
pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

contextId
Type: String

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

type
Type: `ConnectApi.MentionCompletionType`

Type of mention completion.

- `All`—All mention completions, regardless of the type of record to which the mention refers.
- `Group`—Mention completions for groups.
- `User`—Mention completions for users.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.MentionCompletionPage`

Usage

Call this method to generate a page of proposed mentions that a user can choose from when they enter characters after @ in a feed item body or a comment body.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- setTestGetMentionCompletions(communityId, q, contextId, type, pageParam, pageSize, result)
- *Apex Developer Guide*: Testing ConnectApi Code

`getMentionValidations(communityId, parentId, recordIds, visibility)`

Get information about whether the mentions are valid for the context user.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Mentions getMentionValidations(String communityId, String
parentId, List<String> recordIds, ConnectApi.FeedItemVisibilityType visibility)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`parentId`
Type: String

The feed item parent ID.

`recordIds`
Type: List<String>

A comma-separated list of IDs to be mentioned. The maximum value is 25.

`visibility`
Type: `ConnectApi.FeedItemVisibilityType`

Type of users who can see a feed item.

- `AllUsers`—Visibility is not limited to internal users.
- `InternalUsers`—Visibility is limited to internal users.

Return Value

Type: `ConnectApi.MentionValidations`

Usage

Call this method to check whether the record IDs returned from a call to `ConnectApi.Mentions.getMentionCompletions` are valid for the context user. For example, the context users can't mention private groups they don't belong to. If such a group were included in the list of mention validations, the `ConnectApi.MentionValidations.hasErrors` property would be `true` and the group would have a `ConnectApi.MentionValidation.valdiationStatus` of `Disallowed`.

Mentions Test Methods

The following are the test methods for `Mentions`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestGetMentionCompletions(communityId, q, contextId, result)`

Register a `ConnectApi.MentionCompletionPage` object to be returned when `getMentionCompletions(String, String, String)` is called in a test context.

API Version

29.0

Signature

```
public static Void setTestGetMentionCompletions (String communityId, String q, String contextId, ConnectApi.MentionCompletionPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

contextId
Type: String

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

result
Type: `ConnectApi.MentionCompletionPage`

A `ConnectApi.MentionCompletionPage` object containing test data.

Return Value

Type: Void

SEE ALSO:

getMentionCompletions(communityId, q, contextId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetMentionCompletions(communityId, q, contextId, type, pageParam, pageSize, result)

Register a `ConnectApi.MentionCompletionPage` object to be returned when `getMentionCompletions(String, String, String, ConnectApi.MentionCompletionType, Integer, Integer)` is called in a test context.

API Version

29.0

Signature

```
public static Void setTestGetMentionCompletions (String communityId, String q, String contextId, ConnectApi.MentionCompletionType type, Integer pageParam, Integer pageSize, ConnectApi.MentionCompletionPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

contextId
Type: String

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

type
Type: `ConnectApi.MentionCompletionType`

Type of mention completion.

- `All`—All mention completions, regardless of the type of record to which the mention refers.
- `Group`—Mention completions for groups.
- `User`—Mention completions for users.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.MentionCompletionPage`

A `ConnectApi.MentionCompletionPage` object containing test data.

Return Value

Type: Void

SEE ALSO:

getMentionCompletions(communityId, q, contextId, type, pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

Missions Class

Export and purge mission activity for users. Get a user's mission progress. Update mission activity counts for users.

Namespace

ConnectApi

Missions Methods

The following are methods for `Missions`. All methods are static.

IN THIS SECTION:

exportUserMissionsActivities(communityId, userId)
Export mission activity for a user.

getUserMissionsProgress(communityId, userId)
Get mission activity progress for a user.

purgeUserMissionsActivities(communityId, userId)
Start a job to purge mission activity for a user.

purgeUserMissionsActivities(communityId)
Start a job to purge mission activity for all users.

updateUserMissionActivityCount(activityType, activityCount, communityId, userId)
Update the mission activity count for a user.

`exportUserMissionsActivities(communityId, userId)`

Export mission activity for a user.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.UserMissionActivitiesJob exportUserMissionsActivities(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.UserMissionActivitiesJob`

Usage

You can export these activities with this method.

- `FeedItemAnswerAQuestion`—User answered a question.
- `FeedItemLikeSomething`—User liked a post or comment.
- `FeedItemMarkAnswerAsBest`—User marked an answer as the best answer.
- `FeedItemPostQuestion`—User posted a question.
- `FeedItemReceiveAComment`—User received a comment on a post.
- `FeedItemReceiveALike`—User received a like on a post or comment.
- `FeedItemReceiveAnAnswer`—User received an answer to a question.
- `FeedItemWriteAComment`—User commented on a post.
- `FeedItemWriteAPost`—User made a post.
- `FeedItemYourAnswerMarkedBest`—User's answer was marked as the best answer.

`getUserMissionsProgress(communityId, userId)`

Get mission activity progress for a user.

API Version

46.0

Requires Chatter

No

Signature

```
public static ConnectApi.UserMissionActivityCollection getUserMissionsProgress(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.UserMissionActivityCollection`

purgeUserMissionsActivities(communityId, userId)

Start a job to purge mission activity for a user.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.UserMissionActivitiesJob purgeUserMissionsActivities(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: ConnectApi.UserMissionActivitiesJob

Usage

This method purges these activities.

- FeedItemAnswerAQuestion—User answered a question.
- FeedItemLikeSomething—User liked a post or comment.
- FeedItemMarkAnswerAsBest—User marked an answer as the best answer.
- FeedItemPostQuestion—User posted a question.
- FeedItemReceiveAComment—User received a comment on a post.
- FeedItemReceiveALike—User received a like on a post or comment.
- FeedItemReceiveAnAnswer—User received an answer to a question.
- FeedItemWriteAComment—User commented on a post.
- FeedItemWriteAPost—User made a post.
- FeedItemYourAnswerMarkedBest—User's answer was marked as the best answer.

purgeUserMissionsActivities(communityId)

Start a job to purge mission activity for all users.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.UserMissionActivitiesJob purgeUserMissionsActivities(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, internal, or null.

Return Value

Type: ConnectApi.UserMissionActivitiesJob

Usage

This method purges these activities.

- `FeedItemAnswerAQuestion`—User answered a question.
- `FeedItemLikeSomething`—User liked a post or comment.
- `FeedItemMarkAnswerAsBest`—User marked an answer as the best answer.
- `FeedItemPostQuestion`—User posted a question.
- `FeedItemReceiveAComment`—User received a comment on a post.
- `FeedItemReceiveALike`—User received a like on a post or comment.
- `FeedItemReceiveAnAnswer`—User received an answer to a question.
- `FeedItemWriteAComment`—User commented on a post.
- `FeedItemWriteAPost`—User made a post.
- `FeedItemYourAnswerMarkedBest`—User's answer was marked as the best answer.

`updateUserMissionActivityCount(activityType, activityCount, communityId, userId)`

Update the mission activity count for a user.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.UserMissionActivityStatus
updateUserMissionActivityCount(ConnectApi.UserMissionActivityType activityType, Integer
activityCount, String communityId, String userId)
```

Parameters

`activityType`
Type: `ConnectApi.UserMissionActivityType`

Type of mission activity for a user. Values are:

- `FeedItemAnswerAQuestion`—User answered a question.
- `FeedItemLikeSomething`—User liked a post or comment.
- `FeedItemMarkAnswerAsBest`—User marked an answer as the best answer.
- `FeedItemPostQuestion`—User posted a question.
- `FeedItemReceiveAComment`—User received a comment on a post.
- `FeedItemReceiveALike`—User received a like on a post or comment.
- `FeedItemReceiveAnAnswer`—User received an answer to a question.
- `FeedItemWriteAComment`—User commented on a post.
- `FeedItemWriteAPost`—User made a post.
- `FeedItemYourAnswerMarkedBest`—User's answer was marked as the best answer.

activityCount
Type: Integer

Number of mission activities of the specified type for the user.

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.UserMissionActivityStatus`

NamedCredentials Class

Create, get, update, and delete credentials. Get external credentials. Get the URL for the OAuth token flow for an external credential.

Namespace

ConnectApi

NamedCredentials Methods

The following are methods for `NamedCredentials`. All methods are static.

IN THIS SECTION:

createCredential(requestBody)
Create a credential.

deleteCredential(externalCredential, principalName, principalType)
Delete a credential.

getCredential(externalCredential, principalName, principalType)
Get a credential.

getExternalCredential(developerName)
Get an external credential, including the named credentials and principals associated with it and the type and status of each principal.

getExternalCredentials()
Get external credentials that the user can authenticate to.

getOAuthCredentialAuthUrl(requestBody)
Get the URL for the OAuth token flow for an external credential.

updateCredential(requestBody)
Update a credential.

createCredential(requestBody)

Create a credential.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.Credential createCredential(ConnectApi.CredentialInput
requestBody)
```

Parameters

requestBody
Type: ConnectApi.CredentialInput

A ConnectApi.CredentialInput class.

Return Value

Type: ConnectApi.Credential

deleteCredential(externalCredential, principalName, principalType)

Delete a credential.

API Version

56.0

Requires Chatter

No

Signature

```
public static Void deleteCredential(String externalCredential, String principalName,
ConnectApi.CredentialPrincipalType principalType)
```

Parameters

externalCredential
Type: String

Developer name of the external credential.

principalName
Type: String

Name of the external credential named principal.

principalType
Type: ConnectApi.CredentialPrincipalType

Type of credential principal. Values are:

- AwsStsPrincipal
- NamedPrincipal
- PerUserPrincipal

Return Value

Type: Void

getCredential(externalCredential, principalName, principalType)

Get a credential.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.Credential getCredential(String externalCredential, String
principalName, ConnectApi.CredentialPrincipalType principalType)
```

Parameters

externalCredential
Type: String

Developer name of the external credential.

principalName
Type: String

Name of the external credential named principal.

principalType
Type: ConnectApi.CredentialPrincipalType

Type of credential principal. Values are:

- AwsStsPrincipal
- NamedPrincipal
- PerUserPrincipal

Return Value

Type: ConnectApi.Credential

getExternalCredential(developerName)

Get an external credential, including the named credentials and principals associated with it and the type and status of each principal.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalCredential getExternalCredential(String developerName)
```

Parameters

developerName
Type: String

Developer name of the external credential.

Return Value

Type: ConnectApi.ExternalCredential

getExternalCredentials()

Get external credentials that the user can authenticate to.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalCredentialList getExternalCredentials()
```

Return Value

Type: ConnectApi.ExternalCredentialList

getOAuthCredentialAuthUrl(requestBody)

Get the URL for the OAuth token flow for an external credential.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.OAuthCredentialAuthUrl
getOAuthCredentialAuthUrl(ConnectApi.OAuthCredentialAuthUrlInput requestBody)
```

Parameters

requestBody
Type: ConnectApi.OAuthCredentialAuthUrlInput

A `ConnectApi.OAuthCredentialAuthUrlInput` class indicating the OAuth authentication flow.

Return Value

Type: ConnectApi.OAuthCredentialAuthUrl

Usage

Accepts input parameters representing a specific external credential and, optionally, a named principal. Returns the URL a user must visit to begin the authentication flow, ultimately returning authentication tokens to Salesforce. Use this method as part of building a customized or branded user interface to help users initiate authentication.

Example

```
ConnectApi.OAuthCredentialAuthUrlInput input = new ConnectApi.OAuthCredentialAuthUrlInput();

input.externalCredential = 'MyExternalCredentialDeveloperName';
input.principalType = ConnectApi.CredentialPrincipalType.PerUserPrincipal;
input.principalName = 'MyPrincipal'; // Only required when principalType = NamedPrincipal

ConnectApi.OAuthCredentialAuthUrl output =
ConnectApi.NamedCredentials.getOAuthCredentialAuthUrl(input);

String authenticationUrl = output.authenticationUrl; // Redirect users to this URL to
authenticate in the browser
```

updateCredential(requestBody)

Update a credential.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.Credential updateCredential(ConnectApi.CredentialInput
requestBody)
```

Parameters

requestBody
Type: ConnectApi.CredentialInput

A ConnectApi.CredentialInput class.

Return Value

Type: ConnectApi.Credential

NavigationMenu Class

Get navigation menu items for an Experience Cloud site.

Namespace

ConnectApi

NavigationMenu Methods

These methods are for NavigationMenu. All methods are static.

IN THIS SECTION:

getCommunityNavigationMenu(communityId, navigationLinkSetId, navigationLinkSetDeveloperName, publishStatus, includeImageUrl, addHomeMenuItem, menuItemTypesToSkip)
Get navigation menu items for an Experience Cloud site.

getCommunityNavigationMenu(communityId, navigationLinkSetId, navigationLinkSetDeveloperName, publishStatus, includeImageUrl, addHomeMenuItem, menuItemTypesToSkip, effectiveAccountId)
Get navigation menu items for an Experience Cloud based on an effective account.

getCommunityNavigationMenu(communityId, navigationLinkSetId, navigationLinkSetDeveloperName, publishStatus, includeImageUrl, addHomeMenuItem, menuItemTypesToSkip)

Get navigation menu items for an Experience Cloud site.

API Version

52.0

Available to Guest Users

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.NavigationMenuItemCollection getCommunityNavigationMenu(String communityId, String navigationLinkSetId, String navigationLinkSetDeveloperName, ConnectApi.PublishStatus publishStatus, Boolean includeImageUrl, Boolean addHomeMenuItem, List<ConnectApi.NavigationMenuItemType> menuItemTypesToSkip)
```

Parameters

communityId
Type: String

ID of an Experience Cloud site.

navigationLinkSetId
Type: String

ID of the navigation link set.

navigationLinkSetDeveloperName
Type: String

Developer name of the navigation link set.

publishStatus
Type: `ConnectApi.PublishStatus`

Publish status of the navigation menu item. Values are:

- `Draft`
- `Live`

includeImageUrl
Type: Boolean

Specifies whether to include the image URL with the menu item (`true`) or not (`false`).

addHomeMenuItem
Type: Boolean

Specifies whether to add the Home menu item (`true`) or not (`false`).

menuItemTypesToSkip
Type: List<`ConnectApi.NavigationMenuItemType`>

List of menu item types to filter out of the results. Values are:

- `Event`—Event, such as logging in, logging out, or switching accounts.

- `ExternalLink`—URL outside of your site.
- `GlobalAction`—Lets users create records that aren't related to other records.
- `InternalLink`—Relative URL inside your site.
- `MenuLabel`—Menu label.
- `NavigationalTopic`—Dropdown list with links to the navigational topics in your site.
- `SalesforceObject`—Objects such as accounts, cases, contacts, and custom objects.
- `SystemLink`—System link, such as a link to Builder, Workspaces, or Setup.

Return Value

Type: `ConnectApi.NavigationMenuItemCollection`

Usage

Supported navigation menu item types are:

- `Event`—Event, such as logging in, logging out, or switching accounts.
- `ExternalLink`—URL outside of your site.
- `GlobalAction`—Lets users create records that aren't related to other records.
- `InternalLink`—Relative URL inside your site.
- `MenuLabel`—Menu label.
- `NavigationalTopic`—Dropdown list with links to the navigational topics in your site.
- `SalesforceObject`—Objects such as accounts, cases, contacts, and custom objects.
- `SystemLink`—System link, such as a link to Builder, Workspaces, or Setup.

`getCommunityNavigationMenu(communityId, navigationLinkSetId, navigationLinkSetDeveloperName, publishStatus, includeImageUrl, addHomeMenuItem, menuItemTypesToSkip, effectiveAccountId)`

Get navigation menu items for an Experience Cloud based on an effective account.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.NavigationMenuItemCollection getCommunityNavigationMenu(String
communityId, String navigationLinkSetId, String navigationLinkSetDeveloperName,
```

```
ConnectApi.PublishStatus publishStatus, Boolean includeImageUrl, Boolean addHomeMenuItem,
List<ConnectApi.NavigationMenuItemType> menuItemTypesToSkip, String effectiveAccountId)
```

Parameters

communityId
Type: String

ID of an Experience Cloud site.

navigationLinkSetId
Type: String

ID of the navigation link set.

navigationLinkSetDeveloperName
Type: String

Developer name of the navigation link set.

publishStatus
Type: `ConnectApi.PublishStatus`

Publish status of the navigation menu item. Values are:

- `Draft`
- `Live`

includeImageUrl
Type: Boolean

Specifies whether to include the image URL with the menu item (`true`) or not (`false`).

addHomeMenuItem
Type: Boolean

Specifies whether to add the Home menu item (`true`) or not (`false`).

menuItemTypesToSkip
Type: List<`ConnectApi.NavigationMenuItemType`>

List of menu item types to filter out of the results. Values are:

- `Event`—Event, such as logging in, logging out, or switching accounts.
- `ExternalLink`—URL outside of your site.
- `GlobalAction`—Lets users create records that aren't related to other records.
- `InternalLink`—Relative URL inside your site.
- `MenuLabel`—Menu label.
- `NavigationalTopic`—Dropdown list with links to the navigational topics in your site.
- `SalesforceObject`—Objects such as accounts, cases, contacts, and custom objects.
- `SystemLink`—System link, such as a link to Builder, Workspaces, or Setup.

effectiveAccountId
Type: String

ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user.

Return Value

Type: `ConnectApi.NavigationMenuItemCollection`

Usage

Supported navigation menu item types are:

- `Event`—Event, such as logging in, logging out, or switching accounts.
- `ExternalLink`—URL outside of your site.
- `GlobalAction`—Lets users create records that aren't related to other records.
- `InternalLink`—Relative URL inside your site.
- `MenuLabel`—Menu label.
- `NavigationalTopic`—Dropdown list with links to the navigational topics in your site.
- `SalesforceObject`—Objects such as accounts, cases, contacts, and custom objects.
- `SystemLink`—System link, such as a link to Builder, Workspaces, or Setup.

NextBestAction Class

Execute recommendation strategies, get recommendations, manage recommendation reactions.

Namespace

ConnectApi

NextBestAction Methods

The following are methods for `NextBestAction`. All methods are static.

IN THIS SECTION:

deleteRecommendationReaction(reactionId)
Delete a recommendation reaction.

executeStrategy(strategyName, maxResults, contextRecordId)
Execute a strategy.

executeStrategy(strategyName, maxResults, contextRecordId, debugTrace)
Execute a strategy and request a trace.

executeStrategy(strategyName, strategyInput)
Execute a strategy using an input class.

getRecommendation(recommendationId)
Get a recommendation.

getRecommendationReaction(reactionId)
Get a recommendation reaction.

getRecommendationReactions(onBehalfOfId, createdById, targetId, contextRecordId, pageParam, pageSize)
Get recommendation reactions.

setRecommendationReaction(reaction)
Record user reactions to recommendations.

deleteRecommendationReaction(reactionId)

Delete a recommendation reaction.

API Version

45.0

Requires Chatter

No

Signature

```
public static Void deleteRecommendationReaction(String reactionId)
```

Parameters

reactionId
Type: String

ID of the recommendation reaction.

Return Value

Type: Void

Usage

Users with the Manage Next Best Action Recommendations or Modify All Data permission can delete recommendation reactions.

executeStrategy(strategyName, maxResults, contextRecordId)

Execute a strategy.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.NBARecommendations executeStrategy(String strategyName, Integer
maxResults, String contextRecordId)
```

Parameters

strategyName
Type: String

Name of the strategy.

maxResults
Type: Integer

Maximum number of results. Valid values are from 1 to 25. The default is 3.

contextRecordId
Type: String

ID of the context record. For example, if the next best action is on a case detail page, the ID of the case.

Return Value

Type: ConnectApi.NBARecommendations

executeStrategy(strategyName, maxResults, contextRecordId, debugTrace)

Execute a strategy and request a trace.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.NBARecommendations executeStrategy(String strategyName, Integer
maxResults, String contextRecordId, Boolean debugTrace)
```

Parameters

strategyName
Type: String

Name of the strategy.

maxResults
Type: Integer

Maximum number of results. Valid values are from 1 to 25. The default is 3.

contextRecordId
Type: String

ID of the context record. For example, if the next best action is on a case detail page, the ID of the case.

debugTrace
Type: Boolean

Specifies whether to return trace and debug information in the response (`true`) or not (`false`).

Return Value

Type: `ConnectApi.NBARecommendations`

executeStrategy(strategyName, strategyInput)

Execute a strategy using an input class.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.NBARecommendations executeStrategy(String strategyName,
ConnectApi.NBAStrategyInput strategyInput)
```

Parameters

strategyName
Type: String

Name of the strategy.

strategyInput
Type: `ConnectApi.NBAStrategyInput`

A `ConnectApi.NBAStrategyInput` body.

Return Value

Type: `ConnectApi.NBARecommendations`

getRecommendation(recommendationId)

Get a recommendation.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.Recommendation getRecommendation(String recommendationId)
```

Parameters

recommendationId
Type: String

ID of the recommendation.

Return Value

Type: ConnectApi.Recommendation

getRecommendationReaction(reactionId)

Get a recommendation reaction.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationReaction getRecommendationReaction(String
reactionId)
```

Parameters

reactionId
Type: String

ID of the recommendation reaction.

Return Value

Type: ConnectApi.RecommendationReaction

Usage

Users with the Manage Next Best Action Recommendations or Modify All Data permission can get recommendation reactions.

getRecommendationReactions(onBehalfOfId, createdById, targetId, contextRecordId, pageParam, pageSize)

Get recommendation reactions.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationReactions getRecommendationReactions(String onBehalfOfId, String createdById, String targetId, String contextRecordId, Integer pageParam, Integer pageSize)
```

Parameters

onBehalfOfId
Type: String

Use the ID of the user who is indirectly reacting to the recommendation to filter the results.

createdById
Type: String

Use the ID of the user or record that created the recommendation reaction to filter the results.

targetId
Type: String

Use the ID of the target to filter the results.

contextRecordId
Type: String

Use the ID of a context record to filter the results.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: ConnectApi.RecommendationReactions

Usage

Users with the Manage Next Best Action Recommendations or Modify All Data permission can get recommendation reactions.

`setRecommendationReaction(reaction)`

Record user reactions to recommendations.

API Version

45.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationReaction
setRecommendationReaction(ConnectApi.RecommendationReactionInput reaction)
```

Parameters

reaction
Type: ConnectApi.RecommendationReactionInput

A `ConnectApi.RecommendationReactionInput` object representing a reaction to a recommendation produced by a recommendation strategy.

Return Value

Type: ConnectApi.RecommendationReaction

OmnichannelInventoryService Class

Route orders to inventory locations in Order Management.

Namespace

ConnectApi

OmnichannelInventoryService Methods

The following are methods for `OmnichannelInventoryService`. All methods are static.

IN THIS SECTION:

createReservation(createReservationInputRepresentation)
Create an inventory reservation in Omnichannel Inventory.

fulfillReservation(fulfillReservationInputRepresentation)
Fulfill one or more inventory reservations.

getInventoryAvailability(inventoryAvailabilityInputRepresentation)
Retrieve inventory availability data for one or more products at one or more inventory locations or location groups.

getInventoryAvailabilityUploadStatus(uploadId)
Retrieve the status of an inventory availability upload job.

getPublishLocationStructureStatus(uploadId)
Retrieve the status of a publish location structure job.

publishLocationStructure()
Asynchronously publish information about your inventory locations and location groups to Omnichannel Inventory. The publish includes records whose IsEnabled and ShouldSyncWithOci fields are both *true*. This method returns an ID that you can use to retrieve the status of the publish job.

releaseReservation(releaseReservationInputRepresentation)
Release one or more existing inventory reservations to free up that inventory.

submitInventoryAvailabilityUpload(fileUpload)
Upload an inventory availability data file to Omnichannel Inventory.

transferReservation(transferReservationInputRepresentation)
Transfer one or more inventory reservations between locations or location groups. This API doesn't change physical quantities, but reduces the reserved quantity at the source and increases it at the destination.

`createReservation(createReservationInputRepresentation)`

Create an inventory reservation in Omnichannel Inventory.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCICreateReservationOutputRepresentation
createReservation(ConnectApi.OCICreateReservationInputRepresentation
createReservationInputRepresentation)
```

Parameters

createReservationInputRepresentation
Type: ConnectApi.OCICreateReservationInputRepresentation

Data to reserve inventory at one or more Omnichannel Inventory locations or location groups.

Return Value

Type: ConnectApi.OCICreateReservationOutputRepresentation

fulfillReservation(fulfillReservationInputRepresentation)

Fulfill one or more inventory reservations.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIFulfillReservationOutputRepresentation
fulfillReservation(ConnectApi.OCIFulfillReservationInputRepresentation
fulfillReservationInputRepresentation)
```

Parameters

fulfillReservationInputRepresentation
Type: ConnectApi.OCIFulfillReservationInputRepresentation

Wraps a list of inventory reservations to fulfill.

Return Value

Type: ConnectApi.OCIFulfillReservationOutputRepresentation

getInventoryAvailability(inventoryAvailabilityInputRepresentation)

Retrieve inventory availability data for one or more products at one or more inventory locations or location groups.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIGetInventoryAvailabilityOutputRepresentation
getInventoryAvailability(ConnectApi.OCIGetInventoryAvailabilityInputRepresentation
inventoryAvailabilityInputRepresentation)
```

Parameters

inventoryAvailabilityInputRepresentation
Type: ConnectApi.OCIGetInventoryAvailabilityInputRepresentation

Details of a request to retrieve inventory availability.

Return Value

Type: ConnectApi.OCIGetInventoryAvailabilityOutputRepresentation

getInventoryAvailabilityUploadStatus(uploadId)

Retrieve the status of an inventory availability upload job.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIUploadInventoryAvailabilityStatusOutputRepresentation
getInventoryAvailabilityUploadStatus(String uploadId)
```

Parameters

uploadId
Type: String

The upload ID of the upload job.

Return Value

Type: ConnectApi.OCIUploadInventoryAvailabilityStatusOutputRepresentation

getPublishLocationStructureStatus(uploadId)

Retrieve the status of a publish location structure job.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIPublishLocationStructureStatusOutputRepresentation
getPublishLocationStructureStatus(String uploadId)
```

Parameters

uploadId
Type: String

The upload ID of the publish job.

Return Value

Type: ConnectApi.OCIPublishLocationStructureStatusOutputRepresentation

publishLocationStructure()

Asynchronously publish information about your inventory locations and location groups to Omnichannel Inventory. The publish includes records whose IsEnabled and ShouldSyncWithOci fields are both *true*. This method returns an ID that you can use to retrieve the status of the publish job.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIPublishLocationStructureOutputRepresentation
publishLocationStructure()
```

Return Value

Type: ConnectApi.OCIPublishLocationStructureOutputRepresentation

releaseReservation(releaseReservationInputRepresentation)

Release one or more existing inventory reservations to free up that inventory.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIReleaseReservationOutputRepresentation
releaseReservation(ConnectApi.OCIReleaseReservationInputRepresentation
releaseReservationInputRepresentation)
```

Parameters

releaseReservationInputRepresentation
Type: ConnectApi.OCIReleaseReservationInputRepresentation

Details of one or more inventory reservations to release.

Return Value

Type: ConnectApi.OCIReleaseReservationOutputRepresentation

submitInventoryAvailabilityUpload(fileUpload)

Upload an inventory availability data file to Omnichannel Inventory.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIUploadInventoryAvailabilityOutputRepresentation
submitInventoryAvailabilityUpload(ConnectApi.BinaryInput fileUpload)
```

Parameters

fileUpload
Type: ConnectApi.BinaryInput

JSON file containing inventory availability data.

Return Value

Type: ConnectApi.OCIUploadInventoryAvailabilityOutputRepresentation

Usage

To create an inventory data file, format the data as a series of JSON entries representing locations and individual inventory records.

Inventory Import Data Considerations:

- Separate the top-level entries with line feeds, not commas. Each entry must be on a single line.
- When the system reads a location entry, it assigns the subsequent inventory entries to that location until it reads another location entry.
- For each location entry, specify `"mode":"UPDATE"`.
- Each inventory record entry requires a unique recordId. Best practice is to use a UUID. The record Id protects against importing duplicate data.
- Each inventory record entry requires an effectiveDate.
- Each futures entry requires a nonzero quantity and a future expectedDate.
- The system only creates or updates entries that are included in the data. It doesn't delete entries that aren't included. However, if an included entry has an empty value, that value is deleted.

Note: The file size limit is 10 MB, and it must be in JSON format. For larger data sets, you can use the headless Commerce API or split the data into multiple files. The headless Commerce API accepts GZIP or JSON files up to 100 MB in size.

This example illustrates the data format:

Note: For readability, this example shows the first few entries on multiple lines. In the import file, each location and inventory record entry must be on a single line.

```
{
  "location":"Warehouse-A",  // location identifier
  "mode":"UPDATE"  // must be UPDATE (other operations might be available in future releases)
}
{
  "recordId":"0a87539d-f3dd-47bc-91c7-9c752e39dbe0",  // unique identifier for the inventory
 record
  "onHand":10,
  "sku":"12389156",
  "effectiveDate":"2020-12-08T14:05:22.790896-07:00",
  "futures":[  // list of future restocks
    {
    "quantity":1,
    "expectedDate":"2021-04-18T14:05:22.781-07:00"
    },
    {
    "quantity":5,
    "expectedDate":"2021-05-18T14:05:22.781-07:00"
    }
  ],
  "safetyStockCount":0
}
{
  "recordId":"0a87539d-f3dd-47bc-91c7-9c752e312345",
  "onHand":10,
  "sku":"9485728",
  "effectiveDate":"2020-12-08T14:05:22.790896-07:00",
  "futures":[
    {
    "quantity":10,
    "expectedDate":"2021-04-18T14:05:22.781-07:00"
    }
```

```
  ],
  "safetyStockCount":0
}
{"location":"Warehouse-B","mode":"UPDATE"}
{"recordId":"0a75...","uomId":"10","id":"1...","effectiveDate":"2021-08-14T05:22:...","items":[{"quantity":"1","expectedDate":"2021-04-13T14:05:22.781-07:00"}],"safetyStockCount":0}
{"recordId":"0a75...","uomId":"10","id":"9...","effectiveDate":"2021-08-14T05:22:...","items":[{"quantity":"5","expectedDate":"2021-04-13T14:05:22.781-07:00"}],"safetyStockCount":0}
```

`transferReservation(transferReservationInputRepresentation)`

Transfer one or more inventory reservations between locations or location groups. This API doesn't change physical quantities, but reduces the reserved quantity at the source and increases it at the destination.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCITransferReservationOutputRepresentation
transferReservation(ConnectApi.OCITransferReservationInputRepresentation
transferReservationInputRepresentation)
```

Parameters

`transferReservationInputRepresentation`
Type: `ConnectApi.OCITransferReservationInputRepresentation`

Wraps a list of inventory reservation transfers and specifies whether a single failure cancels the entire list.

Return Value

Type: `ConnectApi.OCITransferReservationOutputRepresentation`

Orchestration Class

Get orchestration instances.

Namespace

ConnectApi

Orchestration Methods

The following are methods for `Orchestration`. All methods are static.

IN THIS SECTION:

getOrchestrationInstanceCollection(relatedRecordId)
Get orchestration instances associated with a Salesforce record that's configured as a context record for orchestration interactive steps.

`getOrchestrationInstanceCollection(relatedRecordId)`

Get orchestration instances associated with a Salesforce record that's configured as a context record for orchestration interactive steps.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrchestrationInstanceCollection
getOrchestrationInstanceCollection(String relatedRecordId)
```

Parameters

`relatedRecordId`
Type: String

The ID of a record configured as a context record for orchestration interactive steps.

Return Value

Type: `ConnectApi.OrchestrationInstanceCollection`

OrderPaymentSummary Class

Work with payments in Order Management.

Namespace

ConnectApi

OrderPaymentSummary Methods

The following are methods for `OrderPaymentSummary`. All methods are static.

IN THIS SECTION:

createOrderPaymentSummary(orderPaymentSummaryInput)
Create an OrderPaymentSummary for an OrderSummary. Specify a payment authorization or payments that share the same payment method. In an org with the multicurrency feature enabled, the OrderPaymentSummary inherits the CurrencyIsoCode value from the OrderSummary.

createOrderPaymentSummary(orderPaymentSummaryInput)

Create an OrderPaymentSummary for an OrderSummary. Specify a payment authorization or payments that share the same payment method. In an org with the multicurrency feature enabled, the OrderPaymentSummary inherits the CurrencyIsoCode value from the OrderSummary.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.CreateOrderPaymentSummaryOutputRepresentation
createOrderPaymentSummary(ConnectApi.CreateOrderPaymentSummaryInputRepresentation
orderPaymentSummaryInput)
```

Parameters

orderPaymentSummaryInput
Type: ConnectApi.CreateOrderPaymentSummaryInputRepresentation

The OrderSummary and payment authorization or payments.

Return Value

Type: ConnectApi.CreateOrderPaymentSummaryOutputRepresentation

Example

```
String orderSummaryId = '1Osxx0000004CCG';
String paymentId1 = '0a3xx0000000085AAA';
String paymentId2 = '0a3xx0000000085BBB';

ConnectApi.CreateOrderPaymentSummaryInputRepresentation orderPaymentSummaryInput = new
ConnectApi.CreateOrderPaymentSummaryInputRepresentation();
orderPaymentSummaryInput.orderSummaryId = orderSummaryId;
List<String> paymentList = new List<String>();
paymentList.add(paymentId1);
paymentList.add(paymentId2);
orderPaymentSummaryInput.paymentIds = paymentList;
```

```
ConnectApi.CreateOrderPaymentSummaryOutputRepresentation result =
ConnectAPI.OrderPaymentSummary.createOrderPaymentSummary(orderPaymentSummaryInput);
```

OrderSummary Class

Work with orders in Order Management.

Namespace

ConnectApi

OrderSummary Methods

The following are methods for `OrderSummary`. All methods are static.

IN THIS SECTION:

adjustPreview(orderSummaryId, adjustInput)

Retrieve the expected results of adjusting the price of one or more OrderItemSummaries from an OrderSummary, without actually executing the adjustment. The response data contains the financial changes that would result from submitting the proposed adjustment.

adjustSubmit(orderSummaryId, adjustInput)

Adjust the price of one or more OrderItemSummaries from an OrderSummary, and create corresponding change orders.

createCreditMemo(orderSummaryId, creditMemoInput)

Create a credit memo to represent the refund for one or more change orders associated with an OrderSummary.

createMultipleInvoices(invoicesInput)

Create Invoices to represent the charges for one or more change orders. Create Invoices for change orders that increase order amounts, such as for return fees. When you ensure the refund for a return, include the invoices for any associated return fees in the request.

ensureFundsAsync(orderSummaryId, ensureFundsInput)

Ensure funds for an invoice and apply them to it. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

Ensure refunds for a credit memo or excess funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

multipleEnsureFundsAsync(multipleEnsureFundsInput)

Ensure and apply funds for one or more invoices. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

previewCancel(orderSummaryId, changeInput)

Retrieve the expected change order values for canceling one or more OrderItemSummaries from an OrderSummary, without actually executing the cancel.

previewReturn(orderSummaryId, changeInput)

Retrieve the expected change order values for a simple return of one or more OrderItemSummaries from an OrderSummary, without actually executing the return.

submitCancel(orderSummaryId, changeInput)

Cancel one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order.

submitReturn(orderSummaryId, changeInput)

Return one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order. This return is a simple return that creates a change order but not a ReturnOrder.

`adjustPreview(orderSummaryId, adjustInput)`

Retrieve the expected results of adjusting the price of one or more OrderItemSummaries from an OrderSummary, without actually executing the adjustment. The response data contains the financial changes that would result from submitting the proposed adjustment.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.AdjustOrderSummaryOutputRepresentation adjustPreview(String orderSummaryId, ConnectApi.AdjustOrderItemSummaryInputRepresentation adjustInput)
```

Parameters

`orderSummaryId`

Type: String

ID of the OrderSummary.

`adjustInput`

Type: `ConnectApi.AdjustOrderItemSummaryInputRepresentation`

Price adjustments to OrderItemSummaries that together make up a price adjustment to an order, with options for adjusting items in the process of being fulfilled.

Return Value

Type: `ConnectApi.AdjustOrderSummaryOutputRepresentation`

Usage

When a price adjustment is applied to an OrderItemSummary, its quantities are considered in three groups:

Pre-fulfillment

QuantityAvailableToFulfill, which is equal to QuantityOrdered - QuantityCanceled - QuantityAllocated

In-fulfillment
QuantityAllocated - QuantityFulfilled

Post-fulfillment
QuantityAvailableToReturn, which is equal to QuantityFulfilled - QuantityReturnInitiated

You can apply adjustments to these groups in three different ways, controlled by the `allocatedItemsChangeOrderType` input property:

- Distribute the adjustment evenly between pre-fulfillment and post-fulfillment quantities. Ignore in-fulfillment quantities. Submitting the adjustment would create one change order for the adjustments to pre-fulfillment quantities and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Submitting the adjustment would create one change order for the adjustments to both pre-fulfillment and in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Submitting the adjustment would create one change order for the adjustments to pre-fulfillment quantities, one change order for the adjustments to in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

adjustSubmit(orderSummaryId, adjustInput)

`adjustSubmit(orderSummaryId, adjustInput)`

Adjust the price of one or more OrderItemSummaries from an OrderSummary, and create corresponding change orders.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.AdjustOrderSummaryOutputRepresentation adjustSubmit(String
orderSummaryId, ConnectApi.AdjustOrderItemSummaryInputRepresentation adjustInput)
```

Parameters

`orderSummaryId`
Type: String

ID of the OrderSummary.

`adjustInput`
Type: `ConnectApi.AdjustOrderItemSummaryInputRepresentation`

Price adjustments to OrderItemSummaries that together make up a price adjustment to an order, with options for adjusting items in the process of being fulfilled.

Return Value

Type: `ConnectApi.AdjustOrderSummaryOutputRepresentation`

Usage

When a price adjustment is applied to an OrderItemSummary, its quantities are considered in three groups:

Pre-fulfillment
QuantityAvailableToFulfill, which is equal to QuantityOrdered - QuantityCanceled - QuantityAllocated

In-fulfillment
QuantityAllocated - QuantityFulfilled

Post-fulfillment
QuantityAvailableToReturn, which is equal to QuantityFulfilled - QuantityReturnInitiated

You can apply adjustments to these groups in three different ways, controlled by the *`allocatedItemsChangeOrderType`* input property:

- Distribute the adjustment evenly between pre-fulfillment and post-fulfillment quantities. Ignore in-fulfillment quantities. Create one change order for the adjustments to pre-fulfillment quantities and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Create one change order for the adjustments to both pre-fulfillment and in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Create one change order for the adjustments to pre-fulfillment quantities, one change order for the adjustments to in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.

After submitting a price adjustment, process refunds as appropriate:

- If the discount only applied to OrderItemSummaries for which payment hasn't been captured, it doesn't require a refund. This situation normally applies to OrderItemSummaries in the US that haven't been fulfilled.
- If the discount applied to OrderItemSummaries that haven't been fulfilled and for which payment has been captured, process a refund. In this case, pass the *`totalExcessFundsAmount`* from the output representation to the `ensureRefundsAsync()` method.
- If the discount applied to OrderItemSummaries that have been fulfilled, process a refund. Pass the *`postFulfillmentChangeOrderId`* from the output representation to the `createCreditMemo()` method, then pass the CreditMemo to the `ensureRefundsAsync()` method.
- If the discount applied to both fulfilled and unfulfilled OrderItemSummaries for which payment has been captured, process both refunds. Pass the *`postFulfillmentChangeOrderId`* from the output representation to the `createCreditMemo()` method, then pass the credit memo and the *`totalExcessFundsAmount`* from the output representation to the `ensureRefundsAsync()` method.

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

adjustPreview(orderSummaryId, adjustInput)

createCreditMemo(orderSummaryId, creditMemoInput)

Create a credit memo to represent the refund for one or more change orders associated with an OrderSummary.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.CreateCreditMemoOutputRepresentation createCreditMemo(String orderSummaryId, ConnectApi.CreateCreditMemoInputRepresentation creditMemoInput)
```

Parameters

orderSummaryId
Type: String

ID of the OrderSummary.

creditMemoInput
Type: ConnectApi.CreateCreditMemoInputRepresentation

The list of change order IDs.

Return Value

Type: ConnectApi.CreateCreditMemoOutputRepresentation

createMultipleInvoices(invoicesInput)

Create Invoices to represent the charges for one or more change orders. Create Invoices for change orders that increase order amounts, such as for return fees. When you ensure the refund for a return, include the invoices for any associated return fees in the request.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.CreateMultipleInvoicesFromChangeOrdersOutputRepresentation createMultipleInvoices(ConnectApi.CreateMultipleInvoicesFromChangeOrdersInputRepresentation invoicesInput)
```

Parameters

invoicesInput
Type: ConnectApi.CreateMultipleInvoicesFromChangeOrdersInputRepresentation

Data about the change orders to create Invoices for.

Return Value

Type: ConnectApi.CreateMultipleInvoicesFromChangeOrdersOutputRepresentation

SEE ALSO:

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

createReturnOrder(returnOrderInput)

returnItems(returnOrderId, returnItemsInput)

ensureFundsAsync(orderSummaryId, ensureFundsInput)

Ensure funds for an invoice and apply them to it. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.EnsureFundsAsyncOutputRepresentation ensureFundsAsync(String orderSummaryId, ConnectApi.EnsureFundsAsyncInputRepresentation ensureFundsInput)
```

Parameters

orderSummaryId
Type: String

ID of the OrderSummary.

ensureFundsInput
Type: ConnectApi.EnsureFundsAsyncInputRepresentation

The ID of the invoice.

Return Value

Type: ConnectApi.EnsureFundsAsyncOutputRepresentation

Usage

This method checks the OrderPaymentSummaries associated with the specified OrderSummary for funds to apply to the invoice balance following this logic:

Note: If multiple OrderPaymentSummaries have equal amounts, their order of selection is random.

1. Verify that the invoice balance doesn't exceed the total amount of all the OrderPaymentSummaries.
2. Look for an OrderPaymentSummary with a captured amount equal to the invoice balance. If one exists, apply those funds.
3. If no exact match was found, identify all OrderPaymentSummaries with captured amounts greater than the invoice balance. If any exist, select the smallest one and apply funds from it equal to the invoice balance.
4. If no captured amounts greater than the invoice balance were found, traverse the OrderPaymentSummaries in order of captured amount, from largest to smallest. Apply each captured amount to the invoice until the invoice balance is zero or all captured funds are applied.
5. If the invoice still has a balance, look for an OrderPaymentSummary with an authorized amount equal to the remaining invoice balance. If one exists, capture and apply those funds.
6. If no exact match was found, identify all OrderPaymentSummaries with authorized amounts greater than the invoice balance. If any exist, select the smallest one and apply funds from it equal to the invoice balance.
7. If no authorized amounts greater than the invoice balance were found, traverse the OrderPaymentSummaries in order of authorized amount, from largest to smallest. Capture and apply funds until the invoice balance is zero.

Note: If the method creates a payment, the payment record's ClientContext value isn't predictable. Don't use it in custom logic.

SEE ALSO:

multipleEnsureFundsAsync(multipleEnsureFundsInput)

`ensureRefundsAsync(orderSummaryId, ensureRefundsInput)`

Ensure refunds for a credit memo or excess funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.EnsureRefundsAsyncOutputRepresentation ensureRefundsAsync(String
orderSummaryId, ConnectApi.EnsureRefundsAsyncInputRepresentation ensureRefundsInput)
```

Parameters

`orderSummaryId`
Type: String

ID of the OrderSummary.

ensureRefundsInput

Type: `ConnectApi.EnsureRefundsAsyncInputRepresentation`

ID of a credit memo to ensure refunds for, an amount of excess funds to refund, or both. At least one is required. Also includes any invoices for fees that reduce the refund amount, such as return fees. If multiple payment methods are available, you can specify how to distribute the refund.

Return Value

Type: `ConnectApi.EnsureRefundsAsyncOutputRepresentation`

Usage

By default, this action checks the order payment summaries associated with the specified order summary for amounts to refund following this logic. If you specify refund sequences that don't cover the full refund amount, and `isAllowPartial` is false, then the remaining amount is refunded according to this logic.

Note: If multiple OrderPaymentSummaries have equal amounts, their order of selection is random.

1. If a credit memo is specified, identify OrderPaymentSummaries with captured amounts that were applied to the corresponding invoice.
   a. Examine those OrderPaymentSummaries. If one has a captured amount matching the credit memo amount, apply the refund to that payment.
   b. If no exact match was found, look for captured amounts greater than the credit memo amount. If any exist, apply the refund to the smallest one.
   c. If no greater amounts were found, traverse the OrderPaymentSummaries in order of captured amount, from largest to smallest. Apply the refund to them until it's fully applied.
2. If an excess funds amount is specified, identify OrderPaymentSummaries with captured amounts that weren't applied to any invoice.
   a. Examine those OrderPaymentSummaries. If one has a captured amount matching the excess funds amount, apply the refund to that payment.
   b. If no exact match was found, look for captured amounts greater than the excess funds amount. If any exist, apply the refund to the smallest one.
   c. If no greater amounts were found, traverse the OrderPaymentSummaries in order of captured amount, from largest to smallest. Apply the refund to them until it's fully applied.

Note: If the method creates a refund, the refund record's ClientContext value isn't predictable. Don't use it in custom logic.

SEE ALSO:

createReturnOrder(returnOrderInput)

returnItems(returnOrderId, returnItemsInput)

createMultipleInvoices(invoicesInput)

`multipleEnsureFundsAsync(multipleEnsureFundsInput)`

Ensure and apply funds for one or more invoices. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.MultipleAsyncOutputRepresentation
multipleEnsureFundsAsync(ConnectApi.MultipleEnsureFundsAsyncInputRepresentation
multipleEnsureFundsInput)
```

Parameters

`multipleEnsureFundsInput`

Type: `ConnectApi.MultipleEnsureFundsAsyncInputRepresentation`

List of Invoices and the associated OrderSummaries.

Return Value

Type: `ConnectApi.MultipleAsyncOutputRepresentation`

Usage

For each Invoice in the request, this method checks the OrderPaymentSummaries associated with the specified OrderSummary for funds to apply to the invoice balance following this logic.

Note: If multiple OrderPaymentSummaries have equal amounts, their order of selection is random.

1. Verify that the invoice balance doesn't exceed the total amount of all the OrderPaymentSummaries.
2. Look for an OrderPaymentSummary with a captured amount equal to the invoice balance. If one exists, apply those funds.
3. If no exact match was found, identify all OrderPaymentSummaries with captured amounts greater than the invoice balance. If any exist, select the smallest one and apply funds from it equal to the invoice balance.
4. If no captured amounts greater than the invoice balance were found, traverse the OrderPaymentSummaries in order of captured amount, from largest to smallest. Apply each captured amount to the invoice until the invoice balance is zero or all captured funds are applied.
5. If the invoice still has a balance, look for an OrderPaymentSummary with an authorized amount equal to the remaining invoice balance. If one exists, capture and apply those funds.
6. If no exact match was found, identify all OrderPaymentSummaries with authorized amounts greater than the invoice balance. If any exist, select the smallest one and apply funds from it equal to the invoice balance.

7. If no authorized amounts greater than the invoice balance were found, traverse the OrderPaymentSummaries in order of authorized amount, from largest to smallest. Capture and apply funds until the invoice balance is zero.

Note: If the method creates a payment, the payment record's ClientContext value isn't predictable. Don't use it in custom logic.

SEE ALSO:

ensureFundsAsync(orderSummaryId, ensureFundsInput)

`previewCancel(orderSummaryId, changeInput)`

Retrieve the expected change order values for canceling one or more OrderItemSummaries from an OrderSummary, without actually executing the cancel.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.PreviewCancelOutputRepresentation previewCancel(String
orderSummaryId, ConnectApi.ChangeInputRepresentation changeInput)
```

Parameters

orderSummaryId
Type: String

ID of the OrderSummary.

changeInput
Type: `ConnectApi.ChangeInputRepresentation`

A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Return Value

Type: `ConnectApi.PreviewCancelOutputRepresentation`

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

submitCancel(orderSummaryId, changeInput)

`previewReturn(orderSummaryId, changeInput)`

Retrieve the expected change order values for a simple return of one or more OrderItemSummaries from an OrderSummary, without actually executing the return.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.PreviewReturnOutputRepresentation previewReturn(String
orderSummaryId, ConnectApi.ChangeInputRepresentation changeInput)
```

Parameters

orderSummaryId
Type: String

ID of the OrderSummary.

changeInput
Type: ConnectApi.ChangeInputRepresentation

A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Return Value

Type: ConnectApi.PreviewReturnOutputRepresentation

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

submitReturn(orderSummaryId, changeInput)

submitCancel(orderSummaryId, changeInput)

Cancel one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.SubmitCancelOutputRepresentation submitCancel(String
orderSummaryId, ConnectApi.ChangeInputRepresentation changeInput)
```

Parameters

orderSummaryId
Type: String

ID of the OrderSummary.

changeInput
Type: ConnectApi.ChangeInputRepresentation

A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Return Value

Type: ConnectApi.SubmitCancelOutputRepresentation

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

previewCancel(orderSummaryId, changeInput)

submitReturn(orderSummaryId, changeInput)

Return one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order. This return is a simple return that creates a change order but not a ReturnOrder.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.SubmitReturnOutputRepresentation submitReturn(String
orderSummaryId, ConnectApi.ChangeInputRepresentation changeInput)
```

Parameters

orderSummaryId
Type: String

ID of the OrderSummary.

changeInput
Type: ConnectApi.ChangeInputRepresentation

A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Return Value

Type: ConnectApi.SubmitReturnOutputRepresentation

Usage

After submitting a return, process a refund. Pass the *changeOrderId* from the output representation to the `createCreditMemo()` method, then pass the credit memo to the `ensureRefundsAsync()` method.

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

previewReturn(orderSummaryId, changeInput)

OrderSummaryCreation Class

Create Order Summaries in Order Management.

Namespace

ConnectApi

OrderSummaryCreation Methods

The following are methods for `OrderSummaryCreation`. All methods are static.

IN THIS SECTION:

createOrderSummary(orderSummaryInput)

Create an OrderSummary based on an order. That order is considered the original order for the OrderSummary. Subsequent change orders that apply to the OrderSummary are also represented as orders. You can specify whether the order is managed in Salesforce Order Management or by an external system. Most Salesforce Order Management APIs can run only on orders that it manages.

`createOrderSummary(orderSummaryInput)`

Create an OrderSummary based on an order. That order is considered the original order for the OrderSummary. Subsequent change orders that apply to the OrderSummary are also represented as orders. You can specify whether the order is managed in Salesforce Order Management or by an external system. Most Salesforce Order Management APIs can run only on orders that it manages.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryOutputRepresentation
createOrderSummary(ConnectApi.OrderSummaryInputRepresentation orderSummaryInput)
```

Parameters

orderSummaryInput
Type: ConnectApi.OrderSummaryInputRepresentation

Input object that wraps the ID of the source order.

Return Value

Type: ConnectApi.OrderSummaryOutputRepresentation

Organization Class

Access information about an org.

Namespace

ConnectApi

Organization Methods

The following are methods for `Organization`. All methods are static.

IN THIS SECTION:

getSettings()
Get information about the context user and the org, including which features are enabled.

`getSettings()`

Get information about the context user and the org, including which features are enabled.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi. OrganizationSettings getSettings()
```

Return Value

Type: ConnectApi.OrganizationSettings

PardotBusinessUnitContext Class

Get the Pardot business units the context user has access to.

Namespace

ConnectApi

PardotBusinessUnitContext Methods

The following are methods for `PardotBusinessUnitContext`. All methods are static.

IN THIS SECTION:

getBusinessUnitContext()
Get the Pardot business units the context user has access to.

getBusinessUnitContextByIsCurrentStatus(isCurrent)
Get the Pardot business units the context user has access to by specifying the current status.

`getBusinessUnitContext()`

Get the Pardot business units the context user has access to.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.PardotBusinessUnitContextOutput getBusinessUnitContext()
```

Return Value

Type: `ConnectApi.PardotBusinessUnitContextOutput`

`getBusinessUnitContextByIsCurrentStatus(isCurrent)`

Get the Pardot business units the context user has access to by specifying the current status.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.PardotBusinessUnitContextOutput
getBusinessUnitContextByIsCurrentStatus(Boolean isCurrent)
```

Parameters

isCurrent
Type: Boolean

Specifies whether to return only the business unit that's selected as the context user's current business unit context in the business unit switcher of the Pardot Lightning app (`true`) or to return only the business units that aren't selected as the context user's current business unit context (`false`).

Return Value

Type: `ConnectApi.PardotBusinessUnitContextOutput`

Payments Methods

Authorize a payment, capture an authorized payment, and refund an authorized payment.

Namespace

ConnectApi

Payments Methods

The following are methods for `Payments`. All methods are static.

IN THIS SECTION:

authorize(authorizePayment)
Authorize a payment.

postAuth(postAuthorizePayment)
Confirms that the merchant is ready to capture payment of an existing pre-authorized transaction.

reverseAuthorization(AuthReversalInput, authorizationId)
Reverses a payment authorization.

capture(AuthCaptureInput, authorizationId)
Capture an authorized payment.

refund(ReferencedRefundInput, paymentId)
Refund an authorized payment.

sale(sale)
Captures a payment without any prior authorization and creates a payment entity. The payment sale transaction is a combination of an Authorize transaction and Capture transaction. This payment sale method allows merchants to request that the funds are transferred to the merchant account in a single command, with no further action (such as charging a credit card) from the merchant.

tokenizePaymentMethod(tokenizePaymentMethodInput)

Method to take the input parameters of the payment method you want to tokenize and then pass them to the payment gateway's tokenization service. The results of the tokenization request are returned as a response from the payment gateway.

`authorize(authorizePayment)`

Authorize a payment.

API Version

51.0

Requires Chatter

No

Signature

```
global static ConnectApi.AuthorizationResponse authorize(ConnectApi.AuthorizationRequest
authorizePayment)
```

Parameters

`authorizePayment`

Type: `ConnectApi.AuthorizationRequest`

Represents a payment authorization.

Return Value

Type: `ConnectApi.AuthorizationResponse`

`postAuth(postAuthorizePayment)`

Confirms that the merchant is ready to capture payment of an existing pre-authorized transaction.

API Version

54.0

Requires Chatter

No

Signature

```
global static ConnectApi.PostAuthorizationResponse postAuth(ConnectApi.PostAuthRequest
postAuthorizePayment)
```

Parameters

postAuthorizePayment
Type: ConnectApi.PostAuthRequest

Information about the payment, payment method, and payment gateway from the original payment authorization.

Return Value

Type: ConnectApi.PostAuthorizationResponse

reverseAuthorization(AuthReversalInput, authorizationId)

Reverses a payment authorization.

API Version

51.0

Requires Chatter

No

Signature

```
global static ConnectApi.AuthorizationReversalResponse
reverseAuthorization(ConnectApi.AuthorizationReversalRequest AuthReversalInput, String
authorizationId)
```

Parameters

AuthReversalInput
Type: ConnectApi.AuthorizationReversalRequest

Input information for the payment authorization reversal.

authorizationId
Type: String

The ID of the payment authorization to be reversed.

Return Value

Type: ConnectApi.AuthorizationReversalResponse

capture(AuthCaptureInput, authorizationId)

Capture an authorized payment.

To access Payments methods, you need the following permissions.

- Salesforce Order Management License
- PaymentsAPIUser user permission. This permission is available with the Salesforce Order Management License. Your Salesforce admin assigns it to your profile.

API Version

50.0

Requires Chatter

No

Signature

```
global static ConnectApi.CaptureResponse capture(ConnectApi.CaptureRequest
AuthCaptureInput, String authorizationId)
```

Parameters

AuthCaptureInput
Type: ConnectApi.CaptureRequest

A `ConnectApi.CaptureRequest` object with information about the payment capture.

authorizationId
Type: String

ID of the payment authorization. Required.

Return Value

Type: ConnectApi.CaptureResponse

refund(ReferencedRefundInput, paymentId)

Refund an authorized payment.

To access Payments methods, you need the following permissions.

- Salesforce Order Management License
- PaymentsAPIUser user permission. This permission is available with the Salesforce Order Management License. Your Salesforce admin assigns it to your profile.

API Version

50.0

Requires Chatter

No

Signature

```
global static ConnectApi.ReferencedRefundResponse
refund(ConnectApi.ReferencedRefundRequest ReferencedRefundInput, String paymentId)
```

Parameters

ReferencedRefundInput
Type: ConnectApi.ReferencedRefundRequest

A ConnectApi.ReferencedRefundRequest object with information about the refund.

paymentId
Type: String

ID of the payment to be refunded. Required.

Return Value

Type: ConnectApi.ReferencedRefundResponse

sale(sale)

Captures a payment without any prior authorization and creates a payment entity. The payment sale transaction is a combination of an Authorize transaction and Capture transaction. This payment sale method allows merchants to request that the funds are transferred to the merchant account in a single command, with no further action (such as charging a credit card) from the merchant.

API Version

54.0

Requires Chatter

No

Signature

```
global static ConnectApi.SaleResponse sale(ConnectApi.SaleRequest sale)
```

Parameters

sale
Type: ConnectApi.SaleRequest

Payment sale input class.

Return Value

Type: ConnectApi.SaleResponse

tokenizePaymentMethod(tokenizePaymentMethodInput)

Method to take the input parameters of the payment method you want to tokenize and then pass them to the payment gateway's tokenization service. The results of the tokenization request are returned as a response from the payment gateway.

API Version

52.0

Requires Chatter

No

Signature

```
global static ConnectApi.PaymentMethodTokenizationResponse
tokenizePaymentMethod(ConnectApi.PaymentMethodTokenizationRequest
tokenizePaymentMethodInput)
```

Parameters

tokenizePaymentMethodInput
Type: ConnectApi.PaymentMethodTokenizationRequest

Information about the payment method to be tokenized.

Return Value

Type: ConnectApi.PaymentMethodTokenizationResponse

Usage

Accepts input parameters representing a payment method and passes them in a tokenization request to the payment gateway. The results of the tokenization request are returned as a response from the payment gateway. If the tokenization was successful, the response contains the tokenized value and details about the tokenization process. Otherwise, the response contains an error message and details about the error.

Example

```
ConnectApi.PaymentMethodTokenizationRequest request = new
ConnectApi.PaymentMethodTokenizationRequest();
request.paymentGatewayId = '0b0xx0000001Ja5AAE';
ConnectApi.CardPaymentMethodRequest cpmRequest = new ConnectApi.CardPaymentMethodRequest();
cpmRequest.cardHolderName = 'Jo Manager';
cpmRequest.expiryMonth = 11;
cpmRequest.expiryYear = 2222;
cpmRequest.cardNumber = '4111111111111111';
cpmRequest.cvv = '111';
cpmRequest.cardCategory = ConnectApi.CardCategory.CreditCard;
cpmRequest.cardType = ConnectApi.CardType.Visa.name();
request.cardPaymentMethod = cpmRequest;
ConnectApi.PaymentMethodTokenizationResponse response =
ConnectApi.Payments.tokenizePaymentMethod(request);
```

Personalization Class

Get assigned personalization audiences that match the user context. Create, get, update, and delete an audience. Get personalization targets that match the user context, based on the assigned audiences that include the user. Create and update targets. Get and delete a target.

Namespace

ConnectApi

Note: Personalization varies what the user can see in the browser but doesn't secure data in any way. To prevent users accessing sensitive data, use standard Salesforce security features, such as sharing rules and permission sets.

Personalization Methods

The following are methods for `Personalization`. All methods are static.

IN THIS SECTION:

createAudience(communityId, audience)
Create an audience.

createTargets(communityId, target)
Create targets.

deleteAudience(communityId, audienceId)
Delete an audience.

deleteTarget(communityId, targetId)
Delete a target.

getAudience(communityId, audienceId, includeAudienceCriteria)
Get an audience.

getAudienceBatch(communityId, audienceIds)
Get audience information for a comma-separated list of audience IDs.

getAudiences(communityId, ipAddress, domain, userId, publishStatus, includeAudienceCriteria, targetTypes, recordId)
Get a list of assigned audiences that match the user context and record information.

getAudiences(communityId, ipAddress, domain, userId, publishStatus, includeAudienceCriteria, targetTypes)
Get a list of assigned audiences that match the user context.

getTarget(communityId, targetId)
Get a target.

getTargetBatch(communityId, targetIds)
Get target information for a comma-separated list of target IDs.

getTargets(communityId, ipAddress, domain, userId, publishStatus, recordId, targetTypes, includeAudience, includeAllMatchingTargetsWithinGroup, groupNames)
Get a list of targets that match the user context, based on the assigned audiences that include the user.

updateAudience(communityId, audienceId, audience)
Update an audience.

updateTargets(communityId, target)
Update targets.

`createAudience(communityId, audience)`

Create an audience.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.Audience createAudience(String communityId,
ConnectApi.AudienceInput audience)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

audience
Type: ConnectApi.AudienceInput

A `ConnectApi.AudienceInput` object that defines the audience.

Return Value

Type: ConnectApi.Audience

createTargets(communityId, target)

Create targets.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.TargetCollection createTargets(String communityId,
ConnectApi.TargetCollectionInput target)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

target
Type: ConnectApi.TargetCollectionInput

A ConnectApi.TargetCollectionInput object that defines the targets.

Return Value

Type: ConnectApi.TargetCollection

deleteAudience(communityId, audienceId)

Delete an audience.

API Version

48.0

Requires Chatter

No

Signature

```
public static Void deleteAudience(String communityId, String audienceId)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

audienceId
Type: String

ID of the audience.

Return Value

Type: Void

deleteTarget(communityId, targetId)

Delete a target.

API Version

48.0

Requires Chatter

No

Signature

```
public static Void deleteTarget(String communityId, String targetId)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

targetId
Type: String

ID of the target.

Return Value

Type: Void

getAudience(communityId, audienceId, includeAudienceCriteria)

Get an audience.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.Audience getAudience(String communityId, String audienceId,
Boolean includeAudienceCriteria)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

audienceId
Type: String

ID of the audience.

includeAudienceCriteria
Type: Boolean

Specifies whether to include audience criteria (`true`) or not (`false`). If unspecified, defaults to `false`.

Return Value

Type: `ConnectApi.Audience`

getAudienceBatch(communityId, audienceIds)

Get audience information for a comma-separated list of audience IDs.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.BatchResult[] getAudienceBatch(String communityId, List<String>
audienceIds)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

audienceIds
Type: List<String>

Comma-separated list of audience IDs.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.Audience` object and errors for audiences that didn't load.

getAudiences(communityId, ipAddress, domain, userId, publishStatus, includeAudienceCriteria, targetTypes, recordId)

Get a list of assigned audiences that match the user context and record information.

API Version

51.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.AudienceCollection getAudiences(String communityId, String ipAddress, String domain, String userId, ConnectApi.PublishStatus publishStatus, Boolean includeAudienceCriteria, List<String> targetTypes, String recordId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

ipAddress
Type: String

IP address of the user. If `null`, no audiences with location criteria are returned.

domain
Type: String

Name of the user's Salesforce custom domain. If `null`, no audiences with domain criteria are returned.

userId
Type: String

ID of the user. If `null`, defaults to the ID of the context user.

publishStatus
Type: `ConnectApi.PublishStatus`

Publish status of the audience. Values are:

- `Draft`
- `Live`

If `null`, defaults to `Live`.

includeAudienceCriteria
Type: Boolean

Specifies whether to include audience criteria (`true`) or not (`false`). If unspecified, defaults to `false`.

targetTypes
Type: List<String>

Comma-separated list of target types to filter the results. Supported values include:

- `ExperienceVariation` (version 48.0 and later)

- Custom object API names, such as `CustomObjectName__c` (version 48.0 and later)
- `NavigationLinkSet` (version 49.0 and later)
- `Topic` (version 49.0 and later)
- `CollaborationGroup` (version 49.0 and later)
- `KnowledgeArticle` (version 49.0 and later)
- `ContentDocument` (version 49.0 and later)
- `ManagedContent` (version 49.0 and later)
- `Report` (version 49.0 and later)
- `Dashboard` (version 49.0 and later)

If `null`, all target types are returned.

recordId
Type: String

ID of the record for field based criteria. If `null`, all applicable audiences with field based criteria are returned.

Return Value

Type: `ConnectApi.AudienceCollection`

getAudiences(communityId, ipAddress, domain, userId, publishStatus, includeAudienceCriteria, targetTypes)

Get a list of assigned audiences that match the user context.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.AudienceCollection getAudiences(String communityId, String ipAddress, String domain, String userId, ConnectApi.PublishStatus publishStatus, Boolean includeAudienceCriteria, List<String> targetTypes)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

ipAddress
Type: String

IP address of the user. If `null`, no audiences with location criteria are returned.

domain
Type: String

Name of the user's Salesforce custom domain. If `null`, no audiences with domain criteria are returned.

userId
Type: String

ID of the user. If `null`, defaults to the ID of the context user.

publishStatus
Type: `ConnectApi.PublishStatus`

Publish status of the audience. Values are:

- `Draft`
- `Live`

If `null`, defaults to `Live`.

includeAudienceCriteria
Type: Boolean

Specifies whether to include audience criteria (`true`) or not (`false`). If unspecified, defaults to `false`.

targetTypes
Type: List<String>

Comma-separated list of target types to filter the results. Supported values include:

- `ExperienceVariation` (version 48.0 and later)
- Custom object API names, such as ***`CustomObjectName`***`__c` (version 48.0 and later)
- `NavigationLinkSet` (version 49.0 and later)
- `Topic` (version 49.0 and later)
- `CollaborationGroup` (version 49.0 and later)
- `KnowledgeArticle` (version 49.0 and later)
- `ContentDocument` (version 49.0 and later)
- `ManagedContent` (version 49.0 and later)
- `Report` (version 49.0 and later)
- `Dashboard` (version 49.0 and later)

If `null`, all target types are returned.

Return Value

Type: `ConnectApi.AudienceCollection`

getTarget(communityId, targetId)

Get a target.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.Target getTarget(String communityId, String targetId)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

targetId
Type: String

ID of the target.

Return Value

Type: ConnectApi.Target

getTargetBatch(communityId, targetIds)

Get target information for a comma-separated list of target IDs.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.BatchResult[] getTargetBatch(String communityId, List<String>
targetIds)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

targetIds
Type: List<String>

Comma-separated list of target IDs.

Return Value

Type: `ConnectApi.BatchResult`

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.Target` object and errors for targets that didn't load.

getTargets(communityId, ipAddress, domain, userId, publishStatus, recordId, targetTypes, includeAudience, includeAllMatchingTargetsWithinGroup, groupNames)

Get a list of targets that match the user context, based on the assigned audiences that include the user.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.TargetCollection getTargets(String communityId, String ipAddress, String domain, String userId, ConnectApi.PublishStatus publishStatus, String recordId, List<String> targetTypes, Boolean includeAudience, Boolean includeAllMatchingTargetsWithinGroup, List<String> groupNames)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

ipAddress
Type: String

IP address of the user. If `null`, no audiences with location criteria are returned.

domain
Type: String

Name of the user's Salesforce custom domain. If `null`, no audiences with domain criteria are returned.

userId
Type: String

ID of the user. If `null`, the default is the ID of the context user.

publishStatus
Type: `ConnectApi.PublishStatus`

Publish status of the target. Values are:

- `Draft`
- `Live`

recordId
Type: String

ID of the record, if you want to specify field based criteria in audiences.

targetTypes
Type: List<String>

Comma-separated list of target types to filter the results. Supported values include:

- `ExperienceVariation` (version 48.0 and later)
- Custom object API names, such as ***`CustomObjectName`*****`__c`** (version 48.0 and later)
- `NavigationLinkSet` (version 49.0 and later)
- `Topic` (version 49.0 and later)
- `CollaborationGroup` (version 49.0 and later)
- `KnowledgeArticle` (version 49.0 and later)
- `ContentDocument` (version 49.0 and later)
- `ManagedContent` (version 49.0 and later)
- `Report` (version 49.0 and later)
- `Dashboard` (version 49.0 and later)

If `null`, all target types are returned.

includeAudience
Type: Boolean

Specifies whether to include the matching audience (`true`) or not (`false`). If `null`, the default is `false`.

includeAllMatchingTargetsWithinGroup
Type: Boolean

Specifies whether to include all the matching targets within a target group (`true`) or not (`false`). If `null`, the default is `false`. If `false`, the first matching target within each group, based on priority within the group, is returned.

groupNames
Type: List<String>

A comma-separated list of group names. Groups bundle related target and audience pairs.

Return Value

Type: ConnectApi.TargetCollection

updateAudience(communityId, audienceId, audience)

Update an audience.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.Audience updateAudience(String communityId, String audienceId,
ConnectApi.AudienceInput audience)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

audienceId
Type: String

ID of the audience.

audience
Type: ConnectApi.AudienceInput

A `ConnectApi.AudienceInput` object that defines the updates to the audience.

Return Value

Type: ConnectApi.Audience

updateTargets(communityId, target)

Update targets.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.TargetCollection updateTargets(String communityId,
ConnectApi.TargetCollectionUpdateInput target)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

target
Type: `ConnectApi.TargetCollectionUpdateInput`

A `ConnectApi.TargetCollectionUpdateInput` object that defines the updates for the targets.

Return Value

Type: `ConnectApi.TargetCollection`

QuestionAndAnswers Class

Access question and answers suggestions.

Namespace

ConnectApi

IN THIS SECTION:

QuestionAndAnswers Methods

QuestionAndAnswers Methods

The following are methods for `QuestionAndAnswers`. All methods are static.

IN THIS SECTION:

getSuggestions(communityId, q, subjectId, includeArticles, maxResults)
Get question and answers suggestions.

setTestGetSuggestions(communityId, q, subjectId, includeArticles, maxResults, result)
Register a `ConnectApi.QuestionAndAnswersSuggestions` object to be returned when `getSuggestions` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

updateQuestionAndAnswers(communityId, feedElementId, questionAndAnswersCapability)
Choose or change the best answer for a question.

`getSuggestions(communityId, q, subjectId, includeArticles, maxResults)`

Get question and answers suggestions.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.QuestionAndAnswersSuggestions getSuggestions(String communityId,
String q, String subjectId, Boolean includeArticles, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

subjectId
Type: String

Specify a subject ID to search only questions on that object. If the ID is a topic or a user, the ID is ignored.

includeArticles
Type: Boolean

Specify `true` to include knowledge articles in the search results. To return only questions, specify `false`.

maxResults
Type: Integer

The maximum number of results to return for each type of item. Possible values are 1–10. The default value is 5.

Return Value

Type: `ConnectApi.QuestionAndAnswersSuggestions`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetSuggestions(communityId, q, subjectId, includeArticles, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

setTestGetSuggestions(communityId, q, subjectId, includeArticles, maxResults, result)

Register a `ConnectApi.QuestionAndAnswersSuggestions` object to be returned when `getSuggestions` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetSuggestions(String communityId, String q, String subjectId, Boolean includeArticles, Integer maxResults, ConnectApi.QuestionAndAnswersSuggestions result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

subjectId
Type: String

Specify a subject ID to search only questions on that object. If the ID is a topic or a user, the ID is ignored.

includeArticles
Type: Boolean

Specify `true` to include knowledge articles in the search results. To return only questions, specify `false`.

maxResults
Type: Integer

The maximum number of results to return for each type of item. Possible values are 1–10. The default value is 5.

result
Type: `ConnectApi.QuestionAndAnswersSuggestions`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getSuggestions(communityId, q, subjectId, includeArticles, maxResults)

Apex Developer Guide: Testing ConnectApi Code

updateQuestionAndAnswers(communityId, feedElementId, questionAndAnswersCapability)

Choose or change the best answer for a question.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.QuestionAndAnswersCapability updateQuestionAndAnswers(String communityId, String feedElementId, ConnectApi.QuestionAndAnswersCapabilityInput questionAndAnswersCapability)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

questionAndAnswersCapability
Type: `ConnectApi.QuestionAndAnswersCapabilityInput`

Specify the best answer (comment ID) for the question.

Return Value

Type: `ConnectApi.QuestionAndAnswersCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Example

```
ConnectApi.QuestionAndAnswersCapabilityInput qaInput = new
ConnectApi.QuestionAndAnswersCapabilityInput();
qaInput.bestAnswerId = '0D7D000000001MAKAY';

ConnectApi.QuestionAndAnswersCapability qa =
ConnectApi.QuestionAndAnswers.updateQuestionAndAnswers(null, '0D5D0000000XZjJ', qaInput);
```

Recommendations Class

Get and reject Chatter, custom, and static recommendations. Create, get, update, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

For Next Best Action recommendations, see NextBestAction Class.

Namespace

ConnectApi

Recommendations Methods

The following are methods for `Recommendations`. All methods are static.

IN THIS SECTION:

createRecommendationAudience(communityId, recommendationAudience)
Create an audience for a custom recommendation.

createRecommendationAudience(communityId, name)
Create an audience for a custom recommendation.

createRecommendationDefinition(communityId, recommendationDefinition)
Create a custom recommendation definition.

createRecommendationDefinition(communityId, name, title, actionUrl, actionUrlName, explanation)
Create a custom recommendation definition with the specified parameters.

createScheduledRecommendation(communityId, scheduledRecommendation)
Create a scheduled custom recommendation.

createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId, channel)
Create a scheduled custom recommendation with the specified parameters.

deleteRecommendationAudience(communityId, recommendationAudienceId)
Delete a custom recommendation audience.

deleteRecommendationDefinition(communityId, recommendationDefinitionId)
Delete a custom recommendation definition.

deleteRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)
Delete a custom recommendation definition photo.

deleteScheduledRecommendation(communityId, scheduledRecommendationId, deleteDefinitionIfLast)
Delete a scheduled custom recommendation.

getRecommendationAudience(communityId, recommendationAudienceId)
Get information about a custom recommendation audience.

getRecommendationAudienceMembership(communityId, recommendationAudienceId)
Get the members of a custom recommendation audience.

getRecommendationAudienceMembership(communityId, recommendationAudienceId, pageParam, pageSize)
Get a page of custom recommendation audience members.

getRecommendationAudiences(communityId)

Get custom recommendation audiences.

getRecommendationAudiences(communityId, pageParam, pageSize)

Get a page of custom recommendation audiences.

getRecommendationDefinition(communityId, recommendationDefinitionId)

Get a custom recommendation definition.

getRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)

Get a custom recommendation definition photo.

getRecommendationDefinitions(communityId)

Get custom recommendation definitions.

getRecommendationForUser(communityId, userId, action, objectId)

Get the Chatter, custom, or static recommendation for the context user for the specified action and object ID.

getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)

Get the Chatter recommendations, such as user, group, file, article, record, and topic recommendations for the context user. Get the custom and static recommendations for the context user.

getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)

Get the Chatter, custom, and static recommendations for the context user for the specified action.

getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)

Get the Chatter, custom, and static recommendations for the context user for the specified action and object category.

getScheduledRecommendation(communityId, scheduledRecommendationId)

Get a scheduled custom recommendation.

getScheduledRecommendations(communityId, channel)

Get scheduled custom recommendations.

rejectRecommendationForUser(communityId, userId, action, objectId)

Reject a Chatter, custom, or static recommendation for the context user for the specified action and object ID.

rejectRecommendationForUser(communityId, userId, action, objectEnum)

Reject a static recommendation for the context user.

updateRecommendationAudience(communityId, recommendationAudienceId, recommendationAudience)

Update a custom recommendation audience.

updateRecommendationDefinition(communityId, recommendationDefinitionId, name, title, actionUrl, actionUrlName, explanation)

Update a custom recommendation definition with the specified parameters.

updateRecommendationDefinition(communityId, recommendationDefinitionId, recommendationDefinition)

Update a custom recommendation definition.

updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileUpload)

Update a custom recommendation definition photo with a file that hasn't been uploaded.

updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileId, versionNumber)

Update a custom recommendation definition photo with an uploaded file.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo)

Update a custom recommendation definition photo with an uploaded file that requires cropping.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo, fileUpload)

Update a custom recommendation definition photo with a file that hasn't been uploaded and requires cropping.

updateScheduledRecommendation(communityId, scheduledRecommendationId, scheduledRecommendation)
Update a scheduled custom recommendation.

updateScheduledRecommendation(communityId, scheduledRecommendationId, rank, enabled, recommendationAudienceId)
Update a scheduled custom recommendation with the specified parameters.

createRecommendationAudience(communityId, recommendationAudience)

Create an audience for a custom recommendation.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudience createRecommendationAudience(String communityId, ConnectApi.RecommendationAudienceInput recommendationAudience)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationAudience
Type: `ConnectApi.RecommendationAudienceInput`

A `ConnectApi.RecommendationAudienceInput` object.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

createRecommendationAudience(communityId, name)

Create an audience for a custom recommendation.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudience createRecommendationAudience(String communityId, String name)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

name
Type: String

Name of the audience.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

createRecommendationDefinition(communityId, recommendationDefinition)

Create a custom recommendation definition.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationDefinition createRecommendationDefinition(String communityId, ConnectApi.RecommendationDefinitionInput recommendationDefinition)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinition
Type: `ConnectApi.RecommendationDefinitionInput`

A `ConnectApi.RecommendationDefinitionInput` object.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Recommendation definitions allow you to create custom recommendations that appear in Experience Cloud sites, encouraging users to watch videos, take training and more.

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

These recommendations appear by default on the Customer Service template. They appear on the home and question detail pages and in the feed in Salesforce mobile web. They also appear anywhere community managers add recommendations using Experience Builder in the Customer Service template.

So that users don't see the same recommendations all the time, Salesforce periodically removes and brings back custom recommendations that haven't been accepted or dismissed.

createRecommendationDefinition(communityId, name, title, actionUrl, actionUrlName, explanation)

Create a custom recommendation definition with the specified parameters.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationDefinition createRecommendationDefinition(String communityId, String name, String title, String actionUrl, String actionUrlName, String explanation)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

name
Type: String

Name of the custom recommendation definition. The name is displayed in Setup.

title
Type: String

Title of the custom recommendation definition.

actionUrl
Type: String

URL for acting on the custom recommendation, for example, the URL to join a group.

actionUrlName
Type: String

Text label for the action URL in the user interface, for example, "Launch."

explanation
Type: String

Explanation, or body, of the custom recommendation.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Recommendation definitions allow you to create custom recommendations that appear in Experience Cloud sites, encouraging users to watch videos, take training and more.

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

These recommendations appear by default on the Customer Service template. They appear on the home and question detail pages and in the feed in Salesforce mobile web. They also appear anywhere community managers add recommendations using Experience Builder in the Customer Service template.

So that users don't see the same recommendations all the time, Salesforce periodically removes and brings back custom recommendations that haven't been accepted or dismissed.

`createScheduledRecommendation(communityId, scheduledRecommendation)`

Create a scheduled custom recommendation.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String communityId, ConnectApi.ScheduledRecommendationInput scheduledRecommendation)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

scheduledRecommendation
Type: `ConnectApi.ScheduledRecommendationInput`

A `ConnectApi.ScheduledRecommendationInput` object.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId, channel)`

Create a scheduled custom recommendation with the specified parameters.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String communityId, String recommendationDefinitionId, Integer rank, Boolean enabled, String recommendationAudienceId, ConnectApi.RecommendationChannel channel)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

rank
Type: Integer

Relative rank of the scheduled custom recommendation indicated by ascending whole numbers starting with 1.

Setting the rank is comparable to an insertion into an ordered list. The scheduled custom recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled custom recommendations after it is pushed down. See Ranking scheduled custom recommendations example.

If the specified `rank` is larger than the size of the list, the scheduled custom recommendation is put at the end of the list. The `rank` of the scheduled custom recommendation is the size of the list, instead of the one specified.

If a `rank` is not specified, the scheduled custom recommendation is put at the end of the list.

enabled
Type: Boolean

Indicates whether scheduling is enabled. If `true`, the custom recommendation is enabled and appears in Experience Cloud sites. If `false`, custom recommendations in feeds in Salesforce mobile web aren't removed, but no new custom recommendations appear. In Customer Service and Partner Central sites, disabled custom recommendations no longer appear.

recommendationAudienceId
Type: String

ID of the custom recommendation definition that this scheduled recommendation schedules.

channel
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

Use these channel values; you can't rename or create other channels.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Ranking scheduled custom recommendations example

If you have these scheduled custom recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Custom Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

`deleteRecommendationAudience(communityId, recommendationAudienceId)`

Delete a custom recommendation audience.

API Version

35.0

Requires Chatter

No

Signature

```
public static Void deleteRecommendationAudience(String communityId, String
recommendationAudienceId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the custom recommendation audience.

Return Value

Type: Void

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`deleteRecommendationDefinition(communityId, recommendationDefinitionId)`

Delete a custom recommendation definition.

API Version

35.0

Requires Chatter

No

Signature

```
public static Void deleteRecommendationDefinition(String communityId, String
recommendationDefinitionId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

Return Value

Type: Void

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`deleteRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)`

Delete a custom recommendation definition photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static Void deleteRecommendationDefinitionPhoto(String communityId, String recommendationDefinitionId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

Return Value

Type: Void

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

deleteScheduledRecommendation(communityId, scheduledRecommendationId, deleteDefinitionIfLast)

Delete a scheduled custom recommendation.

API Version

35.0

Requires Chatter

No

Signature

```
public static Void deleteScheduledRecommendation(String communityId, String scheduledRecommendationId, Boolean deleteDefinitionIfLast)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

scheduledRecommendationId
Type: String

ID of the scheduled custom recommendation.

deleteDefinitionIfLast
Type: Boolean

If `true` and if this is the last scheduled custom recommendation of a custom recommendation definition, deletes the custom recommendation definition. Default is `false`.

Return Value

Type: Void

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Deleting a scheduled custom recommendation is comparable to a deletion in an ordered list. All scheduled custom recommendations after the deleted scheduled custom recommendation receive a new, higher rank automatically.

getRecommendationAudience(communityId, recommendationAudienceId)

Get information about a custom recommendation audience.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudience getRecommendationAudience(String communityId, String recommendationAudienceId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the custom recommendation audience.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

getRecommendationAudienceMembership(communityId, recommendationAudienceId)

Get the members of a custom recommendation audience.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.UserReferencePage getRecommendationAudienceMembership(String communityId, String recommendationAudienceId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the custom recommendation audience.

Return Value

Type: `ConnectApi.UserReferencePage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationAudienceMembership(communityId, recommendationAudienceId, pageParam, pageSize)`

Get a page of custom recommendation audience members.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.UserReferencePage getRecommendationAudienceMembership(String communityId, String recommendationAudienceId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the custom recommendation audience.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of members per page.

Return Value

Type: `ConnectApi.UserReferencePage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

getRecommendationAudiences(communityId)

Get custom recommendation audiences.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudiencePage getRecommendationAudiences(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.RecommendationAudiencePage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

getRecommendationAudiences(communityId, pageParam, pageSize)

Get a page of custom recommendation audiences.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudiencePage getRecommendationAudiences(String communityId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of audiences per page.

Return Value

Type: `ConnectApi.RecommendationAudiencePage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

getRecommendationDefinition(communityId, recommendationDefinitionId)

Get a custom recommendation definition.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationDefinition getRecommendationDefinition(String communityId, String recommendationDefinitionId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)`

Get a custom recommendation definition photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo getRecommendationDefinitionPhoto(String communityId, String recommendationDefinitionId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

Return Value

Type: `ConnectApi.Photo`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationDefinitions(communityId)`

Get custom recommendation definitions.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationDefinitionPage getRecommendationDefinitions(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.RecommendationDefinitionPage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationForUser(communityId, userId, action, objectId)`

Get the Chatter, custom, or static recommendation for the context user for the specified action and object ID.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, String objectId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID for the context user or the keyword `me`.

`action`
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

`objectId`
Type: String

Specifies the object to act on.

- If *`action`* is `follow`, *`objectId`* is a user ID, file ID, record ID, or topic ID (version 36.0 and later).
- If *`action`* is `join`, *`objectId`* is a group ID.
- If *`action`* is `view`, *`objectId`* is a user ID, file ID, group ID, record ID, custom recommendation ID (version 34.0 and later), the enum `Today` for static recommendations (version 35.0 and later), or an article ID (version 37.0 and later).

Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecommendationForUser(communityId, userId, action, objectId, result)

Apex Developer Guide: Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)`

Get the Chatter recommendations, such as user, group, file, article, record, and topic recommendations for the context user. Get the custom and static recommendations for the context user.

API Version

36.0

Available to Guest Users

38.0

Note: Only article and file recommendations are available to guest users.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType contextAction, String contextObjectId, ConnectApi.RecommendationChannel channel, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`

- `view`

Use *`contextAction`* and *`contextObjectId`* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`contextObjectId`
Type: String

ID of the object that the context user just performed an action on.

- If *`contextAction`* is `follow`, *`contextObjectId`* is a user ID, file ID, record ID, or topic ID.
- If *`contextAction`* is `view`, *`contextObjectId`* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *`contextAction`* and *`contextObjectId`* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`channel`
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

`maxResults`
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

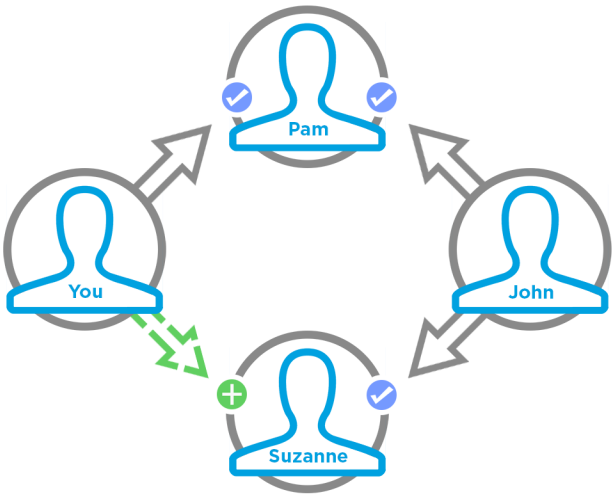
Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *`contextAction`* and *`contextObjectId`* together. For example, if you just followed Pam, you specify `follow` for *`contextAction`* and Pam's user ID for *`contextObjectId`*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.



To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)`

Get the Chatter, custom, and static recommendations for the context user for the specified action.

API Version

36.0

Available to Guest Users

38.0

Note: Only article and file recommendations are available to guest users.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String
communityId, String userId, ConnectApi.RecommendationActionType action,
ConnectApi.RecommendationActionType contextAction, String contextObjectId,
ConnectApi.RecommendationChannel channel, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.

- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

`maxResults`
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

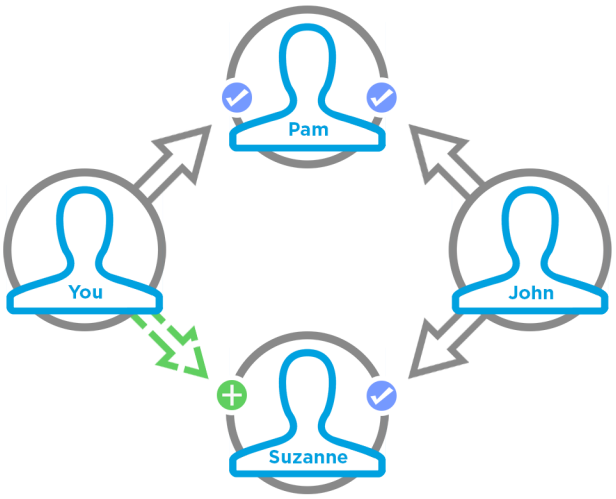
Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *`contextAction`* and *`contextObjectId`* together. For example, if you just followed Pam, you specify `follow` for *`contextAction`* and Pam's user ID for *`contextObjectId`*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.



To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)`

Get the Chatter, custom, and static recommendations for the context user for the specified action and object category.

API Version

36.0

Available to Guest Users

38.0

Note: Only article and file recommendations are available to guest users.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, String objectCategory, ConnectApi.RecommendationActionType contextAction, String contextObjectId, ConnectApi.RecommendationChannel channel, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectCategory
Type: String

- If *action* is `follow`, *objectCategory* is `users`, `files`, `topics`, or `records`.
- If *action* is `join`, *objectCategory* is `groups`.
- If *action* is `view`, *objectCategory* is `users`, `files`, `groups`, `records`, `custom`, `apps`, or `articles` (version 37.0 and later).

You can also specify a key prefix, the first three characters of the object ID, as the *objectCategory*. Valid values are:

- If *action* is `follow`, *objectCategory* is `005` (users), `069` (files), `0TO` (topics), or `001` (accounts), for example.
- If *action* is `join`, *objectCategory* is `0F9` (groups).
- If *action* is `view`, *objectCategory* is `005` (users), `069` (files), `0F9` (groups), `0RD` (custom recommendations), `T` (static recommendations), `001` (accounts), or `kA0` (articles), for example, (version 370 and later).

contextAction

Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId

Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel

Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

maxResults

Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

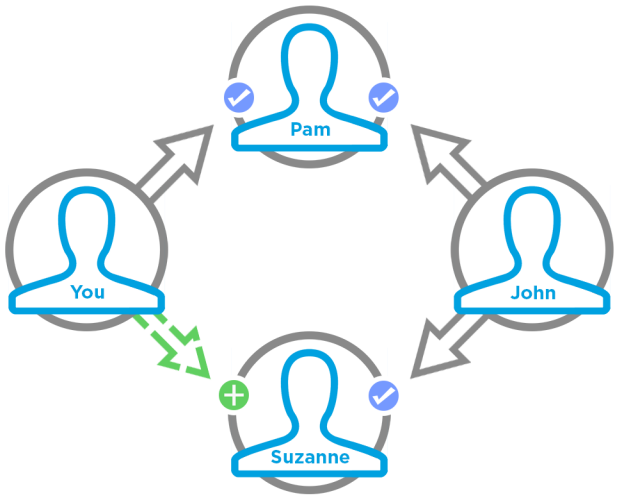
Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *`contextAction`* and *`contextObjectId`* together. For example, if you just followed Pam, you specify `follow` for *`contextAction`* and Pam's user ID for *`contextObjectId`*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.



To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

- setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults, result)
- *Apex Developer Guide*: Testing ConnectApi Code

`getScheduledRecommendation(communityId, scheduledRecommendationId)`

Get a scheduled custom recommendation.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendation getScheduledRecommendation(String communityId, String scheduledRecommendationId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

scheduledRecommendationId
Type: String

ID of the scheduled custom recommendation.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getScheduledRecommendations(communityId, channel)`

Get scheduled custom recommendations.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendationPage getScheduledRecommendations(String communityId, ConnectApi.RecommendationChannel channel)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

channel
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

Return Value

Type: `ConnectApi.ScheduledRecommendationPage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`rejectRecommendationForUser(communityId, userId, action, objectId)`
