</table>
Apex is a strongly typed, object-oriented programming language that allows developers to execute flow and transaction control statements on the Salesforce Platform server, in conjunction with calls to the API. This reference guide includes built-in Apex classes, interfaces, enum, and exceptions, grouped by namespace. It also includes Apex DML statements to insert, update, merge, delete, and restore data in Salesforce.

For information on the Apex development process, see Apex Developer Guide.

Note: In API version 51.0 and earlier, Apex Reference information was included in the Apex Developer Guide in the Apex Language section.

IN THIS SECTION:

- Apex Release Notes
  Use the Salesforce Release Notes to learn about the most recent updates and changes to Apex.
- Apex DML Operations
  You can perform DML operations using the Apex DML statements or the methods of the Database class. For lead conversion, use the convertLead method of the Database class. There is no DML counterpart for it.
- ApexPages Namespace
  The ApexPages namespace provides classes used in Visualforce controllers.
- AppLauncher Namespace
  The AppLauncher namespace provides methods for managing the appearance of apps in the App Launcher, including their visibility and sort order.
- Approval Namespace
  The Approval namespace provides classes and methods for approval processes.
- Auth Namespace
  The Auth namespace provides an interface and classes for single sign-on into Salesforce and session security management.
- Cache Namespace
  The Cache namespace contains methods for managing the platform cache.
- Canvas Namespace
  The Canvas namespace provides an interface and classes for canvas apps in Salesforce.
- ChatterAnswers Namespace
  The ChatterAnswers namespace provides an interface for creating Account records.
- CommercePayments Namespace
  Use the CommercePayments namespace to provide a safe and customizable platform for managing customer payments and refunds.
- ConnectApi Namespace
  The ConnectApi namespace (also called Connect in Apex) provides classes for accessing the same data available in Connect REST API. Use Connect in Apex to create custom experiences in Salesforce.
- Database Namespace
  The Database namespace provides classes used with DML operations.
Datacloud Namespace
The Datacloud namespace provides classes and methods for retrieving information about duplicate rules. Duplicate rules let you control whether and when users can save duplicate records within Salesforce.

DataSource Namespace
The DataSource namespace provides the classes for the Apex Connector Framework. Use the Apex Connector Framework to develop a custom adapter for Salesforce Connect. Then connect your Salesforce organization to any data anywhere via the Salesforce Connect custom adapter.

DataWeave Namespace
The DataWeave namespace provides classes and methods to support the invocation of DataWeave scripts from Apex.

Dom Namespace
The Dom namespace provides classes and methods for parsing and creating XML content.

EventBus Namespace
The EventBus namespace provides classes and methods for platform events and Change Data Capture events.

ExternalService Namespace
The ExternalService namespace provides dynamically generated Apex service interfaces and Apex classes for complex object data types.

Flow Namespace
The Flow namespace provides a class for advanced Visualforce controller access to flows.

Functions Namespace
The Functions namespace provides classes and methods used to invoke and manage Salesforce Functions.

Invocable Namespace
The Invocable namespace provides classes for calling invocable actions from Apex.

KbManagement Namespace
The KbManagement namespace provides a class for managing knowledge articles.

LxScheduler Namespace
The LxScheduler namespace provides an interface and classes for integrating Salesforce Scheduler with external calendars.

Messaging Namespace
The Messaging namespace provides classes and methods for Salesforce outbound and inbound email functionality.

Metadata Namespace
The Metadata namespace provides classes and methods for working with custom metadata in Salesforce

Pref_center Namespace
The Pref_center namespace provides an interface, classes, and methods to create and retrieve data in forms in Preference Manager. Preference Manager, previously called Preference Center, is a feature within the Privacy Center app.

Process Namespace
The Process namespace provides an interface and classes for passing data between your organization and a flow.

QuickAction Namespace
The QuickAction namespace provides classes and methods for quick actions.

Reports Namespace
The Reports namespace provides classes for accessing the same data as is available in the Salesforce Reports and Dashboards REST API.
RichMessaging Namespace
Provides objects and methods for handling content in enhanced Messaging channels.

Schema Namespace
The Schema namespace provides classes and methods for schema metadata information.

Search Namespace
The Search namespace provides classes for getting search results and suggestion results.

Sfc Namespace
The Sfc namespace contains classes used in Salesforce Files.

Sfdc_Checkout Namespace
The Sfdc_Checkout namespace provides an interface and classes for B2B Commerce apps in Salesforce.

sfdc_surveys Namespace
The sfdc_surveys namespace provides an interface for shortening survey invitations.

Site Namespace
The Site namespace provides an interface for rewriting Sites URLs.

Support Namespace
The Support namespace provides an interface used for Case Feed.

System Namespace
The System namespace provides classes and methods for core Apex functionality.

TerritoryMgmt Namespace
The TerritoryMgmt namespace provides an interface used for territory management.

TxnSecurity Namespace
The TxnSecurity namespace provides an interface used for transaction security.

UserProvisioning Namespace
The UserProvisioning namespace provides methods for monitoring outbound user provisioning requests.

VisualEditor Namespace
The VisualEditor namespace provides classes and methods for interacting with the Lightning App Builder. The classes and methods in this namespace operate on Lightning components, which include Lightning web components and Aura components.

Wave Namespace
The classes in the Wave namespace are part of the CRM Analytics Analytics SDK, designed to facilitate querying CRM Analytics data from Apex code.

Appendices

Apex Release Notes

Use the Salesforce Release Notes to learn about the most recent updates and changes to Apex.

For Apex updates and changes that impact the Salesforce Platform, see the Apex Release Notes.

For new and changed Apex classes, methods, exceptions and interfaces, see Apex: New and Changed Items in the Salesforce Release Notes.
Apex DML Operations

You can perform DML operations using the Apex DML statements or the methods of the `Database` class. For lead conversion, use the `convertLead` method of the `Database` class. There is no DML counterpart for it.

SEE ALSO:

* Apex Developer Guide: Working with Data in Apex
  * Database Class

Apex DML Statements

Use Data Manipulation Language (DML) statements to insert, update, merge, delete, and restore data in Salesforce.

The following Apex DML statements are available:

### Insert Statement

The `insert` DML operation adds one or more sObjects, such as individual accounts or contacts, to your organization’s data. `insert` is analogous to the INSERT statement in SQL.

**Syntax**

```
insert sObject
insert sObject[]
```

**Example**

The following example inserts an account named ‘Acme’:

```apex
Account newAcct = new Account(name = 'Acme');
try {
    insert newAcct;
} catch (DmlException e) {
    // Process exception here
}
```

⚠️ Note: For more information on processing `DmlExceptions`, see [Bulk DML Exception Handling](#).

### Update Statement

The `update` DML operation modifies one or more existing sObject records, such as individual accounts or contacts, in your organization’s data. `update` is analogous to the UPDATE statement in SQL.

**Syntax**

```
update sObject
update sObject[]
```
Example
The following example updates the BillingCity field on a single account named ‘Acme’:

```java
Account a = new Account(Name='Acme2');
insert(a);

Account myAcct = [SELECT Id, Name, BillingCity FROM Account WHERE Id = :a.Id];
myAcct.BillingCity = 'San Francisco';

try {
    update myAcct;
} catch (DmlException e) {
    // Process exception here
}
```

Note: For more information on processing DmlExceptions, see Bulk DML Exception Handling.

Upsert Statement
The `upsert` DML operation creates new records and updates sObject records within a single statement, using a specified field to determine the presence of existing objects, or the ID field if no field is specified.

Syntax

```java
upsert sObject [opt_field]
upsert sObject[] [opt_field]
```

The `upsert` statement matches the sObjects with existing records by comparing values of one field. If you don’t specify a field when calling this statement, the `upsert` statement uses the sObject’s ID to match the sObject with existing records in Salesforce. Alternatively, you can specify a field to use for matching. For custom objects, specify a custom field marked as external ID. For standard objects, you can specify any field that has the `idLookup` attribute set to true. For example, the Email field of Contact or User has the `idLookup` attribute set. To check a field’s attribute, see the Object Reference for Salesforce.

Also, you can use foreign keys to upsert sObject records if they have been set as reference fields. For more information, see Field Types in the Object Reference for Salesforce.

The optional field parameter, `opt_field`, is a field token (of type `Schema.SObjectField`). For example, to specify the MyExternalId custom field, the statement is:

```java
upsert sObjectList Account.Fields.MyExternalId__c;
```

If the field used for matching doesn’t have the `Unique` attribute set, the context user must have the “View All” object-level permission for the target object or the “View All Data” permission so that `upsert` doesn’t accidentally insert a duplicate record.

Note: Custom field matching is case-insensitive only if the custom field has the `Unique` and `Treat "ABC" and "abc" as duplicate values (case insensitive)` attributes selected as part of the field definition. If so, “ABC123” is matched with “abc123.” For more information, see “Create Custom Fields” in the Salesforce online help.

How Upsert Chooses to Insert or Update
Upsert uses the sObject record’s primary key (the ID), an idLookup field, or an external ID field to determine whether it should create a record or update an existing one:
If the key isn’t matched, a new object record is created.
If the key is matched once, the existing object record is updated.
If the key is matched multiple times, an error is generated and the object record isn’t inserted or updated.

Example
This example performs an upsert of a list of accounts.

```java
List<Account> acctList = new List<Account>();
// Fill the accounts list with some accounts
try {
    upsert acctList;
} catch (DmlException e) {
}
```

This next example performs an upsert of a list of accounts using a foreign key for matching existing records, if any.

```java
List<Account> acctList = new List<Account>();
// Fill the accounts list with some accounts
try {
    // Upsert using an external ID field
    upsert acctList myExtIDField__c;
} catch (DmlException e) {
}
```

Delete Statement
The delete DML operation deletes one or more existing sObject records, such as individual accounts or contacts, from your organization’s data. delete is analogous to the delete() statement in the SOAP API.

Syntax
```
delete sObject
delete sObject[
```

Example
The following example deletes all accounts that are named 'DotCom':

```java
Account[] doomedAccts = [SELECT Id, Name FROM Account
WHERE Name = 'DotCom'];
try {
    delete doomedAccts;
} catch (DmlException e) {
    // Process exception here
}
```

Note: For more information on processing DmlExceptions, see Bulk DML Exception Handling.
Undelete Statement

The `undelete` DML operation restores one or more existing sObject records, such as individual accounts or contacts, from your organization's Recycle Bin. `undelete` is analogous to the UNDELETE statement in SQL.

Syntax

```
undelete sObject | ID
undelete sObject[] | ID[]
```

Example

The following example undeletes an account named 'Universal Containers'. The `ALL ROWS` keyword queries all rows for both top level and aggregate relationships, including deleted records and archived activities.

```
Account[] savedAccts = [SELECT Id, Name FROM Account WHERE Name = 'Universal Containers' ALL ROWS];
try {
    undelete savedAccts;
} catch (DmlException e) {
    // Process exception here
}
```

Note: For more information on processing `DmlExceptions`, see Bulk DML Exception Handling.

Merge Statement

The `merge` statement merges up to three records of the same sObject type into one of the records, deleting the others, and re-parenting any related records.

Note: This DML operation does not have a matching Database system method.

Syntax

```
merge sObject sObject
merge sObject sObject[]
merge sObject ID
merge sObject ID[]
```

The first parameter represents the master record into which the other records are to be merged. The second parameter represents the one or two other records that should be merged and then deleted. You can pass these other records into the `merge` statement as a single sObject record or ID, or as a list of two sObject records or IDs.

Example

The following example merges two accounts named 'Acme Inc.' and 'Acme' into a single record:

```
List<Account> ls = new List<Account>{new Account(name='Acme Inc.'),new Account(name='Acme')};
insert ls;
Account masterAcct = [SELECT Id, Name FROM Account WHERE Name = 'Acme Inc.' LIMIT 1];
```
Account mergeAcct = [SELECT Id, Name FROM Account WHERE Name = 'Acme' LIMIT 1];
try {
    merge masterAcct mergeAcct;
} catch (DmlException e) {
    // Process exception here
}

Note: For more information on processing DmlExceptions, see Bulk DML Exception Handling.

ApexPages Namespace

The ApexPages namespace provides classes used in Visualforce controllers. The following are the classes in the ApexPages namespace.

IN THIS SECTION:

- **Action Class**
  You can use `ApexPages.Action` to create an action method that you can use in a Visualforce custom controller or controller extension.

- **Component Class**
  Represents a dynamic Visualforce component in Apex.

- **IdeaStandardController Class**
  `IdeaStandardController` objects offer Ideas-specific functionality in addition to what is provided by the `StandardController`.

- **IdeaStandardSetController Class**
  `IdeaStandardSetController` objects offer Ideas-specific functionality in addition to what is provided by the `StandardSetController`.

- **KnowledgeArticleVersionStandardController Class**
  `KnowledgeArticleVersionStandardController` objects offer article-specific functionality in addition to what is provided by the `StandardController`.

- **Message Class**
  Contains validation errors that occur when the user saves the page that uses a standard controller.

- **StandardController Class**
  Use a `StandardController` when defining an extension for a standard controller.

- **StandardSetController Class**
  `StandardSetController` objects allow you to create list controllers similar to, or as extensions of, the pre-built Visualforce list controllers provided by Salesforce.

**Action Class**

You can use `ApexPages.Action` to create an action method that you can use in a Visualforce custom controller or controller extension.
Namespace
ApexPages

Usage
For example, you could create a `saveOver` method on a controller extension that performs a custom save.

Instantiation
The following code snippet illustrates how to instantiate a new `ApexPages.Action` object that uses the save action:

```java
ApexPages.Action saveAction = new ApexPages.Action('{!save}');
```

IN THIS SECTION:
- **Action Constructors**
- **Action Methods**

Action Constructors
The following are constructors for `Action`.

IN THIS SECTION:
- **Action(action)**
  - Creates a new instance of the `ApexPages.Action` class using the specified action.

**Action(action)**
Creates a new instance of the `ApexPages.Action` class using the specified action.

Signature
```
public Action(String action)
```

Parameters
- `action`
  - Type: String
  - The action.

Action Methods
The following are methods for `Action`. All are instance methods.
IN THIS SECTION:

getExpression()
Returns the expression that is evaluated when the action is invoked.

invoke()
Invokes the action.

getExpression()

Returns the expression that is evaluated when the action is invoked.

Signature

public String getExpression()

Return Value

Type: String

invoke()

Invokes the action.

Signature

public System.PageReference invoke()

Return Value

Type: System.PageReference

Component Class

Represents a dynamic Visualforce component in Apex.

Namespace

ApexPages

Dynamic Component Properties

The following are properties for Component.

IN THIS SECTION:

childComponents
Returns a reference to the child components for the component.
expressions
Sets the content of an attribute using the expression language notation. The notation for this is
expressions.name_of_attribute.

facets
Sets the content of a facet to a dynamic component. The notation is facet.name_of_facet.

childComponents
Returns a reference to the child components for the component.

Signature
public List <ApexPages.Component> childComponents {get; set;}

Property Value
Type: List<ApexPages.Component>

Example
Component.Apex.PageBlockSection pageBlkSection = new
Component.Apex.PageBlockSection(title='dummy header');
pageBlk.childComponents.add(pageBlkSection);

expressions
Sets the content of an attribute using the expression language notation. The notation for this is expressions.name_of_attribute.

Signature
public String expressions {get; set;}

Property Value
Type: String

Example
Component.Apex.InputField inpFld = new
Component.Apex.InputField();
inpField.expressions.value = '{!Account.Name}';
inpField.expressions.id = '{!$User.FirstName}';

facets
Sets the content of a facet to a dynamic component. The notation is facet.name_of_facet.
**Signature**

```csharp
public String facets {get; set;}
```

**Property Value**

Type: `String`

**Usage**

Note: This property is only accessible by components that support facets.

**Example**

```csharp
Component.Apex.DataTable myDT = new Component.Apex.DataTable();
myDT.facets.footer = footer;
```

**IdeaStandardController Class**

IdeaStandardController objects offer Ideas-specific functionality in addition to what is provided by the StandardController.

**Namespace**

ApexPages

**Usage**

A method in the IdeaStandardController object is called by and operated on a particular instance of an IdeaStandardController.

Note: The IdeaStandardSetController and IdeaStandardController classes are currently available through a limited release program. For information on enabling these classes for your organization, contact your Salesforce representative.

In addition to the methods listed in this class, the IdeaStandardController class inherits all the methods associated with the StandardController class.

**Instantiation**

An IdeaStandardController object cannot be instantiated. An instance can be obtained through a constructor of a custom extension controller when using the standard ideas controller.
Example

The following example shows how an IdeaStandardController object can be used in the constructor for a custom list controller. This example provides the framework for manipulating the comment list data before displaying it on a Visualforce page.

```java
public class MyIdeaExtension {

    private final ApexPages.IdeaStandardController ideaController;

    public MyIdeaExtension(ApexPages.IdeaStandardController controller) {
        ideaController = (ApexPages.IdeaStandardController)controller;
    }

    public List<IdeaComment> getModifiedComments() {
        IdeaComment[] comments = ideaController.getCommentList();
        // modify comments here
        return comments;
    }
}
```

The following Visualforce markup shows how the IdeaStandardController example shown above can be used in a page. This page must be named `detailPage` for this example to work.

---

Note: For the Visualforce page to display the idea and its comments, in the following example you need to specify the ID of a specific idea (for example, `/apex/detailPage?id=<ideaID>`) whose comments you want to view.

```xml
<!-- page named detailPage -->
<apex:page standardController="Idea" extensions="MyIdeaExtension">
    <apex:pageBlock title="Idea Section">
        <ideas:detailOutputLink page="detailPage" ideaId="{{idea.id}}">{{idea.title}}</ideas:detailOutputLink>
        <br/><br/>
        <apex:outputText >{{idea.body}}</apex:outputText>
    </apex:pageBlock>
    <apex:pageBlock title="Comments Section">
        <apex:dataList var="a" value="{{modifiedComments}}" id="list">
            {!a.commentBody}
        </apex:dataList>
        <ideas:detailOutputLink page="detailPage" ideaId="{{idea.id}}" pageOffset="-1">Prev</ideas:detailOutputLink>
        <ideas:detailOutputLink page="detailPage" ideaId="{{idea.id}}" pageOffset="1">Next</ideas:detailOutputLink>
    </apex:pageBlock>
</apex:page>
```

SEE ALSO:

- StandardController Class
- IdeaStandardController Methods

The following are instance methods for IdeaStandardController.
IN THIS SECTION:

getCommentList()

Returns the list of read-only comments from the current page.

**getCommentList()**

Returns the list of read-only comments from the current page.

**Signature**

```java
public IdeaComment[] getCommentList()
```

**Return Value**

Type: `IdeaComment[]`

This method returns the following comment properties:

- `id`
- `commentBody`
- `createdDate`
- `createdBy.Id`
- `createdBy.communityNickname`

**IdeaStandardSetController Class**

**IdeaStandardSetController** objects offer ideas-specific functionality in addition to what is provided by the **StandardSetController**.

**Namespace**

`ApexPages`

**Usage**

**Note:** The **IdeaStandardSetController** and **IdeaStandardController** classes are currently available through a limited release program. For information on enabling these classes for your organization, contact your Salesforce representative.

In addition to the method listed above, the **IdeaStandardSetController** class inherits the methods associated with the **StandardSetController**.

**Note:** The methods inherited from the **StandardSetController** cannot be used to affect the list of ideas returned by the **getIdeaList** method.

**Instantiation**

An **IdeaStandardSetController** object cannot be instantiated. An instance can be obtained through a constructor of a custom extension controller when using the standard list controller for ideas.
Example: Displaying a Profile Page

The following example shows how an IdeaStandardSetController object can be used in the constructor for a custom list controller:

```java
public class MyIdeaProfileExtension {
    private final ApexPages.IdeaStandardSetController ideaSetController;

    public MyIdeaProfileExtension(ApexPages.IdeaStandardSetController controller) {
        ideaSetController = (ApexPages.IdeaStandardSetController)controller;
    }

    public List<Idea> getModifiedIdeas() {
        Idea[] ideas = ideaSetController.getIdeaList();
        // modify ideas here
        return ideas;
    }
}
```

The following Visualforce markup shows how the IdeaStandardSetController example shown above and the `<ideas:profileListOutputLink>` component can display a profile page that lists the recent replies, submitted ideas, and votes associated with a user. Because this example does not identify a specific user ID, the page automatically shows the profile page for the current logged in user. This page must be named `profilePage` in order for this example to work:

```visualforce
<!-- page named profilePage -->
<apex:page standardController="Idea" extensions="MyIdeaProfileExtension"
    recordSetVar="ideaSetVar">
    <apex:pageBlock>
        <ideas:profileListOutputLink sort="recentReplies" page="profilePage">Recent Replies</ideas:profileListOutputLink>
        |<ideas:profileListOutputLink sort="ideas" page="profilePage">Ideas Submitted</ideas:profileListOutputLink>
        |<ideas:profileListOutputLink sort="votes" page="profilePage">Ideas Voted</ideas:profileListOutputLink>
    </apex:pageBlock>

    <apex:pageBlock>
        <apex:dataList value="{!modifiedIdeas}" var="ideadata">
            <ideas:detailoutputlink ideaId="{!ideadata.id}" page="viewPage">{!ideadata.title}</ideas:detailoutputlink>
        </apex:dataList>
    </apex:pageBlock>
</apex:page>
```

In the previous example, the `<ideas:detailoutputlink>` component links to the following Visualforce markup that displays the detail page for a specific idea. This page must be named `viewPage` in order for this example to work:

```visualforce
<!-- page named viewPage -->
<apex:page standardController="Idea">
    <apex:pageBlock title="Idea Section">
        <ideas:detailOutputLink page="viewPage" ideaId="{!idea.id}">{!idea.title}</ideas:detailOutputLink>
    </apex:pageBlock>
</apex:page>
```
Example: Displaying a List of Top, Recent, and Most Popular Ideas and Comments

The following example shows how an IdeaStandardSetController object can be used in the constructor for a custom list controller:

```java
public class MyIdeaListExtension {
    private final ApexPages.IdeaStandardSetController ideaSetController;

    public MyIdeaListExtension (ApexPages.IdeaStandardSetController controller) {
        ideaSetController = (ApexPages.IdeaStandardSetController)controller;
    }

    public List<Idea> getModifiedIdeas() {
        Idea[] ideas = ideaSetController.getIdeaList();
        // modify ideas here
        return ideas;
    }
}
```

The following Visualforce markup shows how the IdeaStandardSetController example shown above can be used with the `<ideas:listOutputLink>` component to display a list of recent, top, and most popular ideas and comments. This page must be named `listPage` in order for this example to work:

```xml
<apex:page standardController="Idea" extensions="MyIdeaListExtension"
     recordSetVar="ideaSetVar">
    <apex:pageBlock >
        <ideas:listOutputLink sort="recent" page="listPage">Recent Ideas</ideas:listOutputLink>
        |<ideas:listOutputLink sort="top" page="listPage">Top Ideas</ideas:listOutputLink>
        |<ideas:listOutputLink sort="popular" page="listPage">Popular Ideas</ideas:listOutputLink>
        |<ideas:listOutputLink sort="comments" page="listPage">Recent Comments</ideas:listOutputLink>
    </apex:pageBlock>
</apex:page>
```
In the previous example, the `<ideas:detailOutputLink>` component links to the following Visualforce markup that displays the detail page for a specific idea. This page must be named `viewPage`.

```
<!-- page named viewPage -->
<apex:page standardController="Idea">
    <apex:pageBlock title="Idea Section">
        <ideas:detailOutputLink page="viewPage" ideaId="{!idea.id}">{!idea.title}
        <br/>
        <apex:outputText>{!idea.body}</apex:outputText>
    </apex:pageBlock>
</apex:page>
```

SEE ALSO:
- StandardSetController Class

IdeaStandardSetController Methods

The following are instance methods for `IdeaStandardSetController`.

IN THIS SECTION:
- `getIdeaList()`

Returns the list of read-only ideas in the current page set.

**getIdeaList()**

Returns the list of read-only ideas in the current page set.

**Signature**

```
public Idea[] getIdeaList()
```

**Return Value**

Type: Idea[]

**Usage**

You can use the `<ideas:listOutputLink>`, `<ideas:profileListOutputLink>`, and `<ideas:detailOutputLink>` components to display profile pages as well as idea list and detail pages (see the examples below). The following is a list of properties returned by this method:

- Body
- Categories
- Category
- CreatedBy.CommunityNickname
- CreatedBy.Id
- CreatedDate
KnowledgeArticleVersionStandardController Class

KnowledgeArticleVersionStandardController objects offer article-specific functionality in addition to what is provided by the StandardController.

Namespace

ApexPages

Usage

In addition to the method listed above, the KnowledgeArticleVersionStandardController class inherits all the methods associated with StandardController.

Note: Though inherited, the edit, delete, and save methods don’t serve a function when used with the KnowledgeArticleVersionStandardController class.

Example

The following example shows how a KnowledgeArticleVersionStandardController object can be used to create a custom extension controller. In this example, you create a class named AgentContributionArticleController that allows customer-support agents to see pre-populated fields on the draft articles they create while closing cases.

Prerequisites:

1. Create an article type called FAQ. For instructions, see “Create Article Types” in the Salesforce online help.
2. Create a text custom field called Details. For instructions, see “Add Custom Fields to Article Types” in the Salesforce online help.
3. Create a category group called Geography and assign it to a category called USA. For instructions, see “Create and Modify Category Groups” and “Add Data Categories to Category Groups” in the Salesforce online help.
4. Create a category group called Topics and assign it a category called Maintenance.

```java
/** Custom extension controller for the simplified article edit page that appears when an article is created on the close-case page. */
public class AgentContributionArticleController {
    // The constructor must take a ApexPages.KnowledgeArticleVersionStandardController as an argument
```
public AgentContributionArticleController(
    ApexPages.KnowledgeArticleVersionStandardController ctl) {
    // This is the SObject for the new article.
    // It can optionally be cast to the proper article type.
    // For example, FAQ__kav article = (FAQ__kav) ctl.getRecord();
    SObject article = ctl.getRecord();
    // This returns the ID of the case that was closed.
    String sourceId = ctl.getSourceId();
    Case c = [SELECT Subject, Description FROM Case WHERE Id=:sourceId];

    // This overrides the default behavior of pre-filling the
    // title of the article with the subject of the closed case.
    article.put('title', 'From Case: ' + c.subject);
    article.put('details__c', c.description);

    // Only one category per category group can be specified.
    ctl.selectDataCategory('Geography','USA');
    ctl.selectDataCategory('Topics','Maintenance');
}

/** Test class for the custom extension controller. */
@isTest
private class AgentContributionArticleControllerTest {
    static testMethod void testAgentContributionArticleController() {
        String caseSubject = 'my test';
        String caseDesc = 'my test description';

        Case c = new Case();
        c.subject= caseSubject;
        c.description = caseDesc;
        insert c;
        String caseId = c.id;
        System.debug('Created Case: ' + caseId);

        ApexPages.currentPage().getParameters().put('sourceId', caseId);
        ApexPages.currentPage().getParameters().put('sfdc.override', '1');

        ApexPages.KnowledgeArticleVersionStandardController ctl =
            new ApexPages.KnowledgeArticleVersionStandardController(new FAQ__kav());

        new AgentContributionArticleController(ctl);

        System.assertEquals(caseId, ctl.getSourceId());
        System.assertEquals('From Case: ' + caseSubject, ctl.getRecord().get('title'));
        System.assertEquals(caseDesc, ctl.getRecord().get('details__c'));
    }
}

If you created the custom extension controller for the purpose described in the previous example (that is, to modify submitted-via-case articles), complete the following steps after creating the class:

1. Log into your Salesforce organization and from Setup, enter Knowledge Settings in the Quick Find box, then select Knowledge Settings.
2. Click **Edit**.

3. Assign the class to the Use Apex customization field. This associates the article type specified in the new class with the article type assigned to closed cases.

4. Click **Save**.

IN THIS SECTION:

KnowledgeArticleVersionStandardController Constructors

KnowledgeArticleVersionStandardController Methods

SEE ALSO:

StandardController Class

**KnowledgeArticleVersionStandardController Constructors**

The following are constructors for **KnowledgeArticleVersionStandardController**.

IN THIS SECTION:

**KnowledgeArticleVersionStandardController(article)**

Creates a new instance of the **ApexPages.KnowledgeArticleVersionStandardController** class using the specified knowledge article.

**KnowledgeArticleVersionStandardController (article)**

Creates a new instance of the **ApexPages.KnowledgeArticleVersionStandardController** class using the specified knowledge article.

**Signature**

```
public KnowledgeArticleVersionStandardController(SObject article)
```

**Parameters**

- **article**
  - Type: SObject
  - The knowledge article, such as FAQ_kav.

**KnowledgeArticleVersionStandardController Methods**

The following are instance methods for **KnowledgeArticleVersionStandardController**.

IN THIS SECTION:

**getSourceId()**

Returns the ID for the source object record when creating a new article from another object.
**setDataCategory(categoryGroup, category)**

Specifies a default data category for the specified data category group when creating a new article.

**getSourceId()**

Returns the ID for the source object record when creating a new article from another object.

**Signature**

```
public String getSourceId()
```

**Return Value**

Type: String

**setDataCategory(categoryGroup, category)**

Specifies a default data category for the specified data category group when creating a new article.

**Signature**

```
public Void setDataCategory(String categoryGroup, String category)
```

**Parameters**

- **categoryGroup**
  
  Type: String

- **category**
  
  Type: String

**Return Value**

Type: Void

**Message Class**

Contains validation errors that occur when the user saves the page that uses a standard controller.

**Namespace**

ApexPages

**Usage**

When using a standard controller, all validation errors, both custom and standard, that occur when the user saves the page are automatically added to the page error collections. If an inputField component is bound to the field with an error, the message is added to the component’s error collection. All messages are added to the page’s error collection. For more information, see Validation Rules and Standard Controllers in the Visualforce Developer’s Guide.

If your application uses a custom controller or extension, you must use the message class for collecting errors.
Instantiation

In a custom controller or controller extension, you can instantiate a Message in one of these ways:

- `ApexPages.Message myMsg = new ApexPages.Message(ApexPages.severity, summary);`
  
  where `ApexPages.severity` is the enum that determines how severe a message is, and `summary` is the String used to summarize the message. For example:
  
  ```java
  ```

- `ApexPages.Message myMsg = new ApexPages.Message(ApexPages.severity, summary, detail);`
  
  where `ApexPages.severity` is the enum that determines how severe a message is, `summary` is the String used to summarize the message, and `detail` is the String used to provide more detailed information about the error.

ApexPages.Severity Enum

To specify the severity of the message, use the `ApexPages.Severity` enum values. The following are the valid values:

- CONFIRM
- ERROR
- FATAL
- INFO
- WARNING

All enums have access to standard methods, such as `name` and `value`.

IN THIS SECTION:
- Message Constructors
- Message Methods

Message Constructors

The following are constructors for `Message`.

IN THIS SECTION:
- `Message(severity, summary)`
  Creates a new instance of the `ApexPages.Message` class using the specified message severity and summary.
- `Message(severity, summary, detail)`
  Creates a new instance of the `ApexPages.Message` class using the specified message severity, summary, and message detail.
- `Message(severity, summary, detail, id)`
  Creates a new instance of the `ApexPages.Message` class using the specified severity, summary, detail, and component ID.

**Message(severity, summary)**

Creates a new instance of the `ApexPages.Message` class using the specified message severity and summary.
Signature

```java
public Message(ApexPages.Severity severity, String summary)
```

Parameters

- **severity**
  - Type: `ApexPages.Severity`
  - The severity of a Visualforce message.

- **summary**
  - Type: `String`
  - The summary Visualforce message.

### Message(severity, summary, detail)

Creates a new instance of the `ApexPages.Message` class using the specified message severity, summary, and message detail.

Signature

```java
public Message(ApexPages.Severity severity, String summary, String detail)
```

Parameters

- **severity**
  - Type: `ApexPages.Severity`
  - The severity of a Visualforce message.

- **summary**
  - Type: `String`
  - The summary Visualforce message.

- **detail**
  - Type: `String`
  - The detailed Visualforce message.

### Message(severity, summary, detail, id)

Creates a new instance of the `ApexPages.Message` class using the specified severity, summary, detail, and component ID.

Signature

```java
public Message(ApexPages.Severity severity, String summary, String detail, String id)
```

Parameters

- **severity**
  - Type: `ApexPages.Severity`
  - The severity of a Visualforce message.
summary
Type: String
The summary Visualforce message.

detail
Type: String
The detailed Visualforce message.

id
Type: String
The ID of the Visualforce component to associate with the message, for example, a form field with an error.

Message Methods
The following are methods for Message. All are instance methods.

IN THIS SECTION:

getComponentLabel()
Returns the label of the associated inputField component. If no label is defined, this method returns null.

getDetail()
Returns the value of the detail parameter used to create the message. If no detail String was specified, this method returns null.

getSeverity()
Returns the severity enum used to create the message.

getSummary()
Returns the summary String used to create the message.

getComponentLabel()
Returns the label of the associated inputField component. If no label is defined, this method returns null.

Signature
public String getComponentLabel()

Return Value
Type: String

getDetail()
Returns the value of the detail parameter used to create the message. If no detail String was specified, this method returns null.

Signature
public String getDetail()
**Return Value**
Type: String

**getSeverity()**
Returns the severity enum used to create the message.

**Signature**
```java
public ApexPages.Severity getSeverity()
```

**Return Value**
Type: ApexPages.Severity

**getSummary()**
Returns the summary String used to create the message.

**Signature**
```java
public String getSummary()
```

**Return Value**
Type: String

---

**StandardController Class**

Use a StandardController when defining an extension for a standard controller.

**Namespace**
**ApexPages**

**Usage**
StandardController objects reference the pre-built Visualforce controllers provided by Salesforce. The only time it is necessary to refer to a StandardController object is when defining an extension for a standard controller. StandardController is the data type of the single argument in the extension class constructor.

**Instantiation**
You can instantiate a StandardController in the following way:

```java
ApexPages.StandardController sc = new ApexPages.StandardController(sObject);
```
Example

The following example shows how a StandardController object can be used in the constructor for a standard controller extension:

```java
public class myControllerExtension {

    private final Account acct;

    // The extension constructor initializes the private member
    // variable acct by using the getRecord method from the standard
    // controller.
    public myControllerExtension(ApexPages.StandardController stdController) {
        this.acct = (Account)stdController.getRecord();
    }

    public String getGreeting() {
        return 'Hello ' + acct.name + ' (' + acct.id + ')';
    }
}
```

The following Visualforce markup shows how the controller extension from above can be used in a page:

```xml
<apex:page standardController="Account" extensions="myControllerExtension">
    {!greeting} <p/>
    <apex:form>
        <apex:inputField value="{!account.name}"/> <p/>
        <apex:commandButton value="Save" action="{!save}"/>
    </apex:form>
</apex:page>
```

IN THIS SECTION:
StandardController Constructors
StandardController Methods

StandardController Constructors

The following are constructors for StandardController.

IN THIS SECTION:
StandardController(controllerSObject)
    Creates a new instance of the ApexPages.StandardController class for the specified standard or custom object.

**StandardController** (controllerSObject)

Creates a new instance of the ApexPages.StandardController class for the specified standard or custom object.

**Signature**

```java
public StandardController(SObject controllerSObject)
```
Parameters

controllerSObject
Type: SObject
A standard or custom object.

StandardController Methods

The following are methods for StandardController. All are instance methods.

IN THIS SECTION:

addFields(fieldNames)
When a Visualforce page is loaded, the fields accessible to the page are based on the fields referenced in the Visualforce markup. This method adds a reference to each field specified in fieldNames so that the controller can explicitly access those fields as well.

cancel()
Returns the PageReference of the cancel page.

delete()
Deletes record and returns the PageReference of the delete page.

edit()
Returns the PageReference of the standard edit page.

getId()
Returns the ID of the record that is currently in context, based on the value of the id query string parameter in the Visualforce page URL.

getRecord()
Returns the record that is currently in context, based on the value of the id query string parameter in the Visualforce page URL.

reset()
Forces the controller to reacquire access to newly referenced fields. Any changes made to the record prior to this method call are discarded.

save()
Saves changes and returns the updated PageReference.

view()
Returns the PageReference object of the standard detail page.

addFields(fieldNames)
When a Visualforce page is loaded, the fields accessible to the page are based on the fields referenced in the Visualforce markup. This method adds a reference to each field specified in fieldNames so that the controller can explicitly access those fields as well.

Signature

public Void addFields(List<String> fieldNames)
Parameters
fieldNames
Type: List<String>

Return Value
Type: Void

Usage
This method should be called before a record has been loaded—typically, it's called by the controller's constructor. If this method is called outside of the constructor, you must use the reset() method before calling addFields().
The strings in fieldNames can either be the API name of a field, such as AccountId, or they can be explicit relationships to fields, such as something__r.myField__c.
This method is only for controllers used by dynamicVisualforce bindings.

cancel()
Returns the PageReference of the cancel page.

Signature
public System.PageReference cancel()

Return Value
Type: System.PageReference

delete()
Deletes record and returns the PageReference of the delete page.

Signature
public System.PageReference delete()

Return Value
Type: System.PageReference

edit()
Returns the PageReference of the standard edit page.

Signature
public System.PageReference edit()
Return Value
Type: System.PageReference

**getId()**
Returns the ID of the record that is currently in context, based on the value of the `id` query string parameter in the Visualforce page URL.

**Signature**
```
public String getId()
```

Return Value
Type: String

**getRecord()**
Returns the record that is currently in context, based on the value of the `id` query string parameter in the Visualforce page URL.

**Signature**
```
public SObject getRecord()
```

Return Value
Type: sObject

**Usage**
Note that only the fields that are referenced in the associated Visualforce markup are available for querying on this SObject. All other fields, including fields from any related objects, must be queried using a SOQL expression.

⚠️ **Tip:** You can work around this restriction by including a hidden component that references any additional fields that you want to query. Hide the component from display by setting the component’s `rendered` attribute to `false`.

**Example**
```
<apex:outputText
 value="{!account.billingcity}
 {!account.contacts}"
 rendered="false"/>
```

**reset()**
Forces the controller to reacquire access to newly referenced fields. Any changes made to the record prior to this method call are discarded.
Signature
public Void reset()

Return Value
Type: Void

Usage
This method is only used if addFields is called outside the constructor, and it must be called directly before addFields. This method is only for controllers used by dynamicVisualforce bindings.

save()
Saves changes and returns the updated PageReference.

Signature
public System.PageReference save()

Return Value
Type: System.PageReference

view()
Returns the PageReference object of the standard detail page.

Signature
public System.PageReference view()

Return Value
Type: System.PageReference

StandardSetController Class
StandardSetController objects allow you to create list controllers similar to, or as extensions of, the pre-built Visualforce list controllers provided by Salesforce.

Namespace
ApexPages

Usage
The StandardSetController class also contains a prototype object. This is a single sObject contained within the Visualforce StandardSetController class. If the prototype object’s fields are set, those values are used during the save action, meaning that the values
are applied to every record in the set controller’s collection. This is useful for writing pages that perform mass updates (applying identical changes to fields within a collection of objects).

Note: Fields that are required in other Salesforce objects will keep the same requiredness when used by the prototype object.

Instantiation

You can instantiate a StandardSetController in either of the following ways:

- From a list of sObjects:

```java
List<account> accountList = [SELECT Name FROM Account LIMIT 20];
ApexPages.StandardSetController ssc = new ApexPages.StandardSetController(accountList);
```

- From a query locator:

```java
ApexPages.StandardSetController ssc = new ApexPages.StandardSetController(Database.getQueryLocator([SELECT Name, CloseDate FROM Opportunity]));
```

Note: The maximum record limit for StandardSetController is 10,000 records. Instantiating StandardSetController using a query locator returning more than 10,000 records causes a LimitException to be thrown. However, instantiating StandardSetController with a list of more than 10,000 records doesn’t throw an exception, and instead truncates the records to the limit.

Example

The following example shows how a StandardSetController object can be used in the constructor for a custom list controller:

```java
public class opportunityList2Con {
    // ApexPages.StandardSetController must be instantiated
    // for standard list controllers
    public ApexPages.StandardSetController setCon {
        get {
            if(setCon == null) {
                setCon = new ApexPages.StandardSetController(Database.getQueryLocator([SELECT Name, CloseDate FROM Opportunity]));
            }
            return setCon;
        }
        set;
    }

    // Initialize setCon and return a list of records
    public List<Opportunity> getOpportunities() {
        return (List<Opportunity>) setCon.getRecords();
    }
}
```

The following Visualforce markup shows how the controller above can be used in a page:

```xml
<apex:page controller="opportunityList2Con">
    <apex:pageBlock>
        <apex:pageBlockTable value="{"opportunities}" var="o">
            <apex:column value="{!o.Name}="/>
        </apex:pageBlockTable>
    </apex:pageBlock>
</apex:page>
```
IN THIS SECTION:

StandardSetController Constructors
StandardSetController Methods

StandardSetController Constructors

The following are constructors for StandardSetController.

IN THIS SECTION:

StandardSetController(queryLocator)
Creates an instance of the ApexPages.StandardSetController class for the list of objects returned by the query locator.

Signature

public StandardSetController(Database.QueryLocator queryLocator)

Parameters

queryLocator
Type: Database.QueryLocator
A query locator representing a list of sObjects.

StandardSetController(controllerSObjects)
Creates an instance of the ApexPages.StandardSetController class for the specified list of standard or custom objects.

Signature

public StandardSetController(List<sObject> controllerSObjects)

Parameters

controllerSObjects
Type: List on page 3177<sObject on page 3372>
A List of standard or custom objects.
Example

```java
List<account> accountList = [SELECT Name FROM Account LIMIT 20];
ApexPages.StandardSetController ssc = new ApexPages.StandardSetController(accountList);
```

**StandardSetController Methods**

The following are methods for `StandardSetController`. All are instance methods.

**IN THIS SECTION:**

- `cancel()`: Returns the `PageReference` of the original page, if known, or the home page.
- `first()`: Returns the first page of records.
- `getCompleteResult()`: Indicates whether there are more records in the set than the maximum record limit. If this is false, there are more records than you can process using the list controller. The maximum record limit is 10,000 records.
- `getFilterId()`: Returns the ID of the filter that is currently in context.
- `getHasNext()`: Indicates whether there are more records after the current page set.
- `getHasPrevious()`: Indicates whether there are more records before the current page set.
- `getListViewOptions()`: Returns a list of the listviews available to the current user.
- `getPageSize()`: Returns the number of records included in each page set.
- `getRecord()`: Returns the `sObject` that represents the changes to the selected records. This retrieves the prototype object contained within the class, and is used for performing mass updates.
- `getRecords()`: Returns the list of `sObjects` in the current page set. This list is immutable, i.e. you can't call `clear()` on it.
- `getResultSize()`: Returns the number of records in the set.
- `getSelected()`: Returns the list of `sObjects` that have been selected.
- `last()`: Returns the last page of records.
- `next()`: Returns the next page of records.
previous()
Returns the previous page of records.

save()
Inserts new records or updates existing records that have been changed. After this operation is finished, it returns a PageReference
to the original page, if known, or the home page.

setFilterID(filterId)
Sets the filter ID of the controller.

setpageNumber(pageNumber)
Sets the page number.

setPageSize(pageSize)
Sets the number of records in each page set.

setSelected(selectedRecords)
Set the selected records.

cancel()
Returns the PageReference of the original page, if known, or the home page.

Signature
public System.PageReference cancel()

Return Value
Type: System.PageReference

first()
Returns the first page of records.

Signature
public Void first()

Return Value
Type: Void

getCompleteResult()
Indicates whether there are more records in the set than the maximum record limit. If this is false, there are more records than you can
process using the list controller. The maximum record limit is 10,000 records.

Signature
public Boolean getCompleteResult()
Return Value
Type: Boolean

`getFilterId()`
Returns the ID of the filter that is currently in context.

Signature
`public String getFilterId()`

Return Value
Type: String

`getHasNext()`
Indicates whether there are more records after the current page set.

Signature
`public Boolean getHasNext()`

Return Value
Type: Boolean

`getHasPrevious()`
Indicates whether there are more records before the current page set.

Signature
`public Boolean getHasPrevious()`

Return Value
Type: Boolean

`getListViewOptions()`
Returns a list of the listviews available to the current user.

Signature
`public System.SelectOption[] getListViewOptions()`

Return Value
Type: `System.SelectOption[]`
**getPageNumber()**
Returns the page number of the current page set. Note that the first page returns 1.

**Signature**
`public Integer getPageNumber()`

**Return Value**
Type: Integer

**getPageSize()**
Returns the number of records included in each page set.

**Signature**
`public Integer getPageSize()`

**Return Value**
Type: Integer

**getRecord()**
Returns the sObject that represents the changes to the selected records. This retrieves the prototype object contained within the class, and is used for performing mass updates.

**Signature**
`public sObject getRecord()`

**Return Value**
Type: sObject

**getRecords()**
Returns the list of sObjects in the current page set. This list is immutable, i.e. you can't call `clear()` on it.

**Signature**
`public sObject[] getRecords()`

**Return Value**
Type: sObject[]
**getResultSize()**

Returns the number of records in the set.

**Signature**

```java
public Integer getResultSize()
```

**Return Value**

Type: `Integer`

**getSelected()**

Returns the list of sObjects that have been selected.

**Signature**

```java
public sObject[] getSelected()
```

**Return Value**

Type: `sObject[]`

**last()**

Returns the last page of records.

**Signature**

```java
public Void last()
```

**Return Value**

Type: `Void`

**next()**

Returns the next page of records.

**Signature**

```java
public Void next()
```

**Return Value**

Type: `Void`

**previous()**

Returns the previous page of records.
Signature

public Void previous()

Return Value
Type: Void

save()
Inserts new records or updates existing records that have been changed. After this operation is finished, it returns a PageReference to the original page, if known, or the home page.

Signature

public System.PageReference save()

Return Value
Type: System.PageReference

setFilterID(filterId)
Sets the filter ID of the controller.

Signature

public Void setFilterID(String filterId)

Parameters
filterId
Type: String

Return Value
Type: Void

setpageNumber(pageNumber)
Sets the page number.

Signature

public Void setPageNumber(Integer pageNumber)

Parameters
pageNumber
Type: Integer
Return Value
Type: Void

**setPageSize(pageSize)**
Sets the number of records in each page set.

**Signature**
```
public Void setPageSize(Integer pageSize)
```

**Parameters**
- **pageSize**
  Type: Integer

Return Value
Type: Void

**setSelected(selectedRecords)**
Set the selected records.

**Signature**
```
public Void setSelected(sObject[] selectedRecords)
```

**Parameters**
- **selectedRecords**
  Type: sObject[]

Return Value
Type: Void

---

**AppLauncher Namespace**

The AppLauncher namespace provides methods for managing the appearance of apps in the App Launcher, including their visibility and sort order.

The following class is in the AppLauncher namespace.

**IN THIS SECTION:**
- **AppMenu Class**
  Contains methods to set the appearance of apps in the App Launcher.
AppMenu Class

Contains methods to set the appearance of apps in the App Launcher.

Namespace

AppLauncher

IN THIS SECTION:

AppMenu Methods

AppMenu Methods

The following are methods for AppMenu.

IN THIS SECTION:

setAppVisibility(appMenuItemId, isVisible)
Shows or hides specific apps in the App Launcher.

setOrgSortOrder(appIds)
Sets the organization-wide default sort order for the App Launcher based on a List of app menu item IDs in the desired order.

setUserSortOrder(appIds)
Sets an individual user's default sort order for the App Launcher based on a List of app menu item IDs in the desired order.

**setAppVisibility(appMenuItemId, isVisible)**

Shows or hides specific apps in the App Launcher.
Signature

```java
public static void setAppVisibility(Id appMenuItemId, Boolean isVisible)
```

Parameters

- **appMenuItemId**
  - Type: Id
  - The 15-character application ID value for an app. For more information, see the ApplicationId field for `AppMenuItem` or the AppMenuItemId field for `UserAppMenuItem` in the Salesforce Object Reference.

- **isVisible**
  - Type: Boolean
  - If `true`, the app is visible.

Return Value

Type: void

**setOrgSortOrder(appIds)**

Sets the organization-wide default sort order for the App Launcher based on a List of app menu item IDs in the desired order.

Signature

```java
public static void setOrgSortOrder(List<Id> appIds)
```

Parameters

- **appIds**
  - Type: List<Id>
  - A list of application ID values. For more information, see the ApplicationId field for `AppMenuItem` in the Salesforce Object Reference.

Return Value

Type: void

**setUserSortOrder(appIds)**

Sets an individual user’s default sort order for the App Launcher based on a List of app menu item IDs in the desired order.

Signature

```java
public static void setUserSortOrder(List<Id> appIds)
```

Parameters

- **appIds**
  - Type: List<Id>
A list of application ID values. For more information, see the `AppMenuItemId` field for `UserAppMenuItem` in the `Salesforce Object Reference`.

Return Value
Type: `void`

**ChangePasswordController Class**
This class and its methods are for internal use only.

**Namespace**
`AppLauncher`

**CommunityLogoController Class**
This class and its methods are for internal use only.

**Namespace**
`AppLauncher`

**EmployeeLoginLinkController Class**
This class and its methods are for internal use only.

**Namespace**
`AppLauncher`

**ForgotPasswordController Class**
This class and its methods are for internal use only.

**Namespace**
`AppLauncher`

**IdentityHeaderController Class**
This class and its methods are for internal use only.

**Namespace**
`AppLauncher`
LoginFormController Class

This class and its methods are for internal use only.

Namespace

AppLauncher

SelfRegisterController Class

This class and its methods are for internal use only.

Namespace

AppLauncher

SocialLoginController Class

This class and its methods are for internal use only.

Namespace

AppLauncher

Approval Namespace

The Approval namespace provides classes and methods for approval processes.

The following are the classes in the Approval namespace.

IN THIS SECTION:

LockResult Class
The result of a record lock returned by a System.Approval.lock() method.

ProcessRequest Class
The ProcessRequest class is the parent class for the ProcessSubmitRequest and ProcessWorkitemRequest classes. Use the ProcessRequest class to write generic Apex that can process objects from either class.

ProcessResult Class
After you submit a record for approval, use the ProcessResult class to process the results of an approval process.

ProcessSubmitRequest Class
Use the ProcessSubmitRequest class to submit a record for approval.

ProcessWorkitemRequest Class
Use the ProcessWorkitemRequest class for processing an approval request after it is submitted.

UnlockResult Class
The result of a record unlock, returned by a System.Approval.unlock() method.
LockResult Class

The result of a record lock returned by a System.Approval.lock() method.

Namespace

Approval

Usage

The System.Approval.lock() methods return Approval.LockResult objects. Each element in a LockResult array corresponds to an element in the ID or sObject array passed as a parameter to a lock method. The first element in the LockResult array corresponds to the first element in the ID or sObject array, the second element corresponds to the second element, and so on. If only one ID or sObject is passed in, the LockResult array contains a single element.

Example

The following example obtains and iterates through the returned Approval.LockResult objects. It locks some queried accounts using Approval.lock with a false second parameter to allow partial processing of records on failure. Next, it iterates through the results to determine whether the operation was successful for each record. It writes the ID of every record that was processed successfully to the debug log, or writes error messages and failed fields of the failed records.

```
// Query the accounts to lock
Account[] accts = [SELECT Id from Account WHERE Name LIKE 'Acme%'];
// Lock the accounts
Approval.LockResult[] lrList = Approval.lock(accts, false);

// Iterate through each returned result
for(Approval.LockResult lr : lrList) {
    if (lr.isSuccess()) {
        // Operation was successful, so get the ID of the record that was processed
        System.debug('Successfully locked account with ID: ' + lr.getId());
    } else {
        // Operation failed, so get all errors
        for(Database.Error err : lr.getErrors()) {
            System.debug('The following error has occurred: ');
            System.debug(err.getStatusCode() + ': ' + err.getMessage());
            System.debug('Account fields that affected this error: ' + err.getFields());
        }
    }
}
```

IN THIS SECTION:

LockResult Methods

SEE ALSO:

Approval Class
LockResult Methods

The following are methods for LockResult.

IN THIS SECTION:
  * getErrors()
    * If an error occurred, returns an array of one or more database error objects, providing the error code and description.
  * getId()
    * Returns the ID of the sObject you are trying to lock.
  * isSuccess()
    * A Boolean value that is set to true if the lock operation is successful for this object, or false otherwise.

getErrors()

If an error occurred, returns an array of one or more database error objects, providing the error code and description.

Signature

public List<Database.Error> getErrors()

Return Value

Type: List<Database.Error>

getId()

Returns the ID of the sObject you are trying to lock.

Signature

public Id getId()

Return Value

Type: Id

Usage

If the field contains a value, the object was locked. If the field is empty, the operation was not successful.

isSuccess()

A Boolean value that is set to true if the lock operation is successful for this object, or false otherwise.

Signature

public Boolean isSuccess()
Return Value
Type: Boolean

ProcessRequest Class

The ProcessRequest class is the parent class for the ProcessSubmitRequest and ProcessWorkItemRequest classes. Use the ProcessRequest class to write generic Apex that can process objects from either class.

Namespace
Approval

Usage
The request must be instantiated via the child classes, ProcessSubmitRequest and ProcessWorkItemRequest.

ProcessRequest Methods
The following are methods for ProcessRequest. All are instance methods.

IN THIS SECTION:
getComments()  
Returns the comments that have been added previously to the approval request.
getNextApproverIds()  
Returns the list of user IDs of user specified as approvers.
setComments(comments)  
Sets the comments to be added to the approval request.
setNextApproverIds(nextApproverIds)  
If the next step in your approval process is another Apex approval process, you specify exactly one user ID as the next approver. If not, you cannot specify a user ID and this method must be null.

getComments()

Returns the comments that have been added previously to the approval request.

Signature
public String getComments()

Return Value
Type: String

g getNextApproverIds()

Returns the list of user IDs of user specified as approvers.
Signature

public ID[] getNextApproverIds()

Return Value

Type: ID[]

setComments(comments)

Sets the comments to be added to the approval request.

Signature

public Void setComments(String comments)

Parameters

comments

Type: String

Return Value

Type: Void

setNextApproverIds(nextApproverIds)

If the next step in your approval process is another Apex approval process, you specify exactly one user ID as the next approver. If not, you cannot specify a user ID and this method must be null.

Signature

public Void setNextApproverIds(ID[] nextApproverIds)

Parameters

nextApproverIds

Type: ID[]

Must be a single-entry list.

Return Value

Type: Void

ProcessResult Class

After you submit a record for approval, use the ProcessResult class to process the results of an approval process.
Namespace

Approval

Usage

A ProcessResult object is returned by the process method. You must specify the Approval namespace when creating an instance of this class. For example:

```java
Approval.ProcessResult result = Approval.process(req1);
```

ProcessResult Methods

The following are methods for ProcessResult. All are instance methods.

IN THIS SECTION:

- `getEntityId()`
  The ID of the record being processed.

- `getErrors()`
  If an error occurred, returns an array of one or more database error objects including the error code and description.

- `getInstanceId()`
  The ID of the approval process that has been submitted for approval.

- `getInstanceStatus()`
  The status of the current approval process. Valid values are: Approved, Rejected, Removed or Pending.

- `getNewWorkitemIds()`
  The IDs of the new items submitted to the approval process. There can be 0 or 1 approval processes.

- `isSuccess()`
  A Boolean value that is set to `true` if the approval process completed successfully; otherwise, it is set to `false`.

**getEntityId()**

The ID of the record being processed.

**Signature**

```java
public String getEntityId()
```

**Return Value**

Type: `String`

**getErrors()**

If an error occurred, returns an array of one or more database error objects including the error code and description.
Signature
public Database.Error[] getErrors()

Return Value
Type: Database.Error[]

getInstanceId()
The ID of the approval process that has been submitted for approval.

Signature
public String getInstanceId()

Return Value
Type: String

getInstanceStatus()
The status of the current approval process. Valid values are: Approved, Rejected, Removed or Pending.

Signature
public String getInstanceStatus()

Return Value
Type: String

getNewWorkitemIds()
The IDs of the new items submitted to the approval process. There can be 0 or 1 approval processes.

Signature
public ID[] getNewWorkitemIds()

Return Value
Type: ID[]

isSuccess()
A Boolean value that is set to true if the approval process completed successfully; otherwise, it is set to false.

Signature
public Boolean isSuccess()
Return Value
Type: Boolean

ProcessSubmitRequest Class
Use the ProcessSubmitRequest class to submit a record for approval.

Namespace
Approval

Usage
You must specify the Approval namespace when creating an instance of this class. The constructor for this class takes no arguments.
For example:

```
Approval.ProcessSubmitRequest psr = new Approval.ProcessSubmitRequest();
```

Inherited Methods
In addition to the methods listed, the ProcessSubmitRequest class has access to all the methods in its parent class, ProcessRequest Class.
- getComments()
- getNextApproverIds()
- setComments(comments)
- setNextApproverIds(nextApproverIds)

Example
To view sample code, refer to Approval Processing Example.

ProcessSubmitRequest Methods
The following are methods for ProcessSubmitRequest. All are instance methods.

IN THIS SECTION:
- getObjectId()
  Returns the ID of the record that has been submitted for approval. For example, it can return an account, contact, or custom object record.
- getProcessDefinitionNameOrId()
  Returns the developer name or ID of the process definition.
- getSkipEntryCriteria()
  If getProcessDefinitionNameOrId() returns a value other than null, getSkipEntryCriteria() determines whether to evaluate the entry criteria for the process (true) or not (false).
getSubmitterId()
Returns the user ID of the submitter requesting the approval record. The user must be one of the allowed submitters in the process definition setup.

setObjectId(recordId)
Sets the ID of the record to be submitted for approval. For example, it can specify an account, contact, or custom object record.

setProcessDefinitionNameOrId(nameOrId)
Sets the developer name or ID of the process definition to be evaluated.

setSkipEntryCriteria(skipEntryCriteria)
If the process definition name or ID is not null, setSkipEntryCriteria() determines whether to evaluate the entry criteria for the process (true) or not (false).

setSubmitterId(userID)
Sets the user ID of the submitter requesting the approval record. The user must be one of the allowed submitters in the process definition setup. If you don’t set a submitter ID, the process uses the current user as the submitter.

getObjectId()
Returns the ID of the record that has been submitted for approval. For example, it can return an account, contact, or custom object record.

Signature
class ProcessSubmitRequest
{
    public String getObjectId()
    {
    
    }
}

Return Value
Type: String

getProcessDefinitionNameOrId()
Returns the developer name or ID of the process definition.

Signature
class ProcessSubmitRequest
{
    public String getProcessDefinitionNameOrId()
    {
    
    }
}

Return Value
Type: String

Usage
The default is null. If the return value is null, when a user submits a record for approval Salesforce evaluates the entry criteria for all processes applicable to the user.

getSkipEntryCriteria()
If getProcessDefinitionNameOrId() returns a value other than null, getSkipEntryCriteria() determines whether to evaluate the entry criteria for the process (true) or not (false).
**getSkipEntryCriteria()**

Returns a boolean value indicating whether the entry criteria are being skipped.

**Signature**

```java
public Boolean getSkipEntryCriteria()
```

**Return Value**

Type: Boolean

**getSubmitterId()**

Returns the user ID of the submitter requesting the approval record. The user must be one of the allowed submitters in the process definition setup.

**Signature**

```java
public String getSubmitterId()
```

**Return Value**

Type: String

**setObjectId(recordId)**

Sets the ID of the record to be submitted for approval. For example, it can specify an account, contact, or custom object record.

**Signature**

```java
public Void setObjectId(String recordId)
```

**Parameters**

- `recordId`
  Type: String

**Return Value**

Type: Void

**setProcessDefinitionNameOrId(nameOrId)**

Sets the developer name or ID of the process definition to be evaluated.

**Signature**

```java
public Void setProcessDefinitionNameOrId(String nameOrId)
```

**Parameters**

- `nameOrId`
  Type: String
The process definition developer name or process definition ID. The record is submitted to this specific process. If set to `null`, submission of a record approval follows standard evaluation; that is, every entry criteria of the process definition in the process order is evaluated and the one that satisfies is picked and submitted.

**Return Value**
Type: Void

**Usage**
If the process definition name or ID is not set via this method, then by default it is null. If it is null, the submission of a record for approval evaluates entry criteria for all processes applicable to the submitter. The order of evaluation is based on the process order of the setup.

**setSkipEntryCriteria**
`skipEntryCriteria`
If the process definition name or ID is not null, `setSkipEntryCriteria()` determines whether to evaluate the entry criteria for the process (`true`) or not (`false`).

**Signature**
`public Void setSkipEntryCriteria(Boolean skipEntryCriteria)`

**Parameters**
`skipEntryCriteria`
Type: Boolean
- If set to `true`, request submission skips the evaluation of entry criteria for the process set in `setProcessDefinitionNameOrId(nameOrId)`.
- If the process definition name or ID is not specified, this parameter is ignored and standard evaluation is followed based on process order. If set to `false`, or if this method isn’t called, the entry criteria is not skipped.

**Return Value**
Type: Void

**setSubmitterId**
`userID`
Sets the user ID of the submitter requesting the approval record. The user must be one of the allowed submitters in the process definition setup. If you don’t set a submitter ID, the process uses the current user as the submitter.

**Signature**
`public Void setSubmitterId(String userID)`

**Parameters**
`userID`
Type: String
- The user ID on behalf of which the record is submitted. If set to `null`, the current user is the submitter. If the submitter is not set with this method, the default submitter is null (the current user).
Return Value
Type: Void

ProcessWorkitemRequest Class
Use the ProcessWorkitemRequest class for processing an approval request after it is submitted.

Namespace
Approval

Usage
You must specify the Approval namespace when creating an instance of this class. The constructor for this class takes no arguments. For example:

```
```

Inherited Methods
In addition to the methods listed, the ProcessWorkitemRequest class has access to all the methods in its parent class, ProcessRequest Class:

- getComments()
- getNextApproverIds()
- setComments(comments)
- setNextApproverIds(nextApproverIds)

ProcessWorkitemRequest Methods
The following are methods for ProcessWorkitemRequest. All are instance methods.

**getAction()**
Returns the type of action already associated with the approval request. Valid values are: Approve, Reject, or Removed.

**getWorkitemId()**
Returns the ID of the approval request that is in the process of being approved, rejected, or removed.

**setAction(actionType)**
Sets the type of action to take for processing an approval request.

**setWorkitemId(id)**
Sets the ID of the approval request that is being approved, rejected, or removed.
Signature
public String getAction()

Return Value
Type: String

getWorkitemId()
Returns the ID of the approval request that is in the process of being approved, rejected, or removed.

Signature
public String getWorkitemId()

Return Value
Type: String

setAction(actionType)
Sets the type of action to take for processing an approval request.

Signature
public Void setAction(String actionType)

Parameters
actionType
  Type: String
  Valid values are: Approve, Reject, or Removed. Only system administrators can specify Removed.

Return Value
Type: Void

setWorkitemId(id)
Sets the ID of the approval request that is being approved, rejected, or removed.

Signature
public Void setWorkitemId(String id)

Parameters
id
  Type: String
Return Value
Type: Void

UnlockResult Class
The result of a record unlock, returned by a System.Approval.unlock() method.

Namespace
Approval

Usage
The System.Approval.unlock() methods return Approval.UnlockResult objects. Each element in an UnlockResult array corresponds to an element in the ID or sObject array passed as a parameter to an unlock method. The first element in the UnlockResult array corresponds to the first element in the ID or sObject array, the second element corresponds to the second element, and so on. If only one ID or sObject is passed in, the UnlockResult array contains a single element.

Example
The following example shows how to obtain and iterate through the returned Approval.UnlockResult objects. It locks some queried accounts using Approval.unlock with a false second parameter to allow partial processing of records on failure. Next, it iterates through the results to determine whether the operation was successful for each record. It writes the ID of every record that was processed successfully to the debug log, or writes error messages and failed fields of the failed records.

```java
// Query the accounts to unlock
Account[] accts = [SELECT Id from Account WHERE Name LIKE 'Acme%'];

for(Account acct: accts) {
    // Create an approval request for the account
    Approval.ProcessSubmitRequest req1 = new Approval.ProcessSubmitRequest();
    req1.setComments('Submitting request for approval.');
    req1.setObjectId(acct.id);
    // Submit the record to specific process and skip the criteria evaluation
    req1.setProcessDefinitionNameOrId('PTO_Request_Process');
    req1.setSkipEntryCriteria(true);
    // Submit the approval request for the account
    Approval.ProcessResult result = Approval.process(req1);
    // Verify the result
    System.assert(result.isSuccess());
}
// Unlock the accounts
Approval.UnlockResult[] urList = Approval.unlock(accts, false);

// Iterate through each returned result
for(Approval.UnlockResult ur : urList) {
    // Process each UnlockResult object
}
```
if (ur.isSuccess()) {
    // Operation was successful, so get the ID of the record that was processed
    System.debug('Successfully unlocked account with ID: ' + ur.getId());
} else {
    // Operation failed, so get all errors
    for (Database.Error err : ur.getErrors()) {
        System.debug('The following error has occurred: ');
        System.debug(err.getStatusCode() + ': ' + err.getMessage());
        System.debug('Account fields that affected this error: ' + err.getFields());
    }
}

IN THIS SECTION:
UnlockResult Methods

SEE ALSO:
Approval Class

UnlockResult Methods
The following are methods for UnlockResult.

IN THIS SECTION:
getErrors()
If an error occurred, returns an array of one or more database error objects, providing the error code and description.

getId()
Returns the ID of the sObject you are trying to unlock.

isSuccess()
A Boolean value that is set to true if the unlock operation is successful for this object, or false otherwise.

getErrors()
If an error occurred, returns an array of one or more database error objects, providing the error code and description.

Signature
public List<Database.Error> getErrors()

Return Value
Type: List<Database.Error>

getId()
Returns the ID of the sObject you are trying to unlock.
Signature

```java
public Id getId()
```

Return Value

Type: Id

Usage

If the field contains a value, the object was unlocked. If the field is empty, the operation was not successful.

**isSuccess()**

A Boolean value that is set to `true` if the unlock operation is successful for this object, or `false` otherwise.

Signature

```java
public Boolean isSuccess()
```

Return Value

Type: Boolean

---

**Auth Namespace**

The `Auth` namespace provides an interface and classes for single sign-on into Salesforce and session security management. The following is the interface in the `Auth` namespace.

**IN THIS SECTION:**

- **AuthConfiguration Class**
  - Contains methods for configuring settings for users to log in to a Salesforce org using their authentication provider credentials instead of their Salesforce credentials. The authentication provider can be any authentication provider that supports the OpenID Connect protocol, such as Google, Facebook, or Twitter. Users log in to either an Experience Cloud site (https://MyDomainName.my.site.com) or your My Domain login URL (https://MyDomainName.my.salesforce.com).

- **AuthProviderCallbackState Class**
  - Provides request HTTP headers, body, and query parameters to the `AuthProviderPlugin.handleCallback` method for user authentication. This class allows you to group the information passed in rather than passing headers, body, and query parameters individually.

- **AuthProviderPlugin Interface**
  - This interface is deprecated. For new development, use the abstract class `Auth.AuthProviderPluginClass` to create a custom OAuth-based authentication provider plug-in for single sign-on in to Salesforce.

- **AuthProviderPluginClass**
  - Contains methods to create a custom OAuth-based authentication provider plug-in for single sign-on in to Salesforce. Use this class to create a custom authentication provider plug-in if you can’t use one of the authentication providers that Salesforce provides.
AuthProviderTokenResponse Class
Stores the response from the AuthProviderPlugin.handleCallback method.

AuthToken Class
Contains methods for providing the access token associated with an authentication provider for an authenticated user, except for the Janrain provider.

CommunitiesUtil Class
Contains methods for getting information about an Experience Cloud user.

ConfigurableSelfRegHandler Interface
Gives you more control over how customers or partners self-register for your Experience Cloud site by creating a class that implements Auth.ConfigurableSelfRegHandler. You choose the user information to collect, and how users identify themselves—with their email address, phone number, or another identifier. When verified, you create a customer or partner user and log in the user to your Experience Cloud site.

ConfirmUserRegistrationHandler Interface
Manages single sign-on (SSO) user mappings between Salesforce and a third-party identity provider. Use this interface to confirm user mappings before updating them.

ConnectedAppPlugin Class
Contains methods for extending the behavior of a connected app, for example, customizing how a connected app is invoked depending on the protocol used. This class gives you more control over the interaction between Salesforce and your connected app.

HeadlessSelfRegistrationHandler Interface
Creates customer and partner users during the Headless Registration Flow.

InvocationContext Enum
The context in which the connected app is invoked, such as the protocol flow used and the token type issued, if any. Developers can use the context information to write code that is unique to the type of invocation.

JWS Class
Contains methods that apply a digital signature to a JSON Web Token (JWT), using a JSON Web Signature (JWS) data structure. This class creates the signed JWT bearer token, which can be used to request an OAuth access token in the OAuth 2.0 JWT bearer token flow.

JWT Class
Generates the JSON Claims Set in a JSON Web Token (JWT). The resulting Base64-encoded payload can be passed as an argument to create an instance of the Auth.JWS class.

JWTBearerTokenExchange Class
Contains methods that POST the signed JWT bearer token to a token endpoint to request an access token, in the OAuth 2.0 JWT bearer token flow.

LightningLoginEligibility Enum
Contains a Lightning Login eligibility value used by the Auth.SessionManagement.getLightningLoginEligibility method.

LoginDiscoveryHandler Interface
Salesforce gives you the ability to log in users based on other verification methods than username and password. For example, it can prompt users to log in with their email, phone number, or another identifier like a Federation ID or device identifier. Login Discovery is available to these licenses: Customer Community, Customer Community Plus, External Identity, Partner Community, and Partner Community Plus.
LoginDiscoveryMethod Enum
Contains methods used to verify the user’s identity when the My Domain login process uses Login Discovery.

MyDomainLoginDiscoveryHandler Interface
The handler used to implement the My Domain Login Discovery page, which is an interview-based (two-step) login process. First the user is prompted for a unique identifier such as an email address or phone number. Then the handler determines (discovers) how to authenticate the user. Either the user enters a password or is directed to an identity provider’s login page.

OAuthRefreshResult Class
Stores the result of a AuthProviderPluginClass refresh method. OAuth authentication flow provides a refresh token that can be used to get a new access token. Access tokens have a limited lifetime as specified by the session timeout value. When an access token expires, use a refresh token to get a new access token.

RegistrationHandler Interface
Salesforce provides the ability to use an authentication provider, such as Facebook© or Janrain©, for single sign-on into Salesforce.

SamlJitHandler Interface
Use this interface to control and customize Just-in-Time user provisioning logic during SAML single sign-on.

SessionManagement Class
Contains methods for verifying users’ identity, creating custom login flows, customizing security levels, and defining trusted IP ranges for a current session.

SessionLevel Enum
An Auth.SessionLevel enum value is used by the SessionManagement.setSessionLevel method.

UserData Class
Stores user information for Auth.RegistrationHandler.

VerificationMethod Enum
Contains the different ways users can identify themselves when logging in. You can use it to implement mobile-centric passwordless login pages and to self-register (and deregister) verification methods.

VerificationPolicy Enum
The Auth.VerificationPolicy enum contains an identity verification policy value used by the SessionManagement.generateVerificationUrl method.

VerificationResult Class
Contains the result of a verification challenge that you invoke when you create your own Verify page. The challenge can be initiated by either the System.UserManagement.verifyPasswordlessLogin or System.UserManagement.verifySelfRegistration method.

Auth Exceptions
The Auth namespace contains some exception classes.

AuthConfiguration Class
Contains methods for configuring settings for users to log in to a Salesforce org using their authentication provider credentials instead of their Salesforce credentials. The authentication provider can be any authentication provider that supports the OpenID Connect protocol, such as Google, Facebook, or Twitter. Users log in to either an Experience Cloud site (https://MyDomainName.my.site.com) or your My Domain login URL (https://MyDomainName.my.salesforce.com).

Namespace
Auth
Example

This example shows how to call some methods on the Auth.AuthConfiguration class. Before you can run this sample, you must provide valid values for the URLs and developer name.

⚠️ Note: If you’re not using enhanced domains, your org’s My Domain URLs are different. For details, see My Domain URL Formats in Salesforce Help.

```java
String communityUrl = 'MyDomainName.my.site.com';
String startUrl = '<Add URL>,'
Auth.AuthConfiguration authConfig = new Auth.AuthConfiguration(communityUrl, startUrl);
List<AuthProvider> authPrvs = authConfig.getAuthProviders();
String bColor = authConfig.getBackgroundColor();
String fText = authConfig.getFooterText();

String sso = Auth.AuthConfiguration.getAuthProviderSsoUrl(communityUrl, startUrl, 'developerName');
```

AuthConfiguration Constructors

The following are constructors for AuthConfiguration.

⚠️ Note: The AuthConfiguration (networkId, startUrl) constructor is deprecated in API version 56.0 and later.

**AuthConfiguration(communityOrCustomUrl, startUrl)**

Creates an instance of the AuthConfiguration class using the specified URL for an Experience Cloud site or a My Domain subdomain and the start URL for authenticated users.

**Signature**

```java
public AuthConfiguration(String communityOrCustomUrl, String startUrl)
```

**Parameters**

- **communityOrCustomUrl**
  - Type: String
  - The URL for the domain, which can be a Salesforce subdomain created with My Domain (my.salesforce.com) or a subdomain of an Experience Cloud site (force.com).

- **startUrl**
  - Type: String
  - The page users see after successfully logging in to the Experience Cloud site or My Domain subdomain.

AuthConfiguration Methods

The following are methods for AuthConfiguration. Use these methods to manage and customize authentication for a Salesforce community.
getAllowInternalUserLoginEnabled()
Indicates whether the Experience Cloud site allows internal users to log in using the Experience Cloud site login page. To enable, admins configure the setting **Allow internal users to log in directly to the experience** on the Login & Registration page in Experience Workspaces. It's disabled by default.

getAuthConfig()
Returns the AuthConfig sObject, which represents the authentication options for an Experience Cloud site or Salesforce My Domain subdomain.

getAuthConfigProviders()
Returns the list of authentication providers configured for an Experience Cloud site or Salesforce My Domain subdomain.

getAuthProviderSsoDomainUrl(communityUrl, startUrl, developerName)
Returns the single sign-on URL for an Experience Cloud site subdomain.

getAuthProviderSsoUrl(communityUrl, startUrl, developerName)
Returns the single sign-on URL for an Experience Cloud site or Salesforce My Domain subdomain.

getBackgroundColor()
Returns the color for the background of the login page for a community.

getCertificateLoginEnabled(domainUrl)
Returns true if certificate-based authentication is enabled for the My Domain URL.

getCertificateLoginUrl(domainUrl, startUrl)
Returns the certificate-based authentication endpoint for the My Domain URL if the org has certificate-based authentication enabled.

defaultProfileForRegistration()
Returns the profile ID assigned to new community users.

getFooterText()
Returns the text at the bottom of the login page for a community.

getForgotPasswordUrl()
Returns the URL for the standard or custom Forgot Password page that is specified for an Experience Cloud site or portal by the administrator.

getHeadlessForgotPasswordEnabled()
Returns true if the Headless Forgot Password Flow is enabled.

getHeadlessFrgtPswEnabled()
This method will be deprecated in a future release. Use the getHeadlessForgotPasswordEnabled() method in this class instead.

getHeadlessPasswordlessLoginEnabled()
Determines if headless passwordless login is enabled.

getHeadlessRegistrationEnabled()
Determines if the Headless Registration Flow is enabled.

getLogoUrl()
Returns the location of the icon image at the bottom of the login page for a community.
getRightFrameUrl()
Returns the URL for the right-frame content to display on the right side of the Experience Cloud site login page. The admin supplies the URL.

getSamlProviders()
Returns the list of SAML-based authentication providers available for an Experience Cloud site or Salesforce My Domain subdomain.

g getSamlSsoUrl(communityUrl, startURL, samlId)
Returns the single sign-on URL for an Experience Cloud site or Salesforce My Domain subdomain.

getSelfRegistrationEnabled()
Indicates whether the current community allows new users to create their own account by filling out a registration form.

getSelfRegistrationUrl()
Returns the location of the self-registration page for new users to sign up for an account with a community.

getStartUrl()
Returns the start page of an Experience Cloud site or Salesforce My Domain subdomain. This URL is the first page that users see when they log in.

g getUsernamePasswordEnabled()
Indicates whether the current community is set to display a login form asking for a username and password. You can configure the community not to request a username and password if it is for unauthenticated users or users logging in with a third-party authentication provider.

isCommunityUsingSiteAsContainer()
Returns true if the Experience Cloud site uses Site.com pages; otherwise, returns false.

goingalAllowInternalUserLoginEnabled()
Indicates whether the Experience Cloud site allows internal users to log in using the Experience Cloud site login page. To enable, admins configure the setting Allow internal users to log in directly to the experience on the Login & Registration page in Experience Workspaces. It's disabled by default.

Signature
public Boolean getAllowInternalUserLoginEnabled()

Return Value
Type: Boolean

Usage
If true, internal users log in to an Experience Cloud site from the site's login page with their internal credentials. If they navigate to their internal org from the Experience Cloud site, they don't have to log in again.

goingalAuthConfig()
Returns the AuthConfig sObject, which represents the authentication options for an Experience Cloud site or Salesforce My Domain subdomain.
Signature

```java
public AuthConfig getAuthConfig()
```

Return Value

Type: AuthConfig

The AuthConfig sObject for the Experience Cloud site or Salesforce My Domain subdomain.

**getAuthConfigProviders()**

Returns the list of authentication providers configured for an Experience Cloud site or Salesforce My Domain subdomain.

Signature

```java
public List<AuthConfigProviders> getAuthConfigProviders()
```

Return Value

Type: List<AuthConfigProviders>

A list of authentication providers (AuthConfigProviders sObjects), which are children of the AuthProvider sObject.

**getAuthProviders()**

Returns the list of authentication providers available for an Experience Cloud site or Salesforce My Domain subdomain.

Signature

```java
public List<AuthProvider> getAuthProviders()
```

Return Value

Type: List<AuthProvider>

A list of authentication providers (AuthProvider sObjects) for the Experience Cloud site or My Domain subdomain.

**getAuthProviderSsoDomainUrl(communityUrl, startUrl, developerName)**

Returns the single sign-on URL for an Experience Cloud site subdomain.

⚠️ **Note:** For better performance, we recommend using this method instead of `getAuthProviderSsoUrl`. If the authentication provider has `User Subdomain for Callback` enabled, changing the single sign-on URL also changes the callback URL to use the Experience Cloud site subdomain. Before switching to this method, update the callback URL in your third-party applications to avoid getting an invalid callback URL error during single sign-on.

Signature

```java
public static String getAuthProviderSsoDomainUrl(String communityUrl, String startUrl, String developerName)
```
Parameters

communityUrl
Type: String
The URL for the Experience Cloud site subdomain. If null or specified as an empty string, you get the single sign-on URL for the org’s My Domain.

startUrl
Type: String
The page that users see after logging in to the Experience Cloud site subdomain.

developerName
Type: String
The unique name of the authentication provider.

Return Value
Type: String
The Single Sign-On Initialization URL for the Experience Cloud site subdomain.

getAuthProviderSsoUrl(communityUrl, startUrl, developerName)
Returns the single sign-on URL for an Experience Cloud site or Salesforce My Domain subdomain.

Signature

public static String getAuthProviderSsoUrl(String communityUrl, String startUrl, String developerName)

Parameters

communityUrl
Type: String
The URL for the Experience Cloud site or My Domain subdomain. If not null and not specified as an empty string, you get the URL for the Experience Cloud site. If null or specified as an empty string, you get the URL for a custom domain.

startUrl
Type: String
The page that users see after logging in to the Experience Cloud site or My Domain subdomain.

developerName
Type: String
The unique name of the authentication provider.

Return Value
Type: String
The Single Sign-On Initialization URL for the Experience Cloud site or Salesforce My Domain subdomain.
getBackgroundColor()
Returns the color for the background of the login page for a community.

Signature
public String getBackgroundColor()

Return Value
Type: String

gCertificateLoginEnabled(domainUrl)
Returns true if certificate-based authentication is enabled for the My Domain URL.

Signature
public Boolean getCertificateLoginEnabled(String domainUrl)

Parameters
domainUrl
Type: String
The My Domain URL that is being checked for certificate-based authentication.

Return Value
Type: Boolean

gCertificateLoginUrl(domainUrl, startUrl)
Returns the certificate-based authentication endpoint for the My Domain URL if the org has certificate-based authentication enabled.

Signature
public static String getCertificateLoginUrl(String domainUrl, String startUrl)

Parameters
domainUrl
Type: String
The My Domain URL being checked for its certificate-based authentication endpoint.

startUrl
Type: String
The page that the user is directed to after logging in to the My Domain with certificate-based authentication.

Return Value
Type: String
The certificate-based authentication endpoint for the My Domain URL:
mydomainURL:8443/services/certauth?startURL=startURLParam

**getDefaultProfileForRegistration()**
Returns the profile ID assigned to new community users.

**Signature**

```java
public String getDefaultProfileForRegistration()
```

**Return Value**

Type: `String`
The profile ID.

**getFooterText()**
Returns the text at the bottom of the login page for a community.

**Signature**

```java
public String getFooterText()
```

**Return Value**

Type: `String`
The text string displayed at the bottom of the login page, for example “Log in with an existing account.”

**getForgotPasswordUrl()**
Returns the URL for the standard or custom Forgot Password page that is specified for an Experience Cloud site or portal by the administrator.

**Signature**

```java
public String getForgotPasswordUrl()
```

**Return Value**

Type: `String`
URL for the standard or custom Forgot Password page.

**getHeadlessForgotPasswordEnabled()**
Returns true if the Headless Forgot Password Flow is enabled.

**Signature**

```java
public Boolean getHeadlessForgotPasswordEnabled()
```
Return Value
Type: Boolean

getHeadlessFrgtPswEnabled()
This method will be deprecated in a future release. Use the getHeadlessForgotPasswordEnabled() method in this class instead.

Signature
public Boolean getHeadlessFrgtPswEnabled()

Return Value
Type: Boolean

getHeadlessPasswordlessLoginEnabled()
Determines if headless passwordless login is enabled.

Signature
public Boolean getHeadlessPasswordlessLoginEnabled()

Return Value
Type: Boolean
Returns true if headless passwordless login is enabled.

getHeadlessRegistrationEnabled()
Determines if the Headless Registration Flow is enabled.

Signature
public Boolean getHeadlessRegistrationEnabled()

Return Value
Type: Boolean
Returns true if headless registration is enabled.

getLogoUrl()
Returns the location of the icon image at the bottom of the login page for a community.

Signature
public String getLogoUrl()
Return Value
Type: String
The path to the icon image.

**getRightFrameUrl()**
Returns the URL for the right-frame content to display on the right side of the Experience Cloud site login page. The admin supplies the URL.

**Signature**
```java
public String getLoginRightFrameUrl()
```

**Return Value**
Type: String
URL for the right-frame content of the Experience Cloud site login page. Salesforce creates an inline (iframe) on the right side of the login page to display the contents specified by the URL.

**getSamlProviders()**
Returns the list of SAML-based authentication providers available for an Experience Cloud site or Salesforce My Domain subdomain.

**Signature**
```java
public List<SamlSsoConfig> getSamlProviders()
```

**Return Value**
Type: List<SamlSsoConfig>
A list of SAML-based authentication providers, which are SamlSsoConfig sObjects.

**getSamlSsoUrl(communityUrl, startURL, samlId)**
Returns the single sign-on URL for an Experience Cloud site or Salesforce My Domain subdomain.

**Signature**
```java
public static String getSamlSsoUrl(String communityUrl, String startURL, String samlId)
```

**Parameters**
- **communityUrl**
  Type: String
  The URL for the Experience Cloud site or My Domain subdomain. If not null and not specified as an empty string, you get the URL for the Experience Cloud site. If null or specified as an empty string, you get the URL for a My Domain subdomain.
- **startUrl**
  Type: String
The page users see after successfully logging in to the Experience Cloud site or My Domain subdomain

samlId
Type: String
The unique identifier of the SamlSsoConfig standard object for the Experience Cloud site or My Domain subdomain

Return Value
Type: String
The Single Sign-On Initialization URL for the Experience Cloud site or Salesforce My Domain subdomain.

getSelfRegistrationEnabled() 
Indicates whether the current community allows new users to create their own account by filling out a registration form.

Signature
public Boolean getSelfRegistrationEnabled()

Return Value
Type: Boolean

getSelfRegistrationUrl() 
Returns the location of the self-registration page for new users to sign up for an account with a community.

Signature
public String getSelfRegistrationUrl()

Return Value
Type: String
The location of the self-registration page.

getStartUrl() 
Returns the start page of an Experience Cloud site or Salesforce My Domain subdomain. This URL is the first page that users see when they log in.

Signature
public String getStartUrl()

Return Value
Type: String
The location of the start page for the Experience Cloud site or My Domain subdomain.
getUsernamePasswordEnabled()

Indicates whether the current community is set to display a login form asking for a username and password. You can configure the community not to request a username and password if it is for unauthenticated users or users logging in with a third-party authentication provider.

Signature

public Boolean getUsernamePasswordEnabled()

Return Value

Type: Boolean

isCommunityUsingSiteAsContainer()

Returns true if the Experience Cloud site uses Site.com pages; otherwise, returns false.

Signature

public Boolean isCommunityUsingSiteAsContainer()

Return Value

Type: Boolean

AuthProviderCallbackState Class

Provides request HTTP headers, body, and query parameters to the AuthProviderPlugin.handleCallback method for user authentication. This class allows you to group the information passed in rather than passing headers, body, and query parameters individually.

Namespace

Auth

IN THIS SECTION:

AuthProviderCallbackState Constructors

AuthProviderCallbackState Properties

SEE ALSO:

handleCallback(authProviderConfiguration, callbackState)

AuthProviderCallbackState Constructors

The following are constructors for AuthProviderCallbackState.
AuthProviderCallbackState class using the specified HTTP headers, body, and query parameters of the authentication request.

**AuthProviderCallbackState**

Creates an instance of the `AuthProviderCallbackState` class using the specified HTTP headers, body, and query parameters of the authentication request.

**Signature**

```java
public AuthProviderCallbackState(Map<String,String> headers, String body, Map<String,String> queryParameters)
```

**Parameters**

- `headers`
  Type: `Map<String,String>`
  The HTTP headers of the authentication request.

- `body`
  Type: `String`
  The HTTP body of the authentication request.

- `queryParameters`
  Type: `Map<String,String>`
  The HTTP query parameters of the authentication request.

**AuthProviderCallbackState Properties**

The following are properties for `AuthProviderCallbackState`.

**IN THIS SECTION:**

- `body`
  The HTTP body of the authentication request.
- `headers`
  The HTTP headers of the authentication request.
- `queryParameters`
  The HTTP query parameters of the authentication request.

**body**

The HTTP body of the authentication request.

**Signature**

```java
public String body {get; set;}
```
Property Value
Type: String

headers
The HTTP headers of the authentication request.

Signature
public Map<String,String> headers {get; set;}

Property Value
Type: Map<String,String>

queryParameters
The HTTP query parameters of the authentication request.

Signature
public Map<String,String> queryParameters {get; set;}

AuthProviderPlugin Interface
This interface is deprecated. For new development, use the abstract class Auth.AuthProviderPluginClass to create a custom OAuth-based authentication provider plug-in for single sign-on into Salesforce.

Namespace
Auth

Usage
Deprecated. Existing implementations that use Auth.AuthProviderPlugin still work. For new development, use Auth.AuthProviderPluginClass.

IN THIS SECTION:
 AuthProviderPlugin Methods
 AuthProviderPlugin Example Implementation
AuthProviderPlugin Methods

The following methods are for AuthProviderPlugin, which, as of API version 39.0, is deprecated. Use the methods in AuthProviderPluginClass instead.

IN THIS SECTION:

- `getCustomMetadataType()`
  Deprecation as of API version 39.0. Use the corresponding method in Auth.AuthProviderPluginClass.

- `getUserInfo(authProviderConfiguration, response)`
  Deprecation as of API version 39.0. Use the corresponding method in Auth.AuthProviderPluginClass.

- `handleCallback(authProviderConfiguration, callbackState)`
  Deprecation as of API version 39.0. Use the corresponding method in Auth.AuthProviderPluginClass.

- `initiate(authProviderConfiguration, stateToPropagate)`
  Deprecation as of API version 39.0. Use the corresponding method in Auth.AuthProviderPluginClass.

SEE ALSO:

- Salesforce Help: Create a Custom External Authentication Provider

`getCustomMetadataType()`

Deprecation as of API version 39.0. Use the corresponding method in Auth.AuthProviderPluginClass.

**Signature**

```java
public String getCustomMetadataType()
```

**Return Value**

*Type: String*

The custom metadata type API name for the authentication provider.

**Usage**

Returns the custom metadata type API name for a custom OAuth-based authentication provider for single sign-on to Salesforce. The `getCustomMetadataType()` method returns only custom metadata type names. It does not return custom metadata record names.

`getUserInfo(authProviderConfiguration, response)`

Deprecation as of API version 39.0. Use the corresponding method in Auth.AuthProviderPluginClass.

**Signature**

```java
public Auth.UserData getUserInfo(Map<String,String> authProviderConfiguration, Auth.AuthProviderTokenResponse response)
```
Parameters

authProviderConfiguration
Type: Map<String,String>
The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

response
Type: Auth.AuthProviderTokenResponse
The OAuth access token, OAuth secret or refresh token, and state provided by the authentication provider to authenticate the current user.

Return Value

Type: Auth.UserData
Creates a new instance of the Auth.UserData class.

Usage

Returns information from the custom authentication provider about the current user. The registration handler and other authentication provider flows use this information.

handleCallback(authProviderConfiguration, callbackState)
Deprecated as of API version 39.0. Use the corresponding method in Auth.AuthProviderPluginClass.

Signature

public Auth.AuthProviderTokenResponse handleCallback(Map<String,String> authProviderConfiguration, Auth.AuthProviderCallbackState callbackState)

Parameters

authProviderConfiguration
Type: Map<String,String>
The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

callbackState
Type: Auth.AuthProviderCallbackState
The class that contains the HTTP headers, body, and queryParams of the authentication request.

Return Value

Type: Auth.AuthProviderTokenResponse
Creates an instance of the AuthProviderTokenResponse class.
Usage
Uses the authentication provider’s supported authentication protocol to return an OAuth access token, OAuth secret or refresh token, and the state passed in when the request for the current user was initiated.

**initiate(authProviderConfiguration, stateToPropagate)**
Deprecated as of API version 39.0. Use the corresponding method in Auth.AuthProviderPluginClass.

**Signature**

```java
public System.PageReference initiate(Map<String,String> authProviderConfiguration,
 String stateToPropagate)
```

**Parameters**

- **authProviderConfiguration**
  Type: `Map<String,String>`
  The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

- **stateToPropagate**
  Type: `String`
  The state passed in to initiate the authentication request for the user.

**Return Value**

Type: `System.PageReference`

The URL of the page where the user is redirected for authentication.

Usage
Returns the URL where the user is redirected for authentication.

**AuthProviderPlugin Example Implementation**
We’ve removed the example implementation for the `Auth.AuthProviderPlugin` interface because we’ve deprecated the interface and replaced it with an abstract class. See `AuthProviderPluginClass` Class.

**AuthProviderPluginClass Class**
Contains methods to create a custom OAuth-based authentication provider plug-in for single sign-on in to Salesforce. Use this class to create a custom authentication provider plug-in if you can’t use one of the authentication providers that Salesforce provides.

**Namespace**

`Auth`
Usage

To create a custom authentication provider for single sign-on, create a class that extends Auth.AuthProviderPluginClass. This class allows you to store the custom configuration for your authentication provider and handle authentication protocols when users log in to Salesforce with their login credentials for an external service provider. In Salesforce, the class that implements this interface appears in the Provider Type drop-down list in Auth. Providers in Setup. Make sure that the user you specify to run the class has “Customize Application” and “Manage Auth. Providers” permissions.

As of API version 39.0, use the abstract class AuthProviderPluginClass to create a custom external authentication provider. This class replaces the AuthProviderPlugin interface. If you've already implemented a custom authentication provider plug-in using the interface, it still works. However, use AuthProviderPluginClass to extend your plug-in. If you haven't created an interface, create a custom authentication provider plug-in by extending this abstract class. For more information, see AuthProviderPluginClass Code Example.

IN THIS SECTION:

AuthProviderPluginClass Methods
AuthProviderPluginClass Code Example

AuthProviderPluginClass Methods

The AuthProviderPluginClass methods don't support DML options.

IN THIS SECTION:

getCustomMetadataType()
Returns the custom metadata type API name for a custom OAuth-based authentication provider for single sign-on to Salesforce.

getUserInfo(authProviderConfiguration, response)
Returns information from the custom authentication provider about the current user. This information is used by the registration handler and in other authentication provider flows.

handleCallback(authProviderConfiguration, callbackState)
Uses the authentication provider’s supported authentication protocol to return an OAuth access token, OAuth secret or refresh token, and the state passed in when the request for the current user was initiated.

initiate(authProviderConfiguration, stateToPropagate)
Returns the URL where the user is redirected for authentication.

refresh(authProviderConfiguration, refreshToken)
Returns a new access token, which is used to update an expired access token.

getCustomMetadataType()

Returns the custom metadata type API name for a custom OAuth-based authentication provider for single sign-on to Salesforce.

Signature

public String getCustomMetadataType()
Return Value

Type: String

The custom metadata type API name for the authentication provider.

Usage

The `getCustomMetadataType()` method returns only custom metadata type names. It does not return custom metadata record names. As of API version 39.0, use this method when extending `AuthProviderPluginClass` to create a custom external authentication provider.

`getUserInfo(authProviderConfiguration, response)`

Returns information from the custom authentication provider about the current user. This information is used by the registration handler and in other authentication provider flows.

Signature

```java
public Auth.UserData getUserInfo(Map<String,String> authProviderConfiguration, Auth.AuthProviderTokenResponse response)
```

Parameters

`authProviderConfiguration`

Type: `Map<String,String>`

The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates it with the custom metadata type default values. Or you can set the configuration with values that you enter when you create the custom provider in Auth. Providers in Setup.

`response`

Type: `Auth.AuthProviderTokenResponse`

The OAuth access token, OAuth secret or refresh token, and state provided by the authentication provider to authenticate the current user.

Return Value

Type: `Auth.UserData`

Creates a new instance of the `Auth.UserData` class.

Usage

As of API version 39.0, use this method when extending `AuthProviderPluginClass` to create a custom authentication provider.

Note: You might choose to get user information in the response from the `handleCallback` method or by another method. However, you must still call `getUserInfo` in the custom authentication handler to avoid getting errors about mixing objects. For example, if you don’t call `getUserInfo`, and then try to insert a contact in the `Auth.RegistrationHandler.createUser` method, you get the error, “You cannot mix EntityObjects with different UddInfos within one transaction.”
To avoid this error, call `getUserInfo` with dummy user information as follows.

```java
HttpRequest req = new HttpRequest();
String url = 'https://login.salesforce.com/';
req.setEndpoint(url);
req.setMethod('GET');
Http http = new Http();
HTTPResponse res = http.send(req);
```

**handleCallback** *(authProviderConfiguration, callbackState)*

Uses the authentication provider’s supported authentication protocol to return an OAuth access token, OAuth secret or refresh token, and the state passed in when the request for the current user was initiated.

**Signature**

```java
public Auth.AuthProviderTokenResponse handleCallback(Map<String,String> authProviderConfiguration, Auth.AuthProviderCallbackState callbackState)
```

**Parameters**

- **authProviderConfiguration**
  Type: `Map<String,String>`
  The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

- **callbackState**
  Type: `Auth.AuthProviderCallbackState`
  The class that contains the HTTP headers, body, and queryParams of the authentication request.

**Return Value**

Type: `Auth.AuthProviderTokenResponse`

Creates an instance of the `AuthProviderTokenResponse` class.

**Usage**

As of API version 39.0, use this method when extending `Auth.AuthProviderPluginClass` to create a custom authentication provider.

**initiate** *(authProviderConfiguration, stateToPropagate)*

Returns the URL where the user is redirected for authentication.

**Signature**

```java
public System.PageReference initiate(Map<String,String> authProviderConfiguration, String stateToPropagate)
```
Parameters

authProviderConfiguration
Type: Map<String,String>
The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

stateToPropagate
Type: String
The state passed in to initiate the authentication request for the user.

Return Value

Type: System.PageReference
The URL of the page where the user is redirected for authentication.

Usage

As of API version 39.0, use this method when extending Auth.AuthProviderPluginClass to create a custom authentication provider.

refresh(authProviderConfiguration, refreshToken)

Returns a new access token, which is used to update an expired access token.

Signature

public Auth.OAuthRefreshResult refresh(Map<String,String> authProviderConfiguration, String refreshToken)

Parameters

authProviderConfiguration
Type: Map<String,String>
The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

refreshToken
Type: String
The refresh token for the user who is logged in.

Return Value

Type: Auth.OAuthRefreshResult
Returns the new access token, or an error message if an error occurs.
Usage

A successful request returns a `Auth.OAuthRefreshResult` with the access token and refresh token in the response. If you receive an error, make sure that you set the error string to the error message. A NULL error string indicates no error.

The refresh method works only with named credentials; it doesn’t respect the standard OAuth refresh flow. The refresh method with named credentials works only if the earlier request returns a 401.

AuthProviderPluginClass Code Example

The following example demonstrates how to implement a custom Auth. provider plug-in using the abstract class, `Auth.AuthProviderPluginClass`.

```java
global class Concur extends Auth.AuthProviderPluginClass {

    // Use this URL for the endpoint that the
    // authentication provider calls back to for configuration.
    public String redirectUrl;
    private String key;
    private String secret;

    // Application redirection to the Concur website for
    // authentication and authorization.
    private String authUrl;

    // URI to get the new access token from concur using the GET verb.
    private String accessTokenUrl;

    // Api name for the custom metadata type created for this auth provider.
    private String customMetadataTypeApiName;

    // Api URL to access the user in Concur
    private String userAPIUrl;

    // Version of the user api URL to access data from Concur
    private String userAPIVersionUrl;

    global String getCustomMetadataType() {
        return customMetadataTypeApiName;
    }

    global PageReference initiate(Map<string,string> authProviderConfiguration, String stateToPropagate) {
        authUrl = authProviderConfiguration.get('Auth_Url__c');
        key = authProviderConfiguration.get('Key__c');

        // Here the developer can build up a request of some sort.
        // Ultimately, they return a URL where we will redirect the user.
        String url = authUrl + '?client_id='+ key +'
+&scope=USER,EXPRPT,LIST&redirect_uri=' + redirectUrl + '&state=' + stateToPropagate;
        return new PageReference(url);
    }
}
```
global Auth.AuthProviderTokenResponse handleCallback(Map<string,string> authProviderConfiguration, Auth.AuthProviderCallbackState state)
{
    // Here, the developer will get the callback with actual protocol.
    // Their responsibility is to return a new object called
    // AuthProviderTokenResponse.
    // This will contain an optional accessToken and refreshToken
    key = authProviderConfiguration.get('Key__c');
    secret = authProviderConfiguration.get('Secret__c');
    accessTokenUrl = authProviderConfiguration.get('Access_Token_Url__c');

    Map<String,String> queryParams = state.queryParameters;
    String code = queryParams.get('code');
    String sfdcState = queryParams.get('state');

    HttpRequest req = new HttpRequest();
    String url = accessTokenUrl+'?code=' + code + '&client_id=' + key +
    '&client_secret=' + secret;
    req.setEndpoint(url);
    req.setHeader('Content-Type','application/xml');
    req.setMethod('GET');
    Http http = new Http();
    HTTPResponse res = http.send(req);
    String responseBody = res.getBody();
    String token = getTokenValueFromResponse(responseBody, 'Token', null);
    return new Auth.AuthProviderTokenResponse('Concur', token,
    'refreshToken', sfdcState);
}

global Auth.UserData getUserInfo(Map<string,string> authProviderConfiguration,
    Auth.AuthProviderTokenResponse response)
{
    //Here the developer is responsible for constructing an
    //Auth.UserData object
    String token = response.oauthToken;
    HttpRequest req = new HttpRequest();
    userAPIUrl = authProviderConfiguration.get('API_User_Url__c');
    userAPIVersionUrl = authProviderConfiguration.get
    ('API_User_Version_Url__c');
    req.setHeader('Authorization', 'OAuth ' + token);
    req.setEndpoint(userAPIUrl);
    req.setHeader('Content-Type','application/xml');
    req.setMethod('GET');
    Http http = new Http();
    HTTPResponse res = http.send(req);
    String responseBody = res.getBody();
    String id = getTokenValueFromResponse(responseBody, 'LoginId',userAPIVersionUrl);
    String fname = getTokenValueFromResponse(responseBody, 'FirstName', userAPIVersionUrl);
}
String lname = getTokenValueFromResponse(responseBody, 'LastName', userAPIVersionUrl);
String fname = fname + ' ' + lname;
String uname = getTokenValueFromResponse(responseBody, 'EmailAddress', userAPIVersionUrl);
String locale = getTokenValueFromResponse(responseBody, 'LocaleName', userAPIVersionUrl);
Map<String,String> provMap = new Map<String,String>(
    'what1', 'noidea1',
    'what2', 'noidea2'
);
return new Auth.UserData(id, fname, lname, flname, uname, 'what', locale, null, 'Concur', null, provMap);

private String getTokenValueFromResponse(String response, String token, String ns) {
    docx.load(response);
    String ret = null;
    dom.XmlNode xroot = docx.getrootelement();
    if(xroot != null){ ret = xroot.getChildElement(token, ns).getText();
    }
    return ret;
}

Sample Test Classes
The following example contains test classes for the Concur class.

@IsTest
public class ConcurTestClass {
    private static final String OAUTH_TOKEN = 'testToken';
    private static final String STATE = 'mocktestState';
    private static final String REFRESH_TOKEN = 'refreshToken';
    private static final String LOGIN_ID = 'testLoginId';
    private static final String USERNAME = 'testUsername';
    private static final String FIRST_NAME = 'testFirstName';
    private static final String LAST_NAME = 'testLastName';
    private static final String EMAIL_ADDRESS = 'testEmailAddress';
    private static final String LOCALE_NAME = 'testLocalName';
    private static final String FULL_NAME = FIRST_NAME + ' ' + LAST_NAME;
    private static final String PROVIDER = 'Concur';
    private static final String REDIRECT_URL = 'http://localhost/services/authcallback/orgId/Concur';
    private static final String KEY = 'testKey';
    private static final String SECRET = 'testSecret';
    private static final String STATE_TO_PROPAGATE = 'testState';
    private static final String ACCESS_TOKEN_URL =
private static final String API_USER_VERSION_URL = 'http://www.dummyhost.com/user/20/1';
private static final String AUTH_URL = 'http://www.dummy.com/authurl';
private static final String API_USER_URL = 'www.concursolutions.com/user/api';

// In the real world scenario, the key and value would be read
// from the (custom fields in) custom metadata type record.
private static Map<String, String> setupAuthProviderConfig ()
{

AuthProviderTokenResponse Class

Stores the response from theAuthProviderPlugin.handleCallback method.
AuthProviderTokenResponse Class

Namespace
Auth

IN THIS SECTION:
AuthProviderTokenResponse Constructors
AuthProviderTokenResponse Properties

AuthProviderTokenResponse Constructors
The following are constructors for AuthProviderTokenResponse.

IN THIS SECTION:
AuthProviderTokenResponse(provider, oauthToken, oauthSecretOrRefreshToken, state)

AuthProviderTokenResponse(provider, oauthToken, oauthSecretOrRefreshToken, state)

Creates an instance of the AuthProviderTokenResponse class using the specified authentication provider, OAuth access token, OAuth secret or refresh token, and state for a custom authentication provider plug-in.

AuthProviderTokenResponse(provider, oauthToken, oauthSecretOrRefreshToken, state)

Creates an instance of the AuthProviderTokenResponse class using the specified authentication provider, OAuth access token, OAuth secret or refresh token, and state for a custom authentication provider plug-in.

Signature

public AuthProviderTokenResponse(String provider, String oauthToken, String oauthSecretOrRefreshToken, String state)

Parameters

provider
Type: String
The custom authentication provider.

oauthToken
Type: String
The OAuth access token.

oauthSecretOrRefreshToken
Type: String
The OAuth secret or refresh token for the currently logged-in user.

state
Type: String
The state passed in to initiate the authentication request for the user.
AuthProviderTokenResponse Properties

The following are properties for AuthProviderTokenResponse.

IN THIS SECTION:

oauthSecretOrRefreshToken
The OAuth secret or refresh token for the currently logged-in user.

oauthToken
The OAuth access token.

provider
The authentication provider.

state
The state passed in to initiate the authentication request for the user.

oauthSecretOrRefreshToken
The OAuth secret or refresh token for the currently logged-in user.

Signature

public String oauthSecretOrRefreshToken {get; set;}

Property Value
Type: String

oauthToken
The OAuth access token.

Signature

public String oauthToken {get; set;}

Property Value
Type: String

provider
The authentication provider.

Signature

public String provider {get; set;}

Property Value
Type: String

state
The state passed in to initiate the authentication request for the user.

Signature
public String state {get; set;}

Property Value
Type: String

AuthToken Class
Contains methods for providing the access token associated with an authentication provider for an authenticated user, except for the Janrain provider.

Namespace
Auth

AuthToken Methods
The following are methods for AuthToken. All methods are static.

IN THIS SECTION:

getAccessToken(authProviderId, providerName)
Returns an access token for the current user using the specified 18-character identifier of anAuthProvider definition in your org and the proper name of the third party, such as Salesforce or Facebook. Note that querying the ProviderType field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, OpenIdConnect is the ProviderType value for the AuthProvider object, but the expected providerName is Open ID Connect.

getAccessTokenMap(authProviderId, providerName)
Returns a map from the third-party identifier to the access token for the currently logged-in Salesforce user. The identifier value depends on the third party. For example, for Salesforce it would be the user ID, while for Facebook it would be the user number. Note that querying the ProviderType field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, OpenIdConnect is the ProviderType value for the AuthProvider object, but the expected providerName is Open ID Connect.

refreshAccessToken(authProviderId, providerName, oldAccessToken)
Returns a map from the third-party identifier containing a refreshed access token for the currently logged-in Salesforce user. Note that querying the ProviderType field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, OpenIdConnect is the ProviderType value for the AuthProvider object, but the expected providerName is Open ID Connect.
revokeAccess(authProviderId, providerName, userId, remoteIdentifier)

Revoke the access token for a specified social sign-on user from a third-party service such as Facebook©. You can use this method only if the IsNotSsoUsable field on the associated ThirdPartyAccountLink object is set to false. Querying the ProviderType field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, OpenIdConnect is the ProviderType value for the AuthProvider object, but the expected providerName is Open ID Connect.

getAccessToken(authProviderId, providerName)

Returns an access token for the current user using the specified 18-character identifier of an AuthProvider definition in your org and the proper name of the third party, such as Salesforce or Facebook. Note that querying the ProviderType field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, OpenIdConnect is the ProviderType value for the AuthProvider object, but the expected providerName is Open ID Connect.

Signature

public static String getAccessToken(String authProviderId, String providerName)

Parameters

authProviderId

Type: String

providerName

Type: String

The proper name of the third party. For all providers except Janrain, the expected values are

- Facebook
- Salesforce
- Open ID Connect
- Microsoft Access Control Service
- LinkedIn
- Twitter
- Google

For Janrain providers, the parameter value is the proper name of the third party used. Yahoo! is an example of a Janrain provider value.

Return Value

Type: String

getAccessTokenMap(authProviderId, providerName)

Returns a map from the third-party identifier to the access token for the currently logged-in Salesforce user. The identifier value depends on the third party. For example, for Salesforce it would be the user ID, while for Facebook it would be the user number. Note that querying the ProviderType field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, OpenIdConnect is the ProviderType value for the AuthProvider object, but the expected providerName is Open ID Connect.
Signature

public static Map<String, String> getAccessTokenMap(String authProviderId, String providerName)

Parameters

authProviderId
Type: String

providerName
Type: String

The proper name of the third party. For all providers except Janrain, the expected values are

- Facebook
- Salesforce
- Open ID Connect
- Microsoft Access Control Service
- LinkedIn
- Twitter
- Google

For Janrain providers, the parameter value is the proper name of the third party used. Yahoo! is an example of a Janrain provider value.

Return Value
Type: Map<String, String>

refreshAccessToken(authProviderId, providerName, oldAccessToken)

Returns a map from the third-party identifier containing a refreshed access token for the currently logged-in Salesforce user. Note that querying the ProviderType field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, OpenIdConnect is the ProviderType value for the AuthProvider object, but the expected providerName is Open ID Connect.

Signature

public static Map<String, String> refreshAccessToken(String authProviderId, String providerName, String oldAccessToken)

Parameters

authProviderId
Type: String

providerName
Type: String

The proper name of the third party. For all providers except Janrain, the expected values are

- Facebook
For Janrain providers, the parameter value is the proper name of the third party used. Yahoo! is an example of a Janrain provider value.

**oldAccessToken**
Type: String

**Return Value**
Type: Map<String, String>

**Usage**
This method works when using Salesforce or an OpenID Connect provider, but not when using Facebook or Janrain. The returned map contains `AccessToken` and `RefreshError` keys. Evaluate the keys in the response to check if the request was successful. For a successful request, the `RefreshError` value is `null`, and `AccessToken` is a token value. For an unsuccessful request, the `RefreshError` value is an error message, and the `AccessToken` value is `null`.

When successful, this method updates the token stored in the database, which you can get using `Auth.AuthToken.getAccessToken()`.

If you are using an OpenID Connect authentication provider, an `id_token` is not required in the response from the provider. If a `Token Issuer` is specified in the `Auth. Provider` settings and an `id_token` is provided anyway, Salesforce will verify it.

**Example**
```java
String accessToken = Auth.AuthToken.getAccessToken('0SOD000000000DeOAI', 'Open ID connect');
Map<String, String> responseMap = Auth.AuthToken.refreshAccessToken('0SOD000000000DeOAI', 'Open ID connect', accessToken);
```

A successful request includes the access token in the response.
```java
(RefreshError,null)(AccessToken,00DD00000007BhE!AQkAQFzj...)
```

**revokeAccess(authProviderId, providerName, userId, remoteIdentifier)**
Revoke the access token for a specified social sign-on user from a third-party service such as Facebook®. You can use this method only if the `IsNotSsoUsable` field on the associated `ThirdPartyAccountLink` object is set to `false`. Querying the `ProviderType` field on the `AuthProvider` object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the `AuthProvider` object, but the expected `providerName` is `Open ID Connect`.

**Signature**
```java
public static Boolean revokeAccess(String authProviderId, String providerName, String userId, String remoteIdentifier)
```
Parameters

authProviderId
Type: String
The ID of the Auth. Provider in the Salesforce organization.

providerName
Type: String
The proper name of the third party. For all providers except Janrain, the expected values are
- Facebook
- Salesforce
- Open ID Connect
- Microsoft Access Control Service
- LinkedIn
- Twitter
- Google
For Janrain providers, the parameter value is the proper name of the third party used. Yahoo! is an example of a Janrain provider value.

userId
Type: String
The 15-character ID for the user whose access is being revoked.

remoteIdentifier
Type: String
The unique ID for the user in the third-party system (this value is in the associated ThirdPartyAccountLink standard object).

Return Value
Type: Boolean
The return value is true if the revokeAccess() operation is successful; otherwise false.

Example
The following example revokes a Facebook user's access token.

```apex
Auth.AuthToken.revokeAccess('0SOxx00000#####', 'facebook', '005xx00000#####', 'ThirdPartyIdentifier_exist214176560#####');
```

CommunitiesUtil Class
Contains methods for getting information about an Experience Cloud user.

Namespace
Auth
Example

The following example directs a guest (unauthenticated) user to one page, and authenticated users of the Experience Cloud site’s parent organization to another page.

```java
if (Auth.CommunitesUtil.isGuestUser())
  // Redirect to the login page if user is an unauthenticated user
  return new PageReference(LOGIN_URL);

if (Auth.CommunitesUtil.isInternalUser())
  // Redirect to the home page if user is an internal user
  return new PageReference(HOME_URL);
```

CommunitiesUtil Methods

The following are methods for CommunitiesUtil. All methods are static.

**getLogoutUrl()**
Returns the page to display after the current Experience Cloud user logs out.

**getUserDisplayName()**
Returns the current user’s Experience Cloud display name.

**isGuestUser()**
Indicates whether the current user isn’t logged in to the Experience Cloud site. Redirect the user to log in, if necessary.

**isInternalUser()**
Indicates whether the current user is logged in as a member of the parent Salesforce organization, such as an employee.

**getLogoutUrl()**
Returns the page to display after the current Experience Cloud user logs out.

**Signature**

```java
public static String getLogoutUrl()
```

**Return Value**
Type: String

**getUserDisplayName()**
Returns the current user’s Experience Cloud display name.

**Signature**

```java
public static String getUserDisplayName()
```
Return Value
Type: String

`isGuestUser()`
Indicates whether the current user isn't logged in to the Experience Cloud site. Redirect the user to log in, if necessary.

**Signature**
```java
public static Boolean isGuestUser()
```

Return Value
Type: Boolean

`isInternalUser()`
Indicates whether the current user is logged in as a member of the parent Salesforce organization, such as an employee.

**Signature**
```java
public static Boolean isInternalUser()
```

**ConfigurableSelfRegHandler Interface**
Gives you more control over how customers or partners self-register for your Experience Cloud site by creating a class that implements `Auth.ConfigurableSelfRegHandler`. You choose the user information to collect, and how users identify themselves—with their email address, phone number, or another identifier. When verified, you create a customer or partner user and log in the user to your Experience Cloud site.

**Namespace**
`Auth`

**Usage**
You set up site self-registration declaratively on the Login & Registration (L&R) page of the Administration workspace. When combined with a configurable self-registration setup, the handler class can programmatically fill in user fields, including custom fields, and determine how to create a user and log them in.

When you select the Configurable Self-Reg Page registration page, you choose the user fields to collect from the self-registration form, such as last name, first name, username, nickname, mobile, or email. You also determine the verification method that the user identifies themselves with, which can be email, mobile, or neither. Salesforce generates the `Auth.ConfigurableSelfRegHandler` handler, which contains logic on how to create an Experience Cloud site member. Modify the handler to change how users are created, and how collected user information is used.
You can add custom logic to ensure that the email or phone number is unique to the customer or partner who's registering. For example, you can add a custom unique field, and write a copy of the email or phone number to it. You can also change how the user is created. By default, the user is created as a contact associated with the account that you select on the L&R page.

The generated `ConfigurableSelfRegHandler` is located on the Setup Apex Classes page, and begins with `AutocreatedConfigSelfReg`, for example, `AutocreatedConfigSelfReg1532475901849`.

For an example, see `ConfigurableSelfRegHandler Example Implementation`. For more details, see Salesforce Customer Identity in Salesforce Help.

**IN THIS SECTION:**

- **ConfigurableSelfRegHandler Method**
- **ConfigurableSelfRegHandler Example Implementation**

This Apex code implements the `Auth.ConfigurableSelfRegHandler` interface. After the customer or partner fills out the sign-up page and submits it, the handler is invoked to create an Experience Cloud member with the supplied information. If the registration process requires email or phone verification, the verification process finishes before the `Auth.ConfigurableSelfRegHandler.createUser` is invoked. If verification isn't required, `createUser` is invoked when the customer or partner submits the page.

**ConfigurableSelfRegHandler Method**

The following is the method for `ConfigurableSelfRegHandler`.

**IN THIS SECTION:**

- `createUser(accountId, profileId, registrationAttributes, password)`

Create a community member from the information that the visitor provided on your community's self-registration page.

**createUser(accountId, profileId, registrationAttributes, password)**

Create a community member from the information that the visitor provided on your community's self-registration page.

**Signature**

```java
public Id createUser(Id accountId, Id profileId, Map<Schema.SObjectField, String> registrationAttributes, String password)
```

**Parameters**

- **accountId**
  Type: `Id`
  Default account with which the new user is associated. This value comes from the Account field setting on Login and Registration (L&R) page under Registration Page Configuration.

- **profileID**
  Type: `Id`
  Profile to assign the new user. This value comes from the Profile field setting on the L&R page under Registration Page Configuration.

- **registrationAttributes**
  Type: `Map<Schema.sObjectField, String>`
A map of attributes that the registering user entered on the self-registration page. The fields that appear on the self-registration page come from the User Fields selected on the L&R page when the registration type is Configurable Self-Reg Page.

**password**

Type: String

The password entered by the user if “Include Password” is selected on the L&R page. (If a password isn’t entered, the handler must generate one because a password is required to create a user.)

**Return Value**

Type: Id

Returns an identifier for the created User object. Auth.ConfigurableSelfRegHandler inserts a user and then returns the ID of that user.

### ConfigurableSelfRegHandler Example Implementation

This Apex code implements the Auth.ConfigurableSelfRegHandler interface. After the customer or partner fills out the sign-up page and submits it, the handler is invoked to create an Experience Cloud member with the supplied information. If the registration process requires email or phone verification, the verification process finishes before the Auth.ConfigurableSelfRegHandler.createUser is invoked. If verification isn’t required, createUser is invoked when the customer or partner submits the page.

Verification occurs by email if the admin chose Email as the verification method when setting up the Configurable Self-Reg handler on the Login & Registration (L&R) page. When a visitor clicks the sign-up link from the login page, Salesforce prompts for an email address and then sends a one-time password to the specified email address. If the visitor enters the verification code successfully on the verify page, the user is created and logged in. Likewise, if the admin chose Text Message as the verification method on the L&R page, the visitor is prompted to enter a phone number. Salesforce sends a challenge (verification code) via SMS to the user. If successful, the user is created and logged in. Requiring verification before creating a user reduces the number of dummy users cluttering your org.

The Auth.ConfigurableSelfRegHandler class contains logic for generating the user fields required to create a user in case the user doesn’t supply them. The handler generates default values, ensuring that the values are unique by appending a timestamp. You can modify the handler to make sure that the email address and phone number of the customer or partner are also unique.

```apex
global class AutocreatedConfigSelfReg implements Auth.ConfigurableSelfRegHandler {
    private final Long CURRENT_TIME = Datetime.now().getTime();
    private final String[] UPPERCASE_CHARS = 'ABCDEFGHIJKLMNOPQRSTUVWXYZ'.split('');
    private final String[] LOWERCASE_CHARS = 'abcdefghijklmnopqrstuvwxyz'.split('');
    private final String[] NUMBER_CHARS = '1234567890'.split('');
    private final String[] SPECIAL_CHARS = '!#$%-_=+<>'.split('');

    // This method is called once after verification (if any was configured).
    // This method should create a user and insert it.
    // Password can be null.
    // Return null or throw an exception to fail creation.
    global Id createUser(Id accountId, Id profileId, Map<SObjectField, String> registrationAttributes, String password) {
        User u = new User();
        u.ProfileId = profileId;
        for (SObjectField field : registrationAttributes.keySet()) {
            String value = registrationAttributes.get(field);
            u.put(field, value);
        }
    }
}
```
u = handleUnsetRequiredFields(u);
generateContact(u, accountId);
if (String.isBlank(password)) {
    password = generateRandomPassword();
}
Site.validatePassword(u, password, password);
if (u.contactId == null) {
    return Site.createExternalUser(u, accountId, password);
}
u.languagelocalekey = UserInfo.getLocale();
u.localesidkey = UserInfo.getLocale();
u.emailEncodingKey = 'UTF-8';
u.timeZoneSidKey = UserInfo.getTimezone().getID();
insert u;
System.setPassword(u.Id, password);
return u.id;

// Method to autogenerate a password if one isn't passed in.
// By setting a password for a user, we won't send a
// welcome email to set the password.
private String generateRandomPassword() {
    String[] characters = new List<String>(UPPERCASE_CHARS);
    characters.addAll(LOWERCASE_CHARS);
    characters.addAll(NUMBER_CHARS);
    characters.addAll(SPECIAL_CHARS);
    String newPassword = '';
    Boolean needsUpper = true, needsLower = true, needsNumber = true, needsSpecial =
    true;
    while (newPassword.length() < 50) {
        Integer randomInt = generateRandomInt(characters.size());
        String c = characters[randomInt];

}

private String generateUsername() {
    return 'externaluser' + CURRENT_TIME + '@company.com';
}

// Default implementation to try to provide uniqueness.
private String generateEmail() {
    return 'externaluser' + CURRENT_TIME + '@company.com';
}

// Default implementation to try to provide uniqueness.
private String generateCommunityNickname() {
    return 'ExternalUser' + CURRENT_TIME;
}

ConfirmUserRegistrationHandler Interface

Manages single sign-on (SSO) user mappings between Salesforce and a third-party identity provider. Use this interface to confirm user mappings before updating them.

Namespace

Auth

Usage

When you set up SSO with a third-party identity provider, you create a class that implements a registration handler using the Auth.RegistrationHandler interface. This class manages the process of creating and updating users. For advanced use cases that require you to confirm user information during the update process, implement the Auth.ConfirmUserRegistrationHandler interface in your class. This interface must be implemented in addition to Auth.RegistrationHandler.

You can use the Auth.ConfirmUserRegistrationHandler interface to ensure that users are mapped correctly between Salesforce and the third party. When a user who has previously logged in with an authentication provider logs in again, you can confirm that the incoming user data is consistent with the user’s third-party identifier. If not, you can identify which user is supposed to be logged in.

You can also use the Auth.ConfirmUserRegistrationHandler interface to switch context for users with multiple records. For example, a user has two records—an admin user and a standard user. When the user logs in, the third-party identity provider confirms the account used to log in and sends the response to Salesforce via the UserInfo endpoint. You can then use this information to determine whether to log in the user as an admin or standard user.

IN THIS SECTION:

ConfirmUserRegistrationHandler Methods

ConfirmUserRegistrationHandler Example Implementation

ConfirmUserRegistrationHandler Methods

The following are methods for ConfirmUserRegistrationHandler.
IN THIS SECTION:

confirmUser(userId, tpalId, portalId, userdata)

Returns the ID of the user to be logged in based on their mapping to a third-party identifier. This method is called before calling the updateUser() method. It’s called only if the incoming user has previously logged in and has a third-party account link to a Salesforce user.

**confirmUser(userId, tpalId, portalId, userdata)**

Returns the ID of the user to be logged in based on their mapping to a third-party identifier. This method is called before calling the updateUser() method. It’s called only if the incoming user has previously logged in and has a third-party account link to a Salesforce user.

**Signature**

```java
public Id confirmUser(Id userId, Id tpalId, Id portalId, Auth.UserData userdata)
```

**Parameters**

- **userId**
  
  Type: Id
  
  The ID of the user who is mapped to the third-party identifier via a third-party account link.

- **tpalId**
  
  Type: Id
  
  The third-party account link corresponding to the third-party identifier.

- **portalId**
  
  Type: Id
  
  The portal ID the user is logging in to. If there’s no portal configured, this value can be null.

- **userData**
  
  Type: Auth.UserData
  
  Contains user information from the third-party identity provider.

**Return Value**

Type: Id

The Id of the user to be logged in. If null, login fails.

**ConfirmUserRegistrationHandler Example Implementation**

This example implements the Auth.ConfirmUserRegistrationHandler interface during the user update process to confirm that the correct user is logging in based on their email address and last name.

```java
global class StandardUserRegistrationHandler implements Auth.RegistrationHandler,
Auth.ConfirmUserRegistrationHandler {
    global User createUser(Id portalId, Auth.UserData data){
        User u = new User();
        Profile p = [SELECT Id FROM profile WHERE name='Standard User'];
        u.username = data.username + '@salesforce.com';
    }
}
```
global void updateUser(Id userId, Id portalId, Auth.UserData data) {
    User u = new User(id=userId);
    u.username = data.username + '@salesforce.com';
    u.email = data.email;
    u.lastName = data.lastName;
    u.firstName = data.firstName;
    String alias = data.username;
    if(alias.length() > 8) {
        alias = alias.substring(0, 8);
    }
    u.alias = alias;
    u.languagelocalekey = data.attributeMap.get('language');
    u.localesidkey = data.locale;
    u.emailEncodingKey = 'UTF-8';
    u.timeZoneSidKey = 'America/Los_Angeles';
    u.profileId = p.Id;
    return u;
}

global Id confirmUser(Id userId, Id tpalId, Id portalId, Auth.UserData data) {
    if (data.email.contains(data.lastName)) { // looks genuine
        return userId;
    } else { // find the right user
        User confirmedUser = [SELECT id FROM user WHERE email=:data.email];
        return confirmedUser.Id;
    }
}

The following example tests the implementation:

@isTest
class StandardUserRegistrationHandlerTest {
    static testMethod void testConfirmUser() {
        StandardUserRegistrationHandler handler = new StandardUserRegistrationHandler();
        Auth.UserData sampleData = new Auth.UserData('idA', 'firstName', 'A', 'firstName A', 'userA@example.org', null, 'usernameA', 'en_US', 'facebook', null, new Map<String, String>{'language' => 'en_US'});
        User u = handler.createUser(null, sampleData);
        insert(u);
        String uid = u.id;
}
sampleData = new Auth.UserData('idB', 'firstName', 'B',
    'firstName B', 'userA@example.org', null, 'usernameB', 'en_US', 'facebook',
    null, new Map<String, String>{}); // note that user B is using userA's email
Id confirmedUserId = handler.confirmUser(uid, '060xx0000004Eh6', null, sampleData);
System.assertEquals(uid, confirmedUserId); // we should see userA's id
}

ConnectedAppPlugin Class

Contains methods for extending the behavior of a connected app, for example, customizing how a connected app is invoked depending on the protocol used. This class gives you more control over the interaction between Salesforce and your connected app.

Namespace

Auth

Usage

When you create a connected app, you specify general information about the app and settings for OAuth, web apps, mobile apps, and canvas apps. To customize how the app is invoked, create a connected app handler with this ConnectedAppPlugin Apex class. For example, use this class to support new authentication protocols or respond to user attributes in a way that benefits a business process.

When you create a connected app handler, you also configure the ConnectedAppPlugin class to run as an execution user. The execution user authorizes access for the connected app. For example, when you use the authorize method, the execution user authorizes the connected app to access data.

If you don’t specify an execution user, the plug-in runs as an Automated Process User, which is a system user that executes tasks behind the scenes. Most ConnectedAppPlugin methods require that you specify an execution user, with the exception of the customAttributes method. For more information, see Create a Custom Connected App Handler.

Example

This example authorizes the connected app user to use the connected app if the context is SAML and the user has reached the quota tracked in a custom field. It returns the user’s permission set assignments. The example uses Auth.InvocationContext to modify a SAML assertion before it’s sent to the service provider.

global class ConnectedAppPluginExample extends Auth.ConnectedAppPlugin
{
    // Authorize the app if the user has achieved quota tracked in a custom field
    global override Boolean authorize(Id userId, Id connectedAppId, Boolean isAdminApproved, Auth.InvocationContext context)
    {
        // Create a custom boolean field HasAchievedQuota__c on the user record
        // and then uncomment the block below
        // User u = [select id, HasAchievedQuota__c from User where id =: userId].get(0);
        // return u.HasAchievedQuota__c;

        return isAdminApproved;
    }
}
// Call a flow during refresh
global override void refresh(Id userId, Id connectedAppId, Auth.InvocationContext context)
{
  try
  {
    Map<String, Object> inputVariables = new Map<String, Object>();
    inputVariables.put('userId', userId);
    inputVariables.put('connectedAppId', connectedAppId);

    // Create a custom trigger ready flow and uncomment the block below
    // Flow.Interview.MyCustomFlow interview = new Flow.Interview.MyCustomFlow(inputVariables);
    // interview.start();
  }
  catch (Exception e) {
    System.debug('FLOW Exception:' + e);
  }
}

// Return a user's permission set assignments
global override Map<String,String> customAttributes(Id userId, Id connectedAppId,
Map<String,String> formulaDefinedAttributes, Auth.InvocationContext context)
{
  List<PermissionSetAssignment> psas = [SELECT id, PermissionSet.Name FROM PermissionSetAssignment
WHERE PermissionSet.IsOwnedByProfile = false AND (AssigneeId = :userId)];
  String permsets = '][';
  for (PermissionSetAssignment psa :psas)
  {
    permsets += psa.PermissionSet.Name + ';';
  }
  permsets += ']]';
  formulaDefinedAttributes.put('PermissionSets', permsets);
  return formulaDefinedAttributes;
}

IN THIS SECTION:

ConnectedAppPlugin Methods

ConnectedAppPlugin Methods
The following are methods for ConnectedAppPlugin.

IN THIS SECTION:

authorize(userId, connectedAppId, isAdminApproved)
Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use authorize (userId, connectedAppId, isAdminApproved, context) instead.
authorize(userId, connectedAppId, isAdminApproved, context)
Authorizes the specified user to access the connected app. If the connected app is set for users to self-authorize, this method isn’t invoked.

customAttributes(userId, connectedAppId, formulaDefinedAttributes)
Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use customAttributes(userId, connectedAppId, formulaDefinedAttributes, context) instead.

customAttributes(userId, connectedAppId, formulaDefinedAttributes, context)
Sets new attributes for the specified user. When the connected app gets the user’s attributes from the UserInfo endpoint or through a SAML assertion, use this method to update the attribute values.

modifySAMLResponse(authSession, connectedAppId, samlResponse)
Modifies the XML generated by the Salesforce SAML Identity Provider (IDP) before it’s sent to the service provider.

refresh(userId, connectedAppId)
Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use refresh(userId, connectedAppId, context) instead.

refresh(userId, connectedAppId, context)
Salesforce calls this method during a refresh token exchange.

authorize(userId, connectedAppId, isAdminApproved)
Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use authorize(userId, connectedAppId, isAdminApproved, context) instead.

Signature

public Boolean authorize(Id userId, Id connectedAppId, Boolean isAdminApproved)

Parameters

userId
Type: Id
The 15-character ID of the user attempting to use the connected app.

connectedAppId
Type: String
The 15-character ID of the connected app.

isAdminApproved
Type: Boolean
The approval state of the specified user when the connected app requires approval.

Return Value

Type: Boolean
If the connected app requires admin approval, a returned value of true indicates that the current user is approved.
authorize(userId, connectedAppId, isAdminApproved, context)

Authorizes the specified user to access the connected app. If the connected app is set for users to self-authorize, this method isn’t invoked.

Signature

```
public Boolean authorize(Id userId, Id connectedAppId, Boolean isAdminApproved, 
Auth.InvocationContext context)
```

Parameters

- **userId**
  - Type: Id
  - The 15-character ID of the user attempting to use the connected app.

- **connectedAppId**
  - Type: Id
  - The 15-character ID of the connected app.

- **isAdminApproved**
  - Type: Boolean
  - The approval state of the specified user when the connected app requires approval.

- **context**
  - Type: InvocationContext
  - The context in which the connected app is invoked.

Return Value

- Type: Boolean
  - If the connected app requires admin approval, a returned value of `true` indicates that the user is approved.

Usage

`ConnectedAppPlugin` runs on behalf of the current user. But the user must have permission to use the connected app for the plug-in to work. Use this method to authorize the user.

customAttributes(userId, connectedAppId, formulaDefinedAttributes)

Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use `customAttributes(userId, connectedAppId, formulaDefinedAttributes, context)` instead.

Signature

```
public Map<String,String> customAttributes(Id userId, Id connectedAppId, 
Map<String,String> formulaDefinedAttributes,)
```

Parameters

- **userId**
  - Type: Id
The 15-character ID of the user attempting to use the connected app.

`connectedAppId`
Type: Id
The 15-character ID of the connected app.

`formulaDefinedAttributes`
Type: Map<String,String>
A map of the new set of attributes from the UserInfo endpoint (OAuth) or from a SAML assertion. For more information, see The UserInfo Endpoint in the online help.

**Return Value**
Type: Map<String,String>
A map of the updated set of attributes.

`customAttributes(userId, connectedAppId, formulaDefinedAttributes, context)`
Sets new attributes for the specified user. When the connected app gets the user’s attributes from the UserInfo endpoint or through a SAML assertion, use this method to update the attribute values.

**Signature**

```java
public Map<String,String> customAttributes(Id userId, Id connectedAppId, Map<String,String> formulaDefinedAttributes, Auth.InvocationContext context)
```

**Parameters**

`userId`
Type: Id
The 15-character ID of the user attempting to use the connected app.

`connectedAppId`
Type: Id
The 15-character ID for the connected app.

`formulaDefinedAttributes`
Type: Map<String,String>
A map of the current set of attributes from the UserInfo endpoint (OAuth) or from a SAML assertion. For more information, see The UserInfo Endpoint in the online help.

`context`
Type: InvocationContext
The context in which the connected app is invoked.

**Return Value**
Type: Map<String,String>
A map of the updated set of attributes.
modifySAMLResponse(authSession, connectedAppId, samlResponse)

Modifies the XML generated by the Salesforce SAML Identity Provider (IDP) before it's sent to the service provider.

Signature

```java
public dom.XmlNode modifySAMLResponse(Map<String,String> authSession, Id connectedAppId, dom.XmlNode samlResponse)
```

Parameters

- `authSession` Type: `Map<String,String>`
  The attributes for the authorized user's session. The map includes the 15-character ID of the authorized user who's accessing the connected app.

- `connectedAppId` Type: `Id`
  The 15-character ID of the connected app.

- `samlResponse` Type: `Dom.XmlNode`
  Contains the SAML XML response generated by the IDP.

Return Value

Type: `Dom.XmlNode`

Returns an instance of `Dom.XmlNode` containing the modified SAML XML response.

Usage

Use this method to modify the XML SAML response to perform an action based on the context of the SAML request before it's verified, signed, and sent to the target service provider. This method enables developers to extend the connected app plug-in to meet their specific needs.

The developer assumes full responsibility for changes made within the connected app plug-in. The plug-in must include validation and error handling. If the plug-in throws an exception, catch it, log it, and stop the process. Don't send anything to the target service provider.

refresh(userId, connectedAppId)

Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use `refresh(userId, connectedAppId, context)` instead.

Signature

```java
public void refresh(Id userId, Id connectedAppId)
```

Parameters

- `userId` Type: `Id`
  

108
The 15-character ID of the user requesting the refresh token.

\texttt{connectedAppId}
\begin{itemize}
  \item \textbf{Type: \textit{Id}}
  \item The 15-character ID of the connected app.
\end{itemize}

\textbf{Return Value}
\begin{itemize}
  \item \textbf{Type: void}
\end{itemize}

\texttt{refresh(userId, connectedAppId, context)}
Salesforce calls this method during a refresh token exchange.

\textbf{Signature}
\begin{itemize}
  \item \texttt{public void refresh(Id userId, Id connectedAppId, Auth.InvocationContext context)}
\end{itemize}

\textbf{Parameters}
\begin{itemize}
  \item \texttt{userId}
    \begin{itemize}
      \item \textbf{Type: \textit{Id}}
      \item The 15-character ID of the user requesting the refresh token.
    \end{itemize}
  \item \texttt{connectedAppId}
    \begin{itemize}
      \item \textbf{Type: \textit{Id}}
      \item The 15-character ID of the connected app.
    \end{itemize}
  \item \texttt{context}
    \begin{itemize}
      \item \textbf{Type: InvocationContext}
      \item The context in which the connected app is invoked.
    \end{itemize}
\end{itemize}

\textbf{Return Value}
\begin{itemize}
  \item \textbf{Type: void}
\end{itemize}

\textbf{HeadlessSelfRegistrationHandler Interface}
Creates customer and partner users during the Headless Registration Flow.

\textbf{Namespace}
\begin{itemize}
  \item \texttt{Auth}
\end{itemize}

\textbf{Usage}
The Headless Registration Flow allows you to control user registration experience in a third-party app while using Salesforce to authenticate users and manage their data access. When you set up this flow, add users in the class that is implementing the \texttt{Auth.HeadlessSelfRegistrationHandler} interface. This class runs after the user verifies their identity. For a detailed
explanation of headless registration, see Headless Registration Flow for Private Clients or Headless Registration Flow for Public Clients, depending on your app type.

IN THIS SECTION:

HeadlessSelfRegistrationHandler Methods
The following are methods for HeadlessSelfRegistrationHandler.

HeadlessSelfRegistrationHandler Example Implementation
This example class implements the Auth.HeadlessSelfRegistrationHandler interface. The class creates a user based on information that your app sends to Headless Registration API. It associates the user with the default profile for new users, which you configure in your Experience Cloud settings. It also creates a contact for the user and assigns it to an account.

HeadlessSelfRegistrationHandler Methods
The following are methods for HeadlessSelfRegistrationHandler.

IN THIS SECTION:

createUser(profileId, data, customUserDataMap, experienceId, password)
Returns a User object using information submitted by your off-platform app to Headless Registration API. The User object can be a new user that hasn’t been inserted in your org’s database, or it can represent an existing user record. If it’s a new User object, Salesforce inserts the user record for you.

createUser (profileId, data, customUserDataMap, experienceId, password)
Returns a User object using information submitted by your off-platform app to Headless Registration API. The User object can be a new user that hasn’t been inserted in your org’s database, or it can represent an existing user record. If it’s a new User object, Salesforce inserts the user record for you.

Signature
public User createUser(Id profileId, Auth.UserData data, String customUserDataMap, String experienceId, String password)

Parameters

profileId
Type: Id
The ID of the profile that is assigned to new users.

data
Type: Auth.UserData
A class that stores information about the user, such as their name and locale.

customUserDataMap
Type: String
A string representation of a JSON object containing custom user information passed in during registration. We recommend that you deserialize this string into the equivalent Apex class structure. Determine what custom information to collect when you build your app’s registration experience.
**experienceId**
Type: String
The Experience Cloud site ID.

**password**
Type: String
The user password.

**Return Value**
Type: User

### HeadlessSelfRegistrationHandler Example Implementation

This example class implements the `Auth.HeadlessSelfRegistrationHandler` interface. The class creates a user based on information that your app sends to Headless Registration API. It associates the user with the default profile for new users, which you configure in your Experience Cloud settings. It also creates a contact for the user and assigns it to an account.

```apex
global class ExampleHeadlessReg implements Auth.HeadlessSelfRegistrationHandler {

    global User createUser(Id profileId, Auth.UserData data, String customUserDataMap, String experienceId, String password){
        User u = new User();
        u.ProfileId = profileId;
        u.email = data.email;
        Account a;
        List<Account> accounts = 
            [SELECT Id FROM account WHERE name=:social_account];
        if(accounts.isEmpty())
        {
            a = new Account(name = social_account);
            insert(a);
        }else
        a = accounts[0];
        generateContact(u, a.Id);
        u.languagelocalekey = UserInfo.getLocale();
        u.localesidkey = UserInfo.getLocale();
        u.timeZoneSidKey = UserInfo.getTimezone().getID();
        return u;
    }

    private User handleUnsetRequiredFields(User u) {
        return u;
    }

    // Method to construct a contact for a user
    private void generateContact(User u, Id accountId) {
        // Add logic here to build your own contact for the user
        Contact c = new Contact();
        c.accountId = accountId;
    }

```
InvocationContext Enum

The context in which the connected app is invoked, such as the protocol flow used and the token type issued, if any. Developers can use the context information to write code that is unique to the type of invocation.

Enum Values

The following are the values of the Auth.InvocationContext enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASSET_TOKEN</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>OAUTH1</td>
<td>Context used when authentication is through an OAuth 1.0A flow.</td>
</tr>
<tr>
<td>OAUTH2_JWT_BEARER_TOKEN</td>
<td>Context used when authentication is through a JSON-based Web Token (JWT) bearer token flow.</td>
</tr>
<tr>
<td>OAUTH2_SAML_ASSERTION</td>
<td>Context used when authentication is through an OAuth 2.0 SAML assertion flow.</td>
</tr>
<tr>
<td>OAUTH2_SAML_BEARER_ASSERTION</td>
<td>Context used when authentication is through an OAuth 2.0 SAML bearer assertion flow.</td>
</tr>
<tr>
<td>OAUTH2_USERNAME_PASSWORD</td>
<td>Context used when authentication is through an OAuth 2.0 username-password flow.</td>
</tr>
<tr>
<td>OAUTH2_USER_AGENT_ID_TOKEN</td>
<td>Context used when issuing an ID token through an OAuth 2.0 user-agent flow.</td>
</tr>
<tr>
<td>OAUTH2_USER_AGENT_TOKEN</td>
<td>Context used when authentication is through an OAuth 2.0 user agent flow.</td>
</tr>
<tr>
<td>OAUTH2_WEB_SERVER</td>
<td>Context used when authentication is through a web server authentication flow.</td>
</tr>
<tr>
<td>OPENIDCONNECT</td>
<td>Context used when authentication is through an OpenID Connect authentication flow.</td>
</tr>
<tr>
<td>REFRESH_TOKEN</td>
<td>Context used when renewing tokens issued by a web server or user-agent flow.</td>
</tr>
<tr>
<td>SAML_ASSERTION</td>
<td>Context used when authentication is through a SAML assertion flow.</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Context is unknown.</td>
</tr>
</tbody>
</table>
USERID_ENDPOINT | Context used when issuing an access token through a UserInfo endpoint.

Salesforce Help: Authenticating Apps with OAuth

### JWS Class

Contains methods that apply a digital signature to a JSON Web Token (JWT), using a JSON Web Signature (JWS) data structure. This class creates the signed JWT bearer token, which can be used to request an OAuth access token in the OAuth 2.0 JWT bearer token flow.

### Namespace

Auth

### Usage

Use the methods in this class to sign the JWT bearer token with the X509 certificate.

### IN THIS SECTION:

- JWS Constructors
- JWS Methods

### JWS Constructors

The following are constructors for JWS.

### IN THIS SECTION:

- JWS(jwt, certDevName)
  Creates an instance of the JWS class using the specified Auth.JWT payload and the certificate used for signing the JWT bearer token.
- JWS(payload, certDevName)
  Creates an instance of the JWS class using the specified payload and certificate used for signing the JWT bearer token.

### JWS(jwt, certDevName)

Creates an instance of the JWS class using the specified Auth.JWT payload and the certificate used for signing the JWT bearer token.

### Signature

```java
public JWS(Auth.JWT jwt, String certDevName)
```
Parameters

jwt
  Type: Auth.JWT
  The Base64-encoded JSON Claims Set in the JWT bearer token generated by Auth.JWT.

certDevName
  Type: String
  The Unique Name for a certificate stored in the Salesforce org’s Certificate and Key Management page to use for signing the JWT bearer token.

Usage

Calls the toJSONString() method in Auth.JWT and sets the resulting string as the payload of the JWT bearer token. Alternatively, you can specify the payload directly using JWS(payload, certDevName).

JWS(payload, certDevName)

Creates an instance of the JWS class using the specified payload and certificate used for signing the JWT bearer token.

Signature

public JWS(String payload, String certDevName)

Parameters

payload
  Type: String
  The Base64-encoded JSON Claims Set in the JWT bearer token.

certDevName
  Type: String
  The Unique Name for a certificate stored in the Salesforce org’s Certificate and Key Management page to use for signing the JWT bearer token.

Usage

Sets the payload string as the payload of the JWT bearer token. Alternatively, if you generate the payload using Auth.JWT, you can use JWS(jwt, certDevName) instead.

JWS Methods

The following are methods for JWS. All are instance methods.

IN THIS SECTION:

  clone()
  Makes a duplicate copy of the JWS object.
getCompactSerialization()
Returns the compact serialization representation of the JWS as a concatenated string, with the encoded JWS header, encoded JWS payload, and encoded JWS signature strings separated by period (\.') characters.

clone()
Makes a duplicate copy of the JWS object.

Signature
public Object clone()

Return Value
Type: JWS

getCompactSerialization()
Returns the compact serialization representation of the JWS as a concatenated string, with the encoded JWS header, encoded JWS payload, and encoded JWS signature strings separated by period (\.') characters.

Signature
public String getCompactSerialization()

Return Value
Type: String

JWT Class
Generates the JSON Claims Set in a JSON Web Token (JWT). The resulting Base64-encoded payload can be passed as an argument to create an instance of the Auth.JWS class.

Namespace
Auth

Usage
Use the methods in this class to generate the payload in a JWT bearer token.

IN THIS SECTION:
JWT Methods

JWT Methods
The following are methods for JWT. All are instance methods.
IN THIS SECTION:

clone()
Makes a duplicate copy of the JWT object.

getAdditionalClaims()
Returns a map of additional claims in the JWT, where the key string contains the name of the claim, and the value contains the value of the claim.

getAud()
Returns the audience claim that identifies the intended recipients of the JWT.

getIss()
Returns the issuer claim that identifies the issuer of the JWT.

getNbfClockSkew()
Returns the not before claim that identifies the time before which the JWT must not be accepted for processing, while allowing some leeway for clock skew.

getSub()
Returns the subject claim that identifies the current user of the JWT.

getValidityLength()
Returns the length of time (in seconds) that the JWT is valid, which affects the expiration claim.

setAdditionalClaims(additionalClaims)
Sets the additional claims in the JWT. Returned by the getAdditionalClaims() method.

setAud(aud)
Sets the audience claim in the JWT. Returned by the getAud() method.

setIss(iss)
Sets the issuer claim in the JWT. Returned by the getIss() method.

setNbfClockSkew(nbfClockSkew)
Sets the not before claim in the JWT. Returned by the getNbfClockSkew() method.

setSub(sub)
Sets the subject claim in the JWT. Returned by the getSub() method.

setValidityLength(validityLength)
Sets the length of time (in seconds) that the JWT is valid, which affects the expiration claim. Returned by the getValidityLength() method.

toJsonString()
Generates the JSON object representation of the Claims Set as an encoded JWT payload.

clone()
Makes a duplicate copy of the JWT object.

Signature

public Object clone()
Return Value
type: JWT

`getAdditionalClaims()`
Returns a map of additional claims in the JWT, where the key string contains the name of the claim, and the value contains the value of the claim.

**Signature**
```
public Map<String, ANY> getAdditionalClaims()
```

Return Value
type: Map<String, ANY>

`getAud()`
Returns the audience claim that identifies the intended recipients of the JWT.

**Signature**
```
public String getAud()
```

Return Value
type: String

`getIss()`
Returns the issuer claim that identifies the issuer of the JWT.

**Signature**
```
public String getIss()
```

Return Value
type: String

`getNbfClockSkew()`
Returns the not before claim that identifies the time before which the JWT must not be accepted for processing, while allowing some leeway for clock skew.

**Signature**
```
public Integer getNbfClockSkew()
```
Return Value
Type: Integer

`getSub()`
Returns the subject claim that identifies the current user of the JWT.

Signature
`public String getSub()`

Return Value
Type: String

`getValidityLength()`
Returns the length of time (in seconds) that the JWT is valid, which affects the expiration claim.

Signature
`public Integer getValidityLength()`

Return Value
Type: Integer

`setAdditionalClaims(additionalClaims)`
Sets the additional claims in the JWT. Returned by the `getAdditionalClaims()` method.

Signature
`public void setAdditionalClaims(Map<String,ANY> additionalClaims)`

Parameters
`additionalClaims`
Type: `Map<String,ANY>`

Return Value
Type: void

Usage
Additional claims must not include any standard claims.
**setAud(aud)**
Sets the audience claim in the JWT. Returned by the `getAud()` method.

**Signature**
```java
public void setAud(String aud)
```

**Parameters**

*aud*
Type: `String`

**Return Value**
Type: `void`

**setIss(iss)**
Sets the issuer claim in the JWT. Returned by the `getIss()` method.

**Signature**
```java
public void setIss(String iss)
```

**Parameters**

*iss*
Type: `String`

**Return Value**
Type: `void`

**setNbfClockSkew(nbfClockSkew)**
Sets the not before claim in the JWT. Returned by the `getNbfClockSkew()` method.

**Signature**
```java
public void setNbfClockSkew(Integer nbfClockSkew)
```

**Parameters**

*nbfClockSkew*
Type: `Integer`

**Return Value**
Type: `void`
**setSub (sub)**
Sets the subject claim in the JWT. Returned by the `getSub()` method.

**Signature**
```
public void setSub(String sub)
```

**Parameters**

*sub*
Type: `String`

**Return Value**
Type: `void`

**setValidityLength (validityLength)**
Sets the length of time (in seconds) that the JWT is valid, which affects the expiration claim. Returned by the `getValidityLength()` method.

**Signature**
```
public void setValidityLength(Integer validityLength)
```

**Parameters**

*validityLength*
Type: `Integer`

**Return Value**
Type: `void`

**toJSONString()**
Generates the JSON object representation of the Claims Set as an encoded JWT payload.

**Signature**
```
public String toJSONString()
```

**Return Value**
Type: `String`

**JWTBearerTokenExchange Class**
Contains methods that POST the signed JWT bearer token to a token endpoint to request an access token, in the OAuth 2.0 JWT bearer token flow.
Namespace

Auth

Usage

Use the methods in this class to post a signed JWT bearer token to the OAuth token endpoint, in exchange for an access token.

Example

In the following example application, the Apex controller:

1. Creates the JSON Claims Set.
2. Specifies the scope of the request with additional claims.
3. Creates the signed JWT.
4. Specifies the token endpoint and POSTs to it.
5. Gets the access token from the HTTP response.

```java
public class MyController{

    public MyController() {
        Auth.JWT jwt = new Auth.JWT();
        jwt.setSub('user@salesforce.com');
        jwt.setAud('https://login.salesforce.com');
        jwt.setIss('3MVG99OxTyEMCQ3gNp2PjkqeZKxnmA1GLxV4oHh9AKL_rSK.BoSVFGZHQukXnVjzRgSuQqGn75NL7ykQcyy7');

        //Additional claims to set scope
        Map<String, Object> claims = new Map<String, Object>();
        claims.put('scope', 'scope name');
        jwt.setAdditionalClaims(claims);

        //Create the object that signs the JWT bearer token
        Auth.JWS jws = new Auth.JWS(jwt, 'CertFromCertKeyManagement');

        //Get the resulting JWS in case debugging is required
        String token = jws.getCompactSerialization();

        //Set the token endpoint that the JWT bearer token is posted to
        String tokenEndpoint = 'https://login.salesforce.com/services/oauth2/token';

        //POST the JWT bearer token
        Auth.JWTBearerTokenExchange bearer = new Auth.JWTBearerTokenExchange(tokenEndpoint, jws);

        //Get the access token
        String accessToken = bearer.getAccessToken();
    }
}
```
JWTBearerTokenExchange Constructors

The following are constructors for JWTBearerTokenExchange.

IN THIS SECTION:

JWTBearerTokenExchange Constructors

JWTBearerTokenExchange(tokenEndpoint, jws)

Creates an instance of the JWTBearerTokenExchange class using the specified token endpoint and the signed JWT bearer token.

JWTBearerTokenExchange()

Creates an instance of the Auth.JWTBearerTokenExchange class.

Signature

public JWTBearerTokenExchange(String tokenEndpoint, Auth.JWS jws)

Parameters

tokenEndpoint
Type: String
The token endpoint that the signed JWT bearer token is POSTed to.

jws
Type: Auth.JWS
The signed JWT bearer token.

JWTBearerTokenExchange methods

The following are methods for JWTBearerTokenExchange. All are instance methods.

Signature

public JWTBearerTokenExchange()
IN THIS SECTION:

- **clone()**
  Makes a duplicate copy of the JWTBearerTokenExchange object.

- **getAccessToken()**
  Returns the access_token in the token response to the JWT bearer token request.

- **getGrantType()**
  Returns the grant type specified in the JWT bearer token request. The grant type value defaults to `urn:ietf:params:oauth:grant-type:jwt-bearer`.

- **getHttpResponse()**
  Returns the full `System.HttpResponse` token response to the JWT bearer token request.

- **getJWS()**
  Returns the JWS specified in the JWT bearer token request.

- **getTokenEndpoint()**
  Returns the token endpoint that the JWT bearer token request is POSTed to.

- **setGrantType(grantType)**
  Sets the grant type in the JWT bearer token request. Returned by the `getGrantType()` method.

- **setJWS(jws)**
  Sets the JWS in the JWT bearer token request. Returned by the `getJWS()` method.

- **setTokenEndpoint(tokenEndpoint)**
  Sets the token endpoint that the JWT bearer token request is POSTed to. Returned by the `getTokenEndpoint()` method.

---

**clone()**

Makes a duplicate copy of the JWTBearerTokenExchange object.

**Signature**

```java
public Object clone()
```

**Return Value**

Type: **JWTBearerTokenExchange**

**getAccessToken()**

Returns the access_token in the token response to the JWT bearer token request.

**Signature**

```java
public String getAccessToken()
```

**Return Value**

Type: **String**
Usage
This method extracts the access_token from the token response. If the token response issues the access token in a different parameter, the request fails.
If you want the full HTTP token response returned, use getHttpResponse instead.

getGrantType()
Returns the grant type specified in the JWT bearer token request. The grant type value defaults to urn:ietf:params:oauth:grant-type:jwt-bearer.

Signature
public String getGrantType()

Return Value
Type: String

getHttpResponse()
Returns the full System.HttpResponse token response to the JWT bearer token request.

Signature
public System.HttpResponse getHttpResponse()

Return Value
Type: System.HttpResponse

Usage
You can get the access token from the full System.HttpResponse. If you want only the access_token from the token response, you can use getAccessToken instead.

getJWS()
Returns the JWS specified in the JWT bearer token request.

Signature
public Auth.JWS getJWS()

Return Value
Type: Auth.JWS

getTokenEndpoint()
Returns the token endpoint that the JWT bearer token request is POSTed to.
Signature

public String getTokenEndpoint()

Return Value
Type: String

`setGrantType(grantType)`
Sets the grant type in the JWT bearer token request. Returned by the `getGrantType()` method.

Signature

public void setGrantType(String grantType)

Parameters

`grantType`  
Type: String

Return Value
Type: void

`setJWS(jws)`
Sets the JWS in the JWT bearer token request. Returned by the `getJWS()` method.

Signature

public void setJWS(Auth.JWS jws)

Parameters

`jws`  
Type: Auth.JWS

Return Value
Type: void

`setTokenEndpoint(tokenEndpoint)`
Sets the token endpoint that the JWT bearer token request is POSTed to. Returned by the `getTokenEndpoint()` method.

Signature

public void setTokenEndpoint(String tokenEndpoint)
Parameters

tokenEndpoint
  Type: String

Return Value
  Type: void

LightningLoginEligibility Enum

Contains a Lightning Login eligibility value used by the Auth.SessionManagement.getLightningLoginEligibility method.

Usage

If you use the Discovery page type, users can verify themselves with Lightning Login. Lightning Login lets internal users log in with Salesforce Authenticator instead of a password. Certain conditions must be met for Lightning Login to succeed.

Call Auth.SessionManagement.getLightningLoginEligibility before or after a login attempt to get the eligibility status. You can call after a login attempt to determine why the login attempt failed.

Enum Values

The following are the values of the Auth.LightningLoginEligibility enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ELIGIBLE</td>
<td>All eligibility conditions are met. The admin has enabled Salesforce Authenticator and Lightning Login, assigned the user Lightning Login user permission, and selected Allow only for users with the Lightning Login User permission from the Session Settings Setup page. The user has set up Salesforce Authenticator and enrolled in Lightning Login.</td>
</tr>
<tr>
<td>ORG.AUTHENTICATOR_NOT_ENABLED</td>
<td>The admin hasn’t enabled Salesforce Authenticator.</td>
</tr>
<tr>
<td>ORG_PREF_NOT_ENABLED</td>
<td>The admin hasn’t enabled Lightning Login. The Admin must select Allow Lightning Login from the Session Settings Setup page.</td>
</tr>
<tr>
<td>USER.AUTHENTICATOR_NOT_CONNECTED</td>
<td>The user hasn’t set up Salesforce Authenticator.</td>
</tr>
<tr>
<td>USER_NOT_ALLOWED</td>
<td>The admin hasn’t granted the user AllowLightningLogin user permission. Allowing Lightning Login to certain users requires the OnlyLLPermUserAllowed org preference. Admins must select Allow only for users with the Lightning Login User permission from the Session Settings Setup page.</td>
</tr>
<tr>
<td>USER_NOT_ENROLLED</td>
<td>The user hasn’t enrolled in Lightning Login.</td>
</tr>
<tr>
<td>USER_PERM_NOT_ENABLED</td>
<td>The admin hasn’t granted the user the Lightning Login Eligible user permission.</td>
</tr>
</tbody>
</table>
LoginDiscoveryHandler Interface

Salesforce gives you the ability to log in users based on other verification methods than username and password. For example, it can prompt users to log in with their email, phone number, or another identifier like a Federation ID or device identifier. Login Discovery is available to these licenses: Customer Community, Customer Community Plus, External Identity, Partner Community, and Partner Community Plus.

Namespace

Auth

Usage

Implement a Auth/LoginDiscoveryHandler for an interview-based log in. The handler looks up a user from the identifier entered, and can call Site.passwordlessLogin to determine which credential to use, such as email or SMS. Or the handler can redirect a user to a third-party identity provider for login. With this handler, the login page doesn’t show a password field. However, you can use Site.passwordlessLogin to then prompt for a password.

From the user perspective, the user enters an identifier at the log in prompt. Then the user completes the login by entering a PIN or password. Or, if SSO-enabled, the user bypasses login.

For an example, see LoginDiscoveryHandler Example Implementation. For more details, see Salesforce Customer Identity in Salesforce Help.

IN THIS SECTION:

LoginDiscoveryHandler Method
LoginDiscoveryHandler Example Implementation

LoginDiscoveryHandler Method

Here’s the method for LoginDiscoveryHandler.

IN THIS SECTION:

login(identifier, startUrl, requestAttributes)

Log in the customer or partner given the specified identifier, such as email or phone number. If successful, redirect the user to the Experience Cloud site page specified by the start URL.

login(identifier, startUrl, requestAttributes)

Log in the customer or partner given the specified identifier, such as email or phone number. If successful, redirect the user to the Experience Cloud site page specified by the start URL.

Signature

public System.PageReference login(String identifier, String startUrl,
Map<String,String>requestAttributes)
Parameters

**identifier**
- **Type:** String
  - Identifier the customer or partner entered at the login prompt, for example, an email address or phone number.

**startUrl**
- **Type:** String
  - Path to the Experience Cloud site page requested by the customer or partner. The user is redirected to this location after successful login.

**requestAttributes**
- **Type:** Map<String,String>
  - Information about the login request based on the user’s browser state when accessing the login page. requestAttributes passes in the CommunityUrl, IPAddress, UserAgent, Platform, Application, City, Country, and Subdivision values. The City, Country, and Subdivision values come from IP geolocation.

Return Value

- **Type:** System.PageReference
  - The URL of the page where the user is redirected.

Example

Here's a sample requestAttributes response.

```
IpAddress=55.555.0.0
UserAgent=Mozilla/5.0 (Macintosh; Intel Mac OS X 10_13_4) AppleWebKit/605.1.15 (KHTML, like Gecko) Version/11.1 Safari/605.1.15
Platform=Mac OSX
Application=Browser
City=San Mateo
Country=United States
Subdivision=California
```

LoginDiscoveryHandler Example Implementation

This Apex code example implements the Auth.LoginDiscoveryHandler interface. It checks whether the user who is logging in has a verified email or phone number, depending on which identifier was supplied on the login page. If verified, with Auth.VerificationMethod.EMAIL or Auth.VerificationMethod.SMS, we send a challenge to the identifier, either the user's email address or mobile device. If the user enters the code correctly on the verify page, the user is redirected to the Experience Cloud site's page specified by the start URL. If the user isn't verified, the user must enter a password to log in. The handler also checks that the email and phone number are unique with this code: users.size()==1.

**Note:** Passwordless login works only with verified methods. You can check the verification status on the User object, for example, with User list view, a report, or the API. Make sure that your solution handles the case where the user doesn't have a verification method. This code example falls back to a password.

The default discoverable login handler checks whether the user entered a valid email address or phone number before redirecting the user to the verification page. If an invalid entry is made, the handler returns an error. Because this behavior is vulnerable to user enumeration attack, make sure that your solution prevents this attack. For example, you can create a dummy page similar to
the verification page and redirect the user to the dummy page when invalid user identifier is entered. Also, use generic error messages to avoid providing additional information.

The `discoveryResult` function calls the `Site.passwordlessLogin` method to log the user in with the specified verification method. The `getSsoRedirect` function looks up whether the user logs in with SAML or an Auth Provider. Add the implementation-specific logic to handle the lookup.

global class AutocreatedDiscLoginHandler1535377170343 implements Auth.LoginDiscoveryHandler {

    global PageReference login(String identifier, String startUrl, Map<String, String> requestAttributes) {
        if (identifier != null && isValidEmail(identifier)) {
            // Search for user by email.
            List<User> users = [SELECT Id FROM User WHERE Email = :identifier AND IsActive = TRUE];
            if (!users.isEmpty() && users.size() == 1) {
                // User must have a verified email before using this verification method.
                // We cannot send messages to unverified emails.
                // You can check if the user's email verified bit set and add the password verification method as fallback.
                List<TwoFactorMethodsInfo> verifiedInfo = [SELECT HasUserVerifiedEmailAddress FROM TwoFactorMethodsInfo WHERE UserId = :users[0].Id];

Code Example: Filter Login Discovery Users by Profile

Your production org can have multiple users with the same verified email address and mobile number. But your customers must have
unique ones. To address this problem, you can add a few lines of code that filters users by profile to ensure uniqueness. This code example
handles users with the External Identity User profile, but can be adapted to support other use cases. For example, you can modify the
first line of code to address users with other user licenses or criteria.

Login Discovery is available with the following user licenses: Customer Community, Customer Community Plus, External Identity, Partner
Community, and Partner Community Plus. It depends on which profiles have access to your Experience Cloud site.

global class AutocreatedDiscLoginHandler1551301979709 implements Auth.LoginDiscoveryHandler

LoginDiscoveryMethod Enum

Contains methods used to verify the user’s identity when the My Domain login process uses Login Discovery.

Usage

Specifies the verification method used to authenticate internal users when My Domain is set up for Login Discovery.

Enum Values

Auth>LoginDiscoveryMethod enum has the following values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LIGHTNING_LOGIN</td>
<td>Verify identity by Lightning Login, which lets internal users log in with Salesforce Authenticator.</td>
</tr>
<tr>
<td>PASSWORD</td>
<td>Verify identity by entering a password.</td>
</tr>
</tbody>
</table>

MyDomainLoginDiscoveryHandler Interface

The handler used to implement the My Domain Login Discovery page, which is an interview-based (two-step) login process. First the user is prompted for a unique identifier such as an email address or phone number. Then the handler determines (discovers) how to authenticate the user. Either the user enters a password or is directed to an identity provider’s login page.

Namespace

Auth
Usage

Implement `MyDomainLoginDiscoveryHandler` to let My Domain users log in with something other than their username and password. This handler contains the logic to look up the user based on the identifier value entered on the login page. The `Auth.MyDomainLoginDiscoveryHandler.login` method is invoked when the identifier page is submitted and finds the user that corresponds to the submitted identifier. The `Auth.SessionManagement.finishLoginDiscovery` method sends the user to the authentication mechanism and then logs in the user.

Register the handler from the My Domain Setup page. Under Authentication Configuration, select the **Discovery** Login Page Type. For Login Discovery Handler, select this handler from the list of Apex classes.

For an example, see `MyDomainLoginDiscoveryHandler Example Implementation`. For more details, search for My Domain Login Discovery in *Salesforce Help*.

IN THIS SECTION:

- `MyDomainLoginDiscoveryHandler Method`
- `MyDomainLoginDiscoveryHandler Example Implementation`

**MyDomainLoginDiscoveryHandler Method**

`MyDomainLoginDiscoveryHandler` has the following method.

IN THIS SECTION:

- `login(identifier, startUrl, requestAttributes)`

Log in a Salesforce user given the specified identifier, such as email or phone number. If successful, redirect the user to the page specified by the start URL.

**login(identifier, startUrl, requestAttributes)**

Log in a Salesforce user given the specified identifier, such as email or phone number. If successful, redirect the user to the page specified by the start URL.

**Signature**

```java
public System.PageReference login(String identifier, String startUrl, Map<String,String> requestAttributes)
```

**Parameters**

- `identifier`
  - Type: `String`
  - Identifier the Salesforce user entered at the login prompt, for example, an email address or phone number.

- `startUrl`
  - Type: `String`
  - The page users see after successfully logging in to the My Domain subdomain.

- `requestAttributes`
  - Type: `Map <String, String>`
Information about the login request based on the user's browser state when accessing the login page. requestAttributes passes in the MyDomainUrl, IpAddress, UserAgent, Platform, Application, City, Country, and Subdivision values. The City, Country, and Subdivision values come from IP address geolocation.

Return Value
Type: System.PageReference
The URL of the page where the user is redirected to complete authentication.

Example
Here's a sample requestAttributes response.

| CommunityUrl                  | http://my-dev-ed.my.salesforce.com:5555/discover |
| IpAddress                    | 55.255.0.0                                       |
| UserAgent                    | Mozilla/5.0 (Macintosh; Intel Mac OS X 10_13_4) AppleWebKit/605.1.15 (KHTML, like Gecko) Version/11.1 Safari/605.1.15 |
| Platform                     | Mac OSX                                          |
| Application                  | Browser                                          |
| City                         | San Mateo                                        |
| Country                      | United States                                    |
| Subdivision                  | California                                       |

MyDomainLoginDiscoveryHandler Example Implementation
Here's an example of the Auth.MyDomainLoginDiscoveryHandler interface. This sample class contains the default logic for My Domain login discovery using password authentication. You can customize the code to ensure it meets your needs. The requestAttributes parameter provides additional information that you can use in the discovery logic. Attributes include MyDomainUrl, IpAddress, UserAgent, and location information (such as Country and City). Use Auth.DiscoveryCustomErrorException to throw custom errors to display on the login page.

To implement this interface, the My Domain login page type must be set to Discovery.

```java
Option-1
```

// This sample class contains the default logic for My Domain login discovery by password.
// You can customize the code to ensure it meets your needs. The requestAttributes parameter
// provides additional information you can use in the discovery logic. Attributes include MyDomainUrl,
// IpAddress, UserAgent, and location information (such as Country and City).
// Use Auth.DiscoveryCustomErrorException to throw custom errors which will be shown on login page.

global class MyDomainDiscLoginDefaultHandler implements Auth.MyDomainLoginDiscoveryHandler {
    global PageReference login(String identifier, String startUrl, Map<String, String> requestAttributes) { 
        if (identifier != null) {
            // Search for user by email
            List<User> users = [SELECT Id FROM User WHERE Email = :identifier AND IsActive = TRUE];
            if (!users.isEmpty() && users.size() == 1) {
                return discoveryResult(users[0], startUrl, requestAttributes);
            } else {
                throw new Auth.LoginDiscoveryException('No unique user found. User count=' + users.size());
            }
        }
        throw new Auth.LoginDiscoveryException('Invalid Identifier');
    }
}
private PageReference getSsoRedirect(User user, String startUrl, Map<String, String> requestAttributes) {
  // You can lookup if the user should login with SAML or an Auth Provider and return the URL to initialize SSO. For example:
  // SamlSsoConfig SSO = [select Id from SamlSsoConfig where DeveloperName='SamlTest' limit 1];

  // To get the URL for a My Domain subdomain, you can pass null in the communityURL parameter.
  // String ssoUrl = Auth.AuthConfiguration.getSamlSsoUrl(null, startUrl, SSO.Id);
  // return new PageReference(ssoUrl);
  return null;
}

private PageReference discoveryResult(User user, String startUrl, Map<String, String> requestAttributes) {

  PageReference ssoRedirect = getSsoRedirect(user, startUrl, requestAttributes);
  if (ssoRedirect != null) {
    return ssoRedirect;
  } else {
    return Auth.SessionManagement.finishLoginDiscovery(Auth.LoginDiscoveryMethod.password, user.Id);
  }
}

Test Class for MyDomainDiscLoginDefaultHandler Class

The following is the test class for MyDomainDiscoveryLoginHandler. For the test to work, your org must have the My Domain login page type set to Discovery.

// Test class for MyDomainDiscLoginDefaultHandler
@isTest
class MyDomainDiscLoginDefaultHandlerTest {
  /* Test Discoverable handler login.
  Create a user with specific email identifier and invoke login.
  Expected : User should be discovered and pagereference should be returned.
  */
  @isTest static void testLogin() {
    // Create user
    String identifierEmail = getUniqueName() + '@test.org';
    createTestUser(identifierEmail);
    Map<String, String> requestAttributes = new Map<String, String>();
    String startUrl = '';
    MyDomainDiscLoginDefaultHandler myDomainDiscLoginDefaultHandler = new MyDomainDiscLoginDefaultHandler();
    // Invoke login method from handler with the email of user created
    PageReference pageReference = myDomainDiscLoginDefaultHandler.login(identifierEmail, startUrl, requestAttributes);
    // Asser page reference is returned
    System.assertNotEquals(null, pageReference, 'Page reference was not returned');
  }
  /* Test Discoverable handler login with invalid (non-existing) user.
  Expected : Auth.LoginDiscoveryException
  */
  @isTest static void testLoginWithInvalidUser() {
    try {
      Map<String, String> requestAttributes = new Map<String, String>();
      // Create user
      String identifierEmail = getUniqueName() + '@test.org';
      createTestUser(identifierEmail);
      Map<String, String> requestAttributes = new Map<String, String>();
      String startUrl = '';
      MyDomainDiscLoginDefaultHandler myDomainDiscLoginDefaultHandler = new MyDomainDiscLoginDefaultHandler();
      // Invoke login method from handler with the email of user created
      PageReference pageReference = myDomainDiscLoginDefaultHandler.login(identifierEmail, startUrl, requestAttributes);
      // Asser page reference is returned
      System.assertNotEquals(null, pageReference, 'Page reference was not returned');
    } catch (Auth.LoginDiscoveryException exception) {
      System.assertEquals('LoginDiscoveryException', exception.getMessage(), 'Expected Auth.LoginDiscoveryException');
    }
  }
}

137
String startUrl = '';  
String uniqueName = getUniqueName();  
String email = uniqueName + '@test.org';  
MyDomainDiscLoginDefaultHandler myDomainDiscLoginDefaultHandler = new MyDomainDiscLoginDefaultHandler();  
// Invoke login method from handler with non-existing user  
myDomainDiscLoginDefaultHandler.login(email, startUrl, requestAttributes);  
}  
catch (Auth.LoginDiscoveryException loginDiscoveryException) {

    ProfileId = profileID);  
  
  insert tuser;  
}  

OAuthRefreshResult Class

Stores the result of an AuthProviderPluginClass refresh method. OAuth authentication flow provides a refresh token that can be used to get a new access token. Access tokens have a limited lifetime as specified by the session timeout value. When an access token expires, use a refresh token to get a new access token.
Namespace
Auth

Usage

The OAuthRefreshResult class contains the parameters, accessToken, refreshToken, and error, all of which are of type string. For a code example, see .

IN THIS SECTION:

OAuthRefreshResult Constructors
OAuthRefreshResult Properties

OAuthRefreshResult Constructors

The following are constructors for OAuthRefreshResult.

IN THIS SECTION:

OAuthRefreshResult(accessToken, refreshToken, error)
Creates an instance of the OAuthRefreshResult class using the specified access token, refresh token, and error for a custom authentication provider plug-in.

OAuthRefreshResult(accessToken, refreshToken)
Creates an instance of the OAuthRefreshResult class using the specified access token and refresh token for a custom authentication provider plug-in. Use this method when you know that the refresh was successful.

OAuthRefreshResult (accessToken, refreshToken, error)

Creates an instance of the OAuthRefreshResult class using the specified access token, refresh token, and error for a custom authentication provider plug-in.

Signature

class OAuthRefreshResult

public OAuthRefreshResult(String accessToken, String refreshToken, String error)

Parameters

accessToken
Type: String
OAuth access token for the user who is currently logged in.

refreshToken
Type: String
OAuth refresh token for the user who is currently logged in.

error
Type: String
Error that occurred when a user attempted to authenticate with the custom authentication provider.
OAuthRefreshResult(accessToken, refreshToken)

Creates an instance of the OAuthRefreshResult class using the specified access token and refresh token for a custom authentication provider plug-in. Use this method when you know that the refresh was successful.

Signature

public OAuthRefreshResult(String accessToken, String refreshToken)

Parameters

accessToken
Type: String
The OAuth access token for the user who is logged in.

refreshToken
Type: String
The OAuth refresh token for the user who is logged in.

OAuthRefreshResult Properties

The following are properties for OAuthRefreshResult.

IN THIS SECTION:

accessToken
The OAuth access token for the user who is currently logged in.

error
Error that occurs when a user unsuccessfully attempts to authenticate with the custom authentication provider.

refreshToken
The OAuth refresh token for the user who is currently logged in.

accessToken
The OAuth access token for the user who is currently logged in.

Signature

public String accessToken {get; set;}

Property Value

Type: String

error

Error that occurs when a user unsuccessfully attempts to authenticate with the custom authentication provider.
**Signature**

```
public String error {get; set;}
```

**Property Value**

Type: String

**refreshToken**

The OAuth refresh token for the user who is currently logged in.

**Signature**

```
public String refreshToken {get; set;}
```

**Property Value**

Type: String

---

**RegistrationHandler Interface**

Salesforce provides the ability to use an authentication provider, such as Facebook© or Janrain©, for single sign-on into Salesforce.

**Namespace**

Auth

**Usage**

To set up single sign-on, you must create a class that implements `Auth.RegistrationHandler`. Classes implementing the `Auth.RegistrationHandler` interface are specified as the Registration Handler in authentication provider definitions, and enable single sign-on into Salesforce portals and organizations from third-party services such as Facebook. Using information from the authentication providers, your class must perform the logic of creating and updating user data as appropriate, including any associated account and contact records.

**Note:** During the user update process, you can use the `confirmUser()` method to ensure that users are correctly mapped between Salesforce and the third party. For more information, see the ConfirmUserRegistrationHandler Interface.

---

**IN THIS SECTION:**

- RegistrationHandler Methods
- Storing User Information and Getting Access Tokens
- Auth.RegistrationHandler Example Implementation
- Auth.RegistrationHandler Error Example

This example implements the `Auth.RegistrationHandler` interface and shows how to use a custom exception to display an error message in the URL of the page. If you don't use a custom exception, the error code and description appear in the URL and the error description appears on the page.
RegistrationHandler Methods

The following are methods for RegistrationHandler.

IN THIS SECTION:

createUser(portalId, userData)
Returns a User object using the specified portal ID and user information from the third party, such as the username and email address. The User object corresponds to the third party’s user information. It can be a new user that hasn’t been inserted in your org’s database, or it can represent an existing user record in the database. If it’s a new User object, Salesforce inserts a user record for you.

updateUser(userId, portalId, userData)
Updates the specified user’s information. This method is called if the user has logged in before with the authentication provider and then logs in again.

createUser(portalId, userData)
Returns a User object using the specified portal ID and user information from the third party, such as the username and email address. The User object corresponds to the third party’s user information. It can be a new user that hasn’t been inserted in your org’s database, or it can represent an existing user record in the database. If it’s a new User object, Salesforce inserts a user record for you.

Signature

public User createUser(ID portalId, Auth.UserData userData)

Parameters

portalId
Type: ID

userData
Type: Auth.UserData

Return Value

Type: User

Usage

The portalID value can be null or an empty key if there’s no portal configured with this provider.

updateUser(userId, portalId, userData)
Updates the specified user’s information. This method is called if the user has logged in before with the authentication provider and then logs in again.

Signature

public Void updateUser(ID userId, ID portalId, Auth.UserData userData)
Parameters

userId
  Type: ID
portalId
  Type: ID
userData
  Type: Auth.UserData

Return Value
Type: Void

Usage
The portalID value can be null or an empty key if there's no portal configured with this provider.

Storing User Information and Getting Access Tokens

The Auth.UserData class is used to store user information for Auth.RegistrationHandler. The third-party authentication provider can send back a large collection of data about the user, including their username, email address, locale, and so on. Frequently used data is converted into a common format with the Auth.UserData class and sent to the registration handler.

If the registration handler wants to use the rest of the data, the Auth.UserData class has an attributeMap variable. The attribute map is a map of strings (Map<String, String>) for the raw values of all the data from the third party. Because the map is <String, String>, values that the third party returns that aren't strings (like an array of URLs or a map) are converted into an appropriate string representation. The map includes everything returned by the third-party authentication provider, including the items automatically converted into the common format.

The constructor for Auth.UserData has the following syntax:

```java
Auth.UserData(String identifier,
  String firstName,
  String lastName,
  String fullName,
  String email,
  String link,
  String userName,
  String locale,
  String provider,
  String siteLoginUrl,
  Map<String, String> attributeMap)
```

To learn about Auth.UserData properties, see Auth.UserData Class.

⚠️ Note: You can only perform DML operations on additional sObjects in the same transaction with User objects under certain circumstances. For more information, see sObjects That Cannot Be Used Together in DML Operations.

For all authentication providers except Janrain, after a user is authenticated using a provider, the access token associated with that provider for this user can be obtained in Apex using the Auth.AuthToken Apex class. Auth.AuthToken provides two methods to retrieve access tokens. One is `getAccessToken`, which obtains a single access token. Use this method if the user ID is mapped to a single third-party user. If the user ID is mapped to multiple third-party users, use `getAccessTokenMap`, which returns a map
of access tokens for each third-party user. For more information about authentication providers, see Authentication Providers in Salesforce Help.

When using Janrain as an authentication provider, you must use the Janrain `accessCredentials` dictionary values to retrieve the access token or its equivalent. Only some providers supported by Janrain provide an access token, while other providers use other fields. The Janrain `accessCredentials` fields are returned in the `attributeMap` variable of the `Auth.UserData` class. See the Janrain `auth_info` documentation for more information on `accessCredentials`.

![Note: Not all Janrain account types return `accessCredentials`. Sometimes you must change your account type to receive the information.](image)

To learn about the `AuthToken` methods, see `AuthToken Class`.

**Auth.RegistrationHandler Example Implementation**

This example implements the `Auth.RegistrationHandler` interface that creates as well as updates a standard user based on data provided by the authentication provider. Error checking has been omitted to keep the example simple.

```apex
global class StandardUserRegistrationHandler implements Auth.RegistrationHandler{
    global User createUser(Id portalId, Auth.UserData data){
        User u = new User();
        Profile p = [SELECT Id FROM profile WHERE name='Standard User'];
        u.username = data.username + '@salesforce.com';
        u.email = data.email;
        u.lastName = data.lastName;
        u.firstName = data.firstName;
        String alias = data.username;
        if(alias.length() > 8) {
            alias = alias.substring(0, 8);
        }
        u.alias = alias;
        u.languageLocaleKey = data.attributeMap.get('language');
        u.localeSidKey = data.locale;
        u.emailEncodingKey = 'UTF-8';
        u.timeZoneSidKey = 'America/Los_Angeles';
        u.profileId = p.Id;
        return u;
    }

    global void updateUser(Id userId, Id portalId, Auth.UserData data){
        User u = new User(id=userId);
        u.username = data.username + '@salesforce.com';
        u.email = data.email;
        u.lastName = data.lastName;
        u.firstName = data.firstName;
        String alias = data.username;
        if(alias.length() > 8) {
            alias = alias.substring(0, 8);
        }
        u.alias = alias;
        u.languageLocaleKey = data.attributeMap.get('language');
        u.localeSidKey = data.locale;
        update(u);
    }
}
```
The following example tests the above code.

```java
@isTest
private class StandardUserRegistrationHandlerTest {
    static testMethod void testCreateAndUpdateUser() {
        StandardUserRegistrationHandler handler = new StandardUserRegistrationHandler();
        Auth.UserData sampleData = new Auth.UserData('testId', 'testFirst', 'testLast', 'testFirst testLast', 'testuser@example.org', null, 'testuserlong', 'en_US', 'facebook', null, new Map<String, String>{'language' => 'en_US'});
        User u = handler.createUser(null, sampleData);
        System.assertEquals('testuserlong@salesforce.com', u.userName);
        System.assertEquals('testuser@example.org', u.email);
        System.assertEquals('testLast', u.lastName);
        System.assertEquals('testFirst', u.firstName);
        System.assertEquals('testuser', u.alias);
        insert(u);
        String uid = u.id;

        sampleData = new Auth.UserData('testNewId', 'testNewFirst', 'testNewLast', 'testNewFirst testNewLast', 'testnewuser@example.org', null, 'testnewuserlong', 'en_US', 'facebook', null, new Map<String, String>{});
        handler.updateUser(uid, null, sampleData);
        User updatedUser = [SELECT userName, email, firstName, lastName, alias FROM user WHERE id=:uid];
        System.assertEquals('testnewuserlong@salesforce.com', updatedUser.userName);
        System.assertEquals('testnewuser@example.org', updatedUser.email);
        System.assertEquals('testNewLast', updatedUser.lastName);
        System.assertEquals('testNewFirst', updatedUser.firstName);
        System.assertEquals('testnewu', updatedUser.alias);
    }
}
```

**Auth.RegistrationHandler Error Example**

This example implements the `Auth.RegistrationHandler` interface and shows how to use a custom exception to display an error message in the URL of the page. If you don’t use a custom exception, the error code and description appear in the URL and the error description appears on the page.

To limit this example to the custom exception, some code was omitted.

```java
global class RegHandler implements Auth.RegistrationHandler {
    class RegHandlerException extends Exception {

        global User createUser(Id portalId, Auth.UserData data){
            List<Profile> profiles = [SELECT Id, Name, UserType FROM Profile WHERE Name = 'Power User'];
            Profile profile = profiles.isEmpty() ? null : profiles[0];
            if(profile==null)
                throw new RegHandlerException('Cannot find the profile. For help, contact your administrator.');</n        }
    }
```
global void updateUser(Id userId, Id portalId, Auth.UserData data){
    User u = new User(id=userId);
    u.lastName = data.lastName;
    u.firstName = data.firstName;
    update(u);
}

SamlJitHandler Interface
Use this interface to control and customize Just-in-Time user provisioning logic during SAML single sign-on.

Namespace
Auth

Usage
To use custom logic for user provisioning during SAML single sign-on, you must create a class that implements Auth.SamlJitHandler. This allows you to incorporate organization-specific logic (such as populating custom fields) when users log in to Salesforce with single sign-on. Keep in mind that your class must perform the logic of creating and updating user data as appropriate, including any associated account and contact records.

In Salesforce, you specify your class that implements this interface in the SAML JIT Handler field in SAML Single Sign-On Settings. Make sure that the user you specify to run the class has "Manage Users" permission.

IN THIS SECTION:
   SamlJitHandler Methods
   SamlJitHandler Example Implementation

SamlJitHandler Methods
The following are methods for SamlJitHandler.

IN THIS SECTION:
   createUser(samlSsoProviderId, communityId, portalId, federationId, attributes, assertion)
   Returns a User object using the specified Federation ID. The User object corresponds to the user information. This object can be a new user that hasn’t been inserted in the database or an existing user record in the database.

   updateUser(userId, samlSsoProviderId, communityId, portalId, federationId, attributes, assertion)
   Updates the specified user’s information. This method is called if the user has logged in before with SAML single sign-on and then logs in again, or if your application is using the Existing User Linking URL.
**createUser**(*samlSsoProviderId*, *communityId*, *portalId*, *federationId*, *attributes*, *assertion*)

Returns a User object using the specified Federation ID. The User object corresponds to the user information. This object can be a new user that hasn’t been inserted in the database or an existing user record in the database.

**Signature**

```java
public User createUser(Id samlSsoProviderId, Id communityId, Id portalId, String federationId, Map<String,String> attributes, String assertion)
```

**Parameters**

- **samlSsoProviderId**
  - Type: Id
  - The ID of the SamlSsoConfig standard object.

- **communityId**
  - Type: Id
  - The ID of the Experience Cloud site. This parameter can be `null` if you’re not creating an Experience Cloud user.

- **portalId**
  - Type: Id
  - The ID of the portal. This parameter can be `null` if you’re not creating a portal user.

- **federationId**
  - Type: String
  - The ID Salesforce expects to be used for this user.

- **attributes**
  - Type: `Map<String,String>`
  - All attributes in the SAML assertion that were added to the default assertion; for example, custom attributes. Attributes are case-sensitive.
  - If the assertion is encrypted, the attribute map contains a decrypted assertion stored as a value with the key `Sfdc.SamlAssertion`.

- **assertion**
  - Type: String
  - The default SAML assertion, base-64 encoded.
  - If the assertion is encrypted, this parameter is also encrypted. To access the decrypted assertion, see the `Sfdc.SamlAssertion` key in the attribute map.

**Return Value**

- Type: User
- A User sObject.
Usage

The `communityId` and `portalId` parameter values can be `null` or the associated keys can be empty if there's no Experience Cloud site or portal configured with this organization.

**updateUser(userId, samlSsoProviderId, communityId, portalId, federationId, attributes, assertion)**

Updates the specified user's information. This method is called if the user has logged in before with SAML single sign-on and then logs in again, or if your application is using the Existing User Linking URL.

Signature

```java
public void updateUser(Id userId, Id samlSsoProviderId, Id communityId, Id portalId,
String federationId, Map<String,String> attributes, String assertion)
```

Parameters

- `userId`
  Type: `Id`
  The ID of the Salesforce user.

- `samlSsoProviderId`
  Type: `Id`
  The ID of the SamlSsoConfig object.

- `communityId`
  Type: `Id`
  The ID of the Experience Cloud site. This type can be `null` if you're not updating an Experience Cloud user.

- `portalId`
  Type: `Id`
  The ID of the portal. This type can be `null` if you're not updating a portal user.

- `federationId`
  Type: `String`
  The ID Salesforce expects to be used for this user.

- `attributes`
  Type: `Map<String,String>`
  All attributes in the SAML assertion that were added to the default assertion; for example, custom attributes. Attributes are case-sensitive.
  If the assertion is encrypted, the attribute map also contains a decrypted assertion stored as a value with the key `Sfdc.SamlAssertion`.

- `assertion`
  Type: `String`
  The default SAML assertion, base-64 encoded.
  If the assertion is encrypted, this parameter is also encrypted. To access the decrypted assertion, see the `Sfdc.SamlAssertion` key in the attribute map.
SamlJitHandler Example Implementation

This is an example implementation of the Auth.SamlJitHandler interface. This code uses private methods to handle accounts and contacts (handleContact() and handleAccount()), which aren’t included in this example.

global class StandardUserHandler implements Auth.SamlJitHandler {
    private class JitException extends Exception{}
    private void handleUser(boolean create, User u, Map<String, String> attributes,
                            String federationIdentifier, boolean isStandard) {
        if(create && attributes.containsKey('User.Username')) {
            u.Username = attributes.get('User.Username');
        }
        if(create) {
            if(attributes.containsKey('User.FederationIdentifier')) {
                u.FederationIdentifier = attributes.get('User.FederationIdentifier');
            } else {
                u.FederationIdentifier = federationIdentifier;
            }
        }
        if(attributes.containsKey('User.ProfileId')) {
            String profileId = attributes.get('User.ProfileId');
            Profile p = [SELECT Id FROM Profile WHERE Id=:profileId];
            u.ProfileId = p.Id;
        }
        if(attributes.containsKey('User.UserRoleId')) {
            String userRole = attributes.get('User.UserRoleId');
            UserRole r = [SELECT Id FROM UserRole WHERE Id=:userRole];
            u.UserRoleId = r.Id;
        }
        if(attributes.containsKey('User.Phone')) {
            u.Phone = attributes.get('User.Phone');
        }
        if(attributes.containsKey('User.Email')) {
            u.Email = attributes.get('User.Email');
        }
    }
    private void handleJit(boolean create, User u, Id samlSsoProviderId, Id communityId,
                           Id portalId,
                           String federationIdentifier, Map<String, String> attributes, String assertion) {
        if(communityId != null || portalId != null) {
            String account = handleAccount(create, u, attributes);
            //More attributes here - removed for length
            //Handle custom fields here
            if(!create) {
                update(u);
            }
        }
    }
}
handleContact(create, account, u, attributes);
handleUser(create, u, attributes, federationIdentifier, false);
} else {
    handleUser(create, u, attributes, federationIdentifier, true);
}
}

global User createUser(Id samlSsoProviderId, Id communityId, Id portalId, String federationIdentifier, Map<String, String> attributes, String assertion) {
    User u = new User();
    handleJit(true, u, samlSsoProviderId, communityId, portalId, federationIdentifier, attributes, assertion);
    return u;
}

global void updateUser(Id userId, Id samlSsoProviderId, Id communityId, Id portalId, String federationIdentifier, Map<String, String> attributes, String assertion) {
    User u = [SELECT Id FROM User WHERE Id=:userId];
    handleJit(false, u, samlSsoProviderId, communityId, portalId, federationIdentifier, attributes, assertion);
}

# SessionManagement Class

Contains methods for verifying users’ identity, creating custom login flows, customizing security levels, and defining trusted IP ranges for a current session.

## Namespace

Auth

## SessionManagement Methods

The following are methods for SessionManagement. All methods are static. Use these methods to customize your user identity verification flows, manage the use of time-based one-time password (TOTP) apps like Google Authenticator, or create custom login flows. Other methods validate a user’s incoming IP address against trusted IP range settings for an organization or profile.

### IN THIS SECTION:

- finishLoginDiscovery(method, userId)
  Finishes the My Domain Login Discovery login process.
- finishLoginFlow()
  Finish the Visualforce Page login flow process, and redirect the user to the default home page.
- finishLoginFlow(startUrl)
  Finish the Visualforce Page login flow process, and redirect the user to the specified start URL.
generateVerificationUrl(policy, description, destinationUrl)
Initiates a user identity verification flow with the verification method that the user registered with, and returns a URL to the identity verification screen. For example, if you have a custom Visualforce page that displays sensitive account details, you can prompt the user to verify identity before viewing it.

generateVerificationUrl

getCurrentSession()
Returns a map of attributes for the current session.

generateVerificationUrl

getLightningLoginEligibility(userId)
Returns the eligibility status for a user who’s logging in with Lightning Login when you set up your org with My Domain and use the Login Discovery page type. Use this method to redirect the user to a custom login flow. For example, use after a login attempt to redirect the user to password flow if the user is ineligible for Lightning Login.

generateVerificationUrl

getQrCode()
Returns a map containing a URL to a quick response (QR) code and a time-based one-time password (TOTP) shared secret to configure authenticator apps or devices for multi-factor authentication (MFA).

generateVerificationUrl

getRequiredSessionLevelForProfile(profileId)
Indicates the required login security session level for the given profile.

generateVerificationUrl

ignoreForConcurrentSessionLimit(sessions)
This method is reserved for internal Salesforce use.

generateVerificationUrl

inOrgNetworkRange(ipAddress)
Indicates whether the given IP address is within the organization’s trusted IP range according to the organization’s Network Access settings.

generateVerificationUrl

isIpAllowedForProfile(profileId, ipAddress)
Indicates whether the given IP address is within the trusted IP range for the given profile.

generateVerificationUrl

setSessionLevel(level)
Sets the user’s current session security level.

generateVerificationUrl

validateTotpTokenForKey(sharedKey, totpCode)
Deprecated. Use validateTotpTokenForKey(totpSharedKey, totpCode, description) instead.

generateVerificationUrl

validateTotpTokenForUser(totpCode)
Deprecated. Use validateTotpTokenForUser(totpCode, description) instead.

generateVerificationUrl

validateTotpTokenForUser(totpCode, description)
Indicates whether a time-based one-time password (TOTP) code (token) is valid for the current user.

generateVerificationUrl

verifyDeviceFlow(userId, startUrl)
Verifies the user code entered during the device authentication flow and redirects users to the OAuth approval page. If users aren’t logged in, they must log in. After successful login, users are prompted to allow the device to access Salesforce data.

generateVerificationUrl

finishLoginDiscovery(method, userId)
Finishes the My Domain Login Discovery login process.
Signature

```java
public static System.PageReference finishLoginDiscovery(Auth.LoginDiscoveryMethod method, Id userId)
```

Parameters

```java
method
Type: Auth.LoginDiscoveryMethod LoginDiscoveryMethod Enum
Verification method used with My Domain Login Discovery.
```

```java
userId
Type: Id
ID used to log in the user. The user must be active.
```

Return Value

Type: System.PageReference

Usage

Include this method when implementing the `MyDomainLoginDiscoveryHandler` interface to direct users to an authentication mechanism, and then log them in. If users enter a username in the login page, they are sent to the password page for authentication. If users are enrolled in Lightning Login, they are directed to the Salesforce Authenticator to authenticate. If users are SSO-enabled, they are sent to the suitable identity provider (IdP) to authenticate.

The calling user requires Manage Users permission. If the user passed in is frozen or inactive, the method throws an exception.

After implementing the `MyDomainLoginDiscoveryHandler` interface, register the Login Discovery handler from the My Domain Setup page. Under Authentication Configuration, select this handler from the list of Apex classes.

### finishLoginFlow()

Finish the Visualforce Page login flow process, and redirect the user to the default home page.

Signature

```java
public static System.PageReference finishLoginFlow()
```

Return Value

Type: System.PageReference

Usage

Include this method in the Apex controller of the Visualforce Page login flow when creating login flows programmatically. This method indicates that the login flow is finished and redirects the user to the Experience Cloud site’s default home page. The login process runs in a restricted session until users complete the process. Calling this method indicates that the login flow is complete, lifts the restriction, and gives users full access to the Experience Cloud site.
**finishLoginFlow(startUrl)**

Finish the Visualforce Page login flow process, and redirect the user to the specified start URL.

**Signature**

```java
public static System.PageReference finishLoginFlow(String startUrl)
```

**Parameters**

- `startUrl`
  - Type: String
  - Path to the page that users see when they access the Experience Cloud site.

**Return Value**

- Type: `System.PageReference`

**Usage**

Include this method in the Apex controller of the Visualforce Page login flow when creating login flows programmatically. This method indicates that the login flow is finished and redirects the user to the specified location in the Experience Cloud site. The login process runs in a restricted session until users complete the process. Calling this method indicates that the login flow is complete, lifts the restriction, and gives users full access to the Experience Cloud site.

**generateVerificationUrl(policy, description, destinationUrl)**

Initiates a user identity verification flow with the verification method that the user registered with, and returns a URL to the identity verification screen. For example, if you have a custom Visualforce page that displays sensitive account details, you can prompt the user to verify identity before viewing it.

**Signature**

```java
public static String generateVerificationUrl(Auth.VerificationPolicy policy, String description, String destinationUrl)
```

**Parameters**

- `policy`
  - Type: `Auth.VerificationPolicy`
  - The session security policy required to initiate identity verification for the user’s session. For example, if the policy is set to High Assurance level of session security, and the user’s current session has the standard level of session security, the user’s session is raised to high assurance after successful verification of identity. In the Setup user interface, this value is shown in the Triggered By column of Identity Verification History.

- `description`
  - Type: String
  - The custom description that describes the activity requiring identity verification; for example, “Complete purchase and check out”. This text appears to users when they verify their identity in Salesforce and, if they use Salesforce Authenticator version 2 or later, in
the Salesforce Authenticator mobile app. In addition, in the Setup user interface, this text is shown in the Activity Message column of Identity Verification History.

**destinationUrl**

Type: **String**

The relative or absolute Salesforce URL that you want to redirect the user to after identity verification—for example, /apex/mypage. The user is redirected to `destinationUrl` when the identity verification flow is complete, regardless of success. For example, if a user chooses to not respond to the identity challenge and cancels it, the user is still redirected to `destinationUrl`. As a best practice, ensure that your code for this page manually checks that the security policy was satisfied (and the user didn’t just manually type the URL in the browser). For example, if the `policy` is High Assurance, the target page checks that the user’s session is high assurance before allowing access.

**Return Value**

Type: **String**

The URL where the user is redirected to verify identity.

**Usage**

- If the user is already registered to confirm identity using a time-based one-time password (TOTP), then the user is redirected to the one-time password identity verification flow and asked to provide a code.
- If the user isn’t registered with any verification method (such as one-time password or Salesforce Authenticator version 2 or later), the user is prompted to download and verify identity using Salesforce Authenticator. The user can also choose a different verification method.

**getcurrentSession()**

Returns a map of attributes for the current session.

**Signature**

```java
public static Map<String, String> getCurrentSession()
```

**Return Value**

Type: **Map<String, String>**

**Usage**

The map includes a `ParentId` value, which is the 18-character ID for the parent session, if one exists (for example, if the current session is for a canvas app). If the current session doesn’t have a parent, this value is null. The map also includes the `LogoutUrl` assigned to the current session.

If you create an Apex test method that calls this method, the test fails with an error such as, “Unexpected Exception: Current session unavailable.” An error occurs because there isn’t a session in the context through which the test is being run.

When a session is reused, Salesforce updates the `LoginHistoryId` with the value from the most recent login.
The following example shows the name-value pairs in a map returned by `getCurrentSession()`. Note that `UsersId` includes an "s" in the name to match the name of the corresponding field in the AuthSession object.

```java
{
    SessionId=0Ak###############,
    UserType=Standard,
    ParentId=0Ak###############,
    NumSecondsValid=7200,
    LoginType=SAML Idp Initiated SSO,
    LoginDomain=null,
    LoginHistoryId=0Ya###############,
    Username=user@domain.com,

}
```

`getLightningLoginEligibility(userId)`

Returns the eligibility status for a user who’s logging in with Lightning Login when you set up your org with My Domain and use the Login Discovery page type. Use this method to redirect the user to a custom login flow. For example, use after a login attempt to redirect the user to password flow if the user is ineligible for Lightning Login.

**Signature**

```java
public static Auth.LightningLoginEligibility getLightningLoginEligibility(Id userId)
```

**Parameters**

- `userId`
  - Type: `Id`
  - ID of the user who is logging in.

**Return Value**

- Type: `Auth.LightningLoginEligibility`
  - Returns the current eligibility status.

**Example**

```java
Auth.LightningLoginEligibility eligibility = Auth.SessionManagement.getLightningLoginEligibility(id);
if (eligibility == Auth.LightningLoginEligibility.ELIGIBLE) {
    // success
}
```
**getQrCode()**

Returns a map containing a URL to a quick response (QR) code and a time-based one-time password (TOTP) shared secret to configure authenticator apps or devices for multi-factor authentication (MFA).

**Signature**

```java
public static Map<String, String> getQrCode()
```

**Return Value**

Type: `Map<String, String>`

**Usage**

The QR code encodes the returned secret as well as the current user's username. The keys are `qrCodeUrl` and `secret`. Calling this method does not change any state for the user, nor does it read any state from the user. This method returns a brand new secret every time it is called, does not save that secret anywhere, and does not validate the TOTP token. The admin must explicitly save the values for the user after verifying a TOTP token with the secret.

The secret is a base32-encoded string of a 20-byte shared key.

**Example**

The following is an example of how to request the QR code.

```java
public String getGetQRCode() {
    return getQrCode();
}
public String getQRCode() {
    Map<String, String> codeResult = Auth.SessionManagement.getQrCode();
    String result = 'URL: ' + codeResult.get('qrCodeUrl') + ' SECRRT: ' + codeResult.get('secret');
    return result;
}
```

The following is an example of a returned map.

```json
{qrCodeUrl=https://www.salesforce.com/secur/qrCode?w=200&h=200&t=tf&u=user%0000000000.com&s=AAAAA7B5BBBB5AAAAAAA66BBBB,
secret=AAAAA7B5AAAAAA5BBBBBBBB66AAA}
```

**getRequiredSessionLevelForProfile(profileId)**

Indicates the required login security session level for the given profile.

**Signature**

```java
public static Auth.SessionLevel getRequiredSessionLevelForProfile(String profileId)
```

**Parameters**

- `profileId`
  
  Type: `String`
The 15-character profile ID.

Return Value
Type: Auth.SessionLevel
The session security level required at login for the profile with the ID profileId. You can customize the assignment of each level in Session Settings. For example, you can set the High Assurance level to apply only to users who authenticated with multi-factor authentication (MFA) or through a specific identity provider.

ignoreForConcurrentSessionLimit(sessions)
This method is reserved for internal Salesforce use.

Signature
public static Map<String, String> ignoreForConcurrentSessionLimit(Object sessions)

Parameters
sessions
Type: Object

Return Value
Type: Map<String, String>

inOrgNetworkRange(ipAddress)
Indicates whether the given IP address is within the organization's trusted IP range according to the organization's Network Access settings.

Signature
public static Boolean inOrgNetworkRange(String ipAddress)

Parameters
ipAddress
Type: String
The IP address to validate.

Return Value
Type: Boolean

Usage
If a trusted IP range is not defined, this returns false, and throws an exception if the IP address is not valid.
<table>
<thead>
<tr>
<th>Trusted IP Range Exists?</th>
<th>User is in the Trusted IP Range?</th>
<th>Return Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>true</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>false</td>
</tr>
<tr>
<td>No</td>
<td>N/A</td>
<td>false</td>
</tr>
</tbody>
</table>

**isIpAllowedForProfile(profileId, ipAddress)**

Indicates whether the given IP address is within the trusted IP range for the given profile.

**Signature**

```java
public static Boolean isIpAllowedForProfile(String profileId, String ipAddress)
```

**Parameters**

- **profileId**
  - Type: `String`
  - The 15-character alphanumeric string for the current user’s profile ID.

- **ipAddress**
  - Type: `String`
  - The IP address to validate.

**Return Value**

Type: `Boolean`

**Usage**

If a trusted IP range is not defined, this returns `true`, and throws an exception if the IP address is not valid or if the profile ID is not valid.

<table>
<thead>
<tr>
<th>Trusted IP Range Exists?</th>
<th>User is in the Trusted IP Range?</th>
<th>Return Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>true</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>false</td>
</tr>
<tr>
<td>No</td>
<td>N/A</td>
<td>true</td>
</tr>
</tbody>
</table>

**setSessionLevel(level)**

Sets the user’s current session security level.

**Signature**

```java
public static Void setSessionLevel(Auth.SessionLevel level)
```
Parameters

level
Type: Auth.SessionLevel

The session security level to assign to the user. The meaning of each level can be customized in the Session Settings for each organization, such as setting the High Assurance level to apply only to users who authenticated with multi-factor authentication (MFA) or through a specific identity provider.

Return Value

Type: Void

Usage

This setting affects the session level of all sessions associated with the current session, such as Visualforce or UI access.

If you create an Apex test method that calls this method, the test fails with an error such as, "Unexpected Exception: Current session unavailable." An error occurs because there isn’t a session in the context through which the test is being run.

Example

The following is an example class for setting the session level.

```apex
public class RaiseSessionLevel{
    public void setLevelHigh() {
        Auth.SessionManagement.setSessionLevel(Auth.SessionLevel.HIGH_ASSURANCE);
    }
    public void setLevelStandard() {
        Auth.SessionManagement.setSessionLevel(Auth.SessionLevel.STANDARD);
    }
}
```

validateTotpTokenForKey(sharedKey, totpCode)

Deprecated. Use validateTotpTokenForKey(totpSharedKey, totpCode, description) instead.

Signature

public static Boolean validateTotpTokenForKey(String sharedKey, String totpCode)

Parameters

sharedKey
Type: String

The shared (secret) key. The sharedKey must be a base32-encoded string of a 20-byte shared key.

totpCode
Type: String

The time-based one-time password (TOTP) code to validate.
Return Value
Type: Boolean

Usage
If the key is invalid or doesn’t exist, this method throws an invalid parameter value exception or a no data found exception, respectively. If the current user exceeds the maximum of 10 token validation attempts, this method throws a security exception.

**validateTotpTokenForKey(totpSharedKey, totpCode, description)**
Indicates whether a time-based one-time password (TOTP) code (token) is valid for the given shared key.

**Signature**

```java
public static Boolean validateTotpTokenForKey(String totpSharedKey, String totpCode, String description)
```

**Parameters**

totpSharedKey
Type: String
The shared (secret) key. The `totpSharedKey` must be a base32-encoded string of a 20-byte shared key.

totpCode
Type: String
The time-based one-time password (TOTP) code to validate.

description
Type: String
The custom description that describes the activity requiring identity verification; for example, “Complete purchase and check out”. In the Setup user interface, this text is shown in the Activity Message column of Identity Verification History. The `description` must be 128 characters or fewer. If you provide a value that’s longer, it’s truncated to 128 characters.

Return Value
Type: Boolean

Usage
If the key is invalid or doesn’t exist, this method throws an invalid parameter value exception or a no data found exception, respectively. If the current user exceeds the maximum of 10 token validation attempts, this method throws a security exception.

**validateTotpTokenForUser(totpCode)**
Deprecated. Use `validateTotpTokenForUser(totpCode, description)` instead.

**Signature**

```java
public static Boolean validateTotpTokenForUser(String totpCode)
```
Parameters

totpCode
  Type: String
  The time-based one-time password (TOTP) code to validate.

Return Value
Type: Boolean

Usage
If the current user does not have a TOTP code, this method throws an exception. If the current user has attempted too many validations, this method throws an exception.

`validateTotpTokenForUser(totpCode, description)`
Indicates whether a time-based one-time password (TOTP) code (token) is valid for the current user.

Signature
`public static Boolean validateTotpTokenForUser(String totpCode, String description)`

Parameters

totpCode
  Type: String
  The time-based one-time password (TOTP) code to validate.
description
  Type: String
  The custom description that describes the activity requiring identity verification; for example, “Complete purchase and check out”. This text appears to users when they verify their identity in Salesforce and, if they use Salesforce Authenticator version 2 or later, in the Salesforce Authenticator mobile app. In addition, in the Setup user interface, this text is shown in the Activity Message column of Identity Verification History. The `description` must be 128 characters or fewer. If you provide a value that’s longer, it’s truncated to 128 characters.

Return Value
Type: Boolean

Usage
If the current user does not have a TOTP code, or if the current user has attempted too many validations, this method throws an exception.

`verifyDeviceFlow(userCode, startUrl)`
Verifies the user code entered during the device authentication flow and redirects users to the OAuth approval page. If users aren’t logged in, they must log in. After successful login, users are prompted to allow the device to access Salesforce data.
Signature

```java
public static System.PageReference verifyDeviceFlow(String userCode, String startUrl)
```

Parameters

**userCode**
- Type: String
- Human-readable user code provided to the user by Salesforce. The user must enter this code at the verification URL to approve device access to Salesforce data.

**startURL**
- Type: String
- The URL for the page that the user is redirected to after successful login and approval of the device to access Salesforce data. If you don’t specify a start URL, the user is redirected to the Home page.

Return Value

Type: `System.PageReference`

Usage

Include this method in the Apex controller when creating a custom Visualforce User Code Verification page for the OAuth 2.0 device authentication flow. This method verifies the user code, prompts the user to log in as needed, and prompts the user to allow the device access to Salesforce data. Upon successful verification and authentication, the user is redirected to the page defined by the start URL.

SessionLevel Enum

An `Auth.SessionLevel` enum value is used by the `SessionManagement.setSessionLevel` method.

Namespace

`Auth`

Enum Values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOW</td>
<td>The user’s security level for the current session meets the lowest requirements.</td>
</tr>
<tr>
<td>STANDARD</td>
<td>The user’s security level for the current session meets the Standard requirements set in the current organization Session Security Levels.</td>
</tr>
<tr>
<td>HIGH_ASSURANCE</td>
<td>The user’s security level for the current session meets the High Assurance requirements set in the current organization Session Security Levels.</td>
</tr>
</tbody>
</table>

Note: This low level is not available, nor used, in the Salesforce UI. User sessions through the Salesforce UI are either standard or high assurance. You can set this level using the API, but users assigned this level will experience unpredictable and reduced functionality in their Salesforce organization.
Usage

With session-level security, you control user access to features that support it, such as connected apps and reporting. For example, you can customize an organization’s Session Settings to require users to log in with multi-factor authentication (MFA) to get a High Assurance session. Then, you can restrict access to a specific connected app by requiring a High Assurance session level in the settings for the connected app.

UserData Class

Stores user information for Auth.RegistrationHandler.

Namespace

Auth

IN THIS SECTION:

UserData Constructors

UserData Properties

UserData Constructors

The following are constructors for UserData.

IN THIS SECTION:

UserData(identifier, firstName, lastName, fullName, email, link, userName, locale, provider, siteLoginUrl, attributeMap)

Creates a new instance of the Auth.UserData class using the specified arguments.

Signature

public UserData(String identifier, String firstName, String lastName, String fullName, String email, String link, String userName, String locale, String provider, String siteLoginUrl, Map<String,String> attributeMap)

Parameters

identifier

Type: String

An identifier from the third party for the authenticated user, such as the Facebook user number or the Salesforce user ID.

firstName

Type: String

The first name of the authenticated user, according to the third party.
lastName
Type: String
The last name of the authenticated user, according to the third party.

fullName
Type: String
The full name of the authenticated user, according to the third party.

email
Type: String
The email address of the authenticated user, according to the third party.

link
Type: String
A stable link for the authenticated user such as https://www.facebook.com/MyUsername.

userName
Type: String
The username of the authenticated user in the third party.

locale
Type: String
The standard locale string for the authenticated user.

provider
Type: String
The service used to log in, such as Facebook or Janrain.

siteLoginUrl
Type: String
The site login page URL passed in if used with a site; null otherwise.

attributeMap
Type: Map<String, String>
A map of data from the third party, in case the handler has to access non-standard values. For example, when using Janrain as a provider, the fields Janrain returns in its accessCredentials dictionary are placed into the attributeMap. These fields vary by provider.

UserData Properties
The following are properties for UserData.

IN THIS SECTION:

identifier
An identifier from the third party for the authenticated user, such as the Facebook user number or the Salesforce user ID.

firstName
The first name of the authenticated user, according to the third party.

lastName
The last name of the authenticated user, according to the third party.
fullName
The full name of the authenticated user, according to the third party.

e-mail
The email address of the authenticated user, according to the third party.

link
A stable link for the authenticated user such as https://www.facebook.com/MyUsername.

username
The username of the authenticated user in the third party.

locale
The standard locale string for the authenticated user.

derector
The service used to log in, such as Facebook or Janrain.

siteLoginUrl
The site login page URL passed in if used with a site; null otherwise.

attributeMap
A map of data from the third party, in case the handler has to access non-standard values. For example, when using Janrain as a provider, the fields Janrain returns in its accessCredentials dictionary are placed into the attributeMap. These fields vary by provider.

**identifier**
An identifier from the third party for the authenticated user, such as the Facebook user number or the Salesforce user ID.

**Signature**
```java
public String identifier {get; set;}
```

**Property Value**
Type: String

**firstName**
The first name of the authenticated user, according to the third party.

**Signature**
```java
public String firstName {get; set;}
```

**Property Value**
Type: String

**lastName**
The last name of the authenticated user, according to the third party.
Signature

public String lastName {get; set;}

Property Value
Type: String

**fullName**
The full name of the authenticated user, according to the third party.

Signature

public String fullName {get; set;}

Property Value
Type: String

**email**
The email address of the authenticated user, according to the third party.

Signature

public String email {get; set;}

Property Value
Type: String

**link**
A stable link for the authenticated user such as https://www.facebook.com/MyUsername.

Signature

public String link {get; set;}

Property Value
Type: String

**username**
The username of the authenticated user in the third party.

Signature

public String username {get; set;}

166
Property Value
Type: String

locale
The standard locale string for the authenticated user.

Signature
public String locale {get; set;}

Property Value
Type: String

provider
The service used to log in, such as Facebook or Janrain.

Signature
public String provider {get; set;}

Property Value
Type: String

siteLoginUrl
The site login page URL passed in if used with a site; null otherwise.

Signature
public String siteLoginUrl {get; set;}

Property Value
Type: String

attributeMap
A map of data from the third party, in case the handler has to access non-standard values. For example, when using Janrain as a provider, the fields Janrain returns in its accessCredentials dictionary are placed into the attributeMap. These fields vary by provider.

Signature
public Map<String, String> attributeMap {get; set;}
Property Value
Type: Map<String, String>

VerificationMethod Enum

Contains the different ways users can identify themselves when logging in. You can use it to implement mobile-centric passwordless login pages and to self-register (and deregister) verification methods.

Usage

The enum value is an argument in `System.Site.passwordlessLogin`, `System.UserManagement.registerVerificationMethod`, and `System.UserManagement.deregisterVerificationMethod` on page 3563 methods. The value indicates the method used to verify a user’s identity.

Enum Values

The following are the values of the `Auth.VerificationMethod` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILT_IN_AUTHENTICATOR</td>
<td>Identity verified with a built-in authenticator.</td>
</tr>
<tr>
<td>EMAIL</td>
<td>Identity verified with a verification code sent in an email message.</td>
</tr>
<tr>
<td>PASSWORD</td>
<td>Identity verified with a password.</td>
</tr>
<tr>
<td>SALESFORCE_AUTHENTICATOR</td>
<td>Identity verified by Salesforce Authenticator.</td>
</tr>
<tr>
<td>SECURITY_KEY</td>
<td>Identity verified by a WebAuthn-compatible physical security key. Includes all security keys registered or used after Summer ’22.</td>
</tr>
<tr>
<td>SMS</td>
<td>Identity verified with a verification code sent via SMS message.</td>
</tr>
<tr>
<td>TOTP</td>
<td>Identity verified with a time-based one-time password (TOTP).</td>
</tr>
<tr>
<td>U2F</td>
<td>Identity verified by a U2F physical security key, such as a YubiKey.</td>
</tr>
</tbody>
</table>

Note: For U2F security keys registered or used after Summer ’22, use SECURITY_KEY instead.

VerificationPolicy Enum

The `Auth.VerificationPolicy` enum contains an identity verification policy value used by the `SessionManagement.generateVerificationUrl` method.

Usage

The enum value is an argument in the `SessionManagement.generateVerificationUrl` method. The value indicates the session security policy required to initiate identity verification for the user’s session.
Enum Values

The Auth.VerificationPolicy enum has this value.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HIGH_ASSURANCE</td>
<td>The security level for the user’s current session must be High Assurance.</td>
</tr>
</tbody>
</table>

VerificationResult Class

Contains the result of a verification challenge that you invoke when you create your own Verify page. The challenge can be initiated by either the System.UserManagement.verifyPasswordlessLogin or System.UserManagement.verifySelfRegistration method.

Namespace

Auth

Usage

When users sign up for or log in to your Experience Cloud site with an email address or phone number, Salesforce sends them a verification code. At the same time, Salesforce generates the Verify page for users to enter the code to verify their identity. You can replace the Salesforce-generated Verify page with one that you create with Visualforce. Then invoke the verification challenge and, if the verification code is entered correctly, log in the user. For sign-up, you use the System.UserManagement.verifySelfRegistration method. For passwordless login, you use the System.UserManagement.verifyPasswordlessLogin method. The methods return the verification result, which contains the message displayed as a result of the challenge. This message also indicates whether the challenge is successful and where to direct the user when the verification code is entered correctly.

Example

This code contains the result of a verification challenge that registers a new user.

```java
String id = System.UserManagement.initSelfRegistration
            (Auth.VerificationMethod.SMS, user);
    Auth.VerificationResult res = System.UserManagement.verifySelfRegistration
            (Auth.VerificationMethod.SMS, id, '123456', null);
    if(res.success == true){
        //redirect
    }
```

IN THIS SECTION:

  - VerificationResult Constructor
  - VerificationResult Properties
  - VerificationResult Method

VerificationResult Constructor

VerificationResult has the following constructor.
IN THIS SECTION:

VerificationResult(redirect, success, message)

Creates an instance of the VerificationResult class that contains the verification result from System.UserManagement.verifySelfRegistration.

VerificationResult(redirect, success, message)

Creates an instance of the VerificationResult class that contains the verification result from System.UserManagement.verifySelfRegistration.

Signature

public VerificationResult(System.PageReference redirect, Boolean success, String message)

Parameters

redirect
Type: System.PageReference
Where user is directed upon successful verification.

success
Type: Boolean
Indicates whether verification succeeded.

message
Type: String
Message that displays as a result of a verification challenge.

VerificationResult Properties

The following are properties for VerificationResult.

IN THIS SECTION:

message
Message that displays as a result of a verification challenge. SUCCESS if the identity verification is successful. Other values are FAILURE, PENDING, RATE_LIMITED, or FAILURE_REPORT.

redirect
Where the user is directed after entering the verification code successfully, for example, the Experience Cloud site’s home page or location specified by the start URL.

success
The verification challenge is successful.

message
Message that displays as a result of a verification challenge. SUCCESS if the identity verification is successful. Other values are FAILURE, PENDING, RATE_LIMITED, or FAILURE_REPORT.
Signature
public String message {get; set;}

Property Value
Type: String

redirect
Where the user is directed after entering the verification code successfully, for example, the Experience Cloud site's home page or location specified by the start URL.

Signature
public System.PageReference redirect {get; set;}

Property Value
Type: System.PageReference

success
The verification challenge is successful.

Signature
public Boolean success {get; set;}

Property Value
Type: Boolean

VerificationResult Method
VerificationResult has the following method.

IN THIS SECTION:
  clone()
  Duplicates the Auth.VerificationResult object.

clone()
Duplicates the Auth.VerificationResult object.

Signature
public Object clone()
## Return Value

Type: VerificationResult

## Auth Exceptions

The `Auth` namespace contains some exception classes.

All exception classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions.

The `Auth` namespace contains the following exception.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auth.AuthProviderPluginException</td>
<td>Throw this exception to indicate that an error occurred when using the auth provider plug-in. Use to display a custom error message to the user. To get the error message and write it to debug log, use the <code>String</code> <code>getMessage()</code> method.</td>
</tr>
<tr>
<td>Auth.ConnectedAppPluginException</td>
<td>Throw this exception to indicate that an error occurred while running the custom behavior for a connected app. To get the error message and write it to debug log, use the <code>String</code> <code>getMessage()</code> method.</td>
</tr>
<tr>
<td>Auth.DiscoveryCustomErrorException</td>
<td>Throw this exception to customize error messages that appear on Discovery logins and Configurable Self-Registration pages. An error message can have up to 200 characters. Use custom error exceptions to localize error messages. Include this exception in:</td>
</tr>
<tr>
<td></td>
<td>• Auth.MyDomainLoginDiscoveryHandler to show a custom error message on the My Domain login page</td>
</tr>
<tr>
<td></td>
<td>• Auth.LoginDiscoveryHandler to show an error message on the Experience Cloud site login page</td>
</tr>
<tr>
<td></td>
<td>• Auth.ConfigurableSelfRegHandler to show an error message on the Experience Cloud site self-registration Verify page</td>
</tr>
<tr>
<td></td>
<td>The Verify page shows up if you configured self-registration with either an Email or Text Message verification method. If you didn’t set up sign-up with a verification method, the error message appears on the self-registration page.</td>
</tr>
<tr>
<td></td>
<td>To get the error message and write it to debug log, use the <code>String</code> <code>getMessage()</code> method.</td>
</tr>
<tr>
<td>Auth.JWTBearerTokenExchange.JWTBearerTokenExchangeException</td>
<td>Throw this exception to indicate a problem with the response from the token endpoint in the JWTBearerTokenExchange class. This exception occurs during the OAuth 2.0 JWT bearer token flow when the HTTP response:</td>
</tr>
<tr>
<td></td>
<td>• Fails to return an access token</td>
</tr>
<tr>
<td></td>
<td>• Isn’t in JSON format</td>
</tr>
<tr>
<td></td>
<td>• Returns a response code other than a 200 “OK” success code</td>
</tr>
<tr>
<td></td>
<td>To get the error message and write it to debug log, use the <code>String</code> <code>getMessage()</code> method.</td>
</tr>
<tr>
<td>Auth&gt;LoginDiscoveryException</td>
<td>Throw this exception to indicate that an error occurred when executing the Login Discovery handler. For an example, see LoginDiscoveryHandler Example Implementation. To get the error message and write it to debug log, use the <code>String</code> <code>getMessage()</code> method.</td>
</tr>
</tbody>
</table>
**Exception**  
**Description**  

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
</table>
| Auth.VerificationException | Throw this exception to trigger verification based on the passed-in policy. You can throw this exception in an Apex trigger or Visualforce controller. The system automatically sends you to the verification endpoint, if possible.  

**Note:** You can't catch this exception. The exception immediately triggers the verification.  

---

**Examples**

This example uses Auth.ProviderPluginException to throw a custom exception in a custom authentication provider implementation. Use this exception if you want the end user to see a specific message, passing in the error message as a parameter. If you use another exception, users see a standard Salesforce error message.

```apex
global override Auth.OAuthRefreshResult refresh(Map<string,string> authProviderConfiguration, String refreshToken)
{
    HttpRequest req = new HttpRequest();
    String accessToken = null;
    String error = null;
    try {
        // DEVELOPER TODO: Make a refresh token flow using refreshToken passed in as an argument to get the new access token
        // accessToken = ...
    } catch (System.CalloutException e) {
        error = e.getMessage();
    }
    catch(Exception e) {
        error = e.getMessage();
        throw new Auth.AuthProviderPluginException('My custom error');
    }

    return new Auth.OAuthRefreshResult(accessToken,refreshToken, error);
}
```

This example uses Auth.VerificationException to trigger verification if a user attempts to create an account without a high assurance session.

```apex
trigger testTrigger on Account (before insert) {
    Map<String, String> sessionMap = auth.SessionManagement.getCurrentSession();
    if(!sessionMap.get('SessionSecurityLevel').equals('HIGH_ASSURANCE')) {
        throw new Auth.VerificationException(
            Auth.VerificationPolicy.HIGH_ASSURANCE, 'Insert Account');
    }
}
```

---

**Cache Namespace**

The Cache namespace contains methods for managing the platform cache.

The following are the classes in the Cache namespace.
IN THIS SECTION:

CacheBuilder Interface
An interface for safely retrieving and removing values from a session or org cache. Use the interface to generate a value that you want to store in the cache. The interface checks for cache misses, which means you no longer need to check for null cache values yourself.

Org Class
Use the Cache.Org class to add, retrieve, and manage values in the org cache. Unlike the session cache, the org cache is not tied to any session and is available to the organization across requests and to all users.

OrgPartition Class
Contains methods to manage cache values in the org cache of a specific partition. Unlike the session cache, the org cache is not tied to any session. It’s available to the organization across requests and to all users.

Partition Class
Base class of Cache.OrgPartition and Cache.SessionPartition. Use the subclasses to manage the cache partition for org caches and session caches.

Session Class
Use the Cache.Session class to add, retrieve, and manage values in the session cache. The session cache is active as long as the user’s Salesforce session is valid (the user is logged in, and the session is not expired).

SessionPartition Class
Contains methods to manage cache values in the session cache of a specific partition.

Cache Exceptions
The Cache namespace contains exception classes.

Visibility Enum
Use the Cache.Visibility enumeration in the Cache.Session or Cache.Org methods to indicate whether a cached value is visible only in the value’s namespace or in all namespaces.

SEE ALSO:

Apex Developer Guide: Platform Cache

CacheBuilder Interface
An interface for safely retrieving and removing values from a session or org cache. Use the interface to generate a value that you want to store in the cache. The interface checks for cache misses, which means you no longer need to check for null cache values yourself.

Namespace
Cache

SEE ALSO:

Apex Developer Guide: Safely Cache Values with the CacheBuilder Interface
CacheBuilder Methods

The following are methods for CacheBuilder.

IN THIS SECTION:

\[doLoad(var)\]
Contains the logic that builds a cached value. You don’t call this method directly. Instead, it’s called indirectly when you reference the class that implements the CacheBuilder interface.

\[doLoad(var)\]
Contains the logic that builds a cached value. You don’t call this method directly. Instead, it’s called indirectly when you reference the class that implements the CacheBuilder interface.

Signature

```
public Object doLoad(String var)
```

Parameters

\[var\]
Type: String

A case-sensitive string value used to build a cached value. This parameter is also used as part of the unique key that identifies the cached value.

Return Value

Type: Object

The value that was cached. Cast the return value to the appropriate type.

CacheBuilder Example Implementation

This example creates a class called UserInfoCache that implements the CacheBuilder interface. The class caches the results of a SOQL query run against the User object.

```
class UserInfoCache implements Cache.CacheBuilder {
    public Object doLoad(String userid) {
        User u = (User)[SELECT Id, IsActive, username FROM User WHERE id =: userid];
        return u;
    }
}
```

This example gets a cached User record based on a user ID. If the value exists in the org cache, it is returned. If the value doesn’t exist, the doLoad(String var) method is re-executed, and the new value is cached and returned.

```
User batman = (User) Cache.Org.get(UserInfoCache.class, '00541000000ek4c');
```
Org Class

Use the Cache.Org class to add, retrieve, and manage values in the org cache. Unlike the session cache, the org cache is not tied to any session and is available to the organization across requests and to all users.

Namespace

Cache

Usage

Cache Key Format

This table lists the format of the key parameter that some methods in this class take, such as put, get, and contains.

<table>
<thead>
<tr>
<th>Key Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace.partition.key</td>
<td>Fully qualified key name.</td>
</tr>
<tr>
<td>key</td>
<td>Refers to a partition marked as default when the namespace.partition prefix is omitted.</td>
</tr>
<tr>
<td>local.partition.key</td>
<td>Use the local prefix to refer to the org’s namespace when the org doesn’t have a namespace defined. If the org has a namespace defined, the local prefix also refers to that org’s namespace.</td>
</tr>
</tbody>
</table>

Note:

- If no default partition is specified in the org, calling a cache method without fully qualifying the key name causes a Cache.Org.OrgCacheException to be thrown.
- The local prefix in an installed managed package refers to the namespace of the subscriber org and not the package’s namespace. The cache put calls aren’t allowed in a partition that the invoking class doesn’t own.

Example

This class is the controller for a sample Visualforce page (shown in the subsequent code sample). The cached values are initially added to the cache by the init() method, which the Visualforce page invokes when it loads through the action attribute. The cache keys don’t contain the namespace.partition prefix. They all refer to the default partition in your org. To run this sample, create a partition and mark it as default.

The Visualforce page contains four output components. These components call get methods on the controller that returns the following values from the cache: a date, data based on the MyData inner class, a counter, a text value, and a list. The size of the list is also returned.

The Visualforce page also contains two buttons. The Rerender button invokes the go() method on the controller. This method increases the values of the counter and the custom data in the cache. When you click Rerender, the two counters increase by one each time. The go() method retrieves the values of these counters from the cache, increments their values by one, and stores them again in the cache.

The Remove datetime Key button deletes the date-time value (with key datetime) from the cache. As a result, the value next to Cached datetime: is cleared on the page.
public class OrgCacheController {

    // Inner class.
    // Used as the data type of a cache value.
    class MyData {
        public String value { get; set; }
        public Integer counter { get; set; }

        public MyData(String value) {
            this.value = value;
            this.counter = 0;
        }

        public void inc() {
            counter++;
        }

        override public String toString() {
            return this.value + ':' + this.counter;
        }
    }

    // Apex List.
    // Used as the data type of a cached value.
    private List<String> numbers =
        new List<String> { 'ONE', 'TWO', 'THREE', 'FOUR', 'FIVE' };

    // Constructor of the controller for the Visualforce page.
    public OrgCacheController() {
    }

    // Adds various values to the cache.
    // This method is called when the Visualforce page loads.
    public void init() {
        // All key values are not qualified by the namespace.partition
        // prefix because they use the default partition.

        // Add counter to the cache with initial value of 0
        // or increment it if it's already there.
        if (!Cache.Org.contains('counter')) {
            Cache.Org.put('counter', 0);
        } else {
            Cache.Org.put('counter', getCounter() + 1);
        }

        // Add the datetime value to the cache only if it's not already there.
        if (!Cache.Org.contains('datetime')) {
            DateTime dt = DateTime.now();
            Cache.Org.put('datetime', dt);
        }
    }
}
// Add the custom data to the cache only if it's not already there.
if (!Cache.Org.contains('data')) {
    Cache.Org.put('data', new MyData('Some custom value'));
}

// Add a list of number to the cache if not already there.
if (!Cache.Org.contains('list')) {
    Cache.Org.put('list', numbers);
}

// Add a string value to the cache if not already there.
if (!Cache.Org.contains('output')) {
    Cache.Org.put('output', 'Cached text value');
}

// Return counter from the cache.
public Integer getCounter() {
    return (Integer)Cache.Org.get('counter');
}

// Return datetime value from the cache.
public String getCachedDatetime() {
    DateTime dt = (DateTime)Cache.Org.get('datetime');
    return dt != null ? dt.format() : null;
}

// Return cached value whose type is the inner class MyData.
public String getCachedData() {
    MyData mydata = (MyData)Cache.Org.get('data');
    return mydata != null ? mydata.toString() : null;
}

// Return output from the cache.
public String getOutput() {
    return (String)Cache.Org.get('output');
}

// Return list from the cache.
public List<String> getList() {
    return (List<String>)Cache.Org.get('list');
}

// Method invoked by the Rerender button on the Visualforce page.
// Updates the values of various cached values.
// Increases the values of counter and the MyData counter if those
// cache values are still in the cache.
public PageReference go() {
    // Increase the cached counter value or set it to 0
    // if it's not cached.
    if (Cache.Org.contains('counter')) {
        Cache.Org.put('counter', getCounter() + 1);
    } else {
        Cache.Org.put('counter', 0);
    }
}
Get the custom data value from the cache.
MyData d = (MyData)Cache.Org.get('data');
// Only if the data is already in the cache, update it.
if (Cache.Org.contains('data')) {
    d.inc();
    Cache.Org.put('data', d);
}
return null;

// Method invoked by the Remove button on the Visualforce page.
// Removes the datetime cached value from the org cache.
public PageReference remove() {
    Cache.Org.remove('datetime');
    return null;
}

This is the Visualforce page that corresponds to the OrgCacheController class.

This is the output of the page after clicking the Rerender button twice. The counter value could differ in your case if a key named counter was already in the cache before running this sample.

Cached datetime: 8/11/2015 1:58 PM
Cached data: Some custom value: 2
Cached counter: 2
Output: Cached text value
Repeat: ONE TWO THREE FOUR FIVE
List size: 5
IN THIS SECTION:

Org Constants

The Org class provides a constant that you can use when setting the time-to-live (TTL) value.

Org Methods

SEE ALSO:

*Apex Developer Guide: Platform Cache*

### Org Constants

The Org class provides a constant that you can use when setting the time-to-live (TTL) value.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX_TTL_SECS</td>
<td>Represents the maximum amount of time, in seconds, to keep the cached value in the org cache.</td>
</tr>
</tbody>
</table>

### Org Methods

The following are methods for `Org`. All methods are static.

IN THIS SECTION:

- `contains(key)`
  Returns `true` if the org cache contains a cached value corresponding to the specified key.
- `contains(keys)`
  Returns `true` if the org cache contains values for the specified key entries.
- `contains(setOfKeys)`
  Returns `true` if the org cache contains values for a specified set of keys.
- `get(key)`
  Returns the cached value corresponding to the specified key from the org cache.
- `get(cacheBuilder, key)`
  Returns the cached value corresponding to the specified key from the org cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.
- `get(keys)`
  Returns the cached values corresponding to the specified set of keys from the org cache.
- `getAvgGetSize()`
  Returns the average item size of all the keys fetched from the org cache, in bytes.
- `getAvgGetTime()`
  Returns the average time taken to get a key from the org cache, in nanoseconds.
- `getAvgValueSize()`

*Deprecated and available only in API versions 49.0 and earlier.* Returns the average item size for keys in the org cache, in bytes.
getCapacity()
Returns the percentage of org cache capacity that has been used.

getKeys()
Returns a set of all keys that are stored in the org cache and visible to the invoking namespace.

getMaxGetSize()
Returns the maximum item size of all the keys fetched from the org cache, in bytes.

getMaxGetTime()
Returns the maximum time taken to get a key from the org cache, in nanoseconds.

getMaxValueSize()
Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the org cache, in bytes.

getMissRate()
Returns the miss rate in the org cache.

getName()
Returns the name of the default cache partition.

getNumKeys()
Returns the total number of keys in the org cache.

getPartition(partitionName)
Returns a partition from the org cache that corresponds to the specified partition name.

put(key, value)
Stores the specified key/value pair as a cached entry in the org cache. The put method can write only to the cache in your org’s namespace.

put(key, value, visibility)
Stores the specified key/value pair as a cached entry in the org cache and sets the cached value’s visibility.

put(key, value, ttlSecs)
Stores the specified key/value pair as a cached entry in the org cache and sets the cached value’s lifetime.

put(key, value, ttlSecs, visibility, immutable)
Stores the specified key/value pair as a cached entry in the org cache. This method also sets the cached value’s lifetime, visibility, and whether it can be overwritten by another namespace.

remove(key)
Deletes the cached value corresponding to the specified key from the org cache.

remove(cacheBuilder, key)
Deletes the cached value corresponding to the specified key from the org cache. Use this method if your cached value is a class that implements the CacheBuilder interface.

contains(key)
Returns true if the org cache contains a cached value corresponding to the specified key.

Signature

public static Boolean contains(String key)
Parameters
key
  Type: String
  A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

Return Value
Type: Boolean
true if a cache entry is found. Otherwise, false.

contains(keys)
Returns true if the org cache contains values for the specified key entries.

Signature
public static List<Boolean> contains(List<String> keys)

Parameters
keys
  Type: List<String>
  A list of keys that identifies cached values. For information about the format of the key name, see Usage.

Return Value
Type: List<Boolean>
true if the key entries are found. Otherwise, false.

contains(setOfKeys)
Returns true if the org cache contains values for a specified set of keys.

Signature
public static Map<String, Boolean> contains(Set<String> keys)

Parameters
setOfKeys
  Type: Set<String>
  A set of keys that uniquely identifies cached values. For information about the format of the key name, see Usage.

Return Value
Type: Map<String, Boolean>
Returns the cache key and corresponding Boolean value indicating that the key entry exists. The Boolean value is false if the key entry doesn't exist.
Usage
The number of input keys cannot exceed the maximum limit of 10.

Example
In this example, the code checks for the presence of multiple keys on the default partition. It fetches the cache key and the corresponding Boolean value for the key entry from the org cache of the default partition.

```apex
Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Map<String,Boolean> result = Cache.Org.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('Is Key Present in the cache : ' + result.get(key));
}
```

In this example, the code checks for the presence of multiple keys on different partitions. It fetches the cache key and the corresponding Boolean value for the key entry from the org cache of different partitions.

```apex
// Assuming there are three partitions p1, p2, p3 with default 'local' namespace
Set<String> keys = new Set<String>{'local.p1.key','local.p2.key','local.p3.key'};
Map<String,Boolean> result = Cache.Org.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('Is Key Present in the cache : ' + result.get(key));
}
```

get (key)
Returns the cached value corresponding to the specified key from the org cache.

Signature
```
public static Object get(String key)
```

Parameters
```
key
Type: String
A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.
```

Return Value
Type: Object
The cached value as a generic object type. Cast the returned value to the appropriate type.

Usage
Because Cache.Org.get() returns an object, cast the returned value to a specific type to facilitate use of the returned value.

```apex
// Get a cached value
Object obj = Cache.Org.get('ns1.partition1.orderDate');
```
Cast return value to a specific data type

```java
DateTime dt2 = (DateTime)obj;
```

If a `Cache.Org.get()` call doesn’t find the referenced key, it returns `null`.

**get(cacheBuilder, key)**

Returns the cached value corresponding to the specified key from the org cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

**Signature**

```java
public static Object get(System.Type cacheBuilder, String key)
```

**Parameters**

- **cacheBuilder**
  - Type: `System.Type`
  - The Apex class that implements the `CacheBuilder` interface.

- **key**
  - Type: `String`
  - A case-sensitive string value that, combined with the class name corresponding to the `cacheBuilder` parameter, uniquely identifies a cached value.

**Return Value**

- Type: `Object`
  - The cached value as a generic object type. Cast the returned value to the appropriate type.

**Usage**

Because `Cache.Org.get(cacheBuilder, key)` returns an object, cast the returned value to a specific type to facilitate use of the returned value.

```java
return ((DateTime)Cache.Org.get(DateCache.class, 'datetime')).format();
```

**get(keys)**

Returns the cached values corresponding to the specified set of keys from the org cache.

**Signature**

```java
public static Map<String, Object> get(Set<String> keys)
```

**Parameters**

- **keys**
  - Type: `Set<String>`
A set of keys that uniquely identify cached values. For information about the format of the key name, see Usage.

Return Value
Type: Map <String, Object>
Returns the cache key and corresponding value. Returns null when no corresponding value is found for an input key.

Usage
The number of input keys cannot exceed the maximum limit of 10.

Examples
Fetch multiple keys from the org cache of the default partition.

```java
Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Map<String, Object> result = Cache.Org.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' + result.get(key));
}
```

Fetch multiple keys from the org cache of different partitions.

```java
// Assuming there are three partitions p1, p2, p3 with default 'local' namespace
Set<String> keys = new Set<String>{'local.p1.key','local.p2.key', 'local.p3.key'};
Map<String, Object> result = Cache.Org.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' + result.get(key));
}
```

getAvgGetSize()
Returns the average item size of all the keys fetched from the org cache, in bytes.

Signature
```
public static Long getAvgGetSize()
```

Return Value
Type: Long

Example
In this example the following keys and their corresponding value sizes are inserted. The code then fetches the keys: key 1, key 2, key 3 and key 4 and returns the average item size of the fetched keys.

<table>
<thead>
<tr>
<th>Key</th>
<th>Key Value Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>key 1</td>
<td>42</td>
</tr>
</tbody>
</table>
// Inserting keys key1, key2, key3, key4, key5
Cache.Org.put('key1', 'value1');
Cache.Org.put('key2', 'value2');
Cache.Org.put('key3', 'this is a big value !!!');
Cache.Org.put('key4', 4);
Cache.Org.put('key5', 5);

// Fetching keys - key1, key2, key3, key4
Object v1 = Cache.Org.get('key1');
Object v2 = Cache.Org.get('key2');
Object v3 = Cache.Org.get('key3');
Object v4 = Cache.Org.get('key4');

// Fetching average get size
Long val = Cache.Org.getAvgGetSize();
// Avg item size returned is 44 (average of 42(key1), 42(key2), 58(key3) and 36(key4)
// keys that were fetched)
System.debug('Avg Get Size :' + val);

getAvgGetTime()
Returns the average time taken to get a key from the org cache, in nanoseconds.

Signature
public static Long getAvgGetTime()

Return Value
Type: Long

getAvgValueSize()
Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the org cache, in bytes.

Signature
public static Long getAvgValueSize()
Return Value
Type: Long

getCapacity()
Returns the percentage of org cache capacity that has been used.

Signature
public static Double getCapacity()

Return Value
Type: Double
Used cache as a percentage number.

getKeys()
Returns a set of all keys that are stored in the org cache and visible to the invoking namespace.

Signature
public static Set<String> getKeys()

Return Value
Type: Set<String>
A set containing all cache keys.

getMaxGetSize()
Returns the maximum item size of all the keys fetched from the org cache, in bytes.

Signature
public static Long getMaxGetSize()

Return Value
Type: Long

Example
In this example the following keys and their corresponding value sizes are inserted. The code fetches the keys: key 1, key 2 and key 4 and returns the maximum key value size from the fetched keys.

<table>
<thead>
<tr>
<th>Key</th>
<th>Key Value Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>key 1</td>
<td>42</td>
</tr>
</tbody>
</table>
### getMaxSizeGetTime

Returns the maximum time taken to get a key from the org cache, in nanoseconds.

**Signature**

```java
public static Long getMaxGetTime()
```

**Return Value**

Type: `Long`

### getMaxValueSize

Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the org cache, in bytes.

**Signature**

```java
public static Long getMaxValueSize()
```

**Return Value**

Type: `Long`
getMissRate()  
Returns the miss rate in the org cache.

Signature  
public static Double getMissRate()  

Return Value  
Type: Double

getName()  
Returns the name of the default cache partition.

Signature  
public String getName()  

Return Value  
Type: String  
The name of the default cache partition.

getNumKeys()  
Returns the total number of keys in the org cache.

Signature  
public static Long getNumKeys()  

Return Value  
Type: Long

getPartition(partitionName)  
Returns a partition from the org cache that corresponds to the specified partition name.

Signature  
public static cache.OrgPartition getPartition(String partitionName)  

Parameters  
partitionName  
Type: String  
A partition name that is qualified by the namespace, for example, namespace.partition.
Return Value
Type: Cache.OrgPartition

Example
After you get the org partition, you can add and retrieve the partition’s cache values.

```java
// Get partition
// Retrieve cache value from the partition
if (orgPart.contains('BookTitle')) {
    String cachedTitle = (String)orgPart.get('BookTitle');
}
// Add cache value to the partition
orgPart.put('OrderDate', Date.today());
// Or use dot notation to call partition methods
String cachedAuthor = (String)Cache.Org.getPartition('myNs.myPartition').get('BookAuthor');
```

**put(key, value)**
Stores the specified key/value pair as a cached entry in the org cache. The `put` method can write only to the cache in your org’s namespace.

**Signature**
```java
public static void put(String key, Object value)
```

**Parameters**
- **key**
  - Type: String
    - A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.
- **value**
  - Type: Object
    - The value to store in the cache. The cached value must be serializable.

**Return Value**
Type: void

**put(key, value, visibility)**
Stores the specified key/value pair as a cached entry in the org cache and sets the cached value’s visibility.

**Signature**
```java
public static void put(String key, Object value, Cache.Visibility visibility)
```
Parameters

key
Type: String
A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

value
Type: Object
The value to store in the cache. The cached value must be serializable.

visibility
Type: Cache.Visibility
Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

Return Value
Type: void

put(key, value, ttlSecs)
Stores the specified key/value pair as a cached entry in the org cache and sets the cached value’s lifetime.

Signature

public static void put(String key, Object value, Integer ttlSecs)

Parameters

key
Type: String
A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

ttlSecs
Type: Integer
The amount of time, in seconds, to keep the cached value in the org cache. The maximum is 172,800 seconds (48 hours). The minimum value is 300 seconds or 5 minutes. The default value is 86,400 seconds (24 hours).

Return Value
Type: void

put(key, value, ttlSecs, visibility, immutable)
Stores the specified key/value pair as a cached entry in the org cache. This method also sets the cached value’s lifetime, visibility, and whether it can be overwritten by another namespace.
public static void put(String key, Object value, Integer ttlSecs, cache.Visibility visibility, Boolean immutable)

Parameters

key
Type: String
A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

value
Type: Object
The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer
The amount of time, in seconds, to keep the cached value in the org cache. The maximum is 172,800 seconds (48 hours). The minimum value is 300 seconds or 5 minutes. The default value is 86,400 seconds (24 hours).

visibility
Type: Cache.Visibility
Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

immutable
Type: Boolean
Indicates whether the cached value can be overwritten by another namespace (false) or not (true).

Return Value
Type: void

remove(key)
Deletes the cached value corresponding to the specified key from the org cache.

public static Boolean remove(String key)

Parameters

key
Type: String
A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

Return Value
Type: Boolean
true if the cache value was successfully removed. Otherwise, false.
**remove(cacheBuilder, key)**

Deletes the cached value corresponding to the specified key from the org cache. Use this method if your cached value is a class that implements the CacheBuilder interface.

**Signature**

```java
public static Boolean remove(System.Type cacheBuilder, String key)
```

**Parameters**

*cacheBuilder*

Type: `System.Type`

The Apex class that implements the CacheBuilder interface.

*key*

Type: `String`

A case-sensitive string value that, combined with the class name corresponding to the `cacheBuilder` parameter, uniquely identifies a cached value.

**Return Value**

Type: `Boolean`

`true` if the cache value was successfully removed. Otherwise, `false`.

**OrgPartition Class**

Contains methods to manage cache values in the org cache of a specific partition. Unlike the session cache, the org cache is not tied to any session. It’s available to the organization across requests and to all users.

**Namespace**

`Cache`

**Usage**

This class extends `Cache.Partition` and inherits all its non-static methods. Utility methods for creating and validating keys aren’t supported and can be called only from the `Cache.Partition` parent class. For a list of `Cache.Partition` methods, see `Partition Methods`.

To get an org partition, call `Cache.Org.getPartition` and pass in a fully qualified partition name, as follows.

```java
```

See `Cache Key Format for Partition Methods`.

**Example**

This class is the controller for a sample Visualforce page (shown in the subsequent code sample). The controller shows how to use the methods of `Cache.OrgPartition` to manage a cache value on a particular partition. The controller takes inputs from the Visualforce page for the partition name, key name for a counter, and initial counter value. The controller contains default values for these inputs.
When you click **Rerender** on the Visualforce page, the `go()` method is invoked and increases the counter by one. When you click **Remove Key**, the counter key is removed from the cache. The counter value gets reset to its initial value when it’s re-added to the cache.

**Note:** If another user logs in and runs this sample, the user gets the cache values that were last added or updated by the previous user. For example, if the counter value was five, the next user sees the counter value as increased to six.

```java
public class OrgPartitionController {

    // Name of a partition
    String partitionInput = 'local.myPartition';

    // Name of the key
    String counterKeyInput = 'counter';

    // Key initial value
    Integer counterInitValue = 0;

    // Org partition object
    Cache.OrgPartition orgPartition;

    // Constructor of the controller for the Visualforce page.
    public OrgPartitionController() {
    }

    // Adds counter value to the cache.
    // This method is called when the Visualforce page loads.
    public void init() {
        // Create the partition instance based on the partition name
        orgPartition = getPartition();

        // Create the partition instance based on the partition name
        // given in the Visualforce page or the default value.
        orgPartition = Cache.Org.getPartition(partitionInput);

        // Add counter to the cache with an initial value
        // or increment it if it’s already there.
        if (!orgPartition.contains(counterKeyInput)) {
            orgPartition.put(counterKeyInput, counterInitValue);
        } else {
            orgPartition.put(counterKeyInput, getCounter() + 1);
        }
    }

    // Returns the org partition based on the partition name
    // given in the Visualforce page or the default value.
    private Cache.OrgPartition getPartition() {
        if (orgPartition == null) {
            orgPartition = Cache.Org.getPartition(partitionInput);
        }

        return orgPartition;
    }

    // Return counter from the cache.
    public Integer getCounter() {
        return (Integer)getPartition().get(counterKeyInput);
    }
}
```
// Invoked by the Submit button to save input values supplied by the user.
public PageReference save() {
    // Reset the initial key value in the cache
    getPartition().put(counterKeyInput, counterInitValue);

    return null;
}

// Method invoked by the Rerender button on the Visualforce page. Updates the values of various cached values.
// Increases the values of counter and the MyData counter if those cache values are still in the cache.
public PageReference go() {
    // Get the org partition object
    orgPartition = getPartition();
    // Increase the cached counter value or set it to 0 if it's not cached.
    if (orgPartition.contains(counterKeyInput)) {
        orgPartition.put(counterKeyInput, getCounter() + 1);
    } else {
        orgPartition.put(counterKeyInput, counterInitValue);
    }

    return null;
}

// Method invoked by the Remove button on the Visualforce page. Removes the datetime cached value from the org cache.
public PageReference remove() {
    getPartition().remove(counterKeyInput);

    return null;
}

// Get and set methods for accessing variables that correspond to the input text fields on the Visualforce page.
public String getPartitionInput() {
    return partitionInput;
}

public String getCounterKeyInput() {
    return counterKeyInput;
}

public Integer getCounterInitValue() {
    return counterInitValue;
}

public void setPartitionInput(String partition) {
    this.partitionInput = partition;
}
This is the Visualforce page that corresponds to the `OrgPartitionController` class.

```apex
public void setCounterKeyInput(String keyName) {
    this.counterKeyInput = keyName;
}

public void setCounterInitValue(Integer counterValue) {
    this.counterInitValue = counterValue;
}
```

### Partition Class

Base class of `Cache.OrgPartition` and `Cache.SessionPartition`. Use the subclasses to manage the cache partition for org caches and session caches.

### Namespace

* Cache
Cache Key Format for Partition Methods

After you obtain the partition object (an instance of Cache.OrgPartition or Cache.SessionPartition), the methods to add, retrieve, and manage the cache values in a partition take the key name. The key name that you supply to these methods (get(), put(), remove(), and contains()) doesn't include the namespace.partition prefix.

OrgPartition Class
SessionPartition Class
Apex Developer Guide: Platform Cache

Partition Methods

The following are methods for Partition.

IN THIS SECTION:
contains(key)  
Returns true if the cache partition contains a cached value corresponding to the specified key.
contains(setOfKeys)  
Returns true if the cache partition contains values for a specified set of keys.
createFullyQualifiedKey(namespace, partition, key)  
Generates a fully qualified key from the passed-in key components. The format of the generated key string is namespace.partition.key.
createFullyQualifiedPartition(namespace, partition)  
Generates a fully qualified partition name from the passed-in namespace and partition. The format of the generated partition string is namespace.partition.
get(key)  
Returns the cached value corresponding to the specified key from the cache partition.
get(keys)  
Returns the cached values corresponding to the specified set of keys from the cache partition.
get(cacheBuilder, key)  
Returns the cached value corresponding to the specified key from the partition cache. Use this method if your cached value is a class that implements the CacheBuilder interface.
getAvgGetSize()  
Returns the average item size of all the keys fetched from the partition, in bytes.
getAvgGetTime()  
Returns the average time taken to get a key from the partition, in nanoseconds.
getAvgValueSize()  
Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the partition, in bytes.
getCapacity()  
Returns the percentage of cache used of the total capacity for this partition.

getKeys()  
Returns a set of all keys that are stored in the cache partition and visible to the invoking namespace.

getMaxGetSize()  
Returns the maximum item size of all the keys fetched from the partition, in bytes.

getMaxGetTime()  
Returns the maximum time taken to get a key from the partition, in nanoseconds.

getMaxValueSize()  
Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the partition, in bytes.

getMissRate()  
Returns the miss rate in the partition.

getName()  
Returns the name of this cache partition.

getNumKeys()  
Returns the total number of keys in the partition.

isAvailable()  
Returns true if the Salesforce session is available. Only applies to Cache.SessionPartition. The session cache isn’t available when an active session isn’t present, such as in asynchronous Apex or code called by asynchronous Apex. For example, if batch Apex causes an Apex trigger to execute, the session cache isn’t available in the trigger because the trigger runs in asynchronous context.

put(key, value)  
Stores the specified key/value pair as a cached entry in the cache partition. The put method can write only to the cache in your org’s namespace.

put(key, value, visibility)  
Stores the specified key/value pair as a cached entry in the cache partition and sets the cached value’s visibility.

put(key, value, ttlSecs)  
Stores the specified key/value pair as a cached entry in the cache partition and sets the cached value’s lifetime.

put(key, value, ttlSecs, visibility, immutable)  
Stores the specified key/value pair as a cached entry in the cache partition. This method also sets the cached value’s lifetime, visibility, and whether it can be overwritten by another namespace.

remove(key)  
Deletes the cached value corresponding to the specified key from this cache partition.

remove(cacheBuilder, key)  
Deletes the cached value corresponding to the specified key from the partition cache. Use this method if your cached value is a class that implements the CacheBuilder interface.

validateCacheBuilder(cacheBuilder)  
Validates that the specified class implements the CacheBuilder interface.

validateKey(isDefault, key)  
Validates a cache key. This method throws a Cache.InvalidParamException if the key is not valid. A valid key is not null and contains alphanumeric characters.
validateKeyValue(isDefault, key, value)
Validates a cache key and ensures that the cache value is non-null. This method throws a Cache.InvalidParamException if the key or value is not valid. A valid key is not null and contains alphanumeric characters.

validateKeys(isDefault, keys)
Validates the specified cache keys. This method throws a Cache.InvalidParamException if the key is not valid. A valid key is not null and contains alphanumeric characters.

validatePartitionName(name)
Validates the partition name — for example, that it is not null.

contains(key)
Returns true if the cache partition contains a cached value corresponding to the specified key.

Signature
public Boolean contains(String key)

Parameters
key
Type: String
A case-sensitive string value that uniquely identifies a cached value.

Return Value
Type: Boolean
true if a cache entry is found. Otherwise, false.

contains(setOfKeys)
Returns true if the cache partition contains values for a specified set of keys.

Signature
public Map<String, Boolean> contains(Set<String> keys)

Parameters
setOfKeys
Type: Set<String>
A set of keys that uniquely identifies cached values. For information about the format of the key name, see Usage.

Return Value
Type: Map<String, Boolean>
Returns the cache key and corresponding Boolean value indicating that the key entry exists. The Boolean value is false if the key entry doesn’t exist.
Usage

The number of input keys cannot exceed the maximum limit of 10.

Example

In this example, the code checks for the presence of multiple keys on a partition. It fetches the cache key and the corresponding Boolean value for the key entry from the org cache of the partition.

```apex
// Assuming there is a partition p1 in the default 'local' namespace
Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Map<String,Boolean> result = orgPart.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('Is Key Present in the cache:' + result.get(key));
}
```

In this example, the code checks for the presence of multiple keys on a partition. It fetches the cache key and the corresponding Boolean value for the key entry from the session cache of the partition.

```apex
// Assuming there are three partitions p1, p2, p3 with default 'local' namespace
Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Cache.SessionPartition sessionPart = Cache.Session.getPartition('local.p1');
Map<String,Boolean> result = sessionPart.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' + result.get(key));
}
```

createFullyQualifiedKey(namespace, partition, key)

Generates a fully qualified key from the passed-in key components. The format of the generated key string is namespace.partition.key.

Signature

```
public static String createFullyQualifiedKey(String namespace, String partition, String key)
```

Parameters

```
namespace
    Type: String
    The namespace of the cache key.

partition
    Type: String
    The partition of the cache key.

key
    Type: String
```
The name of the cache key.

Return Value
Type: String

createFullyQualifiedPartition(namespace, partition)
Generates a fully qualified partition name from the passed-in namespace and partition. The format of the generated partition string is namespace.partition.

Signature
public static String createFullyQualifiedPartition(String namespace, String partition)

Parameters
namespace
  Type: String
  The namespace of the cache key.
partition
  Type: String
  The partition of the cache key.

Return Value
Type: String

get(key)
Returns the cached value corresponding to the specified key from the cache partition.

Signature
public Object get(String key)

Parameters
key
  Type: String
  A case-sensitive string value that uniquely identifies a cached value.

Return Value
Type: Object
The cached value as a generic object type. Cast the returned value to the appropriate type.
**get (keys)**

Returns the cached values corresponding to the specified set of keys from the cache partition.

**Signature**

```java
public Map<String, Object> get (Set<String> keys)
```

**Parameters**

- **keys**
  
  Type: Set<String>
  
  A set of keys that uniquely identify cached values. For information about the format of the key name, see **Usage**.

**Return Value**

Type: Map<String, Object>

Returns the cache key and corresponding value. Returns null when no corresponding value is found for an input key.

**Usage**

The number of input keys cannot exceed the maximum limit of 10.

**Examples**

Fetch multiple keys from the org cache of a partition.

```java
// Assuming there is a partition p1 in the default 'local' namespace

Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Map<String, Object> result = orgPart.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' + result.get(key));
}
```

Fetch multiple keys from the session cache of a partition.

```java
// Assuming there is a partition p1 in the default 'local' namespace

Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Cache.SessionPartition sessionPart = Cache.Session.getPartition('local.p1');
Map<String, Object> result = sessionPart.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' + result.get(key));
}
```

**get (cacheBuilder, key)**

Returns the cached value corresponding to the specified key from the partition cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.
**Signature**

```java
public Object get(System.Type cacheBuilder, String key)
```

**Parameters**

- `cacheBuilder`
  
  Type: `System.Type`
  
  The Apex class that implements the `CacheBuilder` interface.

- `key`
  
  Type: `String`
  
  A case-sensitive string value that, combined with the class name corresponding to the `cacheBuilder` parameter, uniquely identifies a cached value.

**Return Value**

Type: `Object`

The cached value as a generic object type. Cast the returned value to the appropriate type.

---

**getAvgGetSize()**

Returns the average item size of all the keys fetched from the partition, in bytes.

**Signature**

```java
public Long getAvgGetSize()
```

**Return Value**

Type: `Long`

---

**getAvgGetTime()**

Returns the average time taken to get a key from the partition, in nanoseconds.

**Signature**

```java
public Long getAvgGetTime()
```

**Return Value**

Type: `Long`

---

**getAvgValueSize()**

Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the partition, in bytes.

**Signature**

```java
public Long getAvgValueSize()
```
Return Value
Type: Long

**getCapacity()**
Returns the percentage of cache used of the total capacity for this partition.

**Signature**
```
public Double getCapacity()
```

Return Value
Type: Double
Used partition cache as a percentage number.

**getKeys()**
Returns a set of all keys that are stored in the cache partition and visible to the invoking namespace.

**Signature**
```
public Set<String> getKeys()
```

Return Value
Type: Set<String>
A set containing all cache keys.

**getMaxGetSize()**
Returns the maximum item size of all the keys fetched from the partition, in bytes.

**Signature**
```
public Long getMaxGetSize()
```

Return Value
Type: Long

**getMaxGetTime()**
Returns the maximum time taken to get a key from the partition, in nanoseconds.

**Signature**
```
public Long getMaxGetTime()
```
Return Value
Type: Long

**getMaxValueSize()**

*Deprecated and available only in API versions 49.0 and earlier.* Returns the maximum item size for keys in the partition, in bytes.

**Signature**

```java
public Long getMaxValueSize()
```

Return Value
Type: Long

**getMissRate()**

Returns the miss rate in the partition.

**Signature**

```java
public Double getMissRate()
```

Return Value
Type: Double

**getName()**

Returns the name of this cache partition.

**Signature**

```java
public String getName()
```

Return Value
Type: String

The name of this cache partition.

**getNumKeys()**

Returns the total number of keys in the partition.

**Signature**

```java
public Long getNumKeys()
```
Return Value
Type: Long

**isAvailable()**
Returns `true` if the Salesforce session is available. Only applies to `Cache.SessionPartition`. The session cache isn’t available when an active session isn’t present, such as in asynchronous Apex or code called by asynchronous Apex. For example, if batch Apex causes an Apex trigger to execute, the session cache isn’t available in the trigger because the trigger runs in asynchronous context.

**Signature**

```java
public Boolean isAvailable()
```

**Return Value**
Type: Boolean

**put(key, value)**
Stores the specified key/value pair as a cached entry in the cache partition. The `put` method can write only to the cache in your org’s namespace.

**Signature**

```java
public void put(String key, Object value)
```

**Parameters**

- **key**
  Type: `String`
  A case-sensitive string value that uniquely identifies a cached value.

- **value**
  Type: `Object`
  The value to store in the cache. The cached value must be serializable.

**Return Value**
Type: void

**put(key, value, visibility)**
Stores the specified key/value pair as a cached entry in the cache partition and sets the cached value’s visibility.

**Signature**

```java
public void put(String key, Object value, cache.Visibility visibility)
```
Parameters

key
Type: String
A case-sensitive string value that uniquely identifies a cached value.

value
Type: Object
The value to store in the cache. The cached value must be serializable.

visibility
Type: Cache.Visibility
Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

Return Value
Type: void

put(key, value, ttlSecs)
Stores the specified key/value pair as a cached entry in the cache partition and sets the cached value’s lifetime.

Signature
public void put(String key, Object value, Integer ttlSecs)

Parameters

key
Type: String
A case-sensitive string value that uniquely identifies a cached value.

value
Type: Object
The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer
The amount of time, in seconds, to keep the cached value in the cache.

Return Value
Type: void

put(key, value, ttlSecs, visibility, immutable)
Stores the specified key/value pair as a cached entry in the cache partition. This method also sets the cached value’s lifetime, visibility, and whether it can be overwritten by another namespace.
Signature

public void put(String key, Object value, Integer ttlSecs, cache.Visibility visibility, Boolean immutable)

Parameters

key
Type: String
A case-sensitive string value that uniquely identifies a cached value.

value
Type: Object
The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer
The amount of time, in seconds, to keep the cached value in the cache.

visibility
Type: Cache.Visibility
Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

immutable
Type: Boolean
Indicates whether the cached value can be overwritten by another namespace (false) or not (true).

Return Value
Type: void

remove(key)
Deletes the cached value corresponding to the specified key from this cache partition.

Signature

public Boolean remove(String key)

Parameters

key
Type: String
A case-sensitive string value that uniquely identifies a cached value.

Return Value
Type: Boolean
true if the cache value was successfully removed. Otherwise, false.
**remove(cacheBuilder, key)**

Deletes the cached value corresponding to the specified key from the partition cache. Use this method if your cached value is a class that implements the CacheBuilder interface.

**Signature**

```java
public Boolean remove(System.Type cacheBuilder, String key)
```

**Parameters**

- `cacheBuilder`
  - Type: `System.Type`
  - The Apex class that implements the CacheBuilder interface.

- `key`
  - Type: `String`
  - A case-sensitive string value that, combined with the class name corresponding to the `cacheBuilder` parameter, uniquely identifies a cached value.

**Return Value**

Type: `Boolean`

- `true` if the cache value was successfully removed. Otherwise, `false`.

**validateCacheBuilder(cacheBuilder)**

Validates that the specified class implements the CacheBuilder interface.

**Signature**

```java
public static void validateCacheBuilder(System.Type cacheBuilder)
```

**Parameters**

- `cacheBuilder`
  - Type: `System.Type`
  - The class to validate.

**Return Value**

Type: void

**validateKey(isDefault, key)**

Validates a cache key. This method throws a `Cache.InvalidParamException` if the key is not valid. A valid key is not `null` and contains alphanumeric characters.
**validateKey** (isDefault, key)

**Signature**

```java
public static void validateKey(Boolean isDefault, String key)
```

**Parameters**

- **isDefault**
  - Type: `Boolean`
  - Set to `true` if the key references a default partition. Otherwise, set to `false`.

- **key**
  - Type: `String`
  - The key to validate.

**Return Value**

Type: `void`

**validateKeyValue** (isDefault, key, value)

Validates a cache key and ensures that the cache value is non-null. This method throws a `Cache.InvalidParamException` if the key or value is not valid. A valid key is not `null` and contains alphanumeric characters.

**Signature**

```java
public static void validateKeyValue(Boolean isDefault, String key, Object value)
```

**Parameters**

- **isDefault**
  - Type: `Boolean`
  - Set to `true` if the key references a default partition. Otherwise, set to `false`.

- **key**
  - Type: `String`
  - The key to validate.

- **value**
  - Type: `Object`
  - The cache value to validate.

**Return Value**

Type: `void`

**validateKeys** (isDefault, keys)

Validates the specified cache keys. This method throws a `Cache.InvalidParamException` if the key is not valid. A valid key is not `null` and contains alphanumeric characters.

**Signature**

```java
public static void validateKeys(Boolean isDefault, Keys keys)
```
**Signature**

```java
public static void validateKeys(Boolean isDefault, Set<String> keys)
```

**Parameters**

- `isDefault`
  - Type: `Boolean`
  - Set to `true` if the key references a default partition. Otherwise, set to `false`.

- `keys`
  - Type: `Set<String>`
  - A set of key string values to validate.

**Return Value**

Type: `void`

---

**validatePartitionName(name)**

Validates the partition name — for example, that it is not null.

**Signature**

```java
public static void validatePartitionName(String name)
```

**Parameters**

- `name`
  - Type: `String`
  - The name of the partition to validate.

**Return Value**

Type: `void`

---

**Session Class**

Use the `Cache.Session` class to add, retrieve, and manage values in the session cache. The session cache is active as long as the user’s Salesforce session is valid (the user is logged in, and the session is not expired).

**Namespace**

Cache

**Usage**

**Cache Key Format**

This table lists the format of the key parameter that some methods in this class take, such as `put`, `get`, and `contains`. 
<table>
<thead>
<tr>
<th>Key Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace.partition.key</td>
<td>Fully qualified key name.</td>
</tr>
<tr>
<td>key</td>
<td>Refers to a partition marked as default when the namespace.partition prefix is omitted.</td>
</tr>
<tr>
<td>local.partition.key</td>
<td>Use the local prefix to refer to the org’s namespace when the org doesn’t have a namespace defined. If the org has a namespace defined, the local prefix also refers to that org’s namespace.</td>
</tr>
</tbody>
</table>

**Note:**
- If no default partition is specified in the org, calling a cache method without fully qualifying the key name causes a Cache.Session.SessionCacheException to be thrown.
- The local prefix in an installed managed package refers to the namespace of the subscriber org and not the package’s namespace. The cache put calls are not allowed in a partition that the invoking class doesn’t own.

**Example**

This class is the controller for a sample Visualforce page (shown in the subsequent code sample). The cached values are initially added to the cache by the `init()` method, which the Visualforce page invokes when it loads through the action attribute. The cache keys don’t contain the `namespace.partition` prefix. They all refer to a default partition in your org. The Visualforce page expects a partition named `myPartition`. To run this sample, create a default partition in your org with the name `myPartition`.

The Visualforce page contains four output components. The first three components call `get` methods on the controller that return the following values from the cache: a date, data based on the `MyData` inner class, and a counter. The next output component uses the `$Cache.Session` global variable to get the cached string value for the key named `output`. Next, the `$Cache.Session` global variable is used again in the Visualforce page to iterate over the elements of a cached value of type `List`. The size of the list is also returned.

The Visualforce page also contains two buttons. The Rerender button invokes the `go()` method on the controller. This method increases the values of the counter and the custom data in the cache. If you click Rerender, the two counters increase by one each time. The `go()` method retrieves the values of these counters from the cache, increments their values by one, and stores them again in the cache.

The Remove button deletes the date-time value (with key `datetime`) from the cache. As a result, the value next to `Cached datetime:` is cleared on the page.

```java
public class SessionCacheController {

    // Inner class.
    // Used as the data type of a cache value.
    class MyData {
        public String value { get; set; }
        public Integer counter { get; set; }

        public MyData(String value) {
            this.value = value;
            this.counter = 0;
        }
    }
}
```
public void inc() {
    counter++;
}

override public String toString() {
    return this.value + ': ' + this.counter;
}

// Apex List.
// Used as the data type of a cached value.
private List<String> numbers =
    new List<String> { 'ONE', 'TWO', 'THREE', 'FOUR', 'FIVE' };

// Constructor of the controller for the Visualforce page.
public SessionCacheController() {
}

// Adds various values to the cache.
// This method is called when the Visualforce page loads.
public void init() {
    // All key values are not qualified by the namespace.partition
    // prefix because they use the default partition.
    // Add counter to the cache with initial value of 0
    // or increment it if it's already there.
    if (!Cache.Session.contains('counter')) {
        Cache.Session.put('counter', 0);
    } else {
        Cache.Session.put('counter', getCounter() + 1);
    }

    // Add the datetime value to the cache only if it's not already there.
    if (!Cache.Session.contains('datetime')) {
        DateTime dt = DateTime.now();
        Cache.Session.put('datetime', dt);
    }

    // Add the custom data to the cache only if it's not already there.
    if (!Cache.Session.contains('data')) {
        Cache.Session.put('data', new MyData('Some custom value'));
    }

    // Add a list of number to the cache if not already there.
    if (!Cache.Session.contains('list')) {
        Cache.Session.put('list', numbers);
    }

    // Add a string value to the cache if not already there.
    if (!Cache.Session.contains('output')) {
        Cache.Session.put('output', 'Cached text value');
    }
}
// Return counter from the cache.
public Integer getCounter() {
    return (Integer)Cache.Session.get('counter');
}

// Return datetime value from the cache.
public String getCachedDatetime() {
    DateTime dt = (DateTime)Cache.Session.get('datetime');
    return dt != null ? dt.format() : null;
}

// Return cached value whose type is the inner class MyData.
public String getCachedData() {
    MyData mydata = (MyData)Cache.Session.get('data');
    return mydata != null ? mydata.toString() : null;
}

// Method invoked by the Rerender button on the Visualforce page.
// Updates the values of various cached values.
// Increases the values of counter and the MyData counter if those
// cache values are still in the cache.
public PageReference go() {
    // Increase the cached counter value or set it to 0
    // if it's not cached.
    if (Cache.Session.contains('counter')) {
        Cache.Session.put('counter', getCounter() + 1);
    } else {
        Cache.Session.put('counter', 0);
    }

    // Get the custom data value from the cache.
    MyData d = (MyData)Cache.Session.get('data');
    // Only if the data is already in the cache, update it.
    if (Cache.Session.contains('data')) {
        d.inc();
        Cache.Session.put('data', d);
    }

    return null;
}

// Method invoked by the Remove button on the Visualforce page.
// Removes the datetime cached value from the session cache.
public PageReference remove() {
    Cache.Session.remove('datetime');
    return null;
}

This is the Visualforce page that corresponds to the SessionCacheController class.
This is the output of the page after clicking the Rerender button twice. The counter value could differ in your case if a key named counter was already in the cache before running this sample.

Cached datetime: 8/11/2015 1:58 PM
Cached data: Some custom value: 2
Cached counter: 2
Output: Cached text value
Repeat: ONE TWO THREE FOUR FIVE
List size: 5

IN THIS SECTION:

Session Constants
The Session class provides a constant that you can use when setting the time-to-live (TTL) value.

Session Methods

SEE ALSO:
Apex Developer Guide: Platform Cache

**Session Constants**
The Session class provides a constant that you can use when setting the time-to-live (TTL) value.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX_TTL_SECS</td>
<td>Represents the maximum amount of time, in seconds, to keep the cached value in the session cache.</td>
</tr>
</tbody>
</table>
Session Methods

The following are methods for Session. All methods are static.

IN THIS SECTION:

contains(key)
Returns true if the session cache contains a cached value corresponding to the specified key.

contains(setOfKeys)
Returns true if the cache contains values for a specified set of keys.

get(key)
Returns the cached value corresponding to the specified key from the session cache.

get(keys)
Returns the cached values corresponding to the specified set of keys from the session cache.

get(cacheBuilder, key)
Returns the cached value corresponding to the specified key from the session cache. Use this method if your cached value is a class that implements the CacheBuilder interface.

getAvgGetSize()
Returns the average item size of all the keys fetched from the session cache, in bytes.

getAvgGetTime()
Returns the average time taken to get a key from the session cache, in nanoseconds.

getAvgValueSize()
Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the session cache, in bytes.

getCapacity()
Returns the percentage of session cache capacity that has been used.

getKeys()
Returns all keys that are stored in the session cache and visible to the invoking namespace.

getMaxGetSize()
Returns the maximum item size of all the keys fetched from the session cache, in bytes.

getMaxGetTime()
Returns the maximum time taken to get a key from the session cache, in nanoseconds.

getMaxValueSize()
Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the session cache, in bytes.

getMissRate()
Returns the miss rate in the session cache.

getName()
Returns the name of the default cache partition.

getNumKeys()
Returns the total number of keys in the session cache.
getPartition(partitionName)
Returns a partition from the session cache that corresponds to the specified partition name.

isAvailable()
Returns true if the session cache is available for use. The session cache isn’t available when an active session isn’t present, such as in asynchronous Apex or code called by asynchronous Apex. For example, if batch Apex causes an Apex trigger to execute, the session cache isn’t available in the trigger because the trigger runs in asynchronous context.

put(key, value)
Stores the specified key/value pair as a cached entry in the session cache. The put method can write only to the cache in your org’s namespace.

put(key, value, visibility)
Stores the specified key/value pair as a cached entry in the session cache and sets the cached value’s visibility.

put(key, value, ttlSecs)
Stores the specified key/value pair as a cached entry in the session cache and sets the cached value’s lifetime.

put(key, value, ttlSecs, visibility, immutable)
Stores the specified key/value pair as a cached entry in the session cache. This method also sets the cached value’s lifetime, visibility, and whether it can be overwritten by another namespace.

remove(key)
Deletes the cached value corresponding to the specified key from the session cache.

remove(cacheBuilder, key)
Deletes the cached value corresponding to the specified key from the session cache. Use this method if your cached value is a class that implements the CacheBuilder interface.

contains(key)
Returns true if the session cache contains a cached value corresponding to the specified key.

Signature
public static Boolean contains(String key)

Parameters
key
Type: String
A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

Return Value
Type: Boolean
true if a cache entry is found. Otherwise, false.

contains(setOfKeys)
Returns true if the cache contains values for a specified set of keys.
Signature

public static Map<String, Boolean> contains (Set<String> keys)

Parameters

setOfKeys
Type: Set<String>
A set of keys that uniquely identifies cached values. For information about the format of the key name, see Usage.

Return Value

Type: Map<String, Boolean>
Returns the cache key and corresponding Boolean value indicating that the key entry exists. The Boolean value is false if the key entry doesn’t exist.

Usage

The number of input keys cannot exceed the maximum limit of 10.

Example

In this example, the code checks for the presence of multiple keys on the default partition. It fetches the cache key and the corresponding Boolean value for the key entry from the session cache of the default partition.

```java
Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Map<String,Boolean> result = Cache.Session.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('Is Key Present in the cache : ' + result.get(key));
}
```

In this example, the code checks for the presence of multiple keys on different partitions. It fetches the cache key and the corresponding Boolean value for the key entry from the session cache of different partitions.

```java
// Assuming there are three partitions p1, p2, p3 with default 'local' namespace
Set<String> keys = new Set<String>{'local.p1.key','local.p2.key', 'local.p3.key'};
Map<String,Boolean> result = Cache.Session.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('Is Key Present in the cache : ' + result.get(key));
}
```

get(key)

Returns the cached value corresponding to the specified key from the session cache.

Signature

public static Object get(String key)
Parameters

key
Type: String
A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

Return Value

Type: Object
The cached value as a generic object type. Cast the returned value to the appropriate type.

Usage

Because `Cache.Session.get()` returns an object, we recommend that you cast the returned value to a specific type to facilitate use of the returned value.

```java
// Get a cached value
Object obj = Cache.Session.get('ns1.partition1.orderDate');
// Cast return value to a specific data type
DateTime dt2 = (DateTime)obj;
```

If a `Cache.Session.get()` call doesn’t find the referenced key, it returns `null`.

`get(keys)`

Returns the cached values corresponding to the specified set of keys from the session cache.

Signature

```java
public static Map<String, Object> get (Set<String> keys)
```

Parameters

keys
Type: Set<String>
A set of keys that uniquely identify cached values. For information about the format of the key name, see Usage.

Return Value

Type: Map<String, Object>
Returns the cache key and corresponding value. Returns null when no corresponding value is found for an input key.

Usage

The number of input keys cannot exceed the maximum limit of 10.
Example

Fetch multiple keys from the session cache of the default partition.

```java
Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Map<String,Object> result = Cache.Session.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' + result.get(key));
}
```

Fetch multiple keys from the session cache of different partitions.

```java
// Assuming there are three partitions p1, p2, p3 with default 'local' namespace
Set<String> keys = new Set<String>{'local.p1.key','local.p2.key', 'local.p3.key'};
Map<String,Object> result = Cache.Session.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' + result.get(key));
}
```

get(cacheBuilder, key)

Returns the cached value corresponding to the specified key from the session cache. Use this method if your cached value is a class that implements the CacheBuilderInterface.

Signature

```java
public static Object get(System.Type cacheBuilder, String key)
```

Parameters

cacheBuilder

Type: System.Type

The Apex class that implements the CacheBuilderInterface.

key

Type: String

A case-sensitive string value that, combined with the class name corresponding to the cacheBuilder parameter, uniquely identifies a cached value.

Return Value

Type: Object

The cached value as a generic object type. Cast the returned value to the appropriate type.

Usage

Because Cache.Session.get(cacheBuilder, key) returns an object, cast the returned value to a specific type to facilitate use of the returned value.

```java
return ((DateTime)Cache.Session.get(DateCache.class, 'datetime')).format();
```
getAvgGetSize()  
Returns the average item size of all the keys fetched from the session cache, in bytes.

Signature

\texttt{public static Long getAvgGetSize()}

Return Value

Type: Long

gAvgGetTime()  
Returns the average time taken to get a key from the session cache, in nanoseconds.

Signature

\texttt{public static Long getAvgGetTime()}

Return Value

Type: Long

gAvgValueSize()  
Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the session cache, in bytes.

Signature

\texttt{public static Long getAvgValueSize()}

Return Value

Type: Long

gCapacity()  
Returns the percentage of session cache capacity that has been used.

Signature

\texttt{public static Double getCapacity()}

Return Value

Type: Double

Used cache as a percentage number.
getKeys()
Returns all keys that are stored in the session cache and visible to the invoking namespace.

Signature
public static Set<String> getKeys()

Return Value
Type: Set<String>
A set containing all cache keys.

getMaxGetSize()
Returns the maximum item size of all the keys fetched from the session cache, in bytes.

Signature
public static Long getMaxGetSize()

Return Value
Type: Long

getMaxGetTime()
Returns the maximum time taken to get a key from the session cache, in nanoseconds.

Signature
public static Long getMaxGetTime()

Return Value
Type: Long

getMaxValueSize()
Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the session cache, in bytes.

Signature
public static Long getMaxValueSize()

Return Value
Type: Long
**getMissRate()**

Returns the miss rate in the session cache.

**Signature**

```java
public static Double getMissRate()
```

**Return Value**

Type: Double

**getName()**

Returns the name of the default cache partition.

**Signature**

```java
public String getName()
```

**Return Value**

Type: String

The name of the default cache partition.

**getNumKeys()**

Returns the total number of keys in the session cache.

**Signature**

```java
public static Long getNumKeys()
```

**Return Value**

Type: Long

**getPartition(partitionName)**

Returns a partition from the session cache that corresponds to the specified partition name.

**Signature**

```java
public static cache.SessionPartition getPartition(String partitionName)
```

**Parameters**

- **partitionName**
  
  Type: String
  
  A partition name that is qualified by the namespace, for example, namespace.partition.
Return Value
Type: Cache.SessionPartition

Example
After you get the session partition, you can add and retrieve the partition’s cache values.

```java
// Get partition
Cache.SessionPartition sessionPart = Cache.Session.getPartition('myNs.myPartition');
// Retrieve cache value from the partition
if (sessionPart.contains('BookTitle')) {
    String cachedTitle = (String)sessionPart.get('BookTitle');
}

// Add cache value to the partition
sessionPart.put('OrderDate', Date.today());

// Or use dot notation to call partition methods
String cachedAuthor =
    (String)Cache.Session.getPartition('myNs.myPartition').get('BookAuthor');
```

**isAvailable()**
Returns true if the session cache is available for use. The session cache isn’t available when an active session isn’t present, such as in asynchronous Apex or code called by asynchronous Apex. For example, if batch Apex causes an Apex trigger to execute, the session cache isn’t available in the trigger because the trigger runs in asynchronous context.

**Signature**
```
public static Boolean isAvailable()
```

**Return Value**
Type: Boolean
true if the session cache is available. Otherwise, false.

**put(key, value)**
Stores the specified key/value pair as a cached entry in the session cache. The put method can write only to the cache in your org’s namespace.

**Signature**
```
public static void put(String key, Object value)
```

**Parameters**

- `key`
  Type: String
  A string that uniquely identifies the value to be cached. For information about the format of the key name, see Usage.
value
  Type: Object
  The value to store in the cache. The cached value must be serializable.

Return Value
Type: void

put(key, value, visibility)
Stores the specified key/value pair as a cached entry in the session cache and sets the cached value's visibility.

Signature
public static void put(String key, Object value, Cache.Visibility visibility)

Parameters
key
  Type: String
  A string that uniquely identifies the value to be cached. For information about the format of the key name, see Usage.

value
  Type: Object
  The value to store in the cache. The cached value must be serializable.

visibility
  Type: Cache.Visibility
  Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

Return Value
Type: void

put(key, value, ttlSecs)
Stores the specified key/value pair as a cached entry in the session cache and sets the cached value's lifetime.

Signature
public static void put(String key, Object value, Integer ttlSecs)

Parameters
key
  Type: String
  A string that uniquely identifies the value to be cached. For information about the format of the key name, see Usage.
value
Type: Object
The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer
The amount of time, in seconds, to keep the cached value in the session cache. The cached values remain in the cache as long as the Salesforce session hasn’t expired. The maximum value is 28,800 seconds or eight hours. The minimum value is 300 seconds or five minutes.

Return Value
Type: void

put(key, value, ttlSecs, visibility, immutable)
Stores the specified key/value pair as a cached entry in the session cache. This method also sets the cached value’s lifetime, visibility, and whether it can be overwritten by another namespace.

Signature
public static void put(String key, Object value, Integer ttlSecs, cache.Visibility visibility, Boolean immutable)

Parameters
key
Type: String
A string that uniquely identifies the value to be cached. For information about the format of the key name, see Usage.

value
Type: Object
The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer
The amount of time, in seconds, to keep the cached value in the session cache. The cached values remain in the cache as long as the Salesforce session hasn’t expired. The maximum value is 28,800 seconds or eight hours. The minimum value is 300 seconds or five minutes.

visibility
Type: Cache.Visibility
Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

immutable
Type: Boolean
Indicates whether the cached value can be overwritten by another namespace (false) or not (true).
Return Value
Type: void

**remove(key)**
Deletes the cached value corresponding to the specified key from the session cache.

**Signature**
```java
public static Boolean remove(String key)
```

**Parameters**
- `key`  
  Type: `String`  
  A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

**Return Value**
Type: `Boolean`  
`true` if the cache value was successfully removed. Otherwise, `false`.

**remove(cacheBuilder, key)**
Deletes the cached value corresponding to the specified key from the session cache. Use this method if your cached value is a class that implements the CacheBuilder interface.

**Signature**
```java
public static Boolean remove(System.Type cacheBuilder, String key)
```

**Parameters**
- `cacheBuilder`  
  Type: `System.Type`  
  The Apex class that implements the CacheBuilder interface.
- `key`  
  Type: `String`  
  A case-sensitive string value that, combined with the class name corresponding to the `cacheBuilder` parameter, uniquely identifies a cached value.

**Return Value**
Type: `Boolean`  
`true` if the cache value was successfully removed. Otherwise, `false`.
SessionPartition Class
Contains methods to manage cache values in the session cache of a specific partition.

Namespace
Cache

Usage
This class extends Cache.Partition and inherits all of its non-static methods. Utility methods for creating and validating keys are not supported and can be called only from the Cache.Partition parent class. For a list of Cache.Partition methods, see Partition Methods.

To get a session partition, call Cache.Session.getPartition and pass in a fully qualified partition name, as follows.

```java
Cache.SessionPartition sessionPartition = Cache.Session.getPartition('namespace.myPartition');
```

See Cache Key Format for Partition Methods.

Example
This class is the controller for a sample Visualforce page (shown in the subsequent code sample). The controller shows how to use the methods of Cache.SessionPartition to manage a cache value on a particular partition. The controller takes inputs from the Visualforce page for the partition name, key name for a counter, and initial counter value. The controller contains default values for these inputs. When you click Rerender on the Visualforce page, the go() method is invoked and increases the counter by one. When you click Remove Key, the counter key is removed from the cache. The counter value gets reset to its initial value when it’s re-added to the cache.

```java
public class SessionPartitionController {    
  // Name of a partition in the local namespace
  String partitionInput = 'local.myPartition';
  // Name of the key
  String counterKeyInput = 'counter';
  // Key initial value
  Integer counterInitValue = 0;
  // Session partition object
  Cache.SessionPartition sessionPartition;

  // Constructor of the controller for the Visualforce page.
  public SessionPartitionController() {
  }

  // Adds counter value to the cache.
  // This method is called when the Visualforce page loads.
  public void init() {
    // Create the partition instance based on the partition name
    sessionPartition = getPartition();

    // Add counter to the cache with an initial value
    // or increment it if it's already there.
  }
}
```
if (!sessionPartition.contains(counterKeyInput)) {
    sessionPartition.put(counterKeyInput, counterInitValue);
} else {
    sessionPartition.put(counterKeyInput, getCounter() + 1);
}

// Returns the session partition based on the partition name
// given in the Visualforce page or the default value.
private Cache.SessionPartition getPartition() {
    if (sessionPartition == null) {
        sessionPartition = Cache.Session.getPartition(partitionInput);
    }

    return sessionPartition;
}

// Return counter from the cache.
public Integer getCounter() {
    return (Integer)getPartition().get(counterKeyInput);
}

// Invoked by the Submit button to save input values
// supplied by the user.
public PageReference save() {
    // Reset the initial key value in the cache
    getPartition().put(counterKeyInput, counterInitValue);

    return null;
}

// Method invoked by the Rerender button on the Visualforce page.
// Updates the values of various cached values.
// Increases the values of counter and the MyData counter if those
// cache values are still in the cache.
public PageReference go() {
    // Get the partition object
    sessionPartition = getPartition();
    // Increase the cached counter value or set it to 0
    // if it's not cached.
    if (sessionPartition.contains(counterKeyInput)) {
        sessionPartition.put(counterKeyInput, getCounter() + 1);
    } else {
        sessionPartition.put(counterKeyInput, counterInitValue);
    }

    return null;
}

// Method invoked by the Remove button on the Visualforce page.
// Removes the datetime cached value from the session cache.
public PageReference remove() {
    getPartition().remove(counterKeyInput);
}
// Get and set methods for accessing variables
// that correspond to the input text fields on
// the Visualforce page.
public String getPartitionInput() {
    return partitionInput;
}

public String getCounterKeyInput() {
    return counterKeyInput;
}

public Integer getCounterInitValue() {
    return counterInitValue;
}

public void setPartitionInput(String partition) {
    this.partitionInput = partition;
}

public void setCounterKeyInput(String keyName) {
    this.counterKeyInput = keyName;
}

public void setCounterInitValue(Integer counterValue) {
    this.counterInitValue = counterValue;
}

This is the Visualforce page that corresponds to the SessionPartitionController class.

```apex
<apex:page controller="SessionPartitionController" action="{!init}">
    <apex:form>
        <br/>Partition with Namespace Prefix: <apex:inputText value="{!partitionInput}"/>
        <br/>Counter Key Name: <apex:inputText value="{!counterKeyInput}"/>
        <br/>Counter Initial Value: <apex:inputText value="{!counterInitValue}"/>
        <apex:commandButton action="{!save}" value="Save Key Input Values"/>
    </apex:form>

    <apex:outputPanel id="output">
        <br/>Cached Counter: <apex:outputText value="{!counter}"/>
    </apex:outputPanel>

    <br/>
    <apex:form>
        <apex:commandButton id="go" action="{!go}" value="Rerender" rerender="output"/>
        <apex:commandButton id="remove" action="{!remove}" value="Remove Key" rerender="output"/>
    </apex:form>
</apex:page>
```

  * Apex Developer Guide: Platform Cache

## Cache Exceptions

The Cache namespace contains exception classes.

All exception classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions on page 3076 in the Apex Developer Guide.

The Cache namespace contains these exceptions.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Thrown when</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cache.Session.SessionCacheException</td>
<td>An error occurred while adding or retrieving a value in the session cache.</td>
</tr>
<tr>
<td>Cache.Session.SessionCacheNoSessionException</td>
<td>An attempt is made to access the cache when the session cache isn’t available.</td>
</tr>
<tr>
<td>Cache.Org.OrgCacheException</td>
<td>An attempt is made to access a partition that doesn’t exist or whose name is invalid.</td>
</tr>
<tr>
<td>Cache.InvalidParamException</td>
<td>An invalid parameter value is passed into a method of Cache.Session or Cache.Org. This error occurs when:</td>
</tr>
<tr>
<td></td>
<td>• The key referenced is null or empty or is not alphanumeric.</td>
</tr>
<tr>
<td></td>
<td>• The key isn’t qualified with the namespace and partition in the format &lt;namespace&gt;.&lt;partition&gt;.&lt;key&gt;.</td>
</tr>
<tr>
<td></td>
<td>• The key isn’t qualified in the format &lt;key&gt; for the default partition, or for a key inserted through the partition object.</td>
</tr>
<tr>
<td></td>
<td>• The namespace referenced is null or empty.</td>
</tr>
<tr>
<td></td>
<td>• The partition name is null or empty or is not alphanumeric.</td>
</tr>
<tr>
<td></td>
<td>• Another referenced value is null.</td>
</tr>
<tr>
<td>Cache.ItemSizeLimitExceededException</td>
<td>A cache put call is made with an item that exceeds the maximum size limit. To fix this error, break the item into multiple, smaller items.</td>
</tr>
<tr>
<td>Cache.BulkApiKeysLimitExceededException</td>
<td>The number of key parameters passed into a bulk method - get(keys) or contains(setOfKeys) - exceeds the maximum limit of 10.</td>
</tr>
<tr>
<td>Cache.PlatformCacheInvalidOperationException</td>
<td>A cache put or remove call is made that is not allowed. For example, when calling put or remove inside a Visualforce constructor.</td>
</tr>
<tr>
<td>Cache.CacheBuilderExecutionException</td>
<td>This error occurs when the execution of the CacheBuilder fails; this could be due to an error in parsing, a permissions error while accessing records, or an issue with Apex callouts.</td>
</tr>
</tbody>
</table>
Visibility Enum

Use the Cache.Visibility enumeration in the Cache.Session or Cache.Org methods to indicate whether a cached value is visible only in the value’s namespace or in all namespaces.

Enum Values

The following are the values of the Cache.Visibility enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL</td>
<td>The cached value is available to Apex code executing from any namespace. This is the default state.</td>
</tr>
<tr>
<td>NAMESPACE</td>
<td>The cached value is available to Apex code executing from the same namespace. If a key has the Visibility.NAMESPACE attribute, a get method initiated from a different namespace returns null.</td>
</tr>
</tbody>
</table>

Canvas Namespace

The Canvas namespace provides an interface and classes for canvas apps in Salesforce. The following are the interfaces and classes in the Canvas namespace.

IN THIS SECTION:

- ApplicationContext Interface
  Use this interface to retrieve application context information, such as the application version or URL.

- CanvasLifecycleHandler Interface
  Implement this interface to control context information and add custom behavior during the application render phase.

- ContextTypeEnum Enum
  Describes context data that can be excluded from canvas app context data. You specify which context types to exclude in the excludeContextTypes() method in your CanvasLifecycleHandler implementation.

- EnvironmentContext Interface
  Use this interface to retrieve environment context information, such as the app display location or the configuration parameters.
RenderContext Interface
A wrapper interface that is used to retrieve application and environment context information.

TestClass
Contains methods for automated testing of your Canvas classes.

Canvas Exceptions
The Canvas namespace contains exception classes.

ApplicationContext Interface
Use this interface to retrieve application context information, such as the application version or URL.

Namespace
Canvas

Usage
The ApplicationContext interface provides methods to retrieve application information about the canvas app that's being rendered. Most of the methods are read-only. For this interface, you don't need to create an implementation. Use the default implementation that Salesforce provides.

IN THIS SECTION:
ApplicationContext Methods

ApplicationContext Methods
The following are methods for ApplicationContext.

IN THIS SECTION:
getCanvasUrl() Retrieves the fully qualified URL of the canvas app.
getDeveloperName() Retrieves the internal API name of the canvas app.
getName() Retrieves the name of the canvas app.
getNamespace() Retrieves the namespace prefix of the canvas app.
getVersion() Retrieves the current version of the canvas app.
setCanvasUrlPath(newPath) Overrides the URL of the canvas app for the current request.
getCanvasUrl()
Retrieves the fully qualified URL of the canvas app.

Signature
public String getCanvasUrl()

Return Value
Type: String

Usage
Use this method to get the URL of the canvas app, for example:

getDeveloperName()
Retrieves the internal API name of the canvas app.

Signature
public String getDeveloperName()

Return Value
Type: String

Usage
Use this method to get the API name of the canvas app. You specify this value in the API Name field when you expose the canvas app by creating a connected app.

getName()
Retrieves the name of the canvas app.

Signature
public String getName()

Return Value
Type: String

Usage
Use this method to get the name of the canvas app.
getNamespace()
Retrieves the namespace prefix of the canvas app.

Signature
public String getNamespace()

Return Value
Type: String

Usage
Use this method to get the Salesforce namespace prefix that's associated with the canvas app.

getVersion()
Retrieves the current version of the canvas app.

Signature
public String getVersion()

Return Value
Type: String

Usage
Use this method to get the current version of the canvas app. This value changes after you update and republish a canvas app in an organization. If you are in a Developer Edition organization, using this method always returns the latest version.

setCanvasUrlPath(newPath)
Overrides the URL of the canvas app for the current request.

Signature
public void setCanvasUrlPath(String newPath)

Parameters
newPath
Type: String
The URL (not including domain) that you need to use to override the canvas app URL.

Return Value
Type: Void
Usage

Use this method to override the URL path and query string of the canvas app. Do not provide a fully qualified URL, because the provided URL string will be appended to the original canvas URL domain.

For example, if the current canvas app URL is https://myserver.com:6000/myAppPath and you call setCanvasUrlPath('/alternatePath/args?arg1=1&arg2=2'), the adjusted canvas app URL will be https://myserver.com:6000/alternatePath/args?arg1=1&arg2=2.

If the provided path results in a malformed URL, or a URL that exceeds 2,048 characters, a System.CanvasException will be thrown.

This method overrides the canvas app URL for the current request and does not permanently change the canvas app URL as configured in the UI for the Salesforce canvas app settings.

CanvasLifecycleHandler Interface

Implement this interface to control context information and add custom behavior during the application render phase.

Namespace

Canvas

Usage

Use this interface to specify what canvas context information is provided to your app by implementing the excludeContextTypes() method. Use this interface to call custom code when the app is rendered by implementing the onRender() method.

If you provide an implementation of this interface, you must implement excludeContextTypes() and onRender().

Example Implementation

The following example shows a simple implementation of CanvasLifecycleHandler that specifies that organization context information will be excluded and prints a debug message when the app is rendered.

```java
public class MyCanvasListener implements Canvas.CanvasLifecycleHandler{
    public Set<Canvas.ContextTypeEnum> excludeContextTypes(){
        Set<Canvas.ContextTypeEnum> excluded = new Set<Canvas.ContextTypeEnum>();
        excluded.add(Canvas.ContextTypeEnum.ORGANIZATION);
        return excluded;
    }

    public void onRender(Canvas.RenderContext renderContext){
        System.debug('Canvas lifecycle called.');
    }
}
```

IN THIS SECTION:

CanvasLifecycleHandler Methods
CanvasLifecycleHandler Methods

The following are methods for CanvasLifecycleHandler.

IN THIS SECTION:

excludeContextTypes()
Lets the implementation exclude parts of the CanvasRequest context, if the application does not need it.

onRender(renderContext)
Invoked when a canvas app is rendered. Provides the ability to set and retrieve canvas application and environment context information during the application render phase.

excludeContextTypes()
Lets the implementation exclude parts of the CanvasRequest context, if the application does not need it.

Signature

public Set<Canvas.ContextTypeEnum> excludeContextTypes()

Return Value

Type: SET<Canvas.ContextTypeEnum>

This method must return null or a set of zero or more ContextTypeEnum values. Returning null enables all attributes by default. ContextTypeEnum values that can be set are:

- Canvas.ContextTypeEnum.ORGANIZATION
- Canvas.ContextTypeEnum.RECORD_DETAIL
- Canvas.ContextTypeEnum.USER

See ContextTypeEnum on page 238 for more details on these values.

Usage

Implement this method to specify which attributes to disable in the context of the canvas app. A disabled attribute will set the associated canvas context information to null.

Disabling attributes can help improve performance by reducing the size of the signed request and canvas context. Also, disabled attributes do not need to be retrieved by Salesforce, which further improves performance.

See the Canvas Developer Guide for more information on context information in the Context object that’s provided in the CanvasRequest.

Example

This example implementation specifies that the organization information will be disabled in the canvas context.

```java
public Set<Canvas.ContextTypeEnum> excludeContextTypes() {
    Set<Canvas.ContextTypeEnum> excluded = new Set<Canvas.ContextTypeEnum>();
    excluded.add(Canvas.ContextTypeEnum.ORGANIZATION);
    return excluded;
}
```
onRender(renderContext)
Invoked when a canvas app is rendered. Provides the ability to set and retrieve canvas application and environment context information during the application render phase.

Signature
public void onRender(Canvas.RenderContext renderContext)

Parameters
renderContext
Type: Canvas.RenderContext

Return Value
Type: Void

Usage
If implemented, this method is called whenever the canvas app is rendered. The implementation can set and retrieve context information by using the provided Canvas.RenderContext.
This method is called whenever signed request or context information is retrieved by the client. See the Canvas Developer Guide for more information on signed request authentication.

Example
This example implementation prints 'Canvas lifecycle called.' to the debug log when the canvas app is rendered.

```java
public void onRender(Canvas.RenderContext renderContext) {
    System.debug('Canvas lifecycle called. ');
}
```

ContextTypeEnum Enum
Describes context data that can be excluded from canvas app context data. You specify which context types to exclude in the excludeContextTypes() method in your CanvasLifecycleHandler implementation.

Namespace
Canvas

Enum Values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORGANIZATION</td>
<td>Exclude context information about the organization in which the canvas app is running.</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>RECORD_DETAIL</td>
<td>Exclude context information about the object record on which the canvas app appears.</td>
</tr>
<tr>
<td>USER</td>
<td>Exclude context information about the current user.</td>
</tr>
</tbody>
</table>

**EnvironmentContext Interface**

Use this interface to retrieve environment context information, such as the app display location or the configuration parameters.

**Namespace**

Canvas

**Usage**

The `EnvironmentContext` interface provides methods to retrieve environment information about the current canvas app. For this interface, you don’t need to create an implementation. Use the default implementation that Salesforce provides.

**EnvironmentContext Methods**

The following are methods for `EnvironmentContext`.

**IN THIS SECTION:**

- `addEntityField(fieldName)`
  Adds a field to the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that’s placed on an object.
- `addEntityFields(fieldNames)`
  Adds a set of fields to the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that’s placed on an object.
- `getDisplayLocation()`
  Retrieves the display location where the canvas app is being called from. For example, a value of Visualforce page.
- `getEntityFields()`
  Retrieves the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that’s placed on an object.
- `getLocationUrl()`
  Retrieves the location URL of the canvas app.
- `getParametersAsJSON()`
  Retrieves the current custom parameters for the canvas app. Parameters are returned as a JSON string.
getSublocation()
Retrieves the display sublocation where the canvas app is being called from.

setParametersAsJSON(jsonString)
Sets the custom parameters for the canvas app.

addEntityField(fieldName)
Adds a field to the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that’s placed on an object.

Signature
public void addEntityField(String fieldName)

Parameters

<table>
<thead>
<tr>
<th>fieldName</th>
<th>Type: String</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The object field name that you need to add to the list of returned fields. Using ‘*’ adds all fields that the user has permission to view.</td>
</tr>
</tbody>
</table>

Return Value
Type: Void

Usage
When you use the <apex:canvasApp> component to display a canvas app on a Visualforce page, and that page is associated with an object (placed on the page layout, for example), you can specify fields to be returned from the related object. See the Canvas Developer Guide for more information on the Record object.

Use addEntityField() to add a field to the list of object fields that are returned in the signed request Record object. By default the list of fields includes ID. You can add fields by name or add all fields that the user has permission to view by calling addEntityField('*').

You can inspect the configured list of fields by using Canvas.EnvironmentContext.getEntityFields().

Example
This example adds the Name and BillingAddress fields to the list of object fields. This example assumes the canvas app will appear in a Visualforce page that’s associated with the Account page layout.

```java
Canvas.EnvironmentContext env = renderContext.getEnvironmentContext();
// Add Name and BillingAddress to fields (assumes we'll run from the Account detail page)
env.addEntityField('Name');
env.addEntityField('BillingAddress');
```

addEntityFields(fieldNames)
Adds a set of fields to the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that’s placed on an object.
public void addEntityFields(Set<String> fieldNames)

Parameters

fieldNames
Type: SET<String>
The set of object field names that you need to add to the list of returned fields. If an item in the set is ‘*’, all fields that the user has permission to view are added.

Return Value

Type: Void

Usage

When you use the <apex:canvasApp> component to display a canvas app on a Visualforce page, and that page is associated with an object (placed on the page layout, for example), you can specify fields to be returned from the related object. See the Canvas Developer Guide for more information on the Record object.

Use addEntityFields() to add a set of one or more fields to the list of object fields that are returned in the signed request Record object. By default the list of fields includes ID. You can add fields by name or add all fields that the user has permission to view by adding a set that includes ‘*’ as one of the strings.

You can inspect the configured list of fields by using Canvas.EnvironmentContext.getEntityFields().

Example

This example adds the Name, BillingAddress, and YearStarted fields to the list of object fields. This example assumes that the canvas app will appear in a Visualforce page that’s associated with the Account page layout.

```java
Canvas.EnvironmentContext env = renderContext.getEnvironmentContext();

// Add Name, BillingAddress and YearStarted to fields (assumes we'll run from the Account detail page)
Set<String> fields = new Set<String>{'Name','BillingAddress','YearStarted'};
env.addEntityFields(fields);
```

getDisplayLocation()

Retrieves the display location where the canvas app is being called from. For example, a value of Visualforce page.

Signature

public String getDisplayLocation()
• ChatterFeed—The canvas app was called from a Chatter canvas feed item.
• MobileNav—The canvas app was called from the navigation menu.
• OpenCTI—The canvas app was called from an Open CTI component.
• PageLayout—The canvas app was called from an element within a page layout. If the displayLocation is PageLayout, one of the subLocation values might be returned.
• Publisher—The canvas app was called from a canvas custom quick action.
• ServiceDesk—The canvas app was called from a Salesforce Console component.
• Visualforce—The canvas app was called from a Visualforce page.
• None—The canvas app was called from the Canvas App Previewer.

Usage

Use this method to obtain the display location for the canvas app.

getEntityFields()

Retrieves the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that’s placed on an object.

Signature

public List<String> getEntityFields()

Return Value

Type: LIST<String>

Usage

When you use the <apex:canvasApp> component to display a canvas app on a Visualforce page, and that page is associated with an object (placed on the page layout, for example), you can specify fields to be returned from the related object. See the Canvas Developer Guide for more information on the Record object.

Use getEntityFields() to retrieve the list of object fields that are returned in the signed request Record object. By default the list of fields includes ID. The list of fields can be configured by using the Canvas.EnvironmentContext.addEntityField(fieldName) or Canvas.EnvironmentContext.addEntityFields(fieldNames) methods.

Example

This example gets the current list of object fields and retrieves each item in the list, printing each field name to the debug log.

```
Canvas.EnvironmentContext env = renderContext.getEnvironmentContext();
List<String> entityFields = env.getEntityFields();
for (String fieldVal : entityFields) {
    System.debug('Environment Context entityField: ' + fieldVal);
}
```

If the canvas app that’s using this lifecycle code was run from the detail page of an Account, the debug log output might look like:

```
Environment Context entityField: Id
```
getLocationUrl()
Retrieves the location URL of the canvas app.

Signature
public String getLocationUrl()

Return Value
Type: String

Usage
Use this method to obtain the URL of the page where the user accessed the canvas app. For example, if the user accessed your app by clicking a link on the Chatter tab, this method returns the URL of the Chatter tab, which would be similar to ‘https://MyDomainName.my.salesforce.com/_ui/core/chatter/ui/ChatterPage’.

getParametersAsJSON()
Retrieves the current custom parameters for the canvas app. Parameters are returned as a JSON string.

Signature
public String getParametersAsJSON()

Return Value
Type: String

Usage
Use this method to get the current custom parameters for the canvas app. The parameters are returned in a JSON string that can be de-serialized by using the System.JSON.deserializeUntyped(jsonString) method.

Custom parameters can be modified by using the Canvas.EnvironmentContext.setParametersAsJSON(jsonString) method.

Example
This example gets the current custom parameters, de-serializes them into a map, and prints the results to the debug log.

```java
Canvas.EnvironmentContext env = renderContext.getEnvironmentContext();

// Get current custom params
Map<String, Object> currentParams =
    (Map<String, Object>) JSON.deserializeUntyped(env.getParametersAsJSON());
System.debug('Environment Context custom parameters: ' + currentParams);
```

getSublocation()
Retrieves the display sublocation where the canvas app is being called from.
Signature

public String getSublocation()

Return Value

Type: String

The return value can be one of the following strings:

• `S1MobileCardFullview`—The canvas app was called from a mobile card.
• `S1MobileCardPreview`—The canvas app was called from a mobile card preview. The user must click the preview to open the app.
• `S1RecordHomePreview`—The canvas app was called from a record detail page preview. The user must click the preview to open the app.
• `S1RecordHomeFullview`—The canvas app was called from a page layout.

Usage

Use this method to obtain the display sublocation for the canvas app. Use only if the primary display location can be displayed on mobile devices.

`setParametersAsJSON(jsonString)`

Sets the custom parameters for the canvas app.

Signature

public void setParametersAsJSON(String jsonString)

Parameters

`jsonString`

Type: String

The custom parameters that you need to set, serialized into a JSON format string.

Return Value

Type: Void

Usage

Use this method to set the current custom parameters for the canvas app. The parameters must be provided in a JSON string. You can use the `System.JSON.serialize(objectToSerialize)` method to serialize a map into a JSON string.

Setting the custom parameters will overwrite the custom parameters that are set for the current request. If you need to modify the current custom parameters, first get the current set of custom parameters by using `getParametersAsJSON()`, modify the retrieved parameter set as needed, and then use this modified set in your call to `setParametersAsJSON()`.

If the provided JSON string exceeds 32KB, a `System.CanvasException` will be thrown.
Example

This example gets the current custom parameters, adds a new `newCustomParam` parameter with a value of 'TESTVALUE', and sets the current custom parameters.

```java
Canvas.EnvironmentContext env = renderContext.getEnvironmentContext();

// Get current custom params
Map<String, Object> previousParams =
    (Map<String, Object>) JSON.deserializeUntyped(env.getParametersAsJSON());

// Add a new custom param
previousParams.put('newCustomParam', 'TESTVALUE');

// Now replace the parameters with the current parameters plus our new custom param
env.setParametersAsJSON(JSON.serialize(previousParams));
```

RenderContext Interface

A wrapper interface that is used to retrieve application and environment context information.

Namespace

Canvas

Usage

Use this interface to retrieve application and environment context information for your canvas app. For this interface, you don't need to create an implementation. Use the default implementation that Salesforce provides.

IN THIS SECTION:

RenderContext Methods

RenderContext Methods

The following are methods for `RenderContext`.

IN THIS SECTION:

getApplicationContext()

Retrieves the application context information.

getEnvironmentContext()

Retrieves the environment context information.

getApplicationContext()

Retrieves the application context information.
Signature

public Canvas.ApplicationContext getApplicationContext()

Return Value

Type: Canvas.ApplicationContext

Usage

Use this method to get the application context information for your canvas app.

Example

The following example implementation of the CanvasLifecycleHandler onRender() method uses the provided RenderContext to retrieve the application context information and then checks the namespace, version, and app URL.

```java
public void onRender(Canvas.RenderContext renderContext){
    Canvas.ApplicationContext app = renderContext.getApplicationContext();
    if (!'MyNamespace'.equals(app.getNamespace())){
        // This application is installed, add code as needed
        ...
    }

    // Check the application version
    Double currentVersion = Double.valueOf(app.getVersion());
    if (currentVersion <= 5){
        // Add version specific code as needed
        ...
        // Tell the canvas application to operate in deprecated mode
        app.setCanvasUrlPath('/canvas?deprecated=true');
    }
}
```

getEnvironmentContext()

Retrieves the environment context information.

Signature

public Canvas.EnvironmentContext getEnvironmentContext()

Return Value

Type: Canvas.EnvironmentContext

Usage

Use this method to get the environment context information for your canvas app.
Example

The following example implementation of the CanvasLifecycleHandler onRender() method uses the provided RenderContext to retrieve the environment context information and then modifies the custom parameters.

```java
public void onRender(Canvas.RenderContext renderContext) {
    Canvas.EnvironmentContext env = renderContext.getEnvironmentContext();

    // Retrieve the custom params
    Map<String, Object> previousParams = (Map<String, Object>)
        JSON.deserializeUntyped(env.getParametersAsJSON());
    previousParams.put('param1', 1);
    previousParams.put('param2', 3.14159);
    ...

    // Now, add in some opportunity record IDs
    Opportunity[] o = [select id, name from opportunity];
    previousParams.put('opportunities', o);

    // Now, replace the parameters
    env.setParametersAsJSON(JSON.serialize(previousParams));
}
```

Test Class

Contains methods for automated testing of your Canvas classes.

Namespace

Canvas

Usage

Use this class to test your implementation of Canvas.CanvasLifecycleHandler with mock test data. You can create a test Canvas.RenderContext with mock application and environment context data and use this data to verify that your CanvasLifecycleHandler is being invoked correctly.

IN THIS SECTION:

Test Constants
The Test class provides constants that are used as keys when you set mock application and environment context data.

Test Methods
The Test class provides methods for creating test contexts and invoking your CanvasLifecycleHandler with mock data.

Test Constants
The Test class provides constants that are used as keys when you set mock application and environment context data.
When you call `Canvas.Test.mockRenderContext(applicationContextTestValues, environmentContextTestValues)`, you need to provide maps of key-value pairs to represent your mock application and environment context data. The Test class provides static constant strings that you can use as keys for various parts of the application and environment context.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEY_CANVAS_URL</td>
<td>Represents the canvas app URL key in the ApplicationContext.</td>
</tr>
<tr>
<td>KEY_DEVELOPER_NAME</td>
<td>Represents the canvas app developer or API name key in the ApplicationContext.</td>
</tr>
<tr>
<td>KEY_DISPLAY_LOCATION</td>
<td>Represents the canvas app display location key in the EnvironmentContext.</td>
</tr>
<tr>
<td>KEY_LOCATION_URL</td>
<td>Represents the canvas app location URL key in the EnvironmentContext.</td>
</tr>
<tr>
<td>KEY_NAME</td>
<td>Represents the canvas app name key in the ApplicationContext.</td>
</tr>
<tr>
<td>KEY_NAMESPACE</td>
<td>Represents the canvas app namespace key in the ApplicationContext.</td>
</tr>
<tr>
<td>KEY_SUB_LOCATION</td>
<td>Represents the canvas app sublocation key in the EnvironmentContext.</td>
</tr>
<tr>
<td>KEY_VERSION</td>
<td>Represents the canvas app version key in the ApplicationContext.</td>
</tr>
</tbody>
</table>

Test Methods

The Test class provides methods for creating test contexts and invoking your CanvasLifecycleHandler with mock data. The following are methods for Test. All are static methods.

**IN THIS SECTION:**

- `mockRenderContext(applicationContextTestValues, environmentContextTestValues)`
  Creates and returns a test Canvas.RenderContext based on the provided application and environment context parameters.
- `testCanvasLifecycle(lifecycleHandler, mockRenderContext)`
  Calls the canvas test framework to invoke a CanvasLifecycleHandler with the provided RenderContext.

**mockRenderContext(applicationContextTestValues, environmentContextTestValues)**

Creates and returns a test Canvas.RenderContext based on the provided application and environment context parameters.

**Signature**

```java
public static Canvas.RenderContext mockRenderContext(Map<String, String> applicationContextTestValues, Map<String, String> environmentContextTestValues)
```

**Parameters**

- `applicationContextTestValues`
  Type: Map<String, String>
  Specifies a map of key-value pairs that provide mock application context data. Use constants that are provided by Canvas.Test as keys. If `null` is provided for this parameter, the canvas framework generates some default mock application context values.
environmentContextTestValues

- **Type:** `Map<String,String>`

  Specifies a map of key-value pairs that provide mock environment context data. Use constants provided by Canvas.Test as keys. If `null` is provided for this parameter, the canvas framework generates some default mock environment context values.

**Return Value**

- **Type:** `Canvas.RenderContext`

**Usage**

Use this method to create a mock `Canvas.RenderContext`. Use the returned RenderContext in calls to `Canvas.Test.testCanvasLifecycle(lifecycleHandler, mockRenderContext)` for testing `Canvas.CanvasLifecycleHandler` implementations.

**Example**

The following example creates maps to represent mock application and environment context data and generates a test `Canvas.RenderContext`. This test RenderContext can be used in a call to `Canvas.Test.testCanvasLifecycle(lifecycleHandler, mockRenderContext)`.

```java
Map<String,String> appValues = new Map<String,String>();
appValues.put(Canvas.Test.KEY_NAMESPACE,'alternateNamespace');
appValues.put(Canvas.Test.KEY_VERSION,'3.0');

Map<String,String> envValues = new Map<String,String>();
envValues.put(Canvas.Test.KEY_DISPLAY_LOCATION,'Chatter');
envValues.put(Canvas.Test.KEY_LOCATION_URL,'https://MyDomainName.my.salesforce.com/_ui/core/chatter/ui/ChatterPage');

Canvas.RenderContext mock = Canvas.Test.mockRenderContext(appValues,envValues);
```

**testCanvasLifecycle(lifecycleHandler, mockRenderContext)**

Calls the canvas test framework to invoke a `CanvasLifecycleHandler` with the provided RenderContext.

**Signature**

```java
public static Void testCanvasLifecycle(Canvas.CanvasLifecycleHandler lifecycleHandler,Canvas.RenderContext mockRenderContext)
```

**Parameters**

- **lifecycleHandler**
  - **Type:** `Canvas.CanvasLifecycleHandler`
  - Specifies the `CanvasLifecycleHandler` implementation that you need to invoke.

- **mockRenderContext**
  - **Type:** `Canvas.RenderContext`
  - Specifies the RenderContext information that you need to provide to the invoked `CanvasLifecycleHandler`. If `null` is provided for this parameter, the canvas framework generates and uses a default mock RenderContext.
Return Value
Type: Void

Usage
Use this method to invoke an implementation of `Canvas.CanvasLifecycleHandler.onRender(renderContext)` with a mock `Canvas.RenderContext` that you provide.

Example
The following example creates maps to represent mock application and environment context data and generates a test `Canvas.RenderContext`. This test `RenderContext` is then used to invoke a `Canvas.CanvasLifecycleHandler`.

```java
// Set some application context data in a Map
Map<String, String> appValues = new Map<String, String>();
appValues.put(Canvas.Test.KEY_NAMESPACE, 'alternateNamespace');
appValues.put(Canvas.Test.KEY_VERSION, '3.0');

// Set some environment context data in a Map
Map<String, String> envValues = new Map<String, String>();
envValues.put(Canvas.Test.KEY_DISPLAY_LOCATION, 'Chatter');
envValues.put(Canvas.Test.KEY_LOCATION_URL, 'https://MyDomainName.my.salesforce.com/_ui/core/chatter/ui/ChatterPage');

// Create a mock RenderContext using the test application and environment context data
Canvas.RenderContext mock = Canvas.Test.mockRenderContext(appValues, envValues);

// Set some custom params on the mock RenderContext
mock.getEnvironmentContext().setParametersAsJSON('{"param1":1,"boolParam":true,"stringParam":"test string"}');

// Use the mock RenderContext to invoke a CanvasLifecycleHandler
Canvas.Test.testCanvasLifecycle(handler, mock)
```

Canvas Exceptions
The `Canvas` namespace contains exception classes.

All exception classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions.

The `Canvas` namespace contains this exception:

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Canvas.CanvasRenderException</code></td>
<td>Use this class in your implementation of <code>Canvas.CanvasLifecycleHandler.onRender(renderContext)</code>. To show an error to the user in your <code>onRender()</code> implementation, throw a <code>Canvas.CanvasRenderException</code>, and the canvas framework will render the error message to the user. This exception will be managed only within the <code>onRender()</code> method.</td>
</tr>
</tbody>
</table>
Example

The following example implementation of `onRender()` catches a `CanvasException` that was thrown because a canvas URL was set with a string that exceeded the maximum length. A `CanvasRenderException` is created and thrown to display the error to the user.

```java
public class MyCanvasListener
    implements Canvas.CanvasLifecycleHandler {

    public void onRender(Canvas.RenderContext renderContext) {
        Canvas.ApplicationContext app = renderContext.getApplicationContext();

        // Code to generate a URL string that is too long
        // ...

        // Try to set the canvas app URL using the invalid URL string
        try {
            app.setCanvasUrlPath(aUrlPathThatIsTooLong);
        } catch (CanvasException e) {
            // Display error to user by throwing a new CanvasRenderException
            throw new Canvas.CanvasRenderException(e.getMessage());
        }
    }
}
```

See the Canvas Developer Guide for additional examples that use `CanvasRenderException`.

ChatterAnswers Namespace

The ChatterAnswers namespace provides an interface for creating Account records.

The following is the interface in the ChatterAnswers namespace.

IN THIS SECTION:

AccountCreator Interface

Creates Account records that will be associated with Chatter Answers users.

AccountCreator Interface

Creates Account records that will be associated with Chatter Answers users.

Namespace

ChatterAnswers

Usage

The ChatterAnswers.AccountCreator is specified in the `registrationClassName` attribute of a chatteranswers:registration Visualforce component. This interface is called by Chatter Answers and allows for custom creation of Account records used for portal users.
To implement the `ChatterAnswers.AccountCreator` interface, you must first declare a class with the `implements` keyword as follows:

```java
public class ChatterAnswersRegistration implements ChatterAnswers.AccountCreator {

Next, your class must provide an implementation for the following method:

```java
public String createAccount(String firstname, String lastname, Id siteAdminId) {
    // Your code here
}
```

The implemented method must be declared as `global` or `public`.

IN THIS SECTION:

AccountCreator Methods

AccountCreator Example Implementation

**AccountCreator Methods**

The following are methods for `AccountCreator`.

IN THIS SECTION:

`createAccount(firstName, lastName, siteAdminId)`

Accepts basic user information and creates an Account record. The implementation of this method returns the account ID.

**createAccount(firstName, lastName, siteAdminId)**

Accepts basic user information and creates an Account record. The implementation of this method returns the account ID.

**Signature**

```java
public String createAccount(String firstName, String lastName, Id siteAdminId)
```

**Parameters**

- `firstName`
  - Type: `String`
  - The first name of the user who is registering.

- `lastName`
  - Type: `String`
  - The last name of the user who is registering.

- `siteAdminId`
  - Type: `ID`
  - The user ID of the Site administrator, used for notification if any exceptions occur.

**Return Value**

- Type: `String`
AccountCreator Example Implementation

This is an example implementation of the ChatterAnswers.AccountCreator interface. The createAccount method implementation accepts user information and creates an Account record. The method returns a String value for the Account ID.

```java
public class ChatterAnswersRegistration implements ChatterAnswers.AccountCreator {
    public String createAccount(String firstname, String lastname, Id siteAdminId) {
        Account a = new Account(name = firstname + ' ' + lastname, ownerId = siteAdminId);

        insert a;
        return a.Id;
    }
}
```

This example tests the code above.

```java
@isTest
private class ChatterAnswersCreateAccountTest {
    static testMethod void validateAccountCreation() {
        User[] user = [SELECT Id, Firstname, Lastname from User WHERE UserType='Standard'];

        if (user.size() == 0) { return; }
        String firstName = user[0].FirstName;
        String lastName = user[0].LastName;
        String userId = user[0].Id;
        String accountId = new ChatterAnswersRegistration().createAccount(firstName, lastName, userId);
        Account acct = [SELECT name, ownerId from Account where Id =: accountId];
        System.assertEquals(firstName + ' ' + lastName, acct.name);
        System.assertEquals(userId, acct.ownerId);
    }
}
```

CommercePayments Namespace

Use the CommercePayments namespace to provide a safe and customizable platform for managing customer payments and refunds.

To review CommercePayments use cases and walkthroughs, go to Use Cases for the CommercePayments Namespace.

The following are the classes in the CommercePayments namespace.

IN THIS SECTION:

- **AbstractResponse Class**
  Contains the normalized response fields from payment gateways that are common to all the other gateway responses.

- **AddressRequest Class**
  Contains address request data that is sent to a gateway adapter during a service call.

- **AuditParamsRequest**
  AuditParamsRequest is used for audit parameters in a transaction request. This is an abstract request class that is extended by the BaseRequest class.
AbstractTransactionResponse Class
Abstract class for storing normalized information sent from payment gateways about a payment transaction. Holds the common response fields sent from payment gateways for authorization, sale, capture, and refund transactions.

AuthApiPaymentMethodRequest Class
Sends information about a payment method to a gateway adapter during an authorization service call.

AuthorizationReversalRequest Class
Sends information about an authorization reversal request to a gateway adapter during a service call.

AuthorizationReversalResponse Class
Response sent by the payment gateway following a payment authorization reversal service.

AuthorizationRequest Class
Sends information about an authorization request to a gateway adapter during a service call.

AuthorizationResponse Class
Response sent by the payment gateway adapter for an authorization service.

BaseApiPaymentMethodRequest Class
Abstract class used to send information about a payment method to a gateway adapter during a service call.

BaseNotification Class
Abstract class for storing notification information sent from payment gateways.

BasePaymentMethodRequest Class
Abstract class for storing information about payment methods.

BaseRequest Class
BaseRequest is extended by all the request classes.

CaptureNotification Class
When a payment gateway sends a notification for a capture transaction, the payment gateway adapter creates the CaptureNotification object to store information about the notification.

CaptureRequest Class
Represents a capture request. This class extends the BaseRequest class and inherits all its methods.

CaptureResponse Class
The payment gateway adapter sends this response for the capture request type. This class extends AbstractResponse and inherits its methods.

CardCategory Enum
Defines whether the payment method represents a credit card or a debit card.

CardPaymentMethodRequest Class
Sends data related to a card payment method to a gateway adapter during a service call.

CustomMetadataTypeInfo Class
Access information about custom metadata. The PaymentGatewayAdapter can send CustomMetadataTypeInfo to transaction requests through the response object's SalesforceResultCodeInfo.

GatewayErrorResponse Class
Use to respond with an error indication following errors from the PaymentGateway adapter, such as request-forbidden responses, custom validation errors, or expired API tokens.
GatewayNotificationResponse Class
When the payment gateway sends a notification to the payments platform, the platform responds with a GatewayNotificationResponse indicating whether the platform succeeded or failed at receiving the notification.

GatewayResponse Interface
Generic payment gateway response interface. This class extends the CaptureResponse on page 309, AbstractTransactionResponse on page 265, and AbstractResponse on page 256 classes and inherits all their properties. It has no unique methods or parameters.

NotificationClient Class
Communicates with the payment platform regarding the gateway’s notification.

NotificationSaveResult Class
Contains the result of the payment platform’s attempt to record data from the gateway’s notification.

NotificationStatus Enum
Shows whether the payments platform successfully received the notification from the gateway.

PaymentGatewayAdapter Interface
PaymentGatewayAdapters can implement this interface in order to process requests.

PaymentGatewayAsyncAdapter Interface
Implement the interface to allow customers to process payments asynchronously.

PaymentGatewayContext Class
Wraps the information related to a payment request.

PaymentGatewayNotificationContext Class
Wraps the information related to a gateway notification.

PaymentMethodTokenizationRequest Class
Stores data about a request to tokenize a card payment method. The tokenization process occurs in the payment gateway. This process replaces sensitive customer data, such as a card number or CVV, with unique identification symbols. The symbols are used while the data is handled by Salesforce, the payment gateway, and the customer bank, allowing Salesforce to store the token without storing sensitive customer data.

PaymentMethodTokenizationResponse Class
Gateway response sent by payment gateway adapters for the payment method tokenization request. The response includes the payment method’s token ID value.

PaymentGatewayNotificationRequest Class
Contains the notification request data from the gateway.

PaymentsHttp Class
Makes an HTTP request to start the interaction with the payment gateway.

RefundRequest Class
Sends data related to a refund to the payment gateway adapter.

ReferencedRefundNotification Class
When a payment gateway sends a notification for a refund transaction, the payment gateway adapter creates the ReferencedRefundNotification object to store information about notification.

ReferencedRefundRequest
Access information about the referenced refund requests. Extends the RefundRequest class.

ReferencedRefundResponse Class
The payment gateway adapter sends this response for the ReferencedRefund request type.
RequestType Enum
Defines the type of payment transaction request made to the payment gateway.

SaleApiPaymentMethodRequest Class
Sends data related to a card payment method to a gateway adapter during a sale service call.

SaleRequest Class
Stores information about a sales request.

SaleResponse Class
Response sent by payment gateway adapters for a sales service.

SalesforceResultCode Enum
Defines the gateway call status values in Salesforce based on the call status values that the payment gateway returned.

SalesforceResultCodeInfo
Stores Salesforce result code information from payment gateway adapters.

AbstractResponse Class
Contains the normalized response fields from payment gateways that are common to all the other gateway responses.

Namespace
CommercePayments

Usage
You must specify the CommercePayments namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```
```

This class can’t be instantiated on its own. This class implements the GatewayResponse class. Other GatewayResponse classes extend this class to inherit common properties.

IN THIS SECTION:
AbstractResponse Methods

AbstractResponse Methods
The following are methods for AbstractResponse.

IN THIS SECTION:

```
setGatewayAvsCode(gatewayAvsCode)
Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)
Sets the date that the transaction occurred. Some gateways don’t send this value.

setGatewayMessage(gatewayMessage)
Sets error messages that the gateway returned for the payment request. Maximum length of 255 characters.
```
setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

setGatewayAvsCode(gatewayAvsCode)
Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

Signature

global void setGatewayAvsCode(String gatewayAvsCode)

Parameters

gatewayAvsCode
  Type: String
  Code sent by gateways that use an address verification system.

Return Value

Type: void

setGatewayDate(gatewayDate)
Sets the date that the transaction occurred. Some gateways don’t send this value.

Signature

global void setGatewayDate(Datetime gatewayDate)

Parameters

gatewayDate
  Type: Datetime
  Date and time of the gateway communication.

Return Value

Type: void

setGatewayMessage(gatewayMessage)
Sets error messages that the gateway returned for the payment request. Maximum length of 255 characters.
Signature

`global void setGatewayMessage(String gatewayMessage)`

Parameters

gatewayMessage
   Type: String
   Information on error messages sent from the gateway.

Return Value

Type: void

`setGatewayResultCode(String gatewayResultCode)`

Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

`global void setGatewayResultCode(String gatewayResultCode)`

Parameters

gatewayResultCode
   Type: String
   Gateway-specific result code. Must be used to map a Salesforce-specific result code.

Return Value

Type: void

`setGatewayResultCodeDescription(String gatewayResultCodeDescription)`

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature

`global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)`

Parameters

gatewayResultCodeDescription
   Type: String
   Description of the gateway’s result code. Use this field to learn more about why the gateway returned a certain result code.

Return Value

Type: void
setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Signature

Parameters

salesforceResultCodeInfo
Type: commercepayments.SalesforceResultCodeInfo on page 377
Description of the Salesforce result code value.

Return Value

Type: void

AddressRequest Class

Contains address request data that is sent to a gateway adapter during a service call.

Namespace

CommercePayments

Usage

Contains information about the payment method’s address. Use this information in authorization, sale, and tokenization requests. The payment gateway adapter uses information in an AddressRequest object to construct a JSON request to send to the payment gateway. The constructor of this class takes no arguments. For example:

CommercePayments.AddressRequest adr = new CommercePayments.AddressRequest();

IN THIS SECTION:

AddressRequest Constructors
AddressRequest Properties
AddressRequest Methods

AddressRequest Constructors

The following are constructors for AddressRequest.
IN THIS SECTION:

AddressRequest(street, city, state, country, postalCode)

Constructs a sample address. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

AddressRequest(street, city, state, country, postalCode)

Constructs a sample address. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

global AddressRequest(String street, String city, String state, String country, String postalCode)

Parameters

street
  Type: String
  Street for the payment method's address.

city
  Type: String
  City for the payment method's address.

state
  Type: String
  State for the payment method's address.

country
  Type: String
  Country for the payment method's address.

postalCode
  Type: String
  Postal code for the payment method's address.

AddressRequest Properties

The following are properties for AddressRequest.

IN THIS SECTION:

  city
  City of the payment method address.

  companyName
  Company name of the payment method address.

  country
  Country for the payment method address.
postalCode
Postal code for the payment method address.

state
State for the payment method address.

street
Street for the payment method address.

city
City of the payment method address.

Signature
global String city {get; set;}

Property Value
Type: String

companyName
Company name of the payment method address.

Signature
global String companyName {get; set;}

Property Value
Type: String

country
Country for the payment method address.

Signature
global String country {get; set;}

Property Value
Type: String

postalCode
Postal code for the payment method address.

Signature
global String postalCode {get; set;}

261
Property Value
Type: String

state
State for the payment method address.

Signature
global String state {get; set;}

Property Value
Type: String

street
Street for the payment method address.

Signature
global String street {get; set;}

Property Value
Type: String

AddressRequest Methods
The following are methods for AddressRequest.

IN THIS SECTION:
equals(obj)
Maintains the integrity of lists of type AddressRequest by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type AddressRequest.

toString()
Converts a date to a string.

equals(obj)
Maintains the integrity of lists of type AddressRequest by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

Signature
global Boolean equals(Object obj)
Parameters

**obj**
Type: Object
External object whose key is to be validated.

Return Value
Type: Boolean

**hashCode()**
Maintains the integrity of lists of type AddressRequest.

Signature
`global Integer hashCode()`

Return Value
Type: Integer

**toString()**
Converts a date to a string.

Signature
`global String toString()`

Return Value
Type: String

**AuditParamsRequest**

AuditParamsRequest is used for audit parameters in a transaction request. This is an abstract request class that is extended by the BaseRequest class.

Namespace
CommercePayments

Usage
AuditParamsRequest is an abstract class that holds attributes related to audit parameters such as email, IP address, MAC address, and phone number. This class can't be instantiated on its own. All CommercePayments request classes extend this class.
AuditParamsRequest Constructors

The following are constructors for AuditParamsRequest.

AuditParamsRequest(email, macAddress, ipAddress, phone)
This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature
AuditParamsRequest(String email, String macAddress, String ipAddress, String phone)

Parameters
email
Type: String
Email of the client that initiated the request.

macAddress
Type: String
Mac address of the customer’s device. Gateways often use this data in risk checks.

ipAddress
Type: String
The customer’s IP address. Gateways often use this data in risk checks.

phone
Type: String
Phone number of the client that initiated the request.

AuditParamsRequest Properties

The following are properties for AuditParamsRequest.

IN THIS SECTION:

email
Email of the client that initiated the request.

ipAddress
The customer’s IP address. Gateways often use this data in risk checks.
macAddress
Mac address of the customer’s device. Gateways often use this data in risk checks.

phone
Phone number of the client that initiated the request.

e-mail
Email of the client that initiated the request.

Property Value
Type: String

ipAddress
The customer’s IP address. Gateways often use this data in risk checks.

Property Value
Type: String

macAddress
Mac address of the customer’s device. Gateways often use this data in risk checks.

Property Value
Type: String

phone
Phone number of the client that initiated the request.

Property Value
Type: String

AbstractTransactionResponse Class
Abstract class for storing normalized information sent from payment gateways about a payment transaction. Holds the common response fields sent from payment gateways for authorization, sale, capture, and refund transactions.

Namespace
CommercePayments
Usage

Specify the CommercePayments namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```java
```

IN THIS SECTION:

AbstractTransactionResponse Methods

AbstractTransactionResponse Methods

The following are methods for AbstractTransactionResponse.

**IN THIS SECTION:**

- `setAmount(amount)`: Sets the transaction amount. Must be a non-negative value.
- `setGatewayAvsCode(gatewayAvsCode)`: Sets the AVS (address verification system) result code that the gateway returned. Maximum length of 64 characters.
- `setGatewayDate(gatewayDate)`: Sets the date that the notification occurred. Some gateways don’t send this value.
- `setGatewayMessage(gatewayMessage)`: Sets error messages that the gateway returned for the notification request. Maximum length of 255 characters.
- `setGatewayReferenceDetails(gatewayReferenceDetails)`: Sets the payment gateway’s reference details.
- `setGatewayReferenceNumber(gatewayReferenceNumber)`: Sets the payment gateway’s reference number.
- `setGatewayResultCode(gatewayResultCode)`: Sets a gateway-specific result code. You can map the result code to a Salesforce-specific result code. Maximum length of 64 characters.
- `setGatewayResultCodeDescription(gatewayResultCodeDescription)`: Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.
- `setSalesforceResultCodeInfo(salesforceResultCodeInfo)`: Sets the Salesforce-specific result code information.

**setAmount(amount)**

Sets the transaction amount. Must be a non-negative value.

**Signature**

```java
global void setAmount(Double amount)
```
Parameters

*amount*

Type: **Double**

The amount of the transaction.

Return Value

Type: void

**setGatewayAvsCode (gatewayAvsCode)**

Sets the AVS (address verification system) result code that the gateway returned. Maximum length of 64 characters.

Signature

```java
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

*gatewayAvsCode*

Type: **String**

Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.

Return Value

Type: void

**setGatewayDate (gatewayDate)**

Sets the date that the notification occurred. Some gateways don’t send this value.

Signature

```java
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

*gatewayDate*

Type: **Datetime**

The date that the transaction occurred.

Return Value

Type: void

**setGatewayMessage (gatewayMessage)**

Sets error messages that the gateway returned for the notification request. Maximum length of 255 characters.
Signature

```java
global void setGatewayMessage(String gatewayMessage)
```

Parameters

`gatewayMessage`

Type: `String`

The message that the gateway returned with the transaction request. Contains additional information about the transaction.

Return Value

Type: `void`

`setGatewayReferenceDetails` (gatewayReferenceDetails)

Sets the payment gateway’s reference details.

Signature

```java
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

`gatewayReferenceDetails`

Type: `String`

Provides information about the gateway communication.

Return Value

Type: `void`

`setGatewayReferenceNumber` (gatewayReferenceNumber)

Sets the payment gateway’s reference number.

Signature

```java
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

`gatewayReferenceNumber`

Type: `String`

Unique transaction ID created by the payment gateway.

Return Value

Type: `void`
**setGatewayResultCode (gatewayResultCode)**
Sets a gateway-specific result code. You can map the result code to a Salesforce-specific result code. Maximum length of 64 characters.

**Signature**

```java
global void setGatewayResultCode(String gatewayResultCode)
```

**Parameters**

- `gatewayResultCode` Type: `String`  
  Gateway-specific result code. Must be mapped to a Salesforce-specific result code.

**Return Value**

Type: void

**setGatewayResultCodeDescription (gatewayResultCodeDescription)**
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

**Signature**

```java
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

**Parameters**

- `gatewayResultCodeDescription` Type: `String`  
  Provides additional information about the result code and why the gateway returned the specific code. Descriptions vary between different gateways.

**Return Value**

Type: void

**setSalesforceResultCodeInfo (salesforceResultCodeInfo)**
Sets the Salesforce-specific result code information.

**Signature**

```java
```

**Parameters**

- `salesforceResultCodeInfo` Type: `commercepayments.SalesforceResultCodeInfo` on page 377
Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Return Value
Type: void

AuthApiPaymentMethodRequest Class
Sends information about a payment method to a gateway adapter during an authorization service call.

Namespace
CommercePayments

Usage
Contains information about the payment method that is used for an authorization request. It contains all available payment methods as fields, but populates only one field for each request. The gateway adapter uses this class when constructing an authorization request. An object of this class is available through the paymentMethod field on the AuthorizationRequest Class object.

IN THIS SECTION:
  AuthApiPaymentMethodRequest Constructors
  AuthApiPaymentMethodRequest Properties

AuthApiPaymentMethodRequest Constructors
The following are constructors for AuthApiPaymentMethodRequest.

IN THIS SECTION:
  AuthApiPaymentMethodRequest(cardPaymentMethodRequest)
  AuthApiPaymentMethodRequest()

AuthApiPaymentMethodRequest(cardPaymentMethodRequest)
Constructs a sample cardPaymentMethodRequest. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature
```
global AuthApiPaymentMethodRequest(commercepayments.CardPaymentMethodRequest cardPaymentMethodRequest)
```
Parameters

cardPaymentMethodRequest
Type: commercepayments.CardPaymentMethodRequest on page 315
Contains information about the card payment method. Used to send information to a gateway adapter during a service call.

AuthApiPaymentMethodRequest()
Constructor for AuthApiPaymentMethodRequest.

Signature

global AuthApiPaymentMethodRequest()

AuthApiPaymentMethodRequest Properties
The following are properties for AuthApiPaymentMethodRequest.

IN THIS SECTION:
cardPaymentMethod
The card payment method object used in a payment method request.

cardPaymentMethod
The card payment method object used in a payment method request.

Signature

global commercepayments.CardPaymentMethodRequest cardPaymentMethod {get; set;}

Property Value
Type: commercepayments.CardPaymentMethodRequest on page 315

AuthorizationReversalRequest Class
Sends information about an authorization reversal request to a gateway adapter during a service call.

Namespace
CommercePayments on page 253

Example

Add your reversal classes to your payment gateway adapter. We recommend adding AuthorizationReversal as a possible requestType value when calling processRequest on the gateway’s response.

```cpp
global commercepayments.GatewayResponse processRequest(commercepayments.paymentGatewayContext gatewayContext) {
```
commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();

commercepayments.GatewayResponse response;

try {
    //add other requestType values here
    //..
    else if (requestType == commercepayments.RequestType.AuthorizationReversal) {
        response =
            createAuthReversalResponse((commercepayments.AuthorizationReversalRequest)gatewayContext.getPaymentRequest());
    }
    return response;

Then, add a class that sets the amount of the authorization reversal request, as well as gateway information and the Salesforce result code.

global commercepayments.GatewayResponse
createAuthReversalResponse(commercepayments.AuthorizationReversalRequest authReversalRequest)
{
    if(authReversalRequest.amount!=null )
    {
        authReversalResponse.setAmount(authReversalRequest.amount);
    }
    else
    {
        throw new SalesforceValidationException('Required Field Missing : Amount');
    }
    system.debug('Response - success');
    authReversalResponse.setGatewayDate(system.now());
    authReversalResponse.setGatewayResultCode('00');
    authReversalResponse.setGatewayResultCodeDescription('Transaction Normal');
    authReversalResponse.setGatewayReferenceNumber('SF'+getRandomNumber(6));
    authReversalResponse.setSalesforceResultCodeInfo(SUCCESS_SALESFORCE_RESULT_CODE_INFO);
    return authReversalResponse;
}

IN THIS SECTION:
AuthorizationReversalRequest Constructors
AuthorizationReversalRequest Properties
AuthorizationReversalRequest Methods

AuthorizationReversalRequest Constructors
The following are constructors for AuthorizationReversalRequest.
AuthorizationReversalRequest(amount, authorizationId)

Constructor for building the amount in an authorization reversal request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

global AuthorizationReversalRequest(Double amount, String authorizationId)

Parameters

amount
Type: Double
The amount of the authorization reversal request.

authorizationId
Type: String
The authorization request to be reversed.

AuthorizationReversalRequest Properties

The following are properties for AuthorizationReversalRequest.

IN THIS SECTION:

accountId
References the customer account for the transaction where the authorization reversal was performed.

amount
The total amount of the authorization reversal request. Can be positive or negative.

paymentAuthorizationId
References the payment authorization to be reversed.

accountId
References the customer account for the transaction where the authorization reversal was performed.

Signature

global String accountId {get; set;}

Property Value
Type: String
amount
The total amount of the authorization reversal request. Can be positive or negative.

Signature

global Double amount {get; set;}

Property Value
Type: Double

paymentAuthorizationId
References the payment authorization to be reversed.

Signature

global String paymentAuthorizationId {get; set;}

Property Value
Type: String

AuthorizationReversalRequest Methods
The following are methods for AuthorizationReversalRequest.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type AuthorizationReversalRequest by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type AuthorizationReversalRequest by determining the uniqueness of the external object in a list.

toString()
Converts a date to a string.

equals(obj)
Maintains the integrity of lists of type AuthorizationReversalRequest by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

Signature

global Boolean equals(Object obj)
Parameters

`obj`
Type: Object
External object whose key is to be validated.

Return Value
Type: Boolean

`hashCode()`
Maintains the integrity of lists of type `AuthorizationReversalRequest` by determining the uniqueness of the external object in a list.

Signature
```
global Integer hashCode()
```

Return Value
Type: Integer

`toString()`
Converts a date to a string.

Signature
```
global String toString()
```

Return Value
Type: String

`AuthorizationReversalResponse Class`
Response sent by the payment gateway following a payment authorization reversal service.

Namespace
`CommercePayments`

Usage
The constructor of this class takes no arguments. For example:
```
```
Contains information about the payment gateway’s response following an authorization reversal transaction. The gateway adapter uses the payment gateway’s response to populate the AuthorizationReversalResponse fields. The payments platform uses the information from this class to construct the authorization gateway response shown to the user.

Example

This class builds an authorization reversal response that contains the amount of the original reversal request, gateway information, and the Salesforce result code.

```java
{
    if(authReversalRequest.amount!=null)
    {
        authReversalResponse.setAmount(authReversalRequest.amount);
    }
    else
    {
        throw new SalesforceValidationException('Required Field Missing : Amount');
    }

    system.debug('Response - success');
    authReversalResponse.setGatewayDate(system.now());
    authReversalResponse.setGatewayResultCode('00');
    authReversalResponse.setGatewayResultCodeDescription('Transaction Normal');
    authReversalResponse.setGatewayReferenceNumber('SF'+getRandomNumber(6));
    authReversalResponse.setSalesforceResultCodeInfo(SUCCESS_SALESFORCE_RESULT_CODE_INFO);
    return authReversalResponse;
}
```

IN THIS SECTION:

AuthorizationReversalResponse Methods

AuthorizationReversalResponse Methods

The following are methods for AuthorizationReversalResponse.

IN THIS SECTION:

setAmount(amount)
Contains the amount of the authorization reversal. Must be a non-zero value.

setGatewayAvsCode(gatewayAvsCode)
Sets the AVS (Address Verification System) result code that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)
Sets the date that the authorization reversal request occurred in the payment gateway. Some gateways don’t send this value.
setGatewayMessage(gatewayMessage)
Sets error messages that the gateway returned for the authorization reversal request. Maximum length of 255 characters.

setGatewayReferenceDetails(gatewayReferenceDetails)
Stores data that you can use for subsequent authorizations. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

setGatewayReferenceNumber(gatewayReferenceNumber)
Sets a unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

setAmount(amount)
Contains the amount of the authorization reversal. Must be a non-zero value.

**Signature**

```global void setAmount(Double amount)```

**Parameters**

- **amount**
  Type: Double

**Return Value**

Type: void

setGatewayAvsCode(gatewayAvsCode)
Sets the AVS (Address Verification System) result code that the gateway returned. Maximum length of 64 characters.

**Signature**

```global void setGatewayAvsCode(String gatewayAvsCode)```

**Parameters**

- **gatewayAvsCode**
  Type: String
    
    Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.
Return Value
Type: void

**setGatewayDate(gatewayDate)**
Sets the date that the authorization reversal request occurred in the payment gateway. Some gateways don’t send this value.

**Signature**
```
global void setGatewayDate(Datetime gatewayDate)
```

**Parameters**
- **gatewayDate**
  Type: Datetime

Return Value
Type: void

**setGatewayMessage(gatewayMessage)**
Sets error messages that the gateway returned for the authorization reversal request. Maximum length of 255 characters.

**Signature**
```
global void setGatewayMessage(String gatewayMessage)
```

**Parameters**
- **gatewayMessage**
  Type: String

Return Value
Type: void

**setGatewayReferenceDetails(gatewayReferenceDetails)**
Stores data that you can use for subsequent authorizations. You can use any data that isn’t normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

**Signature**
```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

**Parameters**
- **gatewayReferenceDetails**
  Type: String
Return Value
Type: void

**setGatewayReferenceNumber**: *(gatewayReferenceNumber)*
Sets a unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

**Signature**
global void setGatewayReferenceNumber(String gatewayReferenceNumber)

**Parameters**
gatewayReferenceNumber
   - Type: String
     - Unique reference ID created by the payment gateway.

Return Value
Type: void

**setGatewayResultCode**: *(gatewayResultCode)*
Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

**Signature**
global void setGatewayResultCode(String gatewayResultCode)

**Parameters**
gatewayResultCode
   - Type: String
     - Gateway-specific result code. Must be used to map a Salesforce-specific result code.

Return Value
Type: void

**setGatewayResultCodeDescription**: *(gatewayResultCodeDescription)*
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

**Signature**
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
Parameters

gatewayResultCodeDescription
Type: String
Description of the gateway’s result code. Use this field to learn more about why the gateway returned a certain result code.

Return Value
Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Signature

Parameters

salesforceResultCodeInfo
Type: SalesforceResultCodeInfo
Description of the Salesforce result code value.

Return Value
Type: void

AuthorizationRequest Class

Sends information about an authorization request to a gateway adapter during a service call.

Namespace

CommercePayments

Usage

This class contains information about a transaction authorization request. The gateway adapter reads fields from this class while constructing an authorization JSON request to send to the payment gateway. An object of this class is available by calling getPaymentRequest() in the PaymentGatewayContext Class.
Example

Creating a `buildAuthRequest` class to store information about the authorization request.

```java
private String buildAuthRequest(commercepayments.AuthorizationRequest authRequest) {
    // Multiply amount by 100.0 to convert to cents
    String requestBody = createRequestBody(String.ValueOf((authRequest.amount*100.0).intValue()), authRequest);
    return requestBody;
}

private String createRequestBody(String amount, commercepayments.AuthorizationRequest authRequest) {
    JSONGenerator jsonGeneratorInstance = JSON.createGenerator(true);
    String currencyIso = authRequest.currencyIsoCode;
    commercepayments.AuthApiPaymentMethodRequest paymentMethod = authRequest.paymentMethod;
    commercepayments.GatewayErrorResponse error;
    // Write data to the JSON string.
    jsonGeneratorInstance.writeStartObject();
    jsonGeneratorInstance.writeStringField('merchantAccount', '{!$Credential.Username}');
    jsonGeneratorInstance.writeStringField('reference', authRequest.comments == null ? 'randomstring' : authRequest.comments);
    if(currencyIso == null) {
        currencyIso = UserInfo.getDefaultCurrency();
    }
    jsonGeneratorInstance.writeFieldName('amount');
    jsonGeneratorInstance.writeStartObject();
    jsonGeneratorInstance.writeStringField('value', amount);
    jsonGeneratorInstance.writeStringField('currency', currencyIso);
    jsonGeneratorInstance.writeEndObject();
    commercepayments.CardPaymentMethodRequest cardPaymentMethod;
    if(paymentMethod != null) {
        cardPaymentMethod = paymentMethod.cardPaymentMethod;
        if (cardPaymentMethod != null) {
            if (cardPaymentMethod.CardCategory != null) {
                if (commercepayments.CardCategory.CreditCard == cardPaymentMethod.CardCategory) {
                    jsonGeneratorInstance.writeFieldName('card');
                    jsonGeneratorInstance.writeStartObject();
                    if (cardPaymentMethod.cvv != null)
                        jsonGeneratorInstance.writeStringField('cvc', String.ValueOf(cardPaymentMethod.cvv));
                    if (cardPaymentMethod.cardholdername != null)
                        jsonGeneratorInstance.writeStringField('holderName', cardPaymentMethod.cardholdername);
                    if (cardPaymentMethod.cardnumber != null)
                        jsonGeneratorInstance.writeStringField('number', cardPaymentMethod.cardnumber);
                    if (cardPaymentMethod.expiryMonth != null &&
                        cardPaymentMethod.expiryYear != null)
                        String expMonth =
```
((String.valueOf(cardPaymentMethod.expiryMonth)).length() == 1 ? '0' : '') +
String.valueOf(cardPaymentMethod.expiryMonth);
    jsonGeneratorInstance.writeStringField('expiryMonth', expMonth);
    jsonGeneratorInstance.writeStringField('expiryYear',
    String.valueOf(cardPaymentMethod.expiryYear));
} else {
    //Support for other card type
} else {
    throw new SampleValidationException('Required Field Missing :
CardCategory');
} else {
    throw new SampleValidationException('Required Field Missing :
CardPaymentMethod');
} else {
    throw new SampleValidationException('Required Field Missing :
PaymentMethod');
}
jsonGeneratorInstance.writeObject();
return jsonGeneratorInstanceAsString();

IN THIS SECTION:
AuthorizationRequest Constructors
AuthorizationRequest Properties
AuthorizationRequest Methods

AuthorizationRequest Constructors
The following are constructors for AuthorizationRequest.

IN THIS SECTION:
AuthorizationRequest(amount)
Constructor for building the amount in an authorization request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

AuthorizationRequest(amount)
Constructor for building the amount in an authorization request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

global AuthorizationRequest(Double amount)
Parameters

amount
Type: Double
The amount of the authorization.

AuthorizationRequest Properties

The following are properties for AuthorizationRequest.

IN THIS SECTION:

accountId
The customer account where the authorization is performed.
amount
The total amount of the authorization. Can be positive or negative.
comments
Comments about the authorization. Users can enter comments to provide additional information.
currencyIsoCode
The ISO currency code for the authorization request.
paymentMethod
The payment method used to process the authorization in the authorization request.

accountId
The customer account where the authorization is performed.

Signature
global String accountId {get; set;}

Property Value
Type: String

amount
The total amount of the authorization. Can be positive or negative.

Signature
global Double amount {get; set;}

Property Value
Type: Double
comments
Comments about the authorization. Users can enter comments to provide additional information.

Signature

```
global String comments {get; set;}
```

Property Value
Type: String

currencyIsOCodE
The ISO currency code for the authorization request.

Signature

```
global String currencyIsoCode {get; set;}
```

Property Value
Type: String

paymentMethod
The payment method used to process the authorization in the authorization request.

Signature

```
global AuthApiPaymentMethodRequest paymentMethod {get; set;}
```

Property Value
Type: AuthApiPaymentMethodRequest on page 270

AuthorizationRequest Methods
The following are methods for AuthorizationRequest.

IN THIS SECTION:
  equals(obj)
Maintains the integrity of lists of type AuthorizationRequest by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.
  hashCode()
Maintains the integrity of lists of type AuthorizationRequest by determining the uniqueness of the external object in a list.
  toString()
Converts a date to a string.
equals(obj)
Maintains the integrity of lists of type AuthorizationRequest by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

```
obj
Type: Object
External object whose key is to be validated.
```

Return Value

Type: Boolean

hashCode()
Maintains the integrity of lists of type AuthorizationRequest by determining the uniqueness of the external object in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

toString()
Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

AuthorizationResponse Class
Response sent by the payment gateway adapter for an authorization service.

Namespace

CommercePayments
Usage

The constructor of this class takes no arguments. For example:

```
```

Contains information about the payment gateway’s response following an authorization transaction. The gateway adapter uses the payment gateway’s response to populate the `AuthorizationResponse` fields. The payments platform uses the information from this class to construct the authorization gateway response shown to the user.

Example

```java
private commercepayments.GatewayResponse createAuthResponse(HttpResponse response, Double amount) {
    Map<String, Object> mapOfResponseValues = (Map<String, Object>) JSON.deserializeUntyped(response.getBody());

    String resultCode = (String)mapOfResponseValues.get('resultCode');
    if(resultCode != null){
        system.debug('Response - success');
        if(resultCode.equals('Authorised')){
            system.debug('status - authorised');
            authResponse.setGatewayAuthCode((String)mapOfResponseValues.get('authCode'));
        } else {
            //Sample returns 200 with refused status in some cases
            system.debug('status - refused');
            authResponse.setGatewayResultCodeDescription((String)mapOfResponseValues.get('refusalReason'));
        }
    } else {
        system.debug('Response - failed');
        string statusCode = (String)mapOfResponseValues.get('errorType');
        string message = (String)mapOfResponseValues.get('message');
        commercepayments.GatewayErrorResponse error = new commercepayments.GatewayErrorResponse(errorType, message);
    }

    authResponse.setGatewayReferenceNumber((String)mapOfResponseValues.get('pspReference'));
    authResponse.setAmount(amount);
    authResponse.setGatewayDate(system.now());
    return authResponse;
}
```
IN THIS SECTION:
AuthorizationResponse Methods

AuthorizationResponse Methods
The following are methods for AuthorizationResponse.

setAmount(amount)
Sets the amount of the authorization. Must be a non-zero value.

setAuthorizationExpirationDate(authExpDate)
Sets the expiration date of the authorization request.

setGatewayAuthCode(gatewayAuthCode)
Sets the authorization code that the gateway returned. Maximum length of 64 characters.

setGatewayAvsCode(gatewayAvsCode)
Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)
Sets the date that the authorization occurred. Some gateways don’t send this value.

setGatewayMessage(gatewayMessage)
Sets error messages that the gateway returned for the authorization request. Maximum length of 255 characters.

setGatewayReferenceDetails(gatewayReferenceDetails)
Stores data that you can use for subsequent authorizations. You can use any data that isn’t normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

setGatewayReferenceNumber(gatewayReferenceNumber)
Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse)
Sets information from the gateway about the tokenized payment method.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.
setAmount(amount)
Sets the amount of the authorization. Must be a non-zero value.

Signature
global void setAmount(Double amount)

Parameters
amount
Type: Double

Return Value
Type: void

setAuthorizationExpirationDate(authExpDate)
Sets the expiration date of the authorization request.

Signature
global void setAuthorizationExpirationDate(Datetime authExpDate)

Parameters
authExpDate
Type: Datetime

Return Value
Type: void

setGatewayAuthCode(gatewayAuthCode)
Sets the authorization code that the gateway returned. Maximum length of 64 characters.

Signature
global void setGatewayAuthCode(String gatewayAuthCode)

Parameters
gatewayAuthCode
Type: String
The authorization code returned by the gateway.

Return Value
Type: void
**setGatewayAvsCode (gatewayAvsCode)**
Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

**Signature**
`global void setGatewayAvsCode(String gatewayAvsCode)`

**Parameters**
gatewayAvsCode  
Type: `String`  
Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.

**Return Value**
Type: void

**setGatewayDate (gatewayDate)**
Sets the date that the authorization occurred. Some gateways don’t send this value.

**Signature**
`global void setGatewayDate(Datetime gatewayDate)`

**Parameters**
gatewayDate  
Type: `Datetime`  

**Return Value**
Type: void

**setGatewayMessage (gatewayMessage)**
Sets error messages that the gateway returned for the authorization request. Maximum length of 255 characters.

**Signature**
`global void setGatewayMessage(String gatewayMessage)`

**Parameters**
gatewayMessage  
Type: `String`
Return Value
Type: void

**setGatewayReferenceDetails** (gatewayReferenceDetails)
Stores data that you can use for subsequent authorizations. You can use any data that isn’t normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

Signature
```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters
`gatewayReferenceDetails`
Type: String

Return Value
Type: void

**setGatewayReferenceNumber** (gatewayReferenceNumber)
Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

Signature
```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters
`gatewayReferenceNumber`
Type: String

Unique authorization ID created by the payment gateway.

Return Value
Type: void

**setGatewayResultCode** (gatewayResultCode)
Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature
```
global void setGatewayResultCode(String gatewayResultCode)
```
Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Must be used to map a Salesforce-specific result code.

Return Value
Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature

global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)

Parameters

gatewayResultCodeDescription
Type: String

Description of the gateway's result code. Use this field to learn more about why the gateway returned a certain result code.

Return Value
Type: void

setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse)

Sets information from the gateway about the tokenized payment method.

Signature

global void setPaymentMethodTokenizationResponse(commercepayments.PaymentMethodTokenizationResponse paymentMethodTokenizationResponse)

Parameters

paymentMethodTokenizationResponse
PaymentMethodTokenizationResponse on page 342

Gateway response sent by payment gateway adapters for the payment method tokenization request.

Return Value
Type: void
**setSalesforceResultCodeInfo(salesforceResultCodeInfo)**

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

**Signature**

```java
```

**Parameters**

- `salesforceResultCodeInfo`  
  - Type: `SalesforceResultCodeInfo` on page 377  
  - Description of the Salesforce result code value.

**Return Value**

Type: `void`

---

**BaseApiPaymentMethodRequest Class**

Abstract class used to send information about a payment method to a gateway adapter during a service call.

**Namespace**

`CommercePayments`

**Usage**

`BaseApiPaymentMethodRequest` is the base class for `SaleApiPaymentMethodRequest` and `AuthApiPaymentMethodRequest`.

**BaseApiPaymentMethodRequest Constructors**

The following are constructors for `BaseApiPaymentMethodRequest`.

**BaseApiPaymentMethodRequest(address, id, saveForFuture)**

Constructs a payment method. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.
**BaseApiPaymentMethodRequest(address, id, saveForFuture)**

Constructs a payment method. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

**Signature**

```java
global BaseApiPaymentMethodRequest(commercepayments.AddressRequest address, String id, Boolean saveForFuture)
```

**Parameters**

- **address**
  - Type: `commercepayments.AddressRequest` on page 259
  - Sends data related on address request to a gateway adapter during a service call.
- **id**
  - Type: `String`
- **saveForFuture**
  - Type: `Boolean`
  - Indicates whether Salesforce saves the payment method for future use.

**BaseApiPaymentMethodRequest Properties**

The following are properties for `BaseApiPaymentMethodRequest`.

**IN THIS SECTION:**

- **address**
  - The payment method’s address.
- **id**
  - ID of the payment method request.
- **saveForFuture**
  - Indicates whether the payment method is saved as a record in Salesforce for future use.

**address**

The payment method’s address.

**Signature**

```java
global commercepayments.AddressRequest address {get; set;}
```

**Property Value**

- Type: `AddressRequest` on page 259
**id**
ID of the payment method request.

**Signature**
global String id {get; set;}

**Property Value**
Type: String

**saveForFuture**
Indicates whether the payment method is saved as a record in Salesforce for future use.

**Signature**
global Boolean saveForFuture {get; set;}

**Property Value**
Type: Boolean

**BaseApiPaymentMethodRequest Methods**
The following are methods for `BaseApiPaymentMethodRequest`.

IN THIS SECTION:
- equals(obj)
  Maintains the integrity of lists of type `BaseApiPaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.
- hashCode()
  Maintains the integrity of lists of type `BaseApiPaymentMethodRequest` by determining the uniqueness of the external object records in a list.
- toString()
  Converts a date to a string.

**equals(obj)**
Maintains the integrity of lists of type `BaseApiPaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

**Signature**
global Boolean equals(Object obj)
Parameters

\( obj \)
Type: Object
External object whose key is to be validated.

Return Value
Type: Boolean

**hashCode()**
Maintains the integrity of lists of type `BaseApiPaymentMethodRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value
Type: Integer

**toString()**
Converts a date to a string.

Signature

```
global String toString()
```

Return Value
Type: String

**BaseNotification Class**
Abstract class for storing notification information sent from payment gateways.

**Namespace**
`CommercePayments`

**Usage**
An abstract class that contains the common fields from payment gateways. `BaseNotification` can't be instantiated on its own. The constructor of this class takes no arguments. For example:

```
CommercePayments.BaseNotification bnt = new CommercePayments.BaseNotification();
```
Example

```java
commercepayments.BaseNotification notification = null;
if ('CAPTURE'.equals(eventCode)) {
    notification = new commercepayments.CaptureNotification();
} else if ('REFUND'.equals(eventCode)) {
    notification = new commercepayments.ReferencedRefundNotification();
}
```

IN THIS SECTION:

**BaseNotification Methods**

The following are methods for `BaseNotification`.

**setAmount(amount)**
Sets the transaction amount. Must be a non-negative value.

**setGatewayDate(gatewayDate)**
Sets the date that the notification occurred. Some gateways don’t send this value.

**setGatewayMessage(gatewayMessage)**
Sets error messages that the gateway returned for the notification request. Maximum length of 255 characters.

**setGatewayReferenceDetails(gatewayReferenceDetails)**
Sets the payment gateway’s reference details.

**setGatewayReferenceNumber(gatewayReferenceNumber)**
Sets the payment gateway’s reference number.

**setGatewayResultCode(gatewayResultCode)**
Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

**setGatewayResultCodeDescription(gatewayResultCodeDescription)**
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

**setId(id)**
Sets the ID of the notification sent by the gateway.

**setSalesforceResultCodeInfo(salesforceResultCodeInfo)**
Sets the information about the Salesforce-specific result code used to match a result code from a payment gateway.

**setStatus(status)**
Sets the status of the notification sent by the gateway.

**setAmount(amount)**
Sets the transaction amount. Must be a non-negative value.
Signature

```plaintext
global void setAmount(Double amount)
```

Parameters

`amount`  
Type: `Double`  
The amount of the transaction.

Return Value

Type: `void`

---

**setGatewayDate (gatewayDate)**

Sets the date that the notification occurred. Some gateways don’t send this value.

Signature

```plaintext
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

`gatewayDate`  
Type: `Datetime`  
The date that the notification occurred.

Return Value

Type: `void`

---

**setGatewayMessage (gatewayMessage)**

Sets error messages that the gateway returned for the notification request. Maximum length of 255 characters.

Signature

```plaintext
global void setGatewayMessage(String gatewayMessage)
```

Parameters

`gatewayMessage`  
Type: `String`  
The message that the gateway returned with the notification request. Contains additional information about the notification.

Return Value

Type: `void`
setGatewayReferenceDetails(gatewayReferenceDetails)
Sets the payment gateway's reference details.

Signature

global void setGatewayReferenceDetails(String gatewayReferenceDetails)

Parameters

gatewayReferenceDetails
Type: String
Provides information about the gateway communication.

Return Value
Type: void

setGatewayReferenceNumber(gatewayReferenceNumber)
Sets the payment gateway's reference number.

Signature

global void setGatewayReferenceNumber(String gatewayReferenceNumber)

Parameters

gatewayReferenceNumber
Type: String
Unique transaction ID created by the payment gateway.

Return Value
Type: void

setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

global void setGatewayResultCode(String gatewayResultCode)

Parameters

gatewayResultCode
Type: String
Gateway-specific result code. Must be used to map a Salesforce-specific result code.
Return Value
Type: void

`setGatewayResultCodeDescription(gatewayResultCodeDescription)`
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature
`global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)`

Parameters
`gatewayResultCodeDescription`
Type: `String`
Provides additional information about the result code and why the gateway returned the code. Descriptions vary between different gateways.

Return Value
Type: void

`setId(id)`
Sets the ID of the notification sent by the gateway.

Signature
`global void setId(String id)`

Parameters
`id`
Type: `String`

Return Value
Type: void

`setSalesforceResultCodeInfo(salesforceResultCodeInfo)`
Sets the information about the Salesforce-specific result code used to match a result code from a payment gateway.

Signature
Parameters

\textit{salesforceResultCodeInfo}

\textbf{Type:} \texttt{commercepayments.SalesforceResultCodeInfo} on page 377

Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Return Value

\textbf{Type:} void

\textbf{setStatus (status)}

Sets the status of the notification sent by the gateway.

Signature

\texttt{global void setStatus(commercepayments.NotificationStatus status)}

Parameters

\textit{status}

\textbf{Type:} \texttt{commercepayments.NotificationStatus} on page 330

Shows whether the payments platform successfully received the notification from the gateway.

Return Value

\textbf{Type:} void

\textbf{BasePaymentMethodRequest Class}

Abstract class for storing information about payment methods.

Namespace

\texttt{CommercePayments}

Usage

The \texttt{BasePaymentMethodRequest} class contains fields common to \texttt{CardPaymentMethodRequest} on page 315.

IN THIS SECTION:

BasePaymentMethodRequest Methods

\textbf{BasePaymentMethodRequest Methods}

The following are methods for \texttt{BasePaymentMethodRequest}. 

300
equals(obj)
Maintains the integrity of lists of type BasePaymentMethodRequest by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type BasePaymentMethodRequest by determining the uniqueness of the external object records in a list.

toString()
Converts a date to a string.

equals(obj)
Maintains the integrity of lists of type BasePaymentMethodRequest by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

Signature

global Boolean equals(Object obj)

Parameters

obj
Type: Object
External object whose key is to be validated.

Return Value
Type: Boolean

hashCode()
Maintains the integrity of lists of type BasePaymentMethodRequest by determining the uniqueness of the external object records in a list.

Signature

global Integer hashCode()

Return Value
Type: Integer

toString()
Converts a date to a string.

Signature

global String toString()
Return Value
Type: String

BaseRequest Class
BaseRequest is extended by all the request classes.

Namespace
CommercePayments

IN THIS SECTION:
BaseRequest Methods

BaseRequest Methods
The following are methods for BaseRequest.

IN THIS SECTION:
BaseRequest(AdditionalData, IdempotencyKey)
Used for testing.

BaseRequest(AdditionalData, IdempotencyKey)
Used for testing.

Signature
global Void BaseRequest(String AdditionalData, Map<String, String> IdempotencyKey)

Parameters
AdditionalData
Type: String
Contains additional data that may be required for a payment request. The additionalData object consists of key-value pairs. You can retrieve the additionalData object from the request object: Map<String, String> additionalData=request.additionalData

IdempotencyKey
Type: Map<String, String>
Unique value that's generated by a client and sent to the server in the request. The server stores the value and uses the it to keep track of the request status.

Return Value
Type: Void
CaptureNotification Class

When a payment gateway sends a notification for a capture transaction, the payment gateway adapter creates the `CaptureNotification` object to store information about the notification.

Namespace

`CommercePayments`

Usage

`CaptureNotification` is used in asynchronous payment gateway adapters. Specify the `CommercePayments` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```
CommercePayments.CaptureNotification crn = new CommercePayments.CaptureNotification();
```

Example

```
commercepayments.BaseNotification notification = null;
if ('CAPTURE'.equals(eventCode)) {
    notification = new commercepayments.CaptureNotification();
} else if ('REFUND'.equals(eventCode)) {
    notification = new commercepayments.ReferencedRefundNotification();
}
```

IN THIS SECTION:

CaptureNotification Methods

The following are methods for `CaptureNotification`.

IN THIS SECTION:

- `setAmount(amount)`
  Sets the transaction amount. Must be a non-negative value.
- `setGatewayDate(gatewayDate)`
  Sets the date that the transaction occurred. Some gateways don't send this value.
- `setGatewayMessage(gatewayMessage)`
  Sets error messages that the gateway returned for the payment request. Maximum length of 255 characters.
- `setGatewayReferenceDetails(gatewayReferenceDetails)`
  Sets additional data that you can use for subsequent transactions. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.
- `setGatewayReferenceNumber(gatewayReferenceNumber)`
  Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.
setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets a description of the gateway-specific result code that a gateway returned. Maximum length of 1000 characters.

setId(id)
Sets the ID of a notification sent by the payment gateway.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

setStatus(status)
Sets the notification status to the same value that was sent by the gateway.

setAmount(amount)
Sets the transaction amount. Must be a non-negative value.

Signature

global void setAmount(Double amount)

Parameters

amount
Type: Double
The amount to be debited or captured.

Return Value

Type: void

setGatewayDate(gatewayDate)
Sets the date that the transaction occurred. Some gateways don’t send this value.

Signature

global void setGatewayDate(Datetime gatewayDate)

Parameters

gatewayDate
Type: Datetime
Date and time of the gateway communication.

Return Value

Type: void
**setGatewayMessage(gatewayMessage)**
Sets error messages that the gateway returned for the payment request. Maximum length of 255 characters.

**Signature**

```java
global void setGatewayMessage(String gatewayMessage)
```

**Parameters**

gatewayMessage
Type: String
Information on error messages sent from the gateway.

**Return Value**

Type: void

**setGatewayReferenceDetails(gatewayReferenceDetails)**
Sets additional data that you can use for subsequent transactions. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

**Signature**

```java
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

**Parameters**

gatewayReferenceDetails
Type: String

**Return Value**

Type: void

**setGatewayReferenceNumber(gatewayReferenceNumber)**
Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

**Signature**

```java
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

**Parameters**

gatewayReferenceNumber
Type: String
Unique transaction ID created by the payment gateway.
Return Value
Type: void

**setGatewayResultCode (gatewayResultCode)**
Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature
```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters
```
gatewayResultCode
Type: String
Gateway-specific result code. Map this value to a Salesforce-specific result code.
```

Return Value
Type: void

**setGatewayResultCodeDescription (gatewayResultCodeDescription)**
Sets a description of the gateway-specific result code that a gateway returned. Maximum length of 1000 characters.

Signature
```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters
```
gatewayResultCodeDescription
Type: String
Description of the gateway’s result code. Use this field to learn more about why the gateway returned a certain result code.
```

Return Value
Type: void

**setId (id)**
Sets the ID of a notification sent by the payment gateway.

Signature
```
global void setId(String id)
```
Parameters

$id$
Type: String

Return Value
Type: void

`setSalesforceResultCodeInfo(salesforceResultCodeInfo)`
Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Signature

Parameters

`salesforceResultCodeInfo`
Type: `commercepayments.SalesforceResultCodeInfo` on page 377
Description of the Salesforce result code value.

Return Value
Type: void

`setStatus(status)`
Sets the notification status to the same value that was sent by the gateway.

Signature
`global void setStatus(commercepayments.NotificationStatus status)`

Parameters

`status`
Type: `NotificationStatus` on page 330
Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Return Value
Type: void
CaptureRequest Class

Represents a capture request. This class extends the BaseRequest class and inherits all its methods.

Namespace

CommercePayments on page 253

Usage

The CaptureRequest class’s buildCaptureRequest method creates a CaptureRequest object to store payment information, such as value and currency, as JSON strings.

Example

Builds a CaptureRequest object for a multicurrency org.

```java
private String buildCaptureRequest(commercepayments.CaptureRequest captureRequest) {
    Boolean IS_MULTICURRENCY_ORG = UserInfo.isMultiCurrencyOrganization();
    QueryUtils qBuilderForAuth = new QueryUtils(PaymentAuthorization.SObjectType);
    // Add required fields
    qBuilderForAuth.getSelectClause().addField('GatewayRefNumber', false);
    if (IS_MULTICURRENCY_ORG) {
        // addField also takes a boolean to enable translation (uses label instead of actual value)
        qBuilderForAuth.getSelectClause().addField('CurrencyIsoCode', false);
    }
}
```

IN THIS SECTION:

CaptureRequest Constructors

CaptureRequest Properties

CaptureRequest Constructors

The following are constructors for CaptureRequest.

IN THIS SECTION:

CaptureRequest(amount, authorizationId)

This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

CaptureRequest(amount, authorizationId)

This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Parameters

amount

Type: Double
The amount to be debited or captured.

authorizationId

Type: String

Represents a payment authorization record.

CaptureRequest Properties

The following are properties for CaptureRequest.

IN THIS SECTION:

accountId
Account ID value. References an account record.

amount
Amount of currency that needs to be captured.

paymentAuthorizationId
ID value that references a PaymentAuthorization.

accountId

Account ID value. References an account record.

Property Value
Type: String

amount

Amount of currency that needs to be captured.

Property Value
Type: Double

paymentAuthorizationId

ID value that references a PaymentAuthorization.

Property Value
Type: String

CaptureResponse Class

The payment gateway adapter sends this response for the capture request type. This class extends AbstractResponse and inherits its methods.
Namespace

CommercePayments on page 253

Usage

You must specify the CommercePayments namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```java
CommercePayments.CaptureResponse ctr = new CommercePayments.CaptureResponse();
```

IN THIS SECTION:

CaptureResponse Methods

The following are methods for CaptureResponse.

IN THIS SECTION:

- `setAmount(amount)`
  Sets the transaction amount.

- `setAsync(async)`
  Indicates whether the payment gateway adapter used in the payment capture was asynchronous (`true`) or synchronous (`false`).

- `setGatewayAvsCode(gatewayAvsCode)`
  Sets the payment gateway’s AVS (address verification system) code.

- `setGatewayDate(gatewayDate)`
  Sets the payment gateway’s date.

- `setGatewayMessage(gatewayMessage)`
  Sets information or messages that the gateway returned.

- `setGatewayReferenceDetails(gatewayReferenceDetails)`
  Sets the payment gateway’s reference details.

- `setGatewayReferenceNumber(gatewayReferenceNumber)`
  Sets the payment gateway’s reference number.

- `setGatewayResultCode(gatewayResultCode)`
  Sets the payment gateway’s result code.

- `setGatewayResultCodeDescription(gatewayResultCodeDescription)`
  Sets the payment gateway’s result code description.

- `setSalesforceResultCodeInfo(salesforceResultCodeInfo)`
  Sets Salesforce result code information.

### setAmount(amount)

Sets the transaction amount.
**Signature**

global void setAmount(Double amount)

**Parameters**

amount
Type: Double
The amount to be debited or captured.

**Return Value**
Type: void

**setAsync(async)**
Indicates whether the payment gateway adapter used in the payment capture was asynchronous (True) or synchronous (False).

**Signature**

global void setAsync(Boolean async)

**Parameters**

async
Type: Boolean

**Return Value**
Type: void

**setGatewayAvsCode(gatewayAvsCode)**
Sets the payment gateway's AVS (address verification system) code.

**Signature**

global void setGatewayAvsCode(String gatewayAvsCode)

**Parameters**

gatewayAvsCode
Type: String
Payment gateways that use an AVS system return this code.

**Return Value**
Type: void
setGatewayDate (gatewayDate)
Sets the payment gateway’s date.

Signature

global void setGatewayDate(Datetime gatewayDate)

Parameters

gatewayDate
  Type: Datetime
  The date that communication happened with the gateway.

Return Value

Type: void

setGatewayMessage (gatewayMessage)
Sets information or messages that the gateway returned.

Signature

global void setGatewayMessage(String gatewayMessage)

Parameters

gatewayMessage
  Type: String
  Information or error messages returned by the gateway.

Return Value

Type: void

setGatewayReferenceDetails (gatewayReferenceDetails)
Sets the payment gateway’s reference details.

Signature

global void setGatewayReferenceDetails(String gatewayReferenceDetails)

Parameters

gatewayReferenceDetails
  Type: String
  Provides information about the gateway communication.
Return Value
Type: void

`setGatewayReferenceNumber(gatewayReferenceNumber)`
Sets the payment gateway’s reference number.

Signature
`global void setGatewayReferenceNumber(String gatewayReferenceNumber)`

Parameters
`gatewayReferenceNumber`  
Type: String  
Unique transaction ID created by the payment gateway.

Return Value
Type: void

`setGatewayResultCode(gatewayResultCode)`
Sets the payment gateway’s result code.

Signature
`global void setGatewayResultCode(String gatewayResultCode)`

Parameters
`gatewayResultCode`  
Type: String  
The gateway result code. You must map this to a Salesforce result code.

Return Value
Type: void

`setGatewayResultCodeDescription(gatewayResultCodeDescription)`
Sets the payment gateway’s result code description.

Signature
`global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)`
Parameters

gatewayResultCodeDescription
    Type: String
    Description of the GatewayResultCode. Provides additional context about the result code that the gateway returned.

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets Salesforce result code information.

Signature

Parameters

salesforceResultCodeInfo
    SalesforceResultCodeInfoType: commercepayments.SalesforceResultCodeInfo
    Description of the Salesforce result code value.

Return Value

Type: void

CardCategory Enum

Defines whether the payment method represents a credit card or a debit card.

Namespace

CommercePayments on page 253

Enum Values

The following are the values of the commercepayments.CardCategory enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CreditCard</td>
<td>Shows that the payment method is a credit card.</td>
</tr>
<tr>
<td>DebitCard</td>
<td>Shows that the payment method is a debit card.</td>
</tr>
</tbody>
</table>
CardPaymentMethodRequest Class

Sends data related to a card payment method to a gateway adapter during a service call.

Namespace

CommercePayments on page 253

Usage

This class contains details about the card used as a payment method for authorization, sale, or tokenization transaction requests. The gateway adapter reads the fields of this class object while constructing a transaction JSON request to send to the payment gateway. The object of this class is available as the cardPaymentMethod field in the SaleApiPaymentMethodRequest Class, AuthApiPaymentMethodRequest Class, and PaymentMethodTokenizationRequest Class.

Example: This code sample retrieves the cardPaymentMethod object from the paymentMethod class.

```java
commercepayments.CardPaymentMethodRequest cardPaymentMethod = paymentMethod.cardPaymentMethod;
```

IN THIS SECTION:

CardPaymentMethodRequest Constructors

CardPaymentMethodRequest Properties

CardPaymentMethodRequest Methods

CardPaymentMethodRequest Constructors

The following are constructors for CardPaymentMethodRequest.

IN THIS SECTION:

CardPaymentMethodRequest(cardCategory)

Sets the cardCategory value for the card payment method request.

CardPaymentMethodRequest<CardCategory>

Sets the cardCategory value for the card payment method request.

Signature

```
global CardPaymentMethodRequest(commercepayments.CardCategory cardCategory)
```

Parameters

cardCategory

Type: CardCategory on page 314

Defines whether the card payment method is a credit card or a debit card.
CardPaymentMethodRequest Properties

The following are properties for CardPaymentMethodRequest.

IN THIS SECTION:

  accountId
  Customer account for this payment method.

  autoPay
  Indicates whether a token is being requested so that the payment method can be used for recurring payments.

  cardCategory
  Indicates whether a card payment method is for a credit card or debit card.

  cardHolderFirstName
  The first name of the cardholder for the card payment method.

  cardHolderLastName
  The last name of the cardholder for the card payment method.

  cardHolderName
  Full name of the cardholder on the card payment method.

  cardNumber
  System-defined unique ID for the card payment method.

  cardType
  Defines the credit card bank. Possible values are AmericanExpress, DinersClub, JCB, Maestro, MasterCard, and Visa.

  cvv
  The card security code for the credit or debit card on a card payment method.

  email
  Email address of the cardholder for the credit or debit card on a card payment method.

  expiryMonth
  Expiration month for the credit or debit card on a card payment method.

  expiryYear
  Expiration year of the credit or debit card for the card payment method.

  inputCardType
  Input field for the card type. This field doesn’t store the card type directly, but instead populates CardBin, LastFour, and DisplayCardNumber based on the value entered in inputCardType.

  startMonth
  The credit or debit card becomes valid on the first day of the startMonth in the startYear.

  startYear
  Year during which the credit or debit card becomes valid.

accountId
Customer account for this payment method.
**Signature**

```csharp
global String accountId {get; set;}
```

**Property Value**

Type: `String`

---

**autoPay**

Indicates whether a token is being requested so that the payment method can be used for recurring payments.

**Signature**

```csharp
global Boolean autoPay {get; set;}
```

**Property Value**

Type: `Boolean`

---

**cardCategory**

Indicates whether a card payment method is for a credit card or debit card.

**Signature**

```csharp
global commercepayments.CardCategory cardCategory {get; set;}
```

**Property Value**

Type: `CardCategory` on page 314

---

**cardHolderFirstName**

The first name of the cardholder for the card payment method.

**Signature**

```csharp
global String cardHolderFirstName {get; set;}
```

**Property Value**

Type: `String`

---

**cardHolderLastName**

The last name of the cardholder for the card payment method.

**Signature**

```csharp
global String cardHolderLastName {get; set;}
```
Property Value
Type: String

**cardHolderName**
Full name of the cardholder on the card payment method.

**Signature**
global String cardHolderName {get; set;}

Property Value
Type: String

**cardNumber**
System-defined unique ID for the card payment method.

**Signature**
global String cardNumber {get; set;}

Property Value
Type: String

**cardType**
Defines the credit card bank. Possible values are AmericanExpress, DinersClub, JCB, Maestro, MasterCard, and Visa.

**Signature**
global commercepayments.CardType cardType {get; set;}

Property Value
Type: CardType

**cvv**
The card security code for the credit or debit card on a card payment method.

**Signature**
global String cvv {get; set;}

Property Value
Type: String
email
Email address of the cardholder for the credit or debit card on a card payment method.

Signature
global String email {get; set;}

Property Value
Type: String

expiryMonth
Expiration month for the credit or debit card on a card payment method.

Signature
global Integer expiryMonth {get; set;}

Property Value
Type: Integer

expiryYear
Expiration year of the credit or debit card for the card payment method.

Signature
global Integer expiryYear {get; set;}

Property Value
Type: Integer

inputCardType
Input field for the card type. This field doesn’t store the card type directly, but instead populates CardBin, LastFour, and DisplayCardNumber based on the value entered in inputCardType.

Signature
global String inputCardType {get; set;}

Property Value
Type: String
**startMonth**

The credit or debit card becomes valid on the first day of the `startMonth` in the `startYear`.

**Signature**

global Integer startMonth {get; set;}

**Property Value**

Type: Integer

**startYear**

Year during which the credit or debit card becomes valid.

**Signature**

global Integer startYear {get; set;}

**Property Value**

Type: Integer

**CardPaymentMethodRequest Methods**

The following are methods for `CardPaymentMethodRequest`.

**IN THIS SECTION:**

- `equals(obj)`

  Maintains the integrity of lists of type `CardPaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

- `hashCode()`

  Maintains the integrity of lists of type `CardPaymentMethodRequest`.

- `toString()`

  Converts a date to a string.

**equals(obj)**

Maintains the integrity of lists of type `CardPaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

**Signature**

global Boolean equals(Object obj)
Parameters

\textit{obj}

Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

\textbf{hashCode()}

Maintains the integrity of lists of type \texttt{CardPaymentMethodRequest}.

Signature

\texttt{global Integer hashCode()}

Return Value

Type: Integer

\textbf{toString()}

Converts a date to a string.

Signature

\texttt{global String toString()}

Return Value

Type: String

\textbf{CustomMetadataTypeInfo Class}

Access information about custom metadata. The \texttt{PaymentGatewayAdapter} can send \texttt{CustomMetadataTypeInfo} to transaction requests through the response object's \texttt{SalesforceResultCodeInfo}.

Namespace

\textit{CommercePayments} on page 253

IN THIS SECTION:

- \texttt{CustomMetadataTypeInfo Constructors}
- \texttt{CustomMetadataTypeInfo Methods}
CustomMetadataTypeInfo Constructors

The following are constructors for CustomMetadataTypeInfo.

IN THIS SECTION:

    CustomMetadataTypeInfo(cmtRecordId, cmtSfResultCodeFieldName)
    Constructor for providing custom metadata type information.

CustomMetadataTypeInfo (cmtRecordId, cmtSfResultCodeFieldName)

Constructor for providing custom metadata type information.

Signature

global CustomMetadataTypeInfo(String cmtRecordId, String cmtSfResultCodeFieldName)

Parameters

cmtRecordId
    Type: String
    ID of the matched custom metadata type record

cmtSfResultCodeFieldName
    Type: String
    Field that contains the Salesforce result code values. Belongs to the custom metadata type.

CustomMetadataTypeInfo Methods

The following are methods for CustomMetadataTypeInfo.

GatewayErrorResponse Class

Use to respond with an error indication following errors from the PaymentGateway adapter, such as request-forbidden responses, custom validation errors, or expired API tokens.

Namespace

CommercePayments on page 253

Usage

Use GatewayErrorResponse to create an object that stores information about error responses sent by the payment gateway adapter.
Example

If GatewayResponse receives an exception rather than a valid request, it calls GatewayErrorResponse to create an error object with information about the exception.

```apex
global commercepayments.GatewayResponse processRequest(commercepayments.paymentGatewayContext gatewayContext) {
    commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();
    commercepayments.GatewayResponse response;
    try {
        if (requestType == commercepayments.RequestType.Authorize) {
            response = createAuthResponse((commercepayments.AuthorizationRequest)gatewayContext.getPaymentRequest());
        } else if (requestType == commercepayments.RequestType.Capture) {
            response = createCaptureResponse((commercepayments.CaptureRequest)gatewayContext.getPaymentRequest());
        } else if (requestType == commercepayments.RequestType.ReferencedRefund) {
            response = createRefundResponse((commercepayments.ReferencedRefundRequest)gatewayContext.getPaymentRequest());
        }
        return response;
    } catch(SalesforceValidationException e) {
        commercepayments.GatewayErrorResponse error = new commercepayments.GatewayErrorResponse('400', e.getMessage());
        return error;
    }
}
```

IN THIS SECTION:

GatewayErrorResponse Constructors

GatewayErrorResponse Constructors

The following are constructors for GatewayErrorResponse.

IN THIS SECTION:

GatewayErrorResponse(errorCode, errorMessage)

Constructor to create a GatewayErrorResponse object that accepts errorCode and errorMessage.

GatewayErrorResponse(errorCode, errorMessage)

Constructor to create a GatewayErrorResponse object that accepts errorCode and errorMessage.

Signature

```
global GatewayErrorResponse(String errorCode, String errorMessage)
```
Parameters

errorCode
Type: String
Should match with the HTTP status code to be returned to the user. Here are a few examples.

- If the status code is for a bad request, the errorCode should be 400.
- If the status code is for a forbidden request, errorCode should be 403.
- If errorCode isn’t a valid HTTP status code, a 500 internal server error is returned.

Note: errorCode must have a value, otherwise the platform throws an error.

ererrorMessage
Type: String
The message response to users following an error.

Note: errorMessage must have a value, otherwise the platform throws an error.

GatewayNotificationResponse Class

When the payment gateway sends a notification to the payments platform, the platform responds with a GatewayNotificationResponse indicating whether the platform succeeded or failed at receiving the notification.

Namespace

CommercePayments on page 253

Usage

You must specify the CommercePayments namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

When an asynchronous payment gateway sends a notification, the gateway requires the platform to acknowledge that it has either succeeded or failed in receiving the notification. Payment gateway adapters use this class to construct the acknowledgment response, which gateways expect for a notification. GatewayNotificationResponse is the return type of the processNotification method.

Example

commercepayments.GatewayNotificationResponse gnr = new commercepayments.GatewayNotificationResponse();
if (saveResult.isSuccess()) {
    system.debug('Notification accepted by platform');
} else {
    system.debug('Errors in the result ' + Blob.valueOf(saveResult.getErrorMessage()));
}
gnr.setStatusCode(200);
IN THIS SECTION:

GatewayNotificationResponse Methods

GatewayNotificationResponse Methods
The following are methods for GatewayNotificationResponse.

IN THIS SECTION:

setResponseBody(responseBody)
Sets the body of the response to the gateway. Some gateways expect the payments platform to acknowledge the notification with a response regardless of whether the notification was accepted.

setStatusCode(statusCode)
Sets the HTTP status code sent to the gateway as part of the payments platform’s response notification.

setResponseBody (responseBody)
Sets the body of the response to the gateway. Some gateways expect the payments platform to acknowledge the notification with a response regardless of whether the notification was accepted.

Signature
global void setResponseBody(Blob responseBody)

Parameters

responseBody
Type: Blob
Common response values include accepted for successfully receiving the response. For example:

```apex
commercepayments.GatewayNotificationResponse gnr = new commercepayments.GatewayNotificationResponse();
if (saveResult.isSuccess()) {
    system.debug('Notification accepted by platform');
} else {
    system.debug('Errors in the result ' + Blob.valueOf(saveResult.getErrorMessage()));
}
gnr.setStatusCode(200);
gnr.setResponseBody(Blob.valueOf('[accepted]'));
return gnr;
```

Return Value
Type: void
setStatusCode(statusCode)
Sets the HTTP status code sent to the gateway as part of the payments platform's response notification.

Signature

    global void setStatusCode(Integer statusCode)

Parameters

    statusCode
        Type: Integer

The status code will vary based on the type of payments platform response. Users should configure their
GatewayNotificationResponse class to account for all values that their payments platform can possibly return. For
example:

```
commercepayments.GatewayNotificationResponse gnr = new
commercepayments.GatewayNotificationResponse();
if (saveResult.isSuccess()) {
    system.debug('Notification accepted by platform');
} else {
    system.debug('Errors in the result '+ Blob.valueOf(saveResult.getErrorMessage()));
}
gnr.setStatusCode(200);
gnr.setResponseBody(Blob.valueOf('[accepted]'));
return gnr;
```

Return Value

Type: void

GatewayResponse Interface

Generic payment gateway response interface. This class extends the CaptureResponse on page 309,
AbstractTransactionResponse on page 265, and AbstractResponse on page 256 classes and inherits all their properties.
It has no unique methods or parameters.

Namespace

CommercePayments on page 253

IN THIS SECTION:

GatewayResponse Example Implementation

GatewayResponse Example Implementation

This is an example implementation of the commercepayments.GatewayResponse interface.

```
/**
 * Abstract function to build gateway response for a Transaction
```
The input is the response from gateway
It creates and returns GatewayResponse from the HttpResponse

```java
public abstract commercepayments.GatewayResponse buildResponse(HttpResponse response);
```

** Function to process transaction requests
Steps involved are:
1. Build HttpRequest with the input Request from gateway context
2. Send request and get the response from gateway
3. Parse the response from gateway and return GatewayResponse

```java
public commercepayments.GatewayResponse execute(){
    HttpRequest req;
    try{
        //Building a new request
        req = buildRequest();
    } catch(PayeezeValidationException e) {
        return getValidationExceptionError(e);
    }
    commercepayments.PaymentsHttp http = new commercepayments.PaymentsHttp();
    HttpResponse res = null;
    try{
        //Sending the request
        res = http.send(req);
    } catch(CalloutException ce) {
        return getCalloutExceptionError(ce);
    }
    try{
        //Parsing the response from gateway
        return buildResponse(res);
    } catch(Exception e) {
        return getParseExceptionError(e);
    }
}
```

For additional context, review the complete Sample Gateway Adapter in the CommercePayments Gateway Reference Implementation.

**NotificationClient Class**

Communicates with the payment platform regarding the gateway’s notification.

**Namespace**

CommercePayments on page 253

**Usage**

Specify the CommercePayments namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```java
CommercePayments.NotificationClient ntc = new CommercePayments.NotificationClient();
```
This class is used in asynchronous payment gateway adapters. The notification client contains API for communicating with the payments platform regarding the gateway’s notification. When the gateway sends a notification, the gateway adapter invokes the `record` method in `NotificationClient` to request that the platform updates notification details.

**Example**

The `NotificationSaveResult` class creates a `saveResult` object to store the result of the save request made to the payment gateway.

```java
commercepayments.NotificationSaveResult saveResult = commercepayments.NotificationClient.record(notification);
```

**IN THIS SECTION:**
- NotificationClient Methods

**NotificationClient Methods**

The following are methods for `NotificationClient`.

**record(notification)**

Stores the results of a notification request.

**Signature**

```java
global static commercepayments.NotificationSaveResult record(commercepayments.BaseNotification notification)
```

**Parameters**

- `notification`
  - Type: `BaseNotification` on page 295

**Return Value**

Type: `NotificationSaveResult` on page 328

**NotificationSaveResult Class**

Contains the result of the payment platform’s attempt to record data from the gateway’s notification.

**Namespace**

`CommercePayments` on page 253
Usage

This class is used with asynchronous payments. It is the return type of the NotificationClient.record operation and contains the result of the payment platform’s attempt to save notification details.

The constructor of this class takes no arguments. For example:

```java
CommercePayments.NotificationSaveResult nsr = new CommercePayments.NotificationSaveResult();
```

Example

```java
commercepayments.NotificationSaveResult saveResult = commercepayments.NotificationClient.record(notification);
```

In This Section:

- NotificationSaveResult Methods

NotificationSaveResult Methods

The following are methods for NotificationSaveResult.

In This Section:

- `getErrorMessage()`
  Gets the error message, if any, from the payment platform regarding its attempt to save the notification sent from the payment gateway.

- `getStatusCode()`
  Gets the status code from the payment platform’s attempt to save the notification sent from the payment gateway.

- `isSuccess()`
  Gets the status of whether the payment platform successfully saved the notification sent from the payment gateway.

`getErrorMessage()`

Gets the error message, if any, from the payment platform regarding its attempt to save the notification sent from the payment gateway.

**Signature**

```
global String getErrorMessage()
```

**Return Value**

*Type: String*

`getStatusCode()`

Gets the status code from the payment platform’s attempt to save the notification sent from the payment gateway.

**Signature**

```
global Integer getStatusCode()
```

**Return Value**

*Type: Integer*
Signature

```java
global Integer getStatusCode()
```

Return Value

Type: Integer

`isSuccess()`

Gets the status of whether the payment platform successfully saved the notification sent from the payment gateway.

Signature

```java
global Boolean isSuccess()
```

Return Value

Type: Boolean

NotificationStatus Enum

Shows whether the payments platform successfully received the notification from the gateway.

Usage

When the gateway sends a notification for a payment request, the payments platform delegates the notification request to the gateway adapter. First, the adapter evaluates the signature from the notification request. If the signature is valid, the adapter builds a notification object to store information about the notification. During this process, the adapter sets the `NotificationStatus` to `Failed` or `Success` based on information from the notification request.

Enum Values

The following are the values of the `commercepayments.NotificationStatus` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Failed</td>
<td>The payments platform couldn't receive the notification due to an error.</td>
</tr>
<tr>
<td>Success</td>
<td>The payments platform received the notification.</td>
</tr>
</tbody>
</table>

PaymentGatewayAdapter Interface

PaymentGatewayAdapters can implement this interface in order to process requests.

Namespace

`CommercePayments` on page 253
IN THIS SECTION:
PaymentGatewayAdapter Methods

PaymentGatewayAdapter Methods
The following are methods for PaymentGatewayAdapter.

IN THIS SECTION:
processRequest(var1)
The entry point for processing payment requests. Returns the response from the payment gateway.

processRequest(var1)
The entry point for processing payment requests. Returns the response from the payment gateway.

Signature
global commercepayments.GatewayResponse processRequest(commercepayments.PaymentGatewayContext var1)

Parameters
var1
Type: commercepayments.PaymentGatewayContext
You can retrieve the request type and the request from the Context object.

Return Value
Type: commercepayments.GatewayResponse
The response from the payment gateway.

PaymentGatewayAsyncAdapter Interface
Implement the interface to allow customers to process payments asynchronously.

Namespace
CommercePayments on page 253

Usage
Implementing an asynchronous adapter also requires the processNotification method from the GatewayNotificationResponse on page 324 class.
Example

global with sharing class SampleAsyncAdapter implements commercepayments.PaymentGatewayAsyncAdapter, commercepayments.PaymentGatewayAdapter {
  global SampleAsyncAdapter() {} 

  global commercepayments.GatewayResponse processRequest(commercepayments.paymentGatewayContext gatewayContext) {
  }

  global commercepayments.GatewayNotificationResponse processNotification(commercepayments.PaymentGatewayNotificationContext gatewayNotificationContext) {
  }
}

IN THIS SECTION:
  PaymentGatewayAsyncAdapter Methods
  PaymentGatewayAsyncAdapter Example Implementation

PaymentGatewayAsyncAdapter Methods

The following are methods for PaymentGatewayAsyncAdapter.

IN THIS SECTION:
  processNotification(paymentGatewayNotificationContext)
  Entry point for processing notifications from payment gateways.

processNotification(paymentGatewayNotificationContext)

Entry point for processing notifications from payment gateways.

Signature

global commercepayments.GatewayNotificationResponse processNotification(commercepayments.PaymentGatewayNotificationContext var1)

Parameters

paymentGatewayNotificationContext
  Type: PaymentGatewayNotificationContext on page 336
  The PaymentGatewayNotificationContext object wraps all the information related to a gateway notification.

Return Value

Type: GatewayNotificationResponse on page 324

When the payment gateway sends a notification to the payments platform, the platform responds with a GatewayNotificationResponse indicating whether the platform succeeded or failed at receiving the notification.
PaymentGatewayAsyncAdapter Example Implementation

This is a sample implementation of the commercepayments.PaymentGatewayAsyncAdapter interface.

global with sharing class AdyenAdapter implements commercepayments.PaymentGatewayAsyncAdapter, commercepayments.PaymentGatewayAdapter {
    global AdyenAdapter() {
    }
    global commercepayments.GatewayResponse processRequest(commercepayments.paymentGatewayContext gatewayContext) {
    }
    global commercepayments.GatewayNotificationResponse processNotification(commercepayments.PaymentGatewayNotificationContext gatewayNotificationContext) {
    }
}

commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();
if (requestType == commercepayments.RequestType.Capture) {
    req.setEndpoint('/pal/servlet/Payment/v52/capture');
    // Refer to the end of this doc for sample buildCaptureRequest implementation
    body = buildCaptureRequest((commercepayments.CaptureRequest)gatewayContext.getPaymentRequest());
} else if (requestType == commercepayments.RequestType.ReferencedRefund) {
    req.setEndpoint('/pal/servlet/Payment/v52/refund');
    body = buildRefundRequest((commercepayments.ReferencedRefundRequest)gatewayContext.getPaymentRequest());
}

req.setBody(body);
req.setMethod('POST');
commercepayments.PaymentsHttp http = new commercepayments.PaymentsHttp();
HttpResponse res = null;
try {
    res = http.send(req);
} catch(CalloutException ce) {
    commercepayments.GatewayErrorResponse error = new commercepayments.GatewayErrorResponse('500', ce.getMessage());
    return error;
}

if (requestType == commercepayments.RequestType.Capture) {
    // Refer to the end of this doc for sample createCaptureResponse implementation
    response = createCaptureResponse(res);
} else if (requestType == commercepayments.RequestType.ReferencedRefund) {
    response = createRefundResponse(res);
}
return response;

commercepayments.PaymentGatewayNotificationRequest notificationRequest =
gatewayNotificationContext.getPaymentGatewayNotificationRequest();
Blob request = notificationRequest.getRequestBody();
Map<String, Object> jsonReq = (Map<String, Object>)JSON.deserializeUntyped(request.toString());
List<Object> notificationItems = (List<Object>)jsonReq.get('notificationItems');
Map<String, Object> notificationRequestItem =
    ((Map<String, Object>)notificationItems[0]).get('NotificationRequestItem');
Boolean success = Boolean.valueOf(notificationRequestItem.get('success'));
String pspReference = (String)notificationRequestItem.get('pspReference');
String eventCode = (String)notificationRequestItem.get('eventCode');
Double amount = (Double)((Map<String, Object>)notificationRequestItem.get('amount')).get('value');

commercepayments.NotificationStatus notificationStatus = null;
if (success) {
    notificationStatus = commercepayments.NotificationStatus.Success;
} else {
    notificationStatus = commercepayments.NotificationStatus.Failed;
}
commercepayments.BaseNotification notification = null;
if ('CAPTURE'.equals(eventCode)) {
    notification = new commercepayments.CaptureNotification();
} else if ('REFUND'.equals(eventCode)) {
    notification = new commercepayments.ReferencedRefundNotification();
}
notification setStatus(notificationStatus);
notification.setGatewayReferenceNumber(pspReference);
notification.setAmount(amount);

commercepayments.NotificationSaveResult saveResult =
    commercepayments.NotificationClient.record(notification);

commercepayments.GatewayNotificationResponse gnr = new
commercepayments.GatewayNotificationResponse();
if (saveResult.isSuccess()) {
    system.debug('Notification accepted by platform');
} else {
    system.debug('Errors in the result ' + Blob.valueOf(saveResult.getErrorMessage()));
}
gnr.setStatusCode(200);
gnr.setResponseBody(Blob.valueOf('[accepted]'));
return gnr;

PaymentGatewayContext Class
Wraps the information related to a payment request.

Namespace
CommercePayments on page 253

Usage
The constructor of this class takes no arguments. For example:
CommercePayments.PaymentGatewayContext pgc = new CommercePayments.PaymentGatewayContext();

Example

```java
global commercepayments.GatewayResponse processRequest(commercepayments.PaymentGatewayContext gatewayContext) {
    commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();
    if (requestType == commercepayments.RequestType.Capture) {
        commercepayments.CaptureRequest captureRequest = (commercepayments.CaptureRequest) gatewayContext.getPaymentRequest();
    }
}
```

IN THIS SECTION:
- PaymentGatewayContext Constructors
- PaymentGatewayContext Methods

PaymentGatewayContext Constructors

The following are constructors for PaymentGatewayContext.

IN THIS SECTION:
- PaymentGatewayContext(request, requestType)

Constructor to enable instance creation. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

**PaymentGatewayContext(request, requestType)**

Constructor to enable instance creation. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```java
global CommercePayments.PaymentGatewayContext(commercepayments.PaymentGatewayRequest request, String requestType)
```

Parameters

- `request`
  - Type: commercepayments.PaymentGatewayRequest
  - Raw payload. Sensitive attributes are masked to ensure PCI compliance.

- `requestType`
  - Type: String
  - Defines the type of request made to the gateway
PaymentGatewayContext Methods

The following are methods for PaymentGatewayContext.

IN THIS SECTION:

getPaymentRequest()
Returns the payment request object.

gPaymentRequestType()
Returns the payment request type.

getPaymentRequest()

Returns the payment request object.

Signature

global commercepayments.PaymentGatewayRequest getPaymentRequest()

Return Value

Type: PaymentGatewayRequest

getPaymentRequestType()

Returns the payment request type.

Signature

global String getPaymentRequestType()

Return Value

Type: String

PaymentGatewayNotificationContext Class

Wraps the information related to a gateway notification.

Namespace

CommercePayments on page 253

Usage

This class is used with asynchronous payments. It wraps all of the information related to a notification from the payment gateway. The payments platform provides its context to the payment gateway adapters.

The constructor of this class takes no arguments. For example:
CommercePayments.PaymentGatewayNotificationContext pgnc = new CommercePayments.PaymentGatewayNotificationContext();

Example

```java
global commercepayments.GatewayNotificationResponse processNotification(commercepayments.PaymentGatewayNotificationContext
  gatewayNotificationContext) {
  commercepayments.PaymentGatewayNotificationRequest notificationRequest =
  gatewayNotificationContext.getPaymentGatewayNotificationRequest();
}
```

IN THIS SECTION:
  PaymentGatewayNotificationContext Methods

PaymentGatewayNotificationContext Methods

The following are methods for PaymentGatewayNotificationContext.

IN THIS SECTION:
  getPaymentGatewayNotificationRequest()
  Returns the payment gateway’s notification request.

**getPaymentGatewayNotificationRequest()**

Returns the payment gateway’s notification request.

Signature

```java
global commercepayments.PaymentGatewayNotificationRequest
getPaymentGatewayNotificationRequest()
```

Return Value

Type: PaymentGatewayNotificationRequest on page 348

PaymentMethodTokenizationRequest Class

Stores data about a request to tokenize a card payment method. The tokenization process occurs in the payment gateway. This process replaces sensitive customer data, such as a card number or CVV, with unique identification symbols. The symbols are used while the data is handled by Salesforce, the payment gateway, and the customer bank, allowing Salesforce to store the token without storing sensitive customer data.

Namespace

CommercePayments on page 253
Usage

The constructor of this class takes no arguments. For example:

```java
CommercePayments.PaymentMethodTokenizationRequest pmtr = new CommercePayments.PaymentMethodTokenizationRequest();
```

This class holds all the required details about the tokenize request. Gateway adapters read the information in this class while constructing a tokenization JSON request, which is sent to the payment gateway.

Example

The following code is used within your payment gateway adapter Apex class.

Use the `GatewayResponse` class’s `processRequest` method to build responses based on the request type that it receives from an instance of `PaymentGatewayContext` on page 334. If the request type is Tokenize, `GatewayResponse` on page 326 calls the `createTokenizeResponse` method and passes an instance of the `PaymentMethodTokenizationRequest` class. The passed `PaymentMethodTokenizationRequest` object contains the address and cardPaymentMethod information that the payment gateway needs to manage the tokenization process. For example:

```java
public commercepayments.GatewayResponse createTokenizeResponse(commercepayments.PaymentMethodTokenizationRequest tokenizeRequest) {
    commercepayments.PaymentMethodTokenizationResponse tokenizeResponse = new commercepayments.PaymentMethodTokenizationResponse();
    tokenizeResponse.setGatewayTokenEncrypted(encryptedValue);
    tokenizeResponse.setGatewayTokenDetails(tokenDetails);
    tokenizeResponse.setGatewayAvsCode(avsCode);
    return tokenizeResponse;
}
```

Configure the `createTokenizeResponse` method to accept an instance of `PaymentMethodTokenizationRequest`. Then, build an instance of `PaymentMethodTokenizationResponse` based on the values received from the payment gateway.
The `tokenizeResponse` contains the results of the gateway's tokenization process, and if successful, the tokenized value.

IN THIS SECTION:
- PaymentMethodTokenizationRequest Constructors
- PaymentMethodTokenizationRequest Properties
- PaymentMethodTokenizationRequest Methods

**PaymentMethodTokenizationRequest Constructors**
The following are constructors for `PaymentMethodTokenizationRequest`.

IN THIS SECTION:
- PaymentMethodTokenizationRequest(paymentGatewayId)
  Payment gateway ID constructor used with `paymentMethodTokenizationRequest`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.
- PaymentMethodTokenizationRequest()
  The following are constructors for `PaymentMethodTokenizationRequest`.

### PaymentMethodTokenizationRequest (paymentGatewayId)
Payment gateway ID constructor used with `paymentMethodTokenizationRequest`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

**Signature**

```java
global PaymentMethodTokenizationRequest(String paymentGatewayId)
```

**Parameters**

- `paymentGatewayId`
  Type: `String`
  The payment method’s payment gateway ID that will be tokenized.

### PaymentMethodTokenizationRequest ()
The following are constructors for `PaymentMethodTokenizationRequest`. 

```java
tokenizeResponse.setGatewayMessage(gatewayMessage);
tokenizeResponse.setGatewayResultCode(resultCode);
tokenizeResponse.setGatewayResultCodeDescription(resultCodeDescription);
tokenizeResponse.setSalesforceResultCodeInfo(resultCodeInfo);
tokenizeResponse.setGatewayDate(system.now());
return tokenizeResponse;
```
Signature

```csharp
public PaymentMethodTokenizationRequest()
```

PaymentMethodTokenizationRequest Properties

The following are properties for `PaymentMethodTokenizationRequest`.

IN THIS SECTION:

- `address`
  - The card payment method address to be tokenized.
- `cardPaymentMethod`
  - The card payment method containing data to be tokenized.

`address`

The card payment method address to be tokenized.

Signature

```csharp
public commercepayments.AddressRequest address {get; set;}
```

Property Value

Type: `AddressRequest` on page 259

`cardPaymentMethod`

The card payment method containing data to be tokenized.

Signature

```csharp
public commercepayments.CardPaymentMethodRequest cardPaymentMethod {get; set;}
```

Property Value

Type: `CardPaymentMethodRequest` on page 315

PaymentMethodTokenizationRequest Methods

The following are methods for `PaymentMethodTokenizationRequest`.

IN THIS SECTION:

- `equals(obj)`
  - Maintains the integrity of lists of type `PaymentMethodTokenizationRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.
hashCode()  
Maintains the integrity of lists of type PaymentMethodTokenizationRequest by determining the uniqueness of the external object records in a list.

toString()  
Converts a date to a string.

equals(obj)  
Maintains the integrity of lists of type PaymentMethodTokenizationRequest by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

Signature

```java
global Boolean equals(Object obj)
```

Parameters

- `obj`  
  Type: Object  
  External object whose key is to be validated.

Return Value

Type: Boolean

hashCode()  
Maintains the integrity of lists of type PaymentMethodTokenizationRequest by determining the uniqueness of the external object records in a list.

Signature

```java
global Integer hashCode()
```

Return Value

Type: Integer

toString()  
Converts a date to a string.

Signature

```java
global String toString()
```

Return Value

Type: String
PaymentMethodTokenizationResponse Class

Gateway response sent by payment gateway adapters for the payment method tokenization request. The response includes the payment method’s token ID value.

Namespace

CommercePayments on page 253

Usage

The constructor of this class takes no arguments. For example:

```java
CommercePayments.PaymentMethodTokenizationResponse pmtr = new CommercePayments.PaymentMethodTokenizationResponse();
```

After the payment gateway processes a tokenization request, the fields of PaymentMethodTokenizationResponse receive and store information from the gateway’s response. The gateway’s response shows whether the tokenization request was successful, the token value, and any additional messages or information about the tokenization process. You can then pass an instance of PaymentMethodTokenizationResponse to an authorization response or a sale response. This class is mapped to a response class in the Java layer.

Example

This constructor builds a new instance of the PaymentMethodTokenizationResponse class.

```java
commercepayments.PaymentMethodTokenizationResponse tokenizeResponse = new commercepayments.PaymentMethodTokenizationResponse();
```

PaymentMethodTokenizationResponse contains only setter methods. Each setter accepts a value from the payment gateway and use it to set an attribute of PaymentMethodTokenizationResponse.

The most important method in PaymentMethodTokenizationResponse is setGatewayTokenEncrypted, which uses Salesforce encryption to set an encrypted token value for a payment method. The setGatewayTokenEncrypted method is available in Salesforce API v52.0 and later. We recommend using it to ensure your tokenized payment method values are encrypted and secure. While the setGatewayToken method (available in earlier API versions) also returns a payment method token, the tokenized value isn’t encrypted.

If the instantiated class already has a gateway token, setGatewayTokenEncrypted throws an error.

```java
/** @description Method to set Gateway token to persist in Encrypted Text */
global void setGatewayTokenEncrypted(String gatewayTokenEncrypted) {
    if (gatewayTokenSet) {
        throwTokenError();
    }
    this.delegate.setGatewayTokenEncrypted(gatewayTokenEncrypted);
    gatewayTokenEncryptedSet = true;
}
```

A typical instantiation of PaymentMethodTokenizationResponse sets the encrypted gateway token alongside the other tokenization response values sent by the gateway.

```java
public commercepayments.GatewayResponse createTokenizeResponse(commercepayments.PaymentMethodTokenizationRequest tokenizeRequest)
```
After you've built a `PaymentMethodTokenizationResponse` object and set the encrypted gateway token, pass the object to the `setPaymentMethodTokenizationResponse` method of an authorization response or a sale response.

**Authorization Response**

```java
public commercepayments.GatewayResponse createAuthResponse(commercepayments.AuthorizationRequest authRequest) {
    commercepayments.PaymentMethodTokenizationResponse paymentMethodTokenizationResponse = new commercepayments.PaymentMethodTokenizationResponse();
    if(authRequest.amount!=null )
    {
        authResponse.setAmount(authRequest.amount);
    }
    else
    {
        throw new SalesforceValidationException('Required Field Missing : Amount');
    }
    authResponse.setGatewayResultCode('00');
    authResponse.setGatewayResultCodeDescription('Transaction Normal');
    authResponse.setGatewayAuthCode('SF'+getRandomNumber(6));
    authResponse.setGatewayReferenceNumber(getRandomNumber(10));
    authResponse.setSalesforceResultCodeInfo(SUCCESS_SALESFORCE_RESULT_CODE_INFO);
    paymentMethodTokenizationResponse.setGatewayTokenEncrypted(gatewayTokenEncrypted);
    authResponse.setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse);
    authResponse.setGatewayDate(system.now());
    return authResponse;
}
```

**Sale Response**

```java
public commercepayments.GatewayResponse createSaleResponse(commercepayments.SaleRequest saleRequest) {
    commercepayments.SaleResponse saleResponse = new commercepayments.SaleResponse();
    return saleResponse;
}
```
commercepayments.PaymentMethodTokenizationResponse

paymentMethodTokenizationResponse = new commercepayments.PaymentMethodTokenizationResponse();

if(saleRequest.amount!=null )
{
    saleResponse.setAmount(saleRequest.amount);
}
else
{
    throw new SalesforceValidationException('Required Field Missing : Amount');
}

system.debug('Response - success');
saleResponse.setGatewayDate(system.now());
saleResponse.setGatewayResultCode('00');
saleResponse.setGatewayResultCodeDescription('Transaction Normal');
saleResponse.setGatewayReferenceNumber('SF'+getRandomNumber(6));
saleResponse.setSalesforceResultCodeInfo(SUCCESS_SALESFORCE_RESULT_CODE_INFO);

paymentMethodTokenizationResponse.setGatewayTokenEncrypted(gatewayTokenEncrypted);
saleResponse.setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse);

return saleResponse;

IN THIS SECTION:
PaymentMethodTokenizationResponse Methods

PaymentMethodTokenizationResponse Methods
The following are methods for PaymentMethodTokenizationResponse.

IN THIS SECTION:

setGatewayAvsCode(gatewayAvsCode)
Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)
Sets the date that the tokenization occurred. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)
Sets error messages that the gateway returned for the tokenization request. Maximum length of 255 characters.

setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.
setGatewayToken(gatewayToken)
Sets the gateway token value that the gateway returned.

setGatewayTokenDetails(gatewayTokenDetails)
Sets any additional information that the gateway returned about the payment token.

setGatewayTokenEncrypted(gatewayTokenEncrypted)
Sets the value of the gatewayTokenEncrypted field on a CardPaymentMethod or DigitalWallet object.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

setGatewayAvsCode (gatewayAvsCode)
Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

Signature

```java
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

gatewayAvsCode
Type: String
Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.

Return Value
Type: void

setGatewayDate (gatewayDate)
Sets the date that the tokenization occurred. Some gateways don’t send this value.

Signature

```java
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

Return Value
Type: void

setGatewayMessage (gatewayMessage)
Sets error messages that the gateway returned for the tokenization request. Maximum length of 255 characters.
**Signature**

global void setGatewayMessage(String gatewayMessage)

**Parameters**

gatewayMessage
  Type: String

**Return Value**

Type: void

---

**setGatewayResultCode (gatewayResultCode)**

Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

**Signature**

global void setGatewayResultCode(String gatewayResultCode)

**Parameters**

gatewayResultCode
  Type: String
  Gateway-specific result code. Must be used to map a Salesforce-specific result code.

**Return Value**

Type: void

---

**setGatewayResultCodeDescription (gatewayResultCodeDescription)**

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

**Signature**

global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)

**Parameters**

gatewayResultCodeDescription
  Type: String
  Provides additional information about the result code and why the gateway returned the specific code. Descriptions will vary between different gateways.

**Return Value**

Type: void
**setGatewayToken (gatewayToken)**
Sets the gateway token value that the gateway returned.

**Signature**

```java
global void setGatewayToken(String gatewayToken)
```

**Parameters**

- **gatewayToken**
  - Type: `String`
  - The gateway token that the payment gateway sends following a tokenization request.
  - For the CardPaymentMethod and DigitalWallet objects, use the `gatewayTokenEncrypted` parameter, which encrypts the token value.

**Return Value**

Type: `void`

**setGatewayTokenDetails (gatewayTokenDetails)**
Sets any additional information that the gateway returned about the payment token.

**Signature**

```java
global void setGatewayTokenDetails(String gatewayTokenDetails)
```

**Parameters**

- **gatewayTokenDetails**
  - Type: `String`

**Return Value**

Type: `void`

**setGatewayTokenEncrypted (gatewayTokenEncrypted)**
Sets the value of the `gatewayTokenEncrypted` field on a CardPaymentMethod or DigitalWallet object.

**Signature**

```java
global void setGatewayTokenEncrypted(String gatewayTokenEncrypted)
```

**Parameters**

- **gatewayTokenEncrypted**
  - Type: `String`
The gateway token that the payment gateway sends following a tokenization request. Salesforce Payments uses Salesforce encryption to encrypt the token value.

**Return Value**

Type: void

**setSalesforceResultCodeInfo (salesforceResultCodeInfo)**

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

**Signature**

**Parameters**

`salesforceResultCodeInfo`  
Type: `SalesforceResultCodeInfo` on page 377  
Description of the Salesforce result code value.

**Return Value**

Type: void

**PaymentGatewayNotificationRequest Class**

Contains the notification request data from the gateway.

**Namespace**

`CommercePayments` on page 253

**Usage**

When the payment gateway sends a notification for a payment request, the payments platform sends the notification request to the gateway adapter. If the notification payload contains an `eventCode` of CAPTURE, the adapter constructs a `CaptureNotification`. If the notification payload contains an `eventCode` of REFUND, the adapter constructs a `ReferencedRefundNotification`. If the notification payload contains `eventCode` of AUTHORIZATION, the adapter constructs a `GatewayNotificationResponse`.

You can obtain a notification request from `PaymentGatewayNotificationContext` on page 336 by invoking its `getPaymentGatewayNotificationRequest` method.
Example

global commercepayments.GatewayNotificationResponse
  processNotification(commercepayments.PaymentGatewayNotificationContext
  gatewayNotificationContext) {
    commercepayments.PaymentGatewayNotificationRequest notificationRequest =
    gatewayNotificationContext.getPaymentGatewayNotificationRequest();
  }

IN THIS SECTION:
  PaymentGatewayNotificationRequest Properties
  PaymentGatewayNotificationRequest Methods

PaymentGatewayNotificationRequest Properties
The following are properties for PaymentGatewayNotificationRequest.

IN THIS SECTION:
  requestBody
  Signature

requestBody

Body of the notification request sent by the payment gateway.

Signature

global Blob requestBody {get; set;}

Property Value
Type: Blob

PaymentGatewayNotificationRequest Methods
The following are methods for PaymentGatewayNotificationRequest.

IN THIS SECTION:
  getHeaders()
  getRequestBody()

getHeaders()

Gets HTTP headers from the notification request sent by the payment gateway.

getRequestBody()

Stores the notification request body information from the payment gateway’s notification request.

getHeaders ()

Gets HTTP headers from the notification request sent by the payment gateway.
Signature

```java
global Map<String, String> getHeaders()
```

Return Value

Type: Map<String, String>

**getRequestBody()**

Stores the notification request body information from the payment gateway's notification request.

Signature

```java
global Blob getRequestBody()
```

Return Value

Type: Blob

**PaymentsHttp Class**

Makes an HTTP request to start the interaction with the payment gateway.

**Namespace**

*CommercePayments* on page 253

**Usage**

You must specify the *CommercePayments* namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```java
CommercePayments.PaymentsHttp payhttp = new CommercePayments.PaymentsHttp();
```

**IN THIS SECTION:**

- PaymentsHttp Methods
- PaymentsHttp Constructors

**PaymentsHttp Methods**

The following are methods for *PaymentsHttp*. All methods are instance methods.

**IN THIS SECTION:**

- send(Request)
  Sends an HttpRequest and returns the response.
**send (Request)**
Sends an HttpRequest and returns the response.

**Signature**

```
global HttpResponse send(HttpRequest request)
```

**Parameters**

`request`
Type: `System.HttpRequest`

**Return Value**
Type: `System.HttpResponse`

**PaymentsHttp Constructors**
The following are constructors for `PaymentsHttp`.

**IN THIS SECTION:**

```
PaymentsHttp()
```
Initiates an HTTP request and response.

**PaymentsHttp ()**
Initiates an HTTP request and response.

**Signature**

```
global PaymentsHttp()
```

**RefundRequest Class**
Sends data related to a refund to the payment gateway adapter.

**Namespace**

`CommercePayments` on page 351

**Usage**
The constructor of this class takes no arguments. For example:

```
CommercePayments.RefundRequest rrq = new CommercePayments.RefundRequest();
```
Example

```java
commercepayments.ReferencedRefundRequest refundRequest = new
commercepayments.ReferencedRefundRequest(80, pmt.id);
```

IN THIS SECTION:
- RefundRequest Methods

**RefundRequest Methods**

The following are methods for RefundRequest.

IN THIS SECTION:
- `equals(obj)`
- `hashCode()`

**equals(obj)**

Maintains the integrity of lists of type `RefundRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

**hashCode()**

Maintains the integrity of lists of type `RefundRequest` by determining the uniqueness of the external object records in a list.

**equals(obj)**

Maintains the integrity of lists of type `RefundRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

**Signature**

```java
global Boolean equals(Object obj)
```

**Parameters**

- `obj`
  - Type: Object

**Return Value**

- Type: Boolean

**hashCode()**

Maintains the integrity of lists of type `RefundRequest` by determining the uniqueness of the external object records in a list.

**Signature**

```java
global Integer hashCode()
```

**Return Value**

- Type: Integer

352
ReferencedRefundNotification Class

When a payment gateway sends a notification for a refund transaction, the payment gateway adapter creates the ReferencedRefundNotification object to store information about notification.

Namespace

CommercePayments on page 253

Usage

This class is used with asynchronous payments. When a payment gateway sends a notification for a refund transaction, the gateway adapter creates an object of type ReferencedRefundNotification to populate the respective values.

The constructor of this class takes no arguments. For example:

```java
CommercePayments.ReferencedRefundNotification rrn = new CommercePayments.ReferencedRefundNotification();
```

Example

```java
commercepayments.NotificationStatus notificationStatus = null;
if (success) {
    notificationStatus = commercepayments.NotificationStatus.Success;
} else {
    notificationStatus = commercepayments.NotificationStatus.Failed;
}
commercepayments.BaseNotification notification = null;
if ('CAPTURE'.equals(eventCode)) {
    notification = new commercepayments.CaptureNotification();
} else if ('REFUND'.equals(eventCode)) {
    notification = new commercepayments.ReferencedRefundNotification();
}
```

ReferencedRefundNotification Methods

The following are methods for ReferencedRefundNotification.

setAmount(amount)
Sets the transaction amount. Can be positive, negative, or zero.

setGatewayDate(gatewayDate)
Sets the date that communication for the refund notification occurred with the payment gateway.

setGatewayMessage(gatewayMessage)
Sets information or messages that the gateway returned.
**setGatewayReferenceDetails(gatewayReferenceDetails)**
Sets the payment gateway’s reference details.

**setGatewayReferenceNumber(gatewayReferenceNumber)**
Sets the payment gateway’s reference number.

**setGatewayResultCode(gatewayResultCode)**
Sets the payment gateway’s result code.

**setGatewayResultCodeDescription(gatewayResultCodeDescription)**
Sets the payment gateway’s result code description.

**setId(id)**
Sets the ID of a notification sent by the payment gateway.

**setSalesforceResultCodeInfo(salesforceResultCodeInfo)**
Sets Salesforce result code information.

**setStatus(status)**
Sets the notification status value on the notification object.

---

**setAmount(amount)**
Sets the transaction amount. Can be positive, negative, or zero.

**Signature**

```java
global void setAmount(Double amount)
```

**Parameters**

`amount`
Type: `Double`
The amount to be debited or captured.

**Return Value**

Type: void

---

**setGatewayDate(gatewayDate)**
Sets the date that communication for the refund notification occurred with the payment gateway.

**Signature**

```java
global void setGatewayDate(Datetime gatewayDate)
```

**Parameters**

`gatewayDate`
Type: `Datetime`
The date that communication happened with the gateway.
Return Value
Type: void

*setGatewayMessage*(gatewayMessage)
Sets information or messages that the gateway returned.

**Signature**
```
global void setGatewayMessage(String gatewayMessage)
```

**Parameters**

*gatewayMessage*  
Type: *String*

Return Value
Type: void

*setGatewayReferenceDetails*(gatewayReferenceDetails)
Sets the payment gateway's reference details.

**Signature**
```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

**Parameters**

*gatewayReferenceDetails*  
Type: *String*

  Provides information about the gateway communication.

Return Value
Type: void

*setGatewayReferenceNumber*(gatewayReferenceNumber)
Sets the payment gateway's reference number.

**Signature**
```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

**Parameters**

*gatewayReferenceNumber*  
Type: *String*
Unique transaction ID created by the payment gateway.

*Return Value*
Type: void

**setGatewayResultCode** *gatewayResultCode*
Sets the payment gateway's result code.

*Signature*

```java
global void setGatewayResultCode(String gatewayResultCode)
```

*Parameters*

`gatewayResultCode`
Type: `String`
The gateway result code. You must map this to a Salesforce-specific result code.

*Return Value*
Type: void

**setGatewayResultCodeDescription** *gatewayResultCodeDescription*
Sets the payment gateway's result code description.

*Signature*

```java
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

*Parameters*

`gatewayResultCodeDescription`
Type: `String`
Description of the gateway result code. Provides additional context about the result code.

*Return Value*
Type: void

**setId** *id*
Sets the ID of a notification sent by the payment gateway.

*Signature*

```java
global void setId(String id)
```
Parameters

$id$
Type: String

Return Value
Type: void

`setSalesforceResultCodeInfo(salesforceResultCodeInfo)`
Sets Salesforce result code information.

Signature

Parameters

`salesforceResultCodeInfo`
Type: `SalesforceResultCodeInfo` on page 377
Description of the Salesforce result code value.

Return Value
Type: void

`setStatus(status)`
Sets the notification status value on the notification object.

Signature

`global void setStatus(commercepayments.NotificationStatus status)`

Parameters

`status`
Type: `NotificationStatus` on page 330
Indicates whether the payments platform successfully received the notification from the payment gateway.

Return Value
Type: void

`ReferencedRefundRequest`
Access information about the referenced refund requests. Extends the `RefundRequest` class.
Example

```java
global commercepayments.GatewayResponse processRequest(commercepayments.PaymentGatewayContext gatewayContext) {
  commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();
  if (requestType == commercepayments.RequestType.ReferencedRefund) {
    commercepayments.*ReferencedRefundRequest* refundRequest =
    (commercepayments.*ReferencedRefundRequest*) gatewayContext.getPaymentRequest();
  }
}
```

ReferencedRefundRequest Constructors

The following are constructors for ReferencedRefundRequest.

IN THIS SECTION:
- ReferencedRefundRequest(amount, paymentId)
  
  This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

ReferencedRefundRequest(amount, paymentId)

This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Parameters

- amount
  
  Type: Double
  
  The amount to be debited or captured.

- paymentId
  
  Type: String
  
  The payment record.

ReferencedRefundRequest Properties

The following are properties for ReferencedRefundRequest.
IN THIS SECTION:

**PaymentId**
References a payment object.

**accountId**
References an account.

**amount**
References an amount.

---

**PaymentId**
References a payment object.

**Property Value**
Type: String

**accountId**
References an account.

**Property Value**
Type: String

**amount**
References an amount.

**Property Value**
Type: Double

---

**ReferencedRefundRequest Methods**
The following are methods for ReferencedRefundRequest.

---

**ReferencedRefundResponse Class**
The payment gateway adapter sends this response for the ReferencedRefund request type.

**Namespace**
CommercePayments on page 253

**Usage**
The constructor of this class takes no arguments. For example:
CommercePayments.ReferencedRefundResponse refr = new CommercePayments.ReferencedRefundResponse();

IN THIS SECTION:
ReferencedRefundResponse Methods

ReferencedRefundResponse Methods
The following are methods for ReferencedRefundResponse.

IN THIS SECTION:
  setAmount(amount)
  Sets the transaction amount. The value must be a positive number.
  setGatewayAvsCode(gatewayAvsCode)
  Sets the payment gateway’s address verification system (AVS) code.
  setGatewayDate(gatewayDate)
  Sets the payment gateway’s date.
  setGatewayMessage(gatewayMessage)
  Sets information or messages that the gateway returned.
  setGatewayReferenceDetails(gatewayReferenceDetails)
  Sets the payment gateway’s reference details.
  setGatewayReferenceNumber(gatewayReferenceNumber)
  Sets the payment gateway’s reference number.
  setGatewayResultCode(gatewayResultCode)
  Sets the payment gateway’s result code.
  setGatewayResultCodeDescription(gatewayResultCodeDescription)
  Sets the payment gateway’s result code description.
  setSalesforceResultCodeInfo(salesforceResultCodeInfo)
  Set the Salesforce result code info.

setAmount(amount)
Sets the transaction amount. The value must be a positive number.

Signature

global void setAmount(Double amount)

Parameters

amount
  Type: Double
  The amount to be debited or captured.

360
Return Value
Type: void

**setGatewayAvsCode(gatewayAvsCode)**
Sets the payment gateway's address verification system (AVS) code.

**Signature**

```java
global void setGatewayAvsCode(String gatewayAvsCode)
```

**Parameters**

- **gatewayAvsCode**
  - Type: String
  - Code sent by gateways that use an address verification system.

Return Value
Type: void

**setGatewayDate(gatewayDate)**
Sets the payment gateway's date.

**Signature**

```java
global void setGatewayDate(Datetime gatewayDate)
```

**Parameters**

- **gatewayDate**
  - Type: Datetime
  - Date and time of the gateway communication.

Return Value
Type: void

**setGatewayMessage(gatewayMessage)**
Sets information or messages that the gateway returned.

**Signature**

```java
global void setGatewayMessage(String gatewayMessage)
```
Parameters

`gatewayMessage`
Type: String
Information or error messages returned by the gateway.

Return Value
Type: void

`setGatewayReferenceDetails (gatewayReferenceDetails)`
Sets the payment gateway's reference details.

Signature

`global void setGatewayReferenceDetails(String gatewayReferenceDetails)`

Parameters

`gatewayReferenceDetails`
Type: String
Information about the gateway communication.

Return Value
Type: void

`setGatewayReferenceNumber (gatewayReferenceNumber)`
Sets the payment gateway's reference number.

Signature

`global void setGatewayReferenceNumber(String gatewayReferenceNumber)`

Parameters

`gatewayReferenceNumber`
Type: String
Unique transaction ID created by the payment gateway.

Return Value
Type: void

`setGatewayResultCode (gatewayResultCode)`
Sets the payment gateway's result code.
global void setGatewayResultCode(String gatewayResultCode)

Parameters

gatewayResultCode
    Type: String
    The gateway result code. Must be mapped to a Salesforce result code.

Return Value
Type: void

setGatewayResultCodeDescription(String gatewayResultCodeDescription)
Sets the payment gateway's result code description.

Signature

global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)

Parameters

gatewayResultCodeDescription
    Type: String
    Description of the GatewayResultCode. Provides more information about the result code returned by the gateway.

Return Value
Type: void

setSalesforceResultCodeInfo(SalesforceResultCodeInfo)
Set the Salesforce result code info.

Signature

global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo)

Parameters

salesforceResultCodeInfo
    Type: commercepayments.SalesforceResultCodeInfo on page 377
    Describes the Salesforce result code value.

Return Value
Type: void
RequestType Enum

Defines the type of payment transaction request made to the payment gateway.

Enum Values

The following are the values of the commercepayments.RequestType enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authorize</td>
<td>Payment authorization request</td>
</tr>
<tr>
<td>Capture</td>
<td>Payment capture request</td>
</tr>
<tr>
<td>ReferencedRefund</td>
<td>Payment refund request</td>
</tr>
<tr>
<td>Sale</td>
<td>Sale request</td>
</tr>
<tr>
<td>Tokenization</td>
<td>Payment tokenization request</td>
</tr>
</tbody>
</table>

SaleApiPaymentMethodRequest Class

Sends data related to a card payment method to a gateway adapter during a sale service call.

Namespace

CommercePayments on page 253

Usage

This class holds information about a payment method that was used for a Sale request. SaleApiPaymentMethodRequest contains all the possible payment methods as fields, but only one value is populated for a given request. Gateway adapters use this class when constructing a sale request. The object of this class is obtained through the paymentMethod field on the SaleRequest object.

Example: This code sample retrieves the SaleApiPaymentMethodRequest object from the SaleRequest class.

```
commercepayments.SaleApiPaymentMethodRequest paymentMethod = saleRequest.paymentMethod;
```

IN THIS SECTION:

SaleApiPaymentMethodRequest Constructors
SaleApiPaymentMethodRequest Properties
SaleApiPaymentMethodRequest Methods
SaleApiPaymentMethodRequest Constructors

The following are constructors for SaleApiPaymentMethodRequest.

IN THIS SECTION:

SaleApiPaymentMethodRequest(cardPaymentMethodRequest)
Sends data related to a card payment method to a gateway adapter during a sale service call.

SaleApiPaymentMethodRequest()
Constructor for building a sale payment method request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

SaleApiPaymentMethodRequest (cardPaymentMethodRequest)
Sends data related to a card payment method to a gateway adapter during a sale service call.

Signature

global SaleApiPaymentMethodRequest (commercepayments.CardPaymentMethodRequest cardPaymentMethodRequest)

Parameters

cardPaymentMethodRequest
Type: CardPaymentMethodRequest on page 315

SaleApiPaymentMethodRequest ()
Constructor for building a sale payment method request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

global SaleApiPaymentMethodRequest ()

SaleApiPaymentMethodRequest Properties

The following are properties for SaleApiPaymentMethodRequest.

IN THIS SECTION:

cardPaymentMethod
Contains details of the card used in a payment method.

cardPaymentMethod
Contains details of the card used in a payment method.
Signature

global commercepayments.CardPaymentMethodRequest cardPaymentMethod {get; set;}

Property Value

Type: CardPaymentMethodRequest on page 315

SaleApiPaymentMethodRequest Methods

The following are methods for SaleApiPaymentMethodRequest.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type SaleApiPaymentMethodRequest by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type SaleApiPaymentMethodRequest by determining the uniqueness of the external object records in a list.

toString()
Converts a date to a string.

equals(obj)
Maintains the integrity of lists of type SaleApiPaymentMethodRequest by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

Signature

global Boolean equals(Object obj)

Parameters

obj
Type: Object

Return Value

Type: Boolean

hashCode()
Maintains the integrity of lists of type SaleApiPaymentMethodRequest by determining the uniqueness of the external object records in a list.

Signature

global Integer hashCode()
Return Value
Type: Integer

toString()
Converts a date to a string.

Signature
global String toString()

Return Value
Type: String

SaleRequest Class
Stores information about a sales request.

Namespace
CommercePayments on page 253

Usage
This class holds all the required details about a sale request. Gateway adapters read the fields of this class object while constructing a sale JSON request that is sent to the payment gateway. The object of this class is made available through commercepayments.paymentGatewayContext by calling getPaymentRequest().

Example
This code sample retrieves the SaleRequest object from the PaymentGatewayContext class.

```java
commercepayments.SaleRequest = (commercepayments.SaleRequest)gatewayContext.getPaymentRequest()
```

IN THIS SECTION:
  SaleRequest Constructors
  SaleRequest Properties
  SaleRequest Methods

SaleRequest Constructors
The following are constructors for SaleRequest.
IN THIS SECTION:

**SaleRequest(amount)**

Constructor for defining an amount for the sale request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

**SaleRequest(amount)**

Constructor for defining an amount for the sale request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

**Signature**

```
global SaleRequest(Double amount)
```

**Parameters**

- **amount**
  - Type: `Double`
  - Amount of the sale request.

**SaleRequest Properties**

The following are properties for `SaleRequest`.

IN THIS SECTION:

- **accountId**
  - Customer account ID for the sale request.
- **amount**
  - Amount of the sale request. Can be positive only.
- **comments**
  - Additional information about the sale request.
- **currencyIsoCode**
  - Currency code for the sale request.
- **paymentMethod**
  - Payment method used in the sale request.

**accountId**

Customer account ID for the sale request.

**Signature**

```
global String accountId {get; set;}
```
Property Value
Type: String

**amount**
Amount of the sale request. Can be positive only.

Signature
```csharp
global Double amount {get; set;}
```

Property Value
Type: Double

**comments**
Additional information about the sale request.

Signature
```csharp
global String comments {get; set;}
```

Property Value
Type: String

**currencyIsoCode**
Currency code for the sale request.

Signature
```csharp
global String currencyIsoCode {get; set;}
```

Property Value
Type: String

**paymentMethod**
Payment method used in the sale request.

Signature
```csharp
global commercepayments.SaleApiPaymentMethodRequest paymentMethod {get; set;}
```

Property Value
Type: SaleApiPaymentMethodRequest on page 364
**SaleRequest Methods**

The following are methods for SaleRequest.

**IN THIS SECTION:**
- **equals(obj)**
  Compares this object with the specified object and returns `true` if both objects are equal; otherwise, returns `false`.
- **hashCode()**
  Maintains the integrity of lists of type SaleRequest by determining the uniqueness of the external object records in a list.
- **toString()**
  Converts a date to a string.

**equals(obj)**

Compares this object with the specified object and returns `true` if both objects are equal; otherwise, returns `false`.

**Signature**

```java
global Boolean equals(Object obj)
```

**Parameters**

- **obj**
  Type: Object

**Return Value**

Type: Boolean

**hashCode()**

Maintains the integrity of lists of type SaleRequest by determining the uniqueness of the external object records in a list.

**Signature**

```java
global Integer hashCode()
```

**Return Value**

Type: Integer

**toString()**

Converts a date to a string.

**Signature**

```java
global String toString()
```
Return Value
Type: String

SaleResponse Class
Response sent by payment gateway adapters for a sales service.

Namespace
CommercePayments on page 253

Usage
The constructor of this class takes no arguments. For example:

CommercePayments.SaleResponse slr CommercePayments.SaleResponse();

This class contains details about a customer card that was used as a payment method for Authorization, Sale, or Tokenization request. The gateway adapter reads the fields of this class while constructing a transaction JSON request, which it then sends to the payment gateway. The object of this class is made available by the cardPaymentMethod field in SaleApiPaymentMethodRequest on page 364 and AuthApiPaymentMethodRequest on page 270.

Example
This code sample builds a SaleResponse object.

```java
commercepayments.SaleResponse saleResponse = new commercepayments.SaleResponse();
saleResponse.setGatewayReferenceDetails("refDetailString");
saleResponse.setGatewayResultCode("res_code");
saleResponse.setGatewayResultCodeDescription(""");
saleResponse.setGatewayReferenceNumber("");
saleResponse.setSalesforceResultCodeInfo(getSalesforceResultCodeInfo(commercepayments.SalesforceResultCode.SUCCESS.name()));
```

IN THIS SECTION:
SaleResponse Methods

SaleResponse Methods
The following are methods for SaleResponse.

IN THIS SECTION:
setAmount(amount)
Sets the transaction amount. Must be a non-negative value.

setGatewayAvsCode(gatewayAvsCode)
Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)
Sets the date that the sale occurred. Some gateways don't send this value.
setGatewayMessage(gatewayMessage)
Sets error messages that the gateway returned for the sale request. Maximum length of 255 characters.

setGatewayReferenceDetails(gatewayReferenceDetails)
Sets additional data that you can use for subsequent sales. You can use any data that isn’t normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

setGatewayReferenceNumber(gatewayReferenceNumber)
Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse)
Sets information from the gateway about the tokenized payment method.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

setAmount(amount)
Sets the transaction amount. Must be a non-negative value.

**Signature**

```global void setAmount(Double amount)```

**Parameters**

- **amount**: Type: **Double**
  The amount of the transaction.

**Return Value**

Type: **void**

setGatewayAvsCode(gatewayAvsCode)
Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

**Signature**

```global void setGatewayAvsCode(String gatewayAvsCode)```

**Parameters**

- **gatewayAvsCode**: Type: **String**
Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.

Return Value
Type: void

**setGatewayDate (gatewayDate)**
Sets the date that the sale occurred. Some gateways don’t send this value.

**Signature**

```plaintext
global void setGatewayDate(Datetime gatewayDate)
```

**Parameters**

- **gatewayDate**
  Type: Datetime

**Return Value**
Type: void

**setGatewayMessage (gatewayMessage)**
Sets error messages that the gateway returned for the sale request. Maximum length of 255 characters.

**Signature**

```plaintext
global void setGatewayMessage(String gatewayMessage)
```

**Parameters**

- **gatewayMessage**
  Type: String

**Return Value**
Type: void

**setGatewayReferenceDetails (gatewayReferenceDetails)**
Sets additional data that you can use for subsequent sales. You can use any data that isn’t normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

**Signature**

```plaintext
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```
Parameters

.gatewayReferenceDetails
Type: String

Return Value
Type: void

.setGatewayReferenceNumber(gatewayReferenceNumber)
Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

Signature
global void setGatewayReferenceNumber(String gatewayReferenceNumber)

Parameters

gatewayReferenceNumber
Type: String
Unique authorization ID created by the payment gateway.

Return Value
Type: void

.setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature
global void setGatewayResultCode(String gatewayResultCode)

Parameters

gatewayResultCode
Type: String
Gateway-specific result code. Must be used to map a Salesforce-specific result code.

Return Value
Type: void

.setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.
Signature

```java
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the gateway’s result code. Use this field to learn more about why the gateway returned a certain result code.

Return Value

Type: void

**setPaymentMethodTokenizationResponse (paymentMethodTokenizationResponse)**

Sets information from the gateway about the tokenized payment method.

Signature

```java
global void setPaymentMethodTokenizationResponse(commercepayments.PaymentMethodTokenizationResponse paymentMethodTokenizationResponse)
```

Parameters

paymentMethodTokenizationResponse
Type: PaymentMethodTokenizationResponse on page 342

Gateway response sent by payment gateway adapters for the payment method tokenization request. The response includes the payment method’s token ID value.

Return Value

Type: void

**setSalesforceResultCodeInfo(salesforceResultCodeInfo)**

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Signature

```java
```

Parameters

salesforceResultCodeInfo
Type: SalesforceResultCodeInfo on page 377
Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Return Value

Type: void

SalesforceResultCode Enum

Defines the gateway call status values in Salesforce based on the call status values that the payment gateway returned.

Usage

Payment gateways can return many different responses. Salesforce maps these responses into one of seven possible Salesforce response values.

Enum Values

The following are the values of the `commercepayments.SalesforceResultCode` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decline</td>
<td>The gateway call failed, but it may still work if you try again. For example, the customer had insufficient funds or briefly lost their connection to the internet. This is also known as a &quot;soft decline.&quot;</td>
</tr>
<tr>
<td>Indeterminate</td>
<td>The gateway didn’t respond to the call and the user has to check the transaction request’s status. Indeterminate responses often occur following server timeouts, system failure, or any action that interrupts the gateway’s ability to process the payment.</td>
</tr>
<tr>
<td>PermanentFail</td>
<td>The customer’s bank recognized the payment account as closed, terminated, or fraudulent. The gateway won’t further calls from the payment method associate with the transaction. After a permanent fail response, the transaction changes its gateway status to Permanent Fail.</td>
</tr>
<tr>
<td>RequiresReview</td>
<td>The gateway call initially failed, but the payment method may still work after further evaluation. This response often happens when the customer bank requires more information about the payment request. In this case, the bank provides an authorization code manually when the payment manager calls the processor.</td>
</tr>
<tr>
<td>Success</td>
<td>The gateway processed the transaction successfully.</td>
</tr>
<tr>
<td>SystemError</td>
<td>Salesforce ended the payment request call before receiving a gateway response. System error responses often occur due to gateway server errors, invalid customer credentials, or anytime the request times out before receiving a gateway response. The failure occurs before the request reaches the gateway, so there’s no risk of an unaccounted payment remaining in the gateway. You can continue with the transaction by manually creating a payment.</td>
</tr>
<tr>
<td>ValidationErr</td>
<td>The gateway received incorrect customer payment information, such as misspelled credit card names or a CVV with missing numbers.</td>
</tr>
</tbody>
</table>
SalesforceResultCodeInfo

Stores Salesforce result code information from payment gateway adapters.

Namespace

CommercePayments on page 253

Usage

The constructor of this class takes no arguments. For example:

```java
```

Gateways can return the transaction result as either CustomMetadata or SalesforceResultCode.

IN THIS SECTION:

SalesforceResultCodeInfo Constructors

SalesforceResultCodeInfo Constructors

The following are constructors for SalesforceResultCodeInfo.

IN THIS SECTION:

SalesforceResultCodeInfo(customMetadataTypeInfo)

Constructor for providing the customMetadataTypeInfo for the result of the transaction.

SalesforceResultCodeInfo(salesforceResultCode)

Constructor that provides the salesforceResultCode for the transaction result.

SalesforceResultCodeInfo(customMetadataTypeInfo)

Constructor for providing the customMetadataTypeInfo for the result of the transaction.

Signature

```java
global SalesforceResultCodeInfo(commercepayments.CustomMetadataTypeInfo customMetadataTypeInfo)
```

Parameters

- `customMetadataTypeInfo`
  - Type: CommercePayments.CustomMetadataTypeInfo on page 321
  - Information about the metadata type.

SalesforceResultCodeInfo(salesforceResultCode)

Constructor that provides the salesforceResultCode for the transaction result.
Signature

global SalesforceResultCodeInfo(commercepayments.SalesforceResultCode
salesforceResultCode)

Parameters

salesforceResultCode

Type: SalesforceResultCode on page 376

The enum value for the result code.

ConnectApi Namespace

The ConnectApi namespace (also called Connect in Apex) provides classes for accessing the same data available in Connect REST API. Use Connect in Apex to create custom experiences in Salesforce.

For information about working with the ConnectApi classes, see Connect in Apex.

IN THIS SECTION:

ActionLinks Class
Create, delete, and get information about an action link group definition; get information about an action link group; get action link diagnostic information.

Announcements Class
Access information about announcements and post announcements.

BotVersionActivation Class
Access and update activation information of a bot version.

CdpCalculatedInsight Class
Create, delete, get, run, and update Data Cloud calculated insights.

CdpIdentityResolution Class
Create, delete, get, run, and update Data Cloud identity resolution rulesets.

CdpQuery Class
Get Data Cloud metadata and query data.

CdpSegment Class
Create, delete, get, publish, and update Data Cloud segments. Get segment members.

Chatter Class
Access information about followers and subscriptions for records.

ChatterFavorites Class
Chatter favorites give you easy access to topics, list views, and feed searches.

ChatterFeeds Class
Get, post, and delete feed elements, likes, comments, and bookmarks. You can also search feed elements, share feed elements, and vote on polls.

ChatterGroups Class
Information about groups, such as the group’s members, photo, and the groups the specified user is a member of. Add members to a group, remove members, and change the group photo.
ChatterMessages Class
Get, send, search, and reply to private messages. You can also get and search private conversations, mark conversations as read, and get a count of unread private messages.

ChatterUsers Class
Access information about users, such as activity, followers, subscriptions, files, and groups.

Clm Class
Create and update Contract Lifecycle Management (CLM) contracts using object ID.

CommerceBuyerExperience Class
Create, delete, or get commerce addresses. Get order delivery group, order item, order shipments, shipment items, and order summaries. Get adjustments for order items and order summaries.

CommerceCart Class
Get, create, update, and delete carts. Get cart items, add items to carts, update and delete cart items.

CommerceCatalog Class
Get products, product categories, and product category paths.

CommercePromotions Class
Evaluate promotions for Commerce orders. Get coupon code redemption usage.

CommerceSearch Class

CommerceSearchConnectFamily Class
Search products by search term or category in a webstore.

CommerceSearchSettings Class
Get indexes. Get index logs. Create an index of a product catalog.

CommerceStorePricing Class
Get product prices.

CommerceWishlist Class
Get, create, update, and delete wishlists. Add wishlists to carts. Get wishlist items, add items to wishlists, and delete wishlist items.

Communities Class
Get information about Experience Cloud sites in your org.

CommunityModeration Class
Get information about flagged feed items and comments in an Experience Cloud site. Add and remove flags from comments and feed items.

ContentHub Class
Access Files Connect repositories and their files and folders.

ConversationApplicationDefinition Class
Access information about a conversation application definition.

Datacloud Class
Purchase Data.com contact or company records, and retrieve purchase information.

EmailMergeFieldService Class
Extract a list of merge fields for an object. A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.
**EmployeeProfiles Class**
Get, set and crop, and delete employee banner photos and photos.

**ExternalEmailServices Class**
Access information about integration with external email services, such as sending email within Salesforce through an external email account.

**ExternalManagedAccount Class**
Get externally managed accounts.

**FieldService Class**
Preview and create shifts from a pattern or filter fields on recordset filter criteria.

**FulfillmentOrder Class**
Fulfill orders in Order Management.

**Knowledge Class**
Get information about trending articles in Experience Cloud sites.

**LightningScheduler Class**
Create and update service appointments.

**ManagedContent Class**
Get managed content versions. Get a managed content space.

**ManagedContentDelivery Class**
Get collection items. Get a managed content channel. Get managed content.

**ManagedTopics Class**
Get managed topics in an Experience Cloud site. Create, delete, and reorder managed topics.

**MarketingIntegration Class**
Get, save, and submit a microsites marketing integration form for an Experience Cloud site.

**Mentions Class**
Access information about mentions. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.

**Missions Class**
Export and purge mission activity for users. Get a user's mission progress. Update mission activity counts for users.

**NamedCredentials Class**
Create, refresh, get, delete, replace, and update credentials. Create and get external credentials. Create and get named credentials. Get the URL for the OAuth token flow for an external credential.

**NavigationMenu Class**
Get navigation menu items for an Experience Cloud site.

**NextBestAction Class**
Execute recommendation strategies, get recommendations, manage recommendation reactions.

**OmnichannelInventoryService Class**
Route orders to inventory locations in Order Management.

**Orchestration Class**
Get orchestration instances.

**OrderPaymentSummary Class**
Work with payments in Order Management.
OrderSummary Class
Work with orders in Order Management.

OrderSummaryCreation Class
Create Order Summaries in Order Management.

Organization Class
Access information about an org.

PardotBusinessUnitContext Class
Get the Pardot business units the context user has access to.

Payments Class
Authorize a payment, capture an authorized payment, and refund an authorized payment.

Personalization Class
Get assigned personalization audiences that match the user context. Create, get, update, and delete an audience. Get personalization targets that match the user context, based on the assigned audiences that include the user. Create and update targets. Get and delete a target.

PickTicket Class
Create tickets to fulfill orders.

QuestionAndAnswers Class
Access question and answers suggestions.

Recommendations Class
Get and reject Chatter, custom, and static recommendations. Create, get, update, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Records Class
Access information about record motifs, which are small icons used to distinguish record types in the Salesforce UI.

Repricing Class
Perform functions related to repricing orders in Order Management.

ReturnOrder Class
Process ReturnOrders in Order Management.

Routing Class
Route orders to inventory locations in Order Management.

SalesforceInbox Class
Access information about Automated Activity Capture, which is available in Einstein and Salesforce Inbox.

Sites Class
Search an Experience Cloud site.

SmartDataDiscovery Class
Get predictions on Salesforce objects.

SocialEngagement Class
Manage information about social accounts or fan pages for social networks.

Surveys Class
Send survey invitations by email.

TaxPlatform Class
Apply or cancel tax.
Topics Class
Access information about topics, such as their descriptions, the number of people talking about them, related topics, and information about groups contributing to the topic. Update a topic’s name or description, merge topics, and add and remove topics from records and feed items.

UserProfiles Class
Access user profile data. The user profile data populates the profile page (also called the Chatter profile page). This data includes user information (such as address, manager, and phone number), some user capabilities (permissions), and a set of subtab apps, which are custom tabs on the profile page.

Zones Class
Access information about Chatter Answers zones in your organization. Zones organize questions into logical groups, with each zone having its own focus and unique questions.

ConnectApi Input Classes
Some ConnectApi methods take arguments that are instances of ConnectApi input classes.

ConnectApi Output Classes
Most ConnectApi methods return instances of ConnectApi output classes.

ConnectApi Enums
 Enums specific to the ConnectApi namespace.

ConnectApi Exceptions
The ConnectApi namespace contains exception classes.

ConnectApi Utilities
The ConnectApi namespace contains a utility class.

ConnectApi Release Notes
Use the Salesforce Release Notes to learn about the most recent updates and changes to the ConnectApi namespace in Apex.

ActionLinks Class
Create, delete, and get information about an action link group definition; get information about an action link group; get action link diagnostic information.

Namespace
ConnectApi

Usage
An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can drive productivity and accelerate innovation.

There are two views of an action link and an action link group: the definition, and the context user’s view. The definition includes potentially sensitive information, such as authentication information. The context user’s view is filtered by visibility options and the values reflect the state of the context user.

Action link definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link definition can read, modify, or delete the definition. In addition, the user making the
call must have created the definition or have View All Data permission. Use these methods to operate on action link group definitions (which contain action link definitions).

- `createActionLinkGroupDefinition(communityId, actionLinkGroup)`
- `deleteActionLinkGroupDefinition(communityId, actionLinkGroupId)`
- `getActionLinkGroupDefinition(communityId, actionLinkGroupId)`

Use these methods to operate on a context user’s view of an action link or an action link group.

- `getActionLink(communityId, actionLinkId)`
- `getActionLinkGroup(communityId, actionLinkGroupId)`
- `getActionLinkDiagnosticInfo(communityId, actionLinkId)`

For information about how to use action links, see Working with Action Links.

**ActionLinks Methods**

These are methods for ActionLinks. All methods are static.

**IN THIS SECTION:**

- `createActionLinkGroupDefinition(communityId, actionLinkGroup)`
  Create an action link group definition. To associate an action link group with a feed element, first create an action link group definition. Then post a feed element with an associated actions capability.
- `deleteActionLinkGroupDefinition(communityId, actionLinkGroupId)`
  Delete an action link group definition. Deleting an action link group definition removes all references to it from feed elements.
- `getActionLink(communityId, actionLinkId)`
  Get information about an action link, including state for the context user.
- `getActionLinkGroup(communityId, actionLinkGroupId)`
  Get information about an action link group including state for the context user.
- `getActionLinkDiagnosticInfo(communityId, actionLinkId)`
  Get diagnostic information returned when an action link executes. Diagnostic information is given only for users who can access the action link.
- `getActionLinkGroupDefinition(communityId, actionLinkGroupId)`
  Get information about an action link group definition.

**createActionLinkGroupDefinition(communityId, actionLinkGroup)**

Create an action link group definition. To associate an action link group with a feed element, first create an action link group definition. Then post a feed element with an associated actions capability.

**API Version**

33.0

**Requires Chatter**

No
Signature

```java
public static ConnectApi.ActionLinkGroupDefinition createActionLinkGroupDefinition(String communityId, ConnectApi.ActionLinkGroupDefinitionInput actionLinkGroup)
```

Parameters

`communityId`
Type: String
ID for an Experience Cloud site, internal, or null.

`actionLinkGroup`
Type: `ConnectApi.ActionLinkGroupDefinitionInput`
A `ConnectApi.ActionLinkGroupDefinitionInput` object that defines the action link group.

Return Value

Type: `ConnectApi.ActionLinkGroupDefinition`

Usage

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can drive productivity and accelerate innovation.

All action links must belong to a group. Action links in a group are mutually exclusive and share some properties. Define standalone actions in their own action group.

Information in the action link group definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link group definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

**Note:** Invoking `ApiAsync` action links from an app requires a call to set the status. However, there isn’t currently a way to set the status of an action link using Apex. To set the status, use Connect REST API. See the Action Link resource in the Connect REST API Developer Guide for more information.

Example for Defining an Action Link and Posting with a Feed Element

For more information about this example, see Define an Action Link and Post with a Feed Element.

```java
ConnectApi.ActionLinkGroupDefinitionInput actionLinkGroupDefinitionInput = new ConnectApi.ActionLinkGroupDefinitionInput();
ConnectApi.ActionLinkDefinitionInput actionLinkDefinitionInput = new ConnectApi.ActionLinkDefinitionInput();
ConnectApi.RequestHeaderInput requestHeaderInput1 = new ConnectApi.RequestHeaderInput();
ConnectApi.RequestHeaderInput requestHeaderInput2 = new ConnectApi.RequestHeaderInput();

// Create the action link group definition.
actionLinkGroupDefinitionInput.actionLinks = New List<ConnectApi.ActionLinkDefinitionInput>();
actionLinkGroupDefinitionInput.executionsAllowed = ConnectApi.ActionLinkExecutionsAllowed.OncePerUser;
actionLinkGroupDefinitionInput.category = ConnectApi.PlatformActionGroupCategory.Primary;
```
To Do: Verify that the date is in the future.
To Do: Substitute an OAuth value for your Salesforce org.

```
datetime myDate = datetime.newInstance(2016, 3, 1);
actionLinkGroupDefinitionInput.expirationDate = myDate;

// Create the action link definition.
actionLinkDefinitionInput.actionType = ConnectApi.ActionLinkType.Api;
actionLinkDefinitionInput.actionUrl = '/services/data/v33.0/chatter/feed-elements';
actionLinkDefinitionInput.headers = new List<ConnectApi.RequestHeaderInput>();
actionLinkDefinitionInput.labelKey = 'Post';
actionLinkDefinitionInput.method = ConnectApi.HttpRequestMethod.HttpPost;
actionLinkDefinitionInput.requestBody = '{"subjectId": "me","feedElementType": "FeedItem","body": [{"type": "Text","text": "This is a test post created via an API action link."}]};
actionLinkDefinitionInput.requiresConfirmation = true;

requestHeaderInput1.name = 'Authorization';
requestHeaderInput1.value = 'OAuth 00DD00000007WNP!ARsAQwveV0zzAV847FTT4zF.85w.EwsPbUgXa4Sajsp';
actionLinkDefinitionInput.headers.add(requestHeaderInput1);

requestHeaderInput2.name = 'Content-Type';
requestHeaderInput2.value = 'application/json';
actionLinkDefinitionInput.headers.add(requestHeaderInput2);

// Add the action link definition to the action link group definition.
actionLinkGroupDefinitionInput.actionLinks.add(actionLinkDefinitionInput);

// Instantiate the action link group definition.
ConnectApi.ActionLinkGroupDefinition actionLinkGroupDefinition =
    ConnectApi.ActionLinks.createActionLinkGroupDefinition(Network.getNetworkId(),
    actionLinkGroupDefinitionInput);

ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
    ConnectApi.FeedElementCapabilitiesInput();
ConnectApi.AssociatedActionsCapabilityInput associatedActionsCapabilityInput = new
    ConnectApi.AssociatedActionsCapabilityInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

// Set the properties of the feedItemInput object.
feedItemInput.body = messageBodyInput;
feedItemInput.capabilities = feedElementCapabilitiesInput;
feedItemInput.subjectId = 'me';

// Create the text for the post.
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
textSegmentInput.text = 'Click to post a feed item.';
messageBodyInput.messageSegments.add(textSegmentInput);

// The feedElementCapabilitiesInput object holds the capabilities of the feed item.
```
// Define an associated actions capability to hold the action link group.
// The action link group ID is returned from the call to create the action link group
definition.
feedElementCapabilitiesInput.associatedActions = associatedActionsCapabilityInput;
associatedActionsCapabilityInput.actionLinkGroupIds = new List<String>();
associatedActionsCapabilityInput.actionLinkGroupIds.add(actionLinkGroupDefinition.id);

// Post the feed item.
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);

Example for Defining an Action Link in a Template and Posting with a Feed Element

For more information about this example, see Define an Action Link in a Template and Post with a Feed Element.

// Get the action link group template Id.
ActionLinkGroupTemplate template = [SELECT Id FROM ActionLinkGroupTemplate WHERE
DeveloperName='Doc_Example'];

// Add binding name-value pairs to a map.
// The names are defined in the action link template(s) associated with the action link
group template.
// Get them from Setup UI or SOQL.
Map<String, String> bindingMap = new Map<String, String>();
bindingMap.put('ApiVersion', 'v33.0');
bindingMap.put('Text', 'This post was created by an API action link.');
bindingMap.put('SubjectId', 'me');

// Create ActionLinkTemplateBindingInput objects from the map elements.
List<ConnectApi.ActionLinkTemplateBindingInput> bindingInputs = new
List<ConnectApi.ActionLinkTemplateBindingInput>();
for (String key : bindingMap.keySet()) {
    ConnectApi.ActionLinkTemplateBindingInput bindingInput = new
ConnectApi.ActionLinkTemplateBindingInput();
    bindingInput.key = key;
    bindingInput.value = bindingMap.get(key);
    bindingInputs.add(bindingInput);
}

// Set the template Id and template binding values in the action link group definition.
ConnectApi.ActionLinkGroupDefinitionInput actionLinkGroupDefinitionInput = new
ConnectApi.ActionLinkGroupDefinitionInput();
actionLinkGroupDefinitionInput.templateId = template.id;
actionLinkGroupDefinitionInput.templateBindings = bindingInputs;

// Instantiate the action link group definition.
ConnectApi.ActionLinkGroupDefinition actionLinkGroupDefinition =
    ConnectApi.ActionLinks.createActionLinkGroupDefinition(Network.getNetworkId(),
actionLinkGroupDefinitionInput);

ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
ConnectApi.AssociatedActionsCapabilityInput associatedActionsCapabilityInput = new ConnectApi.AssociatedActionsCapabilityInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

// Define the FeedItemInput object to pass to postFeedElement
feedItemInput.body = messageBodyInput;
feedItemInput.capabilities = feedElementCapabilitiesInput;
feedItemInput.subjectId = 'me';

// The MessageBodyInput object holds the text in the post
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
textSegmentInput.text = 'Click to post a feed item.';
messageBodyInput.messageSegments.add(textSegmentInput);

// The FeedElementCapabilitiesInput object holds the capabilities of the feed item.
// For this feed item, we define an associated actions capability to hold the action link group.
// The action link group ID is returned from the call to create the action link group definition.
feedElementCapabilitiesInput.associatedActions = associatedActionsCapabilityInput;
associatedActionsCapabilityInput.actionLinkGroupIds = new List<String>();
associatedActionsCapabilityInput.actionLinkGroupIds.add(actionLinkGroupDefinition.id);

// Post the feed item.
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);

deleteActionLinkGroupDefinition(communityId, actionLinkGroupId)

Delete an action link group definition. Deleting an action link group definition removes all references to it from feed elements.

API Version
33.0

Requires Chatter
No

Signature

public static void deleteActionLinkGroupDefinition(String communityId, String actionLinkGroupId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.
**actionLinkId**
  Type: `String`
  The ID of the action link.

**Return Value**
Type: Void

**Usage**
Information in the action link group definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link group definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

**getActionLink(communityId, actionLinkId)**
Get information about an action link, including state for the context user.

**API Version**
33.0

**Requires Chatter**
No

**Signature**
```java
public static ConnectApi.PlatformAction getActionLink(String communityId, String actionLinkId)
```

**Parameters**
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.
- `actionLinkId`
  Type: `String`
  The ID of the action link.

**Return Value**
Type: `ConnectApi.PlatformAction`

**getActionLinkDiagnosticInfo(communityId, actionLinkId)**
Get diagnostic information returned when an action link executes. Diagnostic information is given only for users who can access the action link.
API Version
33.0

Requires Chatter
No

Signature
public static ConnectApi.ActionLinkDiagnosticInfo getActionLinkDiagnosticInfo(String communityId, String actionLinkId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

actionLinkId
Type: String
The ID of the action link.

Return Value
Type: ConnectApi.ActionLinkDiagnosticInfo

getActionLinkGroup(communityId, actionLinkGroupId)
Get information about an action link group including state for the context user.

API Version
33.0

Requires Chatter
No

Signature
public static ConnectApi.PlatformActionGroup getActionLinkGroup(String communityId, String actionLinkGroupId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.
**actionLinkGroupId**
Type: **String**
The ID of the action link group.

**Return Value**
Type: **ConnectApi.PlatformActionGroup**

**Usage**
All action links must belong to a group. Action links in a group are mutually exclusive and share some properties. Action link groups are accessible by clients, unlike action link group definitions.

**getActionLinkGroupDefinition(communityId, actionLinkGroupId)**
Get information about an action link group definition.

**API Version**
33.0

**Requires Chatter**
No

**Signature**
```java
public static ConnectApi.ActionLinkGroupDefinition getActionLinkGroupDefinition(String communityId, String actionLinkGroupId)
```

**Parameters**
- **communityId**
  Type: **String**
  ID for an Experience Cloud site, internal, or null.
- **actionLinkGroupId**
  Type: **String**
  The ID of the action link group.

**Return Value**
Type: **ConnectApi.ActionLinkGroupDefinition**

**Usage**
Information in the action link group definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link group definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.
Announcements Class

Access information about announcements and post announcements.

Namespace

ConnectApi

Usage

Use the ConnectApi.Announcements class to get, create, update, and delete announcements. Use an announcement to highlight information. Users can discuss, like, and post comments on announcements. Deleting the feed post deletes the announcement.

This image shows an announcement displayed in a group. Creating an announcement also creates a feed item with the announcement text.

An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.

Announcements Methods

The following are methods for Announcements. All methods are static.

IN THIS SECTION:

- deleteAnnouncement(communityId, announcementId)
  Delete an announcement.
- getAnnouncement(communityId, announcementId)
  Get an announcement.
**getAnnouncements(communityId, parentId)**
Get the first page of announcements.

**getAnnouncements(communityId, parentId, pageParam, pageSize)**
Get a page of announcements.

**postAnnouncement(communityId, announcement)**
Post an announcement.

**updateAnnouncement(communityId, announcementId, expirationDate)**
Update the expiration date of an announcement.

**deleteAnnouncement(communityId, announcementId)**
Delete an announcement.

**API Version**
31.0

**Requires Chatter**
Yes

**Signature**
```java
public static void deleteAnnouncement(String communityId, String announcementId)
```

**Parameters**
- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or null.
- **announcementId**
  Type: String
  An announcement ID, which has a prefix of 0BT.

**Return Value**
Type: Void

**Usage**
To get a list of announcements in a group, call `getAnnouncements(communityId, parentId)` or `getAnnouncements(communityId, parentId, pageParam, pageSize)`.
To post an announcement to a group, call `postAnnouncement(communityId, announcement)`.

**getAnnouncement(communityId, announcementId)**
Get an announcement.
API Version
31.0

Requires Chatter
Yes

Signature
public static ConnectApi.Announcement getAnnouncement(String communityId, String announcementId)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.
announcementId
Type: String
An announcement ID, which has a prefix of 0BT.

Return Value
Type: ConnectApi.Announcement

Usage
To get a list of announcements in a group, call getAnnouncements(communityId, parentId) or getAnnouncements(communityId, parentId, pageParam, pageSize).
To post an announcement to a group, call postAnnouncement(communityId, announcement).

getAnnouncements(communityId, parentId)
Get the first page of announcements.

API Version
36.0

Available to Guest Users
38.0

Requires Chatter
Yes
public static ConnectApi.AnnouncementPage getAnnouncements(String communityId, String parentId)

Parameters

communityId  
Type: String  
Id for an Experience Cloud site, internal, or null.

parentId  
Type: String  
Id of the parent entity for the announcement, that is, a group ID when the announcement appears in a group.

Return Value

Type: ConnectApi.AnnouncementPage

getAnnouncements(communityId, parentId, pageParam, pageSize)
Get a page of announcements.

API Version

36.0

Available to Guest Users

38.0

Requires Chatter

Yes

Signature

public static ConnectApi.AnnouncementPage getAnnouncements(String communityId, String parentId, Integer pageParam, Integer pageSize)

Parameters

communityId  
Type: String  
Id for an Experience Cloud site, internal, or null.

parentId  
Type: String  
Id of the parent entity for the announcement, that is, a group ID when the announcement appears in a group.

pageParam  
Type: Integer

pageSize  
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: `Integer`
Specifies the number of announcements per page.

**Return Value**
Type: `ConnectApi.AnnouncementPage`

**postAnnouncement(communityId, announcement)**
Post an announcement.

**API Version**
36.0

**Requires Chatter**
Yes

**Signature**

```
public static ConnectApi.Announcement postAnnouncement(String communityId,
ConnectApi.AnnouncementInput announcement)
```

**Parameters**

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`announcement`
Type: `ConnectApi.AnnouncementInput`
A `ConnectApi.AnnouncementInput` object.

**Return Value**
Type: `ConnectApi.Announcement` on page 1689

**updateAnnouncement(communityId, announcementId, expirationDate)**
Update the expiration date of an announcement.

**API Version**
31.0
Requires Chatter
Yes

Signature

public static ConnectApi.Announcement updateAnnouncement(String communityId, String announcementId, Datetime expirationDate)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

announcementId
Type: String
An announcement ID, which has a prefix of 0BT.

expirationDate
Type: Datetime
The Salesforce UI displays an announcement until 11:59 p.m. on this date unless another announcement is posted first. The Salesforce UI ignores the time value in the expirationDate. However, you can use the time value to create your own display logic in your own UI.

Return Value
Type: ConnectApi.Announcement

Usage
To get a list of announcements in a group, call getAnnouncements(communityId, parentId) or getAnnouncements(communityId, parentId, pageParam, pageSize).
To post an announcement to a group, call postAnnouncement(communityId, announcement).

BotVersionActivation Class
Access and update activation information of a bot version.

Namespace
ConnectApi

BotVersionActivation Methods
The following are methods for BotVersionActivation. All methods are static.
IN THIS SECTION:

getVersionActivationInfo(botVersionId)
Get the active or inactive status of the bot version.

updateVersionStatus(botVersionId, status, postBody)
Update the status of the specified bot version.

getVersionActivationInfo (botVersionId)
Get the active or inactive status of the bot version.

API Version
50.0

Requires Chatter
No

Signature
public static ConnectApi.BotVersionActivationInfo getVersionActivationInfo(String botVersionId)

Parameters
botVersionId
Type: String
ID of the bot version.

Return Value
Type: ConnectApi.BotVersionActivationInfo

Usage
To access this method, enable the bot feature, and the user must be an admin or have the Manage Bots or Manage Bots Training Data user permissions.

updateVersionStatus(botVersionId, status, postBody)
Update the status of the specified bot version.

API Version
50.0

Requires Chatter
No
**Signature**

```java
ConnectApi.BotVersionActivationInput postBody)
```

**Parameters**

- **botVersionId**
  - Type: String
  - ID of the bot version.

- **status**
  - Type: `ConnectApi.BotVersionActivationStatus`
  - Activation status of the bot version. Values are:
    - Active
    - Inactive
  - Activation status must be specified in the `status` or `postBody` parameter.

- **postBody**
  - Type: `ConnectApi.BotVersionActivationInput`
  - Parameters to update for the bot version. Activation status must be specified in the `status` or `postBody` parameter.

**Return Value**

Type: `ConnectApi.BotVersionActivationInfo`

**Usage**

To access this method, enable the bot feature, and the user must be an admin or have the Manage Bots or Manage Bots Training Data user permissions.

**CdpCalculatedInsight Class**

Create, delete, get, run, and update Data Cloud calculated insights.

**Namespace**

`ConnectApi`

**CdpCalculatedInsight Methods**

The following are methods for `CdpCalculatedInsight`. All methods are static.

**IN THIS SECTION:**

- `createCalculatedInsight(input)`
  - Create a calculated insight.
deleteCalculatedInsight(apiName)
Delete a calculated insight.

getCalculatedInsight(apiName)
Get a calculated insight.

getCalculatedInsights(definitionType, batchSize, offset, orderby, dataspace)
Get calculated insights.

getCalculatedInsights(definitionType, batchSize, offset, orderby, dataspace, pageToken)
Get a page of calculated insights.

runCalculatedInsight(apiName)
Run a calculated insight.

updateCalculatedInsight(apiName, input)
Update a calculated insight.

createCalculatedInsight(input)
Create a calculated insight.

API Version

57.0

Requires Chatter

No

Signature

public static ConnectApi.CdpCalculatedInsightOutput
createCalculatedInsight(ConnectApi.CdpCalculatedInsightInput input)

Parameters

input
  Type: ConnectApi.CdpCalculatedInsightInput
  Input representation for a calculated insight.

Return Value

Type: ConnectApi.CdpCalculatedInsightOutput

deleteCalculatedInsight(apiName)
Delete a calculated insight.

API Version

57.0
Requires Chatter
No

Signature

```java
public static Void deleteCalculatedInsight(String apiName)
```

Parameters

```java
apiName
    Type: String
    API name of the calculated insight to delete.
```

Return Value

Type: Void

`getCalculatedInsight(apiName)`
Get a calculated insight.

API Version

57.0

Requires Chatter
No

Signature

```java
public static ConnectApi.CdpCalculatedInsightOutput getCalculatedInsight(String apiName)
```

Parameters

```java
apiName
    Type: String
    API name of the calculated insight to get.
```

Return Value

Type: `ConnectApi.CdpCalculatedInsightOutput`

`getCalculatedInsights(definitionType, batchSize, offset, orderby, dataspace)`
Get calculated insights.

API Version

56.0
Requires Chatter
No

Signature

```java
public static ConnectApi.CdpCalculatedInsightPage getCalculatedInsights(String definitionType, Integer batchSize, Integer offset, String orderby, String dataspace)
```

Parameters

- **definitionType**
  - Type: `String`
  - Definition type of the calculated insight. Values are:
    - `CalculatedMetric`
    - `ExternalMetric`
    - `StreamingMetric`

- **batchSize**
  - Type: `Integer`
  - Number of items to return. Values are from 1–300. If unspecified, the default value is 25.

- **offset**
  - Type: `Integer`
  - Number of rows to skip before returning results. If unspecified, no rows are skipped.

- **orderby**
  - Type: `String`
  - Sort order for the result set, such as `GenderId__c ASC, Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

- **dataspace**
  - Type: `String`
  - Name of the data space.

Return Value

Type: `ConnectApi.CdpCalculatedInsightPage`

```java
getCalculatedInsights(definitionType, batchSize, offset, orderby, dataspace, pageToken)
```

Get a page of calculated insights.

API Version

57.0

Requires Chatter
No
Signature

public static ConnectApi.CdpCalculatedInsightPage getCalculatedInsights(String definitionType, Integer batchSize, Integer offset, String orderby, String dataspace, String pageToken)

Parameters

definitionType
Type: String
Definition type of the calculated insight. Values are:
- CalculatedMetric
- ExternalMetric
- StreamingMetric

batchSize
Type: Integer
Number of items to return. Values are from 1–300. If unspecified, the default value is 25.

offset
Type: Integer
Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderby
Type: String
Sort order for the result set, such as GenderId__c ASC, Occupation__c DESC. If unspecified, items are returned in the order they are retrieved.

dataspace
Type: String
Name of the data space.

pageToken
Type: String
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

Return Value
Type: ConnectApi.CdpCalculatedInsightPage

runCalculatedInsight(apiName)
Run a calculated insight.

API Version
57.0
Requires Chatter
No

Signature
public static ConnectApi.CdpCalculatedInsightStandardActionResponseRepresentation runCalculatedInsight(String apiName)

Parameters
apiName
  Type: String
  API name of the calculated insight to run.

Return Value
Type: ConnectApi.CdpCalculatedInsightStandardActionResponseRepresentation

updateCalculatedInsight(apiName, input)
Update a calculated insight.

API Version
57.0

Requires Chatter
No

Signature
public static ConnectApi.CdpCalculatedInsightOutput updateCalculatedInsight(String apiName, ConnectApi.CdpCalculatedInsightInput input)

Parameters
apiName
  Type: String
  API name of the calculated insight to update.

input
  Type: ConnectApi.CdpCalculatedInsightInput
  Input representation for a calculated insight.

Return Value
Type: ConnectApi.CdpCalculatedInsightOutput
CdpIdentityResolution Class
Create, delete, get, run, and update Data Cloud identity resolution rulesets.

Namespace
ConnectApi

CdpIdentityResolution Methods
The following are methods for CdpIdentityResolution. All methods are static.

IN THIS SECTION:
createIdentityResolution(input)
Create an identity resolution ruleset.
deleteIdentityResolution(identityResolution)
Delete an identity resolution ruleset.
getIdentityResolution(identityResolution)
Get an identity resolution ruleset.
getIdentityResolutions()
Get identity resolution rulesets.
runIdentityResolutionNow(identityResolution, input)
Trigger an immediate identity resolution ruleset job run.
updateIdentityResolution(identityResolution, input)
Update an identity resolution ruleset.

createIdentityResolution(input)
Create an identity resolution ruleset.

API Version
S7.0

Requires Chatter
No

Signature
public static ConnectApi.CdpIdentityResolutionOutput createIdentityResolution(ConnectApi.CdpIdentityResolutionConfigInput input)

Parameters
input
Type: ConnectApi.CdpIdentityResolutionConfigInput
Input representation for creating an identity resolution ruleset.

Return Value
Type: ConnectApi.CdpIdentityResolutionOutput

deleIdentityResolution(identityResolution)
Delete an identity resolution ruleset.

API Version
57.0

Requires Chatter
No

Signature
public static Void deleteIdentityResolution(String identityResolution)

Parameters

identityResolution
Type: String
Developer name or ID of the ruleset.

Return Value
Type: Void

getIdentityResolution(identityResolution)
Get an identity resolution ruleset.

API Version
57.0

Requires Chatter
No

Signature
public static ConnectApi.CdpIdentityResolutionOutput getIdentityResolution(String identityResolution)
Parameters

\( \text{identityResolution} \)
Type: \text{String}
Developer name or ID of the ruleset.

Return Value
Type: \text{ConnectApi.CdpIdentityResolutionOutput}

\text{getIdentityResolutions()}\)
Get identity resolution rulesets.

API Version
57.0

Requires Chatter
No

Signature
\text{public static ConnectApi.CdpIdentityResolutionsOutput getIdentityResolutions()}

Return Value
Type: \text{ConnectApi.CdpIdentityResolutionsOutput}

\text{runIdentityResolutionNow(identityResolution, input)}\)
Trigger an immediate identity resolution ruleset job run.

API Version
57.0

Requires Chatter
No

Signature
\text{public static ConnectApi.CdpIdentityResolutionRunNowOutput runIdentityResolutionNow(String identityResolution,}
\text{ConnectApi.CdpIdentityResolutionRunNowInput input)}
Parameters

identityResolution
  Type: String
  Developer name of the ruleset.

input
  Type: ConnectApi.CdpIdentityResolutionRunNowInput
  Input representation for running an identity resolution ruleset job on demand.

Return Value

Type: ConnectApi.CdpIdentityResolutionRunNowOutput

updateIdentityResolution(identityResolution, input)

Update an identity resolution ruleset.

API Version

57.0

Requires Chatter

No

Signature

Parameters

identityResolution
  Type: String
  Developer name or ID of the ruleset.

input
  Type: ConnectApi.CdpIdentityResolutionConfigPatchInput
  Input representation for updating an identity resolution ruleset.

Return Value

Type: ConnectApi.CdpIdentityResolutionOutput

CdpQuery Class

Get Data Cloud metadata and query data.
Namespace

ConnectApi

CdpQuery Methods

The following are methods for CdpQuery. All methods are static.

IN THIS SECTION:

- **getAllMetadata()**: Get all metadata, including Calculated Insights, Engagement, Profile, and other objects, as well as their relationships to other objects.
- **getAllMetadata(entityType, entityCategory, entityName)**: Get all metadata, filtering for entity type, category, and name.
- **getInsightsMetadata()**: Get Insight metadata, including Calculated Insight objects, their dimensions and measures.
- **getInsightsMetadata(ciName)**: Get metadata for a Calculated Insight object. Metadata includes dimensions and measures.
- **getProfileMetadata()**: Get metadata for data model objects in the profile category, including Individual, Contact Point Email, Unified Individual, and Contact Point Address objects. Metadata includes the objects, their fields, and category.
- **getProfileMetadata(dataModelName)**: Get metadata for a data model object in the profile category, such as Individual, Contact Point Email, Unified Individual, and Contact Point Address. Metadata includes the list of fields, data types, and indexes available for lookup.
- **nextBatchAnsiSqlV2(nextBatchId)**: Get the next batch of data across data model, lake, unified, and linked objects.
- **queryANSISql(input)**: Synchronously query data across data model, lake, unified, and linked objects. This query returns up to 4,999 rows.
- **queryANSISql(input, batchSize, offset, orderby)**: Synchronously query data across data model, lake, unified, and linked objects. Specify batch size, offset, and order of the results. This query returns up to 4,999 rows.
- **queryAnsiSqlV2(input)**: Query up to 8 MB of data across data model, lake, unified, and linked objects.
- **queryCalculatedInsights(ciName, dimensions, measures, orderby, filters, batchSize, offset)**: Query a Calculated Insight object.
- **queryCalculatedInsights(ciName, dimensions, measures, orderby, filters, batchSize, offset, timeGranularity)**: Query a Calculated Insight object within a specified time range.
- **queryProfileApi(dataModelName, filters, fields, batchSize, offset, orderby)**: Query a Profile data model object using filters.
- **queryProfileApi(dataModelName, id, searchKey, filters, fields, batchSize, offset, orderby)**: Query a Profile data model object using filters and a search key.
- **queryProfileApi(dataModelName, id, childDataModelName, searchKey, filters, fields, batchSize, offset, orderby)**: Query a Profile data model object and a child object using filters and a search key.
getAllMetadata()
Get all metadata, including Calculated Insights, Engagement, Profile, and other objects, as well as their relationships to other objects.

API Version
52.0

Requires Chatter
No

Signature
public static ConnectApi.CdpQueryMetadataOutput getAllMetadata()

Return Value
Type: ConnectApi.CdpQueryMetadataOutput

getAllMetadata(entityType, entityCategory, entityName)
Get all metadata, filtering for entity type, category, and name.

API Version
54.0

Requires Chatter
No

Signature
public static ConnectApi.CdpQueryMetadataOutput getAllMetadata(String entityType, String entityCategory, String entityName)

Parameters
entityType
Type: String
Type of metadata entity requested. Valid values are `DataLakeObject`, `DataModelObject`, and `CalculatedInsight`. If unspecified, all types are returned.

`entityCategory`
Type: `String`
Category of the metadata entity. Valid values are `Profile`, `Engagement`, and `Related`. If unspecified, all category entities are returned.

`entityName`
Type: `String`
Metadata name of the entity, for example `UnifiedIndividual__dlm`. If unspecified, a complete list of entities is returned.

Return Value
Type: `ConnectApi.CdpQueryMetadataOutput`

`getInsightsMetadata()`
Get Insight metadata, including Calculated Insight objects, their dimensions and measures.

API Version
52.0

Requires Chatter
No

Signature
`public static ConnectApi.CdpQueryMetadataOutput getInsightsMetadata()`

Return Value
Type: `ConnectApi.CdpQueryMetadataOutput`

`getInsightsMetadata(ciName)`
Get metadata for a Calculated Insight object. Metadata includes dimensions and measures.

API Version
52.0

Requires Chatter
No

Signature
`public static ConnectApi.CdpQueryMetadataOutput getInsightsMetadata(String ciName)`
Parameters

ciName
Type: String
Name of the Calculated Insight object, for example, IndividualChildrenCount__cio.

Return Value
Type: ConnectApi.CdpQueryMetadataOutput

getProfileMetadata()
Get metadata for data model objects in the profile category, including Individual, Contact Point Email, Unified Individual, and Contact Point Address objects. Metadata includes the objects, their fields, and category.

API Version
52.0

Requires Chatter
No

Signature
public static ConnectApi.CdpQueryMetadataOutput getProfileMetadata()

Return Value
Type: ConnectApi.CdpQueryMetadataOutput

getProfileMetadata(dataModelName)
Get metadata for a data model object in the profile category, such as Individual, Contact Point Email, Unified Individual, and Contact Point Address. Metadata includes the list of fields, data types, and indexes available for lookup.

API Version
52.0

Requires Chatter
No

Signature
public static ConnectApi.CdpQueryMetadataOutput getProfileMetadata(String dataModelName)
Parameters

dataModelName
Type: String
Name of the data model object, for example, UnifiedIndividual__dlm.

Return Value
Type: `ConnectApi.CdpQueryMetadataOutput`

`nextBatchAnsiSqlV2(nextBatchId)`
Get the next batch of data across data model, lake, unified, and linked objects.

API Version
54.0

Requires Chatter
No

Signature
`public static ConnectApi.CdpQueryOutputV2 nextBatchAnsiSqlV2(String nextBatchId)`

Parameters

`nextBatchId`
Type: String
ID of the next batch. See the Usage section for more information.

Return Value
Type: `ConnectApi.CdpQueryOutputV2`

Usage
Initially, use the `queryAnsiSqlV2(input)` method to query up to 8 MB of data. Use the `nextBatchId` from the `ConnectApi.CdpQueryOutputV2` output class as the `nextBatchId` parameter in this method to get the next batch of data. You can continue using subsequent next batch IDs for up to an hour.

`queryAnsiSql(input)`
Synchronously query data across data model, lake, unified, and linked objects. This query returns up to 4,999 rows.

**Note:** A newer version of the Query API is available. We recommend using `queryAnsiSqlV2(input)` and `nextBatchAnsiSqlV2(nextBatchId)` to take advantage of subsequent requests and larger response sizes.
API Version
5.2.0

Requires Chatter
No

Signature
public static ConnectApi.CdpQueryOutput queryANSISql(ConnectApi.CdpQueryInput input)

Parameters
input
  Type: ConnectApi.CdpQueryInput
  A ConnectApi.CdpQueryInput body with the SQL query.

Return Value
Type: ConnectApi.CdpQueryOutput

queryANSISql(input, batchSize, offset, orderby)
Synchronously query data across data model, lake, unified, and linked objects. Specify batch size, offset, and order of the results. This query returns up to 4,999 rows.

Note: A newer version of the Query API is available. We recommend using queryAnsiSqlV2(input) and nextBatchAnsiSqlV2(nextBatchId) to take advantage of subsequent requests and larger response sizes.

API Version
5.3.0

Requires Chatter
No

Signature
public static ConnectApi.CdpQueryOutput queryANSISql(ConnectApi.CdpQueryInput input, Integer batchSize, Integer offset, String orderby)

Parameters
input
  Type: ConnectApi.CdpQueryInput
  A ConnectApi.CdpQueryInput body with the SQL query.

batchSize
  Type: Integer
Number of records to return. Values are from 1–4999. The default value is 4999.

_offset
Type: Integer
Number of rows to skip before returning results. The sum of offset and batchSize must be less than 2147483647. The default value is 0.

_orderby
Type: String
Comma-separated values to sort the results in ascending or descending order, for example, GenderId__c ASC, Occupation__c DESC.

Return Value
Type: ConnectApi.CdpQueryOutput

queryAnsiSqlV2(input)
Query up to 8 MB of data across data model, lake, unified, and linked objects.

API Version
54.0

Requires Chatter
No

Signature
public static ConnectApi.CdpQueryOutputV2 queryAnsiSqlV2(ConnectApi.CdpQueryInput input)

Parameters
input
Type: ConnectApi.CdpQueryInput
A ConnectApi.CdpQueryInput body with the SQL query.

Return Value
Type: ConnectApi.CdpQueryOutputV2

Usage
Use the nextBatchId in the ConnectApi.CdpQueryOutputV2 output class as the nextBatchId parameter in the nextBatchAnsiSqlV2(nextBatchId) method to continue getting batches of data for up to an hour.

queryCalculatedInsights(ciName, dimensions, measures, orderby, filters, batchSize, offset)
Query a Calculated Insight object.
API Version
$2.0

Requires Chatter
No

Signature

```java
public static ConnectApi.CdpQueryOutput queryCalculatedInsights(String ciName, String dimensions, String measures, String orderby, String filters, Integer batchSize, Integer offset)
```

Parameters

ciName
Type: String
Name of the Calculated Insight object, for example, IndividualChildrenCount__cio.

dimensions
Type: String
Comma-separated list of up to 10 dimensions, such as GenderId__c, to project. If unspecified, this parameter includes all of the available dimensions.

measures
Type: String
Comma-separated list of up to 5 measures, such as TotalSales__c, to project. If unspecified, this parameter includes all of the available measures.

orderby
Type: String
Sort order for the result set, such as GenderId__c ASC, Occupation__c DESC. If unspecified, items are returned in the order they are retrieved.

filters
Type: String
Filter the result set to a more narrow scope or specific type, such as [GenderId__c=Male, FirstName__c=Angel].

batchSize
Type: Integer
Number of items to return. Values are from 1–4,999. If unspecified, the default value is 4999.

offset
Type: Integer
Number of rows to skip before returning results. If unspecified, no rows are skipped.

Return Value
Type: ConnectApi.CdpQueryOutput
queryCalculatedInsights(ciName, dimensions, measures, orderby, filters, batchSize, offset, timeGranularity)

Query a Calculated Insight object within a specified time range.

API Version
54.0

Requires Chatter
No

Signature
public static ConnectApi.CdpQueryOutput queryCalculatedInsights(String ciName, String dimensions, String measures, String orderby, String filters, Integer batchSize, Integer offset, String timeGranularity)

Parameters

**ciName**
- Type: String
- Name of the Calculated Insight object, for example, IndividualChildrenCount__c.

**dimensions**
- Type: String
- Comma-separated list of up to 10 dimensions, such as GenderId__c, to project. If unspecified, this parameter includes all of the available dimensions.

**measures**
- Type: String
- Comma-separated list of up to 5 measures, such as TotalSales__c, to project. If unspecified, this parameter includes all of the available measures.

**orderby**
- Type: String
- Sort order for the result set, such as GenderId__c ASC, Occupation__c DESC. If unspecified, items are returned in the order they are retrieved.

**filters**
- Type: String
- Filter the result set to a more narrow scope or specific type, such as [GenderId__c=Male, FirstName__c=Angel].

**batchSize**
- Type: Integer
- Number of items to return. Values are from 1–4,999. If unspecified, the default value is 4999.

**offset**
- Type: Integer
- Number of rows to skip before returning results. If unspecified, no rows are skipped.
timeGranularity
Type: String
Time range for the measures. Values are:
- HOUR
- DAY
- MONTH
- QUARTER
- YEAR
If unspecified, no time range is applied.

Return Value
Type: ConnectApi.CdpQueryOutput

queryProfileApi(dataModelName, filters, fields, batchSize, offset, orderby)
Query a Profile data model object using filters.

API Version
52.0

Requires Chatter
No

Signature
public static ConnectApi.CdpQueryOutput queryProfileApi(String dataModelName, String filters, String fields, Integer batchSize, Integer offset, String orderby)

Parameters
dataModelName
Type: String
Name of the data model object, for example, UnifiedIndividual__d.

filters
Type: String
Comma-separated list of equality expressions within square brackets, for example, [FirstName__c=DON].

fields
Type: String
Comma-separated list of up to 50 field names that you want to include in the result, for example, Id__c, FirstName__c, GenderId__c, Occupation__c. If unspecified, Id__c is returned.
Number of items to return. Values are from 1–4,999. If unspecified, the default value is 100.

offset
  Type: Integer
  Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderby
  Type: String
  Sort order for the result set, such as GenderId__c ASC, Occupation__c DESC. If unspecified, items are returned in the order they are retrieved.

Return Value
Type: ConnectApi.CdpQueryOutput

queryProfileApi(dataModelName, id, searchKey, filters, fields, batchSize, offset, orderby)
Query a Profile data model object using filters and a search key.

API Version
52.0

Requires Chatter
No

Signature
public static ConnectApi.CdpQueryOutput queryProfileApi(String dataModelName, String id, String searchKey, String filters, String fields, Integer batchSize, Integer offset, String orderby)

Parameters
dataModelName
  Type: String
  Name of the data model object, for example, UnifiedIndividual__dlm.

id
  Type: String
  Value of the primary or secondary key field, for example, John. If unspecified, defaults to the value of the primary key field.

searchKey
  Type: String
  If a field other than the primary key is used, name of the key field, for example, FirstName__c.

filters
  Type: String
  Comma-separated list of equality expressions within square brackets, for example, [FirstName__c=DON].
**fields**
  Type: **String**
  Comma-separated list of up to 50 field names that you want to include in the result, for example, `Id__c,FirstName__c, GenderId__c,Occupation__c`. If unspecified, `Id__c` is returned.

**batchSize**
  Type: **Integer**
  Number of items to return. Values are from 1–4,999. If unspecified, the default value is 100.

**offset**
  Type: **Integer**
  Number of rows to skip before returning results. If unspecified, no rows are skipped.

**orderby**
  Type: **String**
  Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

**Return Value**
  Type: `ConnectApi.CdpQueryOutput`

```java
queryProfileApi(dataModelName, id, childDataModelName, searchKey, filters, fields, batchSize, offset, orderby)
```

Query a Profile data model object and a child object using filters and a search key.

**API Version**

52.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.CdpQueryOutput queryProfileApi(String dataModelName, String id, String childDataModelName, String searchKey, String filters, String fields, Integer batchSize, Integer offset, String orderby)
```

**Parameters**

**dataModelName**
  Type: **String**
  Name of the data model object, for example, `UnifiedIndividual__dlm`.

**id**
  Type: **String**
  Value of the primary or secondary key field, for example, `John`. If unspecified, defaults to the value of the primary key field.
childDataModelName
    Type: String
    Name of the child data model object, for example, UnifiedContactPointEmail__dlm.

searchKey
    Type: String
    If a field other than the primary key is used, name of the key field, for example, FirstName__c.

filters
    Type: String
    Comma-separated list of equality expressions within square brackets, for example, [FirstName__c=DON]. Filters are applied to the parent object only.

fields
    Type: String
    Comma-separated list of child object field names that you want to include in the result, for example, Id__c, EmailAddress__c. If unspecified, the first 10 alphabetically sorted fields are returned.

batchSize
    Type: Integer
    Number of items to return. Values are from 1–4,999. If unspecified, the default value is 100.

offset
    Type: Integer
    Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderby
    Type: String
    Sort order for the result set, such as GenderId__c ASC, Occupation__c DESC. If unspecified, items are returned in the order they are retrieved.

Return Value
    Type: ConnectApi.CdpQueryOutput

queryProfileApi(dataModelName, id, ciName, searchKey, dimensions, measures, filters, fields, batchSize, offset, orderby)
Query a Profile data model object and a Calculated Insight object using filters and a search key.

API Version
    52.0

Requires Chatter
    No
**Signature**

```java
public static ConnectApi.CdpQueryOutput queryProfileApi(String dataModelName, String id, String ciName, String searchKey, String dimensions, String measures, String filters, String fields, Integer batchSize, Integer offset, String orderby)
```

**Parameters**

**dataModelName**

Type: `String`

Name of the data model object, for example, `UnifiedIndividual__dlm`.

**id**

Type: `String`

Value of the primary or secondary key field, for example, `John`. If unspecified, defaults to the value of the primary key field.

**ciName**

Type: `String`

Name of the Calculated Insight object, for example, `IndividualChildrenCount__cio`.

**searchKey**

Type: `String`

If a field other than the primary key is used, name of the key field, for example, `FirstName__c`.

**dimensions**

Type: `String`

Comma-separated list of up to 10 dimensions, such as `GenderId__c`, to project. If unspecified, this parameter includes all of the available dimensions.

**measures**

Type: `String`

Comma-separated list of up to 5 measures, such as `TotalSales__c`, to project. If unspecified, this parameter includes all of the available measures.

**filters**

Type: `String`

Comma-separated list of equality expressions within square brackets, for example, `[FirstName__c=DON]`.

**fields**

Type: `String`

Comma-separated list of up to 50 field names that you want to include in the result, for example, `Id__c,FirstName__c, GenderId__c, Occupation__c`. If unspecified, `Id__c` is returned.

**batchSize**

Type: `Integer`

Number of items to return. Values are from 1–4,999. If unspecified, the default value is 100.

**offset**

Type: `Integer`

Number of rows to skip before returning results. If unspecified, no rows are skipped.

**orderby**

Type: `String`
Sort order for the result set, such as GenderId__c ASC, Occupation__c DESC. If unspecified, items are returned in the order they are retrieved.

Return Value
Type: ConnectApi.CdpQueryOutput

queryProfileApi(dataModelName, id, ciName, searchKey, dimensions, measures, filters, fields, batchSize, offset, orderby, timeGranularity)
Query a Profile data model object and a Calculated Insight object using filters, a search key, and a time range.

API Version
54.0

Requires Chatter
No

Signature
public static ConnectApi.CdpQueryOutput queryProfileApi(String dataModelName, String id, String ciName, String searchKey, String dimensions, String measures, String filters, String fields, Integer batchSize, Integer offset, String orderby, String timeGranularity)

Parameters

dataModelName
Type: String
Name of the data model object, for example, UnifiedIndividual__dlm.

id
Type: String
Value of the primary or secondary key field, for example, John. If unspecified, defaults to the value of the primary key field.

ciName
Type: String
Name of the Calculated Insight object, for example, IndividualChildrenCount__cio.

searchKey
Type: String
If a field other than the primary key is used, name of the key field, for example, FirstName__c.

dimensions
Type: String
Comma-separated list of up to 10 dimensions, such as GenderId__c, to project. If unspecified, this parameter includes all of the available dimensions.

measures
Type: String
Comma-separated list of up to 5 measures, such as TotalSales__c, to project. If unspecified, this parameter includes all of the available measures.

**filters**

Type: String

Comma-separated list of equality expressions within square brackets, for example, [FirstName__c=DON].

**fields**

Type: String

Comma-separated list of up to 50 field names that you want to include in the result, for example, Id__c, FirstName__c, GenderId__c, Occupation__c. If unspecified, Id__c is returned.

**batchSize**

Type: Integer

Number of items to return. Values are from 1–4,999. If unspecified, the default value is 100.

**offset**

Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

**orderby**

Type: String

Sort order for the result set, such as GenderId__c ASC, Occupation__c DESC. If unspecified, items are returned in the order they are retrieved.

**timeGranularity**

Type: String

Time range for the measures. Values are:

- HOUR
- DAY
- MONTH
- QUARTER
- YEAR

If unspecified, no time range is applied.

**Return Value**

Type: ConnectApi.CdpQueryOutput

**universalIdLookupBySourceId(entityName, dataSourceId, dataSourceObjectId, sourceRecordId)**

Look up objects by source ID.

**API Version**

54.0
Requires Chatter
No

Signature
public static ConnectApi.CdpQueryDataOutput universalIdLookupBySourceId(String
entityName, String dataSourceId, String dataSourceObjectId, String sourceRecordId)

Parameters
entityName
  Type: String
  Entity name.
dataSourceId
  Type: String
  Data source ID.
dataSourceObjectId
  Type: String
  Data source object ID.
sourceRecordId
  Type: String
  Source record ID.

Return Value
Type: ConnectApi.CdpQueryDataOutput

CdpSegment Class
Create, delete, get, publish, and update Data Cloud segments. Get segment members.

Namespace
ConnectApi

CdpSegment Methods
The following are methods for CdpSegment. All methods are static.

IN THIS SECTION:
  createSegment(input)  
  Create a segment.
  createSegment(input, dataspace)  
  Create a segment in a dataspace.
deleteSegment(segmentApiName)
Delete a segment.

executePublishAdhoc(segmentId)
Publish a segment.

getSegment(segmentApiName)
Get a segment.

getSegmentMembers(limit, offset, orderBy, segmentApiName, filters, fields)
Get segment members.

getSegments()
Get segments.

getSegmentsPaginated(batchSize, offset, orderBy)
Get an ordered batch of segments.

getSegmentsPaginated(batchSize, offset, orderBy, dataspace)
Get paginated segments in a dataspace.

updateSegment(segmentApiName, input)
Update a segment.

**createSegment(input)**
Create a segment.

**API Version**
55.0

**Requires Chatter**
No

**Signature**

```
public static ConnectApi.CdpSegmentOutput createSegment(ConnectApi.CdpSegmentInput input)
```

**Parameters**

- **input**
  - Type: `ConnectApi.CdpSegmentInput`
  - A `ConnectApi.CdpSegmentInput` class.

**Return Value**

- Type: `ConnectApi.CdpSegmentOutput`
createSegment(input, dataspace)
Create a segment in a dataspace.

API Version
58.0

Requires Chatter
No

Signature
public static ConnectApi.CdpSegmentOutput createSegment(ConnectApi.CdpSegmentInput input, String dataspace)

Parameters
input
Type: ConnectApi.CdpSegmentInput
A ConnectApi.CdpSegmentInput class.
dataspace
Type: String
Name of the dataspace in which to perform the action. User must have permission to this dataspace. Optional when bulk-listing segments. If unspecified, default is the default dataspace.

Return Value
Type: ConnectApi.CdpSegmentOutput

deleteSegment(segmentApiName)
Delete a segment.

API Version
56.0

Requires Chatter
No

Signature
public static Void deleteSegment(String segmentApiName)
Parameters

segmentApiName
Type: String
API name of the segment.

Return Value
Type: Void

executePublishAdhoc(segmentId)
Publish a segment.

API Version
56.0

Requires Chatter
No

Signature
public static ConnectApi.CdpSegmentActionOutput executePublishAdhoc(String segmentId)

Parameters

segmentId
Type: String
ID of the segment to publish.

Return Value
Type: ConnectApi.CdpSegmentActionOutput

getSegment(segmentApiName)
Get a segment.

API Version
56.0

Requires Chatter
No

Signature
public static ConnectApi.CdpSegmentContainerOutput getSegment(String segmentApiName)
Parameters

segmentApiName
  Type: String
  API name of the segment.

Return Value

Type: ConnectApi.CdpSegmentContainerOutput

getSegmentMembers(limit, offset, orderBy, segmentApiName, filters, fields)
Get segment members.

API Version

58.0

Requires Chatter

No

Signature

public static ConnectApi.CdpSegmentMemberOutput getSegmentMembers(Integer limit, Integer offset, String orderBy, String segmentApiName, String filters, List<String> fields)

Parameters

limit
  Type: Integer
  Maximum number of rows to return from 1–1000. If unspecified, the default number of rows is 100.

offset
  Type: Integer
  Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderBy
  Type: String
  Sort order for the result set, such as Name ASC or MarketSegmentType DESC. If unspecified, items are returned by ID in ascending order.

segmentApiName
  Type: String
  API name of the segment.

filters
  Type: String
  Filter the result set to a more narrow scope or specific type, such as [Delta_Type__C in('new') AND timestamp__C > '2023-04-02'].
**Fields**

Type: `List<String>`

Comma-separated list of up to 50 field names that you want to include in the result, for example, `Id__c`, `Delta_Type__C`.

If unspecified, `Id__c` is returned.

**Return Value**

Type: `ConnectApi.CdpSegmentMemberOutput`

getSegments()

Get segments.

**API Version**

55.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.CdpSegmentContainerOutput getSegments()
```

**Return Value**

Type: `ConnectApi.CdpSegmentContainerOutput`

getSegmentsPaginated(batchSize, offset, orderBy)

Get an ordered batch of segments.

**API Version**

56.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.CdpSegmentContainerOutput getSegmentsPaginated(Integer batchSize, Integer offset, String orderBy)
```

**Parameters**

`batchSize`

Type: `Integer`
Number of items to return. Values are from 1–200. If unspecified, the default value is 20.

offset
Type: Integer
Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderBy
Type: String
Sort order for the result set, such as Name ASC or MarketSegmentType DESC. If unspecified, items are returned by ID in ascending order.

Return Value
Type: ConnectApi.CdpSegmentContainerOutput

getSegmentsPaginated(batchSize, offset, orderBy, dataspace)
Get paginated segments in a dataspace.

API Version
58.0

Requires Chatter
No

Signature
public static ConnectApi.CdpSegmentContainerOutput getSegmentsPaginated(Integer batchSize, Integer offset, String orderBy, String dataspace)

Parameters
batchSize
Type: Integer
Number of items to return. Values are from 1–200. If unspecified, the default value is 20.

offset
Type: Integer
Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderBy
Type: String
Sort order for the result set, such as Name ASC or MarketSegmentType DESC. If unspecified, items are returned by ID in ascending order.

dataspace
Type: String
Name of the dataspace in which to perform the action. User must have permission to this dataspace. Optional when bulk-listing segments. If unspecified, default is the default dataspace.
Return Value
Type: ConnectApi.CdpSegmentContainerOutput

updateSegment(segmentApiName, input)
Update a segment.

API Version
56.0

Requires Chatter
No

Signature
public static ConnectApi.CdpSegmentOutput updateSegment(String segmentApiName, ConnectApi.CdpSegmentInput input)

Parameters
segmentApiName
Type: String
API name of the segment.

input
Type: ConnectApi.CdpSegmentInput
A ConnectApi.CdpSegmentInput class with the updates.

Return Value
Type: ConnectApi.CdpSegmentOutput

Chatter Class
Access information about followers and subscriptions for records.

Namespace
ConnectApi

Chatter Methods
The following are methods for Chatter. All methods are static.
IN THIS SECTION:

deleteSubscription(communityId, subscriptionId)
Delete a subscription. Use this method to stop following a record, a user, or a file.

getFollowers(communityId, recordId)
Get the first page of followers for a record.

getFollowers(communityId, recordId, pageParam, pageSize)
Get a page of followers for a record.

getSubscription(communityId, subscriptionId)
Get information about a subscription.

submitDigestJob(period)
Submit a daily or weekly Chatter email digest job.

deleteSubscription(communityId, subscriptionId)
Delete a subscription. Use this method to stop following a record, a user, or a file.

API Version
28.0

Requires Chatter
Yes

Signature
public static void deleteSubscription(String communityId, String subscriptionId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subscriptionId
Type: String
The ID for a subscription.

Return Value
Type: Void

Usage
“Following” a user, group, or record is the same as “subscribing” to a user, group, or record. A “follower” is the user who followed the user, group, or record. A “subscription” is an object describing the relationship between the follower and the user, group, or record they followed.

To leave a group, call deleteMember(communityId, membershipId).
Example

When you follow a user, the call to `ConnectApi.ChatterUsers.follow` returns a `ConnectApi.Subscription` object. To stop following the user, pass the `id` property of that object to this method.

```
ConnectApi.Chatter.deleteSubscription(null, '0E8RR0000004CnK0AU');
```

SEE ALSO:

- Follow a Record
- `follow(communityId, userId, subjectId)`

\textbf{getFollowers}(communityId, recordId)

Get the first page of followers for a record.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowerPage getFollowers(String communityId, String recordId)
```

Parameters

- \textit{communityId}
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.
- \textit{recordId}
  - Type: `String`
  - ID for a record or the keyword `me`.

Return Value

Type: `ConnectApi.FollowerPage`

Usage

“Following” a user, group, or record is the same as “subscribing” to a user, group, or record. A “follower” is the user who followed the user, group, or record. A “subscription” is an object describing the relationship between the follower and the user, group, or record they followed.

SEE ALSO:

- Follow a Record
getFollowers(communityId, recordId, pageParam, pageSize)
Get a page of followers for a record.

API Version
28.0

Requires Chatter
Yes

Signature
public static ConnectApi.FollowerPage getFollowers(String communityId, String recordId,
Integer pageParam, Integer pageSize)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

recordId
Type: String
ID for a record or the keyword me.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: ConnectApi.FollowerPage

Usage
“Following” a user, group, or record is the same as “subscribing” to a user, group, or record. A “follower” is the user who followed the user, group, or record. A “subscription” is an object describing the relationship between the follower and the user, group, or record they followed.

SEE ALSO:
Follow a Record

getSubscription(communityId, subscriptionId)
Get information about a subscription.
API Version
28.0

Requires Chatter
Yes

Signature
public static ConnectApi.Subscription getSubscription(String communityId, String subscriptionId)

Parameters
communityId
- Type: String
- ID for an Experience Cloud site, internal, or null.

subscriptionId
- Type: String
- The ID for a subscription.

Return Value
Type: ConnectApi.Subscription

Usage
“Following” a user, group, or record is the same as “subscribing” to a user, group, or record. A “follower” is the user who followed the user, group, or record. A “subscription” is an object describing the relationship between the follower and the user, group, or record they followed.

SEE ALSO:
- Follow a Record

submitDigestJob(period)
Submit a daily or weekly Chatter email digest job.

API Version
37.0

Requires Chatter
Yes
Signature

```java
public static ConnectApi.DigestJobRepresentationsubmitDigestJob(ConnectApi.DigestPeriod period)
```

Parameters

```java
period
```
Type: `ConnectApi.DigestPeriod`

Time period that's included in a Chatter email digest. Values are:

- **DailyDigest**—The email includes up to the 50 latest posts from the previous day.
- **WeeklyDigest**—The email includes up to the 50 latest posts from the previous week.

Return Value

Type: `ConnectApi.DigestJob`

Usage

The times when Chatter sends email digests are not configurable in the UI. To control when email digests are sent and to use this method, contact Salesforce to enable API-only Chatter Digests.

⚠️ **Warning:** Enabling API-only Chatter Digests disables the scheduled digests for your org. You must call the API for your users to receive their digests.

We recommend scheduling digest jobs by implementing the Apex `Schedulable` interface with this method. To monitor your digest jobs from Setup, enter **Background Jobs** in the **Quick Find** box, then select **Background Jobs**.

Example

Schedule daily digests:

```java
global class ExampleDigestJob1 implements Schedulable {
    global void execute(SchedulableContext context) {
        ConnectApi.Chatter.submitDigestJob(ConnectApi.DigestPeriod.DailyDigest);
    }
}
```

Schedule weekly digests:

```java
global class ExampleDigestJob2 implements Schedulable {
    global void execute(SchedulableContext context) {
        ConnectApi.Chatter.submitDigestJob(ConnectApi.DigestPeriod.WeeklyDigest);
    }
}
```

- Apex Scheduler

**ChatterFavorites Class**

Chatter favorites give you easy access to topics, list views, and feed searches.
Namespace

ConnectApi

Usage

Use Connect in Apex to get and delete topics, list views, and feed searches that have been added as favorites. Add topics and feed searches as favorites, and update the last view date of a feed search or list view feed to the current system time.

In this image of Salesforce, “Build Issues” is a topic, “All Accounts” is a list view, and “United” is a feed search.

ChatterFavorites Methods

The following are methods for ChatterFavorites. All methods are static.

IN THIS SECTION:

addFavorite(communityId, subjectId, searchText)
Add a feed search favorite for a user.

addRecordFavorite(communityId, subjectId, targetId)
Add a topic as a favorite.

deleteFavorite(communityId, subjectId, favoriteId)
Delete a favorite.

getFavorite(communityId, subjectId, favoriteId)
Get information about a favorite.

getFavorites(communityId, subjectId)
Get a list of favorites for a user.

getFeedElements(communityId, subjectId, favoriteId)
Get the first page of feed elements for a favorite.
getFeedElements(communityId, subjectId, favoritelid, pageParam, pageSize, sortParam)
Get a page of sorted feed elements for a favorite.

getFeedElements(communityId, subjectId, favoritelid, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam)
Get a page of sorted feed elements for a favorite. Include no more than the specified number of comments per feed element.

updateFavorite(communityId, subjectId, favoritelid, updateLastViewDate)
Update the last view date of the saved search or list view feed to the current system time.

addFavorite(communityId, subjectId, searchText)
Add a feed search favorite for a user.

API Version
28.0

Requires Chatter
Yes

Signature
public static ConnectApi.FeedFavorite addFavorite(String communityId, String subjectId, String searchText)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

searchText
Type: String
Specify the text of the search to be saved as a favorite. This method can only create a feed search favorite, not a list view favorite or a topic.

Return Value
Type: ConnectApi.FeedFavorite

addRecordFavorite(communityId, subjectId, targetId)
Add a topic as a favorite.

API Version
28.0
Requires Chatter

Yes

Signature

public static ConnectApi.FeedFavorite addRecordFavorite(String communityId, String
subjectId, String targetId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

targetId
Type: String
The ID of the topic to add as a favorite.

Return Value

Type: ConnectApi.FeedFavorite

deleteFavorite(communityId, subjectId, favoriteId)

Delete a favorite.

API Version

28.0

Requires Chatter

Yes

Signature

public static Void deleteFavorite(String communityId, String subjectId, String
favoriteId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

*favoriteId*
Type: String
ID of a favorite.

**Return Value**
Type: Void

**getFavorite(communityId, subjectId, favoriteId)**
Get information about a favorite.

**API Version**
28.0

**Requires Chatter**
Yes

**Signature**
public static ConnectApi.FeedFavorite getFavorite(String communityId, String subjectId, String favoriteId)

**Parameters**

*communityId*
Type: String
ID for an Experience Cloud site, internal, or null.

*subjectId*
Type: String
ID of the context user or the alias me.

*favoriteId*
Type: String
ID of a favorite.

**Return Value**
Type: ConnectApi.FeedFavorite

**getFavorites(communityId, subjectId)**
Get a list of favorites for a user.
API Version
28.0

Requires Chatter
Yes

Signature
public static ConnectApi.FeedFavorites getFavorites(String communityId, String subjectId)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

Return Value
Type: ConnectApi.FeedFavorites

getFeedElements(communityId, subjectId, favoriteId)
Get the first page of feed elements for a favorite.

API Version
31.0

Requires Chatter
Yes

Signature
public static ConnectApi.FeedElementPage getFeedElements(String communityId, String subjectId, String favoriteId)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

favoriteId
Type: String
ID of a favorite.

Return Value
Type: ConnectApi.FeedElementPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetFeedElements(communityId, subjectId, favoriteId, result)

getFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)
Get a page of sorted feed elements for a favorite.

API Version
31.0

Requires Chatter
Yes

Signature
public static ConnectApi.FeedElementPage getFeedElements(String communityId, String subjectId, String favoriteId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

favoriteId
Type: String
ID of a favorite.

*pageParam*

Type: `String`

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

*pageSize*

Type: `Integer`

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

*sortParam*

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

**Return Value**

Type: `ConnectApi.FeedElementPage`

**Usage**

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestGetFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

```java
getFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam)
```

Get a page of sorted feed elements for a favorite. Include no more than the specified number of comments per feed element.

**API Version**

31.0

**Requires Chatter**

Yes
Signature

```java
public static ConnectApi.FeedElementPage getFeedElements(String communityId, String subjectId, String favoriteId, Integer recentCommentCount, Integer elementsPerBundle, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
```

Parameters

`communityId`
- Type: String
- ID for an Experience Cloud site, internal, or null.

`subjectId`
- Type: String
- ID of the context user or the alias me.

`favoriteId`
- Type: String
- ID of a favorite.

`recentCommentCount`
- Type: Integer
- Maximum number of comments to return with each feed element. The default value is 3.

`elementsPerBundle`
- Type: Integer
- Maximum number of feed elements per bundle. The default and maximum value is 10.

`pageParam`
- Type: String
- Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

`pageSize`
- Type: Integer
- Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

`sortParam`
- Type: ConnectApi.FeedSortOrder
- Values are:
  - CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
  - CreatedDateDesc—Sorts by most recent creation date.
  - LastModifiedDateDesc—Sorts by most recent activity.
  - MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
  - Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
- If you pass in null, the default value CreatedDateDesc is used.
Return Value
Type: `ConnectApi.FeedElementPage`

Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestGetFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam, result)`

`updateFavorite(communityId, subjectId, favoriteId, updateLastViewDate)`
Update the last view date of the saved search or list view feed to the current system time.

API Version
28.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.FeedFavorite updateFavorite(String communityId, String subjectId, String favoriteId, Boolean updateLastViewDate)
```

Parameters
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, `internal`, or `null`.
- `subjectId`
  Type: `String`
  ID of the context user or the alias `me`.
- `favoriteId`
  Type: `String`
  ID of a favorite.
- `updateLastViewDate`
  Type: `Boolean`
  Specify whether to update the last view date of the specified favorite to the current system time (`true`) or not (`false`).
Return Value
Type: `ConnectApi.FeedFavorite`

ChatterFavorites Test Methods
The following are the test methods for `ChatterFavorites`. All methods are static.
For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

IN THIS SECTION:

- `setTestGetFeedElements(communityId, subjectId, favoriteId, result)`
  Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.
- `setTestGetFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)`
  Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.
- `setTestGetFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam, result)`
  Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.
- `setTestGetFeedElements(communityId, subjectId, favoriteId, result)`
  Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

```java
public static void setTestGetFeedElements(String communityId, String subjectId, String favoriteId, ConnectApi.FeedElementPage result)
```

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
31.0

Signature

```java
public static void setTestGetFeedElements(String communityId, String subjectId, String favoriteId, ConnectApi.FeedElementPage result)
```

Parameters

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, `internal`, or `null`.
- `subjectId`
  Type: `String`
  ID of the context user or the alias `me`.
- `favoriteId`
  Type: `String`
  ID of a favorite.
result
Type: ConnectApi.FeedElementPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getFeedElements(communityId, subjectId, favoriteId)

setTestGetFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)
Register a ConnectApi.FeedElementPage object to be returned when getFeedElements is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
31.0

Signature
public static Void setTestGetFeedElements(String communityId, String subjectId, String favoriteId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

favoriteId
Type: String
ID of a favorite.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for Home feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

**result**

Type: `ConnectApi.FeedElementPage`

Object containing test data.

**Return Value**

Type: Void

SEE ALSO:

- `getFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)`
  - *Apex Developer Guide: Testing ConnectApi Code*

**setTestGetFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam, result)**

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

**API Version**

31.0

**Signature**

```java
public static Void setTestGetFeedElements(String communityId, String subjectId, String favoriteId, Integer recentCommentCount, Integer elementsPerBundle, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

**Parameters**

- **communityId**
  
  Type: `String`

  ID for an Experience Cloud site, internal, or `null`.  

subjectId
Type: String
ID of the context user or the alias me.

favoriteId
Type: String
ID of a favorite.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
• CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
• CreatedDateDesc—Sorts by most recent creation date.
• LastModifiedDateDesc—Sorts by most recent activity.
• MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
• Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
If you pass in null, the default value CreatedDateDesc is used.

result
Type: ConnectApi.FeedElementPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam)

Retired ChatterFavorites Methods

The following methods for ChatterFavorites are retired.

IN THIS SECTION:

- `getFeedItems(communityId, subjectId, favoriteId)`
  - Get the first page of feed items for a favorite.

- `getFeedItems(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)`
  - Get a page of sorted feed items for a favorite.

- `getFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam)`
  - Get a page of sorted feed items for a favorite. Include no more than the specified number of comments per feed item.

- `setTestGetFeedItems(communityId, subjectId, favoriteId, result)`
  - Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItems` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

- `setTestGetFeedItems(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)`
  - Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItems` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

- `setTestGetFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam, result)`
  - Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItems` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

### `getFeedItems(communityId, subjectId, favoriteId)`

Get the first page of feed items for a favorite.

**API Version**

28.0–31.0

ℹ️ **Important:** In version 32.0 and later, use `getFeedElements(communityId, subjectId, favoriteId)`.

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.FeedItemPage getFeedItems(String communityId, String subjectId, String favoriteId)
```

**Parameters**

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, `internal`, or `null`.

---

450
**subjectId**
Type: **String**
ID of the context user or the alias `me`.

**favoriteId**
Type: **String**
ID of a favorite.

**Return Value**
Type: `ConnectApi.FeedItemPage`

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**SEE ALSO:**
- `setTestGetFeedItems(communityId, subjectId, favoriteId, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

**getFeedItems**(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)
Get a page of sorted feed items for a favorite.

**API Version**
28.0–31.0

**Important:** In version 32.0 and later, use `getFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)`.

**Requires Chatter**
Yes

**Signature**
```java
public static ConnectApi.FeedItemPage getFeedItems(String communityId, String subjectId, String favoriteId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
```

**Parameters**

**communityId**
Type: **String**
ID for an Experience Cloud site, `internal`, or `null`.
**subjectId**
Type: String
ID of the context user or the alias me.

**favoriteId**
Type: String
ID of a favorite.

**pageParam**
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

**pageSize**
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

**sortParam**
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

**Return Value**
Type: ConnectApi.FeedItemPage

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- setTestGetFeedItems(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)
  *Apex Developer Guide: Testing ConnectApi Code*

**getFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam)**
Get a page of sorted feed items for a favorite. Include no more than the specified number of comments per feed item.
API Version
29.0–31.0

Important: In version 32.0 and later, use `getFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam).

Requires Chatter
Yes

Signature
```
public static ConnectApi.FeedItemPage getFeedItems(String communityId, String subjectId, String favoriteId, Integer recentCommentCount, String pageParam, Integer pageSize, FeedSortOrder sortParam)
```

Parameters

`communityId`
Type: String
ID for an Experience Cloud site, internal, or `null`. 

`subjectId`
Type: String
ID of the context user or the alias `me`. 

`favoriteId`
Type: String
ID of a favorite. 

`recentCommentCount`
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3. 

`pageParam`
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned. 

`pageSize`
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25. 

`sortParam`
Type: `ConnectApi.FeedSortOrder`
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds. 
- CreatedDateDesc—Sorts by most recent creation date. 
- LastModifiedDateDesc—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.

- **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds. Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

**Return Value**

Type: `ConnectApi.FeedItemPage`

**Usage**

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestGetFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam, result)`
  *Apex Developer Guide: Testing ConnectApi Code*

**setTestGetFeedItems(communityId, subjectId, favoriteId, result)**

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItems` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

**API Version**

28.0–31.0

**Signature**

```
public static Void setTestGetFeedItems(String communityId, String subjectId, String favoriteId, ConnectApi.FeedItemPage result)
```

**Parameters**

`communityId`

Type: `String`

ID for an Experience Cloud site, internal, or `null`.

`subjectId`

Type: `String`

ID of the context user or the alias `me`.

`favoriteId`

Type: `String`

ID of a favorite.

`result`

Type: `ConnectApi.FeedItemPage`
Object containing test data.

**Return Value**
Type: Void

SEE ALSO:
- `getFeedItems(communityId, subjectId, favoriteId)`
- *Apex Developer Guide: Testing ConnectApi Code*

### setTestGetFeedItems(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItems` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

**API Version**
28.0–31.0

**Signature**
```
public static Void setTestGetFeedItems(String communityId, String subjectId, String favoriteId, String pageParam, Integer pageSize, FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

**Parameters**
- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or `null`.
- **subjectId**
  Type: String
  ID of the context user or the alias `me`.
- **favoriteId**
  Type: String
  ID of a favorite.
- **pageParam**
  Type: String
  Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.
- **pageSize**
  Type: Integer
  Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.
sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

result
Type: ConnectApi_FEEDITEMPAGE
Object containing test data.

Return Value
Type: Void

SEE ALSO:
- getFeedItems(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)

setTestGetFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam, result)
Register a ConnectApi_FEEDITEMPAGE object to be returned when getFeedItems is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
29.0–31.0

Signature
public static Void setTestGetFeedItems(String communityId, String subjectId, String favoriteId, Integer recentCommentCount, String pageParam, Integer pageSize, FeedSortOrder sortParam, ConnectApi.FeedItemPage result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.
subjectId
Type: String
ID of the context user or the alias me.

favoriteId
Type: String
ID of a favorite.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

result
Type: ConnectApi.FeedItemPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
- getFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam)
ChatterFeeds Class

Get, post, and delete feed elements, likes, comments, and bookmarks. You can also search feed elements, share feed elements, and vote on polls.

Namespace

ConnectApi

Usage

The Chatter feed is a container of feed elements. The abstract class ConnectApi.FeedElement is a parent class to the ConnectApi.FeedItem class, representing feed posts, and the ConnectApi.GenericFeedElement class, representing bundles and recommendations in the feed. For detailed information, see Working with Feeds and Feed Elements.

⚠️ Important: Feed item methods aren’t available in version 32.0. In version 32.0 and later, use feed element methods.

Message segments in a feed item are typed as ConnectApi.MessageSegment. Feed item capabilities are typed as ConnectApi.FeedItemCapability. Record fields are typed as ConnectApi.AbstractRecordField. These classes are all abstract and have several concrete subclasses. At runtime you can use instanceof to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

⚠️ Important: The composition of a feed can change between releases. Write your code to handle instances of unknown subclasses.

ChatterFeeds Methods

The following are methods for ChatterFeeds. All methods are static.

IN THIS SECTION:

createStream(communityId, streamInput)
Create a Chatter feed stream.

deleteComment(communityId, commentId)
Delete a comment.

deleteFeedElement(communityId, feedElementId)
Delete a feed element.

deleteLike(communityId, likeld)
Delete a like on a comment or post.

deleteStream(communityId, streamId)
Delete a Chatter feed stream.

getComment(communityId, commentId)
Get a comment.

getCommentBatch(communityId, commentIds)
Get a list of comments.

getCommentInContext(communityId, commentId, pageSize)
Get a threaded comment in the context of its parent comments and post.
getCommentsForFeedElement(communityId, feedElementId)
Get comments for a feed element.

getCommentsForFeedElement(communityId, feedElementId, threadedCommentsCollapsed)
Get comments in a threaded style for a feed element.

getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize)
Get a page of comments for a feed element.

getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize, threadedCommentsCollapsed)
Get a page of comments in a threaded style for a feed element.

getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize, threadedCommentsCollapsed, sortParam)
Get a page of sorted comments in a threaded style for a feed element.

getCommentsForFeedElement(communityId, feedElementId, sortParam)
Get sorted comments for a feed element.

getCommentsForFeedElement(communityId, feedElementId, sortParam, threadedCommentsCollapsed)
Get sorted comments in a threaded style for a feed element.

getExtensions(communityId, pageParam, pageSize)
Get extensions.

getFeed(communityId, feedType)
Get a feed.

getFeed(communityId, feedType, sortParam)
Get a sorted feed.

getFeed(communityId, feedType, subjectId)
Get a feed for a record or user.

getFeed(communityId, feedType, subjectId, sortParam)
Get a sorted feed for a record or user.

getFeedDirectory(String)
Get a list of all feeds available to the context user.

getFeedElement(communityId, feedElementId)
Get a feed element.

getFeedElement(communityId, feedElementId, commentSort)
Get a feed element with sorted comments.

getFeedElement(communityId, feedElementId, threadedCommentsCollapsed)
Get a feed element and its comments in a threaded style.

getFeedElement(communityId, feedElementId, threadedCommentsCollapsed, commentSort)
Get a feed element and its sorted comments in a threaded style.

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle)
Get a feed element with the specified number of elements per bundle including no more than the specified number of comments per feed element.
getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, threadedCommentsCollapsed)
Get a feed element with its comments in a threaded style with the specified number of elements per bundle and comments per feed element.

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, threadedCommentsCollapsed, commentSort)
Get a feed element with its sorted comments in a threaded style with the specified number of elements per bundle and comments per feed element.

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, commentSort)
Get a feed element with the specified number of elements per bundle including no more than the specified number of sorted comments per feed element.

getFeedElementBatch(communityId, feedElementIds)
Get a list of feed elements.

getFeedElementPoll(communityId, feedElementId)
Get the poll associated with a feed element.

getFeedElementsFromBundle(communityId, feedElementId)
Get feed elements from a bundle.

getFeedElementsFromBundle(communityId, feedElementId, pageParam, pageSize, elementsPerBundle, recentCommentCount)
Get a page of feed elements from a bundle. Specify the number of elements per bundle and include no more than the specified number of comments per feed element.

getFeedElementsFromFeed(communityId, feedType)

getFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)

getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)
Get a page of sorted feed elements from the Company, DirectMessageModeration, DirectMessages, Home, Moderation, and PendingReview feeds. Each feed element contains no more than the specified number of comments.

getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter)
Get a page of sorted and filtered feed elements from the Home feed. Each feed element contains no more than the specified number of comments.

getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed)
Get a page of filtered and sorted feed elements with comments in a threaded style from the Home feed. Each feed element contains no more than the specified number of comments.

getFeedElementsFromFeed(communityId, feedType, subjectId)
Get feed elements from any feed other than Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview for a user or record.

getFeedElementsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam)
Get a page of sorted feed elements from any feed other than Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.
getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam)
Get a page of sorted feed elements from any feed other than Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview. Each feed element includes no more than the specified number of comments.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)
Get a page of sorted feed elements from a record feed. Each feed element includes no more than the specified number of comments. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter)
Get a page of sorted and filtered feed elements from the UserProfile feed.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed)
Get a page of feed elements with comments in a threaded style from the UserProfile feed.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, customFilter)
Get a page of sorted and filtered feed elements from the case feed.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly)
Get a page of sorted feed elements from a record feed. Specify the number of elements per bundle and include no more than the specified number of comments per feed element. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter)
Get a page of sorted and filtered feed elements from a record feed. Specify the number of elements per bundle and include no more than the specified number of comments per feed element. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter, threadedCommentsCollapsed)
Get a page of sorted and filtered feed elements with comments in a threaded style from a record feed. Specify the number of elements per bundle and include no more than the specified number of comments per feed element. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, customFilter)
Get a page of sorted and filtered feed elements from a case feed.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, customFilter, threadedCommentsCollapsed)
Get a page of filtered and sorted feed elements with comments in a threaded style from a case feed.

generateFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix)
Get feed elements from a feed filtered by a key prefix for a user.

generateFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam)
Get a page of sorted feed elements from a feed filtered by a key prefix for a user.
getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from a feed filtered by a key prefix for a user. Each feed element contains no more than the specified number of comments.

getFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince)

Get a page of feed elements from a feed filtered by a key prefix for a user. Include only feed elements that have been updated since the time specified in the updatedSince parameter. Each feed element contains no more than the specified number of comments.

getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince)

Get a page of feed elements from the Company, DirectMessageModeration, Home, and Moderation feeds. Include only feed elements that have been updated since the time specified in the updatedSince parameter. Each feed element contains no more than the specified number of comments.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince)

Get a page of feed elements from the Files, Groups, News, People, and Record feeds. Include only feed elements that have been updated since the time specified in the updatedSince parameter. Each feed element contains no more than the specified number of comments.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, filter)

Get a page of filtered feed elements from the Home feed. Include only feed elements that have been updated since the time specified in the updatedSince parameter. Each feed element contains no more than the specified number of comments.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince)

Get a page of filtered feed elements from a UserProfile feed. Include only feed elements that have been updated since the time specified in the updatedSince parameter.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly)

Get a page of filtered feed elements from a case feed. Include only feed elements that have been updated since the time specified in the updatedSince parameter. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, customFilter)

Get a page of filtered feed elements from a case feed. Include only feed elements that have been updated since the time specified in the updatedSince parameter. Specify the maximum number of feed elements in a bundle.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly)

Get a page of filtered feed elements from a record feed. Include only feed elements that have been updated since the time specified in the updatedSince parameter. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, filter)

Get a page of filtered feed elements from a record feed. Include only feed elements that have been updated since the time specified in the updatedSince parameter. Specify the maximum number of feed elements in a bundle and whether to return feed elements posted by internal (non-Experience Cloud site) users only.
getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, customFilter)
Get a page of filtered feed elements from a case feed. Include only feed elements that have been updated since the time specified in the updatedSince parameter.

getFeedWithFeedElements(communityId, feedType, pageSize)
Get information about a feed and a page of feed elements from the feed.

getFeedWithFeedElements(communityId, feedType, pageSize, recentCommentCount)
Get a page of information about the feed and the feed elements with the specified number of comments per feed element from the feed.

getFilterFeed(communityId, subjectId, keyPrefix)
Get a feed filtered by a key prefix for a user.

getFilterFeed(communityId, subjectId, keyPrefix, sortParam)
Get a sorted feed filtered by a key prefix for a user.

getFilterFeedDirectory(communityId, subjectId)
Get a feed directory of filter feeds available to the context user.

getLike(communityId, likeId)
Get a like on a post or comment.

getLikesForComment(communityId, commentId)
Get likes for a comment.

getLikesForComment(communityId, commentId, pageParam, pageSize)
Get a page of likes for a comment.

getLikesForFeedElement(communityId, feedElementId)
Get likes for a feed element.

getLikesForFeedElement(communityId, feedElementId, pageParam, pageSize)
Get a page of likes for a feed element.

getLinkMetadata(communityId, urls)
Get link metadata for URLs.

getPinnedFeedElementsFromFeed(communityId, feedType, subjectId)
Get pinned feed elements from a group or topic feed.

getReadByForFeedElement(communityId, feedElementId)
Get information about who read a feed element and when.

getReadByForFeedElement(communityId, feedElementId, pageParam, pageSize)
Get a page of information about who read a feed element and when.

getRelatedPosts(communityId, feedElementId, filter, maxResults)
Get posts related to the context feed element.

getStream(communityId, streamId)
Get information about a Chatter feed stream.

getStream(communityId, streamId, globalScope)
Get information about a Chatter feed stream, regardless of Experience Cloud site.

getStreams(communityId)
Get the Chatter feed streams for the context user.
getStreams(communityId, sortParam)
Get and sort the Chatter feed streams for the context user.

getStreams(communityId, pageParam, pageSize)
Get a page of Chatter feed streams for the context user.

getStreams(communityId, pageParam, pageSize, sortParam)
Get a sorted page of Chatter feed streams for the context user.

getStreams(communityId, pageParam, pageSize, sortParam, globalScope)
Get a sorted page of Chatter feed streams from all Enterprise Cloud sites for the context user.

getSupportedEmojis()
Get supported emojis for the org.

getThreadsForFeedComment(communityId, commentId)
Get threaded comments for a comment.

getThreadsForFeedComment(communityId, commentId, pageParam, pageSize)
Get a page of threaded comments for a comment.

getThreadsForFeedComment(communityId, commentId, threadedCommentsCollapsed)
Access the comments capability for a comment.

getTopUnansweredQuestions(communityId) (Pilot)
Get top unanswered questions for the context user in a Experience Cloud site.

getTopUnansweredQuestions(communityId, filter) (Pilot)
Get filtered top unanswered questions for the context user in an Experience Cloud site.

getTopUnansweredQuestions(communityId, pageSize) (Pilot)
Get a page of top unanswered questions for the context user in an Experience Cloud site.

getTopUnansweredQuestions(communityId, filter, pageSize) (Pilot)
Get a page of filtered top unanswered questions for the context user in an Experience Cloud site.

getVotesForComment(communityId, commentId, vote)
Get the first page of users who upvoted or downvoted a comment.

getVotesForComment(communityId, commentId, vote, pageParam, pageSize)
Get a page of users who upvoted or downvoted a comment.

getVotesForFeedElement(communityId, feedElementId, vote)
Get the first page of users who upvoted or downvoted a feed element.

getVotesForFeedElement(communityId, feedElementId, vote, pageParam, pageSize)
Get a page of users who upvoted or downvoted a feed element.

isCommentEditableByMe(communityId, commentId)
Discover whether the context user can edit a comment.

isFeedElementEditableByMe(communityId, feedElementId)
Discover whether the context user can edit a feed element.

isModified(communityId, feedType, subjectId, since)
Discover whether a news feed has been updated or changed. Use this method to poll a news feed for updates.

likeComment(communityId, commentId)
Like a comment for the context user.
likeFeedElement(communityId, feedElementId)
Like a feed element.

postCommentToFeedElement(communityId, feedElementId, text)
Post a plain-text comment to a feed element.

postCommentToFeedElement(communityId, feedElementId, comment, feedElementFileUpload)
Post a rich-text comment to a feed element. Use this method to include mentions and to attach a file.

postFeedElement(communityId, subjectId, feedElementType, text)
Post a plain-text feed element.

postFeedElement(communityId, feedElement)
Post a rich-text feed element. Include mentions and hashtag topics, attach already uploaded files to a feed element, and associate action link groups with a feed element. You can also use this method to share a feed element and add a comment.

postFeedElementBatch(communityId, feedElements)
Post a list of feed elements.

publishDraftFeedElement(communityId, feedElementId, feedElement)
Publish a draft feed element.

searchFeedElements(communityId, q)
Get the first page of feed elements that match the search criteria.

searchFeedElements(communityId, q, sortParam)
Get the first page of sorted feed elements that match the search criteria.

searchFeedElements(communityId, q, threadedCommentsCollapsed)
Get the feed elements and comments that match the search criteria.

searchFeedElements(communityId, q, pageParam, pageSize)
Get a page of feed elements that match the search criteria.

searchFeedElements(communityId, q, pageParam, pageSize, sortParam)
Get a page of sorted feed elements that match the search criteria.

searchFeedElements(communityId, q, pageParam, pageSize, threadedCommentsCollapsed)
Get a page of feed elements with comments in a threaded style that match the search criteria.

searchFeedElements(communityId, q, recentCommentCount, pageParam, pageSize, sortParam)
Get a page of sorted feed elements that match the search criteria. Each feed element includes no more than the specified number of comments.

searchFeedElementsInFeed(communityId, feedType, q)
Get the feed elements from the Company, DirectMessageModeration, Home, Moderation, and PendingReview feeds that match the search criteria.

searchFeedElementsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q)
Get a page of sorted feed elements from the Company, DirectMessageModeration, Home, Moderation, and PendingReview feeds that match the search criteria.

searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q)
Get a page of sorted feed elements from the Company, DirectMessageModeration, Home, Moderation, and PendingReview feeds that match the search criteria. Each feed element includes no more than the specified number of comments.
searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)
Get a page of sorted and filtered feed elements from the Home feed that match the search criteria. Each feed element includes no more than the specified number of comments.

searchFeedElementsInFeed(communityId, feedType, subjectId, q)
Search up to 5,000 of the most recent feed elements in a feed for a subject ID that match the search string. Feed elements are returned in order of most recent activity.

searchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)
Get a page of sorted feed elements from a feed for a record or user that match the search criteria.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)
Get a page of sorted feed elements from a feed that match the search criteria. Each feed element includes no more than the specified number of comments.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)
Get a page of sorted and filtered feed elements from a UserProfile feed that match the search criteria.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, customFilter)
Get a page of sorted and filtered feed elements from a case feed that match the search criteria.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly)
Get a page of sorted feed elements from a feed for a record or user that match the search criteria. Each feed element includes no more than the specified number of comments. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, filter)
Get a page of sorted and filtered feed elements from a feed for a record or user that match the search criteria. Each feed element includes no more than the specified number of comments. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, customFilter)
Get a page of sorted and filtered feed elements from a case feed that match the search criteria.

searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q)
Get the feed elements from a feed filtered by a key prefix that match the search criteria.

searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q)
Get a page of sorted feed elements from a feed filtered by a key prefix that match the search criteria.

searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)
Get a page of sorted feed elements from a feed filtered by a key prefix that match the search criteria. Each feed element includes no more than the specified number of comments.

searchStreams(communityId, q)
Search the Chatter feed streams for the context user.

searchStreams(communityId, q, sortParam)
Search and sort the Chatter feed streams for the context user.
searchStreams(communityId, q, pageParam, pageSize)
Search the Chatter feed streams for the context user and return a page of results.

searchStreams(communityId, q, pageParam, pageSize, sortParam)
Search the Chatter feed streams for the context user and return a sorted page of results.

searchStreams(communityId, q, pageParam, pageSize, sortParam, globalScope)
Search the Chatter feed streams from all Experience Cloud sites for the context user and return a sorted page of results.

setCommentIsVerified(communityId, commentId, isVerified)
Mark a comment as verified or unverified.

setCommentIsVerifiedByAnonymized(communityId, commentId, isVerified, isVerifiedByAnonymized)
Mark a comment as verified by an anonymous user.

setCommentVote(communityId, commentId, upDownVote)
Upvote or downvote a comment.

setFeedCommentStatus(communityId, commentId, status)
Set the status of a comment.

setFeedElementIsClosed(communityId, feedElementId, isClosed)
Set a feed element to closed.

setFeedElementVote(communityId, feedElementId, upDownVote)
Upvote or downvote a feed element.

setFeedEntityStatus(communityId, feedElementId, status)
Set the status of a feed post.

setIsMutedByMe(communityId, feedElementId, isMutedByMe)
Mute or unmute a feed element.

setIsReadByMe(communityId, feedElementId, isReadByMe)
Mark a feed element as read for the context user.

setIsReadByMe(communityId, feedElementId, readBy)
Mark a feed element as read for the context user using an input class.

updateComment(communityId, commentId, comment)
Edit a comment.

updateDirectMessage(communityId, feedElementId, directMessage)
Update the members of a direct message.

updateFeedElement(communityId, feedElementId, feedElement)
Edit a feed element.

updateFeedElementBookmarks(communityId, feedElementId, bookmarks)
Bookmark a feed element or remove a bookmark from a feed element using an input class.

updateFeedElementBookmarks(communityId, feedElementId, isBookmarkedByCurrentUser)
Bookmark a feed element or remove a bookmark from a feed element.

updateFeedElementReadByCapabilityBatch(communityId, feedElementIds, readBy)
Mark multiple feed elements as read by the context user at the same time using an input class.

updateFeedElementReadByCapabilityBatch(communityId, feedElementIds, isReadByMe)
Mark multiple feed elements as read by the context user at the same time.
updateLikeForComment(communityId, commentId, isLikedByCurrentUser)
Like or unlike a comment.

updateLikeForFeedElement(communityId, feedElementId, isLikedByCurrentUser)
Like or unlike a feed element.

updatePinnedFeedElements(communityId, feedType, subjectId, pin)
Pin or unpin feed elements to a group or topic feed.

updateStream(communityId, streamId, streamInput)
Update a Chatter feed stream.

voteOnFeedElementPoll(communityId, feedElementId, myChoiceId)
Vote on a poll or change your vote on a poll.

createStream(communityId, streamInput)
Create a Chatter feed stream.

API Version
39.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterStream createStream(String communityId,
ConnectApi.ChatterStreamInput streamInput)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

streamInput
Type: ConnectApi.ChatterStreamInput
A ConnectApi.ChatterStreamInput body.

Return Value
Type: ConnectApi.ChatterStream

deleteComment(communityId, commentId)
Delete a comment.
API Version
28.0

Requires Chatter
Yes

Signature
public static Void deleteComment(String communityId, String commentId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

commentId
Type: String
ID for a comment.

Return Value
Type: Void

deleteFeedElement(communityId, feedElementId)
Delete a feed element.

API Version
31.0

Requires Chatter
Yes

Signature
public static deleteFeedElement(String communityId, String feedElementId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.
Return Value
Type: Void

**deleteLike(communityId, likeId)**
Delete a like on a comment or post.

**API Version**
28.0

**Requires Chatter**
Yes

**Signature**
```
public static Void deleteLike(String communityId, String likeId)
```

**Parameters**

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **likeId**
  - Type: String
  - ID for a like.

**Return Value**
Type: Void

**deleteStream(communityId, streamId)**
Delete a Chatter feed stream.

**API Version**
39.0

**Requires Chatter**
Yes

**Signature**
```
public static Void deleteStream(String communityId, String streamId)
```
Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

streamId
Type: String
ID of the Chatter feed stream.

Return Value
Type: Void

getComment(communityId, commentId)
Get a comment.

API Version
28.0

Available to Guest Users
31.0

Requires Chatter
Yes

Signature
public static ConnectApi.Comment getComment(String communityId, String commentId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

commentId
Type: String
ID for a comment.

Return Value
Type: ConnectApi.Comment

getCommentBatch(communityId, commentIds)
Get a list of comments.
**API Version**

42.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.BatchResult[] getCommentBatch(String communityId, List<String> commentIds)
```

**Parameters**

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.
- `commentIds`
  - Type: `List<String>`
  - A list of up to 100 comment IDs.

**Return Value**

Type: `ConnectApi.BatchResult[]`

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.Comment` object and errors for comments that didn't load.

**getCommentInContext(communityId, commentId, pageSize)**

Get a threaded comment in the context of its parent comments and post.

**API Version**

44.0

**Available to Guest Users**

44.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.FeedElement getCommentInContext(String communityId, String commentId, Integer pageSize)
```
Parameters

*communityId*

- Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

*commentId*

- Type: `String`
  - ID of the comment.

*pageSize*

- Type: `Integer`
  - Specifies the number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 25.

Return Value

- Type: `ConnectApi.FeedElement`

If the comment doesn't support the `comments` capability, the return value is `ConnectApiNotFoundException`.

**getCommentsForFeedElement(communityId, feedElementId)**

Get comments for a feed element.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.CommentPage getCommentsForFeedElement(String communityId, String feedElementId)
```

Parameters

*communityId*

- Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

*feedElementId*

- Type: `String`
  - ID of the feed element.
Return Value
Type: `ConnectApi.CommentPage`
If the feed element doesn’t support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

`getCommentsForFeedElement(communityId, feedElementId, threadedCommentsCollapsed)`
Get comments in a threaded style for a feed element.

API Version
44.0

Available to Guest Users
44.0

Requires Chatter
Yes

Signature
```
public static ConnectApi.CommentPage getCommentsForFeedElement(String communityId,
                    String feedElementId, Boolean threadedCommentsCollapsed)
```

Parameters
```
communityId
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.

feedElementId
  Type: `String`
  ID of the feed element.

threadedCommentsCollapsed
  Type: `Boolean`
  Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.
```

Return Value
Type: `ConnectApi.CommentPage`
If the feed element doesn’t support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

`getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize)`
Get a page of comments for a feed element.
API Version
32.0

Available to Guest Users
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.CommentPage getCommentsForFeedElement(String communityId, String feedElementId, String pageParam, Integer pageSize)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of comments per page. Valid values are from 1 through 100. If you pass null, the default size is 25.

Return Value
Type: ConnectApi.CommentPage
If the feed element doesn’t support the Comments capability, the return value is ConnectApi.NotFoundException.

getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize, threadedCommentsCollapsed)
Get a page of comments in a threaded style for a feed element.

API Version
44.0
Available to Guest Users

44.0

Requires Chatter

Yes

Signature

public static ConnectApi.CommentPage getCommentsForFeedElement(String communityId,
String feedElementId, String pageParam, Integer pageSize, Boolean
threadedCommentsCollapsed)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of comments per page. Valid values are from 1 through 100. If you pass null, the default size is 25.

threadedCommentsCollapsed
Type: Boolean
Specifies whether to return threaded comments in a collapsed style (true) or not (false). If you pass in null, the default is false.

Return Value

Type: ConnectApi.CommentPage
If the feed element doesn’t support the Comments capability, the return value is ConnectApi.NotFoundException.

getCommentsForFeedElement(communityId, feedElementId,
threadedCommentsCollapsed, sortParam)

Get sorted comments in a threaded style for a feed element.

API Version

44.0
Available to Guest Users
44.0

Requires Chatter
Yes

Signature
public static ConnectApi.CommentsCapability getCommentsForFeedElement(String communityId, String feedElementId, Boolean threadedCommentsCollapsed, ConnectApi.FeedCommentSortOrder sortParam)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

threadedCommentsCollapsed
Type: Boolean
Specifies whether to return threaded comments in a collapsed style (true) or not (false). If you pass in null, the default is false.

sortParam
Type: ConnectApi.FeedCommentSortOrder
Order of comments. Values are:
• CreatedDateLatestAsc—Sorts by most recently created comments in ascending order.
• CreatedDateOldestAsc—Sorts by oldest comments in ascending order.
• Relevance—Sorts by most relevant content.
Sorting in descending order isn’t supported.

Return Value
Type: ConnectApi.CommentPage
If the feed element doesn’t support the Comments capability, the return value is ConnectApi.NotFoundException.

getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize, threadedCommentsCollapsed, sortParam)
Get a page of sorted comments in a threaded style for a feed element.
API Version

Yes

Signature
public static ConnectApi.CommentPage getCommentsForFeedElement(String communityId,
String feedElementId, String pageParam, Integer pageSize, Boolean threadedCommentsCollapsed, ConnectApi.FeedCommentSortOrder sortParam)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of comments per page. Valid values are from 1 through 100. If you pass null, the default size is 25.

threadedCommentsCollapsed
Type: Boolean
Specifies whether to return threaded comments in a collapsed style (true) or not (false). If you pass in null, the default is false.

sortBy
Type: ConnectApi.FeedCommentSortOrder
Order of comments. Values are:
• CreatedDateLatestAsc—Sorts by most recently created comments in ascending order.
• CreatedDateOldestAsc—Sorts by oldest comments in ascending order.
• Relevance—Sorts by most relevant content.
Sorting in descending order isn’t supported.
Return Value
Type: ConnectApi.CommentPage
If the feed element doesn't support the Comments capability, the return value is ConnectApi.NotFoundException.

getCommentsForFeedElement(communityId, feedElementId, sortParam)
Get sorted comments for a feed element.

API Version
41.0

Available to Guest Users
41.0

Requires Chatter
Yes

Signature
public static ConnectApi.CommentsCapability getCommentsForFeedElement(String communityId, String feedElementId, ConnectApi.FeedCommentSortOrder sortParam)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

sortParam
Type: ConnectApi.FeedCommentSortOrder
Order of comments. Values are:
• CreatedDateLatestAsc—Sorts by most recently created comments in ascending order.
• CreatedDateOldestAsc—Sorts by oldest comments in ascending order.
• Relevance—Sorts by most relevant content.
  Sorting in descending order isn't supported.

Return Value
Type: ConnectApi.CommentsCapability
If the feed element doesn't support the Comments capability, the return value is ConnectApi.NotFoundException.
getCommentsForFeedElement(communityId, feedElementId, sortParam, threadedCommentsCollapsed)

Get sorted comments in a threaded style for a feed element.

API Version
44.0

Available to Guest Users
44.0

Requires Chatter
Yes

Signature
public static ConnectApi.CommentsCapability getCommentsForFeedElement(String communityId, String feedElementId, ConnectApi.FeedCommentSortOrder sortParam, Boolean threadedCommentsCollapsed)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

sortParam
Type: ConnectApi.FeedCommentSortOrder
Order of comments. Values are:
• CreatedDateLatestAsc—Sorts by most recently created comments in ascending order.
• CreatedDateOldestAsc—Sorts by oldest comments in ascending order.
• Relevance—Sorts by most relevant content.
Sorting in descending order isn’t supported.

threadedCommentsCollapsed
Type: Boolean
Specifies whether to return threaded comments in a collapsed style (true) or not (false). If you pass in null, the default is false.

Return Value
Type: ConnectApi.CommentsCapability
If the feed element doesn't support the Comments capability, the return value is `ConnectApi.NotFoundException`.

### getExtensions(communityId, pageParam, pageSize)

Get extensions.

**API Version**

40.0

**Available to Guest Users**

40.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.ExtensionDefinitions getExtensions(String communityId, String pageParam, Integer pageSize)
```

**Parameters**

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **pageParam**
  - Type: `String`
  - Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

- **pageSize**
  - Type: `Integer`
  - Specifies the number of items per page. Valid values are from 1 through 100. The default size is 15.

**Return Value**

Type: `ConnectApi.ExtensionDefinitions`

### getFeed(communityId, feedType)

Get a feed.

**API Version**

28.0
Available to Guest Users
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.Feed getFeed(String communityId, ConnectApi.FeedType feedType)

Parameters
- communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.
- feedType
  Type: ConnectApi.FeedType
  Type of feed. Valid values are Company, DirectMessageModeration, DirectMessages, Home, Moderation, and PendingReview.

Return Value
Type: ConnectApi.Feed

getFeed(communityId, feedType, sortParam)
Get a sorted feed.

API Version
28.0

Available to Guest Users
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.Feed getFeed(String communityId, ConnectApi.FeedType feedType, ConnectApi.FeedSortOrder sortParam)
Parameters

```
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

feedType
  Type: ConnectApi.FeedType
  Type of feed. Valid values are Company, DirectMessageModeration, DirectMessages, Home, Moderation, and PendingReview.

sortParam
  Type: ConnectApi.FeedSortOrder
  Values are:
  • CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
  • CreatedDateDesc—Sorts by most recent creation date.
  • LastModifiedDateDesc—Sorts by most recent activity.
  • MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
  • Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

If feedType is DirectMessages, sortParam must be LastModifiedDateDesc.
```

Return Value

```
Type: ConnectApi.Feed
```

getFeed(communityId, feedType, subjectId)

Get a feed for a record or user.

API Version

```
28.0
```

Available to Guest Users

```
32.0
```

Requires Chatter

```
Yes
```

Signature

```
public static ConnectApi.Feed getFeed(String communityId, ConnectApi.FeedType feedType, String subjectId)
```
Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.

subjectId
Type: String
If feedType is Record, subjectId can be any record ID, including a group ID. If feedType is Streams, subjectId must be a stream ID. If feedType is Topics, subjectId must be a topic ID. If feedType is UserProfile, subjectId can be any user ID. If the feedType is any other value, subjectId must be the ID of the context user or the alias me.

Return Value
Type: ConnectApi.Feed

getFeed(communityId, feedType, subjectId, sortParam)
Get a sorted feed for a record or user.

API Version
28.0

Available to Guest Users
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.Feed getFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, ConnectApi.FeedSortOrder sortParam)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

**subjectId**
Type: `String`
If `feedType` is `Record`, `subjectId` can be any record ID, including a group ID. If `feedType` is `Streams`, `subjectId` must be a stream ID. If `feedType` is `Topics`, `subjectId` must be a topic ID. If `feedType` is `UserProfile`, `subjectId` can be any user ID. If the `feedType` is any other value, `subjectId` must be the ID of the context user or the alias `me`.

**sortParam**
Type: `ConnectApi.FeedSortOrder`
Values are:
- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

**Return Value**
Type: `ConnectApi.Feed`

**getFeedDirectory(String)**
Get a list of all feeds available to the context user.

**API Version**
30.0

**Requires Chatter**
Yes

**Signature**
```java
public static ConnectApi.FeedDirectory getFeedDirectory(String communityId)
```

**Parameters**
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, `internal`, or `null`. 
Return Value
Type: `ConnectApi.FeedDirectory`

`getFeedElement(communityId, feedElementId)`
Get a feed element.

API Version
31.0

Available to Guest Users
31.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.FeedElement getFeedElement(String communityId, String feedElementId)
```

Parameters

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.

- `feedElementId`
  Type: `String`
  ID of the feed element.

Return Value
Type: `ConnectApi.FeedElement`

`getFeedElement(communityId, feedElementId, commentSort)`
Get a feed element with sorted comments.

API Version
41.0

Available to Guest Users
41.0
Requires Chatter
Yes

Signature

```java
public static ConnectApi.FeedElement getFeedElement(String communityId, String feedElementId, ConnectApi.FeedCommentSortOrder commentSort)
```

Parameters

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.

- `feedElementId`
  Type: `String`
  ID of the feed element.

- `commentSort`
  Type: `ConnectApi.FeedCommentSortOrder`
  Order of comments.
  - CreatedDateLatestAsc—Sorts by most recently created comments in ascending order.
  - CreatedDateOldestAsc—Sorts by oldest comments in ascending order.
  - Relevance—Sorts by most relevant content.
  The default value is CreatedDateLatestAsc.
  Sorting in descending order isn’t supported.

Return Value

Type: `ConnectApi.FeedElement`

```java
getFeedElement(communityId, feedElementId, threadedCommentsCollapsed)
```

Get a feed element and its comments in a threaded style.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes
Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String feedElementId, Boolean threadedCommentsCollapsed)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `feedElementId`
  - Type: `String`
  - ID of the feed element.

- `threadedCommentsCollapsed`
  - Type: `Boolean`
  - Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.FeedElement`

```
getFeedElement(communityId, feedElementId, threadedCommentsCollapsed, commentSort)
```

Get a feed element and its sorted comments in a threaded style.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String feedElementId, Boolean threadedCommentsCollapsed, ConnectApi.FeedCommentSortOrder commentSort)
```

Parameters

- `communityId`
  - Type: `String`
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

threadedCommentsCollapsed
Type: Boolean
Specifies whether to return threaded comments in a collapsed style (true) or not (false). If you pass in null, the default is false.

commentSort
Type: ConnectApi.FeedCommentSortOrder
Order of comments.
- CreatedDateLatestAsc—Sorts by most recently created comments in ascending order.
- CreatedDateOldestAsc—Sorts by oldest comments in ascending order.
- Relevance—Sorts by most relevant content.
  Sorting in descending order isn’t supported.

Return Value
Type: ConnectApi.FeedElement

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle)
Get a feed element with the specified number of elements per bundle including no more than the specified number of comments per feed element.

API Version
31.0

Available to Guest Users
31.0

Requires Chatter
Yes

Signature
public static ConnectApi.FeedElement getFeedElement(String communityId, String feedElementId, Integer recentCommentCount, Integer elementsPerBundle)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

**feedElementId**
Type: String
ID of the feed element.

**recentCommentCount**
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

**elementsPerBundle**
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.

Return Value
Type: `ConnectApi.FeedElement`

```java
getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, threadedCommentsCollapsed)
```
Get a feed element with its comments in a threaded style with the specified number of elements per bundle and comments per feed element.

API Version
44.0

Available to Guest Users
44.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.FeedElement getFeedElement(String communityId, String feedElementId, Integer recentCommentCount, Integer elementsPerBundle, Boolean threadedCommentsCollapsed)
```

**Parameters**

**communityId**
Type: String
ID for an Experience Cloud site, internal, or null.

**feedElementId**
Type: String
ID of the feed element.
recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.
threadedCommentsCollapsed
Type: Boolean
Specifies whether to return threaded comments in a collapsed style (true) or not (false). If you pass in null, the default is false.

Return Value
Type: ConnectApi.FeedElement

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, threadedCommentsCollapsed, commentSort)
Get a feed element with its sorted comments in a threaded style with the specified number of elements per bundle and comments per feed element.

API Version
44.0

Available to Guest Users
44.0

Requires Chatter
Yes

Signature
public static ConnectApi.FeedElement getFeedElement(String communityId, String feedElementId, Integer recentCommentCount, Integer elementsPerBundle, Boolean threadedCommentsCollapsed, ConnectApi.FeedCommentSortOrder commentSort)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.
recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.
threadedCommentsCollapsed
Type: Boolean
Specifies whether to return threaded comments in a collapsed style (true) or not (false). If you pass in null, the default is false.

commentSort
Type: ConnectApi.FeedCommentSortOrder
Order of comments.
  • CreatedDateLatestAsc—Sorts by most recently created comments in ascending order.
  • CreatedDateOldestAsc—Sorts by oldest comments in ascending order.
  • Relevance—Sorts by most relevant content.
  Sorting in descending order isn’t supported.

Return Value
Type: ConnectApi.FeedElement

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, commentSort)
Get a feed element with the specified number of elements per bundle including no more than the specified number of sorted comments per feed element.

API Version
41.0

Available to Guest Users
41.0

Requires Chatter
Yes

Signature
public static ConnectApi.FeedElement getFeedElement(String communityId, String feedElementId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedCommentSortOrder commentSort)
Parameters

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **feedElementId**
  - Type: String
  - ID of the feed element.

- **recentCommentCount**
  - Type: Integer
  - Maximum number of comments to return with each feed element. The default value is 3.

- **elementsPerBundle**
  - Type: Integer
  - Maximum number of feed elements per bundle. The default and maximum value is 10.

- **commentSort**
  - Type: ConnectApi.FeedCommentSortOrder
    - Order of comments.
    - **CreatedDateLatestAsc**—Sorts by most recently created comments in ascending order.
    - **CreatedDateOldestAsc**—Sorts by oldest comments in ascending order.
    - **Relevance**—Sorts by most relevant content.
    - The default value is CreatedDateLatestAsc.
    - Sorting in descending order isn’t supported.

Return Value

- Type: ConnectApi.FeedElement

**getFeedElementBatch(communityId, feedElementIds)**

Get a list of feed elements.

API Version

- 31.0

Available to Guest Users

- 32.0

Requires Chatter

- Yes
Signature

public static ConnectApi.BatchResult[] getFeedElementBatch(String communityId, List<String> feedElementIds)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementIds
Type: List<String>
A list of up to 500 feed element IDs.

Return Value

Type: ConnectApi.BatchResult[]
The ConnectApi.BatchResult.getResult() method returns a ConnectApi.FeedElement object and errors for feed elements that didn’t load.

getFeedElementPoll(communityId, feedElementId)
Get the poll associated with a feed element.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

public static ConnectApi.PollCapability getFeedElementPoll(String communityId, String feedElementId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.
Return Value

Type: `ConnectApi.PollCapability`

If the feed element doesn’t support this capability, the return value is `ConnectApi.NotFoundException`.

Note: Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that
`ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information
may not be available in the trigger.

`getFeedElementsFromBundle(communityId, feedElementId)`

Get feed elements from a bundle.

API Version

31.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.FeedElementPage getFeedElementsFromBundle(String communityId, String feedElementId)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, `internal`, or `null`.

- `feedElementId`
  - Type: `String`
  - ID of the feed element.

Return Value

Type: `ConnectApi.FeedElementPage`

`getFeedElementsFromBundle(communityId, feedElementId, pageParam, pageSize, elementsPerBundle, recentCommentCount)`

Get a page of feed elements from a bundle. Specify the number of elements per bundle and include no more than the specified number
of comments per feed element.

API Version

31.0
Requires Chatter
Yes

Signature
public static ConnectApi.FeedElementPage getFeedElementsFromBundle(String communityId,
String feedElementId, String pageParam, Integer pageSize, Integer elementsPerBundle,
Integer recentCommentCount)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

pageParam
Type: String
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

Return Value
Type: ConnectApi.FeedElementPage

getFeedElementsFromFeed(communityId, feedType)

API Version
31.0
Available to Guest Users
31.0

Requires Chatter
Yes

Signature

```java
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType)
```

Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`feedType`
Type: `ConnectApi.FeedType`
Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

Return Value
Type: `ConnectApi.FeedElementPage`

Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

```java
setTestGetFeedElementsFromFeed(communityId, feedType, result)
```

**getFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)**

API Version
31.0

Available to Guest Users
31.0
Requires Chatter

Yes

Signature

```java
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

**communityId**

Type: `String`

ID for an Experience Cloud site, `internal`, or `null`.

**feedType**

Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

**pageParam**

Type: `String`

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**

Type: `Integer`

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

If `feedType` is `DirectMessages`, `sortParam` must be `LastModifiedDesc`.

Return Value

Type: `ConnectApi.FeedElementPage`
Usage

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

### Signature

`public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)`

### Parameters

- **communityId**
  
  Type: `String`

  ID for an Experience Cloud site, internal, or null.

- **feedType**
  
  Type: `ConnectApi.FeedType`

  Type of feed. Valid values are Company, DirectMessageModeration, DirectMessages, Home, Moderation, and PendingReview.

- **recentCommentCount**
  
  Type: `Integer`

  Maximum number of comments to return with each feed item. The default value is 3.

- **density**
  
  Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.

- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`

Type: `String`  
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`

Type: `Integer`  
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`

Type: `ConnectApi.FeedSortOrder`  
Values are:

- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

If `feedType` is `DirectMessages`, `sortParam` must be `LastModifiedDesc`.

**Return Value**

Type: `ConnectApi.FeedElementPage`

**Usage**

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

*Apex Developer Guide: Testing ConnectApi Code*

`getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter)`  
Get a page of sorted and filtered feed elements from the `Home` feed. Each feed element contains no more than the specified number of comments.
API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam,
ConnectApi.FeedFilter filter)

Parameters

communityId

Type: String

ID for an Experience Cloud site, internal, or null.

feedType

Type: ConnectApi.FeedType

The type of feed. The only valid value is Home.

recentCommentCount

Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density

Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

• AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.

• FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam

Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

When the sortParam is MostViewed, you must pass in null for the pageParam.

pageSize

Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.
When the `sortParam` is `MostViewed`, the `pageSize` must be a value from 1 to 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`
Values are:
- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`filter`
Type: `ConnectApi.FeedFilter`
Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the `Access Einstein-Generated Answers` permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the `Access Einstein-Generated Answers` permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the `Access Einstein-Generated Answers` permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

**Return Value**
Type: `ConnectApi.FeedElementPage`
Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

Parameters

  communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

  feedType
  Type: ConnectApi.FeedType
  The type of feed. The only valid value is Home.

  recentCommentCount
  Type: Integer
  Maximum number of comments to return with each feed item. The default value is 3.
density
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.

- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

When the `sortParam` is `MostViewed`, you must pass in `null` for the `pageParam`.

`pageSize`
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

When the `sortParam` is `MostViewed`, the `pageSize` must be a value from 1 to 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`
Values are:

- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`filter`
Type: `ConnectApi.FeedFilter`
Specifies the feed filters.

- **AllQuestions**—Feed elements that are questions.
- **AuthoredBy**—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- **CommunityScoped**—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- **QuestionsWithCandidateAnswers**—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the `Access Einstein-Generated Answers` permission.
- **QuestionsWithCandidateAnswersReviewedPublished**—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the `Access Einstein-Generated Answers` permission.
- **Read**—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the **Record** feed of a group.
- **SolvedQuestions**—Feed elements that are questions and that have a best answer.
- **UnansweredQuestions**—Feed elements that are questions and that don’t have any answers.
- **UnansweredQuestionsWithCandidateAnswers**—Feed elements that are questions that don’t have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Unread**—Feed elements that are created in the past 30 days and aren’t marked as read for the context user. This value is valid only for the **Record** feed of a group.
- **UnsolvedQuestions**—Feed elements that are questions and that don’t have a best answer.

**threadedCommentsCollapsed**
Type: **Boolean**
Specifies whether to return threaded comments in a collapsed style (**true**) or not (**false**). If you pass in **null**, the default is **false**.

**Return Value**
Type: **ConnectApi.FeedElementPage**

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with **setTest**). Use the set test method with the same parameters or the code throws an exception.

Signature

```java
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId)
```

Parameters

- `communityId`
  - **Type:** String
  - ID for an Experience Cloud site, internal, or null.

- `feedType`
  - **Type:** ConnectApi.FeedType
  - Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.

- `subjectId`
  - **Type:** String
  - If `feedType` is Record, `subjectId` can be any record ID, including a group ID. If `feedType` is Streams, `subjectId` must be a stream ID. If `feedType` is Topics, `subjectId` must be a topic ID. If `feedType` is UserProfile, `subjectId` can be any user ID. If the `feedType` is any other value, `subjectId` must be the ID of the context user or the alias me.

Return Value

- **Type:** ConnectApi.FeedElementPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example for Getting the Context User’s News Feed

```java
ConnectApi.FeedElementPage fep =
ConnectApi.ChatterFeeds.getFeedElementsFromFeed(Network.getNetworkId(),
ConnectApi.FeedType.News, 'me');
```

Example for Getting Another User’s Profile Feed

```java
ConnectApi.FeedElementPage fep =
ConnectApi.ChatterFeeds.getFeedElementsFromFeed(Network.getNetworkId(),
ConnectApi.FeedType.UserProfile, '005R0000000HwMA');
```
Example for Getting Another User’s Record Feed

```java
ConnectApi.FeedElementPage fep =
ConnectApi.ChatterFeeds.getFeedElementsFromFeed(Network.getNetworkId(),
ConnectApi.FeedType.Record, '005R0000000HwMA');
```

### getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)

Get a page of sorted feed elements from a record feed. Each feed element includes no more than the specified number of comments. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

**API Version**

31.0

**Available to Guest Users**

31.0

**Requires Chatter**

Yes
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Value must be ConnectApi.FeedType.Record.

subjectId
Type: String
Any record ID, including a group ID.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
• MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.

• Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

showInternalOnly
Type: Boolean
Specifies whether to show only feed items from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

Return Value
Type: ConnectApi.FeedElementPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly, result)

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter)
Get a page of sorted and filtered feed elements from the UserProfile feed.

API Version

35.0

Requires Chatter
Yes

Signature
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter)
Parameters

**communityId**
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

**feedType**
Type: `ConnectApi.FeedType`
Value must be `ConnectApi.FeedType.UserProfile`.

**subjectId**
Type: `String`
ID of any user. To specify the context user, use the user ID or the alias `me`.

**recentCommentCount**
Type: `Integer`
Maximum number of comments to return with each feed element. The default value is 3.

**density**
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
Type: `ConnectApi.FeedSortOrder`
Values are:
- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.
If you pass in `null`, the default value `CreatedDateDesc` is used.

**filter**
Type: `ConnectApi.FeedFilter`
Value must be ConnectApi.FeedFilter.CommunityScoped or ConnectApi.FeedFilter.AuthoredBy.

Return Value
Type: ConnectApi.FeedElementPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

Example
This example gets only community-specific feed elements.

```java
ConnectApi.FeedElementPage fep = ConnectApi.ChatterFeeds.getFeedElementsFromFeed(Network.getNetworkId(),
ConnectApi.FeedType.UserProfile, 'me', 3, ConnectApi.FeedDensity.FewerUpdates, null, null,
ConnectApi.FeedSortOrder.LastModifiedDateDesc, ConnectApi.FeedFilter.CommunityScoped);
```

SEE ALSO:
setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize,
sortParam, filter, result)

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed)
Get a page of feed elements with comments in a threaded style from the UserProfile feed.

public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter, Boolean threadedCommentsCollapsed)
Parameters

`communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.

`feedType`
  Type: `ConnectApi.FeedType`
  Value must be `ConnectApi.FeedType.UserProfile`.

`subjectId`
  Type: `String`
  ID of any user. To specify the context user, use the user ID or the alias `me`.

`recentCommentCount`
  Type: `Integer`
  Maximum number of comments to return with each feed element. The default value is 3.

`density`
  Type: `ConnectApi.FeedDensity`
  Specify the amount of content in a feed.
  - AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
  - FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
  Type: `String`
  Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
  Type: `Integer`
  Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
  Type: `ConnectApi.FeedSortOrder`
  Values are:
  - CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
  - CreatedDateDesc—Sorts by most recent creation date.
  - LastModifiedDesc—Sorts by most recent activity.
  - MostViewed—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
  - Relevance—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.
  If you pass in `null`, the default value `CreatedDateDesc` is used.

`filter`
  Type: `ConnectApi.FeedFilter`
Value must be `ConnectApi.FeedFilter.CommunityScoped` or `ConnectApi.FeedFilter.AuthoredBy`.

`threadedCommentsCollapsed`
- **Type:** Boolean
- Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

**Return Value**
- **Type:** `ConnectApi.FeedElementPage`

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**SEE ALSO:**
- `setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed, result)`

```java
getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, customFilter)
```

Get a page of sorted and filtered feed elements from the case feed.

**Requires Chatter**
Yes

**Signature**
```java
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String customFilter)
```

**Parameters**
- `communityId`
  - **Type:** String
ID for an Experience Cloud site, internal, or null.

**feedType**
- Type: `ConnectApi.FeedType`
- Value must be `ConnectApi.FeedType.Record`.

**subjectId**
- Type: `String`
- The ID of a case.

**recentCommentCount**
- Type: `Integer`
- Maximum number of comments to return with each feed element. The default value is 3.

**density**
- Type: `ConnectApi.FeedDensity`
- Specify the amount of content in a feed.
  - `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
  - `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
- Type: `String`
- Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
- Type: `Integer`
- Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
- Type: `ConnectApi.FeedSortOrder`
- Values are:
  - `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
  - `CreatedDateDesc`—Sorts by most recent creation date.
  - `LastModifiedDateDesc`—Sorts by most recent activity.
  - `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
  - `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.
- If you pass in `null`, the default value `CreateDateDesc` is used.

**customFilter**
- Type: `String`
- Custom filter that applies only to the case feed. See `customFeedFilter` in the Metadata API Developer Guide for supported values.
Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

Yes

Signature

```java
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or null.

- `feedType`
  - Type: `ConnectApi.FeedType`
  - Value must be `ConnectApi.FeedType.Record`.
subjectId
Type: String
Any record ID, including a group ID.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

showInternalOnly
Type: Boolean
Specifies whether to show only feed items from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.
Return Value

Type: ConnectApi.FeedElementPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Value must be `ConnectApi.FeedType.Record`.

**subjectId**

*Type: String*

Any record ID, including a group ID.

**recentCommentCount**

*Type: Integer*

Maximum number of comments to return with each feed item. The default value is 3.

**elementsPerBundle**

*Type: Integer*

Maximum number of feed elements per bundle. The default and maximum value is 10.

**density**

*Type: `ConnectApi.FeedDensity`*

Specify the amount of content in a feed.

- **AllUpdates**— Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**— Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**

*Type: String*

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**

*Type: Integer*

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**

*Type: `ConnectApi.FeedSortOrder`*

Values are:

- **CreatedDateAsc**— Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- **CreatedDateDesc**— Sorts by most recent creation date.
- **LastModifiedDateDesc**— Sorts by most recent activity.
- **MostViewed**— Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**— Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `ModifiedDateDesc` is used.

**showInternalOnly**

*Type: Boolean*

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

**filter**

*Type: `ConnectApi.FeedFilter`*
Specifies the feed filters.

- **AllQuestions**—Feed elements that are questions.
- **AuthoredBy**—Feed elements authored by the user profile owner. This value is valid only for the *UserProfile* feed.
- **CommunityScoped**—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the *UserProfile* feed.
- **QuestionsWithCandidateAnswers**—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **QuestionsWithCandidateAnswersReviewedPublished**—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Read**—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the *Record* feed of a group.
- **SolvedQuestions**—Feed elements that are questions and that have a best answer.
- **UnansweredQuestions**—Feed elements that are questions and that don’t have any answers.
- **UnansweredQuestionsWithCandidateAnswers**—Feed elements that are questions that don’t have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Unread**—Feed elements that are created in the past 30 days and aren’t marked as read for the context user. This value is valid only for the *Record* feed of a group.
- **UnsolvedQuestions**—Feed elements that are questions and that don’t have a best answer.

**Return Value**

Type: `ConnectApi.FeedElementPage`

**Usage**

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**SEE ALSO:**

- `setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter, result)`

```java
getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter, threadedCommentsCollapsed)
```

Get a page of sorted and filtered feed elements with comments in a threaded style for a record feed. Specify the number of elements per bundle and include no more than the specified number of comments per feed element. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Value must be ConnectApi.FeedType.Record.

subjectId
Type: String
Any record ID, including a group ID.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Value must be ConnectApi.FeedType.Record.

subjectId
Type: String
The ID of a case.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
  • AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
  • FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

textParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

- *Apex Developer Guide: Testing ConnectApi Code*

**getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix)**
Get feed elements from a feed filtered by a key prefix for a user.

**API Version**
31.0

**Requires Chatter**
Yes

**Signature**
```java
public static ConnectApi.FeedElementPage getFeedElementsFromFilterFeed(String communityId, String subjectId, String keyPrefix)
```
Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

Return Value
Type: ConnectApi.FeedElementPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, result)

getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam)
Get a page of sorted feed elements from a feed filtered by a key prefix for a user.

API Version
31.0

Requires Chatter
Yes

Signature
public static ConnectApi.FeedElementPage getFeedElementsFromFilterFeed(String communityId, String subjectId, String keyPrefix, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

subjectId
  Type: String
  ID of the context user or the alias me.

keyPrefix
  Type: String
  A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
  Type: String
  Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
  Type: Integer
  Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
  Type: ConnectApi.FeedSortOrder
  Values are:
  • CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
  • CreatedDateDesc—Sorts by most recent creation date.
  • LastModifedDateDesc—Sorts by most recent activity.
  • MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
  • Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
  If you pass in null, the default value CreatedDateDesc is used.

Return Value
  Type: ConnectApi.FeedElementPage

Usage
  To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
  setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, result)
getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from a feed filtered by a key prefix for a user. Each feed element contains no more than the specified number of comments.

API Version
31.0

Requires Chatter
Yes

Signature
public static ConnectApi.FeedElementPage getFeedElementsFromFilterFeed(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 00S and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
• FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
• CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
• CreatedDateDesc—Sorts by most recent creation date.
• LastModifiedDateDesc—Sorts by most recent activity.
• MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
• Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
If you pass in null, the default value CreatedDateDesc is used.

Return Value
Type: ConnectApi.FeedElementPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, result)

getFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince)
Get a page of feed elements from a feed filtered by a key prefix for a user. Include only feed elements that have been updated since the time specified in the updatedSince parameter.

API Version
31.0
Requires Chatter

Yes

Signature

public static ConnectApi.FeedElementPage getFeedElementsFromFilterFeedUpdatedSince(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.
updatedSince
  Type: String

Opaque token defining the modification timestamp of the feed and the sort order.
The updatedSince parameter doesn't return feed elements that are created in the same second as the call.

Return Value
Type: ConnectApi.FeedElementPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, result)

getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince)

Get a page of feed elements from the Company, DirectMessageModeration, Home, and Moderation feeds. Include only feed elements that have been updated since the time specified in the updatedSince parameter. Each feed element contains no more than the specified number of comments.

Yes

Signature
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince)

Parameters
communityId
  Type: String
ID for an Experience Cloud site, internal, or null.

**feedType**
Type: `ConnectApi.FeedType`
Type of feed. Valid values are Company, DirectMessageModeration, Home, and Moderation.

**recentCommentCount**
Type: `Integer`
Maximum number of comments to return with each feed element. The default value is 3.

**density**
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**updatedSince**
Type: `String`
An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.
The `updatedSince` parameter doesn’t return feed elements that are created in the same second as the call.

**Return Value**
Type: `ConnectApi.FeedElementPage`

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**SEE ALSO:**
- `setTestGetFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, result)`

*Apex Developer Guide: Testing ConnectApi Code*
getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, filter)

Get a page of filtered feed elements from the Home feed. Include only feed elements that have been updated since the time specified in the updatedSince parameter. Each feed element contains no more than the specified number of comments.

API Version
32.0

Available to Guest Users
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedFilter filter)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
The type of feed. The only valid value is Home.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
• AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
• FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.
**pageSizesize**
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**updatedSince**
Type: `String`
An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The `updatedSince` parameter doesn’t return feed elements that are created in the same second as the call.

**filter**
Type: `ConnectApi.FeedFilter`
 Specifies the feed filters.

- **AllQuestions**—Feed elements that are questions.
- **AuthoredBy**—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- **CommunityScoped**—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- **QuestionsWithCandidateAnswers**—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **QuestionsWithCandidateAnswersReviewedPublished**—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Read**—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- **SolvedQuestions**—Feed elements that are questions and that have a best answer.
- **UnansweredQuestions**—Feed elements that are questions and that don’t have any answers.
- **UnansweredQuestionsWithCandidateAnswers**—Feed elements that are questions that don’t have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Unread**—Feed elements that are created in the past 30 days and aren’t marked as read for the context user. This value is valid only for the `Record` feed of a group.
- **UnsolvedQuestions**—Feed elements that are questions and that don’t have a best answer.

**Return Value**
Type: `ConnectApi.FeedElementPage`
Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

Signature

```java
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince)
```

Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`feedType`
Type: `ConnectApi.FeedType`
One of these values:
- Files
- Groups
- News
- People
- **Record**

  **subjectId**
  Type: String

  If `feedType` is `ConnectApi.Record`, `subjectId` can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

- **recentCommentCount**
  Type: Integer

  Maximum number of comments to return with each feed item. The default value is 3.

- **density**
  Type: `ConnectApi.FeedDensity`

  Specify the amount of content in a feed.

  - **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
  - **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

- **pageParam**
  Type: String

  Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

- **pageSize**
  Type: Integer

  Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

- **updatedSince**
  Type: String

  An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

  The `updatedSince` parameter doesn’t return feed elements that are created in the same second as the call.

**Return Value**

Type: `ConnectApi.FeedElementPage`

**Usage**

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Yes

Signature

public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, Boolean showInternalOnly)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Value must be ConnectApi.FeedType.Record.

subjectId
Type: String
Any record ID, including a group ID.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.

- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
• FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in **null**, the first page is returned.

**pageSize**
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in **null**, the default size is 25.

**updatedSince**
Type: String
An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The `updatedSince` parameter doesn’t return feed elements that are created in the same second as the call.

**showInternalOnly**
Type: Boolean
Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (**true**), or not (**false**). The default value is **false**.

**Return Value**
Type: `ConnectApi.FeedElementPage`

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**SEE ALSO:**

Signature

public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, ConnectApi.FeedFilter filter)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Value must be ConnectApi.FeedType.UserProfile.

subjectId
Type: String
ID of any user. To specify the context user, use the user ID or the alias me.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
• AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
• FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**updatedSince**
Type: `String`
Opaque token defining the modification timestamp of the feed and the sort order.
The `updatedSince` parameter doesn’t return feed elements that are created in the same second as the call.

**filter**
Type: `ConnectApi.FeedFilter`
Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out.

**Return Value**
Type: `ConnectApi.FeedElementPage`

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**SEE ALSO:**

```java
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, Integer density, Integer pageParam, Integer pageSize, Instant updatedSince, ConnectApi.FeedFilter customFilter)
```
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, String customFilter)

Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

feedType
  Type: ConnectApi.FeedType
  Value must be ConnectApi.FeedType.Record.

subjectId
  Type: String
  The ID of a case.

recentCommentCount
  Type: Integer
  Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
  Type: Integer
  Maximum number of feed elements per bundle. The default and maximum value is 10.

density
  Type: ConnectApi.FeedDensity
  Specify the amount of content in a feed.
  • AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
  • FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
  Type: String
  Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
  Type: Integer
  Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

updatedSince
  Type: String
  Opaque token defining the modification timestamp of the feed and the sort order.
  The updatedSince parameter doesn’t return feed elements that are created in the same second as the call.

customFilter
  Type: String
  Custom filter that applies only to the case feed. See customFeedFilter in the Metadata API Developer Guide for supported values.
Return Value
Type: `ConnectApi.FeedElementPage`

Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

```java
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, Boolean showInternalOnly)
```

Parameters
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.
- `feedType`
  Type: `ConnectApi.FeedType`
  Value must be `ConnectApi.FeedType.Record`.
subjectId
Type: String
Any record ID, including a group ID.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

updatedSince
Type: String
An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the updatesToken property of the ConnectApi.FeedElementPage response body.

The updatedSince parameter doesn’t return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean
Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

Return Value
Type: ConnectApi.FeedElementPage
Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, Boolean showInternalOnly, ConnectApi.FeedFilter filter)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Value must be ConnectApi.FeedType.Record.

subjectId
Type: String
Any record ID, including a group ID.
**recentCommentCount**
- **Type:** Integer
- Maximum number of comments to return with each feed element. The default value is 3.

**elementsPerBundle**
- **Type:** Integer
- Maximum number of feed elements per bundle. The default and maximum value is 10.

**density**
- **Type:** ConnectApi.FeedDensity
- Specify the amount of content in a feed.
  - **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
  - **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
- **Type:** String
- Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
- **Type:** Integer
- Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**updatedSince**
- **Type:** String
- An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.
  - The `updatedSince` parameter doesn’t return feed elements that are created in the same second as the call.

**showInternalOnly**
- **Type:** Boolean
- Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

**filter**
- **Type:** ConnectApi.FeedFilter
- Specifies the feed filters.
  - **AllQuestions**—Feed elements that are questions.
  - **AuthoredBy**—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
  - **CommunityScoped**—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
  - **QuestionsWithCandidateAnswers**—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the `Access Einstein-Generated Answers` permission.
- **QuestionsWithCandidateAnswersReviewedPublished**—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Read**—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the Record feed of a group.
- **SolvedQuestions**—Feed elements that are questions and that have a best answer.
- **UnansweredQuestions**—Feed elements that are questions and that don't have any answers.
- **UnansweredQuestionsWithCandidateAnswers**—Feed elements that are questions that don’t have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Unread**—Feed elements that are created in the past 30 days and aren’t marked as read for the context user. This value is valid only for the Record feed of a group.
- **UnsolvedQuestions**—Feed elements that are questions and that don’t have a best answer.

**Return Value**

Type: `ConnectApi.FeedElementPage`

**Usage**

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**SEE ALSO:**

`setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, filter, result)`

*Apex Developer Guide: Testing ConnectApi Code*

**getFeedElementsUpdatedSince**(`communityId`, `feedType`, `subjectId`, `recentCommentCount`, `elementsPerBundle`, `density`, `pageParam`, `pageSize`, `updatedSince`, `showInternalOnly`, `customFilter`)

Get a page of filtered feed elements from a case feed. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter.

**API Version**

40.0

**Available to Guest Users**

40.0

**Requires Chatter**

Yes
signature

```java
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, Boolean showInternalOnly, String customFilter)
```

parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **feedType**
  - Type: `ConnectApi.FeedType`
  - Value must be `ConnectApi.FeedType.Record`.

- **subjectId**
  - Type: `String`
  - The ID of a case.

- **recentCommentCount**
  - Type: `Integer`
  - Maximum number of comments to return with each feed element. The default value is 3.

- **elementsPerBundle**
  - Type: `Integer`
  - Maximum number of feed elements per bundle. The default and maximum value is 10.

- **density**
  - Type: `ConnectApi.FeedDensity`
  - Specify the amount of content in a feed.
    - **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
    - **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

- **pageParam**
  - Type: `String`
  - Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

- **pageSize**
  - Type: `Integer`
  - Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

- **updatedSince**
  - Type: `String`
  - An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.
  - The `updatedSince` parameter doesn’t return feed elements that are created in the same second as the call.
showInternalOnly
Type: Boolean
Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

customFilter
Type: String
Custom filter that applies only to the case feed. See customFeedFilter in the Metadata API Developer Guide for supported values.

Return Value
Type: ConnectApi.FeedElementPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, customFilter, result)

getFeedWithFeedElements(communityId, feedType, pageSize)
Get information about a feed and a page of feed elements from the feed.

API Version
40.0

Available to Guest Users
40.0

Requires Chatter
Yes

Signature
public static ConnectApi.Feed getFeedWithFeedElements(String communityId, ConnectApi.FeedType feedType, Integer pageSize)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.
feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values are Company, DirectMessageModeration, DirectMessages, Home, Landing, Moderation, and PendingReview. Landing is valid only when `communityId` is internal.

pageSize
Type: `Integer`

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in 0, feed elements aren’t returned with the feed.

Return Value
Type: `ConnectApi.Feed`

`getFeedWithFeedElements(communityId, feedType, pageSize, recentCommentCount)`

Get a page of information about the feed and the feed elements with the specified number of comments per feed element from the feed.

API Version
40.0

Available to Guest Users
40.0

Requires Chatter
Yes

Signature

```java
public static ConnectApi.Feed getFeedWithFeedElements(String communityId,
ConnectApi.FeedType feedType, Integer pageSize, Integer recentCommentCount)
```

Parameters

`communityId`
Type: `String`

ID for an Experience Cloud site, internal, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

The type of feed. Valid values are Company, DirectMessageModeration, DirectMessages, Home, Landing, Moderation, and PendingReview. Landing is valid only when `communityId` is internal.

`pageSize`
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in 0, feed elements aren’t returned with the feed.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

Return Value
Type: ConnectApi.Feed

getFilterFeed(communityId, subjectId, keyPrefix)
Get a feed filtered by a key prefix for a user.

API Version
28.0

Requires Chatter
Yes

Signature
public static ConnectApi.Feed getFilterFeed(String communityId, String subjectId, String keyPrefix)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix is the first three characters of a record ID, which specifies the object type.

Return Value
Type: ConnectApi.Feed

getFilterFeed(communityId, subjectId, keyPrefix, sortParam)
Get a sorted feed filtered by a key prefix for a user.
API Version
28.0

Requires Chatter
Yes

Signature
public static ConnectApi.Feed getFilterFeed(String communityId, String subjectId, String keyPrefix, ConnectApi.FeedType sortParam)

Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

subjectId
  Type: String
  ID of the context user or the alias me.

keyPrefix
  Type: String
  A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

sortParam
  Type: ConnectApi.FeedType
  Values are:
  • CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
  • CreatedDateDesc—Sorts by most recent creation date.
  • LastModifiedDateDesc—Sorts by most recent activity.
  • MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
  • Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
  If you pass in null, the default value CreatedDateDesc is used.

Return Value
Type: ConnectApi.Feed

getFilterFeedDirectory(communityId, subjectId)
Get a feed directory of filter feeds available to the context user.
API Version
30.0

Requires Chatter
Yes

Signature
public static ConnectApi.FeedDirectory getFilterFeedDirectory(String communityId, String subjectId)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

Return Value
Type: ConnectApi.FeedDirectory
This feed directory contains a list of filter feeds, which are the news feed filtered to include feed items whose parent is a specific entity type.

Usage
Call this method to return a directory containing a list of ConnectApi.FeedDirectoryItem objects. Each object contains a key prefix associated with an entity type the context user is following. A key prefix is the first three characters of a record ID, which specifies the object type.

Use key prefixes to filter the news feed so that it contains only feed items whose parent is the entity type associated with the key prefix. For example, get all the feed items whose parent is an Account. To get the feed items, pass a key prefix to the ConnectApi.getFeedItemsFromFilterFeed method.

The information about filter feeds never contains the key prefixes for users (005) or groups (0F9), but all users can use those key prefixes as filters.

The ConnectApi.FeedDirectory.favorites property is always empty when returned by a call to getFilterFeedDirectory because you can’t filter a news feed by favorites.

Example
This example calls getFilterFeedDirectory and loops through the returned FeedDirectoryItem objects to find the key prefixes the context user can use to filter their news feed. It then copies each keyPrefix value to a list. Finally, it passes one of
the key prefixes from the list to the `getFeedItemsFromFilterFeed` method. The returned feed items include every feed item from the news feed whose parent is the entity type specified by the passed key prefix.

```java
String communityId = null;
String subjectId = 'me';

// Create a list to populate with key prefixes.
List<String> keyPrefixList = new List<String>();

// Prepopulate with User and Group record types
// which are available to all users.
keyPrefixList.add('005');
keyPrefixList.add('0F9');

System.debug(keyPrefixList);

// Get the key prefixes available to the context user.
ConnectApi.FeedDirectory myFeedDirectory =
    ConnectApi.ChatterFeeds.getFilterFeedDirectory(null, 'me');

// Loop through the returned feeds list.
for (ConnectApi.FeedDirectoryItem i : myFeedDirectory.feeds) {
    // Grab each key prefix and add it to the list.
    keyPrefixList.add(i.keyPrefix);
}
System.debug(keyPrefixList);

// Use a key prefix from the list to filter the feed items in the news feed.
ConnectApi.FeedItemPage myFeedItemPage =
    ConnectApi.ChatterFeeds.getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefixList[0]);
System.debug(myFeedItemPage);
```

**getLike(communityId, likeId)**

Get a like on a post or comment.

**API Version**

28.0

**Available to Guest Users**

32.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.ChatterLike getLike(String communityId, String likeId)
```
Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

likeId
  Type: String
  ID for a like.

Return Value

Type: ConnectApi.ChatterLike

getLikesForComment(communityId, commentId)

Get likes for a comment.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

public static ConnectApi.ChatterLikePage getLikesForComment(String communityId, String commentId)

Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

commentId
  Type: String
  ID for a comment.

Return Value

Type: ConnectApi.ChatterLikePage
getLikesForComment(communityId, commentId, pageParam, pageSize)
Get a page of likes for a comment.

API Version
28.0

Available to Guest Users
31.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterLikePage getLikesForComment(String communityId, String commentId, Integer pageParam, Integer pageSize)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

commentId
Type: String
ID for a comment.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: ConnectApi.ChatterLikePage

getLikesForFeedElement(communityId, feedElementId)
Get likes for a feed element.

API Version
32.0
Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.ChatterLikePage getLikesForFeedElement(String communityId,
                                                      String feedElementId)
```

Parameters

- `communityId`
  
  Type: `String`
  
  ID for an Experience Cloud site, internal, or `null`.

- `feedElementId`
  
  Type: `String`
  
  ID of the feed element.

Return Value

Type: `ConnectApi.ChatterLikePage`

If the feed element doesn’t support the `ChatterLikes` capability, the return value is `ConnectApi.NotFoundException`.

```java
getLikesForFeedElement(communityId, feedElementId, pageParam, pageSize)
```

Get a page of likes for a feed element.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.ChatterLikePage getLikesForFeedElement(String communityId,
                                                      String feedElementId, Integer pageParam, Integer pageSize)
```
Parameters

`communityId`
- Type: String
- ID for an Experience Cloud site, internal, or `null`.

`feedElementId`
- Type: String
- ID of the feed element.

`pageParam`
- Type: String
- Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
- Type: Integer
- Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterLikePage`

If the feed element doesn’t support the ChatterLikes capability, the return value is `ConnectApi.NotFoundException`.

`getLinkMetadata(communityId, urls)`

Get link metadata for URLs.

API Version

42.0

Available to Guest Users

42.0

Requires Chatter

No

Signature

`public static ConnectApi.LinkMetadataCollection getLinkMetadata(String communityId, String urls)`

Parameters

`communityId`
- Type: String
- ID for an Experience Cloud site, internal, or `null`.
urls
  Type: String
  Comma-separated list of URL-encoded URLs.

Return Value
Type: ConnectApi.LinkMetadataCollection

getPinnedFeedElementsFromFeed(communityId, feedType, subjectId)
Get pinned feed elements from a group or topic feed.

API Version
41.0

Available to Guest Users
41.0

Requires Chatter
Yes

Signature
public static ConnectApi.PinnedFeedElements getPinnedFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId)

Parameters
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

feedType
  Type: ConnectApi.FeedType
  The type of feed. Valid values are Record and Topics.

subjectId
  Type: String
  If feedType is Record, subjectId must be a group ID. If feedType is Topics, subjectId must be a topic ID.

Return Value
Type: ConnectApi.PinnedFeedElements
If the feed doesn’t support this capability, the return value is ConnectApi.NotFoundException.
Usage
In the UI, pinned feed elements don’t show all auxiliary information, such as comments, likes, interaction counts, or read by information. As a result, the ConnectApi.PinnedFeedElements output class doesn’t include all the information for these capabilities.

**getReadByForFeedElement(communityId, feedElementId)**
Get information about who read a feed element and when.

**API Version**
40.0

**Requires Chatter**
Yes

**Signature**
```
public static ConnectApi.ReadByPage getReadByForFeedElement(String communityId, String feedElementId)
```

**Parameters**
- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or **null**.
- **feedElementId**
  Type: String
  ID of the feed element.

**Return Value**
Type: `ConnectApi.ReadByPage`
If the feed element doesn’t support this capability, the return value is `ConnectApi.NotFoundException`.

**getReadByForFeedElement(communityId, feedElementId, pageParam, pageSize)**
Get a page of information about who read a feed element and when.

**API Version**
40.0

**Requires Chatter**
Yes
**Signature**

public static ConnectApi.ReadByPage getReadByForFeedElement(String communityId, String feedElementId, Integer pageParam, Integer pageSize)

**Parameters**

*communityId*
Type: String
ID for an Experience Cloud site, internal, or null.

*feedElementId*
Type: String
ID of the feed element.

*pageParam*
Type: String
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

*pageSize*
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

**Return Value**

Type: ConnectApi.ReadByPage
If the feed element doesn’t support this capability, the return value is ConnectApi.NotFoundException.

**getRelatedPosts(communityId, feedElementId, filter, maxResults)**
Get posts related to the context feed element.

**API Version**

37.0

**Available to Guest Users**

37.0

**Requires Chatter**

Yes

**Signature**

public static ConnectApi.RelatedFeedPosts getRelatedPosts(String communityId, String feedElementId, ConnectApi.RelatedFeedPostType filter, Integer maxResults)
Parameters

**communityId**
Type: String
ID for an Experience Cloud site, internal, or null.

**feedElementId**
Type: String
ID of the feed element. The feed element must be a question.

**filter**
Type: `ConnectApi.RelatedFeedPostType`
Specifies the type of related post. Values are:

- **Answered**—Related questions that have at least one answer.
- **BestAnswer**—Related questions that have a best answer.
- **Generic**—All types of related questions, including answered, with a best answer, and unanswered.
- **Unanswered**—Related questions that don’t have answers.

`Generic` is the default value.

**maxResults**
Type: Integer
The maximum number of results to return. You can return up to 25 results; 5 is the default.

Return Value
Type: `ConnectApi.RelatedFeedPosts`
In version 37.0 and later, related feed posts are questions.

Each related feed post has a score indicating how closely it’s related to the context feed post. We return related feed posts sorted by score, with the highest score first.

Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**getStream(communityId, streamId)**
Get information about a Chatter feed stream.

API Version
39.0

Requires Chatter
Yes
Signature

public static ConnectApi.ChatterStream getStream(String communityId, String streamId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

streamId
Type: String
ID of the Chatter feed stream.

Return Value
Type: ConnectApi.ChatterStream

getStream(communityId, streamId, globalScope)
Get information about a Chatter feed stream, regardless of Experience Cloud site.

API Version
41.0

Requires Chatter
Yes

Signature

public static ConnectApi.ChatterStream getStream(String communityId, String streamId, Boolean globalScope)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

streamId
Type: String
ID of the Chatter feed stream.

globalScope
Type: Boolean
Specifies whether to get streams from all the context user’s Experience Cloud sites, regardless of the communityId value.

Tip: If you know the communityId for the stream, we recommend setting globalScope to false.
Return Value
Type: `ConnectApi.ChatterStream`

`getStreams(communityId)`
Get the Chatter feed streams for the context user.

API Version
39.0

Requires Chatter
Yes

Signature
```
public static ConnectApi.ChatterStreamPage getStreams(String communityId)
```

Parameters
```
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.
```

Return Value
Type: `ConnectApi.ChatterStreamPage`

`getStreams(communityId, sortParam)`
Get and sort the Chatter feed streams for the context user.

API Version
40.0

Requires Chatter
Yes

Signature
```
public static ConnectApi.ChatterStreamPage getStreams(String communityId, ConnectApi.SortOrder sortParam)
```

Parameters
```
communityId
  Type: String
```

ID for an Experience Cloud site, internal, or null.

**sortParam**
Type: `ConnectApi.SortOrder`
Specifies the sort order. Values are:
- **Ascending**—Items are in ascending alphabetical order (A-Z).
- **Descending**—Items are in descending alphabetical order (Z-A).
- **MostRecentlyViewed**—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.
If not specified, default value is **Ascending**.

**Return Value**
Type: `ConnectApi.ChatterStreamPage`

**getStreams(communityId, pageParam, pageSize)**
Get a page of Chatter feed streams for the context user.

**API Version**
39.0

**Requires Chatter**
Yes

**Signature**

```java
public static ConnectApi.ChatterStreamPage getStreams(String communityId, Integer pageParam, Integer pageSize)
```

**Parameters**

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or null.

- `pageParam`
  Type: `Integer`
  Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

- `pageSize`
  Type: `Integer`
  Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

**Return Value**
Type: `ConnectApi.ChatterStreamPage`
getStreams(communityId, pageParam, pageSize, sortParam)
Get a sorted page of Chatter feed streams for the context user.

API Version
40.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterStreamPage getStreams(String communityId, Integer pageParam, Integer pageSize, ConnectApi.SortOrder sortParam)

Parameters
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

pageParam
  Type: Integer
  Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
  Type: Integer
  Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam
  Type: ConnectApi.SortOrder
  Specifies the sort order. Values are:
  • Ascending—Items are in ascending alphabetical order (A-Z).
  • Descending—Items are in descending alphabetical order (Z-A).
  • MostRecentlyViewed—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

  If not specified, default value is Ascending.

Return Value
Type: ConnectApi.ChatterStreamPage

getStreams(communityId, pageParam, pageSize, sortParam, globalScope)
Get a sorted page of Chatter feed streams from all Enterprise Cloud sites for the context user.
API Version
41.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterStreamPage getStreams(String communityId, Integer pageParam, Integer pageSize, ConnectApi.SortOrder sortParam, Boolean globalScope)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam
Type: ConnectApi.SortOrder
Specifies the sort order. Values are:
• Ascending—Items are in ascending alphabetical order (A-Z).
• Descending—Items are in descending alphabetical order (Z-A).
• MostRecentlyViewed—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.
If not specified, default value is Ascending.

globalScope
Type: Boolean
Specifies whether to get streams from all the context user’s Experience Cloud sites, regardless of the communityId value.

Tip: If you know the communityId for the streams, we recommend setting globalScope to false.

Return Value
Type: ConnectApi.ChatterStreamPage

getSupportedEmojis()
Get supported emojis for the org.
API Version
39.0

Requires Chatter
Yes

Signature
public static ConnectApi.SupportedEmojis getSupportedEmojis()

Return Value
Type: ConnectApi.SupportedEmojis

Usage
To get the list, emojis must be enabled in your org.

getThreadsForFeedComment(communityId, commentId)
Get threaded comments for a comment.

API Version
44.0

Available to Guest Users
44.0

Requires Chatter
Yes

Signature
public static ConnectApi.CommentPage getThreadsForFeedComment(String communityId, String commentId)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

commentId
Type: String
ID of the comment.
Return Value
Type: ConnectApi.CommentPage
If the comment doesn’t support the comments capability, the return value is ConnectApi.NotFoundException.

getThreadsForFeedComment(communityId, commentId, pageParam, pageSize)
Get a page of threaded comments for a comment.

API Version
44.0

Available to Guest Users
44.0

Requires Chatter
Yes

Signature
public static ConnectApi.CommentPage getThreadsForFeedComment(String communityId, String commentId, String pageParam, Integer pageSize)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

commentId
Type: String
ID of the comment.

pageParam
Type: String
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: ConnectApi.CommentPage
If the comment doesn’t support the comments capability, the return value is ConnectApi.NotFoundException.
getThreadsForFeedComment(communityId, commentId, threadedCommentsCollapsed)

Access the comments capability for a comment.

API Version
44.0

Available to Guest Users
44.0

Requires Chatter
Yes

Signature
public static ConnectApi.CommentsCapability getThreadsForFeedComment(String communityId, String commentId, Boolean threadedCommentsCollapsed)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

commentId
Type: String
ID of the comment.

threadedCommentsCollapsed
Type: Boolean
Specifies whether to return threaded comments in a collapsed style (true) or not (false). If you pass in null, the default is false.

Return Value
Type: ConnectApi.CommentsCapability
If the comment doesn't support the comments capability, the return value is ConnectApi.NotFoundException.

getTopUnansweredQuestions(communityId) (Pilot)

Get top unanswered questions for the context user in an Experience Cloud site.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version
42.0
Requires Chatter
Yes

Signature
public static ConnectApi.FeedElementPage getTopUnansweredQuestions(String communityId)

Parameters

communityId
Type: String
ID of the Experience Cloud site.

Return Value
Type: ConnectApi.FeedElementPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetTopUnansweredQuestions(communityId, result) (Pilot)

getTopUnansweredQuestions(communityId, filter) (Pilot)
Get filtered top unanswered questions for the context user in an Experience Cloud site.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version
42.0

Requires Chatter
Yes

Signature
public static ConnectApi.FeedElementPage getTopUnansweredQuestions(String communityId, ConnectApi.TopUnansweredQuestionsFilterType filter)
Parameters

communityId
Type: String
ID of the Experience Cloud site.

filter
Type: ConnectApi.FeedFilter
Specifies the filter for the feed. UnansweredQuestionsWithCandidateAnswers is the only valid value.

Return Value
Type: ConnectApi.FeedElementPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetTopUnansweredQuestions(communityId, filter, result) (Pilot)

getTopUnansweredQuestions(communityId, pageSize) (Pilot)
Get a page of top unanswered questions for the context user in an Experience Cloud site.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version
42.0

Requires Chatter
Yes

Signature
public static ConnectApi.FeedElementPage getTopUnansweredQuestions(String communityId, Integer pageSize)

Parameters

communityId
Type: String
ID of the Experience Cloud site.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 0 through 10. If you pass in `null`, the default size is 5.

Return Value
Type: `ConnectApi.FeedElementPage`

Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestGetTopUnansweredQuestions(communityId, pageSize, result)` (Pilot)

`getTopUnansweredQuestions(communityId, filter, pageSize)` (Pilot)
Get a page of filtered top unanswered questions for the context user in an Experience Cloud site.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version
42.0

Requires Chatter
Yes

Signature
```
public static ConnectApi.FeedElementPage getTopUnansweredQuestions(String communityId,
ConnectApi.FeedFilter filter, Integer pageSize)
```

Parameters
- `communityId`
  Type: `String`
  ID of the Experience Cloud site.
- `filter`
  Type: `ConnectApi.FeedFilter`
  Specifies the filter for the feed. `UnansweredQuestionsWithCandidateAnswers` is the only valid value.
- `pageSize`
  Type: `Integer`
  Specifies the number of items per page. Valid values are from 0 through 10. If you pass in `null`, the default size is 5.
Return Value
Type: `ConnectApi.FeedElementPage`

Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

  *Apex Developer Guide: Testing ConnectApi Code*

`getVotesForComment(communityId, commentId, vote)`
Get the first page of users who upvoted or downvoted a comment.

API Version
42.0

Available to Guest Users
42.0

Requires Chatter
Yes

Signature
`public static ConnectApi.VotePage getVotesForComment(String communityId, String commentId, ConnectApiUpDownVoteValue vote)`

Parameters
- `communityId`
  *Type: String*
  ID for an Experience Cloud site, internal, or `null`.
- `commentId`
  *Type: String*
  ID of the comment.
- `vote`
  *Type: ConnectApiUpDownVoteValue*
  Specifies the value of the vote for the feed element. Values are:
  - Down
  - Up
You can’t specify None.

Return Value
Type: ConnectApi.VotePage
If the comment doesn’t support this capability, the return value is ConnectApi.NotFoundException.

getVotesForComment(communityId, commentId, vote, pageParam, pageSize)
Get a page of users who upvoted or downvoted a comment.

API Version
42.0

Available to Guest Users
42.0

Requires Chatter
Yes

Signature
public static ConnectApi.VotePage getVotesForComment(String communityId, String commentId, ConnectApi.UpDownVoteValue vote, Integer pageParam, Integer pageSize)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

commentId
Type: String
ID of the comment.

vote
Type: ConnectApi.UpDownVoteValue
Specifies the value of the vote for the feed element. Values are:
• Down
• Up
You can’t specify None.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.
**PageSize**

Type: `Integer`

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**Return Value**

Type: `ConnectApi.VotePage`

If the comment doesn’t support this capability, the return value is `ConnectApi.NotFoundException`.

**getVotesForFeedElement(communityId, feedElementId, vote)**

Get the first page of users who upvoted or downvoted a feed element.

**API Version**

42.0

**Available to Guest Users**

42.0

**Requires Chatter**

Yes

**Signature**

```
public static ConnectApi.VotePage getVotesForFeedElement(String communityId, String feedElementId, ConnectApi.UpDownVoteValue vote)
```

**Parameters**

`communityId`

Type: `String`

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`

Type: `String`

ID of the feed element.

`vote`

Type: `ConnectApi.UpDownVoteValue`

Specifies the value of the vote for the feed element. Values are:

- **Down**
- **Up**

You can’t specify `None`. 
Return Value
Type: ConnectApi.VotePage
If the feed element doesn’t support this capability, the return value is ConnectApi.NotFoundException.

getVotesForFeedElement(communityId, feedElementId, vote, pageParam, pageSize)
Get a page of users who upvoted or downvoted a feed element.

API Version
42.0

Available to Guest Users
42.0

Requires Chatter
Yes

Signature
public static ConnectApi.VotePage getVotesForFeedElement(String communityId, String feedElementId, ConnectApi.UpDownVoteValue vote, Integer pageParam, Integer pageSize)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

vote
Type: ConnectApi.UpDownVoteValue
Specifies the value of the vote for the feed element. Values are:
• Down
• Up
You can’t specify None.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.
Return Value
Type: `ConnectApi.VotePage`
If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`isCommentEditableByMe(communityId, commentId)`
Discover whether the context user can edit a comment.

API Version
34.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.FeedEntityIsEditable isCommentEditableByMe(String communityId, String commentId)
```

Parameters
- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.
- **commentId**
  - Type: `String`
  - ID of the comment.

Return Value
Type: `ConnectApi.FeedEntityIsEditable`
If the comment doesn't support the edit capability, the return value is `ConnectApi.NotFoundException`.

SEE ALSO:
- Edit a Comment

`isFeedElementEditableByMe(communityId, feedElementId)`
Discover whether the context user can edit a feed element.

API Version
34.0
Requires Chatter
Yes

Signature

```java
public static ConnectApi.FeedEntityIsEditable isFeedElementEditableByMe(String communityId, String feedElementId)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `feedElementId`
  - Type: `String`
  - ID of the feed element. Feed items are the only type of feed element that can be edited.

Return Value

- Type: `ConnectApi.FeedEntityIsEditable`
- If the feed element doesn't support the edit capability, the return value is `ConnectApi.NotFoundException`.

SEE ALSO:
- Edit a Feed Element
- Edit a Question Title and Post

`isModified(communityId, feedType, subjectId, since)`

Discover whether a news feed has been updated or changed. Use this method to poll a news feed for updates.

⚠️ **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.

API Version

- 28.0

Requires Chatter
Yes

Signature

```java
public static ConnectApi.FeedModifiedInfo isModified(String communityId, ConnectApi.FeedType feedType, String subjectId, String since)
```
Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Specifies the type of feed. The only supported type is News

subjectId
Type: String
ID of the context user or the alias me.

since
Type: String
An opaque token containing information about the last modified date of the feed. Retrieve this token from the FeedElementPage.isModifiedToken property.

Return Value
Type: ConnectApi.FeedModifiedInfo

likeComment(communityId, commentId)
Like a comment for the context user.

API Version
28.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterLike likeComment(String communityId, String commentId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

commentId
Type: String
ID for a comment.
Return Value
Type: `ConnectApi.ChatterLike`
If the context user has already liked the comment, this method is a non-operation and returns the existing like.

`likeFeedElement(communityId, feedElementId)`
Like a feed element.

API Version
32.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.ChatterLike likeFeedElement(String communityId, String feedElementId)
```

Parameters
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.
- `feedElementId`
  Type: `String`
  ID of the feed element.

Return Value
Type: `ConnectApi.ChatterLike`
If the feed element doesn’t support the ChatterLikes capability, the return value is `ConnectApi.NotFoundException`.

Example
```java
ConnectApi.ChatterLike chatterLike = ConnectApi.ChatterFeeds.likeFeedElement(null, '0D5D0000000KuGh');
```

`postCommentToFeedElement(communityId, feedElementId, text)`
Post a plain-text comment to a feed element.

API Version
32.0
Requires Chatter
Yes

Signature
public static ConnectApi.Comment postCommentToFeedElement(String communityId, String feedElementId, String text)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

text
Type: String
Text of the comment. A comment can contain up to 10,000 characters.

Return Value
Type: ConnectApi.Comment
If the feed element doesn’t support the Comments capability, the return value is ConnectApi.NotFoundException.

Example
ConnectApi.Comment comment = ConnectApi.ChatterFeeds.postCommentToFeedElement(null, '0D5D0000000KuGh', 'I agree with the proposal.' );

postCommentToFeedElement(communityId, feedElementId, comment, feedElementFileUpload)
Post a rich-text comment to a feed element. Use this method to include mentions and to attach a file.

API Version
32.0

Requires Chatter
Yes
Signature

```java
public static ConnectApi.Comment postCommentToFeedElement(String communityId, String feedElementId, ConnectApi.CommentInput comment, ConnectApi.BinaryInput feedElementFileUpload)
```

Parameters

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **feedElementId**
  - Type: String
  - ID of the feed element.

- **comment**
  - Type: ConnectApi.CommentInput
  - The comment body, including text and mentions, and capabilities, such as information about an attached file. A comment can contain up to 10,000 characters.

- **feedElementFileUpload**
  - Type: ConnectApi.BinaryInput
  - A new binary file to attach to the comment, or null. If you specify a binary file, specify the title and description of the file in the comment parameter.

Return Value

- Type: ConnectApi.Comment
  - If the feed element doesn't support the Comments capability, the return value is ConnectApi.NotFoundException.

Example for Posting a Comment with Mentions

You can post comments with mentions two ways. Use the ConnectApiHelper repository on GitHub to write a single line of code, or use this method example.

```java
String communityId = null;
String feedElementId = '0D5D0000000KtW3';

ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput();
ConnectApi.MentionSegmentInput mentionSegmentInput = new ConnectApi.MentionSegmentInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

messageBodyInput.messageSegments.add(textSegmentInput);
textSegmentInput.text = 'Does anyone in this group have an idea? ';
messageBodyInput.messageSegments.add(textSegmentInput);
mentionSegmentInput.id = '005D0000000oOT';
messageBodyInput.messageSegments.add(mentionSegmentInput);
```
commentInput.body = messageBodyInput;

ConnectApi.Comment commentRep = ConnectApi.ChatterFeeds.postCommentToFeedElement(communityId, feedElementId, commentInput, null);

Example for Posting a Comment with an Existing File

String feedElementId = '0D5D0000000KtW3';

ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput();

ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

textSegmentInput.text = 'I attached this file from Salesforce Files.';
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageBodyInput.messageSegments.add(textSegmentInput);
commentInput.body = messageBodyInput;

ConnectApi.CommentCapabilitiesInput commentCapabilitiesInput = new ConnectApi.CommentCapabilitiesInput();
ConnectApi.ContentCapabilityInput contentCapabilityInput = new ConnectApi.ContentCapabilityInput();

commentCapabilitiesInput.content = contentCapabilityInput;
contentCapabilityInput.contentDocumentId = '069D0000001rNJ';

commentInput.capabilities = commentCapabilitiesInput;

ConnectApi.Comment commentRep =
ConnectApi.ChatterFeeds.postCommentToFeedElement(Network.getNetworkId(), feedElementId, commentInput, null);

Example for Posting a Comment with a New File

String feedElementId = '0D5D0000000KtW3';

ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput();

ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

textSegmentInput.text = 'Enjoy this new file.';
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageBodyInput.messageSegments.add(textSegmentInput);
commentInput.body = messageBodyInput;

ConnectApi.CommentCapabilitiesInput commentCapabilitiesInput = new ConnectApi.CommentCapabilitiesInput();
ConnectApi.ContentCapabilityInput contentCapabilityInput = new ConnectApi.ContentCapabilityInput();

587
Example for Posting a Rich-Text Comment with an Inline Image

You can post rich-text comments with inline images and mentions two ways. Use the ConnectApiHelper repository on GitHub to write a single line of code, or use this method example. In this example, the image file is existing content that has already been uploaded to Salesforce.

String communityId = null;
String feedElementId = '0DSR0000000SBEr';
String imageId = '069R00000000IgQ';
String mentionedUserId = '005R0000000DiMz';

ConnectApi.CommentInput input = new ConnectApi.CommentInput();
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MentionSegmentInput mentionSegment;
ConnectApi.MarkupBeginSegmentInput markupBeginSegment;
ConnectApi.MarkupEndSegmentInput markupEndSegment;
ConnectApi.InlineImageSegmentInput inlineImageSegment;

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

markupBeginSegment = new ConnectApi.MarkupBeginSegmentInput();
markupBeginSegment.markupType = ConnectApi.MarkupType.Bold;
messageInput.messageSegments.add(markupBeginSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'Hello ';
messageInput.messageSegments.add(textSegment);

mentionSegment = new ConnectApi.MentionSegmentInput();
mentionSegment.id = mentionedUserId;
messageInput.messageSegments.add(mentionSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = '!!';
messageInput.messageSegments.add(textSegment);
Example for Posting a Rich-Text Comment with a Code Block

```java
String communityId = null;
String feedElementId = '0D5R0000000SBEr';
String codeSnippet = '<html>
	<body>
		Hello, world!
	</body>
</html>'

ConnectApi.CommentInput input = new ConnectApi.CommentInput();
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MarkupBeginSegmentInput markupBeginSegment;
ConnectApi.MarkupEndSegmentInput markupEndSegment;

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>()

markupBeginSegment = new ConnectApi.MarkupBeginSegmentInput();
markupBeginSegment.markupType = ConnectApi.MarkupType.Code;
messageInput.messageSegments.add(markupBeginSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = codeSnippet;
messageInput.messageSegments.add(textSegment);

markupEndSegment = new ConnectApi.MarkupEndSegmentInput();
markupEndSegment.markupType = ConnectApi.MarkupType.Code;
messageInput.messageSegments.add(markupEndSegment);

input.body = messageInput;

ConnectApi.ChatterFeeds.postCommentToFeedElement(communityId, feedElementId, input, null);
```

postFeedElement(communityId, subjectId, feedElementType, text)

Post a plain-text feed element.

API Version

31.0
Requires Chatter
Yes

Signature
public static ConnectApi.FeedElement postFeedElement(String communityId, String subjectId, ConnectApi.FeedElementType feedElementType, String text)

Parameters
communityId
   Type: String
   ID for an Experience Cloud site, internal, or null.

subjectId
   Type: String
   The ID of the parent this feed element is being posted to. This value can be the ID of a user, group, or record, or the string me to indicate the context user.

feedElementType
   Type: ConnectApi.FeedElementType
   The only possible value is FeedItem.

text
   Type: String
   The text of the feed element. A feed element can contain up to 10,000 characters.

Return Value
Type: ConnectApi.FeedElement

Example
ConnectApi.FeedElement feedElement = ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), '0F9d0000000TreH', ConnectApi.FeedElementType.FeedItem, 'On vacation this week.');

postFeedElement(communityId, feedElement)
Post a rich-text feed element. Include mentions and hashtag topics, attach already uploaded files to a feed element, and associate action link groups with a feed element. You can also use this method to share a feed element and add a comment.

API Version
36.0

Requires Chatter
Yes
Signature

```java
public static ConnectApi.FeedElement postFeedElement(String communityId,
                                                     ConnectApi.FeedElementInput feedElement)
```

Parameters

- `communityId`
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- `feedElement`
  - Type: `ConnectApi.FeedElementInput`
  - Specify rich text, including mentions. Optionally, specify a link, a poll, or up to 10 existing files.

Return Value

- Type: `ConnectApi.FeedElement`

Example for Posting a Feed Element with a Mention

You can post feed elements with mentions two ways. Use the `ConnectApiHelper` repository on GitHub to write a single line of code, or use this method example.

```java
ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
ConnectApi.MentionSegmentInput mentionSegmentInput = new ConnectApi.MentionSegmentInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
mentionSegmentInput.id = '005RR000000Dme9';
messageBodyInput.messageSegments.add(mentionSegmentInput);
textSegmentInput.text = 'Could you take a look?';
messageBodyInput.messageSegments.add(textSegmentInput);

feedItemInput.body = messageBodyInput;
feedItemInput.feedElementType = ConnectApi.FeedElementType.FeedItem;
feedItemInput.subjectId = '0F9RR0000004CPw';

ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);
```

Example for Posting a Feed Element with Existing Content

```java
// Define the FeedItemInput object to pass to postFeedElement
ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
feedItemInput.subjectId = 'me';
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();
textSegmentInput.text = 'Would you please review these docs?';
```

---

591
// The MessageBodyInput object holds the text in the post
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageBodyInput.messageSegments.add(textSegmentInput);
feedItemInput.body = messageBodyInput;

// The FeedElementCapabilitiesInput object holds the capabilities of the feed item.
// For this feed item, we define a files capability to hold the file(s).
List<String> fileIds = new List<String>();
fileIds.add('069xx00000000QO');
fileIds.add('069xx00000000QT');
fileIds.add('069xx00000000Qn');
fileIds.add('069xx00000000Qi');
fileIds.add('069xx00000000Qd');

ConnectApi.FilesCapabilityInput filesInput = new ConnectApi.FilesCapabilityInput();
filesInput.items = new List<ConnectApi.FileIdInput>();
for (String fileId : fileIds) {
    ConnectApi.FileIdInput idInput = new ConnectApi.FileIdInput();
    idInput.id = fileId;
    filesInput.items.add(idInput);
}

ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
feedElementCapabilitiesInput.files = filesInput;

feedItemInput.capabilities = feedElementCapabilitiesInput;

// Post the feed item.
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);

Example for Posting a Rich-Text Feed Element with an Inline Image
You can post rich-text feed elements with inline images and mentions two ways. Use the ConnectApiHelper repository on GitHub to write a single line of code, or use this method example. In this example, the image file is existing content that has already been uploaded to Salesforce. The post also includes text and a mention.

String communityId = null;
String imageId = '069D0000000011NA';
String mentionedUserId = '005D0000001Qpr';
String targetUserOrGroupOrRecordId = '005D0000001Gif0';
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.subjectId = targetUserOrGroupOrRecordId;
input.feedElementType = ConnectApi.FeedElementType.FeedItem;
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MentionSegmentInput mentionSegment;
ConnectApi.MarkupBeginSegmentInput markupBeginSegment;
ConnectApi.MarkupEndSegmentInput markupEndSegment;
ConnectApi.InlineImageSegmentInput inlineImageSegment;

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

markupBeginSegment = new ConnectApi.MarkupBeginSegmentInput();
markupBeginSegment.markupType = ConnectApi.MarkupType.Bold;
messageInput.messageSegments.add(markupBeginSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'Hello ';
messageInput.messageSegments.add(textSegment);

mentionSegment = new ConnectApi.MentionSegmentInput();
mentionSegment.id = mentionedUserId;
messageInput.messageSegments.add(mentionSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = '!';
messageInput.messageSegments.add(textSegment);

markupEndSegment = new ConnectApi.MarkupEndSegmentInput();
markupEndSegment.markupType = ConnectApi.MarkupType.Bold;
messageInput.messageSegments.add(markupEndSegment);

inlineImageSegment = new ConnectApi.InlineImageSegmentInput();
inlineImageSegment.altText = 'image one';
inlineImageSegment.fileId = imageId;
messageInput.messageSegments.add(inlineImageSegment);

input.body = messageInput;
ConnectApi.ChatterFeeds.postFeedElement(communityId, input);

Example for Posting a Rich-Text Feed Element with a Code Block

String communityId = null;
String targetUserOrGroupOrRecordId = 'me';
String codeSnippet = '<html>
	<body>
		Hello, world!
	</body>
</html>';
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.subjectId = targetUserOrGroupOrRecordId;
input.feedElementType = ConnectApi.FeedElementType.FeedItem;

ConnectApi.TextSegmentInput textSegment;
ConnectApi.MarkupBeginSegmentInput markupBeginSegment;
ConnectApi.MarkupEndSegmentInput markupEndSegment;

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

markupBeginSegment = new ConnectApi.MarkupBeginSegmentInput();
markupBeginSegment.markupType = ConnectApi.MarkupType.Code;
messageInput.messageSegments.add(markupBeginSegment);
textSegment.text = codeSnippet;
messageInput.messageSegments.add(textSegment);

markupEndSegment = new ConnectApiMarkupEndSegmentInput();
markupEndSegment.markupType = ConnectApiMarkupType.Code;
messageInput.messageSegments.add(markupEndSegment);

input.body = messageInput;
ConnectApi.ChatterFeeds.postFeedElement(communityId, input);

Example for Sharing a Feed Element (in Version 39.0 and Later)

// Define the FeedItemInput object to pass to postFeedElement
ConnectApiFeedItemInput feedItemInput = new ConnectApiFeedItemInput();
feedItemInput.subjectId = 'me';
ConnectApiTextSegmentInput textSegmentInput = new ConnectApiTextSegmentInput();
textSegmentInput.text = 'Look at this post I'm sharing.';
// The MessageBodyInput object holds the text in the post
ConnectApiMessageBodyInput messageBodyInput = new ConnectApiMessageBodyInput();
messageBodyInput.messageSegments = new List<ConnectApiMessageSegmentInput>(){
messageBodyInput.messageSegments.add(textSegmentInput);

feedItemInput.body = messageBodyInput;
ConnectApiFeedEntityShareCapabilityInput shareInput = new
ConnectApiFeedEntityShareCapabilityInput();
shareInput.feedEntityId = '0D5R0000000SEbc';
ConnectApiFeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApiFeedElementCapabilitiesInput();
feedElementCapabilitiesInput.feedEntityShare = shareInput;
feedItemInput.capabilities = feedElementCapabilitiesInput;
// Post the feed item.
ConnectApiFeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);

Example for Sending a Direct Message

// Define the FeedItemInput object to pass to postFeedElement
ConnectApiFeedItemInput feedItemInput = new ConnectApiFeedItemInput();

ConnectApiTextSegmentInput textSegmentInput = new ConnectApiTextSegmentInput();
textSegmentInput.text = 'Thanks for attending my presentation test run this morning. Send me any feedback.';
// The MessageBodyInput object holds the text in the post
ConnectApiMessageBodyInput messageBodyInput = new ConnectApiMessageBodyInput();
messageBodyInput.messageSegments = new List<ConnectApiMessageSegmentInput>(){
messageBodyInput.messageSegments.add(textSegmentInput);

feedItemInput.body = messageBodyInput;
// The FeedElementCapabilitiesInput object holds the capabilities of the feed item.
// For this feed item, we define a direct message capability to hold the member(s) and the subject.
List<String> memberIds = new List<String>();
memberIds.add('005B00000016OUQ');
memberIds.add('005B0000001rIN6');

ConnectApi.DirectMessageCapabilityInput dmInput = new
ConnectApi.DirectMessageCapabilityInput();
dmInput.subject = 'Thank you!';
dmInput.membersToAdd = memberIds;

ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
feedElementCapabilitiesInput.directMessage = dmInput;

feedItemInput.capabilities = feedElementCapabilitiesInput;

// Post the feed item.
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);

postFeedElementBatch(communityId, feedElements)
Post a list of feed elements.

API Version
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.BatchResult[] postFeedElementBatch(String communityId,
List<ConnectApi.BatchInput> feedElements)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.
feedElements
Type: List<ConnectApi.BatchInput>
The list can contain up to 500 ConnectApi.BatchInput objects. In the ConnectApi.BatchInput constructor,
the input object must be a concrete instance of the abstract ConnectApi.FeedElementInput class.

Return Value
Type: ConnectApi.BatchResult[]}
The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.FeedElement` object. The returned objects correspond to each of the input objects and are returned in the same order as the input objects. The method call fails only if an error occurs that affects the entire operation (such as a parsing failure). If an individual object causes an error, the error is embedded within the `ConnectApi.BatchResult` list.

Usage

Use this method to post a list of feed elements efficiently. Create a list containing up to 500 objects and insert them all for the cost of one DML statement.

In version 36.0 and later, you can attach only one already uploaded file to each post. The `ConnectApi.BatchInput` has three constructors, but the `postFeedElementBatch` method supports only `ConnectApi.BatchInput(Object input)` in version 35.0 and later. This constructor doesn't support a binary input.

In version 32.0–35.0, this method supports both `ConnectApi.BatchInput(Object input)` and `ConnectApi.BatchInput(Object input, ConnectApi.BinaryInput binary)` constructors. The `ConnectApi.BatchInput(Object input, ConnectApi.BinaryInput binary)` constructor allows for a single binary input.

In each constructor, the input object must be an instance of `ConnectApi.FeedElementInput`.

Example

This trigger bulk posts to the feeds of newly inserted accounts.

```apex
trigger postFeedItemToAccount on Account (after insert) {
    Account[] accounts = Trigger.new;

    // Bulk post to the account feeds.
    List<ConnectApi.Batch> batchInputs = new List<ConnectApi.Batch>();

    for (Account a : accounts) {
        ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();

        input.subjectId = a.id;

        body.messageSegments = new List<ConnectApi.MessageSegmentInput>();
        ConnectApi.TextSegmentInput textSegment = new ConnectApi.TextSegmentInput();
        textSegment.text = 'Let\'s win the ' + a.name + ' account.';

        body.messageSegments.add(textSegment);
        input.body = body;

        ConnectApi.BatchInput batchInput = new ConnectApi.BatchInput(input);
        batchInputs.add(batchInput);
    }

    ConnectApi.ChatterFeeds.postFeedElementBatch(Network.getNetworkId(), batchInputs);
}
```
**publishDraftFeedElement(communityId, feedElementId, feedElement)**

Publish a draft feed element.

**API Version**

44.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.FeedElement publishDraftFeedElement(String communityId, String feedElementId, ConnectApi.FeedElementInput feedElement)
```

**Parameters**

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.
- **feedElementId**
  - Type: `String`
  - ID of the feed element to publish.
- **feedElement**
  - Type: `ConnectApi.FeedElementInput`
  - Use this optional parameter to edit your draft before publishing.

**Return Value**

- Type: `ConnectApi.FeedElement`
  - The published feed element has a new ID.

**searchFeedElements(communityId, q)**

Get the first page of feed elements that match the search criteria.

**API Version**

31.0

**Available to Guest Users**

31.0

**Requires Chatter**

Yes
Signature

```java
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String q)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `q`
  - Type: `String`
  - Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestSearchFeedElements(communityId, q, result)`

`searchFeedElements(communityId, q, sortParam)`

Get the first page of sorted feed elements that match the search criteria.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String q, ConnectApi.FeedSortOrder sortParam)
```
Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

q
  Type: String
  Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam
  Type: ConnectApi.FeedSortOrder
  Values are:
  • CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
  • CreatedDateDesc—Sorts by most recent creation date.
  • LastModifiedDateDesc—Sorts by most recent activity.
  • MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
  • Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
  If you pass in null, the default value CreatedDateDesc is used.

Return Value
  Type: ConnectApi.FeedElementPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
  setTestSearchFeedElements(communityId, q, sortParam, result)

searchFeedElements(communityId, q, threadedCommentsCollapsed)
Get the feed elements and comments that match the search criteria.

API Version
  44.0

Available to Guest Users
  44.0
Requires Chatter
Yes

Signature

```java
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String q, Boolean threadedCommentsCollapsed)
```

Parameters

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **q**
  - Type: String
  - Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

- **threadedCommentsCollapsed**
  - Type: Boolean
  - Specifies whether to return threaded comments in a collapsed style (true) or not (false). If you pass in null, the default is false.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestSearchFeedElements(communityId, q, threadedCommentsCollapsed, result)`

**Signature**

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String q, String pageParam, Integer pageSize)
```

**Parameters**

- **communityId**
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.

- **q**
  Type: `String`
  Required and can’t be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See **Wildcards**.

- **pageParam**
  Type: `String`
  Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

- **pageSize**
  Type: `Integer`
  Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**Return Value**

Type: `ConnectApi.FeedElementPage`

**Usage**

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Available to Guest Users
31.0

Requires Chatter
Yes

Signature
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.
**FeedType**
Type: `ConnectApi.FeedType`
Type of feed. Valid values are Company, DirectMessageModeration, Home, Moderation, and PendingReview.

**recentCommentCount**
Type: `Integer`
Maximum number of comments to return with each feed element. The default value is 3.

**density**
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
Type: `ConnectApi.FeedSortOrder`
Values are:
- **CreateDateAsc**—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- **CreateDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
If you pass in `null`, the default value `CreateDateDesc` is used.

**q**
Type: `String`
Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

**Return Value**
Type: `ConnectApi.FeedElementPage`
Usage

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)

Get a page of sorted and filtered feed elements from the Home feed that match the search criteria. Each feed element includes no more than the specified number of comments.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedFilter filter)

Parameters

communityId

Type: String

ID for an Experience Cloud site, internal, or null.

feedType

Type: ConnectApi.FeedType

The type of feed. The only valid value is Home.

recentCommentCount

Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.
density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.
When the sortParam is MostViewed, you must pass in null for the pageParam.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.
When the sortParam is MostViewed, the pageSize must be a value from 1 to 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
If you pass in null, the default value CreatedDateDesc is used.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: ConnectApi.FeedFilter
Specifies the feed filters.
- AllQuestions—Feed elements that are questions.
- AuthoredBy—Feed elements authored by the user profile owner. This value is valid only for the UserProfile feed.
- CommunityScoped—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the UserProfile feed.
- QuestionsWithCandidateAnswers—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
• QuestionsWithCandidateAnswersReviewedPublished—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
• Read—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the Record feed of a group.
• SolvedQuestions—Feed elements that are questions and that have a best answer.
• UnansweredQuestions—Feed elements that are questions and that don’t have any answers.
• UnansweredQuestionsWithCandidateAnswers—Feed elements that are questions that don’t have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
• Unread—Feed elements that are created in the past 30 days and aren’t marked as read for the context user. This value is valid only for the Record feed of a group.
• UnsolvedQuestions—Feed elements that are questions and that don’t have a best answer.

Return Value
Type: ConnectApi.FeedElementPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestSearchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter, result)

searchFeedElementsInFeed(communityId, feedType, subjectId, q)
Search up to 5,000 of the most recent feed elements in a feed for a subject ID that match the search string. Feed elements are returned in order of most recent activity.

API Version
31.0

Available to Guest Users
31.0

Requires Chatter
Yes
Signature

```java
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String q)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `feedType`
  - Type: `ConnectApi.FeedType`
  - Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, `Streams`, and `Topics`.

- `subjectId`
  - Type: `String`
  - If `feedType` is `Record`, `subjectId` can be any record ID, including a group ID. If `feedType` is `UserProfile`, `subjectId` can be any user ID. If the `feedType` is any other value, `subjectId` must be the ID of the context user or the alias `me`.

- `q`
  - Type: `String`
  - Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, q, result)`

```java
searchFeedElementsInFeed(communityId, feedType, subjectId, pageParam,
pageSize, sortParam, q)
```

Get a page of sorted feed elements from a feed for a record or user that match the search criteria.

API Version

31.0
Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`feedType`
Type: `ConnectApi.FeedType`
Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, `Streams`, and `Topics`.

`subjectId`
Type: `String`
If `feedType` is `Record`, `subjectId` can be any record ID, including a group ID. If `feedType` is `UserProfile`, `subjectId` can be any user ID. If the `feedType` is any other value, `subjectId` must be the ID of the context user or the alias me.

`pageParam`
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`
Order of feed items in the feed.
- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.
If you pass in null, the default value CreatedDateDesc is used.

q
Type: String

Search term. Searches keywords in the user or group name. A minimum of one character is required. This parameter doesn’t support wildcards. This parameter is required.

Return Value
Type: ConnectApi.FeedElementPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)
Get a page of sorted feed elements from a feed that match the search criteria. Each feed element includes no more than the specified number of comments.

Yes

Signature
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

**feedType**
Type: `ConnectApi.FeedType`
Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, `Streams`, and `Topics`.

**subjectId**
Type: `String`
If `feedType` is `Record`, `subjectId` can be any record ID, including a group ID. If `feedType` is `UserProfile`, `subjectId` can be any user ID. If the `feedType` is any other value, `subjectId` must be the ID of the context user or the alias me.

**recentCommentCount**
Type: `Integer`
Maximum number of comments to return with each feed element. The default value is 3.

**density**
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
Type: `ConnectApi.FeedSortOrder`
Values are:
- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

**q**
Type: `String`
Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value
Type: `ConnectApi.FeedElementPage`

Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)`

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)
Get a page of sorted and filtered feed elements from a UserProfile feed that match the search criteria.

API Version
35.0

Available to Guest Users
35.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
                      ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
                      ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
                      ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedFilter filter)
```

Parameters
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or null.
- `feedType`
  Type: `ConnectApi.FeedType`
Value must be `ConnectApi.FeedType.UserProfile`.

**subjectId**
Type: `String`
ID of any user. To specify the context user, use the user ID or the alias `me`.

**recentCommentCount**
Type: `Integer`
Maximum number of comments to return with each feed element. The default value is 3.

**density**
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
Type: `ConnectApi.FeedSortOrder`
Values are:
- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

**q**
Type: `String`
One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren’t wildcards. See `Wildcards`.

**filter**
Type: `ConnectApi.FeedFilter`
Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out.
Return Value
Type: `ConnectApi.FeedElementPage`

Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

Signature
```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, String customFilter)
```

Parameters

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or null.
- `feedType`
  Type: `ConnectApi.FeedType`
  Value must be `ConnectApi.FeedType.Record`.
- `subjectId`
  Type: `String`
The ID of a case.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
If you pass in null, the default value CreatedDateDesc is used.

q
Type: String
One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren’t wildcards. See Wildcards.

customFilter
Type: String
Custom filter that applies only to the case feed. See customFeedFilter in the Metadata API Developer Guide for supported values.

Return Value
Type: ConnectApi.FeedElementPage
Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly)
```

Parameters

`communityId`

Type: `String`

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

`subjectId`

Type: `String`

Any record ID, including a group ID.
recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
If you pass in null, the default value CreatedDateDesc is used.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean
Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

Return Value
Type: ConnectApi.FeedElementPage
Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

```java
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
    ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
    ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
    ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly,
    ConnectApi.FeedFilter filter)
```

**Parameters**
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, *internal*, or `null`.
- `feedType`
  Type: `ConnectApi.FeedType`
  Value must be `ConnectApi.FeedType.Record`.
- `subjectId`
  Type: `String`
  Any record ID, including a group ID.
recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
  • AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
  • FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
  • CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
  • CreatedDateDesc—Sorts by most recent creation date.
  • LastModifiedDateDesc—Sorts by most recent activity.
  • MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
  • Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
If you pass in null, the default value CreatedDateDesc is used.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean
Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

filter
Type: ConnectApi.FeedFilter
Specifies the feed filters.
  • AllQuestions—Feed elements that are questions.
  • AuthoredBy—Feed elements authored by the user profile owner. This value is valid only for the UserProfile feed.
• CommunityScoped—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the UserProfile feed.

• QuestionsWithCandidateAnswers—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.

• QuestionsWithCandidateAnswersReviewedPublished—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.

• Read—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the Record feed of a group.

• SolvedQuestions—Feed elements that are questions and that have a best answer.

• UnansweredQuestions—Feed elements that are questions and that don’t have any answers.

• UnansweredQuestionsWithCandidateAnswers—Feed elements that are questions that don’t have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.

• Unread—Feed elements that are created in the past 30 days and aren’t marked as read for the context user. This value is valid only for the Record feed of a group.

• UnsolvedQuestions—Feed elements that are questions and that don’t have a best answer.

**Return Value**

Type: `ConnectApi.FeedElementPage`

**Usage**

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

</tbody>
</table>
• CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.

• CreatedDateDesc—Sorts by most recent creation date.

• LastModifiedDateDesc—Sorts by most recent activity.

• MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.

• Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

q
Type: String
Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean
Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

filter
Type: String
Custom filter that applies only to the case feed. See customFeedFilter in the Metadata API Developer Guide for supported values.

Return Value
Type: ConnectApi.FeedElementPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, customFilter, result)

searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q)
Get the feed elements from a feed filtered by a key prefix that match the search criteria.

API Version
31.0

Requires Chatter
Yes
Signature

```java
public static ConnectApi.FeedElementPage searchFeedElementsInFilterFeed(String communityId, String subjectId, String keyPrefix, String q)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **subjectId**
  - Type: `String`
  - ID of the context user or the alias `me`.

- **keyPrefix**
  - Type: `String`
  - A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

- **q**
  - Type: `String`
  - Required and can’t be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See **Wildcards**.

Return Value

- Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q, result)`

**searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q)**

Get a page of sorted feed elements from a feed filtered by a key prefix that match the search criteria.

API Version

- 31.0

Requires Chatter

- Yes
function searchFeedElementsInFilterFeed(communityId: String, subjectId: String, keyPrefix: String, pageParam: String, pageSize: Integer, sortParam: ConnectApi.FeedSortOrder, q: String): ConnectApi.FeedElementPage {
    // Function implementation goes here
}

**Parameters**

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **subjectId**
  - Type: String
  - ID of the context user or the alias me.

- **keyPrefix**
  - Type: String
  - A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 00S and Group objects have a prefix of 0F9.

- **pageParam**
  - Type: String
  - Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

- **pageSize**
  - Type: Integer
  - Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

- **sortParam**
  - Type: ConnectApi.FeedSortOrder
  - Values are:
    - CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
    - CreatedDateDesc—Sorts by most recent creation date.
    - LastModifiedDateDesc—Sorts by most recent activity.
    - MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
    - Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
  - If you pass in null, the default value CreatedDateDesc is used.

- **q**
  - Type: String
  - Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

**Return Value**

Type: ConnectApi.FeedElementPage
Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
   - `setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q, result)`
   - *Apex Developer Guide: Testing ConnectApi Code*

`searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)`
Get a page of sorted feed elements from a feed filtered by a key prefix that match the search criteria. Each feed element includes no more than the specified number of comments.

API Version
31.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.FeedElementPage searchFeedElementsInFilterFeed(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters
- `communityId`<br>  Type: `String`<br>  ID for an Experience Cloud site, internal, or `null`.
- `subjectId`<br>  Type: `String`<br>  ID of the context user or the alias `me`.
- `keyPrefix`<br>  Type: `String`<br>  A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 00S and Group objects have a prefix of 0F9.
- `recentCommentCount`<br>  Type: `Integer`<br>  Maximum number of comments to return with each feed element. The default value is 3.
- `density`<br>  Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.

- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**

Type: **String**

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**

Type: **Integer**

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**

Type: **ConnectApi.FeedSortOrder**

Values are:

- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

**q**

Type: **String**

Required and can’t be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See **Wildcards**.

**Return Value**

Type: **ConnectApi.FeedElementPage**

**Usage**

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**SEE ALSO:**

- `setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)`
- *Apex Developer Guide: Testing ConnectApi Code*
searchStreams(communityId, q)
Search the Chatter feed streams for the context user.

API Version
40.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q)

Parameters
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

q
  Type: String
  Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value
Type: ConnectApi.ChatterStreamPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestSearchStreams(communityId, q, result)

searchStreams(communityId, q, sortParam)
Search and sort the Chatter feed streams for the context user.

API Version
40.0
Requires Chatter
Yes

Signature
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q, ConnectApi.SortOrder sortParam)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam
Type: ConnectApi.SortOrder
Specifies the sort order. Values are:
- Ascending—Items are in ascending alphabetical order (A-Z).
- Descending—Items are in descending alphabetical order (Z-A).
- MostRecentlyViewed—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.
If not specified, default value is Ascending.

Return Value
Type: ConnectApi.ChatterStreamPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestSearchStreams(communityId, q, sortParam, result)

searchStreams(communityId, q, pageParam, pageSize)
Search the Chatter feed streams for the context user and return a page of results.

API Version
40.0
Requires Chatter
Yes

Signature

```java
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q, Integer pageParam, Integer pageSize)
```

Parameters

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.

- `q`
  Type: `String`
  Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See `Wildcards`.

- `pageParam`
  Type: `Integer`
  Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

- `pageSize`
  Type: `Integer`
  Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

Return Value

Type: `ConnectApi.ChatterStreamPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestSearchStreams(communityId, q, pageParam, pageSize, result)`

`searchStreams(communityId, q, pageParam, pageSize, sortParam)`

Search the Chatter feed streams for the context user and return a sorted page of results.

API Version

40.0
Requires Chatter
Yes

Signature

public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q, Integer pageParam, Integer pageSize, ConnectApi.SortOrder sortParam)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam
Type: ConnectApi.SortOrder
Specifies the sort order. Values are:
- Ascending—Items are in ascending alphabetical order (A-Z).
- Descending—Items are in descending alphabetical order (Z-A).
- MostRecentlyViewed—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is Ascending.

Return Value
Type: ConnectApi.ChatterStreamPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestSearchStreams(communityId, q, pageParam, pageSize, sortParam, result)
searchStreams(communityId, q, pageParam, pageSize, sortParam, globalScope)

Search the Chatter feed streams from all Experience Cloud sites for the context user and return a sorted page of results.

API Version
41.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q, Integer pageParam, Integer pageSize, ConnectApi.SortOrder sortParam, Boolean globalScope)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam
Type: ConnectApi.SortOrder
Specifies the sort order. Values are:
• Ascending—Items are in ascending alphabetical order (A-Z).
• Descending—Items are in descending alphabetical order (Z-A).
• MostRecentlyViewed—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is Ascending.

globalScope
Type: Boolean
 Specifies whether to get streams from all the context user's Experience Cloud sites, regardless of the communityId value.

Tip: If you know the communityId for the streams, we recommend setting globalScope to false.
Return Value
Type: `ConnectApi.ChatterStreamPage`

Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

```java
setCommentIsVerified(communityId, commentId, isVerified)
```
Mark a comment as verified or unverified.

API Version
41.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.VerifiedCapability setCommentIsVerified(String communityId, String commentId, Boolean isVerified)
```

Parameters
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.
- `commentId`
  Type: `String`
  ID of the comment on a question post. Only one comment on a question post can be marked as verified.
- `isVerified`
  Type: `Boolean`
  Specifies whether to mark the comment as verified (`true`) or unverified (`false`). Only verified comments can be marked as unverified, and only unverified comments can be marked as verified.

Return Value
Type: `ConnectApi.VerifiedCapability`
If the comment doesn’t support this capability, the return value is `ConnectApi.NotFoundException`.

```java
setCommentIsVerifiedByAnonymized(communityId, commentId, isVerified, isVerifiedByAnonymized)
```
Mark a comment as verified by an anonymous user.
API Version
43.0

Requires Chatter
Yes

Signature
public static ConnectApi.VerifiedCapability setCommentIsVerifiedByAnonymized(String communityId, String commentId, Boolean isVerified, Boolean isVerifiedByAnonymized)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

commentId
Type: String
ID of the comment on a question post. Only one comment on a question post can be marked as verified.

isVerified
Type: Boolean
Specifies whether to mark the comment as verified (true) or unverified (false).

Only verified comments can be marked as unverified, and only unverified comments can be marked as verified.

isVerifiedByAnonymized
Type: Boolean
Specifies whether to mark the comment as verified by an anonymous user (true).

If a user previously verified a comment and then requested the activity to be deleted, use isVerifiedByAnonymized to maintain the verification and anonymize the value of lastVerifiedByUser.

You can't set isVerified and isVerifiedByAnonymized to true at the same time. isVerifiedByAnonymized can be set to true only if isVerified is already set to true.

You can't set isVerifiedByAnonymized to false. After isVerifiedByAnonymized is set to true, it can be undone only when another user marks the comment as unverified and then reverifies the comment.

Return Value
Type: ConnectApi.VerifiedCapability
If the comment doesn't support this capability, the return value is ConnectApi.NotFoundException.

setCommentVote(communityId, commentId, upDownVote)
Upvote or downvote a comment.
API Version
41.0

Requires Chatter
Yes

Signature
public static ConnectApi.UpDownVoteCapability setCommentVote(String communityId, String commentId, ConnectApi.UpDownVoteCapabilityInput upDownVote)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

commentId
Type: String
ID of the comment.

upDownVote
Type: ConnectApi.UpDownVoteCapabilityInput
A ConnectApi.UpDownVoteCapabilityInput object that includes your vote.

Return Value
Type: ConnectApi.UpDownVoteCapability
If the comment doesn’t support this capability, the return value is ConnectApi.NotFoundException.

setFeedCommentStatus(communityId, commentId, status)
Set the status of a comment.

API Version
38.0

Requires Chatter
Yes

Signature
public static ConnectApi.StatusCapability setFeedCommentStatus(String communityId, String commentId, ConnectApi.StatusCapabilityInput status)
Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

commentId
Type: String
ID of the comment.

status
Type: ConnectApi.StatusCapabilityInput
A ConnectApi.StatusCapabilityInput object that includes the status you want to set.

Return Value
Type: ConnectApi.StatusCapability
If the comment doesn’t support this capability, the return value is ConnectApiNotFoundException.

Usage
Only users with the Can Approve Feed Post and Comment permission can set the status of a feed post or comment.

setFeedElementIsClosed(communityId, feedElementId, isClosed)
Set a feed element to closed.

Users can’t edit (specifically the feed item body or title), comment on, or delete a closed feed element. If the closed feed element is a poll, users can’t vote on it. Users can’t edit (specifically the comment body) or delete a comment on a closed feed element or select or remove it as best answer.

Admins and moderators can edit and delete closed feed elements and comments on closed feed elements. Admins and moderators can select or remove the best answer status on comments on closed feed elements.

API Version
43.0

Requires Chatter
Yes

Signature
public static ConnectApi.CloseCapability setFeedElementIsClosed(String communityId, String feedElementId, Boolean isClosed)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.
feedElementId
  Type: String
  ID of the feed element.

isClosed
  Type: Boolean
  Specifies whether to set the feed element to closed (true) or not (false).

Return Value
Type: ConnectApi.CloseCapability
If the feed element doesn’t support this capability, the return value is ConnectApi.NotFoundException.

setFeedElementVote(communityId, feedElementId, upDownVote)
Upvote or downvote a feed element.

API Version
41.0

Requires Chatter
Yes

Signature
public static ConnectApi.UpDownVoteCapability setFeedElementVote(String communityId, String feedElementId, ConnectApi.UpDownVoteCapabilityInput upDownVote)

Parameters
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

feedElementId
  Type: String
  ID of the feed element.

upDownVote
  Type: ConnectApi.UpDownVoteCapabilityInput
  A ConnectApi.UpDownVoteCapabilityInput object that includes your vote.

Return Value
Type: ConnectApi.UpDownVoteCapability
If the feed element doesn’t support this capability, the return value is ConnectApi.NotFoundException.
**setFeedEntityStatus(communityId, feedElementId, status)**

Set the status of a feed post.

**API Version**

37.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.StatusCapability setFeedEntityStatus(String communityId, String feedElementId, ConnectApi.StatusCapabilityInput status)
```

**Parameters**

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **feedElementId**
  - Type: String
  - ID of the feed element.

- **status**
  - Type: `ConnectApi.StatusCapabilityInput`
  - A `ConnectApi.StatusCapabilityInput` object that includes the status you want to set.

**Return Value**

Type: `ConnectApi.StatusCapability`

If the feed element doesn’t support this capability, the return value is `ConnectApi.NotFoundException`.

**Usage**

Only users with the Can Approve Feed Post and Comment permission can set the status of a feed post or comment.

**setIsMutedByMe(communityId, feedElementId, isMutedByMe)**

Mute or unmute a feed element.

**API Version**

35.0

**Requires Chatter**

Yes
Signature

public static ConnectApi.MuteCapability setIsMutedByMe(String communityId, String feedElementId, Boolean isMutedByMe)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

isMutedByMe
Type: Boolean
Indicates whether the feed element is muted for the context user. Default value is false.

Return Value

Type: ConnectApi.MuteCapability
If the feed element doesn’t support this capability, the return value is ConnectApi.NotFoundException.

setIsReadByMe(communityId, feedElementId, readBy)
Mark a feed element as read for the context user using an input class.

API Version

40.0

Requires Chatter

Yes

Signature

public static ConnectApi.ReadByCapability setIsReadByMe(String communityId, String feedElementId, ConnectApi.ReadByCapabilityInput readBy)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element to mark as read.
**readBy**
Type: `ConnectApi.ReadByCapabilityInput`  
A `ConnectApi.ReadByCapabilityInput` body indicating to mark the feed elements as read.

**Return Value**
Type: `ConnectApi.ReadByCapability`
If the feed element doesn’t support this capability, the return value is `ConnectApi.NotFoundException`.

**setIsReadByMe(communityId, feedElementId, isReadByMe)**  
Mark a feed element as read for the context user.

**API Version**  
40.0

**Requires Chatter**  
Yes

**Signature**

```java
public static ConnectApi.ReadByCapability setIsReadByMe(String communityId, String feedElementId, Boolean isReadByMe)
```

**Parameters**

- **communityId**
  Type: `String`  
  ID for an Experience Cloud site, internal, or `null`.

- **feedElementId**
  Type: `String`  
  ID of the feed element to mark as read.

- **isReadByMe**
  Type: `Boolean`  
  Specifies to mark the feed element as read (`true`) for the context user.

**Return Value**
Type: `ConnectApi.ReadByCapability`
If the feed element doesn’t support this capability, the return value is `ConnectApi.NotFoundException`.

**updateComment(communityId, commentId, comment)**  
Edit a comment.
API Version
34.0

Requires Chatter
Yes

Signature

```java
public static ConnectApi.Comment updateComment(String communityId, String commentId, ConnectApi.CommentInput comment)
```

Parameters

- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or null.

- **commentId**
  Type: String
  ID of the comment to be edited.

- **comment**
  Type: ConnectApi.CommentInput
  Information about the comment to be edited.

Return Value

Type: ConnectApi.Comment

If the comment doesn’t support the edit capability, the return value is `ConnectApi.NotFoundException`.

Example

```java
String commentId;
String communityId = Network.getNetworkId();

// Get the last feed item created by the context user.
List<FeedItem> feedItems = [SELECT Id FROM FeedItem WHERE CreatedById = :UserInfo.getUserId() ORDER BY CreatedDate DESC];
if (feedItems.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
String feedElementId = feedItems[0].id;

ConnectApi.CommentPage commentPage =
ConnectApi.ChatterFeeds.getCommentsForFeedElement(communityId, feedElementId);
if (commentPage.items.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
```
commentId = commentPage.items[0].id;

ConnectApi.FeedEntityIsEditable isEditable =
ConnectApi.ChatterFeeds.isCommentEditableByMe(communityId, commentId);

if (isEditable.isEditableByMe == true){
    ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput();
    ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

    messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

    textSegmentInput.text = 'This is my edited comment.';
    messageBodyInput.messageSegments.add(textSegmentInput);

    commentInput.body = messageBodyInput;

    ConnectApi.Comment editedComment = ConnectApi.ChatterFeeds.updateComment(communityId,
    commentId, commentInput);
}

updateDirectMessage(communityId, feedElementId, directMessage)

Update the members of a direct message.

API Version
40.0

Requires Chatter
Yes

Signature
public static ConnectApi.DirectMessageCapability updateDirectMessage(String communityId,
String feedElementId, ConnectApi.DirectMessageCapabilityInput directMessage)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

directMessage
Type: ConnectApi.DirectMessageCapabilityInput
A ConnectApi.DirectMessageCapabilityInput body that includes the members to add and remove.
Return Value
Type: `ConnectApi.DirectMessageCapability`
If the feed element doesn’t support this capability, the return value is `ConnectApi.NotFoundException`.

`updateFeedElement(communityId, feedElementId, feedElement)`
Edit a feed element.

API Version
34.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.FeedElement updateFeedElement(String communityId, String feedElementId, ConnectApi.FeedElementInput feedElement)
```

Parameters
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.
- `feedElementId`
  Type: `String`
  ID of the feed element to be edited. Feed items are the only type of feed element that can be edited.
- `feedElement`
  Type: `ConnectApi.FeedElementInput`
  Information about the feed item to be edited.

Return Value
Type: `ConnectApi.FeedElement`
If the feed element doesn’t support the edit capability, the return value is `ConnectApi.NotFoundException`.

Example for Editing a Feed Post
```java
String communityId = Network.getNetworkId();

// Get the last feed item created by the context user.
List<FeedItem> feedItems = [SELECT Id FROM FeedItem WHERE CreatedById = :UserInfo.getUserId() ORDER BY CreatedDate DESC];
if (feedItems.isEmpty()) {
    // Return null within anonymous apex.
    return null;
```
String feedElementId = feedItems[0].id;

ConnectApi.FeedEntityIsEditable isEditable =
ConnectApi.ChatterFeeds.isFeedElementEditableByMe(communityId, feedElementId);

if (isEditable.isEditableByMe == true){
    ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
    ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

    messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

    textSegmentInput.text = 'This is my edited post.';
    messageBodyInput.messageSegments.add(textSegmentInput);

    feedItemInput.body = messageBodyInput;
    ConnectApi.FeedElement editedFeedElement =
    ConnectApi.ChatterFeeds.updateFeedElement(communityId, feedElementId, feedItemInput);
}

Example for Editing a Question Title and Post

String communityId = Network.getNetworkId();

// Get the last feed item created by the context user.
List<FeedItem> feedItems = [SELECT Id FROM FeedItem WHERE CreatedById = :UserInfo.getUserId()
    ORDER BY CreatedDate DESC];
if (feedItems.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
String feedElementId = feedItems[0].id;

ConnectApi.FeedEntityIsEditable isEditable =
ConnectApi.ChatterFeeds.isFeedElementEditableByMe(communityId, feedElementId);

if (isEditable.isEditableByMe == true){
    ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
    ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
    ConnectApi.FeedElementCapabilitiesInput();
    ConnectApi.QuestionAndAnswersCapabilityInput questionAndAnswersCapabilityInput = new
    ConnectApi.QuestionAndAnswersCapabilityInput();
    ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

    messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

    textSegmentInput.text = 'This is my edited question.';
    messageBodyInput.messageSegments.add(textSegmentInput);

    feedItemInput.body = messageBodyInput;
updateFeedElementBookmarks communityId, feedElementId, bookmarks

Bookmark a feed element or remove a bookmark from a feed element using an input class.

API Version
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.BookmarksCapability updateFeedElementBookmarks(String communityId, String feedElementId, ConnectApi.BookmarksCapabilityInput bookmarks)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

bookmarks
Type: ConnectApi.BookmarksCapabilityInput
Information about a bookmark.

Return Value
Type: ConnectApi.BookmarksCapability
If the feed element doesn’t support this capability, the return value is ConnectApi.NotFoundException.

updateFeedElementBookmarks communityId, feedElementId, isBookmarkedByCurrentUser

Bookmark a feed element or remove a bookmark from a feed element.
API Version
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.BookmarksCapability updateFeedElementBookmarks(String communityId, String feedElementId, Boolean isBookmarkedByCurrentUser)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

isBookmarkedByCurrentUser
Type: Boolean
Specify whether to bookmark the feed element (true) or not (false).

Return Value
Type: ConnectApi.BookmarksCapability
If the feed element doesn’t support this capability, the return value is ConnectApi.NotFoundException.

Example
ConnectApi.BookmarksCapability bookmark =
ConnectApi.ChatterFeeds.updateFeedElementBookmarks(null, '0D5D0000000KuGh', true);

updateFeedElementReadByCapabilityBatch(communityId, feedElementIds, readBy)
Mark multiple feed elements as read by the context user at the same time using an input class.

API Version
40.0

Requires Chatter
Yes
public static ConnectApi.BatchResult[] updateFeedElementReadByCapabilityBatch(String communityId, List<String> feedElementIds, ConnectApi.ReadByCapabilityInput readBy)

Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

feedElementIds
  Type: List<String>
  Up to 500 feed element IDs to mark as read.

readBy
  Type: ConnectApi.ReadByCapabilityInput
  A ConnectApi.ReadByCapabilityInput body indicating to mark the feed elements as read.

Return Value

Type: ConnectApi.BatchResult[]
If the feed element doesn't support this capability, the return value is ConnectApiNotFoundException.
The returned objects correspond to each of the input objects and are returned in the same order as the input objects.
The method call fails only if an error occurs that affects the entire operation (such as a parsing failure). If an individual object causes an error, the error is embedded within the ConnectApi.BatchResult list.

updateFeedElementReadByCapabilityBatch(communityId, feedElementIds, isReadByMe)
Mark multiple feed elements as read by the context user at the same time.

API Version
40.0

Requires Chatter
Yes

Signature

public static ConnectApi.BatchResult[] updateFeedElementReadByCapabilityBatch(String communityId, List<String> feedElementIds, Boolean isReadByMe)

Parameters

communityId
  Type: String
ID for an Experience Cloud site, internal, or null.

`feedElementIds`
Type: `List<String>`
Up to 500 feed element IDs to mark as read.

`isReadByMe`
Type: `Boolean`
Specifies to mark the feed element as read (`true`) for the context user.

Return Value
Type: `ConnectApi.BatchResult[]`
If the feed element doesn’t support this capability, the return value is `ConnectApi.NotFoundException`.

**updateLikeForComment(communityId, commentId, isLikedByCurrentUser)**
Like or unlike a comment.

API Version
39.0

Requires Chatter
Yes

Signature
```
public static ConnectApi.ChatterLikePage updateLikeForComment(String communityId, String commentId, Boolean isLikedByCurrentUser)
```

Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or null.

`commentId`
Type: `String`
ID of the comment.

`isLikedByCurrentUser`
Type: `Boolean`
Specifies if the context user likes (`true`) or unlikes (`false`) the comment.

Return Value
Type: `ConnectApi.ChatterLikePage`
updateLikeForFeedElement(communityId, feedElementId, isLikedByCurrentUser)
Like or unlike a feed element.

API Version
39.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterLikePage updateLikeForFeedElement(String communityId, String feedElementId, Boolean isLikedByCurrentUser)

Parameters
communityId
 Type: String
 ID for an Experience Cloud site, internal, or null.

feedElementId
 Type: String
 ID of the feed element.

isLikedByCurrentUser
 Type: Boolean
 Specifies if the context user likes (true) or unlikes (false) the feed element.

Return Value
Type: ConnectApi.ChatterLikePage
If the feed element doesn’t support the ChatterLikes capability, the return value is ConnectApi.NotFoundException.

updatePinnedFeedElements(communityId, feedType, subjectId, pin)
Pin or unpin feed elements to a group or topic feed.

API Version
41.0

Available to Guest Users
41.0

Requires Chatter
Yes
Signature

```java
public static ConnectApi.PinCapability updatePinnedFeedElements(String communityId,
        ConnectApi.FeedType feedType, String subjectId, ConnectApi.PinCapabilityInput pin)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or null.

- `feedType`
  - Type: `ConnectApi.FeedType`
  - The type of feed. Valid values are Record and Topics.

- `subjectId`
  - Type: `String`
  - If `feedType` is Record, `subjectId` must be a group ID. If `feedType` is Topics, `subjectId` must be a topic ID.

- `pin`
  - Type: `ConnectApi.PinCapabilityInput`
  - A `ConnectApi.PinCapabilityInput` object indicating the feed element to pin or unpin.

Return Value

- Type: `ConnectApi.PinCapability`

If the feed doesn’t support this capability, the return value is `ConnectApi.NotFoundException`.

```java
updateStream(communityId, streamId, streamInput)
```

Update a Chatter feed stream.

API Version

39.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.ChatterStream updateStream(String communityId, String streamId,
        ConnectApi.ChatterStreamInput streamInput)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or null.
**streamId**
Type: `String`
ID of the Chatter feed stream.

**streamInput**
Type: `ConnectApi.ChatterStreamInput`

**Return Value**
Type: `ConnectApi.ChatterStream`

**voteOnFeedElementPoll**
`communityId`, `feedElementId`, `myChoiceId`
Vote on a poll or change your vote on a poll.

**API Version**
32.0

**Requires Chatter**
Yes

**Signature**
```java
public static ConnectApi.PollCapability voteOnFeedElementPoll(String communityId, String feedElementId, String myChoiceId)
```

**Parameters**

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`feedElementId`
Type: `String`
ID of the feed element.

`myChoiceId`
Type: `String`
ID of the poll item you’re voting for. The key prefix for poll items is 09A.

**Return Value**
Type: `ConnectApi.PollCapability`
If the feed element doesn’t support this capability, the return value is `ConnectApiNotFoundException`.
Example

```java
ConnectApi.PollCapability poll = ConnectApi.ChatterFeeds.voteOnFeedElementPoll(null, '0D5D0000000XZaUKAW', '09AD000000000TKMAY');
```

ChatterFeeds Test Methods

The following are the test methods for ChatterFeeds. All methods are static.

For information about using these methods to test your ConnectApi code, see Testing ConnectApi Code.

IN THIS SECTION:

- `setTestGetFeedElementsFromFeed(communityId, feedType, result)`
  - Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the `getFeedElementsFromFeed` method with the same parameters or the code throws an exception.

- `setTestGetFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)`
  - Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the `getFeedElementsFromFeed` method with the same parameters or the code throws an exception.

- `setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)`
  - Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the `getFeedElementsFromFeed` method with the same parameters or the code throws an exception.

- `setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, result)`
  - Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the `getFeedElementsFromFeed` method with the same parameters or the code throws an exception.

- `setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, result)`
  - Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the `getFeedElementsFromFeed` method with the same parameters or the code throws an exception.

- `setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, result)`
  - Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the `getFeedElementsFromFeed` method with the same parameters or the code throws an exception.

- `setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, result)`
  - Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the `getFeedElementsFromFeed` method with the same parameters or the code throws an exception.

- `setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly, result)`
  - Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the `getFeedElementsFromFeed` method with the same parameters or the code throws an exception.
Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsFromFeed is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.getFeedElementsFromFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.getFeedElementsFromFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.getFeedElementsFromFilterFeed method is called in a test context. Use the method with the same parameters or the code throws an exception.

Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsFromFilterFeed method is called in a test context. Use the method with the same parameters or the code throws an exception.

Register a ConnectApi.FeedElementPage object to be returned when the matching getFeedElementsFromFilterFeed method is called in a test context. Use the method with the same parameters or the code throws an exception.

Register a ConnectApi.FeedElementPage object to be returned when the matching getFeedElementsFromFilterFeed method is called in a test context. Use the method with the same parameters or the code throws an exception.
setTestGetFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, result)
Register a ConnectApi.FeedElementPage object to be returned when the getFeedElementsFromFilterFeedUpdatedSince method is called in a test context.

setTestGetFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, result)
Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, filter, result)
Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, result)
Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)
Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, filter, result)
Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, filter, result)
Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, customFilter, result)
Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, customFilter, result)
Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, customFilter, result)
Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, customFilter, result)
Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRelatedPosts(communityId, feedElementId, filter, maxResults, result)
Register a ConnectApi.RelatedFeedPosts object to be returned when the matching ConnectApi.getRelatedPosts(communityId, feedElementId, filter, maxResults) method is called in a test context. Use the method with the same parameters or you receive an exception.
setTestGetTopUnansweredQuestions(communityId, result) (Pilot)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.getTopUnansweredQuestions method is called in a test context. Use the method with the same parameters
or you receive an exception.

setTestGetTopUnansweredQuestions(communityId, filter, result) (Pilot)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.getTopUnansweredQuestions method is called in a test context. Use the method with the same parameters
or you receive an exception.

setTestGetTopUnansweredQuestions(communityId, pageSize, result) (Pilot)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.getTopUnansweredQuestions method is called in a test context. Use the method with the same parameters
or you receive an exception.

setTestGetTopUnansweredQuestions(communityId, filter, pageSize, result) (Pilot)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.getTopUnansweredQuestions method is called in a test context. Use the method with the same parameters
or you receive an exception.

setTestSearchFeedElements(communityId, q, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElements method is called in a test context. Use the method with the same parameters or you
receive an exception.

setTestSearchFeedElements(communityId, q, sortParam, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElements method is called in a test context. Use the method with the same parameters or you
receive an exception.

setTestSearchFeedElements(communityId, q, threadedCommentsCollapsed, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElements method is called in a test context. Use the method with the same parameters or you
receive an exception.

setTestSearchFeedElements(communityId, q, pageParam, pageSize, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElements method is called in a test context. Use the method with the same parameters or you
receive an exception.

setTestSearchFeedElements(communityId, q, pageParam, pageSize, sortParam, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElements method is called in a test context. Use the method with the same parameters or you
receive an exception.

setTestSearchFeedElements(communityId, q, recentCommentCount, pageParam, pageSize, sortParam, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElements method is called in a test context. Use the method with the same parameters or you
receive an exception.
setTestSearchFeedElementsInFeed(communityId, feedType, q, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters
or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters
or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters
or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters
or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, q, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters
or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters
or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters
or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters
or the code throws an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, customFilter, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters
or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters
or you receive an exception.
setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, filter, result)

Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, customFilter, result)

Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.searchFeedElementsInFilterFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q, result)

Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.searchFeedElementsInFilterFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.searchFeedElementsInFilterFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchStreams(communityId, q, result)

Register a ConnectApi.ChatterStreamPage object to be returned when the matching ConnectApi.searchStream(communityId, q) method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchStreams(communityId, q, sortParam, result)

Register a ConnectApi.ChatterStreamPage object to be returned when the matching ConnectApi.searchStream(communityId, q, sortParam) method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchStreams(communityId, q, pageParam, pageSize, result)

Register a ConnectApi.ChatterStreamPage object to be returned when the matching ConnectApi.searchStreams(communityId, q, pageParam, pageSize) method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchStreams(communityId, q, pageParam, pageSize, sortParam, result)

Register a ConnectApi.ChatterStreamPage object to be returned when the matching ConnectApi.searchStreams(communityId, q, pageParam, pageSize, sortParam) method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchStreams(communityId, q, pageParam, pageSize, sortParam, globalScope, result)

Register a ConnectApi.ChatterStreamPage object to be returned when the matching ConnectApi.searchStreams(communityId, q, pageParam, pageSize, sortParam, globalScope) method is called in a test context. Use the method with the same parameters or you receive an exception.
setTestGetFeedElementsFromFeed(communityId, feedType, result)

Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version
31.0

Signature
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, ConnectApi.FeedElementPage result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Type of feed. Valid values are Company, DirectMessageModeration, DirectMessages, Home, Moderation, and PendingReview.

result
Type: ConnectApi.FeedElementPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getFeedElementsFromFeed(communityId, feedType)

setTestGetFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)

Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version
31.0
Signature

public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
The only valid value for this parameter is Company.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
If you pass in null, the default value CreatedDateDesc is used.

result
Type: ConnectApi.FeedElementPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)
**setTestGetFeedElementsFromFeed**

`setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

**API Version**

31.0

**Signature**

```java
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrders sortParam, ConnectApi.FeedElementPage result)
```

**Parameters**

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **feedType**
  - Type: `ConnectApi.FeedType`
  - Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

- **recentCommentCount**
  - Type: `Integer`
  - Maximum number of comments to return with each feed element. The default value is 3.

- **density**
  - Type: `ConnectApi.FeedDensity`
  - Specify the amount of content in a feed.
    - `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
    - `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

- **pageParam**
  - Type: `String`
  - Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

- **pageSize**
  - Type: `Integer`
  - Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

- **sortParam**
  - Type: `ConnectApi.FeedSortOrder`
  - Values are:
• CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
• CreatedDateDesc—Sorts by most recent creation date.
• LastModifiedDateDesc—Sorts by most recent activity.
• MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
• Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in `null`, the default value CreatedDateDesc is used.

result
 Type: ConnectApi.FeedElementPage
 Object containing test data.

Return Value
 Type: Void

SEE ALSO:
- `getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)`

`setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, result)`

Register a ConnectApi.FeedElementPage object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version
32.0

Signature

`public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)`

Parameters

- `communityId`
  Type: String
  ID for an Experience Cloud site, internal, or `null`.

- `feedType`
  Type: ConnectApi.FeedType
  The type of feed. The only valid value is Home.
recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
If you pass in null, the default value CreatedDateDesc is used.

filter
Type: ConnectApi.FeedFilter
Specifies the feed filters.
- AllQuestions—Feed elements that are questions.
- AuthoredBy—Feed elements authored by the user profile owner. This value is valid only for the UserProfile feed.
- CommunityScoped—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the UserProfile feed.
- QuestionsWithCandidateAnswers—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- QuestionsWithCandidateAnswersReviewedPublished—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Read**—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the Record feed of a group.
- **SolvedQuestions**—Feed elements that are questions and that have a best answer.
- **UnansweredQuestions**—Feed elements that are questions and that don’t have any answers.
- **UnansweredQuestionsWithCandidateAnswers**—Feed elements that are questions that don’t have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Unread**—Feed elements that are created in the past 30 days and aren’t marked as read for the context user. This value is valid only for the Record feed of a group.
- **UnsolvedQuestions**—Feed elements that are questions and that don’t have a best answer.

`result`

Type: `ConnectApi.FeedElementPage`  
Object containing test data.

**Return Value**

Type: `Void`

**SEE ALSO:**  
`getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter)`  
*Apex Developer Guide: Testing ConnectApi Code*

`setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getFeedElementsFromFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

44.0

**Signature**

```java
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter, Boolean threadedCommentsCollapsed, ConnectApi.FeedElementPage result)
```

**Parameters**

- `communityId`
  
  Type: `String`  
  ID for an Experience Cloud site, `internal`, or `null`.  

667
**feedType**
Type: `ConnectApi.FeedType`
The type of feed. The only valid value is `Home`.

**recentCommentCount**
Type: `Integer`
Maximum number of comments to return with each feed item. The default value is 3.

**density**
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
Type: `ConnectApi.FeedSortOrder`
Values are:
- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.
If you pass in `null`, the default value `CreatedDateDesc` is used.

**filter**
Type: `ConnectApi.FeedFilter`
Specifies the feed filters.
- **AllQuestions**—Feed elements that are questions.
- **AuthoredBy**—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- **CommunityScoped**—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a `User` or a `Group` parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- **QuestionsWithCandidateAnswers**—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
• QuestionsWithCandidateAnswersReviewedPublished—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.

• Read—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the Record feed of a group.

• SolvedQuestions—Feed elements that are questions and that have a best answer.

• UnansweredQuestions—Feed elements that are questions and that don’t have any answers.

• UnansweredQuestionsWithCandidateAnswers—Feed elements that are questions that don’t have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.

• Unread—Feed elements that are created in the past 30 days and aren’t marked as read for the context user. This value is valid only for the Record feed of a group.

• UnsolvedQuestions—Feed elements that are questions and that don’t have a best answer.

threadedCommentsCollapsed
Type: Boolean
Specifies whether to return threaded comments in a collapsed style (true) or not (false). If you pass in null, the default is false.

result
Type: ConnectApi.FeedElementPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed)

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, result)
Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version
31.0

Signature
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, ConnectApi.FeedElementPage result)
Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`feedType`
Type: `ConnectApi.FeedType`
The feed type.

`subjectId`
Type: `String`
ID of the context user or the alias `me`.

`result`
Type: `ConnectApi.FeedElementPage`
Object containing test data.

Return Value
Type: `Void`

- `getFeedElementsFromFeed(communityId, feedType, subjectId)`

`setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, result)`
Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version
31.0

Signature
```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`feedType`
Type: `ConnectApi.FeedType`
Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.

`subjectId`

Type: String

If `feedType` is Record, `subjectId` can be any record ID, including a group ID. If `feedType` is Streams, `subjectId` must be a stream ID. If `feedType` is Topics, `subjectId` must be a topic ID. If `feedType` is UserProfile, `subjectId` can be any user ID. If the `feedType` is any other value, `subjectId` must be the ID of the context user or the alias `me`.

`pageParam`

Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in null, the first page is returned.

`pageSize`

Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

`sortParam`

Type: ConnectApi.FeedSortOrder

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- `Relevance`—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value `CreatedDateDesc` is used.

`result`

Type: ConnectApi.FeedElementPage

Object containing test data.

Return Value

Type: Void

SEE ALSO:

- `getFeedElementsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam)`
- *Apex Developer Guide: Testing ConnectApi Code*

`setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.
API Version
31.0

Signature
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)

Parameters
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

feedType
  Type: ConnectApi.FeedType
  Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.

subjectId
  Type: String
  If feedType is Record, subjectId can be any record ID, including a group ID. If feedType is Streams, subjectId must be a stream ID. If feedType is Topics, subjectId must be a topic ID. If feedType is UserProfile, subjectId can be any user ID. If the feedType is any other value, subjectId must be the ID of the context user or the alias me.

recentCommentCount
  Type: Integer
  Maximum number of comments to return with each feed element. The default value is 3.

density
  Type: ConnectApi.FeedDensity
  Specify the amount of content in a feed.
  - AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
  - FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
  Type: String
  Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
  Type: Integer
  Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
  Type: ConnectApi.FeedSortOrder
Values are:

- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in `null`, the default value CreatedDateDesc is used.

`result`

Type: `ConnectApi.FeedElementPage`

Object containing test data.

**Return Value**

Type: Void

**SEE ALSO:**

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam)

**setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly, result)**

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

**API Version**

31.0

**Signature**

```java
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedElementPage result)
```

**Parameters**

- **communityId**
  
  Type: `String`
  
  ID for an Experience Cloud site, internal, or `null`.

- **feedType**
  
  Type: `ConnectApi.FeedType`
Value must be `ConnectApi.FeedType.Record`.

**subjectId**
Type: `String`
Any record ID, including a group ID.

**recentCommentCount**
Type: `Integer`
Maximum number of comments to return with each feed item. The default value is 3.

**density**
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
Type: `ConnectApi.FeedSortOrder`
Values are:
- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

**showInternalOnly**
Type: `Boolean`
Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

**result**
Type: `ConnectApi.FeedElementPage`
Object containing test data.
Return Value
Type: Void

SEE ALSO:
- getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, result)

Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsFromFeed is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
35.0

Signature
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Value must be ConnectApi.FeedType.UserProfile.

subjectId
Type: String
ID of any user. To specify the context user, use the user ID or the alias me.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
• FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**

Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

**pageSize**

Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

**sortParam**

Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

**filter**

Type: ConnectApi.FeedFilter

Value must be ConnectApi.FeedFilter.CommunityScoped. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out. Currently, feed elements scoped to sites have a User or a Group parent record. However, other parent record types could be scoped to sites in the future.

**result**

Type: ConnectApi.FeedElementPage

Object containing test data.

**Return Value**

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter)

*Apex Developer Guide: Testing ConnectApi Code*
setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getFeedElementsFromFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

44.0

**Signature**

public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter, Boolean threadedCommentsCollapsed, ConnectApi.FeedElementPage result)
```

**Parameters**

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **feedType**
  - Type: `ConnectApi.FeedType`
  - Value must be `ConnectApi.FeedType.UserProfile`.

- **subjectId**
  - Type: `String`
  - ID of any user. To specify the context user, use the user ID or the alias `me`.

- **recentCommentCount**
  - Type: `Integer`
  - Maximum number of comments to return with each feed element. The default value is 3.

- **density**
  - Type: `ConnectApi.FeedDensity`
  - Specify the amount of content in a feed.
    - `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
    - `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

- **pageParam**
  - Type: `String`
  - Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.
**pageSize**
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

**sortParam**
Type: `ConnectApi.FeedSortOrder`
Values are:
- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the `ConnectApi.FeedFilter` is UnansweredQuestions.
- **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value **CreatedDateDesc** is used.

**filter**
Type: `ConnectApi.FeedFilter`
Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out. Currently, feed elements scoped to sites have a User or a Group parent record. However, other parent record types could be scoped to sites in the future.

**threadedCommentsCollapsed**
Type: Boolean
Specifies whether to return threaded comments in a collapsed style (true) or not (false). If you pass in null, the default is false.

**result**
Type: `ConnectApi.FeedElementPage`
Object containing test data.

**Return Value**
Type: Void

**SEE ALSO:**
* `getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed)`

```java
setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, customFilter, result)
```

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the `get feed` method with the same parameters or the code throws an exception.
API Version

40.0

Signature

```java
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String customFilter, ConnectApi.FeedElementPage result)
```

Parameters

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **feedType**
  - Type: ConnectApi.FeedType
  - Value must be ConnectApi.FeedType.Record.

- **subjectId**
  - Type: String
  - The ID of a case.

- **recentCommentCount**
  - Type: Integer
  - Maximum number of comments to return with each feed element. The default value is 3.

- **density**
  - Type: ConnectApi.FeedDensity
  - Specify the amount of content in a feed.
    - AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
    - FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

- **pageParam**
  - Type: String
  - Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

- **pageSize**
  - Type: Integer
  - Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

- **sortParam**
  - Type: ConnectApi.FeedSortOrder
  - Values are:
    - CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in **null**, the default value CreatedDateDesc is used.

`customFilter`

Type: **String**

Custom filter that applies only to the case feed. See `customFeedFilter` in the *Metadata API Developer Guide* for supported values.

`result`

Type: **ConnectApi.FeedElementPage**

Object containing test data.

**Return Value**

Type: Void

SEE ALSO:

- `getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, customFilter)`
- *Apex Developer Guide: Testing ConnectApi Code*

`setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

**API Version**

31.0

**Signature**

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrdersortParam, Boolean showInternalOnly, ConnectApi.FeedElementPage result)
```

**Parameters**

`communityId`

Type: **String**

ID for an Experience Cloud site, internal, or **null**.
**feedType**
Type: `ConnectApi.FeedType`
Value must be `ConnectApi.FeedType.Record`.

**subjectId**
Type: `String`
Any record ID, including a group ID.

**recentCommentCount**
Type: `Integer`
Maximum number of comments to return with each feed item. The default value is 3.

**elementsPerBundle**
Type: `Integer`
Maximum number of feed elements per bundle. The default and maximum value is 10.

**density**
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
Type: `ConnectApi.FeedSortOrder`
Values are:
- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.
If you pass in `null`, the default value `CreatedDateDesc` is used.

**showInternalOnly**
Type: `Boolean`
Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`. 
result

Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

- `getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly)`

```java
public static void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```java
public static void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, `internal`, or `null`.

- `feedType`
  Type: `ConnectApi.FeedType`
  Value must be `ConnectApi.FeedType.Record`.

- `subjectId`
  Type: `String`
  Any record ID, including a group ID.

- `recentCommentCount`
  Type: `Integer`
  Maximum number of comments to return with each feed item. The default value is 3.
elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
If you pass in null, the default value CreatedDateDesc is used.

showInternalOnly
Type: Boolean
Specifies whether to show only feed items from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

filter
Type: ConnectApi.FeedFilter
Specifies the feed filters.
- AllQuestions—Feed elements that are questions.
- AuthoredBy—Feed elements authored by the user profile owner. This value is valid only for the UserProfile feed.
- CommunityScoped—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the UserProfile feed.
ChatterFeeds Class

- **QuestionsWithCandidateAnswers**—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **QuestionsWithCandidateAnswersReviewedPublished**—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Read**—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the Record feed of a group.
- **SolvedQuestions**—Feed elements that are questions and that have a best answer.
- **UnansweredQuestions**—Feed elements that are questions and that don’t have any answers.
- **UnansweredQuestionsWithCandidateAnswers**—Feed elements that are questions that don’t have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Unread**—Feed elements that are created in the past 30 days and aren’t marked as read for the context user. This value is valid only for the Record feed of a group.
- **UnsolvedQuestions**—Feed elements that are questions and that don’t have a best answer.

result

Type: `ConnectApi.FeedElementPage`

Object containing test data.

**Return Value**

Type: Void

`setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter, threadedCommentsCollapsed, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

**API Version**

44.0

**Signature**

```java
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedFilter filter, Boolean threadedCommentsCollapsed, ConnectApi.FeedElementPage result)
```
Parameters

`communityId`  
Type: String  
ID for an Experience Cloud site, internal, or null.

`feedType`  
Type: `ConnectApi.FeedType`  
Value must be `ConnectApi.FeedType.Record`.

`subjectId`  
Type: String  
Any record ID, including a group ID.

`recentCommentCount`  
Type: Integer  
Maximum number of comments to return with each feed item. The default value is 3.

`elementsPerBundle`  
Type: Integer  
Maximum number of feed elements per bundle. The default and maximum value is 10.

`density`  
Type: `ConnectApi.FeedDensity`  
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`  
Type: String  
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

`pageSize`  
Type: Integer  
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

`sortParam`  
Type: `ConnectApi.FeedSortOrder`  
Values are:
- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
If you pass in `null`, the default value `CreatedDateDesc` is used.

`showInternalOnly`
- **Type:** `Boolean`
- Specifies whether to show only feed items from internal (non-Experience Cloud site) users (true), or not (false). The default value is `false`.

`filter`
- **Type:** `ConnectApi.FeedFilter`
- Specifies the feed filters.
  - `AllQuestions` — Feed elements that are questions.
  - `AuthoredBy` — Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
  - `CommunityScoped` — Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
  - `QuestionsWithCandidateAnswers` — Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
  - `QuestionsWithCandidateAnswersReviewedPublished` — Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
  - `Read` — Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
  - `SolvedQuestions` — Feed elements that are questions and that have a best answer.
  - `UnansweredQuestions` — Feed elements that are questions and that don’t have any answers.
  - `UnansweredQuestionsWithCandidateAnswers` — Feed elements that are questions that don’t have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
  - `Unread` — Feed elements that are created in the past 30 days and aren’t marked as read for the context user. This value is valid only for the `Record` feed of a group.
  - `UnsolvedQuestions` — Feed elements that are questions and that don’t have a best answer.

`threadedCommentsCollapsed`
- **Type:** `Boolean`
- Specifies whether to return threaded comments in a collapsed style (true) or not (false). If you pass in `null`, the default is `false`.

`result`
- **Type:** `ConnectApi.FeedElementPage`
- Object containing test data.
Return Value

Type: Void

SEE ALSO:

`getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter, threadedCommentsCollapsed)`

*Apex Developer Guide: Testing ConnectApi Code*

**setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, customFilter, result)**

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

**API Version**

40.0

**Signature**

```java
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, String customFilter, ConnectApi.FeedElementPage result)
```

**Parameters**

- `communityId`  
  Type: String  
  ID for an Experience Cloud site, internal, or null.

- `feedType`  
  Type: `ConnectApi.FeedType`  
  Value must be `ConnectApi.FeedType.Record`.

- `subjectId`  
  Type: String  
  The ID of a case.

- `recentCommentCount`  
  Type: Integer  
  Maximum number of comments to return with each feed item. The default value is 3.

- `elementsPerBundle`  
  Type: Integer  
  Maximum number of feed elements per bundle. The default and maximum value is 10.
density
  Type: ConnectApi.FeedDensity
  Specify the amount of content in a feed.
  • AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
  • FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
  Type: String
  Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
  Type: Integer
  Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
  Type: ConnectApi.FeedSortOrder
  Values are:
  • CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
  • CreatedDateDesc—Sorts by most recent creation date.
  • LastModifiedDateDesc—Sorts by most recent activity.
  • MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
  • Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
  If you pass in null, the default value CreatedDateDesc is used.

showInternalOnly
  Type: Boolean
  Specifies whether to show only feed items from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

customFilter
  Type: String
  Custom filter that applies only to the case feed. See customFeedFilter in the Metadata API Developer Guide for supported values.

result
  Type: ConnectApi.FeedElementPage
  Object containing test data.
Return Value
Type: Void

SEE ALSO:
getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, customFilter)

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, customFilter, threadedCommentsCollapsed, result)

Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.getFeedElementsFromFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
44.0

Signature
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, String customFilter, Boolean threadedCommentsCollapsed, ConnectApi.FeedElementPage result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Value must be ConnectApi.FeedType.Record.

subjectId
Type: String
The ID of a case.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.
density
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- Relevance—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.
If you pass in `null`, the default value `CreateDateDesc` is used.

showInternalOnly
Type: `Boolean`
Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

customFilter
Type: `String`
Custom filter that applies only to the case feed. See `customFeedFilter` in the `Metadata API Developer Guide` for supported values.

threadedCommentsCollapsed
Type: `Boolean`
Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

result
Type: `ConnectApi.FeedElementPage`
Object containing test data.
Return Value
Type: Void

SEE ALSO:

`getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, customFilter, threadedCommentsCollapsed)`

`setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, result)`

A `ConnectApi.FeedElementPage` object to be returned when the matching `getFeedElementsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version
31.0

Signature

```java
public static Void setTestGetFeedElementsFromFilterFeed(String communityId, String subjectId, String keyPrefix, ConnectApi.FeedElementPage result)
```

Parameters

- `communityId` Type: `String`
  
  ID for an Experience Cloud site, `internal`, or `null`.

- `subjectId` Type: `String`
  
  ID of the context user or the alias `me`.

- `keyPrefix` Type: `String`
  
  A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

- `result` Type: `ConnectApi.FeedElementPage`
  
  Object containing test data.
Return Value

Type: Void

SEE ALSO:
- `getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix)`
  *Apex Developer Guide: Testing ConnectApi Code*

`setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `getFeedElementsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```java
public static Void setTestGetFeedElementsFromFilterFeed(String communityId, String subjectId, String keyPrefix, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, `internal`, or `null`.

- **subjectId**
  - Type: `String`
  - ID of the context user or the alias `me`.

- **keyPrefix**
  - Type: `String`
  - A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of `005` and Group objects have a prefix of `0F9`.

- **pageParam**
  - Type: `String`
  - Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

- **pageSize**
  - Type: `Integer`
  - Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

- **sortParam**
  - Type: `ConnectApi.FeedSortOrder`
Values are:

- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in `null`, the default value CreatedDateDesc is used.

```java
result
Type: ConnectApi.FeedElementPage
Object containing test data.
```

Return Value

Type: Void

SEE ALSO:

- `getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam)`
- *Apex Developer Guide: Testing ConnectApi Code*

```java
setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, result)
```

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `getFeedElementsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```java
public static Void setTestGetFeedElementsFromFilterFeed(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or null.

- **subjectId**
  Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
• AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
• FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
• CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
• CreatedDateDesc—Sorts by most recent creation date.
• LastModifiedDateDesc—Sorts by most recent activity.
• MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
• Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
If you pass in null, the default value CreatedDateDesc is used.

result
Type: ConnectApi.FeedElementPage
Object containing test data.
Return Value
Type: Void

SEE ALSO:
getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam)

setTestGetFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, result)

Register a ConnectApi.FeedElementPage object to be returned when the getFeedElementsFromFilterFeedUpdatedSince method is called in a test context.

API Version
31.0

Signature
public static Void setTestGetFeedElementsFromFilterFeedUpdatedSince(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedElementPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.
Density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
  • AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
  • FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

PageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

PageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

UpdatedSince
Type: String
Opaque token defining the modification timestamp of the feed and the sort order.
The updatedSince parameter doesn’t return feed elements that are created in the same second as the call.

Result
Type: ConnectApi.FeedElementPage
Object containing test data.

Return Value
Type: Void

See Also:

Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
31.0
Signature

```java
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedElementPage result)
```

Parameters

**communityId**
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

**feedType**
Type: `ConnectApi.FeedType`
Type of feed. Valid values are `Company`, `DirectMessageModeration`, `Home`, `Moderation`, and `PendingReview`.

**recentCommentCount**
Type: `Integer`
Maximum number of comments to return with each feed element. The default value is 3.

**density**
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**updatedSince**
Type: `String`
An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The `updatedSince` parameter doesn’t return feed elements that are created in the same second as the call.

**result**
Type: `ConnectApi.FeedElementPage`
Object containing test data.
Return Value
Type: Void

SEE ALSO:
getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince)

setTestGetFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, filter, result)

Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
32.0

Signature
public static Void setTestGetFeedElementsUpdatedSince(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Type of feed. Valid values are Company, DirectMessageModeration, DirectMessages, Home, Moderation, and PendingReview.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.

• AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
• FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

### pageSize
Type: `Integer`

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

### updatedSince
Type: `String`

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body. The `updatedSince` parameter doesn’t return feed elements that are created in the same second as the call.

### filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- **AllQuestions**—Feed elements that are questions.
- **AuthoredBy**—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- **CommunityScoped**—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- **QuestionsWithCandidateAnswers**—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **QuestionsWithCandidateAnswersReviewedPublished**—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Read**—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- **SolvedQuestions**—Feed elements that are questions and that have a best answer.
- **UnansweredQuestions**—Feed elements that are questions and that don’t have any answers.
- **UnansweredQuestionsWithCandidateAnswers**—Feed elements that are questions that don’t have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Unread**—Feed elements that are created in the past 30 days and aren’t marked as read for the context user. This value is valid only for the `Record` feed of a group.
- **UnsolvedQuestions**—Feed elements that are questions and that don’t have a best answer.

### result
Type: `ConnectApi.FeedElementPage`

Object containing test data.
Return Value
Type: Void

SEE ALSO:
getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, filter)

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, result)

Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
31.0

Signature
public static Void setTestGetFeedElementsUpdatedSince(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedElementPage result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
One of these values:
• Files
• Groups
• News
• People
• Record

subjectId
Type: String
If feedType is ConnectApi.Record, subjectId can be any record ID, including a group ID. Otherwise, it must be the context user or the alias me.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.
density
    Type: ConnectApi.FeedDensity
    Specify the amount of content in a feed.
    • AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
    • FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
    Type: String
    Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
    Type: Integer
    Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

updatedSince
    Type: String
    An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the updatesToken property of the ConnectApi.FeedElementPage response body.
    The updatedSince parameter doesn’t return feed elements that are created in the same second as the call.

result
    Type: ConnectApi.FeedElementPage
    Object containing test data.

Return Value
    Type: Void

SEE ALSO:

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)
    Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
    31.0
public static Void setTestGetFeedElementsUpdatedSince(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, Boolean showInternalOnly, ConnectApi.FeedElementPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Value must be ConnectApi.FeedType.Record.

subjectId
Type: String
Any record ID, including a group ID.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

updatedSince
Type: String
An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the updatesToken property of the ConnectApi.FeedElementPage response body.

The updatedSince parameter doesn’t return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean
Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

result
Type: ConnectApi.FeedElementPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, filter, result)
Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
35.0

Signature
public static Void setTestGetFeedElementsUpdatedSince(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Value must be ConnectApi.FeedType.UserProfile.

subjectId
Type: String
ID of any user. To specify the context user, use the user ID or the alias me.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
   Type: Integer
   Maximum number of feed elements per bundle. The default and maximum value is 10.

density
   Type: ConnectApi.FeedDensity
   Specify the amount of content in a feed.
   - AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
   - FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
   Type: String
   Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
   Type: Integer
   Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

updatedSince
   Type: String
   Opaque token defining the modification timestamp of the feed and the sort order.
   The updatedSince parameter doesn’t return feed elements that are created in the same second as the call.

filter
   Type: ConnectApi.FeedFilter
   Value must be ConnectApi.FeedFilter.CommunityScoped. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out. Currently, feed elements scoped to sites have a User or a Group parent record. However, other parent record types could be scoped to sites in the future.

result
   Type: ConnectApi.FeedElementPage
   Object containing test data.

Return Value
   Type: Void

SEE ALSO:
   getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, filter)
setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, customFilter, result)

Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
40.0

Signature
public static Void setTestGetFeedElementsUpdatedSince(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, String customFilter, ConnectApi.FeedElementPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Value must be ConnectApi.FeedType.Record.

subjectId
Type: String
The ID of a case.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

updatedSince
Type: String
Opaque token defining the modification timestamp of the feed and the sort order.
The updatedSince parameter doesn’t return feed elements that are created in the same second as the call.

customFilter
Type: String
Custom filter that applies only to the case feed. See customFeedFilter in the Metadata API Developer Guide for supported values.

result
Type: ConnectApi.FeedElementPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, customFilter)

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, result)

Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
31.0

Signature
public static Void setTestGetFeedElementsUpdatedSince(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, Boolean showInternalOnly, ConnectApi.FeedElementPage result)
Parameters

*communityId*
  Type: String
  ID for an Experience Cloud site, internal, or null.

*feedType*
  Type: `ConnectApi.FeedType`
  Value must be `ConnectApi.FeedType.Record`.

*subjectId*
  Type: String
  Any record ID, including a group ID.

*recentCommentCount*
  Type: Integer
  Maximum number of comments to return with each feed element. The default value is 3.

*elementsPerBundle*
  Type: Integer
  Maximum number of feed elements per bundle. The default and maximum value is 10.

*density*
  Type: `ConnectApi.FeedDensity`
  Specify the amount of content in a feed.
  - AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
  - FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

*pageParam*
  Type: String
  Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

*pageSize*
  Type: Integer
  Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

*updatedSince*
  Type: String
  An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the updatesToken property of the `ConnectApi.FeedElementPage` response body.
  
  The *updatedSince* parameter doesn’t return feed elements that are created in the same second as the call.

*showInternalOnly*
  Type: Boolean
  Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

*result*
  Type: `ConnectApi.FeedElementPage`
Object containing test data.

**Return Value**
Type: Void

SEE ALSO:
- `getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly)`
- *Apex Developer Guide: Testing ConnectApi Code*

### setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

**API Version**
32.0

**Signature**
```
public static Void setTestGetFeedElementsUpdatedSince(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, Boolean showInternalOnly, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

**Parameters**
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or null.
- `feedType`
  Type: `ConnectApi.FeedType`
  Value must be `ConnectApi.FeedType.Record`.
- `subjectId`
  Type: `String`
  Any record ID, including a group ID.
- `recentCommentCount`
  Type: `Integer`
  Maximum number of comments to return with each feed element. The default value is 3.
- `elementsPerBundle`
  Type: `Integer`
Maximum number of feed elements per bundle. The default and maximum value is 10.

**density**
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**updatedSince**
Type: `String`
An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The `updatedSince` parameter doesn’t return feed elements that are created in the same second as the call.

**showInternalOnly**
Type: `Boolean`
Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

**filter**
Type: `ConnectApi.FeedFilter`
Specifies the feed filters.
- **AllQuestions**—Feed elements that are questions.
- **AuthoredBy**—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- **CommunityScoped**—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- **QuestionsWithCandidateAnswers**—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **QuestionsWithCandidateAnswersReviewedPublished**—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Read**—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- **SolvedQuestions**—Feed elements that are questions and that have a best answer.
- **UnansweredQuestions**—Feed elements that are questions and that don’t have any answers.
• UnansweredQuestionsWithCandidateAnswers—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
• Unread—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the Record feed of a group.
• UnsolvedQuestions—Feed elements that are questions and that don't have a best answer.

result
Type: ConnectApi.FeedElementPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, filter)

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, customFilter, result)

Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
40.0

Signature
public static Void setTestGetFeedElementsUpdatedSince(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, Boolean showInternalOnly, String customFilter, ConnectApi.FeedElementPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Value must be ConnectApi.FeedType.Record.
subjectId
Type: String
The ID of a case.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer
Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

customFilter
Type: String
Custom filter that applies only to the case feed. See customFeedFilter in the Metadata API Developer Guide for supported values.

result
Type: ConnectApi.FeedElementPage
Object containing test data.
Return Value
Type: Void

SEE ALSO:
getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, customFilter)

callTestGetRelatedPosts(communityId, feedElementId, filter, maxResults, result)

Register a ConnectApi.RelatedFeedPosts object to be returned when the matching
ConnectApi.getRelatedPosts(communityId, feedElementId, filter, maxResults) method is called
in a test context. Use the method with the same parameters or you receive an exception.

API Version
37.0

Signature
public static Void callTestGetRelatedPosts(String communityId, String feedElementId,
ConnectApi.RelatedFeedPostType filter, Integer maxResults, ConnectApi.RelatedFeedPosts
result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element. The feed element must be a question.

filter
Type: ConnectApi.RelatedFeedPostType
Specifies the type of related feed post. Values are:

• Answered—Related questions that have at least one answer.
• BestAnswer—Related questions that have a best answer.
• Generic—All types of related questions, including answered, with a best answer, and unanswered.
• Unanswered—Related questions that don’t have answers.

Generic is the default value.

maxResults
Type: Integer
The maximum number of results to return. You can return up to 25 results; 5 is the default.
result
Type: ConnectApi.RelatedFeedPosts
Object containing test data.
In version 37.0 and later, related feed posts are questions.

Return Value
Type: Void

**setTestGetTopUnansweredQuestions(communityId, result) (Pilot)**

Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.getTopUnansweredQuestions method is called in a test context. Use the method with the same parameters or you receive an exception.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

**API Version**

42.0

**Signature**

public static Void setTestGetTopUnansweredQuestions(String communityId, ConnectApi.FeedElementPage result)

**Parameters**

`communityId`
Type: String
ID of the Experience Cloud site.

`result`
Type: ConnectApi.FeedElementPage
Object containing test data.

**Return Value**

Type: Void

**SEE ALSO:**

getTopUnansweredQuestions(communityId) (Pilot)
**setTestGetTopUnansweredQuestions(communityId, filter, result) (Pilot)**

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getTopUnansweredQuestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

**Note:** We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

**API Version**

42.0

**Signature**

```
public static Void setTestGetTopUnansweredQuestions(String communityId, 
ConnectApi.TopUnansweredQuestionsFilterType filter, ConnectApi.FeedElementPage result)
```

**Parameters**

- `communityId`
  - Type: String
  - ID of the Experience Cloud site.

- `filter`
  - Type: `ConnectApi.FeedFilter`
  - Specifies the filter for the feed. `UnansweredQuestionsWithCandidateAnswers` is the only valid value.

- `result`
  - Type: `ConnectApi.FeedElementPage`
  - Object containing test data.

**Return Value**

Type: Void

**SEE ALSO:**

- `getTopUnansweredQuestions(communityId, filter)` (Pilot)
- *Apex Developer Guide: Testing ConnectApi Code*

**setTestGetTopUnansweredQuestions(communityId, pageSize, result) (Pilot)**

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getTopUnansweredQuestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

**Note:** We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.
API Version
42.0

Signature
public static Void setTestGetTopUnansweredQuestions(String communityId, Integer pageSize, ConnectApi.FeedElementPage result)

Parameters

communityId
Type: String
ID of the Experience Cloud site.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 0 through 10. If you pass in null, the default size is 5.

result
Type: ConnectApi.FeedElementPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getTopUnansweredQuestions(communityId, pageSize) (Pilot)

setTestGetTopUnansweredQuestions(communityId, filter, pageSize, result) (Pilot)
Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.getTopUnansweredQuestions method is called in a test context. Use the method with the same parameters or you receive an exception.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version
42.0

Signature
public static Void setTestGetTopUnansweredQuestions(String communityId, ConnectApi.FeedFilter filter, Integer pageSize, ConnectApi.FeedElementPage result)
Parameters

`communityId`
Type: `String`
ID of the Experience Cloud site.

`filter`
Type: `ConnectApi.FeedFilter`
Specifies the filter for the feed. `UnansweredQuestionsWithCandidateAnswers` is the only valid value.

`pageSize`
Type: `Integer`
Specifies the number of items per page. Valid values are from 0 through 10. If you pass in `null`, the default size is 5.

`result`
Type: `ConnectApi.FeedElementPage`
Object containing test data.

Return Value
Type: Void

SEE ALSO:
- `getTopUnansweredQuestions(communityId, filter, pageSize)` (Pilot)

`setTestSearchFeedElements(communityId, q, result)`
Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
31.0

Signature

```java
public static Void setTestSearchFeedElements(String communityId, String q, ConnectApi.FeedElementPage result)
```

Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`q`
Type: `String`
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: ConnectApi.FeedElementPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
searchFeedElements(communityId, q)

setTestSearchFeedElements(communityId, q, sortParam, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.searchFeedElements method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
31.0

Signature
public static Void setTestSearchFeedElements(String communityId, String q, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
• CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
• CreatedDateDesc—Sorts by most recent creation date.
• LastModifiedDateDesc—Sorts by most recent activity.
MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.

Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in `null`, the default value CreatedDateDesc is used.

**result**

Type: `ConnectApi.FeedElementPage`

Object containing test data.

**Return Value**

Type: Void

**SEE ALSO:**

`searchFeedElements(communityId, q, sortParam)`

### setTestSearchFeedElements(communityId, q, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

44.0

**Signature**

```java
public static Void setTestSearchFeedElements(String communityId, String q, Boolean threadedCommentsCollapsed, ConnectApi.FeedElementPage result)
```

**Parameters**

- `communityId`
  
  Type: `String`
  
  ID for an Experience Cloud site, internal, or `null`.

- `q`
  
  Type: `String`
  
  Required and can’t be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

- `threadedCommentsCollapsed`
  
  Type: `Boolean`
  
  Specifies whether to return threaded comments in a collapsed style (true) or not (false). If you pass in `null`, the default is `false`.

- `result`
  
  Type: `ConnectApi.FeedElementPage`
Object containing test data.

**Return Value**
Type: Void

SEE ALSO:
- `searchFeedElements(communityId, q, threadedCommentsCollapsed)`
- *Apex Developer Guide: Testing ConnectApi Code*

```java
public static Void setTestSearchFeedElements(String communityId, String q, String pageParam, Integer pageSize, ConnectApi.FeedElementPage result)
```

**Parameters**

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.

- `q`
  Type: `String`
  Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See *Wildcards*.

- `pageParam`
  Type: `String`
  Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

- `pageSize`
  Type: `Integer`
  Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

- `result`
  Type: `ConnectApi.FeedElementPage`
  Object containing test data.
Return Value
Type: Void

SEE ALSO:
searchFeedElements(communityId, q, pageParam, pageSize)

setTestSearchFeedElements(communityId, q, pageParam, pageSize, sortParam, result)

Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElements method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
31.0

Signature
public static Void setTestSearchFeedElements(String communityId, String q, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
• CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
• CreatedDateDesc—Sorts by most recent creation date.
• LastModifiedDateDesc—Sorts by most recent activity.
• MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
• Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

Register a `ConnectApi.FeedElementPage` object to be returned when the matching
`ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters
or you receive an exception.

API Version

31.0

Signature

```java
public static Void setTestSearchFeedElementsInFeed(String communityId,
        ConnectApi.FeedType feedType, String pageParam, Integer pageSize,
        ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)
```
Parameters

`communityId`
Type: String
ID for an Experience Cloud site, internal, or null.

`feedType`
Type: `ConnectApi.FeedType`
Type of feed. Valid values are Company, DirectMessageModeration, Home, Moderation, and PendingReview.

`pageParam`
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

`pageSize`
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`
Values are:
- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for Home feeds when the `ConnectApi.FeedFilter` is UnansweredQuestions.
- `Relevance`—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value `CreatedDateDesc` is used.

`q`
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`result`
Type: `ConnectApi.FeedElementPage`
Object containing test data.

Return Value
Type: Void

SEE ALSO:
s`earchFeedElementsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q)`

*Apex Developer Guide: Testing ConnectApi Code*
`setTestSearchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

31.0

**Signature**

```java
public static Void setTestSearchFeedElementsInFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)
```

**Parameters**

- `communityId`
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- `feedType`
  - Type: `ConnectApi.FeedType`
  - Type of feed. Valid values are Company, DirectMessageModeration, Home, Moderation, and PendingReview.

- `recentCommentCount`
  - Type: Integer
  - Maximum number of comments to return with each feed element. The default value is 3.

- `density`
  - Type: `ConnectApi.FeedDensity`
  - Specify the amount of content in a feed.
    - AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
    - FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

- `pageParam`
  - Type: String
  - Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

- `pageSize`
  - Type: Integer
  - Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

- `sortParam`
  - Type: `ConnectApi.FeedSortOrder`
Values are:

- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`q`

Type: **String**

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

`result`

Type: **ConnectApi.FeedElementPage**

Object containing test data.

**Return Value**

Type: Void

**SEE ALSO:**

**setTestSearchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter, result)**

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

32.0

**Signature**

```java
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q,
ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```
Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`feedType`
Type: `ConnectApi.FeedType`
The type of feed. The only valid value is `Home`.

`recentCommentCount`
Type: `Integer`
Maximum number of comments to return with each feed element. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`
Values are:
- `CreateDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreateDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.
If you pass in `null`, the default value `CreateDateDesc` is used.

`q`
Type: `String`
Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`filter`
Type: `ConnectApi.FeedFilter`
Specifies the feed filters.

- **AllQuestions**—Feed elements that are questions.
- **AuthoredBy**—Feed elements authored by the user profile owner. This value is valid only for the UserProfile feed.
- **CommunityScoped**—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the UserProfile feed.
- **QuestionsWithCandidateAnswers**—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **QuestionsWithCandidateAnswersReviewedPublished**—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Read**—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the Record feed of a group.
- **SolvedQuestions**—Feed elements that are questions and that have a best answer.
- **UnansweredQuestions**—Feed elements that are questions and that don’t have any answers.
- **UnansweredQuestionsWithCandidateAnswers**—Feed elements that are questions that don’t have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Unread**—Feed elements that are created in the past 30 days and aren’t marked as read for the context user. This value is valid only for the Record feed of a group.
- **UnsolvedQuestions**—Feed elements that are questions and that don’t have a best answer.

```result
Type: ConnectApi.FeedElementPage
Object containing test data.
```

**Return Value**

Type: Void

SEE ALSO:

- `searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)`

```setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, q, result)`

Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

31.0
Signature

```java
public static Void setTestSearchFeedElementsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String q, ConnectApi.FeedElementPage result)
```

Parameters

- `communityId`
  - Type: `String`  
  - ID for an Experience Cloud site, `internal`, or `null`.

- `feedType`
  - Type: `ConnectApi.FeedType`  
  - Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, `Streams`, and `Topics`.

- `subjectId`
  - Type: `String`  
  - If `feedType` is `Record`, `subjectId` can be any record ID, including a group ID. If `feedType` is `UserProfile`, `subjectId` can be any user ID. If `feedType` is any other value, `subjectId` must be the ID of the context user or the alias `me`.

- `q`
  - Type: `String`  
  - Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See `Wildcards`.

- `result`
  - Type: `ConnectApi.FeedElementPage`  
  - Object containing test data.

Return Value

- Type: `Void`

SEE ALSO:

- `searchFeedElementsInFeed(communityId, feedType, subjectId, q)`  

```
setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)
```

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

- `31.0`
public static Void setTestSearchFeedElementsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessages, Filter, Landing, Streams, and Topics.

subjectId
Type: String
If feedType is Record, subjectId can be any record ID, including a group ID. If feedType is UserProfile, subjectId can be any user ID. If the feedType is any other value, subjectId must be the ID of the context user or the alias me.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Order of feed items in the feed.

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
If you pass in null, the default value CreatedDateDesc is used.

q
Type: String
Search term. Searches keywords in the user or group name. A minimum of one character is required. This parameter doesn’t support wildcards. This parameter is required.
result
   Type: ConnectApi.FeedElementPage
   Object containing test data.

Return Value
Type: Void

SEE ALSO:
  searchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId,
recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters
or you receive an exception.

API Version
31.0

Signature
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)

Parameters
communityId
   Type: String
   ID for an Experience Cloud site, internal, or null.

feedType
   Type: ConnectApi.FeedType
   Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessages, Filter,
   Landing, Streams, and Topics.

subjectId
   Type: String
   If feedType is Record, subjectId can be any record ID, including a group ID. If feedType is UserProfile,
   subjectId can be any user ID. If the feedType is any other value, subjectId must be the ID of the context user or the
   alias me.

recentCommentCount
   Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.

- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`
Values are:

- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: `String`
Required and can’t be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](https://developer.salesforce.com/docs/atlas.en-us.apexcode.meta/apexcode/sldemo apex developer guide.htm).

result
Type: `ConnectApi.FeedElementPage`
Object containing test data.

Return Value
Type: Void

SEE ALSO:

- `searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

APEX Developer Guide: Testing ConnectApi Code
Register a ConnectApi.FeedElementPage object to be returned when searchFeedElementsInFeed is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

**API Version**

35.0

**Signature**

```java
public static Void setTestSearchFeedElementsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

**Parameters**

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **feedType**
  - Type: ConnectApi.FeedType
  - Value must be ConnectApi.FeedType.UserProfile.

- **subjectId**
  - Type: String
  - ID of any user. To specify the context user, use the user ID or the alias me.

- **recentCommentCount**
  - Type: Integer
  - Maximum number of comments to return with each feed element. The default value is 3.

- **density**
  - Type: ConnectApi.FeedDensity
  - The amount of content in a feed.
  - **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
  - **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

- **pageParam**
  - Type: String
  - Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.
pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
• CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
• CreatedDateDesc—Sorts by most recent creation date.
• LastModifiedDateDesc—Sorts by most recent activity.
• MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
• Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
If you pass in null, the default value CreatedDateDesc is used.

q
Type: String
One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren’t wildcards. See Wildcards.

filter
Type: ConnectApi.FeedFilter
Value must be ConnectApi.FeedFilter.CommunityScoped. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out. Currently, feed elements scoped to sites have a User or a Group parent record. However, other parent record types could be scoped to sites in the future.

result
Type: ConnectApi.FeedElementPage
Object containing test data.

Return Value
Type: Void

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Value must be ConnectApi.FeedType.Record.

subjectId
Type: String
The ID of a case.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity
The amount of content in a feed.

• AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
• FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
• **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.

• **CreatedDateDesc**—Sorts by most recent creation date.

• **LastModifiedDateDesc**—Sorts by most recent activity.

• **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.

• **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

**q**

Type: String

One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren’t wildcards. See Wildcards.

**customFilter**

Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the Metadata API Developer Guide for supported values.

**result**

Type: ConnectApi.FeedElementPage

Object containing test data.

**Return Value**

Type: Void

```
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly, ConnectApi.FeedElementPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Value must be ConnectApi.FeedType.Record.

subjectId
Type: String
Any record ID, including a group ID.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
If you pass in null, the default value CreatedDateDesc is used.
q
  Type: String
  Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
  Type: Boolean
  Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

result
  Type: ConnectApi.FeedElementPage
  Object containing test data.

Return Value
  Type: Void

SEE ALSO:

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, filter, result)

Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
  32.0

Signature
  public static Void setTestSearchFeedElementsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)

Parameters
  communityId
    Type: String
    ID for an Experience Cloud site, internal, or null.
**feedType**
Type: `ConnectApi.FeedType`
Value must be `ConnectApi.FeedType.Record`.

**subjectId**
Type: `String`
Any record ID, including a group ID.

**recentCommentCount**
Type: `Integer`
Maximum number of comments to return with each feed element. The default value is 3.

**density**
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: `Integer`
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
Type: `ConnectApi.FeedSortOrder`
Values are:
- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

**q**
Type: `String`
Required and can’t be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

**showInternalOnly**
Type: `Boolean`
Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

**filter**

Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- **AllQuestions**—Feed elements that are questions.
- **AuthoredBy**—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- **CommunityScoped**—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- **QuestionsWithCandidateAnswers**—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **QuestionsWithCandidateAnswersReviewedPublished**—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Read**—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- **SolvedQuestions**—Feed elements that are questions and that have a best answer.
- **UnansweredQuestions**—Feed elements that are questions and that don’t have any answers.
- **UnansweredQuestionsWithCandidateAnswers**—Feed elements that are questions that don’t have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- **Unread**—Feed elements that are created in the past 30 days and aren’t marked as read for the context user. This value is valid only for the `Record` feed of a group.
- **UnsolvedQuestions**—Feed elements that are questions and that don’t have a best answer.

**result**

Type: `ConnectApi.FeedElementPage`

Object containing test data.

**Return Value**

Type: Void

SEE ALSO:

- `searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, filter)`
- *Apex Developer Guide: Testing ConnectApi Code*
setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, customFilter, result)

Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
40.0

Signature
public static Void setTestSearchFeedElementsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly, String customFilter, ConnectApi.FeedElementPage result)

Parameters

communityId
Type: String

ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType

Value must be ConnectApi.FeedType.Record.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.
pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
• CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
• CreatedDateDesc—Sorts by most recent creation date.
• LastModifiedDateDesc—Sorts by most recent activity.
• MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
• Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds. If you pass in null, the default value CreatedDateDesc is used.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean
Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

customFilter
Type: String
Custom filter that applies only to the case feed. See customFeedFilter in the Metadata API Developer Guide for supported values.

result
Type: ConnectApi.FeedElementPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, customFilter)
setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Register a ConnectApi.FeedElementPage object to be returned when the matching
ConnectApi.searchFeedElementsInFilterFeed method is called in a test context. Use the method with the same
parameters or you receive an exception.

API Version
31.0

Signature
public static Void setTestSearchFeedElementsInFilterFeed(String communityId, String
subjectId, String keyPrefix, String q, ConnectApi.FeedElementPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: ConnectApi.FeedElementPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:

searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q)

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q, result)

Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.searchFeedElementsInFilterFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
31.0

Signature
public static Void setTestSearchFeedElementsInFilterFeed(String communityId, String subjectId, String keyPrefix, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds. If you pass in null, the default value CreatedDateDesc is used.

q
Type: String
Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: ConnectApi.FeedElementPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q)

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)
Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.searchFeedElementsInFilterFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
31.0

Signature
public static Void setTestSearchFeedElementsInFilterFeed(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

**recentCommentCount**
- **Type:** Integer
- Maximum number of comments to return with each feed element. The default value is 3.

**density**
- **Type:** `ConnectApi.FeedDensity`
- Specify the amount of content in a feed.
  - **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
  - **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
- **Type:** String
- Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
- **Type:** Integer
- Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
- **Type:** `ConnectApi.FeedSortOrder`
- Values are:
  - **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
  - **CreatedDateDesc**—Sorts by most recent creation date.
  - **LastModifiedDesc**—Sorts by most recent activity.
  - **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
  - **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.
- If you pass in `null`, the default value `CreatedDateDesc` is used.

**q**
- **Type:** String
- Required and can’t be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

**result**
- **Type:** `ConnectApi.FeedElementPage`
- Object containing test data.
Return Value
Type: Void

SEE ALSO:
searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)

setTestSearchStreams(communityId, q, result)
Register a ConnectApi.ChatterStreamPage object to be returned when the matching ConnectApi.searchStream(communityId, q) method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
40.0

Signature
public static Void setTestSearchStreams(String communityId, String q, ConnectApi.ChatterStreamPage result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: ConnectApi.ChatterStreamPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
searchStreams(communityId, q)
setTestSearchStreams(communityId, q, sortParam, result)

Register a `ConnectApi.ChatterStreamPage` object to be returned when the matching `ConnectApi.searchStream(communityId, q, sortParam)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```java
public static Void setTestSearchStreams(String communityId, String q,
ConnectApi.SortOrder sortParam, ConnectApi.ChatterStreamPage result)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **q**
  - Type: `String`
  - Required and can’t be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See `Wildcards`.

- **sortParam**
  - Type: `ConnectApi.SortOrder`
  - Specifies the sort order. Values are:
    - `Ascending`—Items are in ascending alphabetical order (A-Z).
    - `Descending`—Items are in descending alphabetical order (Z-A).
    - `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.
  - If not specified, default value is `Ascending`.

- **result**
  - Type: `ConnectApi.ChatterStreamPage`
  - Object containing test data.

Return Value

- Type: `Void`

SEE ALSO:

- `searchStreams(communityId, q, sortParam)`
- *Apex Developer Guide: Testing ConnectApi Code*
**setTestSearchStreams**(communityId, q, pageParam, pageSize, result)

Register a `ConnectApi.ChatterStreamPage` object to be returned when the matching `ConnectApi.searchStreams(communityId, q, pageParam, pageSize)` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

40.0

**Signature**

```java
public static Void setTestSearchStreams(String communityId, String q, Integer pageParam, Integer pageSize, ConnectApi.ChatterStreamPage result)
```

**Parameters**

`communityId`

Type: `String`

ID for an Experience Cloud site, `internal`, or `null`.

`q`

Type: `String`

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

`pageParam`

Type: `Integer`

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`

Type: `Integer`

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

`result`

Type: `ConnectApi.ChatterStreamPage`

Object containing test data.

**Return Value**

Type: `Void`

**SEE ALSO:**

- `searchStreams(communityId, q, pageParam, pageSize)`
- *Apex Developer Guide: Testing ConnectApi Code*
setTestSearchStreams(communityId, q, pageParam, pageSize, sortParam, result)

Register a ConnectApi.ChatterStreamPage object to be returned when the matching
ConnectApi.searchStreams(communityId, q, pageParam, pageSize, sortParam) method is called in
a test context. Use the method with the same parameters or you receive an exception.

API Version
40.0

Signature
public static Void setTestSearchStreams(String communityId, String q, Integer pageParam,
Integer pageSize, ConnectApi.SortOrder sortParam, ConnectApi.ChatterStreamPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See wildcards.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam
Type: ConnectApi.SortOrder
Specifies the sort order. Values are:
• Ascending—Items are in ascending alphabetical order (A-Z).
• Descending—Items are in descending alphabetical order (Z-A).
• MostRecentlyViewed—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is Ascending.

result
Type: ConnectApi.ChatterStreamPage
Object containing test data.
Return Value
Type: Void

SEE ALSO:
searchStreams(communityId, q, pageParam, pageSize, sortParam)

setTestSearchStreams(communityId, q, pageParam, pageSize, sortParam, globalScope, result)

Register a ConnectApi.ChatterStreamPage object to be returned when the matching
ConnectApi.searchStreams(communityId, q, pageParam, pageSize, sortParam, globalScope)
method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
41.0

Signature
public static Void setTestSearchStreams(String communityId, String q, Integer pageParam, Integer pageSize, ConnectApi.SortOrder sortParam, Boolean globalScope, ConnectApi.ChatterStreamPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam
Type: ConnectApi.SortOrder
Specifies the sort order. Values are:
- Ascending—Items are in ascending alphabetical order (A-Z).
- Descending—Items are in descending alphabetical order (Z-A).
• MostRecentlyViewed—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is Ascending.

`globalScope`
  Type: Boolean
  Specifies whether to get streams from all the context user’s Experience Cloud sites, regardless of the `communityId` value.

`result`
  Type: `ConnectApi.ChatterStreamPage`
  Object containing test data.

**Return Value**

Type: Void

**Retired ChatterFeeds Methods**

The following methods for ChatterFeeds are retired.

IN THIS SECTION:

- `deleteFeedItem(communityId, feedItemId)`
  Delete a feed item.
- `getCommentsForFeedItem(communityId, feedItemId)`
  Get comments for a feed item.
- `getCommentsForFeedItem(communityId, feedItemId, pageParam, pageSize)`
  Get a page of comments for a feed item.
- `getFeedItem(communityId, feedItemId)`
  Get a feed item.
- `getFeedItemBatch(communityId, feedItemIds)`
  Get a list of feed items.
- `getFeedItemsFromFeed(communityId, feedType)`
  Get feed items from the Company, Home, and Moderation feeds.
- `getFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)`
  Get a page of sorted feed items from the Company, Home, and Moderation feeds.
- `getFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)`
  Get a page of sorted feed items from the Company, Home, and Moderation feeds. Each feed item contains no more than the specified number of comments.
- `getFeedItemsFromFeed(communityId, feedType, subjectId)`
  Get feed items from a feed for a user or record.
- `getFeedItemsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam)`
  Get a page of sorted feed items from a feed for a user or record.
getFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam)
Get a page of sorted feed items from a feed for a user or record. Each feed item includes no more than the specified number of comments.

getFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)
Get a page of sorted feed items from a record feed for a user or record. Each feed item includes no more than the specified number of comments. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.

getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix)
Get feed items from a feed filtered by a key prefix for a user.

getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam)
Get a page of sorted feed items from a feed filtered by a key prefix for a user.

getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam)
Get a page of sorted feed items from a feed filtered by a key prefix for a user. Each feed item contains no more than the specified number of comments.

getFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, updatedSince)
Get a page of feed items from a feed filtered by a key prefix for a user. Include only feed items that have been updated since the time specified in the updatedSince parameter.

getFeedItemsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince)
Get a page of feed items from the Company, Home, and Moderation feeds. Include only feed items that have been updated since the time specified in the updatedSince parameter. Each feed item contains no more than the specified number of comments.

getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince)
Get a page of feed items from the Files, Groups, News, People, and Record feeds. Include only feed items that have been updated since the time specified in the updatedSince parameter. Each feed item contains no more than the specified number of comments.

getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly)
Get a page of feed items from a record feed. Include only feed items that have been updated since the time specified in the updatedSince parameter. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.

getFeedPoll(communityId, feedItemId)
Get the poll associated with a feed item.

getLikesForFeedItem(communityId, feedItemId)
Get likes for a feed item.

getLikesForFeedItem(communityId, feedItemId, pageParam, pageSize)
Get a page of likes for a feed item.

likeFeedItem(communityId, feedItemId)
Like a feed item for the context user.

postComment(communityId, feedItemId, text)
Post a plain-text comment to a feed item.

postComment(communityId, feedItemId, comment, feedItemFileUpload)
Post a rich-text comment to a feed item. Use this method to include mentions and to attach a file to a comment.
postFeedElement(communityId, feedElement, feedElementFileUpload)
Post a rich-text feed element. Include mentions and hashtag topics, attach a file to a feed element, and associate action link groups with a feed element. You can also use this method to share a feed element and add a comment.

postFeedItem(communityId, feedType, subjectId, text)
Post a plain-text feed item.

postFeedItem(communityId, feedType, subjectId, feedItemInput, feedItemFileUpload)
Post a rich-text feed item to a feed. Use this method to include mentions and hashtag topics and to attach a file to a feed item. You can also use this method to share a feed item and add a comment.

searchFeedItems(communityId, q)
Get the feed items that match the search criteria.

searchFeedItems(communityId, q, sortParam)
Get the sorted feed items that match the search criteria.

searchFeedItems(communityId, q, pageParam, pageSize)
Get a page of feed items that match the search criteria.

searchFeedItems(communityId, q, pageParam, pageSize, sortParam)
Get a page of sorted feed items that match the search criteria.

searchFeedItems(communityId, q, recentCommentCount, pageParam, pageSize, sortParam)
Get a page of sorted feed items that match the search criteria. Each feed item includes no more than the specified number of comments.

searchFeedItemsInFeed(communityId, feedType, q)
Get the feed items from the Company, Home, and Moderation feeds that match the search criteria.

searchFeedItemsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q)
Get a page of sorted feed items from the Company, Home, and Moderation feeds that match the search criteria.

searchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q)
Get a page of sorted feed items from the Company, Home, and Moderation feeds that match the search criteria. Each feed item includes no more than the specified number of comments.

searchFeedItemsInFeed(communityId, feedType, subjectId, q)
Get the feed items from a feed that match the search criteria.

searchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)
Get a page of sorted feed items from a feed for a user or record that match the search criteria.

searchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)
Get a page of sorted feed items from a feed that match the search criteria. Each feed item includes no more than the specified number of comments.

searchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly)
Get a page of sorted feed items from a feed for a user or record that match the search criteria. Each feed item includes no more than the specified number of comments. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.

searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q)
Get the feed items that match the search criteria from a feed filtered by a key prefix for a user.

searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q)
Get a page of sorted feed items that match the search criteria from a feed filtered by a key prefix for a user.
searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items that match the search criteria from a feed filtered by a key prefix for a user. Each feed item includes no more than the specified number of comments.

shareFeedElement(communityId, subjectId, feedElementType, originalFeedElementId)

Share the originalFeedElementId as the context user.

shareFeedItem(communityId, feedType, subjectId, originalFeedItemId)

Share the originalFeedItemId to the feed specified by the feedType.

updateBookmark(communityId, feedId, isBookmarkedByCurrentUser)

Bookmark a feed item or remove a bookmark from a feed item.

voteOnFeedPoll(communityId, feedItemId, myChoiceId)

Vote or change your vote on a feed poll.

setTestGetFeedItemsFromFeed(communityId, feedType, result)

Register a ConnectApi.FeedItemPage object to be returned when getFeedItemsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)

Register a ConnectApi.FeedItemPage object to be returned when getFeedItemsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a ConnectApi.FeedItemPage object to be returned when getFeedItemsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, result)

Register a ConnectApi.FeedItemPage object to be returned when getFeedItemsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, result)

Register a ConnectApi.FeedItemPage object to be returned when getFeedItemsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a ConnectApi.FeedItemPage object to be returned when getFeedItemsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly, result)

Register a ConnectApi.FeedItemPage object to be returned when getFeedItemsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, result)

Register a ConnectApi.FeedItemPage object to be returned when the matching getFeedItemsFromFeed method is called in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, result)

Register a ConnectApi.FeedItemPage object to be returned when the matching getFeedItemsFromFilterFeed method is called in a test context. Use the method with the same parameters or the code throws an exception.
setTestGetFeedItemsFromFilterFeed

Register a ConnectApi.FeedItemPage object to be returned when the matching getFeedItemsFromFilterFeed method is called in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFilterFeedUpdatedSince

Register a ConnectApi.FeedItemPage object to be returned when the getFeedItemsFromFilterFeedUpdatedSince method is called in a test context.

setTestGetFeedItemsUpdatedSince

Register a ConnectApi.FeedItemPage object to be returned when getFeedItemsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItemsUpdatedSince

Register a ConnectApi.FeedItemPage object to be returned when the matching ConnectApi.searchFeedItemsInFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed

Register a ConnectApi.FeedItemPage object to be returned when the matching ConnectApi.searchFeedItemsInFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItems

Register a test feed item page to be returned when searchFeedItems (communityId, q) is called during a test.

setTestSearchFeedItems

Register a test feed item page to be returned when searchFeedItems (String, String, ConnectApi.FeedSortOrder) is called during a test.

setTestSearchFeedItems

Register a test feed item page to be returned when searchFeedItems (String, String, String, Integer) is called during a test.

setTestSearchFeedItems

Register a test feed item page to be returned when searchFeedItems (String, String, String, Integer, ConnectApi.FeedSortOrder) is called during a test.

setTestSearchFeedItems

Register a test feed item page to be returned when searchFeedItems (communityId, q, recentCommentCount, pageParam, pageSize, sortParam, result) is called during a test.
setTestSearchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

`deleteFeedItem(communityId, feedItemId)`

Delete a feed item.

API Version

28.0–31.0

⚠️ Important: In version 32.0 and later, use `deleteFeedElement(communityId, feedElementId)`. 

758
Requires Chatter

Yes

Signature

```java
public static Void deleteFeedItem(String communityId, String feedItemId)
```

Parameters

- `communityId`
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- `feedItemId`
  - Type: String
  - ID for a feed item.

Return Value

Type: Void

`getCommentsForFeedItem(communityId, feedItemId)`

Get comments for a feed item.

API Version

28.0–31.0

⚠️ Important: In version 32.0 and later, use `getCommentsForFeedElement(communityId, feedElementId)`.

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```java
public static ConnectApi.CommentPage getCommentsForFeedItem(String communityId, String feedItemId)
```

Parameters

- `communityId`
  - Type: String
  - ID for an Experience Cloud site, internal, or null.
feedItemId
Type: String
ID for a feed item.

Return Value
Type: ConnectApi.CommentPage

getCommentsForFeedItem(communityId, feedItemId, pageParam, pageSize)
Get a page of comments for a feed item.

API Version
28.0–31.0

⚠️ Important: In version 32.0 and later, use getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize).

Available to Guest Users
31.0 only

Requires Chatter
Yes

Signature
public static ConnectApi.CommentPage getCommentsForFeedItem(String communityId, String feedItemId, String pageParam, Integer pageSize)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedItemId
Type: String
ID for a feed item.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.
Return Value
Type: `ConnectApi.CommentPage`

`getFeedItem(communityId, feedItemId)`
Get a feed item.

API Version
28.0–31.0

⚠️ **Important:** In version 32.0 and later, use `getFeedElement(communityId, feedElementId)`.

Available to Guest Users
31.0 only

Requires Chatter
Yes

Signature
```
public static ConnectApi.FeedItem getFeedItem(String communityId, String feedItemId)
```

Parameters
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.
- `feedItemId`
  Type: `String`
  ID for a feed item.

Return Value
Type: `ConnectApi.FeedItem`

⚠️ **Note:** Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that ConnectApi.FeedItem.attachment information and ConnectApi.FeedElement.capabilities information may not be available in the trigger.

`getFeedItemBatch(communityId, feedItemIds)`
Get a list of feed items.

API Version
31.0–31.0
Important: In version 32.0 and later, use `getFeedElementBatch(communityId, feedElementIds)`.

Requires Chatter
Yes

Signature
```
public static ConnectApi.BatchResult[] getFeedItemBatch(String communityId, List<String> feedItemIds)
```

Parameters
- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **feedItemIds**
  - Type: `List<String>`
  - A list of up to 500 feed item IDs.

Return Value
- Type: `ConnectApi.BatchResult[]`

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.FeedItem` object and errors for feed items that didn’t load.

Example
```
// Create a list of feed items.
ConnectApi.FeedItemPage feedItemPage = ConnectApi.ChatterFeeds.getFeedItemsFromFeed(null, ConnectApi.FeedType.Company);
System.debug(feedItemPage);

// Create a list of feed item IDs.
List<String> feedItemIds = new List<String>();
for (ConnectApi.FeedItem aFeedItem : feedItemPage.items){
  feedItemIds.add(aFeedItem.id);
}

// Get info about the feed items in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterFeeds.getFeedItemBatch(null, feedItemIds);

for (ConnectApi.BatchResult batchResult : batchResults) {
  if (batchResult.isSuccess()) {
    // Operation was successful.
    // Print the header for each feed item.
    ConnectApi.FeedItem aFeedItem;
    if(batchResult.getResult() instanceof ConnectApi.FeedItem) {
      aFeedItem = (ConnectApi.FeedItem) batchResult.getResult();
      // Further processing of the feed item.
    }
  }
```

```
getFeedItemsFromFeed(communityId, feedType)
Get feed items from the Company, Home, and Moderation feeds.

API Version
28.0–31.0

⚠️ Important: In version 32.0 and later, use getFeedElementsFromFeed(communityId, feedType).

Available to Guest Users
31.0 only

Requires Chatter
Yes

Signature
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Type of feed. Valid values are Company, DirectMessageModeration, DirectMessages, Home, Moderation, and PendingReview.

Return Value
Type: ConnectApi.FeedItemPage
Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
  setTestGetFeedItemsFromFeed(communityId, feedType, result)

getFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)
Get a page of sorted feed items from the Company, Home, and Moderation feeds.

API Version
28.0–31.0
⚠️ Important: In version 32.0 and later, use getFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam).

Available to Guest Users
31.0 only

Requires Chatter
Yes

Signature
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)

Parameters
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

feedType
  Type: ConnectApi.FeedType
  Type of feed. Valid values are Company, DirectMessageModeration, DirectMessages, Home, Moderation, and PendingReview.

pageParam
  Type: String
  Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
  Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
- **Type:** `ConnectApi.FeedSortOrder`
- **Values are:**
  - `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
  - `CreatedDateDesc`—Sorts by most recent creation date.
  - `LastModifiedDateDesc`—Sorts by most recent activity.
  - `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
  - `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

**Return Value**
- **Type:** `ConnectApi.FeedItemPage`

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**SEE ALSO:**
- `setTestGetFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

**getFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)**
Get a page of sorted feed items from the `Company`, `Home`, and `Moderation` feeds. Each feed item contains no more than the specified number of comments.

**API Version**
- 29.0–31.0

**Important:** In version 32.0 and later, use `getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)`.

**Available to Guest Users**
- 31.0 only

**Requires Chatter**
- Yes
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Type of feed. Valid values are Company, DirectMessageModeration, DirectMessages, Home, Moderation, and PendingReview.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

Return Value
Type: ConnectApi.FeedItemPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)

getFeedItemsFromFeed(communityId, feedType, subjectId)
Get feed items from a feed for a user or record.

API Version
28.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFeed(communityId, feedType, subjectId).

Available to Guest Users
31.0 only

Requires Chatter
Yes

Signature
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.
subjectId
Type: String

If feedType is Record, subjectId can be any record ID, including a group ID. If feedType is Streams, subjectId must be a stream ID. If feedType is Topics, subjectId must be a topic ID. If feedType is UserProfile, subjectId can be any user ID. If the feedType is any other value, subjectId must be the ID of the context user or the alias me.

Return Value
Type: ConnectApi.FeedItemPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, result)

getFeedItemsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam)
Get a page of sorted feed items from a feed for a user or record.

API Version
28.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam).

Available to Guest Users
31.0 only

Requires Chatter
Yes

Signature
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

**feedType**
Type: `ConnectApi.FeedType`
Type of feed. Valid values include every `ConnectApi.FeedType` except Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.

**subjectId**
Type: `String`
If `feedType` is Record, `subjectId` can be any record ID, including a group ID. If `feedType` is Streams, `subjectId` must be a stream ID. If `feedType` is Topics, `subjectId` must be a topic ID. If `feedType` is UserProfile, `subjectId` can be any user ID. If the `feedType` is any other value, `subjectId` must be the ID of the context user or the alias `me`.

**pageParam**
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: `Integer`
Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
Type: `ConnectApi.FeedSortOrder`
Values are:
- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

**Return Value**
Type: `ConnectApi.FeedItemPage`

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**SEE ALSO:**
- `setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, result)`
getFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam)

Get a page of sorted feed items from a feed for a user or record. Each feed item includes no more than the specified number of comments.

API Version
29.0–31.0

⚠️ Important: In version 32.0 and later, use getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam).

Available to Guest Users
31.0 only

Requires Chatter
Yes

Signature
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.

subjectId
Type: String
If feedType is Record, subjectId can be any record ID, including a group ID. If feedType is Streams, subjectId must be a stream ID. If feedType is Topics, subjectId must be a topic ID. If feedType is UserProfile, subjectId can be any user ID. If the feedType is any other value, subjectId must be the ID of the context user or the alias me.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
• AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.

• FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
• CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
• CreatedDateDesc—Sorts by most recent creation date.
• LastModifiedDateDesc—Sorts by most recent activity.
• MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
• Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

Return Value
Type: ConnectApi.FeedItemPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, result)

gGetFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)

Get a page of sorted feed items from a record feed for a user or record. Each feed item includes no more than the specified number of comments. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.
API Version

30.0–31.0

⚠️ Important: In version 32.0 and later, use `getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)`.

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```java
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly)
```

Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`feedType`
Type: `ConnectApi.FeedType`
Value must be `ConnectApi.FeedType.Record`.

`subjectId`
Type: `String`
Any record ID, including a group ID.

`recentCommentCount`
Type: `Integer`
Maximum number of comments to return with each feed item. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: `Integer`
Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`
Values are:
- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for Home feeds when the `ConnectApi.FeedFilter` is UnansweredQuestions.
- `Relevance`—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

`showInternalOnly`
Type: `Boolean`
Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

**Return Value**
Type: `ConnectApi.FeedItemPage`

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**SEE ALSO:**
- `setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

**getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix)**
Get feed items from a feed filtered by a key prefix for a user.

**API Version**
28.0–31.0

**Important:** In version 32.0 and later, use `getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix)`.
Requires Chatter
Yes

Signature

```java
public static ConnectApi.FeedItemPage getFeedItemsFromFilterFeed(String communityId, String subjectId, String keyPrefix)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `subjectId`
  - Type: `String`
  - ID of the context user or the alias `me`.

- `keyPrefix`
  - Type: `String`
  - A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, result)`

```java
getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam)
```

Get a page of sorted feed items from a feed filtered by a key prefix for a user.

API Version

28.0–31.0

**Important:** In version 32.0 and later, use `getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam)`.
Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFilterFeed(String communityId, String subjectId, String keyPrefix, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
```

Parameters

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **subjectId**
  - Type: String
  - ID of the context user or the alias me.

- **keyPrefix**
  - Type: String
  - A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

- **pageParam**
  - Type: String
  - Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

- **pageSize**
  - Type: Integer
  - Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

- **sortParam**
  - Type: ConnectApi.FeedSortOrder
  - Values are:
    - CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
    - CreatedDateDesc—Sorts by most recent creation date.
    - LastModifiedDateDesc—Sorts by most recent activity.
    - MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
    - Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
  
  Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

Return Value

Type: ConnectApi.FeedItemPage
Usage

To test code that uses this method, use the matching set test method (prefix the method name with \texttt{setTest}). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

\begin{itemize}
  \item \texttt{setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, result)}
  \item \textit{Apex Developer Guide: Testing ConnectApi Code}
\end{itemize}

\texttt{getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam)}

Get a page of sorted feed items from a feed filtered by a key prefix for a user. Each feed item contains no more than the specified number of comments.

API Version

29.0–31.0

\begin{itemize}
  \item \textbf{Important:} In version 32.0 and later, use \texttt{getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam)}.
\end{itemize}

Requires Chatter

Yes

Signature

\begin{verbatim}
public static ConnectApi.FeedItemPage getFeedItemsFromFilterFeed(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
\end{verbatim}

Parameters

\begin{itemize}
  \item \textit{communityId} \\
      Type: \texttt{String} \\
      ID for an Experience Cloud site, internal, or \texttt{null}.
  \item \textit{subjectId} \\
      Type: \texttt{String} \\
      ID of the context user or the alias \texttt{me}.
  \item \textit{keyPrefix} \\
      Type: \texttt{String} \\
      A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.
  \item \textit{recentCommentCount} \\
      Type: \texttt{Integer} \\
      Maximum number of comments to return with each feed item. The default value is 3.
\end{itemize}
density
  Type: ConnectApi.FeedDensity
  Specify the amount of content in a feed.
  • AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
  • FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
  Type: String
  Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
  Type: Integer
  Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
  Type: ConnectApi.FeedSortOrder
  Values are:
  • CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
  • CreatedDateDesc—Sorts by most recent creation date.
  • LastModifiedDateDesc—Sorts by most recent activity.
  • MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
  • Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
  Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

Return Value
  Type: ConnectApi.FeedItemPage

Usage
  To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
  setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, result)
getFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, updatedSince)

Get a page of feed items from a feed filtered by a key prefix for a user. Include only feed items that have been updated since the time specified in the updatedSince parameter.

API Version
30.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince).

Requires Chatter
Yes

Signature
public static ConnectApi.FeedItemPage getFeedItemsFromFilterFeedUpdatedSince(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.
**getPageParam**

*Type: String*

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

**pageSize**

*Type: Integer*

Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

**updatedSince**

*Type: String*

Opaque token containing information about the last modified date of the feed. Do not construct this token. To retrieve this token, call getFeedItemsFromFilterFeed and take the value from the updatesToken property of the ConnectApi.FeedItemPage response body.

**Return Value**

*Type: ConnectApi.FeedItemPage*

**Usage**

This method returns only feed items that have been updated since the time specified in the updatedSince argument. A feed item is considered to be updated if it was created since the last feed request, or if sort=LastModifiedDateDesc and a comment was added to the feed item since the last feed request. Adding likes and topics doesn’t update a feed item.

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

**SEE ALSO:**

setTestGetFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, updatedSince, result)

**getFeedItemsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince)**

Get a page of feed items from the Company, Home, and Moderation feeds. Include only feed items that have been updated since the time specified in the updatedSince parameter. Each feed item contains no more than the specified number of comments.

**API Version**

30.0–31.0

**Important:** In version 32.0 and later, use getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince).

**Available to Guest Users**

31.0 only
Requires Chatter

Yes

Signature

```java
public static ConnectApi.FeedItemPage getFeedItemsUpdatedSince(String communityId,
    ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
    String pageParam, Integer pageSize, String updatedSince)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **feedType**
  - Type: `ConnectApi.FeedType`
  - Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

- **recentCommentCount**
  - Type: `Integer`
  - Maximum number of comments to return with each feed item. The default value is 3.

- **density**
  - Type: `ConnectApi.FeedDensity`
  - Specify the amount of content in a feed.
    - **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
    - **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

- **pageParam**
  - Type: `String`
  - Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

- **pageSize**
  - Type: `Integer`
  - Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

- **updatedSince**
  - Type: `String`
  - An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updateToken` property of the `ConnectApi.FeedItemPage` response body.

Return Value

- Type: `ConnectApi.FeedItemPage`
Usage

This method returns only feed items that have been updated since the time specified in the `updatedSince` argument. A feed item is considered to be updated if it was created since the last feed request, or if `sort=LastModifiedDateDesc` and a comment was added to the feed item since the last feed request. Adding likes and topics doesn’t update a feed item.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets the feed items in the company feed and grabs the `updatesToken` property from the returned object. It then passes the value of `updatesToken` to the `getFeedItemsUpdatedSince` method to get the feed items updated since the first call:

```java
// Get the feed items in the company feed and return the updatesToken
String communityId = null;

// Get the feed and extract the update token
ConnectApi.FeedItemPage page = ConnectApi.ChatterFeeds.getFeedItemsFromFeed(communityId, ConnectApi.FeedType.Company);

// page.updatesToken is opaque and has a value like '2:1384549034000'

// Get the feed items that changed since the provided updatesToken
ConnectApi.FeedItemPage feedItems= ConnectApi.ChatterFeeds.getFeedItemsUpdatedSince(communityId, ConnectApi.FeedType.Company, 1, ConnectApi.FeedDensity.AllUpdates, null, 1, page.updatesToken);
```

SEE ALSO:

`setTestGetFeedItemsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, ConnectApi.FeedItemPage, results)`

*Apex Developer Guide: Testing ConnectApi Code*

`getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince)`

Get a page of feed items from the Files, Groups, News, People, and Record feeds. Include only feed items that have been updated since the time specified in the `updatedSince` parameter. Each feed item contains no more than the specified number of comments.

**API Version**

30.0–31.0

⚠️ **Important:** In version 32.0 and later, use `getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince)`. 

**Available to Guest Users**

31.0 only
Requires Chatter
Yes

Signature

```java
public static ConnectApi.FeedItemPage getFeedItemsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince)
```

Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`feedType`
Type: `ConnectApi.FeedType`
One of these values:
- Files
- Groups
- News
- People
- Record

`subjectId`
Type: `String`
If `feedType` is `ConnectApi.Record`, `subjectId` can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

`recentCommentCount`
Type: `Integer`
Maximum number of comments to return with each feed item. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: `Integer`
Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.
updatedSince
Type: String
An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the updatesToken property of the ConnectApi.FeedItemPage response body.

Return Value
Type: ConnectApi.FeedItemPage

Usage
This method returns only feed items that have been updated since the time specified in the updatedSince argument. A feed item is considered to be updated if it was created since the last feed request, or if sort=LastModifiedDateDesc and a comment was added to the feed item since the last feed request. Adding likes and topics doesn’t update a feed item.
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

Example
This example gets the feed items in the news feed and grabs the updatesToken property from the returned object. It then passes the value of updatesToken to the getFeedItemsUpdatedSince method to get the feed items updated since the first call:

```java
// Get the feed items in the news feed and return the updatesToken
String communityId = null;
String subjectId = 'me';

// Get the feed and extract the update token
ConnectApi.FeedItemPage page = ConnectApi.ChatterFeeds.getFeedItemsFromFeed(communityId, ConnectApi.FeedType.News, subjectId);

// page.updatesToken is opaque and has a value like '2:1384549034000'

// Get the feed items that changed since the provided updatesToken
ConnectApi.FeedItemPage feedItems= ConnectApi.ChatterFeeds.getFeedItemsUpdatedSince(communityId, ConnectApi.FeedType.News, subjectId, null, 1, ConnectApi.FeedDensity.AllUpdates, page.updatesToken);
```

SEE ALSO:
setTestGetFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, result)

getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly)

Get a page of feed items from a record feed. Include only feed items that have been updated since the time specified in the updatedSince parameter. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.
API Version
30.0–31.0

⚠ Important: In version 32.0 and later, use getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly).

Available to Guest Users
31.0 only

Requires Chatter
Yes

Signature

```java
public static ConnectApi.FeedItemPage getFeedItemsUpdatedSince(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, Boolean showInternalOnly)
```

Parameters

- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or null.

- **feedType**
  Type: ConnectApi.FeedType
  Value must be ConnectApi.FeedType.Record.

- **subjectId**
  Type: String
  Any record ID, including a group ID.

- **recentCommentCount**
  Type: Integer
  Maximum number of comments to return with each feed item. The default value is 3.

- **density**
  Type: ConnectApi.FeedDensity
  Specify the amount of content in a feed.
  - **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
  - **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

- **pageParam**
  Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

**pageSize**
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

**updatedSince**
Type: String
An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the updatesToken property of the ConnectApi.FeedItemPage response body.

**showInternalOnly**
Type: Boolean
Specifies whether to show only feed items from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

**Return Value**
Type: `ConnectApi.FeedItemPage`

**Usage**
This method returns only feed items that have been updated since the time specified in the updatedSince argument. A feed item is considered to be updated if it was created since the last feed request, or if sort=LastModifiedDateDesc and a comment was added to the feed item since the last feed request. Adding likes and topics doesn’t update a feed item.

If `showInternalOnly` is true and digital experiences is enabled, feed items from Experience Cloud sites are included. Otherwise, only feed items from the internal site are included.

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

**Example**
This example gets the feed items in the news feed and grabs the updatesToken property from the returned object. It then passes the value of updatesToken to the getFeedItemsUpdatedSince method to get the feed items updated since the first call:

```java
// Get the feed items in the news feed and return the updatesToken
String communityId = null;
String subjectId = 'me';

// Get the feed and extract the update token
ConnectApi.FeedItemPage page = ConnectApi.ChatterFeeds.getFeedItemsFromFeed(communityId, ConnectApi.FeedType.News, subjectId);

// page.updatesToken is opaque and has a value like '2:1384549034000'

// Get the feed items that changed since the provided updatesToken
ConnectApi.FeedItemPage feedItems= ConnectApi.ChatterFeeds.getFeedItemsUpdatedSince
```
SEE ALSO:

setTestGetFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)

getFeedPoll(communityId, feedItemID)

Get the poll associated with a feed item.

API Version

28.0–31.0

**Important:** In version 32.0 and later, use getFeedElementPoll(communityId, feedElementId).

Requires Chatter

Yes

**Signature**

```java
public static ConnectApi.FeedPoll getFeedPoll(String communityId, String feedItemId)
```

**Parameters**

- **communityId**
  
  Type: String
  
  ID for an Experience Cloud site, internal, or null.

- **feedItemId**
  
  Type: String
  
  ID for a feed item.

**Return Value**

Type: ConnectApi.FeedPoll

**Note:** Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that ConnectApi.FeedItem.attachment information and ConnectApi.FeedElement.capabilities information may not be available in the trigger.

getLikesForFeedItem(communityId, feedItemID)

Get likes for a feed item.
API Version
28.0–31.0

Important: In version 32.0 and later, use `getLikesForFeedElement(communityId, feedElementId)`.

Available to Guest Users
31.0 only

Requires Chatter
Yes

Signature
```java
public static ConnectApi.ChatterLikePage getLikesForFeedItem(String communityId, String feedItemId)
```

Parameters
`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`feedItemId`
Type: `String`
ID for a feed item.

Return Value
Type: `ConnectApi.ChatterLikePage`

`getLikesForFeedItem(communityId, feedItemId, pageParam, pageSize)`
Get a page of likes for a feed item.

API Version
28.0–31.0

Important: In version 32.0 and later, use `getLikesForFeedElement(communityId, feedElementId, pageParam, pageSize)`.

Available to Guest Users
31.0 only

Requires Chatter
Yes
Signature

```java
public static ConnectApi.ChatterLikePage getLikesForFeedItem(String communityId, String feedItemId, Integer pageParam, Integer pageSize)
```

Parameters

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **feedItemId**
  - Type: String
  - ID for a feed item.

- **pageParam**
  - Type: Integer
  - Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

- **pageSize**
  - Type: Integer
  - Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value

- Type: `ConnectApi.ChatterLikePage`

**likeFeedItem(communityId, feedItemId)**

Like a feed item for the context user.

API Version

28.0–31.0

ℹ️ Important: In version 32.0 and later, use `likeFeedElement(communityId, feedElementId)`.

Requires Chatter

Yes

Signature

```java
public static ConnectApi.ChatterLike likeFeedItem(String communityId, String feedItemId)
```

Parameters

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.
feedItemId
Type: String
ID for a feed item.

Return Value
Type: ConnectApi.ChatterLike
If the context user already liked the feed item, this method is a non-operation and returns the existing like.

postComment(communityId, feedItemId, text)
Post a plain-text comment to a feed item.

API Version
28.0–31.0

Important: In version 32.0 and later, use postCommentToFeedElement(communityId, feedElementId, text).

Requires Chatter
Yes

Signature
public static ConnectApi.Comment postComment(String communityId, String feedItemId, String text)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedItemId
Type: String
ID for a feed item.

text
Type: String
The text of the comment. Mentions are downgraded to plain text. To include a mention that links to a user, call postComment(communityId, feedItemId, comment, feedItemFileUpload) and pass the mention in a ConnectApi.CommentInput object.

Return Value
Type: ConnectApi.Comment
Usage

If hashtags or links are detected in text, they're included in the comment as hashtag and link segments. Mentions aren't detected in text and aren't separated out of the text.

Feed items and comments can contain up to 10,000 characters.

`postComment(communityId, feedItemId, comment, feedItemFileUpload)`

Post a rich-text comment to a feed item. Use this method to include mentions and to attach a file to a comment.

API Version

28.0–31.0

⚠️ Important: In version 32.0 and later, use `postCommentToFeedElement(communityId, feedElementId, comment, feedElementFileUpload)`.

Requires Chatter

Yes

Signature

```java
public static ConnectApi.Comment postComment(String communityId, String feedItemId, ConnectApi.CommentInput comment, ConnectApi.BinaryInput feedItemFileUpload)
```

Parameters

- `communityId`
  
  Type: `String`
  
  ID for an Experience Cloud site, internal, or `null`.

- `feedItemId`
  
  Type: `String`
  
  ID for a feed item.

- `comment`
  
  Type: `ConnectApi.CommentInput`
  
  In the `CommentInput` object, specify rich text, including @mentions. Optionally, in the `CommentInput.attachment` property, specify an existing file or a new file

- `feedItemFileUpload`
  
  Type: `ConnectApi.BinaryInput`
  
  If you specify a `NewFileAttachmentInput` object in the `CommentInput.attachment` property, specify the new binary file to attach in this argument. Otherwise, do not specify a value.

Return Value

Type: `ConnectApi.Comment`
Usage

Feed items and comments can contain up to 10,000 characters.

Sample: Posting a Comment with a New File Attachment

To post a comment and upload and attach a new file to the comment, create a `ConnectApi.CommentInput` object and a `ConnectApi.BinaryInput` object to pass to the `ConnectApi.ChatterFeeds.postComment` method.

```java
String communityId = null;
String feedItemId = '0D5D0000000Kcd1';

ConnectApi.CommentInput input = new ConnectApi.CommentInput();
ConnectApi.TextSegmentInput textSegment;

String commentId = null;
String feedItemId = '0D5D0000000Kcd1';

ConnectApi.CommentInput input = new ConnectApi.CommentInput();
ConnectApi.TextSegmentInput textSegment;

ConnectApi.NewFileAttachmentInput attachmentInput = new ConnectApi.NewFileAttachmentInput();
attachmentInput.description = 'The description of the file';
attachmentInput.title = 'contentFile.txt';
input.attachment = attachmentInput;

String fileContents = 'This is the content of the file.';
Blob fileBlob = Blob.valueOf(fileContents);

ConnectApi.Comment commentRep = ConnectApi.ChatterFeeds.postComment(communityId, feedItemId, input, binaryInput);
```

`postFeedElement(communityId, feedElement, feedElementFileUpload)`

Post a rich-text feed element. Include mentions and hashtag topics, attach a file to a feed element, and associate action link groups with a feed element. You can also use this method to share a feed element and add a comment.

API Version

31.0–35.0

⚠️ Important: In version 36.0 and later, this method is no longer available because you can’t create a feed post and upload a binary file in the same call. Upload files to Salesforce first, and then use `postFeedElement(communityId, feedElement)` to create the feed post and attach the files.

Requires Chatter

Yes
Signature

```java
public static ConnectApi.FeedElement postFeedElement(String communityId,
ConnectApi.FeedElementInput feedElement, ConnectApi.BinaryInput feedElementFileUpload)
```

Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

feedElement
  Type: ConnectApi.FeedElementInput
  Specify rich text, including mentions. Optionally, specify a link, a poll, an existing file, or a new file.

feedElementFileUpload
  Type: ConnectApi.BinaryInput
  Specify the new binary file to attach to the post only if you also specify a NewFileAttachmentInput object in the feedElement parameter. Otherwise, pass null.

Return Value

Type: ConnectApi.FeedElement

Example for Posting a Feed Element with a New (Binary) File

```java
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.subjectId = 'me';

ConnectApi.ContentCapabilityInput contentInput = new ConnectApi.ContentCapabilityInput();
contentInput.title = 'Title';

ConnectApi.FeedElementCapabilitiesInput capabilities = new
ConnectApi.FeedElementCapabilitiesInput();
capabilities.content = contentInput;

capabilities.content = contentInput;

capabilities = capabilities;

String text = 'These are the contents of the new file.';
Blob myBlob = Blob.valueOf(text);
ConnectApi.BinaryInput binInput = new ConnectApi.BinaryInput(myBlob, 'text/plain', 'fileName');

ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), input, binInput);
```

postFeedItem(communityId, feedType, subjectId, text)
Post a plain-text feed item.

API Version

28.0–31.0
Important: In version 32.0 and later, use `postFeedElement(communityId, subjectId, feedElementType, text)`.

Requires Chatter
Yes

Signature
```
public static ConnectApi.FeedItem postFeedItem(String communityId, ConnectApi.FeedType feedType, String subjectId, String text)
```

Parameters
- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.
- **feedType**
  - Type: `ConnectApi.FeedType`
  - One of the following:
    - News
    - Record
    - UserProfile
  - Use Record to post to a group.
- **subjectId**
  - Type: String
  - The value depends on the `feedType`:
    - News—ID of the context user or the keyword me.
    - Record—ID of any record with a feed, including groups.
    - UserProfile—ID of any user.
- **text**
  - Type: String
  - Text of the feed item. Mentions are downgraded to plain text. To include a mention that links to the user, call the `postFeedItem(communityId, feedType, subjectId, feedItemInput, feedItemFileUpload)` method and pass the mention in a `ConnectApi.FeedItemInput` object.

Return Value
- Type: `ConnectApi.FeedItem`

Note: Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that `ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information may not be available in the trigger.
Usage

Feed items and comments can contain up to 10,000 characters.

Posts to ConnectApi.FeedType.UserProfile in API versions 23.0 and 24.0 created user status updates, not feed items. For posts to the User Profile Feed in those API versions, the character limit is 1,000 characters.

postFeedItem(communityId, feedType, subjectId, feedItemInput, feedItemFileUpload)

Post a rich-text feed item to a feed. Use this method to include mentions and hashtag topics and to attach a file to a feed item. You can also use this method to share a feed item and add a comment.

API Version

28.0–31.0

⚠️ Important: In version 32.0 and later, use postFeedElement(communityId, feedElement, feedElementFileUpload).

Requires Chatter

Yes

Signature

public static ConnectApi.FeedItem postFeedItem(String communityId, ConnectApi.FeedType feedType, String subjectId, ConnectApi.FeedItemInput feedItemInput, ConnectApi.BinaryInput feedItemFileUpload)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
One of the following:
- News
- Record
- UserProfile

To post a feed item to a group, use Record and use a group ID as the subjectId.

subjectId
Type: String

If feedType is Record, subjectId can be any record ID, including a group ID. If feedType is Streams, subjectId must be a stream ID. If feedType is Topics, subjectId must be a topic ID. If feedType is UserProfile, subjectId can be any user ID. If the feedType is any other value, subjectId must be the ID of the context user or the alias me.

feedItemInput
Type: ConnectApi.FeedItemInput
In the FeedItemInput object, specify rich text. Optionally, in the FeedItemInput.attachment property, specify a link, a poll, an existing file, or a new file.

**feedItemFileUpload**
Type: ConnectApi.BinaryInput

If you specify a NewFileAttachmentInput object in the FeedItemInput.attachment property, specify the new binary file to attach in this argument. Otherwise, do not specify a value.

**Return Value**
Type: ConnectApi.FeedItem

*Note:* Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that ConnectApi.FeedItem.attachment information and ConnectApi.FeedElement.capabilities information may not be available in the trigger.

**Usage**
Feed items and comments can contain up to 10,000 characters. Posts to ConnectApi.FeedType.UserProfile in API versions 23.0 and 24.0 created user status updates, not feed items. For posts to the User Profile Feed in those API versions, the character limit is 1,000 characters.

**Example for Sharing a Feed Item and Adding a Comment**
To share a feed item and add a comment, create a ConnectApi.FeedItemInput object containing the comment and the feed item to share. Then pass the object to ConnectApi.ChatterFeeds.postFeedItem in the feedItemInput argument. The message segments in the message body input are used as the comment.

```java
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.originalFeedItemId = '0D5D0000000JuAG';

List<ConnectApi.MessageSegmentInput> segmentList = new List<ConnectApi.MessageSegmentInput>();
ConnectApi.TextSegmentInput textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'I hope you enjoy this post I found in another group.';
segmentList.add((ConnectApi.MessageSegmentInput)textSegment);
body.messageSegments = segmentList;
input.body = body;

ConnectApi.ChatterFeeds.postFeedItem(null, ConnectApi.FeedType.UserProfile, 'me', input, null);
```

**Example for Posting a Mention to a User Profile Feed**
To post to a user profile feed and include an @mention, call the ConnectApi.ChatterFeeds.postFeedItem method.

```java
String communityId = null;
ConnectApi.FeedType feedType = ConnectApi.FeedType.UserProfile;

ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
ConnectApi.TextSegmentInput textSegment;
```
ConnectApi.MentionSegmentInput mentionSegment = new ConnectApi.MentionSegmentInput();
messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'Hey there ';
messageInput.messageSegments.add(textSegment);

mentionSegment.id = '005D0000001LLO1';
messageInput.messageSegments.add(mentionSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = '. How are you?';
messageInput.messageSegments.add(textSegment);

input.body = messageInput;

ConnectApi.FeedItem feedItemRep = ConnectApi.ChatterFeeds.postFeedItem(communityId, feedType, 'me', input, null);

searchFeedItems(communityId, q)
Get the feed items that match the search criteria.

API Version
28.0–31.0

⚠️ Important: In version 32.0 and later, use searchFeedElements(communityId, q).

Available to Guest Users
31.0 only

Requires Chatter
Yes

Signature
public static ConnectApi.FeedItemPage searchFeedItems(String communityId, String q)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.
Return Value
Type: `ConnectApi.FeedItemPage`

Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestSearchFeedItems(communityId, q, result)`
  - *Apex Developer Guide: Testing ConnectApi Code*

`searchFeedItems(communityId, q, sortParam)`
Get the sorted feed items that match the search criteria.

API Version
28.0–31.0

⚠️ **Important:** In version 32.0 and later, use `searchFeedElements(communityId, q, sortParam)`.

Available to Guest Users
31.0 only

Requires Chatter
Yes

Signature
```java
public static ConnectApi.FeedItemPage searchFeedItems(String communityId, String q,
ConnectApi.FeedSortOrder sortParam)
```

Parameters
- `communityId`
  Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.
- `q`
  Type: `String`
  - Required and can’t be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See *Wildcards*.
- `sortParam`
  Type: `ConnectApi.FeedSortOrder`
  - Values are:
• `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
• `CreatedDateDesc`—Sorts by most recent creation date.
• `LastModifiedDateDesc`—Sorts by most recent activity.
• `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
• `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

**Return Value**

Type: `ConnectApi.FeedItemPage`

**Usage**

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

`setTestSearchFeedItems(communityId, q, sortParam, result)`

*Apex Developer Guide: Testing ConnectApi Code*

`searchFeedItems(communityId, q, pageParam, pageSize)`

Get a page of feed items that match the search criteria.

**API Version**

28.0–31.0

⚠️ **Important:** In version 32.0 and later, use `searchFeedElements(communityId, q, pageParam, pageSize)`.

**Available to Guest Users**

31.0 only

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.FeedItemPage searchFeedItems(String communityId, String q, String pageParam, Integer pageSize)
```
Parameters

- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or null.

- **q**
  Type: String
  Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

- **pageParam**
  Type: String
  Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

- **pageSize**
  Type: Integer
  Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value

Type: ConnectApi.FeedItemPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- setTestSearchFeedItems(communityId, q, pageParam, pageSize, result)

**searchFeedItems(communityId, q, pageParam, pageSize, sortParam)**

Get a page of sorted feed items that match the search criteria.

API Version

**Important:** In version 32.0 and later, use searchFeedElements(communityId, q, pageParam, pageSize, sortParam).

Available to Guest Users

31.0 only

Requires Chatter

Yes
public static ConnectApi.FeedItemPage searchFeedItems(String communityId, String q, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds. Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

Return Value
Type: ConnectApi.FeedItemPage
Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**searchFeedItems(communityId, q, recentCommentCount, pageParam, pageSize, sortParam)**

Get a page of sorted feed items that match the search criteria.

API Version
29.0–31.0

**Important:** In version 32.0 and later, use `searchFeedElements(communityId, q, recentCommentCount, pageParam, pageSize, sortParam)`.

Available to Guest Users
31.0 only

Requires Chatter
Yes

Signature
```java
public static ConnectApi.FeedItemPage searchFeedItems(String communityId, String q, Integer recentCommentCount, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
```

Parameters
- **communityId**
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.
- **q**
  Type: `String`
  Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See *Wildcards*.
- **recentCommentCount**
  Type: `Integer`
  Maximum number of comments to return with each feed item. The default value is 3.
pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
• CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.

searchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q)
Get a page of sorted feed items from the Company, Home, and Moderation feeds that match the search criteria. Each feed item includes no more than the specified number of comments.

API Version
29.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q).

Available to Guest Users
31.0 only

Requires Chatter
Yes

Signature
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)

Parameters
  communityId
    Type: String
ID for an Experience Cloud site, internal, or null.

`feedType`
Type: `ConnectApi.FeedType`
Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

`recentCommentCount`
Type: `Integer`
Maximum number of comments to return with each feed item. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: `Integer`
Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`
Values are:
- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.
Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

`q`
Type: `String`
Required and can’t be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See `Wildcards`.

**Return Value**
Type: `ConnectApi.FeedItemPage`
Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestSearchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)`

`searchFeedItemsInFeed(communityId, feedType, subjectId, q)`
Get the feed items from a feed that match the search criteria.

API Version
28.0–31.0

⚠️ **Important:** In version 32.0 and later, use `searchFeedElementsInFeed(communityId, feedType, subjectId, q)`.

Signature
```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId, 
                   ConnectApi.FeedType feedType, String subjectId, String q)
```

Parameters
- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.
- `feedType`
  - Type: `ConnectApi.FeedType`
  - Type of feed. Valid values include every `ConnectApi.FeedType` except Company, DirectMessages, Filter, Landing, and Streams.
- `subjectId`
  - Type: `String`
  - If `feedType` is Record, `subjectId` can be any record ID, including a group ID. If `feedType` is UserProfile, `subjectId` can be any user ID. If `feedType` is any other value, `subjectId` must be the ID of the context user or the alias `me`.
- `q`
  - Type: `String`
Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

**Return Value**
Type: `ConnectApi.FeedItemPage`

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

### searchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)
Get a page of sorted feed items from a feed for a user or record that match the search criteria.

**API Version**
28.0–31.0

⚠️ **Important:** In version 32.0 and later, use `searchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)`.

**Available to Guest Users**
31.0 only

**Requires Chatter**
Yes

**Signature**
```java
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)
```

**Parameters**
- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.
- `feedType`
  - Type: `ConnectApi.FeedType`
Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

`subjectId`
Type: String  
If `feedType` is `Record`, `subjectId` can be any record ID, including a group ID. If `feedType` is `Streams`, `subjectId` must be a stream ID. If `feedType` is `Topics`, `subjectId` must be a topic ID. If `feedType` is `UserProfile`, `subjectId` can be any user ID. If the `feedType` is any other value, `subjectId` must be the ID of the context user or the alias `me`.

`pageParam`
Type: String  
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer  
Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`  
Order of feed items in the feed.
- `CreatedByAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

`q`
Type: String  
Search term. Searches keywords in the user or group name. A minimum of one character is required. This parameter doesn’t support wildcards. This parameter is required.

Return Value
Type: `ConnectApi.FeedItemPage`

Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:  
`setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)`  
searchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items from a feed that match the search criteria. Each feed item includes no more than the specified number of comments.

API Version
29.0–31.0

⚠️ Important: In version 32.0 and later, use searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q).

Available to Guest Users
31.0 only

Requires Chatter
Yes

Signature
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessages, Filter, Landing, and Streams.

subjectId
Type: String
If feedType is Record, subjectId can be any record ID, including a group ID. If feedType is Streams, subjectId must be a stream ID. If feedType is Topics, subjectId must be a topic ID. If feedType is UserProfile, subjectId can be any user ID. If the feedType is any other value, subjectId must be the ID of the context user or the alias me.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: **String**
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: **Integer**
Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
Type: **ConnectApi.FeedSortOrder**
Values are:
- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

**q**
Type: **String**
Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

**Return Value**
Type: **ConnectApi.FeedItemPage**

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**SEE ALSO:**
- setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)
- *Apex Developer Guide: Testing ConnectApi Code*
**searchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly)**

Get a page of sorted feed items from a feed for a user or record that match the search criteria. Each feed item includes no more than the specified number of comments. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.

**API Version**
30.0–31.0

ℹ️ **Important:** In version 32.0 and later, use `searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly)`.

**Available to Guest Users**
31.0 only

**Requires Chatter**
Yes

**Signature**

public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly)

**Parameters**

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **feedType**
  - Type: ConnectApi.FeedType
  - Value must be ConnectApi.FeedType.Record.

- **subjectId**
  - Type: String
  - Any record ID, including a group ID.

- **recentCommentCount**
  - Type: Integer
  - Maximum number of comments to return with each feed item. The default value is 3.

- **density**
  - Type: ConnectApi.FeedDensity
  - Specify the amount of content in a feed.
    - AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
• FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
• CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
• CreatedDateDesc—Sorts by most recent creation date.
• LastModifiedDateDesc—Sorts by most recent activity.
• MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
• Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds. Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean
Specifies whether to show only feed items from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

Return Value
Type: ConnectApi.FeedItemPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, result)
**searchFeedItemsInFilterFeed**(communityId, subjectId, keyPrefix, q)

Get the feed items that match the search criteria from a feed filtered by a key prefix for a user.

**API Version**

28.0–31.0

⚠️ **Important:** In version 32.0 and later, use `searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q)`.

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.FeedItemPage searchFeedItemsInFilterFeed(String communityId,
    String subjectId, String keyPrefix, String q)
```

**Parameters**

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **subjectId**
  - Type: `String`
  - ID of the context user or the alias `me`.

- **keyPrefix**
  - Type: `String`
  - A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

- **q**
  - Type: `String`
  - Required and can’t be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

**Return Value**

Type: `ConnectApi.FeedItemPage`
Usage

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items that match the search criteria from a feed filtered by a key prefix for a user.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q).

Requires Chatter

Yes

Signature

public static ConnectApi.FeedItemPage searchFeedItemsInFilterFeed(String communityId, String subjectId, String keyPrefix, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)

Parameters

communityId

Type: String

ID for an Experience Cloud site, internal, or null.

subjectId

Type: String

ID of the context user or the alias me.

keyPrefix

Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam

Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.
pageSize
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

q
Type: String
Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value
Type: ConnectApi.FeedItemPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, pageParam, pageSize, sortParam, q, result)

searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items that match the search criteria from a feed filtered by a key prefix for a user. Each feed item includes no more than the specified number of comments.

API Version
29.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q).
Requires Chatter

Yes

Signature

public static ConnectApi.FeedItemPage searchFeedItemsInFilterFeed(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
• CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.

• CreatedDateDesc—Sorts by most recent creation date.

• LastModifiedDateDesc—Sorts by most recent activity.

• MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.

• Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value
Type: ConnectApi.FeedItemPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

shareFeedElement(communityId, subjectId, feedElementType, originalFeedElementId)
Share the originalFeedElementId as the context user.

API Version
31.0–38.0

Important: In version 39.0 and later, use postFeedElement(communityId, feedElement) or updateFeedElement(communityId, feedElementId, feedElement) with the ConnectApi.FeedEntityShareCapabilityInput to share a feed entity with a feed element.

Requires Chatter
Yes
Signature

```java
public static ConnectApi.FeedElement shareFeedElement(String communityId, String subjectId, ConnectApi.FeedElementType feedElementType, String originalFeedElementId)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **subjectId**
  - Type: `String`
  - The ID of the user or group with whom to share the feed element.

- **feedElementType**
  - Type: `ConnectApi.FeedElementType`
  - Values are:
    - `Bundle`—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values.
    - `FeedItem`—A feed item has a single parent and is scoped to one Experience Cloud site or across all Experience Cloud sites. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values.
    - `Recommendation`—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user.

- **originalFeedElementId**
  - Type: `String`
  - The ID of the feed element to share.

Return Value

- Type: `ConnectApi.FeedElement`

Example

```java
ConnectApi.ChatterFeeds.shareFeedElement(null, '0F9RR0000004CPw',
ConnectApi.FeedElementType.FeedItem, '0D5RR0000004Gxc');
```

`shareFeedItem(communityId, feedType, subjectId, originalFeedItemId)`

Share the `originalFeedItemId` to the feed specified by the `feedType`.

API Version

- 28.0–31.0

Important:

- In version 32.0–38.0, use `shareFeedElement(communityId, subjectId, feedElementType, originalFeedElementId)`.
In version 39.0 and later, use `postFeedElement(communityId, feedElement)` or `updateFeedElement(communityId, feedElementId, feedElement)` with the `ConnectApi.FeedEntityShareCapabilityInput`.

**Requires Chatter**
Yes

**Signature**

```java
public static ConnectApi.FeedItem shareFeedItem(String communityId, ConnectApi.FeedType feedType, String subjectId, String originalFeedItemId)
```

**Parameters**

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.

- `feedType`
  Type: `ConnectApi.FeedType`
  One of the following:
  - News
  - Record
  - UserProfile

  To share a feed item with a group, use `Record` and use a group ID as the `subjectId`.

- `subjectId`
  Type: `String`
  The value depends on the value of `feedType`:
  - News—`subjectId` must be the ID of the context user or the keyword `me`.
  - Record—`subjectId` can be a group ID or the ID of the context user (or `me`).
  - UserProfile—`subjectId` can be any user ID.

- `originalFeedItemId`
  Type: `String`
  The ID of the feed item to share.

**Return Value**

Type: `ConnectApi.FeedItem`
**Example**

To share a feed item with a group, pass in the Experience Cloud site ID (or null), the feed type Record, the group ID, and the ID of the feed item to share.

```java
ConnectApi.ChatterFeeds.shareFeedItem(null, ConnectApi.FeedType.Record, '0F9D00000000izf', '0D5D0000000JuAG');
```

**updateBookmark(communityId, feedItemId, isBookmarkedByCurrentUser)**

Bookmark a feed item or remove a bookmark from a feed item.

**API Version**

28.0–31.0

⚠️ **Important:** In version 32.0 and later, use `updateFeedElementBookmarks(communityId, feedElementId, bookmarks)` or `updateFeedElementBookmarks(communityId, feedElementId, isBookmarkedByCurrentUser)`.

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.FeedItem updateBookmark(String communityId, String feedItemId, Boolean isBookmarkedByCurrentUser)
```

**Parameters**

- `communityId`
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- `feedItemId`
  - Type: String
  - ID for a feed item.

- `isBookmarkedByCurrentUser`
  - Type: Boolean
  - Specifying true adds the feed item to the list of bookmarks for the context user. Specify false to remove a bookmark.

**Return Value**

Type: `ConnectApi.FeedItem`

**voteOnFeedPoll(communityId, feedItemId, myChoiceId)**

Vote or change your vote on a feed poll.
### voteOnFeedPoll

**Signature**

```java
public static ConnectApi.FeedPoll voteOnFeedPoll(String communityId, String feedItemId, String myChoiceId)
```

**Parameters**

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **feedItemId**
  - Type: `String`
  - ID of the feed item that is associated with the poll.

- **myChoiceId**
  - Type: `String`
  - ID of the item in the poll you’re voting for.

**Return Value**

Type: `ConnectApi.FeedPoll`

### setTestGetFeedItemsFromFeed

**Signature**

```java
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, ConnectApi.FeedItemPage result)
```

**Parameters**

- **communityId**
  - Type: `String`

**setTestGetFeedItemsFromFeed(communityId, feedType, result)**

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

**API Version**

28.0–31.0

**Important:** In version 32.0 and later, use `voteOnFeedElementPoll(communityId, feedElementId, myChoiceId)`.
ID for an Experience Cloud site, internal, or null.

**feedType**

Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

**result**

Type: `ConnectApi.FeedItemPage`

Object containing test data.

**Return Value**

Type: Void

SEE ALSO:

- `getFeedItemsFromFeed(communityId, feedType)`

**setTestGetFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)**

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

**API Version**

28.0–31.0

**Signature**

```java
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

**Parameters**

**communityId**

Type: `String`

ID for an Experience Cloud site, internal, or null.

**feedType**

Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

**pageParam**

Type: `String`

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in null, the first page is returned.
pageSize
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

result
Type: ConnectApi.FeedItemPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
- getFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)

setTestGetFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)
Register a ConnectApi.FeedItemPage object to be returned when getFeedItemsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version
29.0–31.0

Signature
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
Parameters

**communityId**
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

**feedType**
Type: `ConnectApi.FeedType`
Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

**recentCommentCount**
Type: `Integer`
Maximum number of comments to return with each feed item. The default value is 3.

**density**
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- **AllUpdates**—Displays all update from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: `Integer`
Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
Type: `ConnectApi.FeedSortOrder`
Values are:
- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

**result**
Type: `ConnectApi.FeedItemPage`
Object containing test data.
Return Value
Type: Void

SEE ALSO:
getFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)

**setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, result)**

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

**API Version**
28.0–31.0

**Signature**
```java
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, ConnectApi.FeedItemPage result)
```

**Parameters**
- **communityId**
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.
- **feedType**
  Type: `ConnectApi.FeedType`
  Type of feed. Valid values include every `ConnectApi.FeedType` except Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.
- **subjectId**
  Type: `String`
  If `feedType` is Record, `subjectId` can be any record ID, including a group ID. If `feedType` is Streams, `subjectId` must be a stream ID. If `feedType` is Topics, `subjectId` must be a topic ID. If `feedType` is UserProfile, `subjectId` can be any user ID. If the `feedType` is any other value, `subjectId` must be the ID of the context user or the alias `me`.
- **result**
  Type: `ConnectApi.FeedItemPage`
  Object containing test data.
Return Value
Type: Void

SEE ALSO:
getFeedItemsFromFeed(communityId, feedType, subjectId)

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, result)
Register a ConnectApi.FeedItemPage object to be returned when getFeedItemsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version
28.0–31.0

Signature
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.

subjectId
Type: String
If feedType is Record, subjectId can be any record ID, including a group ID. If feedType is Streams, subjectId must be a stream ID. If feedType is Topics, subjectId must be a topic ID. If feedType is UserProfile, subjectId can be any user ID. If the feedType is any other value, subjectId must be the ID of the context user or the alias me.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.
sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

result
Type: ConnectApi.FeedItemPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
- getFeedItemsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam)

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a ConnectApi.FeedItemPage object to be returned when getFeedItemsFromFeed is called with matching parameters in a test context. Use the get method with the same parameters or the code throws an exception.

API Version
29.0–31.0

Signature
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

**feedType**
Type: `ConnectApi.FeedType`
Type of feed. Valid values include every `ConnectApi.FeedType` except Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.

**subjectId**
Type: `String`
If `feedType` is Record, `subjectId` can be any record ID, including a group ID. If `feedType` is Streams, `subjectId` must be a stream ID. If `feedType` is Topics, `subjectId` must be a topic ID. If `feedType` is UserProfile, `subjectId` can be any user ID. If the `feedType` is any other value, `subjectId` must be the ID of the context user or the alias me.

**recentCommentCount**
Type: `Integer`
Maximum number of comments to return with each feed item. The default value is 3.

**density**
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: `String`
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: `Integer`
Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
Type: `ConnectApi.FeedSortOrder`
Values are:
- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

**result**
Type: `ConnectApi.FeedItemPage`
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam)

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly, result)

Register a ConnectApi.FeedItemPage object to be returned when getFeedItemsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version
30.0–31.0

Signature
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedItemPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.

subjectId
Type: String
If feedType is Record, subjectId can be any record ID, including a group ID. If feedType is Streams, subjectId must be a stream ID. If feedType is Topics, subjectId must be a topic ID. If feedType is UserProfile, subjectId can be any user ID. If the feedType is any other value, subjectId must be the ID of the context user or the alias me.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.
density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

showInternalOnly
Type: Boolean
Specifies whether to show only feed items from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

result
Type: ConnectApi.FeedItemPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
- getFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)
setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, result)

Register a ConnectApi.FeedItemPage object to be returned when the matching getFeedItemsFromFilterFeed method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version
28.0–31.0

Signature

public static Void setTestGetFeedItemsFromFilterFeed(String communityId, String subjectId, String keyPrefix, ConnectApi.FeedItemPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

result
Type: ConnectApi.FeedItemPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix)

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, result)

Register a ConnectApi.FeedItemPage object to be returned when the matching getFeedItemsFromFilterFeed method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version
28.0–31.0
public static Void setTestGetFeedItemsFromFilterFeed(String communityId, String subjectId, String keyPrefix, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds. Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

result
Type: ConnectApi.FeedItemPage
Object containing test data.
Return Value
Type: Void

getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam)

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, result)
Register a ConnectApi.FeedItemPage object to be returned when the matching getFeedItemsFromFilterFeed method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version
29.0–31.0

Signature
public static Void setTestGetFeedItemsFromFilterFeed(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.

• AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
• FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

**pageSize**
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

**sortParam**
Type: ConnectApi.FeedSortOrder
Values are:
• CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
• CreatedDateDesc—Sorts by most recent creation date.
• LastModifiedDateDesc—Sorts by most recent activity.
• MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
• Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds. Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

**result**
Type: ConnectApi.FeedItemPage
Object containing test data.

**Return Value**
Type: Void

**SEE ALSO:**
getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam)

setTestGetFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, updatedSince, result)
Register a ConnectApi.FeedItemPage object to be returned when the getFeedItemsFromFilterFeedUpdatedSince method is called in a test context.

**API Version**
30.0–31.0
public static Void setTestGetFeedItemsFromFilterFeedUpdatedSince(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String updatedSince, ConnectApi.FeedItemPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.

Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds. Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

updatedSince
Type: String
Opaque token containing information about the last modified date of the feed. Do not construct this token. To retrieve this token, call getFeedItemsFromFilterFeed and take the value from the updatesToken property of the ConnectApi.FeedItemPage response body.

result
Type: ConnectApi.FeedItemPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, updatedSince)

setTestGetFeedItemsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, ConnectApi.FeedItemPage, results)
Register a ConnectApi.FeedItemPage object to be returned when getFeedItemsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
30.0–31.0

Signature
public static Void setTestGetFeedItemsUpdatedSince(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedItemPage results)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Type of feed. Valid values are Company, DirectMessageModeration, DirectMessages, Home, Moderation, and PendingReview.

**recentCommentCount**
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

**density**
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

**pageSize**
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

**updatedSince**
Type: String
An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the updatesToken property of the ConnectApi.FeedItemPage response body.

**result**
Type: ConnectApi.FeedItemPage
Object containing test data.

**Return Value**
Type: Void

SEE ALSO:
- getFeedItemsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince)

**setTestGetFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, result)**
Register a ConnectApi.FeedItemPage object to be returned when getFeedItemsUpdatedSince is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

**API Version**
30.0–31.0
public static Void setTestGetFeedItemsUpdatedSince(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedItemPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
One of these values:
- Files
- Groups
- News
- People
- Record

subjectId
Type: String
If feedType is ConnectApi.Record, subjectId can be any record ID, including a group ID. Otherwise, it must be the context user or the alias me.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

updatedSince
Type: String
An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

```java
result
  Type: ConnectApi.FeedItemPage
  Object containing test data.
```

Return Value

Type: Void

SEE ALSO:

- `getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince)`
  *Apex Developer Guide: Testing ConnectApi Code*

```java
setTestGetFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)
```

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

30.0–31.0

Signature

```java
public static Void setTestGetFeedItemsUpdatedSince(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince, Boolean showInternalOnly, ConnectApi.FeedItemPage result)
```

Parameters

- `communityId`
  Type: String
  ID for an Experience Cloud site, `internal`, or `null`.

- `feedType`
  Type: `ConnectApi.FeedType`
  One of these values:
  - Files
  - Groups
  - News
  - People
  - Record
subjectId
Type: String
If `feedType` is `ConnectApi.Record`, `subjectId` can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String
An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

showInternalOnly
Type: Boolean
Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

result
Type: `ConnectApi.FeedItemPage`
Object containing test data.

Return Value
Type: Void

SEE ALSO:
- `getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly)`
- *Apex Developer Guide: Testing ConnectApi Code*
**setTestSearchFeedItems**(communityId, q, result)

Register a test feed item page to be returned when `searchFeedItems(communityId, q)` is called during a test.

**API Version**
28.0–31.0

**Signature**

```java
public static Void searchFeedItems(String communityId, String q, ConnectApi.FeedItemPage result)
```

**Parameters**

- **communityId**
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.

- **q**
  Type: `String`
  Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

- **result**
  Type: `ConnectApi.FeedItemPage`
  Object containing test data.

**Return Value**
Type: `Void`

**SEE ALSO:**
- `searchFeedItems(communityId, q)`

**setTestSearchFeedItems**(communityId, q, sortParam, result)

Register a test feed item page to be returned when `searchFeedItems(String, String, ConnectApi.FeedSortOrder)` is called during a test.

**API Version**
28.0–31.0

**Signature**

```java
public static Void setTestSearchFeedItems(String communityId, String q, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```
Parameters

**communityId**
- Type: String
- ID for an Experience Cloud site, internal, or null.

**q**
- Type: String
- Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

**sortParam**
- Type: ConnectApi.FeedSortOrder
- Values are:
  - CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
  - CreatedDateDesc—Sorts by most recent creation date.
  - LastModifiedDateDesc—Sorts by most recent activity.
  - MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
  - Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds. Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

**result**
- Type: ConnectApi.FeedItemPage
- The feed item test page.

Return Value

Type: Void

SEE ALSO:
- searchFeedItems(communityId, q, sortParam)

setTestSearchFeedItems(communityId, q, pageParam, pageSize, result)

Register a test feed item page to be returned when searchFeedItems(String, String, String, Integer) is called during a test.

API Version

28.0–31.0
Signature

```java
public static Void setTestSearchFeedItems(String communityId, String q, String pageParam,
Integer pageSize, ConnectApi.FeedItemPage result)
```

Parameters

- `communityId`  
  Type: String  
  ID for an Experience Cloud site, internal, or `null`.
- `q`  
  Type: String  
  Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See `Wildcards`.
- `pageParam`  
  Type: String  
  Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.
- `pageSize`  
  Type: Integer  
  Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.
- `result`  
  Type: `ConnectApi.FeedItemPage`  
  The test feed item page.

Return Value

Type: Void

SEE ALSO:

- `searchFeedItems(communityId, q, pageParam, pageSize)`

```java
setTestSearchFeedItems(communityId, q, pageParam, pageSize, sortParam, result)
```

Register a test feed item page to be returned when `searchFeedItems(String, String, String, Integer, ConnectApi.FeedSortOrder)` is called during a test.

API Version

28.0–31.0

Signature

```java
public static Void setTestSearchFeedItems(String communityId, String q, String pageParam,
Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```
Parameters

**communityId**
- Type: **String**
  - ID for an Experience Cloud site, internal, or **null**.

**q**
- Type: **String**
  - Required and can't be **null**. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

**pageParam**
- Type: **String**
  - Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in **null**, the first page is returned.

**pageSize**
- Type: **Integer**
  - Number of feed items per page. Valid values are from 1 through 100. If you pass in **null**, the default size is 25.

**sortParam**
- Type: **ConnectApi.FeedSortOrder**
  - Values are:
    - **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
    - **CreatedDateDesc**—Sorts by most recent creation date.
    - **LastModifiedDateDesc**—Sorts by most recent activity.
    - **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
    - **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds. Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in **null**, the default value `CreatedDateDesc` is used.

**result**
- Type: **ConnectApi.FeedItemPage**
  - The test feed item page.

Return Value

Type: **Void**

**SEE ALSO:**
- `searchFeedItems(communityId, q, pageParam, pageSize, sortParam)`
- [Apex Developer Guide: Testing ConnectApi Code](#)
setTestSearchFeedItems(communityId, q, recentCommentCount, pageParam, pageSize, sortParam, result)

Register a test feed item page to be returned when searchFeedItems(communityId, q, recentCommentCount, pageParam, pageSize, sortParam) is called during a test.

API Version
29.0–31.0

Signature
public static Void setTestSearchFeedItems(String communityId, String q, Integer recentCommentCount, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder
Values are:
• CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
• CreatedDateDesc—Sorts by most recent creation date.
• LastModifiedDateDesc—Sorts by most recent activity.
• MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
• Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in \texttt{null}, the default value \texttt{CreatedDateDesc} is used.

\texttt{result}

Type: \texttt{ConnectApi.FeedItemPage}

The test feed item page.

Return Value

Type: \texttt{Void}

SEE ALSO:

searchFeedItems(communityId, q, recentCommentCount, pageParam, pageSize, sortParam)

\texttt{setTestSearchFeedItemsInFeed(communityId, feedType, q, result)}

Register a \texttt{ConnectApi.FeedItemPage} object to be returned when the matching \texttt{ConnectApi.searchFeedItemsInFeed} method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0–31.0

Signature

\texttt{public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String q, ConnectApi.FeedItemPage result)}

Parameters

\texttt{communityId}

Type: \texttt{String}

ID for an Experience Cloud site, internal, or \texttt{null}.

\texttt{feedType}

Type: \texttt{ConnectApi.FeedType}

Type of feed. Valid values are Company, DirectMessageModeration, DirectMessages, Home, Moderation, and PendingReview.

\texttt{q}

Type: \texttt{String}

Required and can’t be \texttt{null}. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

\texttt{result}

Type: \texttt{ConnectApi.FeedItemPage}

Object containing test data.
setTestSearchFeedItemsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q, result)

Register a ConnectApi.FeedItemPage object to be returned when the matching ConnectApi.searchFeedItemsInFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
28.0–31.0

Signature

public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage result)

Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

feedType
  Type: ConnectApi.FeedType
  Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessageModeration, Draft, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.

pageParam
  Type: String
  Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
  Type: Integer
  Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
  Type: ConnectApi.FeedSortOrder
  Values are:
  • CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
• CreatedDateDesc—Sorts by most recent creation date.
• LastModifiedDateDesc—Sorts by most recent activity.
• MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the
  ConnectApi.FeedFilter is UnansweredQuestions.
• Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null,
the default value CreatedDateDesc is used.

q
Type: String
Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including
wildcards. See Wildcards.

result
Type: ConnectApi.FeedItemPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
  searchFeedItemsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q)

setTestSearchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a ConnectApi.FeedItemPage object to be returned when the matching
ConnectApi.searchFeedItemsInFeed method is called in a test context. Use the method with the same parameters or you
receive an exception.

API Version
29.0–31.0

Signature
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage result)

Parameters
  communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.
**feedType**  
Type: `ConnectApi.FeedType`  
Type of feed. Valid values include every `ConnectApi.FeedType` except Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.

**recentCommentCount**  
Type: `Integer`  
Maximum number of comments to return with each feed item. The default value is 3.

**density**  
Type: `ConnectApi.FeedDensity`  
Specify the amount of content in a feed.
- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**  
Type: `String`  
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**  
Type: `Integer`  
Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**  
Type: `ConnectApi.FeedSortOrder`  
Values are:
- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds. Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

**q**  
Type: `String`  
Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

**result**  
Type: `ConnectApi.FeedItemPage`  
Object containing test data.
Return Value
Type: Void

SEE ALSO:
searchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q)

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, q, result)

Register a ConnectApi.FeedItemPage object to be returned when the matching ConnectApi.searchFeedItemsInFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
28.0–31.0

Signature
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String q, ConnectApi.FeedItemPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessages, Filter, Landing, and Streams.

subjectId
Type: String
If feedType is Record, subjectId can be any record ID, including a group ID. If feedType is Streams, subjectId must be a stream ID. If feedType is Topics, subjectId must be a topic ID. If feedType is UserProfile, subjectId can be any user ID. If the feedType is any other value, subjectId must be the ID of the context user or the alias me.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: ConnectApi.FeedItemPage
Object containing test data.
Return Value
Type: Void

SEE ALSO:
searchFeedItemsInFeed(communityId, feedType, subjectId, q)

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)

Register a ConnectApi.FeedItemPage object to be returned when the matching
ConnectApi.searchFeedItemsInFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
28.0–31.0

Signature
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage result)

Parameters
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

feedType
  Type: ConnectApi.FeedType
  Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessages, Filter, Landing, and Streams.

subjectId
  Type: String
  If feedType is Record, subjectId can be any record ID, including a group ID. If feedType is Streams, subjectId must be a stream ID. If feedType is Topics, subjectId must be a topic ID. If feedType is UserProfile, subjectId can be any user ID. If the feedType is any other value, subjectId must be the ID of the context user or the alias me.

pageParam
  Type: String
  Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
  Type: Integer
  Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.
sortParam
Type: ConnectApi.FeedSortOrder
Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: ConnectApi.FeedItemPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
- searchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a ConnectApi.FeedItemPage object to be returned when the matching ConnectApi.searchFeedItemsInFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
29.0–31.0

Signature
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage result)
Parameters

**communityId**
- Type: String
- ID for an Experience Cloud site, internal, or null.

**feedType**
- Type: `ConnectApi.FeedType`
- Type of feed. Valid values include every `ConnectApi.FeedType` except Company, DirectMessages, Filter, Landing, and Streams.

**subjectId**
- Type: String
- If `feedType` is Record, `subjectId` can be any record ID, including a group ID. If `feedType` is Streams, `subjectId` must be a stream ID. If `feedType` is Topics, `subjectId` must be a topic ID. If `feedType` is UserProfile, `subjectId` can be any user ID. If the `feedType` is any other value, `subjectId` must be the ID of the context user or the alias me.

**recentCommentCount**
- Type: Integer
- Maximum number of comments to return with each feed item. The default value is 3.

**density**
- Type: `ConnectApi.FeedDensity`
- Specify the amount of content in a feed.
  - **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
  - **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

**pageParam**
- Type: String
- Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
- Type: Integer
- Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
- Type: `ConnectApi.FeedSortOrder`
- Values are:
  - **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
  - **CreatedDateDesc**—Sorts by most recent creation date.
  - **LastModifiedDateDesc**—Sorts by most recent activity.
  - **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the `ConnectApi.FeedFilter` is UnansweredQuestions.
  - **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.
Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: `String`
Required and can’t be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See `Wildcards`.

result
Type: `ConnectApi.FeedItemPage`
Object containing test data.

Return Value
Type: `Void`

SEE ALSO:
`searchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

```
setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, result)
```

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
29.0–31.0

Signature
```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly, ConnectApi.FeedItemPage result)
```

Parameters

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, `internal`, or `null`.

- `feedType`
  Type: `ConnectApi.FeedType`
  Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

- `subjectId`
  Type: `String`
  Subject ID for the search feed item.

- `recentCommentCount`
  Type: `Integer`
  Maximum number of recent comments to return.

- `density`
  Type: `ConnectApi.FeedDensity`
  Feed item density. Valid values include `All`, `Medium`, `Low`, and `High`.

- `pageParam`
  Type: `String`
  Custom query parameter.

- `pageSize`
  Type: `Integer`
  Number of items to return per page.

- `sortParam`
  Type: `ConnectApi.FeedSortOrder`
  Feed item sort order.

- `q`
  Type: `String`
  Search string. See `Wildcards`.

- `showInternalOnly`
  Type: `Boolean`
  Whether to show internal feeds.

- `result`
  Type: `ConnectApi.FeedItemPage`
  Object containing test data.
subjectId
Type: String

If feedType is Record, subjectId can be any record ID, including a group ID. If feedType is Streams, subjectId
must be a stream ID. If feedType is Topics, subjectId must be a topic ID. If feedType is UserProfile, subjectId
can be any user ID. If the feedType is any other value, subjectId must be the ID of the context user or the alias me.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken
or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration,
  Draft, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the
  ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null,
the default value CreatedDateDesc is used.

q
Type: String

Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean
Specifies whether to show only feed items from internal (non-Experience Cloud site) users (true), or not (false). The default value is false.

result
Type: ConnectApi.FeedItemPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
searchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly)

setTestSearchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Register a ConnectApi.FeedItemPage object to be returned when the matching ConnectApi.searchFeedItemsInFilterFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
28.0–31.0

Signature
public static Void setTestSearchFeedItemsInFilterFeed(String communityId, String subjectId, String keyPrefix, String q, ConnectApi.FeedItemPage result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

subjectId
Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

q
Type: String
Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`result`  
Type: `ConnectApi.FeedItemPage`  
Specify the test feed item page.

**Return Value**  
Type: Void

SEE ALSO:

```plaintext
public static Void setTestSearchFeedItemsInFilterFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String keyPrefix, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage result)
```

**Parameters**

- **communityId**  
  Type: `String`  
  ID for an Experience Cloud site, internal, or null.

- **feedType**  
  Type: `ConnectApi.FeedType`  
  Type of feed. Valid values include every `ConnectApi.FeedType` except Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.

- **subjectId**  
  Type: `String`  
  ID of the context user or the alias me.

- **keyPrefix**  
  Type: `String`
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

**pageParam**
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

**pageSize**
Type: Integer
Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

**sortParam**
Type: ConnectApi.FeedSortOrder
Values are:
- **CreateDateAsc**—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Moderation, and PendingReview feeds.
- **CreateDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType
Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessageModeration, DirectMessages, Filter, Home, Landing, Moderation, and PendingReview.

subjectId
Type: String
ID of the context user or the alias me.

keyPrefix
Type: String
A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 00S and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer
Maximum number of comments to return with each feed item. The default value is 3.

density
Type: ConnectApi.FeedDensity
Specify the amount of content in a feed.
• AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
• FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.
**pageParam**

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: **Integer**
Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
Type: **ConnectApi.FeedSortOrder**
Values are:
- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Moderation`, and `PendingReview` feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

**q**
Type: **String**
Required and can’t be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

**result**
Type: **ConnectApi.FeedItemPage**
Specify the test feed item page.

**Return Value**
Type: Void

SEE ALSO:
- `searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)`
  *Apex Developer Guide: Testing ConnectApi Code*

**ChatterGroups Class**
Information about groups, such as the group’s members, photo, and the groups the specified user is a member of. Add members to a group, remove members, and change the group photo.
Namespace

ConnectApi

ChatterGroups Methods

The following are methods for ChatterGroups. All methods are static.

IN THIS SECTION:

- `addMember(communityId, groupId, userId)`: Add a user to a group as a standard member.
- `addMemberWithRole(communityId, groupId, userId, role)`: Add a user with a role to a group.
- `addRecord(communityId, groupId, recordId)`: Associate a record with a group.
- `createGroup(communityId, groupInput)`: Create a group.
- `deleteBannerPhoto(communityId, groupId)`: Delete the group banner photo.
- `deleteGroup(communityId, groupId)`: Delete a group.
- `deleteMember(communityId, membershipId)`: Remove a member from a group.
- `deletePhoto(communityId, groupId)`: Delete the group photo.
- `getAnnouncements(communityId, groupId)`: Get the first page of announcements in a group.
- `getAnnouncements(communityId, groupId, pageParam, pageSize)`: Get a page of announcements in a group.
- `getBannerPhoto(communityId, groupId)`: Get the group banner photo.
- `getGroup(communityId, groupId)`: Get information about a group.
- `getGroupBatch(communityId, groupIds)`: Get information about a list of groups.
- `getGroupMembershipRequest(communityId, requestId)`: Get information about a request to join a private group.
- `getGroupMembershipRequests(communityId, groupId)`: Get information about every request to join a private group.
- `getGroupMembershipRequests(communityId, groupId, status)`: Get information about every request to join a private group that has a specified status.
getGroups(communityId)
Get the first page of groups.

groups(communityId, pageParam, pageSize)
Get a page of groups.

groups(communityId, pageParam, pageSize, archiveStatus)
Get a page of groups with an archive status.

getMember(communityId, membershipId)
Get information about a group member.

getMembers(communityId, groupId)
Get the first page of information about the members of a group.

groups(communityId, groupId, pageParam, pageSize)
Get a page of information about the members of a group.

getMembershipBatch(communityId, membershipIds)
Get information about a list of group memberships.

getMyChatterSettings(communityId, groupId)
Get the context user’s Chatter settings for a group.

groups(communityId, groupId)
Get the photo for a group.

getRecord(communityId, groupRecordId)
Get a record associated with a group.

getRecords(communityId, groupId)
Get the first page of records associated with a group.

groups(communityId, groupId, pageParam, pageSize)
Get a page of records associated with a group.

inviteUsers(groupId, invite)
Invite internal and external users to join a group.

postAnnouncement(communityId, groupId, announcement)
Post an announcement to a group.

removeRecord(communityId, groupRecordId)
Remove the association of a record with a group.

requestGroupMembership(communityId, groupId)
Request membership in a private group.

searchGroups(communityId, q)
Get the first page of groups that match the search criteria.

searchGroups(communityId, q, pageParam, pageSize)
Get a page of groups that match the search criteria.

searchGroups(communityId, q, archiveStatus, pageParam, pageSize)
Get a page of groups with the archive status that match the search criteria.

setBannerPhoto(communityId, groupId, fileId, versionNumber)
Set an uploaded file as the group banner photo.
setBannerPhoto(communityId, groupId, fileUpload)
Set a file that hasn’t been uploaded as the group banner photo.

setBannerPhotoWithAttributes(communityId, groupId, bannerPhoto)
Set and crop an uploaded file as the group banner photo.

setBannerPhotoWithAttributes(communityId, groupId, bannerPhoto, fileUpload)
Set and crop a file that hasn’t been uploaded as the group banner photo.

setPhoto(communityId, groupId, fileId, versionNumber)
Set an uploaded file as the group photo.

setPhoto(communityId, groupId, fileUpload)
Set a file that hasn’t been uploaded as the group photo.

setPhotoWithAttributes(communityId, groupId, photo)
Set and crop an uploaded file as the group photo.

setPhotoWithAttributes(communityId, groupId, photo, fileUpload)
Set and crop a file that hasn’t been uploaded as the group photo.

updateGroup(communityId, groupId, groupInput)
Update the settings of a group.

updateGroupMember(communityId, membershipId, role)
Update the role of a group member.

updateMyChatterSettings(communityId, groupId, emailFrequency)
Update the context user’s email frequency for a group.

updateRequestStatus(communityId, requestId, status)
Update a request to join a private group.

updateRequestStatus(communityId, requestId, status, responseMessage)
Update a request to join a private group and optionally provide a message when the request is denied.

addMember(communityId, groupId, userId)
Add a user to a group as a standard member.

API Version
28.0

Requires Chatter
Yes

Signature
public static ConnectApi.GroupMember addMember(String communityId, String groupId, String userId)
Parameters

- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or null.

- **groupId**
  Type: String
  ID for a group.

- **userId**
  Type: String
  ID for a user.

Return Value

Type: ConnectApi.GroupMember

Usage

To execute this method, the context user must be the group owner or moderator.

```
addMemberWithRole(communityId, groupId, userId, role)
```

Add a user with a role to a group.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMember addMemberWithRole(String communityId, String groupId, String userId, ConnectApi.GroupMembershipType role)
```

Parameters

- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or null.

- **groupId**
  Type: String
  ID for a group.

- **userId**
  Type: String
ID for a user.

**role**
Type: `ConnectApi.GroupMembershipType`
The group membership type. One of these values:
- GroupManager
- StandardMember

**Return Value**
Type: `ConnectApi.GroupMember`

**Usage**
To execute this method, the context user must be the group owner or moderator.

**addRecord(communityId, groupId, recordId)**
Associate a record with a group.

**API Version**
34.0

**Requires Chatter**
Yes

**Signature**
```
public static ConnectApi.GroupRecord addRecord(String communityId, String groupId, String recordId)
```

**Parameters**
- **communityId**
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.
- **groupId**
  Type: `String`
  ID of the group with which to associate the record.
- **recordId**
  Type: `String`
  ID of the record to associate with the group.

**Return Value**
Type: `ConnectApi.GroupRecord`
createGroup(communityId, groupInput)
Create a group.

API Version
29.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterGroupDetail createGroup(String communityId, ConnectApi.ChatterGroupInput groupInput)

Parameters

communityId
Type: String,
ID for an Experience Cloud site, internal, or null.

groupInput
Type: ConnectApi.ChatterGroupInput
The properties of the group.

Return Value
Type: ConnectApi.ChatterGroupDetail

deleteBannerPhoto(communityId, groupId)
Delete the group banner photo.

API Version
36.0

Requires Chatter
Yes

Signature
public static Void deleteBannerPhoto(String communityId, String groupId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

groupId
  Type: String
  ID of the group.

Return Value
Type: Void

Usage
This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

deleteGroup(communityId, groupId)
Delete a group.

API Version
29.0

Requires Chatter
Yes

Signature
public static Void deleteGroup(String communityId, String groupId)

Parameters
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

groupId
  Type: String
  ID for a group.

Return Value
Type: Void

deleteMember(communityId, memberId)
Remove a member from a group.

API Version
28.0
Requires Chatter
Yes

Signature
public static Void deleteMember(String communityId, String membershipId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

membershipId
Type: String
ID for a membership.

Return Value
Type: Void

Usage
This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

deletePhoto(communityId, groupId)
Delete the group photo.

API Version
28.0

Requires Chatter
Yes

Signature
public static Void deletePhoto(String communityId, String groupId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

groupId
Type: String
ID for a group.
Return Value
Type: Void

Usage
This method is only successful when the context user is the group manager or owner, or has Modify All Data permission.

getAnnouncements(communityId, groupId)
Get the first page of announcements in a group.

API Version
31.0

Requires Chatter
Yes

Signature
public static ConnectApi.AnnouncementPage getAnnouncements(String communityId, String groupId)

Parameters
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

groupId
  Type: String
  ID for a group.

Return Value
Type: ConnectApi.AnnouncementPage

Usage
To post an announcement, get information about an announcement, update the expiration date of an announcement, or delete an announcement, use the methods of the ConnectApi.Announcements class.

getAnnouncements(communityId, groupId, pageParam, pageSize)
Get a page of announcements in a group.

API Version
31.0
Requires Chatter
Yes

Signature

```java
public static ConnectApi.AnnouncementPage getAnnouncements(String communityId, String groupId, Integer pageParam, Integer pageSize)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **groupId**
  - Type: `String`
  - ID for a group.

- **pageParam**
  - Type: `Integer`
  - Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

- **pageSize**
  - Type: `Integer`
  - Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.AnnouncementPage`

Usage

To post an announcement, get information about an announcement, update the expiration date of an announcement, or delete an announcement, use the methods of the `ConnectApi.Announcements` class.

`getBannerPhoto(communityId, groupId)`

Get the group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.BannerPhoto getBannerPhoto(String communityId, String groupId)
```
Parameters

**communityId**
Type: String
ID for an Experience Cloud site, internal, or null.

**groupId**
Type: String
The ID of the group.

Return Value
Type: `ConnectApi.BannerPhoto`

**getGroup(communityId, groupId)**
Get information about a group.

API Version
28.0

Available to Guest Users
31.0

Requires Chatter
Yes

Signature

```
public static ConnectApi.ChatterGroupDetail getGroup(String communityId, String groupId)
```

Parameters

**communityId**
Type: String
ID for an Experience Cloud site, internal, or null.

**groupId**
Type: String
ID for a group.

Return Value
Type: `ConnectApi.ChatterGroupDetail`

**getGroupBatch(communityId, groupIds)**
Get information about a list of groups.
API Version
31.0

Requires Chatter
Yes

Signature
public static ConnectApi.BatchResult[] getGroupBatch(String communityId, List<String> groupIds)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

groupId
Type: List<String>
A list of up to 500 group IDs.

Return Value
Type: ConnectApi.BatchResult[]
The ConnectApi.BatchResult.getResult() method returns a ConnectApi.ChatterGroup object and errors embedded in the results for groups that didn’t load.

Example
```
// Create a list of groups.
ConnectApi.ChatterGroupPage groupPage = ConnectApi.ChatterGroups.getGroups(null);

// Create a list of group IDs.
List<String> groupIds = new List<String>();
for (ConnectApi.ChatterGroup aGroup : groupPage.groups){
    groupIds.add(aGroup.id);
}

// Get info about all the groups in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterGroups.getGroupBatch(null, groupIds);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        ConnectApi.ChatterGroup aGroup;
        if (batchResult.getResult() instanceof ConnectApi.ChatterGroup) {
            aGroup = (ConnectApi.ChatterGroup) batchResult.getResult();
        }
    }
```
System.debug('SUCCESS');
System.debug(aGroup.memberCount);
}
else {
    // Operation failed. Print errors.
    System.debug('FAILURE');
    System.debug(batchResult.getErrorMessage());
}

SEE ALSO:
getMembershipBatch(communityId, membershipIds)

getGroupMembershipRequest(communityId, requestId)
Get information about a request to join a private group.

API Version
28.0

Requires Chatter
Yes

Signature
public static ConnectApi.GroupMembershipRequest getGroupMembershipRequest(String communityId, String requestId)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.
requestId
Type: String
The ID of a request to join a private group.

Return Value
Type: ConnectApi.GroupMembershipRequest

Usage
This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.
**getGroupMembershipRequests(communityId, groupId)**

Get information about every request to join a private group.

API Version

28.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.GroupMembershipRequests getGroupMembershipRequests(String communityId, String groupId)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or null.

- **groupId**
  - Type: `String`
  - ID for a group.

Return Value

Type: `ConnectApi.GroupMembershipRequests`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

**getGroupMembershipRequests(communityId, groupId, status)**

Get information about every request to join a private group that has a specified status.

API Version

28.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.GroupMembershipRequests getGroupMembershipRequests(String communityId, String groupId, ConnectApi.GroupMembershipRequestStatus status)
```
Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`groupId`
Type: `String`
ID for a group.

`status`
Type: `ConnectApi.GroupMembershipRequestStatus`
  `status`—Status of a request to join a private group.
  - Accepted
  - Declined
  - Pending

Return Value
Type: `ConnectApi.GroupMembershipRequests`

Usage
This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

`getGroups(communityId)`
Get the first page of groups.

API Version
28.0

Available to Guest Users
31.0

Requires Chatter
Yes

Signature
`public static ConnectApi.ChatterGroupPage getGroups(String communityId)`

Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`. 
Return Value
Type: `ConnectApi.ChatterGroupPage`

`getGroups(communityId, pageParam, pageSize)`
Get a page of groups.

API Version
28.0

Available to Guest Users
31.0

Requires Chatter
Yes

Signature
`public static ConnectApi.ChatterGroupPage getGroups(String communityId, Integer pageParam, Integer pageSize)`

Parameters
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.
- `pageParam`
  Type: `Integer`
  Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.
- `pageSize`
  Type: `Integer`
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value
Type: `ConnectApi.ChatterGroupPage`

`getGroups(communityId, pageParam, pageSize, archiveStatus)`
Get a page of groups with an archive status.

API Version
29.0
Available to Guest Users
31.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterGroupPage getGroups(String communityId, Integer pageParam, Integer pageSize, ConnectApi.GroupArchiveStatus archiveStatus)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

archiveStatus
Type: ConnectApi.GroupArchiveStatus
Archive status of groups.

• All—All groups, including groups that are archived and groups that aren’t archived.
• Archived—Groups that are archived.
• NotArchived—Groups that aren’t archived.
If you pass in null, the default value is All.

Return Value
Type: ConnectApi.ChatterGroupPage

getMember(communityId, membershipId)
Get information about a group member.

API Version
28.0

Requires Chatter
Yes
Signature

```java
public static ConnectApi.GroupMember getMember(String communityId, String membershipId)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `membershipId`
  - Type: `String`
  - ID for a membership.

Return Value

Type: `ConnectApi.GroupMember`

```java
getMembers(communityId, groupId)
```

Get the first page of information about the members of a group.

API Version

28.0

Available to Guest Users

36.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.GroupMemberPage getMembers(String communityId, String groupId)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `groupId`
  - Type: `String`
  - ID for a group.

Return Value

Type: `ConnectApi.GroupMemberPage`
**getMembers(communityId, groupId, pageParam, pageSize)**
Get a page of information about the members of a group.

**API Version**
28.0

**Available to Guest Users**
36.0

**Requires Chatter**
Yes

**Signature**
```
public static ConnectApi.GroupMemberPage getMembers(String communityId, String groupId, Integer pageParam, Integer pageSize)
```

**Parameters**
- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.
- **groupId**
  - Type: String
  - ID for a group.
- **pageParam**
  - Type: Integer
  - Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.
- **pageSize**
  - Type: Integer
  - Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

**Return Value**
Type: ConnectApi.GroupMemberPage

**getMembershipBatch(communityId, membershipIds)**
Get information about a list of group memberships.

**API Version**
31.0
Requires Chatter
Yes

Signature

```java
public static ConnectApi.BatchResult[] getMembershipBatch(String communityId,
List<String> membershipIds)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `membershipIds`
  - Type: `List<String>`
  - A list of up to 500 group membership IDs.

Return Value

- Type: `ConnectApi.BatchResult[]`

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.GroupMember` object and errors embedded in the results for group memberships that didn’t load.

Example

```java
// Get members of a group.
ConnectApi.GroupMemberPage membersPage = ConnectApi.ChatterGroups.getMembers(null,
'0F9D00000000oOT');

// Create a list of membership IDs.
List<String> membersList = new List<String>();
for (ConnectApi.GroupMember groupMember : membersPage.members){
    membersList.add(groupMember.id);
}

// Get info about all group memberships in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterGroups.getMembershipBatch(null,
membersList);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the first name of each member.
        ConnectApi.GroupMember groupMember;
        if(batchResult.getResult() instanceof ConnectApi.GroupMember) {
            groupMember = (ConnectApi.GroupMember) batchResult.getResult();
        } System.debug('SUCCESS');
        System.debug(groupMember.user.firstName);
    }
else {
    // Operation failed. Print errors.
    System.debug('FAILURE');
    System.debug(batchResult.getErrorMessage());
}

SEE ALSO:

getGroupBatch(communityId, groupIds)

getMyChatterSettings(communityId, groupId)
Get the context user’s Chatter settings for a group.

API Version
28.0

Requires Chatter
Yes

Signature
public static ConnectApi.GroupChatterSettings getMyChatterSettings(String communityId, String groupId)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

groupId
Type: String
ID for a group.

Return Value
Type: ConnectApi.GroupChatterSettings

getPhoto(communityId, groupId)
Get the photo for a group.

API Version
28.0
Requires Chatter
Yes

Signature

public static ConnectApi.Photo getPhoto(String communityId, String groupId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

groupId
Type: String
ID for a group.

Return Value
Type: ConnectApi.Photo

getRecord(communityId, groupRecordId)
Get a record associated with a group.

API Version
34.0

Requires Chatter
Yes

Signature

public static ConnectApi.GroupRecord getRecord(String communityId, String groupRecordId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

groupRecordId
Type: String
ID of the group record.

Return Value
Type: ConnectApi.GroupRecord
**getRecords(communityId, groupId)**

Get the first page of records associated with a group.

**API Version**

33.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.GroupRecordPage getRecords(String communityId, String groupId)
```

**Parameters**

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.
- **groupId**
  - Type: String
  - ID for a group.

**Return Value**

Type: `ConnectApi.GroupRecordPage`

**getRecords(communityId, groupId, pageParam, pageSize)**

Get a page of records associated with a group.

**API Version**

33.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.GroupRecordPage getRecords(String communityId, String groupId, Integer pageParam, Integer pageSize)
```

**Parameters**

- **communityId**
  - Type: String
ID for an Experience Cloud site, internal, or null.

groupId
Type: String
ID for a group.

groupId
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: ConnectApi.GroupRecordPage

inviteUsers(groupId, invite)
Invite internal and external users to join a group.

API Version
39.0

Requires Chatter
Yes

Signature
public static ConnectApi.Invitations inviteUsers(String groupId, ConnectApi.InviteInput invite)

Parameters

groupId
Type: String
ID of the group.

invite
Type: ConnectApi.InviteInput
A ConnectApi.InviteInput body.

Return Value
Type: ConnectApi.Invitations
postAnnouncement(communityId, groupId, announcement)

Post an announcement to a group.

API Version
31.0

Requires Chatter
Yes

Signature
public static ConnectApi.Announcement postAnnouncement(String communityId, String groupId, ConnectApi.AnnouncementInput announcement)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

groupId
Type: String
ID for a group.

announcement
Type: ConnectApi.AnnouncementInput
A ConnectApi.AnnouncementInput object.

Return Value
Type: ConnectApi.Announcement

Usage
Use an announcement to highlight information. Users can discuss, like, and post comments on announcements. Deleting the feed post deletes the announcement.

To post an announcement, get information about an announcement, update the expiration date of an announcement, or delete an announcement, use the methods of the ConnectApi.Announcements class.

removeRecord(communityId, groupRecordId)

Remove the association of a record with a group.

API Version
34.0
Requires Chatter
Yes

Signature

\[
\text{public static Void removeRecord(} \text{String communityId, String groupRecordId)}
\]

Parameters

\[
\text{communityId}
\]
Type: \text{String}
ID for an Experience Cloud site, internal, or \text{null}.

\[
\text{groupRecordId}
\]
Type: \text{String}
ID of the group record.

Return Value
Type: \text{Void}

\[
\text{requestGroupMembership(} \text{String communityId, String groupId)}
\]
Request membership in a private group.

API Version
28.0

Requires Chatter
Yes

Signature

\[
\text{public static ConnectApi.GroupMembershipRequest requestGroupMembership(} \text{String communityId, String groupId)}
\]

Parameters

\[
\text{communityId}
\]
Type: \text{String}
ID for an Experience Cloud site, internal, or \text{null}.

\[
\text{groupId}
\]
Type: \text{String}
ID for a group.
Return Value
Type: ConnectApi.GroupMembershipRequest

Sample: Requesting to Join a Private Group
This sample code calls ConnectApi.ChatterGroups.requestGroupMembership to request to join a private group.

```java
String communityId = null;
ID groupId = '0F9x00000000hAZ';

ConnectApi.GroupMembershipRequest membershipRequest =
ConnectApi.ChatterGroups.requestGroupMembership(communityId, groupId);
```

`searchGroups(communityId, q)`
Get the first page of groups that match the search criteria.

API Version
28.0

Available to Guest Users
31.0

Requires Chatter
Yes

Signature
`public static ConnectApi.ChatterGroupPage searchGroups(String communityId, String q)`

Parameters
`communityId`
Type: String
ID for an Experience Cloud site, internal, or null.

`q`
Type: String
Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as null.

Return Value
Type: ConnectApi.ChatterGroupPage
Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
  setTestSearchGroups(communityId, q, result)

searchGroups(communityId, q, pageParam, pageSize)
Get a page of groups that match the search criteria.

API Version
28.0

Available to Guest Users
31.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterGroupPage searchGroups(String communityId, String q, Integer pageParam, Integer pageSize)

Parameters
  communityId
    Type: String
    ID for an Experience Cloud site, internal, or null.
  q
    Type: String
    Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as null.
  pageParam
    Type: Integer
    Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.
  pageSize
    Type: Integer
    Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.
Return Value
Type: `ConnectApi.ChatterGroupPage`

Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestSearchGroups(communityId, q, pageParam, pageSize, result)`  
  *Apex Developer Guide: Testing ConnectApi Code*

`searchGroups(communityId, q, archiveStatus, pageParam, pageSize)`
Get a page of groups with the archive status that match the search criteria.

API Version
29.0

Available to Guest Users
31.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.ChatterGroupPage searchGroups(String communityId, String q, ConnectApi.GroupArchiveStatus archiveStatus, Integer pageParam, Integer pageSize)
```

Parameters
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.
- `q`
  Type: `String`
  Specifies the string to search. The search string must contain at least two characters, not including wildcards. See `Wildcards`. Can be specified as `null`.
- `archiveStatus`
  Type: `ConnectApi.GroupArchiveStatus`
  Archive status of groups.
  - **All**—All groups, including groups that are archived and groups that aren’t archived.
  - **Archived**—Groups that are archived.
NotArchived—Groups that aren’t archived.

**pageParam**
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

**pageSize**
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**Return Value**
Type: `ConnectApi.ChatterGroupPage`

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestSearchGroups(communityId, q, archiveStatus, pageParam, pageSize, result)`

### `setBannerPhoto(communityId, groupId, fileId, versionNumber)`
Set an uploaded file as the group banner photo.

**API Version**
36.0

**Requires Chatter**
Yes

**Signature**
```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String groupId, String fileId, Integer versionNumber)
```

**Parameters**
- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or `null`.
- **groupId**
  Type: String
  The ID of the group.
**fileId**
Type: *String*
The ID of the already uploaded file. The key prefix must be 069, and the image must be smaller than 8 MB.

**versionNumber**
Type: *Integer*
Version number of the existing file. Specify either an existing version number or, to get the latest version, specify `null`.

**Return Value**
Type: *ConnectApi.BannerPhoto*

**Usage**
This method is successful only when the context user is the group manager or owner, or has Modify All Data permission. Photos are processed asynchronously and might not be visible right away.

**setBannerPhoto(communityId, groupId, fileUpload)**
Set a file that hasn’t been uploaded as the group banner photo.

**API Version**
36.0

**Requires Chatter**
Yes

**Signature**
```java
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String groupId, ConnectApi.BinaryInput fileUpload)
```

**Parameters**

**communityId**
Type: *String*
ID for an Experience Cloud site, internal, or `null`.

**groupId**
Type: *String*
The ID of the group.

**fileUpload**
Type: *ConnectApi.BinaryInput*
File to use as the photo. The content type must be usable as an image.
Return Value
Type: `ConnectApi.BannerPhoto`

Usage
This method is successful only when the context user is the group manager or owner, or has Modify All Data permission. Photos are processed asynchronously and might not be visible right away.

```java
setBannerPhotoWithAttributes(communityId, groupId, bannerPhoto)
```
Set and crop an uploaded file as the group banner photo.

API Version
36.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId, String groupId, ConnectApi.BannerPhotoInput bannerPhoto)
```

Parameters
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.
- `groupId`
  Type: `String`
  The ID of the group.
- `bannerPhoto`
  Type: `ConnectApi.BannerPhotoInput`
  A `ConnectApi.BannerPhotoInput` object that specifies the ID and version of the file, and how to crop the file.

Return Value
Type: `ConnectApi.BannerPhoto`

Usage
This method is successful only when the context user is the group manager or owner, or has Modify All Data permission. Photos are processed asynchronously and might not be visible right away.
setBannerPhotoWithAttributes(communityId, groupId, bannerPhoto, fileUpload)

Set and crop a file that hasn’t been uploaded as the group banner photo.

API Version
36.0

Requires Chatter
Yes

Signature
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId, String groupId, ConnectApi.BannerPhotoInput bannerPhoto, ConnectApi.BinaryInput fileUpload)

Parameters
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

groupId
  Type: String
  The ID of the group.

bannerPhoto
  Type: ConnectApi.BannerPhotoInput
  A ConnectApi.BannerPhotoInput object specifying the cropping parameters.

fileUpload
  Type: ConnectApi.BinaryInput
  File to use as the photo. The content type must be usable as an image.

Return Value
Type: ConnectApi.BannerPhoto

Usage
This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.
Photos are processed asynchronously and might not be visible right away.

setPhoto(communityId, groupId, fileId, versionNumber)

Set an uploaded file as the group photo.
API Version

28.0

Requires Chatter

Yes

Signature

public static ConnectApi.Photo setPhoto(String communityId, String groupId, String fileId, Integer versionNumber)

Parameters

communityId
    Type: String
    ID for an Experience Cloud site, internal, or null.

groupId
    Type: String
    ID for a group.

fileId
    Type: String
    ID of a file already uploaded. The key prefix must be 069, and the file must be an image that is smaller than 2 GB.

versionNumber
    Type: Integer
    Version number of the existing file. Specify either an existing version number or, to get the latest version, specify null.

Return Value

Type: ConnectApi.Photo

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

Sample: Updating a Group Photo with an Existing File

When a group is created, it doesn’t have a group photo. You can set an existing photo that has already been uploaded to Salesforce as the group photo. The key prefix must be 069 and the file size must be less than 2 GB.

    String communityId = null;
    ID groupId = '0F9x00000000hAK';
    ID fileId = '069x00000001Ion';

    // Set photo
    ConnectApi.Photo photo = ConnectApi.ChatterGroups.setPhoto(communityId, groupId, fileId, null);
**setPhoto(communityId, groupId, fileUpload)**

Set a file that hasn’t been uploaded as the group photo.

**API Version**

28.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.Photo setPhoto(String communityId, String groupId, ConnectApi.BinaryInput fileUpload)
```

**Parameters**

- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or null.

- **groupId**
  Type: String
  ID for a group.

- **fileUpload**
  Type: ConnectApi.BinaryInput
  File to use as the photo. The content type must be usable as an image.

**Return Value**

Type: ConnectApi.Photo

**Usage**

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission. Photos are processed asynchronously and might not be visible right away.

**Sample: Uploading a New File and Using It as a Group Photo**

When a group is created, it doesn’t have a group photo. You can upload a photo and set it as the group photo.

```java
String communityId = null;
ID groupId = '0F9x00000000hAP';
ID photoId = '069x00000001Io0';

// Set photo
List<ContentVersion> groupPhoto = [Select c.VersionData From ContentVersion c where ContentDocumentId=:photoId];
ConnectApi.BinaryInput binary = new ConnectApi.BinaryInput(groupPhoto.get(0).VersionData,
```
ConnectApi.Photo photo = ConnectApi.ChatterGroups.setPhoto(communityId, groupId, binary);

setPhotoWithAttributes(communityId, groupId, photo)
Set and crop an uploaded file as the group photo.

API Version
29.0

Requires Chatter
Yes

Signature
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String groupId, ConnectApi.PhotoInput photo)

Parameters
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

groupId
  Type: String
  ID for a group.

photo
  Type: ConnectApi.PhotoInput
  A ConnectApi.PhotoInput object that specifies the ID and version of the file, and how to crop the file.

Return Value
Type: ConnectApi.Photo

Usage
This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.
Photos are processed asynchronously and might not be visible right away.

setPhotoWithAttributes(communityId, groupId, photo, fileUpload)
Set and crop a file that hasn’t been uploaded as the group photo.
API Version
29.0

Requires Chatter
Yes

Signature

public static ConnectApi.PhotosetPhotoWithAttributes(String communityId, String groupId, ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)

Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

groupId
  Type: String
  ID for a group.

photo
  Type: ConnectApi.PhotoInput
  A ConnectApi.PhotoInput object that specifies how to crop the file specified in fileUpload.

fileUpload
  Type: ConnectApi.BinaryInput
  File to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.Photo

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.
Photos are processed asynchronously and might not be visible right away.

updateGroup(communityId, groupId, groupInput)

Update the settings of a group.

API Version
28.0

Requires Chatter
Yes
Signature

public static ConnectApi.ChatterGroup updateGroup(String communityId, String groupId, ConnectApi.ChatterGroupInput groupInput)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

groupId
Type: String
ID for a group.

groupInput
Type: ConnectApi.ChatterGroupInput
A ConnectApi.ChatterGroupInput object.

Return Value
Type: ConnectApi.ChatterGroup

Usage
This method is successful only when the context user is the group manager or owner, or has Modify All Data permission. Use this method to update any settings in the ConnectApi.ChatterGroupInput class. These settings include the group title and text in the “Information” section, whether the group is public or private, and whether the group is archived.

Example
This example archives a group.

```java
String groupId = '0F9D00000000qSz';
String communityId = null;
ConnectApi.ChatterGroupInput groupInput = new ConnectApi.ChatterGroupInput();
groupInput.isArchived = true;
ConnectApi.ChatterGroups.updateGroup(communityId, groupId, groupInput);
```

updateGroupMember(communityId, membershipId, role)
Update the role of a group member.

API Version
29.0

Requires Chatter
Yes
Signature

```java
public static ConnectApi.ChatterGroup updateGroupMember(String communityId, String membershipId, ConnectApi.GroupMembershipType role)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `membershipId`
  - Type: `String`
  - ID for a membership.

- `role`
  - Type: `ConnectApi.GroupMembershipType`
  - The group membership type. One of these values:
    - `GroupManager`
    - `StandardMember`

Return Value

Type: `ConnectApi.ChatterGroup`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

```java
updateMyChatterSettings(communityId, groupId, emailFrequency)
```

Update the context user's email frequency for a group.

API Version

28.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.GroupChatterSettings updateMyChatterSettings(String communityId, String groupId, ConnectApi.GroupEmailFrequency emailFrequency)
```

Parameters

- `communityId`
  - Type: `String`
ID for an Experience Cloud site, internal, or null.

**groupId**
Type: String
ID for a group.

**emailFrequency**
Type: `ConnectApi.GroupEmailFrequency`
Frequency with which a user receives email.
- EachPost
- DailyDigest
- WeeklyDigest
- Never
- UseDefault
The value UseDefault uses the value set in a call to `updateChatterSettings(communityId, userId, defaultGroupEmailFrequency)`.

**Return Value**
Type: `ConnectApi.GroupChatterSettings`

**updateRequestStatus(communityId, requestId, status)**
Update a request to join a private group.

**API Version**
28.0

**Requires Chatter**
Yes

**Signature**

```java
public static ConnectApi.GroupMembershipRequest updateRequestStatus(String communityId, String requestId, ConnectApi.GroupMembershipRequestStatus status)
```

**Parameters**

**communityId**
Type: String
ID for an Experience Cloud site, internal, or null.

**requestId**
Type: String
ID for a request to join a private group.

**status**
Type: `ConnectApi.GroupMembershipRequestStatus`
Status of the request:
• Accepted
• Declined

The Pending value of the enum is not valid in this method.

Return Value
Type: ConnectApi.GroupMembershipRequest

Usage
This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Sample: Accepting or Declining a Request to Join a Private Group
This sample code calls ConnectApi.ChatterGroups.updateRequestStatus and passes it the membership request ID and an ConnectApi.GroupMembershipRequestStatus.Accepted status. You can also pass ConnectApi.GroupMembershipRequestStatus.Declined.

```java
String communityId = null;
ID groupId = '0F9x00000000hAZ';
String requestId = '0I5x000000001snCAA';

ConnectApi.GroupMembershipRequest membershipRequestRep =
ConnectApi.ChatterGroups.updateRequestStatus(communityId, requestId,
ConnectApi.GroupMembershipRequestStatus.Accepted);
```

updateRequestStatus(communityId, requestId, status, responseMessage)
Update a request to join a private group and optionally provide a message when the request is denied.

API Version
35.0

Requires Chatter
Yes

Signature
public static ConnectApi.GroupMembershipRequest updateRequestStatus(String communityId,
String requestId, ConnectApi.GroupMembershipRequestStatus status, String responseMessage)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.
requestId
Type: String
ID for a request to join a private group.

status
Type: ConnectApi.GroupMembershipRequestStatus
Status of the request:
• Accepted
• Declined
The Pending value of the enum is not valid in this method.

responseMessage
Type: String
Provide a message to the user if their membership request is declined. The value of this property is used only when the value of the status property is Declined.
The maximum length is 756 characters.

Return Value
Type: ConnectApi.GroupMembershipRequest

Usage
This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

ChatterGroups Test Methods
The following are the test methods for ChatterGroups. All methods are static.
For information about using these methods to test your ConnectApi code, see Testing ConnectApi Code.

setTestSearchGroups(communityId, q, result)
Register a ConnectApi.ChatterGroupPage object to be returned when the matching ConnectApi.searchGroups method is called in a test context. Use the test method with the same parameters or you receive an exception.

API Version
29.0

Signature
public static Void setTestSearchGroups(String communityId, String q, ConnectApi.ChatterGroupPage result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as null.

result
Type: ConnectApi.ChatterGroupPage
Test ConnectApi.ChatterGroupPage object.

Return Value
Type: Void

SEE ALSO:
searchGroups(communityId, q)

setTestSearchGroups(communityId, q, pageParam, pageSize, result)

Register a ConnectApi.ChatterGroupPage object to be returned when the matching ConnectApi.searchGroups method is called in a test context. Use the test method with the same parameters or you receive an exception.

API Version
28.0

Signature
public static Void setTestSearchGroups(String communityId, String q, Integer pageParam, Integer pageSize, ConnectApi.ChatterGroupPage result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as null.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

```java
result
    Type: ConnectApi.ChatterGroupPage
    Test ConnectApi.ChatterGroupPage object.
```

Return Value
Type: Void

SEE ALSO:
- `searchGroups(communityId, q, pageParam, pageSize)`

```java
setTestSearchGroups(communityId, q, archiveStatus, pageParam, pageSize, result)
```

Register a ConnectApi.ChatterGroupPage object to be returned when the matching ConnectApi.searchGroups method is called in a test context. Use the test method with the same parameters or you receive an exception.

API Version
29.0

Signature
```java
public static Void setTestSearchGroups(String communityId, String q,
ConnectApi.GroupArchiveStatus, archiveStatus, Integer pageParam, Integer pageSize,
ConnectApi.ChatterGroupPage result)
```

Parameters
- `communityId`
  Type: String
  ID for an Experience Cloud site, internal, or null.
- `q`
  Type: String
  Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as null.
- `archiveStatus`
  Type: ConnectApi.GroupArchiveStatus
  Archive status of groups.
  - All—all groups, including groups that are archived and groups that aren’t archived.
  - Archived—Groups that are archived.
  - NotArchived—Groups that aren’t archived.
pageParam  
Type: Integer  
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.  

pageSize  
Type: Integer  
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.  

result  
Type: ConnectApi.ChatterGroupPage  
Test ConnectApi.ChatterGroupPage object.  

Return Value  
Type: Void  

SEE ALSO:  
searchGroups(communityId, q, archiveStatus, pageParam, pageSize)  

ChatterMessages Class  
Get, send, search, and reply to private messages. You can also get and search private conversations, mark conversations as read, and get a count of unread private messages.  

Namespace  
ConnectApi  

Usage  
Private messages and direct messages are different features. Direct messages are newer and offer a richer feature set for private communication in Experience Cloud sites. Direct messages are a capability within Chatter feeds. To work with direct messages, use the ChatterFeeds Class.  

ChatterMessages Methods  
The following are methods for ChatterMessages. All methods are static.  

IN THIS SECTION:  
getConversation(conversationId)  
Get a conversation.  
getConversation(conversationId, pageParam, pageSize)  
Get a page of a conversation.  
getConversation(communityId, conversationId)  
Get a conversation from an Experience Cloud site.
getConversation(communityId, conversationId, pageParam, pageSize)
Get a page of a conversation from an Experience Cloud site.

getConversations()
Get the most recent conversations.

getConversations(pageParam, pageSize)
Get a page of conversations.

getConversations(communityId)
Get the most recent conversations from an Experience Cloud site.

getConversations(communityId, pageParam, pageSize)
Get a page of conversations from an Experience Cloud site.

ggetMessage(messageId)
Get a message.

ggetMessage(communityId, messageId)
Get a message from an Experience Cloud site.

getMessages()
Get the most recent messages.

getMessages(pageParam, pageSize)
Get a page of messages.

getMessages(communityId)
Get the most recent messages from an Experience Cloud site.

getMessages(communityId, pageParam, pageSize)
Get a page of messages from an Experience Cloud site.

getUnreadCount()
Get the number of conversations that are marked unread.

getUnreadCount(communityId)
Get the number of conversations that are marked unread in an Experience Cloud site.

markConversationRead(conversationId, read)
Mark a conversation as read or unread.

markConversationRead(communityId, conversationID, read)
Mark a conversation as read or unread in an Experience Cloud site.

replyToMessage(text, inReplyTo)
Reply to a message.

replyToMessage(communityId, text, inReplyTo)
Reply to a message in an Experience Cloud site.

searchConversation(conversationId, q)
Get a conversation that matches the search criteria.

searchConversation(conversationId, pageParam, pageSize, q)
Get a conversation with a page of messages that match the search criteria.

searchConversation(communityId, conversationId, q)
Get a conversation with messages that match the search criteria in an Experience Cloud site.
searchConversation(communityId, conversationId, pageParam, pageSize, q)
Get a conversation with a page of messages that match the search criteria in an Experience Cloud site.

searchConversations(q)
Get conversations in which member names and messages match the search criteria.

searchConversations(pageParam, pageSize, q)
Get a page of conversations in which member names and messages match the search criteria.

searchConversations(communityId, q)
Get conversations in which member names and messages match the search criteria in an Experience Cloud site.

searchConversations(communityId, pageParam, pageSize, q)
Get a page of conversations in which member names and messages match the search criteria in an Experience Cloud site.

searchMessages(q)
Get messages that match the search criteria.

searchMessages(pageParam, pageSize, q)
Get a page of messages that match the search criteria.

searchMessages(communityId, q)
Get messages that match the search criteria in an Experience Cloud site.

searchMessages(communityId, pageParam, pageSize, q)
Get a page of messages that match the search criteria in an Experience Cloud site.

sendMessage(text, recipients)
Send a message to a list of recipients.

sendMessage(communityId, text, recipients)
Send a message to a list of recipients in an Experience Cloud site.

getConversation(conversationId)
Get a conversation.

API Version
29.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterConversation getConversation(String conversationId)

Parameters
conversationId
Type: String
ID for the conversation.
Return Value
Type: ConnectApi.ChatterConversation

getConversation(conversationId, pageParam, pageSize)
Get a page of a conversation.

API Version
29.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterConversation getConversation(String conversationId, String pageParam, Integer pageSize)

Parameters
conversationId
Type: String
ID for the conversation.

pageParam
Type: String
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: ConnectApi.ChatterConversation

getConversation(communityId, conversationId)
Get a conversation from an Experience Cloud site.

API Version
30.0

Requires Chatter
Yes
Signature

```java
public static ConnectApi.ChatterConversation getConversation(String communityId, String conversationId)
```

Parameters

- `communityId`: Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.
- `conversationId`: Type: `String`
  - ID for the conversation.

Return Value

Type: `ConnectApi.ChatterConversation`

```java
getConversation(communityId, conversationId, pageParam, pageSize)
```

Get a page of a conversation from an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.ChatterConversation getConversation(String communityId, String conversationId, String pageParam, String pageSize)
```

Parameters

- `communityId`: Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.
- `conversationId`: Type: `String`
  - ID for the conversation.
- `pageParam`: Type: `String`
  - Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.
**pageSize**
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

**Return Value**
Type: ConnectApi.ChatterConversation

**getConversations()**
Get the most recent conversations.

**API Version**
29.0

**Requires Chatter**
Yes

**Signature**
public static ConnectApi.ChatterConversationPage getConversations()

**Return Value**
Type: ConnectApi.ChatterConversationPage

**getConversations(pageParam, pageSize)**
Get a page of conversations.

**API Version**
29.0

**Requires Chatter**
Yes

**Signature**
public static ConnectApi.ChatterConversationPage getConversations(String pageParam, Integer pageSize)

**Parameters**

*pageParam*  
Type: String
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: ConnectApi.ChatterConversationPage

getConversations(communityId)
Get the most recent conversations from an Experience Cloud site.

API Version
30.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterConversationPage getConversations(String communityId)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

Return Value
Type: ConnectApi.ChatterConversationPage

getConversations(communityId, pageParam, pageSize)
Get a page of conversations from an Experience Cloud site.

API Version
30.0

Requires Chatter
Yes
public static ConnectApi.ChatterConversationPage getConversations(String communityId, String pageParam, Integer pageSize)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

pageParam
Type: String
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: ConnectApi.ChatterConversationPage

getMessage (messageId)
Get a message.

API Version
29.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterMessage getMessage(String messageId)

Parameters

messageId
Type: String
ID for the message.

Return Value
Type: ConnectApi.ChatterMessage
getMessage(communityId, messageId)
Get a message from an Experience Cloud site.

API Version
30.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterMessage getMessage(String communityId, String messageId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

messageId
Type: String
ID for the message.

Return Value
Type: ConnectApi.ChatterMessage

getMessages()
Get the most recent messages.

API Version
29.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterMessagePage getMessages()

Return Value
Type: ConnectApi.ChatterMessagePage
**getMessages(pageParam, pageSize)**

Get a page of messages.

**API Version**

29.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.ChatterMessagePage getMessages(String pageParam, Integer pageSize)
```

**Parameters**

- `pageParam`
  - Type: `String`
  - Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

- `pageSize`
  - Type: `Integer`
  - Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**Return Value**

Type: `ConnectApi.ChatterMessagePage`

**getMessages(communityId)**

Get the most recent messages from an Experience Cloud site.

**API Version**

30.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.ChatterMessagePage getMessages(String communityId)
```
Parameters

*communityId*
Type: String
ID for an Experience Cloud site, internal, or null.

Return Value
Type: `ConnectApi.ChatterMessagePage`

**getMessages(communityId, pageParam, pageSize)**
Get a page of messages from an Experience Cloud site.

API Version
30.0

Requires Chatter
Yes

Signature

```java
public static ConnectApi.ChatterMessagePage getMessages(String communityId, String pageParam, Integer pageSize)
```

Parameters

*communityId*
Type: String
ID for an Experience Cloud site, internal, or null.

*pageParam*
Type: String
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

*pageSize*
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: `ConnectApi.ChatterMessagePage`

**getUnreadCount()**
Get the number of conversations that are marked unread.
API Version
29.0

Requires Chatter
Yes

Signature
public static ConnectApi.UnreadConversationCount getUnreadCount()

Return Value
Type: ConnectApi.UnreadConversationCount
If there are fewer than 50 unread conversations, ConnectApi.UnreadConversationCount returns the exact number of unread conversations and the hasMore property is false. If there are more than 50 unread conversations, ConnectApi.UnreadConversationCount returns 50 unread conversations and the hasMore property is true.

Example
ConnectApi.UnreadConversationCount unread = ConnectApi.ChatterMessages.getUnreadCount();

getUnreadCount(communityId)
Get the number of conversations that are marked unread in an Experience Cloud site.

API Version
30.0

Requires Chatter
Yes

Signature
public static ConnectApi.UnreadConversationCount getUnreadCount(String communityId)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

Return Value
Type: ConnectApi.UnreadConversationCount
If there are fewer than 50 unread conversations, `ConnectApi.UreadConversationCount` returns the exact number of unread conversations and the `hasMore` property is `false`. If there are more than 50 unread conversations, `ConnectApi.UreadConversationCount` returns 50 unread conversations and the `hasMore` property is `true`.

### markConversationRead(conversationId, read)
Mark a conversation as read or unread.

#### API Version
29.0

#### Requires Chatter
Yes

#### Signature
```java
public static ConnectApi.ChatterConversationSummary markConversationRead(String conversationId, Boolean read)
```

#### Parameters
- **conversationId**
  - Type: `String`
  - ID for the conversation.
- **read**
  - Type: `Boolean`
  - Specify whether the conversation is read (`true`) or not (`false`).

#### Return Value
Type: `ConnectApi.ChatterConversationSummary`

### markConversationRead(communityId, conversationID, read)
Mark a conversation as read or unread in an Experience Cloud site.

#### API Version
30.0

#### Requires Chatter
Yes

#### Signature
```java
public static ConnectApi.ChatterConversationSummary markConversationRead(String communityId, String conversationID, Boolean read)
```
Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **conversationId**
  - Type: `String`
  - ID for the conversation.

- **read**
  - Type: `Boolean`
  - Specify whether the conversation is read (`true`) or not (`false`).

Return Value

Type: `ConnectApi.ChatterConversationSummary`

**replyToMessage(text, inReplyTo)**

Reply to a message.

API Version

29.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.ChatterMessage replyToMessage(String text, String inReplyTo)
```

Parameters

- **text**
  - Type: `String`
  - Text of the message. Can't be empty or over 10,000 characters.

- **inReplyTo**
  - Type: `String`
  - ID of the message that is being responded to.

Return Value

Type: `ConnectApi.ChatterMessage`

**replyToMessage(communityId, text, inReplyTo)**

Reply to a message in an Experience Cloud site.
API Version
30.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterMessage replyToMessage(String communityId, String text, String inReplyTo)

Parameters
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.
text
  Type: String
  Text of the message. Can’t be empty or over 10,000 characters.
inReplyTo
  Type: String
  ID of the message that is being responded to.

Return Value
Type: ConnectApi.ChatterMessage

searchConversation(conversationId, q)
Get a conversation that matches the search criteria.

API Version
29.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterConversation searchConversation(String conversationId, String q)
Parameters

conversationId
  Type: String
  ID for the conversation.

q
  Type: String
  Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: ConnectApi.ChatterConversation

searchConversation(conversationId, pageParam, pageSize, q)

Get a conversation with a page of messages that match the search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

public static ConnectApi.ChatterConversation searchConversation(String conversationId, String pageParam, Integer pageSize, String q)

Parameters

conversationId
  Type: String
  ID for the conversation.

pageParam
  Type: String
  Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
  Type: Integer
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

q
  Type: String
  Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.
Return Value
Type: `ConnectApi.ChatterConversation`

`searchConversation(communityId, conversationId, q)`
Get a conversation with messages that match the search criteria in an Experience Cloud site.

API Version
30.0

Requires Chatter
Yes

Signature
`public static ConnectApi.ChatterConversation searchConversation(String communityId, String conversationId, String q)`

Parameters
`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`conversationId`
Type: `String`
ID for the conversation.

`q`
Type: `String`
Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See `Wildcards`.

Return Value
Type: `ConnectApi.ChatterConversation`

`searchConversation(communityId, conversationId, pageParam, pageSize, q)`
Get a conversation with a page of messages that match the search criteria in an Experience Cloud site.

API Version
30.0

Requires Chatter
Yes
Signature

```java
public static ConnectApi.ChatterConversation searchConversation(String communityId,
                    String conversationId, String pageParam, Integer pageSize, String q)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **conversationId**
  - Type: `String`
  - ID for the conversation.

- **pageParam**
  - Type: `String`
  - Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

- **pageSize**
  - Type: `Integer`
  - Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

- **q**
  - Type: `String`
  - Required and can’t be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

- Type: `ConnectApi.ChatterConversation`

`searchConversations(q)`

Get conversations in which member names and messages match the search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.ChatterConversationPage searchConversations(String q)
```
Parameters

$q$
Type: String

Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: ConnectApi.ChatterConversationPage

searchConversations(pageParam, pageSize, q)

Get a page of conversations in which member names and messages match the search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

public static ConnectApi.ChatterConversationPage searchConversations(String pageParam, Integer pageSize, String q)

Parameters

$\text{pageParam}$
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

$\text{pageSize}$
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

$q$
Type: String

Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: ConnectApi.ChatterConversationPage

searchConversations(communityId, q)

Get conversations in which member names and messages match the search criteria in an Experience Cloud site.
API Version
30.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterConversationPage searchConversations(String communityId, String q)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value
Type: ConnectApi.ChatterConversationPage

searchConversations(communityId, pageParam, pageSize, q)
Get a page of conversations in which member names and messages match the search criteria in an Experience Cloud site.

API Version
30.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterConversationPage searchConversations(String communityId, String pageParam, Integer pageSize, String q)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.
**searchMessages**(q)

Get messages that match the search criteria.

### API Version

29.0

### Requires Chatter

Yes

### Signature

```java
public static ConnectApi.ChatterMessagePage searchMessages(String q)
```

### Parameters

- **q**
  - Type: `String`
  - Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

### Return Value

Type: `ConnectApi.ChatterMessagePage`
API Version
29.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterMessagePage searchMessages(String pageParam, Integer pageSize, String q)

Parameters

pageParam
Type: String
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value
Type: ConnectApi.ChatterMessagePage

searchMessages(communityId, q)
Get messages that match the search criteria in an Experience Cloud site.

API Version
30.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterMessagePage searchMessages(String communityId, String q)
Parameters

**communityId**
Type: **String**
ID for an Experience Cloud site, internal, or **null**.

**q**
Type: **String**
Required and can't be **null**. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value
Type: **ConnectApi.ChatterMessagePage**

`searchMessages(communityId, pageParam, pageSize, q)`
Get a page of messages that match the search criteria in an Experience Cloud site.

API Version
30.0

Requires Chatter
Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String communityId, String pageParam, Integer pageSize, String q)
```

Parameters

**communityId**
Type: **String**
ID for an Experience Cloud site, internal, or **null**.

**pageParam**
Type: **String**
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in **null**, the first page is returned.

**pageSize**
Type: **Integer**
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in **null**, the default size is 25.

**q**
Type: **String**
Required and can't be **null**. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).
Return Value
Type: `ConnectApi.ChatterMessagePage`

`sendMessage(text, recipients)`
Send a message to a list of recipients.

API Version
29.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.ChatterMessage sendMessage(String text, String recipients)
```

Parameters

text
Type: `String`
Text of the message. Can't be empty or over 10,000 characters.

recipients
Type: `String`
Up to nine comma-separated IDs of the users receiving the message.

Return Value
Type: `ConnectApi.ChatterMessage`

`sendMessage(communityId, text, recipients)`
Send a message to a list of recipients in an Experience Cloud site.

API Version
30.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.ChatterMessage sendMessage(String communityId, String text, String recipients)
```
Parameters

- **communityId**: String
  - ID for an Experience Cloud site, internal, or null.

- **text**: String
  - Text of the message. Can’t be empty or over 10,000 characters.

- **recipients**: String
  - Up to nine comma-separated IDs of users to receive the message.

Return Value

Type: `ConnectApi.ChatterMessage`

ChatterUsers Class

Access information about users, such as activity, followers, subscriptions, files, and groups.

Namespace

- `ConnectApi`

ChatterUsers Methods

The following are methods for ChatterUsers. All methods are static.

IN THIS SECTION:

- `exportUserActivities(communityId, userId)`: Export Chatter-related user activity, such as bookmarks, topic endorsements, and votes.
- `follow(communityId, userId, subjectId)`: Follow a user or record.
- `getChatterSettings(communityId, userId)`: Get the default Chatter settings for a user.
- `getFollowers(communityId, userId)`: Get the first page of followers for a user.
- `getFollowers(communityId, userId, pageParam, pageSize)`: Get a page of followers for a user.
- `getFollowings(communityId, userId)`: Get the first page of users and records that a user follows.
- `getFollowings(communityId, userId, pageParam)`: Get a page of users and records that a user follows.
getFollowings(communityId, userId, pageParam, pageSize)
Get a page with the specified number of users and records that a user follows.

getFollowings(communityId, userId, filterType)
Get the first page of records, filtered by key prefix, that a user follows.

getFollowings(communityId, userId, filterType, pageParam)
Get a page of records, filtered by key prefix, that a user follows.

getFollowings(communityId, userId, filterType, pageParam, pageSize)
Get a page with the specified number of records, filtered by key prefix, that a user follows.

getReputation(communityId, userId)
Get a user’s reputation.

getUser(communityId, userId)
Get information about a user.

getUserBatch(communityId, userIds)
Get information about a list of users.

getUserGroups(communityId, userId)
Get a user’s groups.

getUserGroups(communityId, userId, pageParam, pageSize)
Get a page of a user’s groups.

getUsers(communityId)
Get the first page of users.

getUsers(communityId, pageParam, pageSize)
Get a page of users.

purgeUserActivities(communityId, userId)
Start a job to purge Chatter-related user activity, such as bookmarks, topic endorsements, and votes.

searchUserGroupDetails(communityId, userId, q)
Get the user’s groups that match the search criteria.

searchUserGroupDetails(communityId, userId, q, pageParam, pageSize)
Get a page of a user’s groups that match the search criteria.

searchUsers(communityId, q)
Get the first page of users that match the search criteria.

searchUsers(communityId, q, pageParam, pageSize)
Get a page of users that match the search criteria.

searchUsers(communityId, q, searchContextId, pageParam, pageSize)
Get a page of users that match the search criteria.

updateChatterSettings(communityId, userId, defaultGroupEmailFrequency)
Update the default Chatter settings for a user.

updateUser(communityId, userId, userInput)
Update the About Me section for a user.
exportUserActivities(communityId, userId)

Export Chatter-related user activity, such as bookmarks, topic endorsements, and votes.

API Version

42.0

Requires Chatter

Yes

Signature

public static ConnectApi.UserActivitiesJob exportUserActivities(String communityId, String userId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID of the user.

Return Value

Type: ConnectApi.UserActivitiesJob

Usage

The following activities can be exported.

• Bookmark—User bookmarked a post.
• ChatterActivity—Total counts of posts and comments made and likes and comments received for a user.
• ChatterLike—User liked a post or comment.
• Comment—User commented on a post.
• CompanyVerify—User verified comment.
• DownVote—User downvoted a post or comment.
• FeedEntityRead—User read a post.
• FeedRead—User read a feed.
• Mute—User muted a post.
• Post—User made a post.
• TopicEndorsement—User endorsed another user on a topic or received endorsement on a topic.
• UpVote—User upvoted a post or comment.
follow(communityId, userId, subjectId)
Follow a user or record.

API Version
28.0

Requires Chatter
Yes

Signature
public static ConnectApi.Subscription follow(String communityId, String userId, String subjectId)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID for the context user or the keyword me.

subjectId
Type: String
ID of the user or record to follow.

Return Value
Type: ConnectApi.Subscription

Example
ChatterUsers.ConnectApi.Subscription subscriptionToRecord =
ConnectApi.ChatterUsers.follow(null, 'me', '001RR000002G4Y0');

SEE ALSO:
   Unfollow a Record

getChatterSettings(communityId, userId)
Get the default Chatter settings for a user.

API Version
28.0
Requires Chatter
Yes

Signature
public static ConnectApi.UserChatterSettings getChatterSettings(String communityId, String userId)

Parameters
communityId
   Type: String
   ID for an Experience Cloud site, internal, or null.

userId
   Type: String
   ID for the context user or the keyword me.

Return Value
Type: ConnectApi.UserChatterSettings

getFollowers(communityId, userId)
Get the first page of followers for a user.

API Version
28.0

Available to Guest Users
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.FollowerPage getFollowers(String communityId, String userId)

Parameters
communityId
   Type: String
   ID for an Experience Cloud site, internal, or null.

userId
   Type: String
ID for a user.

Return Value
Type: ConnectApi.FollowerPage

getFollowers(communityId, userId, pageParam, pageSize)
Get a page of followers for a user.

API Version
28.0

Available to Guest Users
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.FollowerPage getFollowers(String communityId, String userId, Integer pageParam, Integer pageSize)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID for a user.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: ConnectApi.FollowerPage
**getFollowings(communityId, userId)**
Get the first page of users and records that a user follows.

**API Version**
28.0

**Available to Guest Users**
32.0

**Requires Chatter**
Yes

**Signature**
```java
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId)
```

**Parameters**
- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or null.
- **userId**
  Type: String
  ID for a user.

**Return Value**
Type: `ConnectApi.FollowingPage`

**getFollowings(communityId, userId, pageParam)**
Get a page of users and records that a user follows.

**API Version**
28.0

**Available to Guest Users**
32.0

**Requires Chatter**
Yes
Signature

```java
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId, Integer pageParam)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `userId`
  - Type: `String`
  - ID for a user.

- `pageParam`
  - Type: `Integer`
  - Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

Return Value

Type: `ConnectApi.FollowingPage`

```java
getFollowings(communityId, userId, pageParam, pageSize)
```

Get a page with the specified number of users and records that a user follows.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId, Integer pageParam, Integer pageSize)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `userId`
  - Type: `String`

- `pageParam`
  - Type: `Integer`

- `pageSize`
  - Type: `Integer`
ID for a user.

**pageParam**

Type: **Integer**

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

**pageSize**

Type: **Integer**

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**Return Value**

Type: `ConnectApi.FollowingPage`

**getFollowings(communityId, userId, filterType)**

Get the first page of records, filtered by key prefix, that a user follows.

**API Version**

28.0

**Available to Guest Users**

32.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId, String filterType)
```

**Parameters**

**communityId**

Type: **String**

ID for an Experience Cloud site, internal, or `null`.

**userId**

Type: **String**

ID for a user.

**filterType**

Type: **String**

Specifies the key prefix to filter the type of objects returned. A key prefix is the first three characters of the object ID, which specifies the object type. For example, User objects have a prefix of `00S` and Group objects have a prefix of `0F9`. 
Return Value
Type: ConnectApi.FollowingPage

getFollowings(communityId, userId, filterType, pageParam)
Get a page of records, filtered by key prefix, that a user follows.

API Version
28.0

Available to Guest Users
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId, String filterType, Integer pageParam)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID for a user.

filterType
Type: String
Specifies the key prefix to filter the type of objects returned. A key prefix is the first three characters of the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

Return Value
Type: ConnectApi.FollowingPage

getFollowings(communityId, userId, filterType, pageParam, pageSize)
Get a page with the specified number of records, filtered by key prefix, that a user follows.
API Version
28.0

Available to Guest Users
32.0

Requires Chatter
Yes

Signature
```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId,
String filterType, Integer pageParam, Integer pageSize)
```

Parameters
- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.
- **userId**
  - Type: String
  - ID for a user.
- **filterType**
  - Type: String
  - Specifies the key prefix to filter the type of objects returned. A key prefix is the first three characters of the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.
- **pageParam**
  - Type: Integer
  - Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.
- **pageSize**
  - Type: Integer
  - Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: ConnectApi.FollowingPage

**getReputation(communityId, userId)**
Get a user's reputation.
Available to Guest Users
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.Reputation getReputation(String communityId, String userId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID of the user.

Return Value
Type: ConnectApi.Reputation

getUser(communityId, userId)
Get information about a user.

API Version
28.0

Available to Guest Users
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.UserSummary getUser(String communityId, String userId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.
userId
    Type: String
    ID for a user.

Return Value
Type: ConnectApi.UserDetail

Usage
If the user is external, the properties that the ConnectApi.UserDetail output class shares with the ConnectApi.UserSummary output class can have non-null values. Other properties are always null.

getUserBatch(communityId, userIds)
Get information about a list of users.

API Version
31.0

Available to Guest Users
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.BatchResult[] getUserBatch(String communityId, List<String> userIds)

Parameters
communityId
    Type: String
    ID for an Experience Cloud site, internal, or null.

userIds
    Type: List<String>
    A list of up to 500 user IDs.

Return Value
Type: ConnectApi.BatchResult[]
The ConnectApi.BatchResult.getResult() method returns a ConnectApi.User object and errors for users that didn't load.
Example

```java
// Get users in an organization.
ConnectApi.UserPage userPage = ConnectApi.ChatterUsers.getUsers(null);

// Create a list of user IDs.
List<String> userList = new List<String>();
for (ConnectApi.User user : userPage.users) {
    userList.add(user.id);
}

// Get info about all users in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterUsers.getUserBatch(null, userList);
for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print each user's username.
        ConnectApi.UserDetail user;
        if (batchResult.getResult() instanceof ConnectApi.UserDetail) {
            user = (ConnectApi.UserDetail) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(user.username);
    } else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

getUserGroups(communityId, userId)

Get a user's groups.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.UserGroupDetailPage getUserGroups(String communityId, String userId)
```
Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID for a user.

Return Value
Type: ConnectApi.UserGroupDetailPage

getUserGroups(communityId, userId, pageParam, pageSize)
Get a page of a user’s groups.

API Version
45.0

Available to Guest Users
45.0

Requires Chatter
Yes

Signature
public static ConnectApi.UserGroupDetailPage getUserGroups(String communityId, String userId, Integer pageParam, Integer pageSize)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID for a user.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in \texttt{null}, the default size is 25.

**Return Value**

Type: \texttt{ConnectApi.UserGroupDetailPage}

\textbf{getUsers(communityId)}

Get the first page of users.

**API Version**

28.0

**Available to Guest Users**

32.0

**Requires Chatter**

Yes

**Signature**

\texttt{public static ConnectApi.UserPage getUsers(String communityId)}

**Parameters**

\texttt{communityId}

Type: \texttt{String}

ID for an Experience Cloud site, internal, or \texttt{null}.

**Return Value**

Type: \texttt{ConnectApi.UserPage}

\textbf{getUsers(communityId, pageParam, pageSize)}

Get a page of users.

**API Version**

28.0

**Available to Guest Users**

32.0

**Requires Chatter**

Yes
**getUsers(String communityId, Integer pageParam, Integer pageSize)**

**Parameters**

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **pageParam**
  - Type: Integer
  - Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

- **pageSize**
  - Type: Integer
  - Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

**Return Value**

Type: ConnectApi.UserPage

**purgeUserActivities(String communityId, String userId)**

Start a job to purge Chatter-related user activity, such as bookmarks, topic endorsements, and votes.

**API Version**

42.0

**Requires Chatter**

Yes

**purgeUserActivities(String communityId, String userId)**

**Parameters**

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **userId**
  - Type: String
  - ID of the user.
Return Value
Type: `ConnectApi.UserActivitiesJob`

Usage
The following activities can be purged with this method.
- **Bookmark**—User bookmarked a post.
- **ChatterActivity**—Total counts of posts and comments made and likes and comments received for a user.
- **ChatterLike**—User liked a post or comment.
- **CompanyVerify**—User verified comment.
- **DownVote**—User downvoted a post or comment.
- **FeedEntityRead**—User read a post.
- **FeedRead**—User read a feed.
- **Mute**—User muted a post.
- **TopicEndorsement**—User endorsed another user on a topic or received endorsement on a topic.
- **UpVote**—User upvoted a post or comment.

To delete a user's posts and comments, use these methods, respectively.
- `deleteFeedElement(communityId, feedElementId)`
- `deleteComment(communityId, commentId)`

`searchUserGroupDetails(communityId, userId, q)`
Get the user's groups that match the search criteria.

API Version
45.0

Available to Guest Users
45.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.UserGroupDetailPage searchUserGroupDetails(String communityId, String userId, String q)
```

Parameters
- `communityId` Type: `String`
  ID for an Experience Cloud site, internal, or `null`.

947
userId
Type: String
ID for a user.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value
Type: ConnectApi.UserGroupDetailPage

searchUserGroupDetails(communityId, userId, q, pageParam, pageSize)
Get a page of a user’s groups that match the search criteria.

API Version
45.0

Available to Guest Users
45.0

Requires Chatter
Yes

Signature
public static ConnectApi.UserGroupDetailPage searchUserGroupDetails(String communityId, String userId, String q, Integer pageParam, Integer pageSize)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID for a user.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

`pageSize`
Type: `Integer`

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: `ConnectApi.UserGroupDetailPage`

`searchUsers(communityId, q)`
Get the first page of users that match the search criteria.

API Version
28.0

Available to Guest Users
32.0

Requires Chatter
Yes

Signature
`public static ConnectApi.UserPage searchUsers(String communityId, String q)`

Parameters
`communityId`
Type: `String`

ID for an Experience Cloud site, internal, or null.

`q`
Type: `String`

Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value
Type: `ConnectApi.UserPage`
Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestSearchUsers(communityId, q, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

`searchUsers(communityId, q, pageParam, pageSize)`
Get a page of users that match the search criteria.

API Version
28.0

Available to Guest Users
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.UserPage searchUsers(String communityId, String q, Integer pageParam, Integer pageSize)

Parameters

- `communityId`  
  Type: `String`  
  ID for an Experience Cloud site, `internal`, or `null`.

- `q`  
  Type: `String`  
  Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See *Wildcards*.

- `pageParam`  
  Type: `Integer`  
  Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

- `pageSize`  
  Type: `Integer`  
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.
Return Value

Type: `ConnectApi.UserPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestSearchUsers(communityId, q, pageParam, pageSize, result)

`searchUsers(communityId, q, searchContextId, pageParam, pageSize)`

Get a page of users that match the search criteria.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.UserPage searchUsers(String communityId, String q, String searchContextId, Integer pageParam, Integer pageSize)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `q`
  - Type: `String`
  - Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See `Wildcards`.

- `searchContextId`
  - Type: `String`
  - A feed item ID that filters search results for feed @mentions. More useful results are listed first. When you specify this argument, you cannot query more than 500 results and you cannot use wildcards in the search term.
pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: ConnectApi.UserPage

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestSearchUsers(communityId, q, searchContextId, pageParam, pageSize, result)

updateChatterSettings(communityId, userId, defaultGroupEmailFrequency)
Update the default Chatter settings for a user.

API Version
28.0

Requires Chatter
Yes

Signature
public static ConnectApi.UserChatterSettings updateChatterSettings(String communityId, String userId, ConnectApi.GroupEmailFrequency defaultGroupEmailFrequency)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID for the context user or the keyword me.

defaultGroupEmailFrequency
Type: ConnectApi.GroupEmailFrequency
Frequency with which a user receives email. Values are:

- EachPost
- DailyDigest
- WeeklyDigest
- Never
- UseDefault

Don’t pass the value UseDefault for the `defaultGroupEmailFrequency` parameter because calling `updateChatterSettings` sets the default value.

Return Value

Type: `ConnectApi.UserChatterSettings`

`updateUser(communityId, userId, userInput)`

Update the About Me section for a user.

API Version

29.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.UserDetail updateUser(String communityId, String userId, ConnectApi.UserInput userInput)
```

Parameters

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.

- `userId`
  Type: `String`
  ID for the context user or the keyword `me`.

- `userInput`
  Type: `ConnectApi.UserInput`
  Specifies the updated information.

Return Value

Type: `ConnectApi.UserDetail`
ChatterUsers Test Methods

The following are the test methods for ChatterUsers. All methods are static.
For information about using these methods to test your ConnectApi code, see Testing ConnectApi Code.

IN THIS SECTION:

setTestSearchUsers(communityId, q, result)
Register a ConnectApi.UserPage object to be returned when the matching ConnectApi.searchUsers method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchUsers(communityId, q, pageParam, pageSize, result)
Register a ConnectApi.UserPage object to be returned when the matching ConnectApi.searchUsers method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchUsers(communityId, q, searchContextId, pageParam, pageSize, result)
Register a ConnectApi.UserPage object to be returned when the matching ConnectApi.searchUsers method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchUsers(communityId, q, result)
Register a ConnectApi.UserPage object to be returned when the matching ConnectApi.searchUsers method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchUsers(communityId, q, result)
Register a ConnectApi.UserPage object to be returned when the matching ConnectApi.searchUsers method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
28.0

Signature

public static Void setTestSearchUsers(String communityId, String q, ConnectApi.UserPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: ConnectApi.UserPage
Object containing test data.
Return Value
Type: Void

SEE ALSO:
searchUsers(communityId, q)

setTestSearchUsers(communityId, q, pageParam, pageSize, result)
Register a ConnectApi.UserPage object to be returned when the matching ConnectApi.searchUsers method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
28.0

Signature
public static Void setTestSearchUsers(String communityId, String q, Integer pageParam, Integer pageSize, ConnectApi.UserPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

result
Type: ConnectApi.UserPage
Object containing test data.
Return Value
Type: Void

SEE ALSO:
searchUsers(communityId, q, pageParam, pageSize)

**setTestSearchUsers(communityId, q, searchContextId, pageParam, pageSize, result)**

Register a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**
28.0

**Signature**
```
public static Void setTestSearchUsers(String communityId, String q, String searchContextId, Integer pageParam, Integer pageSize, ConnectApi.UserPage result)
```

**Parameters**

*communityId*
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

*q*
Type: `String`
Required and can’t be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

*searchContextId*
Type: `String`
A feed item ID that filters search results for feed @mentions. More useful results are listed first. When you specify this argument, you cannot query more than 500 results and you cannot use wildcards in the search term.

*pageParam*
Type: `Integer`
Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

*pageSize*
Type: `Integer`
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

*result*
Type: `ConnectApi.UserPage`
Object containing test data.
Return Value

Type: Void

SEE ALSO:

searchUsers(communityId, q, searchContextId, pageParam, pageSize)

Retired ChatterUsers Methods

The following methods for ChatterUsers are retired.

IN THIS SECTION:

deletePhoto(communityId, userId)
Delete a user's photo.

groups(communityId, userId)
Get the groups that a user is a member of.

groups(communityId, userId, pageParam, pageSize)
Get a page of groups that a user is a member of.

getPhoto(communityId, userId)
Get a user's photo.

searchUserGroups(communityId, userId, q)
Get the user's groups that match the search criteria.

searchUserGroups(communityId, userId, q, pageParam, pageSize)
Get a page of a user's groups that match the search criteria.

setPhoto(communityId, userId, fileId, versionNumber)
Set an uploaded file as a user's photo.

setPhoto(communityId, userId, fileUpload)
Set a file that hasn't been uploaded as the user's photo.

setPhotoWithAttributes(communityId, userId, photo)
Set and crop an uploaded file as a user's photo.

setPhotoWithAttributes(communityId, userId, photo, fileUpload)
Set and crop a file that hasn't been uploaded as a user's photo.

deletePhoto(communityId, userId)
Delete a user's photo.

API Version

28.0–34.0

Important: In version 35.0 and later, use ConnectApi.UserProfiles.deletePhoto(communityId, userId)
Signature

```
public static Void deletePhoto(String communityId, String userId)
```

Parameters

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **userId**
  - Type: String
  - ID for the context user or the keyword me.

Return Value

Type: Void

**getGroups(communityId, userId)**

Get the groups that a user is a member of.

API Version

28.0–44.0

⚠️ Important: In version 45.0 and later, use `getUserGroups(communityId, userId)`.

Available to Guest Users

32.0–44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage getGroups(String communityId, String userId)
```

Parameters

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **userId**
  - Type: String
  - ID for a user.
Return Value
Type: `ConnectApi.UserGroupPage`

`getGroups(communityId, userId, pageParam, pageSize)`
Get a page of groups that a user is a member of.

API Version
28.0–44.0

⚠️ Important: In version 45.0 and later, use `getUserGroups(communityId, userId, pageParam, pageSize)`.

Available to Guest Users
32.0–44.0

Requires Chatter
Yes

Signature

```java
public static ConnectApi.UserGroupPage getGroups(String communityId, String userId,
    Integer pageParam, Integer pageSize)
```

Parameters

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.
- `userId`
  Type: `String`
  ID for a user.
- `pageParam`
  Type: `Integer`
  Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.
- `pageSize`
  Type: `Integer`
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value
Type: `ConnectApi.UserGroupPage`

`getPhoto(communityId, userId)`
Get a user’s photo.
API Version
28.0–34.0

**Important:** In version 35.0 and later, use `ConnectApi.UserProfiles.getPhoto(communityId, userId)`.

Available to Guest Users
32.0

Requires Chatter
Yes

Signature

```java
public static ConnectApi.Photo getPhoto(String communityId, String userId)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.
- **userId**
  - Type: `String`
  - ID for a user.

Return Value

Type: `ConnectApi.Photo`

`searchUserGroups(communityId, userId, q)`

Get the user’s groups that match the search criteria.

API Version

30.0–44.0

**Important:** In version 45.0 and later, use `searchUserGroupDetails(communityId, userId, q)`.

Available to Guest Users

32.0–44.0

Requires Chatter

Yes
Signature

```java
public static ConnectApi.UserGroupPage searchUserGroups(String communityId, String userId, String q)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `userId`
  - Type: `String`
  - ID for a user.

- `q`
  - Type: `String`
  - Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.UserGroupPage`

```java
searchUserGroups(communityId, userId, q, pageParam, pageSize)
```

Get a page of a user’s groups that match the search criteria.

API Version

30.0–44.0

**Important:** In version 45.0 and later, use `searchUserGroupDetails(communityId, userId, q, pageParam, pageSize)`.

Available to Guest Users

32.0–44.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.UserGroupPage searchUserGroups(String communityId, String userId, String q, Integer pageParam, Integer pageSize)
```

Parameters

- `communityId`
  - Type: `String`
ID for an Experience Cloud site, internal, or null.

**userId**
- Type: String
- ID for a user.

**q**
- Type: String
- Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

**pageParam**
- Type: Integer
- Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

**pageSize**
- Type: Integer
- Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

**Return Value**
- Type: ConnectApi.UserGroupPage

**setPhoto(communityId, userId, fileId, versionNumber)**
Set an uploaded file as a user’s photo.

**API Version**
- 28.0–34.0

⚠️ **Important:** In version 35.0 and later, use `ConnectApi.UserProfiles.setPhoto(communityId, userId, fileId, versionNumber)`

**Requires Chatter**
- Yes

**Signature**
- `public static ConnectApi.Photo setPhoto(String communityId, String userId, String fileId, Integer versionNumber)`

**Parameters**

**communityId**
- Type: String
- ID for an Experience Cloud site, internal, or null.

**userId**
- Type: String
- ID for the context user or the keyword me.
fileId
  Type: String
  ID of a file already uploaded. The file must be an image, and be smaller than 2 GB.

versionNumber
  Type: Integer
  Version number of the existing file. Specify either an existing version number, or null to get the latest version.

Return Value
Type: ConnectApi.Photo

Usage
Photos are processed asynchronously and might not be visible right away.

setPhoto(communityId, userId, fileUpload)
Set a file that hasn’t been uploaded as the user’s photo.

API Version
28.0–34.0

⚠️ Important: In version 35.0 and later, use ConnectApi.UserProfiles.setPhoto(communityId, userId, fileUpload)

Requires Chatter
Yes

Signature
public static ConnectApi.Photo setPhoto(String communityId, String userId, ConnectApi.BinaryInput fileUpload)

Parameters
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

userId
  Type: String
  ID for the context user or the keyword me.

fileUpload
  Type: ConnectApi.BinaryInput
  File to use as the photo. The content type must be usable as an image.
Return Value
Type: ConnectApi.Photo

Usage
Photos are processed asynchronously and might not be visible right away.

**setPhotoWithAttributes**(communityId, userId, photo)
Set and crop an uploaded file as a user’s photo.

API Version
29.0–34.0

⚠️ **Important**: In version 35.0 and later, use
`ConnectApi.UserProfiles.setPhotoWithAttributes(communityId, userId, photo)`

Requires Chatter
Yes

Signature
`public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo)`

Parameters
- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or null.
- **userId**
  Type: String
  ID for the context user or the keyword me.
- **photo**
  Type: ConnectApi.PhotoInput
  A ConnectApi.PhotoInput object specifying the file ID, version number, and cropping parameters.

Return Value
Type: ConnectApi.Photo

Usage
Photos are processed asynchronously and might not be visible right away.
**setPhotoWithAttributes**(communityId, userId, photo, fileUpload)

Set and crop a file that hasn’t been uploaded as a user’s photo.

**API Version**

29.0–34.0

**Important:** In version 35.0 and later, use

```java
ConnectApi.UserProfiles.setPhotoWithAttributes(communityId, userId, photo, fileUpload)
```

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

**Parameters**

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **userId**
  - Type: `String`
  - ID for the context user or the keyword `me`.

- **photo**
  - Type: `ConnectApi.PhotoInput`
  - A `ConnectApi.PhotoInput` object specifying the cropping parameters.

- **fileUpload**
  - Type: `ConnectApi.BinaryInput`
  - File to use as the photo. The content type must be usable as an image.

**Return Value**

Type: `ConnectApi.Photo`

**Usage**

Photos are processed asynchronously and might not be visible right away.

**Clm Class**

Create and update Contract Lifecycle Management (CLM) contracts using object ID.
 Namespace

ConnectApi

Clm Methods

The following are methods for Clm. All methods are static.

IN THIS SECTION:

createContract(contractInputPayload)
Create contracts using the object ID.

updateContract(contractInputPayload)
Update contracts using the object ID.

createContract(contractInputPayload)
Create contracts using the object ID.

API Version
56.0

Requires Chatter
No

Signature

Parameters

contractInputPayload
Type: ConnectApi.ContractInputRepresentation on page 1578
Input payload to create contract.

Return Value

Type: ConnectApi.ContractOutputRepresentation on page 1766

updateContract(contractInputPayload)
Update contracts using the object ID.

API Version
56.0
Requires Chatter
No

Signature
public static ConnectApi.ContractOutputRepresentation
updateContract(ConnectApi.ContractInputRepresentation contractInputPayload)

Parameters
contractInputPayload
Type: ConnectApi.ContractInputRepresentation on page 1578
Input payload to update contract.

Return Value
Type: ConnectApi.ContractOutputRepresentation on page 1766

CommerceBuyerExperience Class
Create, delete, or get commerce addresses. Get order delivery group, order item, order shipments, shipment items, and order summaries. Get adjustments for order items and order summaries.

Namespace
ConnectApi

CommerceBuyerExperience Methods
These methods are for CommerceBuyerExperience. All methods are static.

IN THIS SECTION:
addOrderToCart(webstoreId, orderSummaryId, orderToCartInput)
Add an order to a cart using a webstore order summary.
addOrderToCart(webstoreId, orderSummaryId, orderToCartInput, effectiveAccountId)
Add an order to a cart for a specific account using a webstore order summary.
calculateAdjustmentAggregates(webstoreId, orderSummaryIds)
Submit a job to calculate adjustment aggregates for a list of order summary IDs.
createCommerceAccountAddress(webstoreId, accountld, addressInput)
Create a Commerce account address for a webstore account.
deleteCommerceAccountAddress(webstoreId, accountld, addressId)
Delete a Commerce account address for a webstore.
getCommerceAccountAddress(webstoreId, accountld)
Get a Commerce account address for a webstore.
getCommerceAccountAddress(webstoreId, accountId, defaultOnly)
Get Commerce account addresses for a webstore and account.

getCommerceAccountAddress(webstoreId, accountId, defaultOnly, addressType, fields, pageToken, pageSize, sortOrder)
Get Commerce account addresses for a webstore and account.

getCommerceAccountAddress(webstoreId, accountId, defaultOnly, addressType, excludeUnsupportedCountries)
Get Commerce account addresses for a webstore and account.

getCommerceAccountAddress(webstoreId, accountId, defaultOnly, addressType, excludeUnsupportedCountries, fields, pageToken, pageSize, sortOrder)
Get Commerce account addresses for a webstore and account.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId)
Get order delivery group summaries.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageSize)
Get order delivery group summaries.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageParam)
Get a page of order delivery group summaries.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields)
Get order delivery group summaries with specific fields.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageParam, fields)
Get a page of order delivery group summaries with specific fields.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, pageSize)
Get order delivery group summaries with specific fields.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, sortParam)
Get a sorted list of order delivery group summaries with specific fields.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, pageSize, sortParam)
Get a sorted list of order delivery group summaries with specific fields.

getAddressSummaries(webstoreId, effectiveAccountId, orderSummaryId)
Get order item summaries.

getAddressSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageSize)
Get order item summaries.

getAddressSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId)
Get order item summaries for a delivery group summary.

getAddressSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, pageSize)
Get order item summaries for a delivery group summary.

getAddressSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, pageParam)
Get a page of order item summaries for a delivery group summary.

getAddressSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields)
Get order item summaries for a delivery group summary with specific fields.

getAddressSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageSize)
Get order item summaries for a delivery group summary with specific fields.
getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageParam)
Get a page of order item summaries for a delivery group summary with specific fields.

getoOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, sortParam)
Get a sorted list of order item summaries for a delivery group summary with specific fields.

getoOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageSize, sortParam)
Get a sorted page of order item summaries for a delivery group summary with specific fields.

getoOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageParam, pageSize, sortParam, includeAdjustmentDetails)
Get a sorted page of order item summaries for a delivery group summary with specific fields and include adjustment details.

getoOrderItemSummaryAdjustments(webstoreId, orderSummaryId, orderItemSummaryAdjustmentCollectionInput)
Get adjustments for order items.

getoOrderItemSummaryAdjustments(webstoreId, orderSummaryId, orderItemSummaryAdjustmentCollectionInput, effectiveAccountId)
Get adjustments for order items.

getoOrderShipmentItems(webstoreId, shipmentId)
Get order shipment items.

getoOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId)
Get order shipment items.

getoOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields)
Get order shipment items with specific fields.

getoOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields, pageToken, pageSize)
Get a page of order shipment items with specific fields.

getoOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields, pageToken, pageSize, sortOrder)
Get a sorted page of order shipment items.

getoOrderShipments(webstoreId, orderSummaryId)
Get order shipments.

getoOrderShipments(webstoreId, orderSummaryId, effectiveAccountId)
Get order shipments.

getoOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields)
Get order shipments with specific fields.

getoOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields, pageSize, pageToken)
Get a page of order shipments with specific fields.

getoOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields, pageSize, pageToken, sortOrder)
Get a sorted page of order shipments with specific fields.

getoOrderSummaries(webstoreId)
Get order summaries.

getoOrderSummaries(webstoreId, effectiveAccountId)
Get order summaries.

getoOrderSummaries(webstoreId, effectiveAccountId, fields)
Get order summaries with specific fields.

getoOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken)
Get a page of order summaries with specific fields.
getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder)
Get a sorted page of order summaries with specific fields.

getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate)
Get a sorted page of order summaries with specific fields within a specific date range.

getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate, ownerScoped)
Get a sorted page of order summaries with specific fields within a specific date range and scoped to orders owned by the context user.

getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate, ownerScoped, includeAdjustmentDetails)
Get a sorted page of order summaries with specific fields within a specific date range and scoped to orders owned by the context user.

g.getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId)
Get an order summary.

g.getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId, fields)
Get an order summary with fields.

g.getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId, fields, includeAdjustmentDetails)
Get an order summary with fields and include adjustment details.

g.getOrderSummaryAdjustments(webstoreId, orderSummaryId)
Get adjustments for an order summary.

g.getOrderSummaryAdjustments(webstoreId, orderSummaryId, effectiveAccountId)
Get adjustments for an order summary.

lookupOrderSummary(webstoreId, effectiveAccountId, fields, excludeLineItems, excludeDeliveryGroups, excludeAdjustmentAggregates, excludeAdjustments, deliveryGroupId, orderSummaryLookupInput) (Developer Preview)
Look up details about an order summary for a guest shopper or a registered buyer using the effective account ID, requested fields, line items, delivery groups, adjustments aggregates, and adjustments.

lookupOrderSummary(webstoreId, effectiveAccountId, fields, orderSummaryLookupInput) (Developer Preview)
Look up details about an order summary for a guest shopper or a registered buyer using the effective account ID and requested fields.

lookupOrderSummary(webstoreId, effectiveAccountId, orderSummaryLookupInput) (Developer Preview)
Look up details about an order summary for a guest shopper or a registered buyer using the effective account ID.

updateCommerceAccountAddress(webstoreId, accountId, addressId, addressInput)
Update a Commerce account address for a webstore.

addOrderToCart(webstoreId, orderSummaryId, orderToCartInput)
Add an order to a cart using a webstore order summary.

**API Version**

57.0

**Requires Chatter**

No
Signature

```java
public static ConnectApi.OrderToCartResult addOrderToCart(String webstoreId, String orderSummaryId, ConnectApi.OrderToCartInput orderToCartInput)
```

Parameters

- `webstoreId`
  - Type: `String`
  - ID of the webstore.
- `orderSummaryId`
  - Type: `String`
  - ID of the order summary.
- `orderToCartInput`
  - Type: `ConnectApi.OrderToCartInput`
  - Input value indicating which cart the order should be added to.

Return Value

- Type: `ConnectApi.OrderToCartResult`

```
addOrderToCart(webstoreId, orderSummaryId, orderToCartInput, effectiveAccountId)
```

Add an order to a cart for a specific account using a webstore order summary.

API Version

57.0

Requires Chatter

No

Signature

```java
public static ConnectApi.OrderToCartResult addOrderToCart(String webstoreId, String orderSummaryId, ConnectApi.OrderToCartInput orderToCartInput, String effectiveAccountId)
```

Parameters

- `webstoreId`
  - Type: `String`
  - ID of the webstore.
- `orderSummaryId`
  - Type: `String`
  - ID of the order summary.
orderToCartInput
   Type: ConnectApi.OrderToCartInput
   Input value indicating which cart the order should be added to.

effectiveAccountId
   Type: String
   ID of the account for which the request is made. If null, defaults to the account ID for the context user.

Return Value
   Type: ConnectApi.OrderToCartResult

calculateAdjustmentAggregates(webstoreId, orderSummaryIds)
Submit a job to calculate adjustment aggregates for a list of order summary IDs.

API Version
55.0

Requires Chatter
No

Signature
public static ConnectApi.OrderSummaryAdjustmentAggregatesAsyncOutput calculateAdjustmentAggregates(String webstoreId,
ConnectApi.OrderSummaryAdjustmentAggregatesAsyncInput orderSummaryIds)

Parameters
webstoreId
   Type: String
   ID of the webstore.

orderSummaryIds
   Type: ConnectApi.OrderSummaryAdjustmentAggregatesAsyncInput
   A ConnectApi.OrderSummaryAdjustmentAggregatesAsyncInput class with a list of order summary IDs.

Return Value
   Type: ConnectApi.OrderSummaryAdjustmentAggregatesAsyncOutput

createCommerceAccountAddress(webstoreId, accountId, addressInput)
Create a Commerce account address for a webstore account.
API Version
54.0

Requires Chatter
No

Signature
public static ConnectApi.CommerceAddressOutput createCommerceAccountAddress(String webstoreId, String accountId, ConnectApi.commerceAddressInput addressInput)

Parameters
webstoreId
Type: String
ID of the webstore.

accountId
Type: String
ID of the account.

addressInput
Type: ConnectApi.commerceAddressInput
Information about the address you want to create.

Return Value
Type: ConnectApi.CommerceAddressOutput

deleteCommerceAccountAddress(webstoreId, accountId, addressId)
Delete a Commerce account address for a webstore.

API Version
54.0

Requires Chatter
No

Signature
public static Void deleteCommerceAccountAddress(String webstoreId, String accountId, String addressId)
Parameters

**webstoreId**
Type: String
ID of the webstore.

**accountId**
Type: String
ID of the account.

**addressId**
Type: String
ID of the address.

Return Value
Type: Void

**getCommerceAccountAddress(webstoreId, accountId)**
Get a Commerce account address for a webstore.

API Version
54.0

Requires Chatter
No

Signature

```java
public static ConnectApi.CommerceAddressCollection getCommerceAccountAddress(String webstoreId, String accountId)
```

Parameters

**webstoreId**
Type: String
ID of the webstore.

**accountId**
Type: String
ID of the account.

Return Value
Type: `ConnectApi.CommerceAddressCollection`
**getCommerceAccountAddress** *(webstoreId, accountId, defaultOnly)*

Get Commerce account addresses for a webstore and account.

You can get the default address by itself, or you can get all of the addresses for the account.

**API Version**

54.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.CommerceAddressCollection getCommerceAccountAddress(String webstoreId, String accountId, Boolean defaultOnly)
```

**Parameters**

- **webstoreId**
  - Type: String
  - ID of the webstore.

- **accountId**
  - Type: String
  - ID of the account.

- **defaultOnly**
  - Type: Boolean
  - Indicate if you only want the default address (true) or all addresses for the account (false). The default value is false.

**Return Value**

Type: `ConnectApi.CommerceAddressCollection`

---

**getCommerceAccountAddress** *(webstoreId, accountId, defaultOnly, addressType, fields, pageToken, pageSize, sortOrder)*

Get Commerce account addresses for a webstore and account.

**API Version**

54.0

**Requires Chatter**

No
Signature

```java
public static ConnectApi.CommerceAddressCollection getCommerceAccountAddress(String webstoreId, String accountId, Boolean defaultOnly, List<String> addressType, List<String> fields, String pageToken, Integer pageSize, ConnectApi.CommerceAddressSort sortOrder)
```

Parameters

- **webstoreId**
  - Type: String
  - ID of the webstore.

- **accountId**
  - Type: String
  - ID of the account.

- **defaultOnly**
  - Type: Boolean
  - Indicate if you want only the default address (true) or all addresses for the account (false). The default value is false.

- **addressType**
  - Type: List<String>
  - Type of address, for example, Billing or Shipping.

- **fields**
  - Type: List<String>
  - A list of custom fields for the address.

- **pageToken**
  - Type: String
  - Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

- **pageSize**
  - Type: Integer
  - Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

- **sortOrder**
  - Type: ConnectApi.CommerceAddressSort
  - Sort order for Commerce addresses.
  - - CreatedDateAsc—Sort in ascending order of created date.
  - - CreatedDateDesc—Sort in descending order of created date.
  - - NameAsc—Sort in ascending order of name.
  - - NameDesc—Sort in descending order of name.

Return Value

- Type: ConnectApi.CommerceAddressCollection
getCommerceAccountAddress(webstoreId, accountId, addressType, excludeUnsupportedCountries)

Get Commerce account addresses for a webstore and account.

API Version
57.0

Requires Chatter
No

Signature

public static ConnectApi.CommerceAddressCollection getCommerceAccountAddress(String webstoreId, String accountId, List<String> addressType, Boolean excludeUnsupportedCountries)

Parameters

webstoreId
Type: String
ID of the webstore.

accountId
Type: String
ID of the account.

addressType
Type: List<String>
Type of address, for example, Billing or Shipping.

excludeUnsupportedCountries
Type: Boolean
Indicate if you want to retrieve all addresses (false) or only addresses of type Shipping that are in countries included in the store’s shipToCountries list (true). The default value is false.

Return Value
Type: ConnectApi.CommerceAddressCollection

getCommerceAccountAddress(webstoreId, accountId, defaultOnly, addressType, excludeUnsupportedCountries)

Get Commerce account addresses for a webstore and account.

API Version
57.0
Requires Chatter
No

Signature

public static ConnectApi.CommerceAddressCollection getCommerceAccountAddress(String webstoreId, String accountId, Boolean defaultOnly, List<String> addressType, Boolean excludeUnsupportedCountries)

Parameters

webstoreId
Type: String
ID of the webstore.

accountId
Type: String
ID of the account.

defaultOnly
Type: Boolean
Indicate if you want only the default address (true) or all addresses for the account (false). The default value is false.

addressType
Type: List<String>
Type of address, for example, Billing or Shipping.

excludeUnsupportedCountries
Type: Boolean
Indicate if you want to retrieve all addresses (false) or only addresses of type Shipping that are in countries included in the store’s shipToCountries list (true). The default value is false.

Return Value

Type: ConnectApi.CommerceAddressCollection

getCommerceAccountAddress(webstoreId, accountId, defaultOnly, addressType, excludeUnsupportedCountries, fields, pageToken, pageSize, sortOrder)

Get Commerce account addresses for a webstore and account.

API Version

57.0

Requires Chatter
No
public static ConnectApi.CommerceAddressCollection getCommerceAccountAddress(String webstoreId, String accountId, Boolean defaultOnly, List<String> addressType, Boolean excludeUnsupportedCountries, List<String> fields, String pageToken, Integer pageSize, ConnectApi.CommerceAddressSort sortOrder)

Parameters

webstoreId
Type: String
ID of the webstore.

accountId
Type: String
ID of the account.

defaultOnly
Type: Boolean
Indicate if you want only the default address (true) or all addresses for the account (false). The default value is false.

addressType
Type: List<String>
Type of address, for example, Billing or Shipping.

excludeUnsupportedCountries
Type: Boolean
Indicate if you want to retrieve all addresses (false) or only addresses of type Shipping that are in countries included in the store’s shipToCountries list (true). The default value is false.

fields
Type: List<String>
A list of custom fields for the address.

pageToken
Type: String
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortOrder
Type: ConnectApi.CommerceAddressSort
Sort order for Commerce addresses. Values are:
- CreatedDateAsc—Sort in ascending order of created date.
- CreatedDateDesc—Sort in descending order of created date.
- NameAsc—Sort in ascending order of name.
- NameDesc—Sort in descending order of name.
Return Value
Type: `ConnectApi.CommerceAddressCollection`

`getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId)`
Get order delivery group summaries.

API Version
51.0

Requires Chatter
No

Signature

```java
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId)
```

Parameters

- `webstoreId`
  Type: `String`
  ID of the webstore.
- `effectiveAccountId`
  Type: `String`
  ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.
- `orderSummaryId`
  Type: `String`
  ID of the order summary.

Return Value
Type: `ConnectApi.OrderDeliveryGroupSummaryCollection`

`getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageSize)`
Get order delivery group summaries.

API Version
51.0
Requires Chatter
No

Signature

```java
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, Integer pageSize)
```

Parameters

- `webstoreId`
  - Type: `String`
  - ID of the webstore.

- `effectiveAccountId`
  - Type: `String`
  - ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

- `orderSummaryId`
  - Type: `String`
  - ID of the order summary.

- `pageSize`
  - Type: `Integer`
  - Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.OrderDeliveryGroupSummaryCollection`

```java
getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageParam)
```

Get a page of order delivery group summaries.

API Version

51.0

Requires Chatter
No

Signature

```java
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String pageParam)
```
Parameters

webstoreId
Type: String
ID of the webstore.

effectiveAccountId
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

orderSummaryId
Type: String
ID of the order summary.

pageParam
Type: String
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

Return Value
Type: ConnectApi.OrderDeliveryGroupSummaryCollection

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields)
Get order delivery group summaries with specific fields.

API Version
51.0

Requires Chatter
No

Signature
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, List<String> fields)

Parameters

webstoreId
Type: String
ID of the webstore.

effectiveAccountId
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.
orderSummaryId
   Type: String
   ID of the order summary.

fields
   Type: List<String>
   List of up to 15 order delivery group summary or order delivery method fields to display in the UI in each item row.

Return Value
Type: ConnectApi.OrderDeliveryGroupSummaryCollection

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageParam, fields)
Get a page of order delivery group summaries with specific fields.

API Version
51.0

Requires Chatter
No

Signature
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String pageParam, List<String> fields)

Parameters
webstoreId
   Type: String
   ID of the webstore.

effectiveAccountId
   Type: String
   ID of the account for which the request is made. If null, defaults to the account ID for the context user.

orderSummaryId
   Type: String
   ID of the order summary.

pageParam
   Type: String
   Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.
**Fields**

Type: `List<String>`

List of up to 15 order delivery group summary or order delivery method fields to display in the UI in each item row.

**Return Value**

Type: `ConnectApi.OrderDeliveryGroupSummaryCollection`

**getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, pageSize)**

Get order delivery group summaries with specific fields.

**API Version**

51.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.OrderDeliveryGroupSummaryCollection
    getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, List<String> fields, Integer pageSize)
```

**Parameters**

- `webstoreId`
  
  **Type:** `String`
  
  ID of the webstore.

- `effectiveAccountId`
  
  **Type:** `String`
  
  ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

- `orderSummaryId`
  
  **Type:** `String`
  
  ID of the order summary.

- `fields`
  
  **Type:** `List<String>`
  
  List of up to 15 order delivery group summary or order delivery method fields to display in the UI in each item row.

- `pageSize`
  
  **Type:** `Integer`
  
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.
Return Value
Type: `ConnectApi.OrderDeliveryGroupSummaryCollection`

`getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, sortParam)`
Get a sorted list of order delivery group summaries with specific fields.

API Version
S1.0

Requires Chatter
No

Signature
```java
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, List<String> fields, ConnectApi.OrderDeliveryGroupSummarySort sortParam)
```

Parameters
- **webstoreId**
  - Type: `String`
  - ID of the webstore.
- **effectiveAccountId**
  - Type: `String`
  - ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.
- **orderSummaryId**
  - Type: `String`
  - ID of the order summary.
- **fields**
  - Type: `List<String>`
  - List of up to 15 order delivery group summary or order delivery method fields to display in the UI in each item row.
- **sortParam**
  - Type: `ConnectApi.OrderDeliveryGroupSummarySort`
  - Sort order for order delivery group summaries. Values are:
    - `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
    - `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).
  - If `null`, `IdAsc` is the default sort order.
Return Value
Type: ConnectApi.OrderDeliveryGroupSummaryCollection

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, pageSize, sortParam)
Get a sorted list of order delivery group summaries with specific fields.

API Version
51.0

Requires Chatter
No

Signature
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, List<String> fields, Integer pageSize, ConnectApi.OrderDeliveryGroupSummarySort sortParam)

Parameters
webstoreId
  Type: String
  ID of the webstore.

effectiveAccountId
  Type: String
  ID of the account for which the request is made. If null, defaults to the account ID for the context user.

orderSummaryId
  Type: String
  ID of the order summary.

fields
  Type: List<String>
  List of up to 15 order delivery group summary or order delivery method fields to display in the UI in each item row.

pageSize
  Type: Integer
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
  Type: ConnectApi.OrderDeliveryGroupSummarySort
  Sort order for order delivery group summaries. Values are:
  • IdAsc—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
  • IdDesc—Sorts by ID in descending alphanumeric order (Z–A, 9–0).
If `null`, `IdAsc` is the default sort order.

Return Value
Type: `ConnectApi.OrderDeliveryGroupSummaryCollection`

```java
getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId)
```
Get order item summaries.

API Version
51.0

Requires Chatter
No

Signature
```java
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId)
```

Parameters
- `webstoreId`
  Type: `String`
  ID of the webstore.
- `effectiveAccountId`
  Type: `String`  
  ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.
- `orderSummaryId`
  Type: `String`
  ID of the order summary.

Return Value
Type: `ConnectApi.OrderItemSummaryCollection`

```java
getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageSize)
```
Get order item summaries.

API Version
51.0
Requires Chatter
No

Signature

```java
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, Integer pageSize)
```

Parameters

- **webstoreId**
  Type: `String`
  ID of the webstore.

- **effectiveAccountId**
  Type: `String`
  ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

- **orderSummaryId**
  Type: `String`
  ID of the order summary.

- **pageSize**
  Type: `Integer`
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.OrderItemSummaryCollection`

```java
getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId)
```

Get order item summaries for a delivery group summary.

API Version

51.0

Requires Chatter

No

Signature

```java
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId)
```
Parameters

webstoreId
  Type: String
  ID of the webstore.

effectiveAccountId
  Type: String
  ID of the account for which the request is made. If null, defaults to the account ID for the context user.

orderSummaryId
  Type: String
  ID of the order summary.

orderDeliveryGroupSummaryId
  Type: String
  ID of the order delivery group summary.

Return Value

Type: ConnectApi.OrderItemSummaryCollection

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, pageSize)

Get order item summaries for a delivery group summary.

API Version

S1.0

Requires Chatter

No

Signature

public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, Integer pageSize)

Parameters

webstoreId
  Type: String
  ID of the webstore.

effectiveAccountId
  Type: String
  ID of the account for which the request is made. If null, defaults to the account ID for the context user.
**orderSummaryId**  
Type: **String**  
ID of the order summary.

**orderDeliveryGroupSummaryId**  
Type: **String**  
ID of the order delivery group summary.

**pageSize**  
Type: **Integer**  
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in **null**, the default size is 25.

**Return Value**  
Type: **ConnectApi.OrderItemSummaryCollection**

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, pageParam)

Get a page of order item summaries for a delivery group summary.

**API Version**

$1.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, String pageParam)
```

**Parameters**

**webstoreId**  
Type: **String**  
ID of the webstore.

**effectiveAccountId**  
Type: **String**  
ID of the account for which the request is made. If **null**, defaults to the account ID for the context user.

**orderSummaryId**  
Type: **String**  
ID of the order summary.

**orderDeliveryGroupSummaryId**  
Type: **String**
ID of the order delivery group summary.

**pageParam**
Type: **String**
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**Return Value**
Type: `ConnectApi.OrderItemSummaryCollection`

`getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields)`
Get order item summaries for a delivery group summary with specific fields.

**API Version**
51.0

**Requires Chatter**
No

**Signature**

```java
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields)
```

**Parameters**

- **webstoreId**
  Type: **String**
  ID of the webstore.

- **effectiveAccountId**
  Type: **String**
  ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

- **orderSummaryId**
  Type: **String**
  ID of the order summary.

- **orderDeliveryGroupSummaryId**
  Type: **String**
  ID of the order delivery group summary.

- **fields**
  Type: `List<String>`
  List of up to 15 order item summary or product fields to display in the UI in each item row.
Return Value
Type: `ConnectApi.OrderItemSummaryCollection`

```java
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields, Integer pageSize)
```
Get order item summaries for a delivery group summary with specific fields.

**API Version**

51.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields, Integer pageSize)
```

**Parameters**

- `webstoreId`
  - Type: `String`
  - ID of the webstore.
- `effectiveAccountId`
  - Type: `String`
  - ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.
- `orderSummaryId`
  - Type: `String`
  - ID of the order summary.
- `orderDeliveryGroupSummaryId`
  - Type: `String`
  - ID of the order delivery group summary.
- `fields`
  - Type: `List<String>`
  - List of up to 15 order item summary or product fields to display in the UI in each item row.
- `pageSize`
  - Type: `Integer`
  - Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**Return Value**

Type: `ConnectApi.OrderItemSummaryCollection`
getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageParam)

Get a page of order item summaries for a delivery group summary with specific fields.

API Version

$1.0

Requires Chatter

No

Signature

public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields, String pageParam)

Parameters

webstoreId
  Type: String
  ID of the webstore.

effectiveAccountId
  Type: String
  ID of the account for which the request is made. If null, defaults to the account ID for the context user.

orderSummaryId
  Type: String
  ID of the order summary.

orderDeliveryGroupSummaryId
  Type: String
  ID of the order delivery group summary.

fields
  Type: List<String>
  List of up to 15 order item summary or product fields to display in the UI in each item row.

pageParam
  Type: String
  Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

Return Value

Type: ConnectApi.OrderItemSummaryCollection
getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, sortParam)

Get a sorted list of order item summaries for a delivery group summary with specific fields.

API Version

$1.0

Requires Chatter

No

Signature

public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields, ConnectApi.OrderItemSummarySort sortParam)

Parameters

webstoreId
Type: String
ID of the webstore.

effectiveAccountId
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

orderSummaryId
Type: String
ID of the order summary.

orderDeliveryGroupSummaryId
Type: String
ID of the order delivery group summary.

fields
Type: List<String>
List of up to 15 order item summary or product fields to display in the UI in each item row.

sortParam
Type: ConnectApi.OrderItemSummarySort
Sort order for order item summaries. Values are:
- IdAsc—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
- IdDesc—Sorts by ID in descending alphanumeric order (Z–A, 9–0).
If null, IdAsc is the default sort order.
Return Value
Type: `ConnectApi.OrderItemSummaryCollection`

`getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageSize, sortParam)`
Get a sorted page of order item summaries for a delivery group summary with specific fields.

API Version
51.0

Requires Chatter
No

Signature
```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields, Integer pageSize, ConnectApi.OrderItemSummarySort sortParam)
```

Parameters
- **webstoreId**
  Type: `String`
  ID of the webstore.
- **effectiveAccountId**
  Type: `String`
  ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.
- **orderSummaryId**
  Type: `String`
  ID of the order summary.
- **orderDeliveryGroupSummaryId**
  Type: `String`
  ID of the order delivery group summary.
- **fields**
  Type: `List<String>`
  List of up to 15 order item summary or product fields to display in the UI in each item row.
- **pageSize**
  Type: `Integer`
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.
- **sortParam**
  Type: `ConnectApi.OrderItemSummarySort`
Sort order for order item summaries. Values are:

- **IdAsc**—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
- **IdDesc**—Sorts by ID in descending alphanumeric order (Z–A, 9–0).

If **null**, **IdAsc** is the default sort order.

**Return Value**

Type: `ConnectApi.OrderItemSummaryCollection`

```java
getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageParam, pageSize, sortParam, includeAdjustmentDetails)
```

Get a sorted page of order item summaries for a delivery group summary with specific fields and include adjustment details.

**API Version**

56.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields, String pageParam, Integer pageSize, ConnectApi.OrderItemSummarySort sortParam, Boolean includeAdjustmentDetails)
```

**Parameters**

- **webstoreId**
  Type: `String`
  ID of the webstore.
- **effectiveAccountId**
  Type: `String`
  ID of the account for which the request is made. If **null**, defaults to the account ID for the context user.
- **orderSummaryId**
  Type: `String`
  ID of the order summary.
- **orderDeliveryGroupSummaryId**
  Type: `String`
  ID of the order delivery group summary.
- **fields**
  Type: `List<String>`
List of up to 15 order item summary or product fields to display in the UI in each item row.

**pageParam**
Type: `String`
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: `Integer`
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**sortParam**
Type: `ConnectApi.OrderItemSummarySort`
Sort order for order item summaries. Values are:
- `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
- `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).
If `null`, `IdAsc` is the default sort order.

**includeAdjustmentDetails**
Type: `Boolean`
Specifies whether to return adjustment details (true) or not (false).

### Return Value
Type: `ConnectApi.OrderItemSummaryCollection`

#### getOrderItemSummaryAdjustments (webstoreId, orderSummaryId, orderItemSummaryAdjustmentCollectionInput)
Get adjustments for order items.

### API Version
53.0

### Requires Chatter
No

### Signature
```
public static ConnectApi.OrderItemSummaryAdjustmentCollection
getOrderItemSummaryAdjustments(String webstoreId, String orderSummaryId,
ConnectApi.OrderItemSummaryAdjustmentCollectionInput
orderItemSummaryAdjustmentCollectionInput)
```

### Parameters
- **webstoreId**
  Type: `String`
ID of the webstore.

`orderSummaryId`  
Type: `String`  
ID of the order summary.

`orderItemSummaryAdjustmentCollectionInput`  
Type: `ConnectApi.OrderItemSummaryAdjustmentCollectionInput`  
Collection of order item summaries to get adjustments for.

**Return Value**

Type: `ConnectApi.OrderItemSummaryAdjustmentCollection`

```java
getOrderItemSummaryAdjustments(String webstoreId, String orderSummaryId, 
ConnectApi.OrderItemSummaryAdjustmentCollectionInput, String effectiveAccountId)
```

Get adjustments for order items.

**API Version**

53.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.OrderItemSummaryAdjustmentCollection 
getOrderItemSummaryAdjustments(String webstoreId, String orderSummaryId, 
ConnectApi.OrderItemSummaryAdjustmentCollectionInput orderItemSummaryAdjustmentCollectionInput, String effectiveAccountId)
```

**Parameters**

`webstoreId`  
Type: `String`  
ID of the webstore.

`orderSummaryId`  
Type: `String`  
ID of the order summary.

`orderItemSummaryAdjustmentCollectionInput`  
Type: `ConnectApi.OrderItemSummaryAdjustmentCollectionInput`  
Collection of order item summaries to get adjustments for.

`effectiveAccountId`  
Type: `String`  
ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.
Return Value
Type: `ConnectApi.OrderItemSummaryAdjustmentCollection`

`getOrderShipmentItems(webstoreId, shipmentId)`
Get order shipment items.

API Version
52.0

Requires Chatter
No

Signature
```java
public static ConnectApi.OrderShipmentItemCollection getOrderShipmentItems(String webstoreId, String shipmentId)
```

Parameters
- `webstoreId`
  Type: `String`
  ID of the webstore.
- `shipmentId`
  Type: `String`
  ID of the shipment.

Return Value
Type: `ConnectApi.OrderShipmentItemCollection`

`getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId)`
Get order shipment items.

API Version
52.0

Requires Chatter
No

Signature
```java
public static ConnectApi.OrderShipmentItemCollection getOrderShipmentItems(String webstoreId, String shipmentId, String effectiveAccountId)
```
Parameters

`webstoreId`
Type: `String`
ID of the webstore.

`shipmentId`
Type: `String`
ID of the shipment.

`effectiveAccountId`
Type: `String`
ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value
Type: `ConnectApi.OrderShipmentItemCollection`

`getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields)`
Get order shipment items with specific fields.

API Version
52.0

Requires Chatter
No

Signature

```java
public static ConnectApi.OrderShipmentItemCollection getOrderShipmentItems(String webstoreId, String shipmentId, String effectiveAccountId, List<String> fields)
```

Parameters

`webstoreId`
Type: `String`
ID of the webstore.

`shipmentId`
Type: `String`
ID of the shipment.

`effectiveAccountId`
Type: `String`
ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

`fields`
Type: `List<String>`
List of up to 15 additional shipment items, order item summary, and product fields to display in the UI in each item row.
Return Value
Type: ConnectApi.OrderShipmentItemCollection

getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields, pageToken, pageSize)
Get a page of order shipment items with specific fields.

API Version
52.0

Requires Chatter
No

Signature
public static ConnectApi.OrderShipmentItemCollection getOrderShipmentItems(String webstoreId, String shipmentId, String effectiveAccountId, List<String> fields, String pageToken, Integer pageSize)

Parameters
webstoreId
Type: String
ID of the webstore.

shipmentId
Type: String
ID of the shipment.

effectiveAccountId
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

fields
Type: List<String>
List of up to 15 additional shipment items, order item summary, and product fields to display in the UI in each item row.

pageToken
Type: String
Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: ConnectApi.OrderShipmentItemCollection
**getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields, pageToken, pageSize, sortOrder)**

Get a sorted page of order shipment items.

**API Version**

52.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.OrderShipmentItemCollection getOrderShipmentItems(String webstoreId, String shipmentId, String effectiveAccountId, List<String> fields, String pageToken, Integer pageSize, ConnectApi.OrderShipmentItemSort sortOrder)
```

**Parameters**

- **webstoreId**
  
  Type: `String`
  
  ID of the webstore.

- **shipmentId**
  
  Type: `String`
  
  ID of the shipment.

- **effectiveAccountId**
  
  Type: `String`
  
  ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

- **fields**
  
  Type: `List<String>`
  
  List of up to 15 additional shipment items, order item summary, and product fields to display in the UI in each item row.

- **pageToken**
  
  Type: `String`
  
  Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

- **pageSize**
  
  Type: `Integer`
  
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

- **sortOrder**
  
  Type: `ConnectApi.OrderShipmentItemSort`
  
  Sort order for order shipment items. Values are:
  
  - `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
  - `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).
  
  If unspecified, defaults to `IdAsc`. 

Return Value
Type: `ConnectApi.OrderShipmentItemCollection`

`getOrderShipments(webstoreId, orderSummaryId)`
Get order shipments.

API Version
52.0

Requires Chatter
No

Signature
```java
public static ConnectApi.OrderShipmentCollection getOrderShipments(String webstoreId,
String orderSummaryId)
```

Parameters
- `webstoreId`
  Type: `String`
  ID of the webstore.
- `orderSummaryId`
  Type: `String`
  ID of the order summary.

Return Value
Type: `ConnectApi.OrderShipmentCollection`

`getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId)`
Get order shipments.

API Version
52.0

Requires Chatter
No

Signature
```java
public static ConnectApi.OrderShipmentCollection getOrderShipments(String webstoreId,
String orderSummaryId, String effectiveAccountId)
```
Parameters

webstoreId
Type: String
ID of the webstore.

orderSummaryId
Type: String
ID of the order summary.

effectiveAccountId
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

Return Value

Type: ConnectApi.OrderShipmentCollection

getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields)
Get order shipments with specific fields.

API Version

52.0

Requires Chatter

No

Signature

public static ConnectApi.OrderShipmentCollection getOrderShipments(String webstoreId, String orderSummaryId, String effectiveAccountId, List<String> fields)

Parameters

webstoreId
Type: String
ID of the webstore.

orderSummaryId
Type: String
ID of the order summary.

effectiveAccountId
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

fields
Type: List<String>
List of up to 15 additional shipment and order delivery method fields to display in the UI in each item row.
Return Value
Type: `ConnectApi.OrderShipmentCollection`

```java
public static ConnectApi.OrderShipmentCollection getOrderShipments(String webstoreId, String orderSummaryId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken)
```

Get a page of order shipments with specific fields.

API Version
52.0

Requires Chatter
No

Signature

</tbody>
</table>

Return Value
Type: `ConnectApi.OrderShipmentCollection`
getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields, pageSize, pageToken, sortOrder)

Get a sorted page of order shipments with specific fields.

API Version

52.0

Requires Chatter

No

Signature

public static ConnectApi.OrderShipmentCollection getOrderShipments(String webstoreId, String orderSummaryId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken, ConnectApi.OrderShipmentSort sortOrder)

Parameters

webstoreId
Type: String
ID of the webstore.

orderSummaryId
Type: String
ID of the order summary.

effectiveAccountId
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

fields
Type: List<String>
List of up to 15 additional shipment and order delivery method fields to display in the UI in each item row.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

pageToken
Type: String
Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

sortOrder
Type: ConnectApi.OrderShipmentSort
Sort order for order shipments. Values are:

- ExpectedDeliveryDateAsc—Sorts by the oldest expected delivery date.
- ExpectedDeliveryDateDesc—Sorts by the most recent expected delivery date.
- ShipmentNumberAsc—Sorts by shipment number in ascending order (0–9).
• ShipmentNumberDesc—Sorts by shipment number in descending order (9–0).
If unspecified, defaults to ShipmentNumberAsc.
If you’re sorting by expected delivery date, make sure the expected delivery date is populated on your shipment records. A null value isn’t supported and results in an error.

Return Value
Type: ConnectApi.OrderShipmentCollection

getOrderSummaries(webstoreId)
Get order summaries.

API Version
51.0

Requires Chatter
No

Signature
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId)

Parameters
webstoreId
  Type: String
  ID of the webstore.

Return Value
Type: ConnectApi.OrderSummaryCollectionRepresentation

getOrderSummaries(webstoreId, effectiveAccountId)
Get order summaries.

API Version
51.0

Requires Chatter
No
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountID)

Parameters

webstoreId
Type: String
ID of the webstore.
effectiveAccountID
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

Return Value

Type: ConnectApi.OrderSummaryCollectionRepresentation

getOrderSummaries(webstoreId, effectiveAccountID, fields)
Get order summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountID, List<String> fields)

Parameters

webstoreId
Type: String
ID of the webstore.
effectiveAccountID
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

fields
Type: List<String>
List of up to 35 additional order summary fields to display in the UI in each item row.
These order summary fields are returned regardless of fields specified.
getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken)

Get a page of order summaries with specific fields.

API Version
51.0

Requires Chatter
No

Signature
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken)

Parameters

webstoreId
Type: String
ID of the webstore.

effectiveAccountId
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

fields
Type: List<String>
List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- createdDate
- orderSummaryId
- orderNumber
• orderedDate
• ownerID
• status
• totalAmount

**pageSize**
Type: **Integer**
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**pageToken**
Type: **String**
Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

**Return Value**
Type: `ConnectApi.OrderSummaryCollectionRepresentation`

**getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder)**
Get a sorted page of order summaries with specific fields.

**API Version**
**51.0**

**Requires Chatter**
No

**Signature**
`public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken, ConnectApi.OrderSummarySortOrder sortOrder)`

**Parameters**

**webstoreId**
Type: **String**
ID of the webstore.

**effectiveAccountId**
Type: **String**
ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

**fields**
Type: `List<String>`
List of up to 35 additional order summary fields to display in the UI in each item row.
These order summary fields are returned regardless of fields specified.
• createdDate
• orderSummaryId
• orderNumber
• orderedDate
• ownerId
• status
• totalAmount

**pageSize**
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**pageToken**
Type: String
Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

**sortOrder**
Type: `ConnectApi.OrderSummarySortOrder`
Sort order for order summaries. Values are:
• CreatedDateAsc—Sorts by the oldest created date.
• CreatedDateDesc—Sorts by the most recent created date.
• OrderedDateAsc—Sorts by the oldest ordered date.
• OrderedDateDesc—Sorts by the most recent ordered date.
If unspecified, defaults to `OrderedDateDesc`.
If you’re sorting by ordered date, make sure the ordered date is populated on your order summary records. A `null` value isn’t supported and results in an error.

**Return Value**
Type: `ConnectApi.OrderSummaryCollectionRepresentation`

`getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate)`
Get a sorted page of order summaries with specific fields within a specific date range.

**API Version**
51.0

**Requires Chatter**
No
Signature

public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken, ConnectApi.OrderSummarySortOrder sortOrder, String earliestDate, String latestDate)

Parameters

webstoreId
Type: String
ID of the webstore.

effectiveAccountId
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

fields
Type: List<String>
List of up to 35 additional order summary fields to display in the UI in each item row. These order summary fields are returned regardless of fields specified.

• createdDate
• orderSummaryId
• orderNumber
• orderedDate
• ownerId
• status
• totalAmount

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

pageToken
Type: String
Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

sortOrder
Type: ConnectApi.OrderSummarySortOrder
Sort order for order summaries. Values are:

• CreatedDateAsc—Sorts by the oldest created date.
• CreatedDateDesc—Sorts by the most recent created date.
• OrderedDateAsc—Sorts by the oldest ordered date.
• OrderedDateDesc—Sorts by the most recent ordered date.

If unspecified, defaults to OrderedDateDesc.

If you’re sorting by ordered date, make sure the ordered date is populated on your order summary records. A null value isn’t supported and results in an error.
earliestDate
Type: String
Oldest created or ordered date, depending on the sortOrder value, for order summaries to return. Results include any orders on and after this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

latestDate
Type: String
Most recent created or ordered date, depending on the sortOrder value, for order summaries to return. Results include any orders before this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

Return Value
Type: ConnectApi.OrderSummaryCollectionRepresentation

getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate, ownerScoped)
Get a sorted page of order summaries with specific fields within a specific date range and scoped to orders owned by the context user.

API Version
S1.0

Requires Chatter
No

Signature
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken, ConnectApi.OrderSummarySortOrder sortOrder, String earliestDate, String latestDate, Boolean ownerScoped)

Parameters
webstoreId
Type: String
ID of the webstore.

effectiveAccountId
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

fields
Type: List<String>
List of up to 35 additional order summary fields to display in the UI in each item row.
These order summary fields are returned regardless of fields specified.
• createdDate
- orderSummaryId
- orderNumber
- orderedDate
- ownerId
- status
- totalAmount

**pageSize**
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

**pageToken**
Type: String
Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

**sortOrder**
Type: ConnectApi.OrderSummarySortOrder
Sort order for order summaries. Values are:
- CreatedDateAsc—Sorts by the oldest created date.
- CreatedDateDesc—Sorts by the most recent created date.
- OrderedDateAsc—Sorts by the oldest ordered date.
- OrderedDateDesc—Sorts by the most recent ordered date.
If unspecified, defaults to OrderedDateDesc.
If you’re sorting by ordered date, make sure the ordered date is populated on your order summary records. A null value isn’t supported and results in an error.

**earliestDate**
Type: String
Oldest created or ordered date, depending on the sortOrder value, for order summaries to return. Results include any orders on and after this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

**latestDate**
Type: String
Most recent created or ordered date, depending on the sortOrder value, for order summaries to return. Results include any orders before this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

**ownerScoped**
Type: Boolean
Specifies whether the results are scoped to orders owned by the context user (true) or to orders owned by and shared with the context user (false). If unspecified, defaults to true.

**Return Value**
Type: ConnectApi.OrderSummaryCollectionRepresentation
getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate, ownerScoped, includeAdjustmentDetails)

Get a sorted page of order summaries with specific fields within a specific date range and scoped to orders owned by the context user.

API Version

S1.0

Requires Chatter

No

Signature

public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken, ConnectApi.OrderSummarySortOrder sortOrder, String earliestDate, String latestDate, Boolean ownerScoped, Boolean includeAdjustmentDetails)

Parameters

webstoreId
  Type: String
  ID of the webstore.

effectiveAccountId
  Type: String
  ID of the account for which the request is made. If null, defaults to the account ID for the context user.

fields
  Type: List<String>
  List of up to 35 additional order summary fields to display in the UI in each item row.
  These order summary fields are returned regardless of fields specified.
  • createdDate
  • orderSummaryId
  • orderNumber
  • orderedDate
  • ownerId
  • status
  • totalAmount

pageSize
  Type: Integer
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

pageToken
  Type: String
  Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.
sortOrder
Type: `ConnectApi.OrderSummarySortOrder`
Sort order for order summaries. Values are:
- CreatedDateAsc—Sorts by the oldest created date.
- CreatedDateDesc—Sorts by the most recent created date.
- OrderedDateAsc—Sorts by the oldest ordered date.
- OrderedDateDesc—Sorts by the most recent ordered date.
If unspecified, defaults to OrderedDateDesc.
If you’re sorting by ordered date, make sure the ordered date is populated on your order summary records. A null value isn’t supported and results in an error.

earliestDate
Type: String
Oldest created or ordered date, depending on the sortOrder value, for order summaries to return. Results include any orders on and after this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

latestDate
Type: String
Most recent created or ordered date, depending on the sortOrder value, for order summaries to return. Results include any orders before this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

ownerScoped
Type: Boolean
Specifies whether the results are scoped to orders owned by the context user (`true`) or to orders owned by and shared with the context user (`false`). If unspecified, defaults to `true`.

includeAdjustmentDetails
Type: Boolean
Specifies whether to fetch price adjustment details based on their type (`true`). If unspecified, defaults to `false`.

Return Value
Type: `ConnectApi.OrderSummaryCollectionRepresentation`

`getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId)`
Get an order summary.

API Version
5.5.0

Requires Chatter
No
public static ConnectApi.OrderSummaryRepresentation getOrderSummary(String webstoreId, String orderSummaryId, String effectiveAccountId)

Parameters

webstoreId
Type: String
ID of the webstore.

orderSummaryId
Type: String
ID of the order summary.

effectiveAccountId
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

Return Value
Type: ConnectApi.OrderSummaryRepresentation

getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId, fields)
Get an order summary with fields.

API Version
55.0

Requires Chatter
No

Signature
public static ConnectApi.OrderSummaryRepresentation getOrderSummary(String webstoreId, String orderSummaryId, String effectiveAccountId, List<String> fields)

Parameters

webstoreId
Type: String
ID of the webstore.

orderSummaryId
Type: String
ID of the order summary.

effectiveAccountId
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

**fields**

Type: `List<String>`

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- createdDate
- orderSummaryId
- orderNumber
- orderedDate
- ownerId
- status
- totalAmount

**Return Value**

Type: `ConnectApi.OrderSummaryRepresentation`

**getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId, fields, includeAdjustmentDetails)**

Get an order summary with fields and include adjustment details.

**API Version**

55.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.OrderSummaryRepresentation getOrderSummary(String webstoreId, String orderSummaryId, String effectiveAccountId, List<String> fields, Boolean includeAdjustmentDetails)
```

**Parameters**

- `webstoreId`
  
  Type: `String`
  
  ID of the webstore.

- `orderSummaryId`
  
  Type: `String`
  
  ID of the order summary.

- `effectiveAccountId`
  
  Type: `String`
ID of the account for which the request is made. If **null**, defaults to the account ID for the context user.

**fields**

Type: **List<String>**

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- createdDate
- orderSummaryId
- orderNumber
- orderedDate
- ownerId
- status
- totalAmount

**includeAdjustmentDetails**

Type: **Boolean**

Specifies whether to return adjustment details (**true**) or not (**false**). If unspecified, the default value is **false**.

**Return Value**

Type: **ConnectApi.OrderSummaryRepresentation**

`getOrderSummaryAdjustments(webstoreId, orderSummaryId)`

Get adjustments for an order summary.

**API Version**

53.0

**Requires Chatter**

No

**Signature**

`public static ConnectApi.OrderSummaryAdjustmentCollection getOrderSummaryAdjustments(String webstoreId, String orderSummaryId)`

**Parameters**

- **webstoreId**
  Type: **String**
  ID of the webstore.

- **orderSummaryId**
  Type: **String**
  ID of the order summary.
Return Value
Type: ConnectApi.OrderSummaryAdjustmentCollection

getOrderSummaryAdjustments(webstoreId, orderSummaryId, effectiveAccountId)
Get adjustments for an order summary.

API Version
53.0

Requires Chatter
No

Signature
public static ConnectApi.OrderSummaryAdjustmentCollection
getOrderSummaryAdjustments(String webstoreId, String orderSummaryId, String
effectiveAccountId)

Parameters
webstoreId
Type: String
ID of the webstore.

orderSummaryId
Type: String
ID of the order summary.

effectiveAccountId
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

Return Value
Type: ConnectApi.OrderSummaryAdjustmentCollection

lookupOrderSummary(webstoreId, effectiveAccountId, fields, excludeLineItems,
excludeDeliveryGroups, excludeAdjustmentAggregates, excludeAdjustments,
deliveryGroupId, orderSummaryLookupInput) (Developer Preview)
Look up details about an order summary for a guest shopper or a registered buyer using the effective account ID, requested fields, line items, delivery groups, adjustments aggregates, and adjustments.

Note: This API is available as a developer preview. It isn’t generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. All commands, parameters, and other features are subject to change or deprecation at any time, with or without notice. Don’t implement functionality developed with these commands or tools.

Signature
public static ConnectApi.OrderSummaryLookupOutput lookupOrderSummary(String webstoreId, 
String effectiveAccountId, List<String> fields, Boolean excludeLineItems, Boolean 
excludeDeliveryGroups, Boolean excludeAdjustmentAggregates, Boolean excludeAdjustments, 
String deliveryGroupId, ConnectApi.OrderSummaryLookupInput orderSummaryLookupInput)

Parameters
webstoreId
  Type: String
  ID of the webstore.

effectiveAccountId
  Type: String
  ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user or, for guest users, the 
guest buyer profile ID of the current store.

fields
  Type: List<String>
  List of specific fields, including custom fields, to return in the response along with default fields. For example, 
  OrderSummary.TotalAmount, OrderItemSummary.Quantity, Product2.Description, 

excludeLineItems
  Type: Boolean
  Specifies whether to exclude line items from the response. If unspecified, the default value is false.

excludeDeliveryGroups
  Type: Boolean
  Specifies whether to exclude delivery groups from the response. If unspecified, the default value is false.

excludeAdjustmentAggregates
  Type: Boolean
  Specifies whether to exclude adjustment aggregates associated with an order summary. Adjustment aggregates include fields 
detailing promotional amounts by price, tax, and total. Aggregates are calculated asynchronously and results returned to the order 
summary. If unspecified, the default value is false.

excludeAdjustments
  Type: Boolean
Specifies whether to exclude adjustments associated with an order summary. Adjustments include promotional discounts. If unspecified, the default value is false.

deliveryGroupId
Type: String
ID of the delivery group associated with the order summary.

orderSummaryLookupInput
Type: ConnectApi.OrderSummaryLookupInput
Order summary lookup input representation.

Return Value
Type: ConnectApi.OrderSummaryLookupOutput

lookupOrderSummary(webstoreId, effectiveAccountId, fields, orderSummaryLookupInput) (Developer Preview)
Look up details about an order summary for a guest shopper or a registered buyer using the effective account ID and requested fields.

Note: This API is available as a developer preview. It isn’t generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. ```
public static ConnectApi.OrderSummaryLookupOutput lookupOrderSummary(String webstoreId, String effectiveAccountId, ConnectApi.OrderSummaryLookupInput orderSummaryLookupInput)
```

**Parameters**
- `webstoreId`
  Type: `String`
  ID of the webstore.
effectiveAccountId
- Type: String
  ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user or, for guest users, the guest buyer profile ID of the current store.

orderSummaryLookupInput
- Type: ConnectApi.OrderSummaryLookupInput
  Order summary lookup input representation.

Return Value
- Type: ConnectApi.OrderSummaryLookupOutput

updateCommerceAccountAddress(webstoreId, accountId, addressId, addressInput)
Update a Commerce account address for a webstore.

API Version
54.0

Requires Chatter
No

Signature
public static ConnectApi.CommerceAddressOutput updateCommerceAccountAddress(String webstoreId, String accountId, String addressId, ConnectApi.commerceAddressInput addressInput)

Parameters
- webstoreId
  - Type: String
    ID of the webstore.
- accountId
  - Type: String
    ID of the account.
- addressId
  - Type: String
    ID of the address.
- addressInput
  - Type: ConnectApi.commerceAddressInput
    Information about the address fields you want to update.
Return Value
Type: `ConnectApi.CommerceAddressOutput`

**CommerceCart Class**

Get, create, update, and delete carts. Get cart items, add items to carts, update and delete cart items.

**Namespace**

`ConnectApi`

**CommerceCart Methods**

These methods are for `CommerceCart`. All methods are static.

**IN THIS SECTION:**

- `addItemToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItemInput, currencyIsoCode)`
  Add an item to a cart of a specific currency.

- `addItemToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItems)`
  Add a batch of up to 100 items to a cart.

- `addItemToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItems, currencyIsoCode)`
  Add a batch of up to 100 items to a cart of a specific currency.

- `addItemToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItemInput)`
  Add an item to a cart.

- `applyCartCoupon(webstoreId, effectiveAccountId, activeCartOrId, cartCouponInput)`
  Apply a coupon to a cart.

- `applyCartCoupon(webstoreId, effectiveAccountId, activeCartOrId, cartCouponInput, currencyIsoCode)`
  Apply a coupon to a cart.

- `copyCartToWishlist(webstoreId, effectiveAccountId, activeCartOrId, cartToWishlistInput)`
  Copy the products from a cart to a wishlist.

- `createCart(webstoreId, cart)`
  Create a cart.

- `deleteCart(webstoreId, effectiveAccountId, activeCartOrId)`
  Delete a cart.

- `deleteCartCoupon(webstoreId, effectiveAccountId, activeCartOrId, cartCouponId)`
  Delete a coupon from a cart.

- `deleteCartCoupon(webstoreId, effectiveAccountId, activeCartOrId, cartCouponId, currencyIsoCode)`
  Delete a coupon from a cart.

- `deleteCartItem(webstoreId, effectiveAccountId, activeCartOrId, cartItemId)`
  Delete an item from a cart.

- `deleteInventoryReservation(webstoreId, activeCartOrId, effectiveAccountId) (Pilot)`
  Delete an inventory reservation.
getCartCoupons(webstoreId, effectiveAccountId, activeCartOrId)
Get coupons for a cart.
getCartCoupons(webstoreId, effectiveAccountId, activeCartOrId, currencyIsoCode)
Get coupons for a cart.
getCartItemPromotion(webstoreId, effectiveAccountId, activeCartOrId, cartItemPromotionCollectionInput)
Get promotions for a cart item.
getCartItemPromotion(webstoreId, effectiveAccountId, activeCartOrId, cartItemPromotionCollectionInput, currencyIsoCode)
Get a promotion for a cart item.
getCartItems(webstoreId, effectiveAccountId, activeCartOrId)
Get items in a cart.
getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam)
Get a page of items in a cart.
getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, sortParam)
Get a sorted page of items in a cart.
getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, pageSize)
Get a specified size page of items in a cart.
getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, pageSize, sortParam)
Get a specified size, sorted page of items in a cart.
getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, pageSize, sortParam, currencyIsoCode)
Get a specified size, sorted page of items filtered by product fields in a cart.
getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, pageSize, sortParam, currencyIsoCode, includePromotions, includeCoupons)
Get a sorted page of items in a cart, including coupons and promotions.
getCartPromotions(webstoreId, effectiveAccountId, activeCartOrId)
Get promotions for a cart.
getCartPromotions(webstoreId, effectiveAccountId, activeCartOrId, currencyIsoCode)
Get promotions for a cart in a specific currency.
getCartSummary(webstoreId, effectiveAccountId, activeCartOrId)
Get a cart.
getCartSummary(webstoreId, effectiveAccountId, activeCartOrId, currencyIsoCode)
Get a cart in a specific currency.
getOrCreateActiveCartSummary(webstoreId, effectiveAccountId, activeCartOrId)
Get a cart or create an active cart if one doesn’t exist.
getOrCreateActiveCartSummary(webstoreId, effectiveAccountId, activeCartOrId, currencyIsoCode)
Get a cart in a specific currency, or create an active cart if one doesn’t exist.
makeCartPrimary(webstoreId, activeCartOrId, effectiveAccountId)
Make a secondary cart a primary cart.
setCartMessagesVisibility(webstoreId, activeCartOrId, effectiveAccountId, messageVisibility)
Set the visibility for cart messages.
updateCartItem(webstoreId, effectiveAccountId, activeCartOrId, cartItemId, cartItem)
Update an item in a cart.

updateCartItem(webstoreId, effectiveAccountId, activeCartOrId, cartItemId, cartItem, currencyIsoCode)
Update an item in a cart of a specific currency.

upsertInventoryReservation(webstoreId, activeCartOrId, effectiveAccountId, cartInventoryReservationInput) (Pilot)
Create or update an inventory reservation.

addItemToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItemInput, currencyIsoCode)
Add an item to a cart of a specific currency.

API Version
57.0

Available to Guest Users
57.0

Requires Chatter
No

Signature
public static ConnectApi.CartItem addItemToCart(String webstoreId, String effectiveAccountId, String activeCartOrId, ConnectApi.CartItemInput cartItemInput, String currencyIsoCode)

Parameters
webstoreId
Type: String
ID of the webstore.

effectiveAccountId
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

activeCartOrId
Type: String
ID of the cart, active, or current. The current value indicates a cart with a status that isn’t Closed or PendingDelete.

cartItemInput
Type: ConnectApi.CartItemInput
A ConnectApi.CartItemInput object representing an item to add to the cart.

currencyIsoCode
Type: String
The currency ISO code of the cart.

Return Value
Type: `ConnectApi.CartItem`

Usage
Buyers with read access to carts can add, update, and delete items in carts.
This method respects buyer View Product entitlements and only users entitled to view product data can access it.

```java
addItemsToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItems)
```
Add a batch of up to 100 items to a cart.

API Version
49.0

Available to Guest Users
54.0

Requires Chatter
No

Signature
```java
public static ConnectApi.BatchResult[] addItemsToCart(String webstoreId, String effectiveAccountId, String activeCartOrId, List<ConnectApi.BatchInput> cartItems)
```

Parameters
- `webstoreId`
  Type: `String`
  ID of the webstore.
- `effectiveAccountId`
  Type: `String`
  ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.
- `activeCartOrId`
  Type: `String`
  ID of the cart, active, or current. The current value is available in version 50.0 and later and indicates a cart with a status that isn’t Closed or PendingDelete.
- `cartItems`
  Type: `List<ConnectApi.BatchInput>`
  The list can contain up to 100 `ConnectApi.BatchInput` objects. In the `ConnectApi.BatchInput` constructor, the input object must be `ConnectApi.CartItemInput`.
Return Value
Type: `ConnectApi.BatchResult[]`

The returned objects correspond to each of the input objects and are returned in the same order as the input objects.
The method call fails only if an error occurs that affects the entire operation (such as a parsing failure). If an individual object causes an error, the error is embedded within the `ConnectApi.BatchResult` list.

Usage
Buyers with read access to carts can add, update, and delete items in carts.
This method respects buyer View Product entitlements and only users entitled to view product data can access it.

`addItemsToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItems, currencyIsoCode)`
Add a batch of up to 100 items to a cart of a specific currency.

Available to Guest Users
57.0

Requires Chatter
No

Signature
```java
public static ConnectApi.BatchResult[] addItemsToCart(String webstoreId, String effectiveAccountId, String activeCartOrId, List<ConnectApi.BatchInput> cartItems, String currencyIsoCode)
```

Parameters
- `webstoreId`  
  Type: `String`  
  ID of the webstore.
- `effectiveAccountId`  
  Type: `String`  
  ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.
- `activeCartOrId`  
  Type: `String`  
  ID of the cart, active, or current. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.
cartItems
Type: List<ConnectApi.BatchInput>
The list can contain up to 100 ConnectApi.BatchInput objects. In the ConnectApi.BatchInput constructor, the input object must be ConnectApi.CartItemInput.
currencyIsoCode
Type: String
The currency ISO code of the cart.

Return Value
Type: ConnectApi.BatchResult[]
The returned objects correspond to each of the input objects and are returned in the same order as the input objects.
The method call fails only if an error occurs that affects the entire operation (such as a parsing failure). If an individual object causes an error, the error is embedded within the ConnectApi.BatchResult list.

Usage
Buyers with read access to carts can add, update, and delete items in carts.
This method respects buyer View Product entitlements and only users entitled to view product data can access it.

  ID of the webstore.
- `effectiveAccountId`
  Type: `String`
  ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.
- `activeCartOrId`
  Type: `String`
  ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn’t `Closed` or `PendingDelete`.

**Return Value**
Type: `ConnectApi.CartItemCollection`

### getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam)
Get a page of items in a cart.

**API Version**
49.0
Available to Guest Users
54.0

Requires Chatter
No

Signature
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String pageParam)

Parameters
webstoreId
Type: String
ID of the webstore.

effectiveAccountId
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

activeCartOrId
Type: String
ID of the cart, active, or current. The current value is available in version 50.0 and later and indicates a cart with a status that isn’t Closed or PendingDelete.

pageParam
Type: String
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

Return Value
Type: ConnectApi.CartItemCollection

getcartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, sortParam)
Get a sorted page of items in a cart.

API Version
49.0

Available to Guest Users
54.0
The function `getCartItems` is used to retrieve a specified size page of items in a cart.

**Parameters**

- **webstoreId**
  - Type: String
  - ID of the webstore.
- **effectiveAccountId**
  - Type: String
  - ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.
- **activeCartOrId**
  - Type: String
  - ID of the cart, active, or current. The current value is available in version 50.0 and later and indicates a cart with a status that isn’t Closed or PendingDelete.
- **pageParam**
  - Type: String
  - Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.
- **sortParam**
  - Type: `ConnectApi.CartItemSortOrder`
  - Sort order for items in a cart. Values are:
    - CreatedDateAsc—Sorts by oldest creation date.
    - CreatedDateDesc—Sorts by most recent creation date.
    - NameAsc—Sorts by name in ascending alphabetical order (A–Z).
    - NameDesc—Sorts by name in descending alphabetical order (Z–A).
    - SalesPriceAsc—Sorts from lowest to highest negotiated price.
    - SalesPriceDesc—Sorts from highest to lowest negotiated price.
  - If `null`, the default is CreatedDateDesc.

**Return Value**

- Type: `ConnectApi.CartItemCollection`
  - `getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, pageSize)`

Get a specified size page of items in a cart.
API Version
49.0

Available to Guest Users
54.0

Requires Chatter
No

Signature
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String pageParam, Integer pageSize)

Parameters
webstoreId
Type: String
ID of the webstore.

effectiveAccountId
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

activeCartOrId
Type: String
ID of the cart, active, or current. The current value is available in version 50.0 and later and indicates a cart with a status that isn’t Closed or PendingDelete.

pageParam
Type: String
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: ConnectApi.CartItemCollection

getcartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, pageSize, sortParam)
Get a specified size, sorted page of items in a cart.
API Version
49.0

Available to Guest Users
54.0

Requires Chatter
No

Signature

```java
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String pageParam, Integer pageSize, ConnectApi.CartItemSortOrder sortParam)
```

Parameters

- `webstoreId`
  Type: `String`
  ID of the webstore.

- `effectiveAccountId`
  Type: `String`
  ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

- `activeCartOrId`
  Type: `String`
  ID of the cart, active, or current. The current value is available in version 50.0 and later and indicates a cart with a status that isn’t Closed or PendingDelete.

- `pageParam`
  Type: `String`
  Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

- `pageSize`
  Type: `Integer`
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

- `sortParam`
  Type: `ConnectApi.CartItemSortOrder`
  Sort order for items in a cart. Values are:
  - `CreatedDateAsc`—Sorts by oldest creation date.
  - `CreatedDateDesc`—Sorts by most recent creation date.
  - `NameAsc`—Sorts by name in ascending alphabetical order (A–Z).
  - `NameDesc`—Sorts by name in descending alphabetical order (Z–A).
  - `SalesPriceAsc`—Sorts from lowest to highest negotiated price.
• **SalesPriceDesc**—Sorts from highest to lowest negotiated price.
  If `null`, the default is `CreatedDateDesc`.

**Return Value**
Type: `ConnectApi.CartItemCollection`

```java
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String productFields, String pageParam, Integer pageSize, ConnectApi.CartItemSortOrder sortParam)
```

Get a specified size, sorted page of items filtered by product fields in a cart.

**API Version**
49.0

**Available to Guest Users**
54.0

**Requires Chatter**
No

**Signature**
```java
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String productFields, String pageParam, Integer pageSize, ConnectApi.CartItemSortOrder sortParam)
```

**Parameters**
- **webstoreId**
  Type: `String`
  ID of the webstore.
- **effectiveAccountId**
  Type: `String`
  ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.
- **activeCartOrId**
  Type: `String`
  ID of the cart, active, or current. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn’t `Closed` or `PendingDelete`.
- **productFields**
  Type: `String`
  Comma-separated list of up to five product fields. Results include fields that you have access to. Some product fields (such as `productName` and `sku`) are returned even when not included in the `productFields` parameter.
pageParam
  Type: String
  Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in `null`, the first page is returned.

pageSize
  Type: Integer
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
  Type: ConnectApi.CartItemSortOrder
  Sort order for items in a cart. Values are:
  - CreatedDateAsc—Sorts by oldest creation date.
  - CreatedDateDesc—Sorts by most recent creation date.
  - NameAsc—Sorts by name in ascending alphabetical order (A–Z).
  - NameDesc—Sorts by name in descending alphabetical order (Z–A).
  - SalesPriceAsc—Sorts from lowest to highest negotiated price.
  - SalesPriceDesc—Sorts from highest to lowest negotiated price.
  If `null`, the default is CreatedDateDesc.

Return Value
  Type: ConnectApi.CartItemCollection

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, productFields, pageParam, pageSize, sortParam, currencyIsoCode)
Get a specified size, sorted page of items filtered by product fields in a cart.

API Version
57.0

Available to Guest Users
57.0

Requires Chatter
No

Signature
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String productFields, String pageParam, Integer pageSize, ConnectApi.CartItemSortOrder sortParam, String currencyIsoCode)
Parameters

webstoreId
Type: String
ID of the webstore.

effectiveAccountId
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

activeCartOrId
Type: String
ID of the cart, active, or current. The current value is available in version 50.0 and later and indicates a cart with a status that isn't Closed or PendingDelete.

productFields
Type: String
Comma-separated list of up to five product fields. Results include fields that you have access to. Some product fields (such as productName and sku) are returned even when not included in the productFields parameter.

pageParam
Type: String
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

currencyIsoCode
Type: String
Currency ISO code of the cart.

Return Value
Type: ConnectApi.CartItemCollection

gGetCartItems(webstoreId, effectiveAccountId, activeCartOrId, productFields, pageParam, pageSize, sortParam, currencyIsoCode, includePromotions, includeCoupons)
Get a sorted page of items in a cart, including coupons and promotions.

API Version
59.0

Available to Guest Users
54.0
Requires Chatter
No

Signature

```java
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String productFields, String pageParam, Integer pageSize, ConnectApi.CartItemSortOrder sortParam, String currencyIsoCode, Boolean includePromotions, Boolean includeCoupons)
```

Parameters

- `webstoreId`
  Type: `String`
  ID of the webstore.

- `effectiveAccountId`
  Type: `String`
  ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

- `activeCartOrId`
  Type: `String`
  ID of the cart, active, or current. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn’t Closed or PendingDelete.

- `productFields`
  Type: `String`
  Comma-separated list of up to five product fields. Results include fields that you have access to. Some product fields (such as `productName` and `sku`) are returned even when not included in the `productFields` parameter.

- `pageParam`
  Type: `String`
  Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

- `pageSize`
  Type: `Integer`
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

- `includePromotions`
  Type: `Boolean`
  Indicates whether to include coupons (`True`) or not (`False`)

- `includeCoupons`
  Type: `Boolean`
  Indicates whether to include promotions (`True`) or not (`False`).

Return Value

Type: `ConnectApi.CartItemCollection`
getCartPromotions(webstoreId, effectiveAccountId, activeCartOrId)

Get promotions for a cart.

API Version
53.0

Available to Guest Users
57.0

Requires Chatter
No

Signature
public static ConnectApi.CartPromotionCollection getCartPromotions(String webstoreId, String effectiveAccountId, String activeCartOrId)

Parameters
webstoreId
  Type: String
  ID of the webstore.

effectiveAccountId
  Type: String
  ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

activeCartOrId
  Type: String
  ID of the cart, active, or current. The current value indicates a cart with a status that isn’t Closed or PendingDelete.

Return Value
Type: ConnectApi.CartPromotionCollection

getCodePromotions(webstoreId, effectiveAccountId, activeCartOrId, currencyIsoCode)

Get promotions for a cart in a specific currency.

API Version
57.0

Available to Guest Users
57.0
Requires Chatter
No

Signature

```java
public static ConnectApi.CartPromotionCollection getCartPromotions(String webstoreId, String effectiveAccountId, String activeCartOrId, String currencyIsoCode)
```

Parameters

- **webstoreId**
  Type: String
  ID of the webstore.

- **effectiveAccountId**
  Type: String
  ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

- **activeCartOrId**
  Type: String
  ID of the cart, active, or current. The current value indicates a cart with a status that isn’t Closed or PendingDelete.

- **currencyIsoCode**
  Type: String
  Currency ISO code of the cart.

Return Value

Type: ConnectApi.CartPromotionCollection

getCartSummary(webstoreId, effectiveAccountId, activeCartOrId)

Get a cart.

API Version

49.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```java
public static ConnectApi.CartSummary getCartSummary(String webstoreId, String effectiveAccountId, String activeCartOrId)
```
Parameters

webstoreId
Type: String
ID of the webstore.

effectiveAccountId
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

activeCartOrId
Type: String
ID of the cart, active, or current. The current value is available in version 50.0 and later and indicates a cart with a status that isn’t Closed or PendingDelete. If you specify active and there isn’t an active cart, you get an error.

Return Value
Type: ConnectApi.CartSummary

gGetCartSummary(webstoreId, effectiveAccountId, activeCartOrId, currencyIsoCode)
Get a cart in a specific currency.

API Version
57.0

Available to Guest Users
57.0

Requires Chatter
No

Signature

public static ConnectApi.CartSummary getCartSummary(String webstoreId, String effectiveAccountId, String activeCartOrId, String currencyIsoCode)

Parameters

webstoreId
Type: String
ID of the webstore.

effectiveAccountId
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.
activeCartOrId
Type: String
ID of the cart, active, or current. The current value is available in version 50.0 and later and indicates a cart with a status that isn’t Closed or PendingDelete. If you specify active and there isn’t an active cart, you get an error.

currencyIsoCode
Type: String
Currency ISO code of the cart.

Return Value
Type: ConnectApi.CartSummary

getOrCreateActiveCartSummary(webstoreId, effectiveAccountId, activeCartOrId)
Get a cart or create an active cart if one doesn’t exist.

API Version
49.0

Available to Guest Users
54.0

Requires Chatter
No

Signature
public static ConnectApi.CartSummary getOrCreateActiveCartSummary(String webstoreId, String effectiveAccountId, String activeCartOrId)

Parameters

webstoreId
Type: String
ID of the webstore.

effectiveAccountId
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

activeCartOrId
Type: String
ID of the cart, active, or current. The current value is available in version 50.0 and later and indicates a cart with a status that isn’t Closed or PendingDelete. If you specify active and there isn’t an active cart, one is created.
Return Value
Type: `ConnectApi.CartSummary`

Usage
Buyers with read access to carts can create and delete carts.

`getOrCreateActiveCartSummary(webstoreId, effectiveAccountId, activeCartOrId, currencyIsoCode)`
Get a cart in a specific currency, or create an active cart if one doesn’t exist.

API Version
57.0

Available to Guest Users
57.0

Requires Chatter
No

Signature
`public static ConnectApi.CartSummary getOrCreateActiveCartSummary(String webstoreId, String effectiveAccountId, String activeCartOrId, String currencyIsoCode)`

Parameters
`webstoreId`
Type: `String`
ID of the webstore.
`effectiveAccountId`
Type: `String`
ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.
`activeCartOrId`
Type: `String`
ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn’t `Closed` or `PendingDelete`. If you specify `active` and there isn’t an active cart, one is created.
`currencyIsoCode`
Type: `String`
Currency ISO code of the cart.
Return Value
Type: `ConnectApi.CartSummary`

Usage
Buyers with read access to carts can create and delete carts.

`makeCartPrimary(webstoreId, activeCartOrId, effectiveAccountId)`
Make a secondary cart a primary cart.

API Version
53.0

Available to Guest Users
56.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.CommerceActionResult makeCartPrimary(String webstoreId, String activeCartOrId, String effectiveAccountId)
```

Parameters
- `webstoreId`
  Type: `String`
  ID of the webstore.
- `activeCartOrId`
  Type: `String`
  ID of the cart, active, or current. The current value is available in version 50.0 and later and indicates a cart with a status that isn't Closed or PendingDelete.
- `effectiveAccountId`
  Type: `String`
  ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

Return Value
Type: `ConnectApi.CommerceActionResult`
setCartMessagesVisibility(webstoreId, activeCartOrId, effectiveAccountId, messageVisibility)

Set the visibility for cart messages.

API Version
50.0

Available to Guest Users
54.0

Requires Chatter
No

Signature
public static ConnectApi.CartMessagesVisibilityResult setCartMessagesVisibility(String webstoreId, String activeCartOrId, String effectiveAccountId, ConnectApi.CartMessagesVisibilityInput messageVisibility)

Parameters
webstoreId
  Type: String
  ID of the webstore.
activeCartOrId
  Type: String
  ID of the cart, active, or current. The current value is available in version 50.0 and later and indicates a cart with a status that isn’t Closed or PendingDelete.
effectiveAccountId
  Type: String
  ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.
messageVisibility
  Type: ConnectApi.CartMessagesVisibilityInput
  A ConnectApi.CartMessagesVisibilityInput object specifying the visibility setting.

Return Value
Type: ConnectApi.CartMessagesVisibilityResult

updateCartItem(webstoreId, effectiveAccountId, activeCartOrId, cartItemId, cartItem)

Update an item in a cart.
API Version

49.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

public static ConnectApi.CartItem updateCartItem(String webstoreId, String effectiveAccountId, String activeCartOrId, String cartItemId, ConnectApi.CartItemInput cartItem)

Parameters

webstoreId
  Type: String
  ID of the webstore.

effectiveAccountId
  Type: String
  ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

activeCartOrId
  Type: String
  ID of the cart, active, or current. The current value is available in version 50.0 and later and indicates a cart with a status that isn’t Closed or PendingDelete.

cartItemId
  Type: String
  ID of the cart item.

cartItem
  Type: ConnectApi.CartItemInput
  A ConnectApi.CartItemInput object representing a cart item to update.

Return Value

Type: ConnectApi.CartItem

Usage

Buyers with read access to carts can add, update, and delete items in carts.

This method respects buyer View Product entitlements and only users entitled to view product data can access it.
updateCartItem(webstoreId, effectiveAccountId, activeCartOrId, cartItemId, cartItem, currencyIsoCode)

Update an item in a cart of a specific currency.

API Version
57.0

Available to Guest Users
57.0

Requires Chatter
No

Signature
public static ConnectApi.CartItem updateCartItem(String webstoreId, String effectiveAccountId, String activeCartOrId, String cartItemId, ConnectApi.CartItemInput cartItem, String currencyIsoCode)

Parameters

webstoreId
  Type: String
  ID of the webstore.

effectiveAccountId
  Type: String
  ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

activeCartOrId
  Type: String
  ID of the cart, active, or current. The current value is available in version 50.0 and later and indicates a cart with a status that isn't Closed or PendingDelete.

cartItemId
  Type: String
  ID of the cart item.

cartItem
  Type: ConnectApi.CartItemInput
  A ConnectApi.CartItemInput object representing a cart item to update.

currencyIsoCode
  Type: String
  The currency ISO code of the cart.
Return Value
Type: `ConnectApi.CartItem`

Usage
Buyers with read access to carts can add, update, and delete items in carts.
This method respects buyer View Product entitlements and only users entitled to view product data can access it.

```java
upsertInventoryReservation(webstoreId, activeCartOrId, effectiveAccountId, cartInventoryReservationInput) (Pilot)
```
Create or update an inventory reservation.

Signature
```java
public static ConnectApi.CartInventoryReservationOutputRepresentation upsertInventoryReservation(String webstoreId, String activeCartOrId, String effectiveAccountId, ConnectApi.CartInventoryReservationInputRepresentation cartInventoryReservationInput)
```

Parameters
- `webstoreId`
  Type: `String`
  ID of the webstore.
- `activeCartOrId`
  Type: `String`
  ID of the cart, active, or current. The current value indicates a cart with a status that isn't Closed or PendingDelete.
- `effectiveAccountId`
  Type: `String`
ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

**cartInventoryReservationInput**

Type: `ConnectApi.CartInventoryReservationInputRepresentation`

A ConnectApi.CartInventoryReservationInputRepresentation input class indicating the reservation duration.

**Return Value**

Type: `ConnectApi.CartInventoryReservationOutputRepresentation`

### CommerceCatalog Class

Get products, product categories, and product category paths.

### Namespace

`ConnectApi`

### CommerceCatalog Methods

These methods are for CommerceCatalog. All methods are static.

**IN THIS SECTION:**

- `getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory)`
  - Get a product.
- `getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo)`
  - Get a product with variation and attribute information.
- `getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo, excludeQuantityRule)`
  - Get a product with quantity rule information.
- `getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo, excludeQuantityRule, excludeProductSellingModels)`
  - Get detailed information for a product, optionally including information about its product selling models.
- `getProduct(webstoreId, productId, effectiveAccountId, fields, mediaGroups, excludeFields, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo, excludeQuantityRule, excludeProductSellingModels)`
  - Get detailed information for a product without its entitlement information.
- `getProductCategory(webstoreId, productCategoryId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia)`
  - Get a product category.
- `getProductCategoryChildren(webstoreId, effectiveAccountId, parentProductCategoryId, fields, excludeFields, mediaGroups, excludeMedia)`
  - Get product categories.
- `getProductCategoryPath(webstoreId, productCategoryId)`
  - Get the product category path from the root category to the current category.
getProductChildCollection(webstoreId, productId, effectiveAccountId, fields, mediaGroups, excludeFields, excludeMedia, excludeAttributeSetInfo, excludeQuantityRule, pageToken, pageSize)
Get a collection of child products related to a parent product.

getProducts(webstoreId, effectiveAccountId, ids, skus, fields, excludeMedia, excludePrices)
Get fields, prices, and default images for a list of products.

getProducts(webstoreId, effectiveAccountId, ids, skus, fields, excludeMedia)
Get fields and default images for a list of products.

getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory)
Get a product.

API Version
49.0

Available to Guest Users
51.0

Requires Chatter
No

Signature
public static ConnectApi.ProductDetail getProduct(String webstoreId, String productId, String effectiveAccountId, List<String> fields, Boolean excludeFields, List<String> mediaGroups, Boolean excludeMedia, Boolean excludeEntitlementDetails, Boolean excludePrimaryProductCategory)

Parameters

webstoreId
Type: String
ID of the webstore.

productId
Type: String
ID of the product.

effectiveAccountId
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

fields
Type: List<String>
Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If excludeFields and fields are specified, the excludeFields parameter takes precedence.

**excludeFields**

Type: Boolean

Specifies whether the fields are returned (false) or not (true). If unspecified, defaults to false.

**mediaGroups**

Type: List<String>

Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If excludeMedia and mediaGroups are specified, the excludeMedia parameter takes precedence.

**excludeMedia**

Type: Boolean

Specifies whether the media groups and default images of the product are returned (false) or not (true). If unspecified, defaults to false.

**excludeEntitlementDetails**

Type: Boolean

Specifies whether the entitlement details of the product are returned (false) or not (true). If unspecified, defaults to false.

**excludePrimaryProductCategory**

Type: Boolean

Specifies whether the primary category path of the product is returned (false) or not (true). If unspecified, defaults to false.

**Return Value**

Type: ConnectApi.ProductDetail

**Usage**

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

```java
getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo)
```

Get a product with variation and attribute information.

**API Version**

50.0

**Available to Guest Users**

51.0
Requires Chatter
No

Signature

```java
public static ConnectApi.ProductDetail getProduct(String webstoreId, String productId,
String effectiveAccountId, List<String> fields, Boolean excludeFields, List<String>
mediaGroups, Boolean excludeMedia, Boolean excludeEntitlementDetails, Boolean excludePrimaryProductCategory, Boolean excludeVariationInfo, Boolean excludeAttributeSetInfo)
```

Parameters

`webstoreId`
Type: String
ID of the webstore.

`productId`
Type: String
ID of the product.

`effectiveAccountId`
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

`fields`
Type: List<String>
Comma-separated list of field names.
If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If excludeFields and fields are specified, the excludeFields parameter takes precedence.

`excludeFields`
Type: Boolean
Specifies whether the fields are returned (false) or not (true). If unspecified, defaults to false.

`mediaGroups`
Type: List<String>
Comma-separated list of developer names of media group records.
If this list is empty or unspecified, all media groups are returned. If excludeMedia and mediaGroups are specified, the excludeMedia parameter takes precedence.

`excludeMedia`
Type: Boolean
Specifies whether the media groups and default images of the product are returned (false) or not (true). If unspecified, defaults to false.

`excludeEntitlementDetails`
Type: Boolean
Specifies whether the entitlement details of the product are returned (false) or not (true). If unspecified, defaults to false.
excludePrimaryProductCategory
Type: Boolean
Specifies whether the primary category path of the product is returned (false) or not (true). If unspecified, defaults to false.

excludeVariationInfo
Type: Boolean
Specifies whether the variation information for the product is returned (false) or not (true). If unspecified, defaults to false.

excludeAttributeSetInfo
Type: Boolean
Specifies whether the attribute set information for the product is returned (false) or not (true). If unspecified, defaults to false.

Return Value
Type: ConnectApi.ProductDetail

Usage
This method respects buyer View Product entitlements and only users entitled to view product data can access it.

getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo, excludeQuantityRule)
Get a product with quantity rule information.

API Version
52.0

Available to Guest Users
52.0

Requires Chatter
No

Signature
public static ConnectApi.ProductDetail getProduct(String webstoreId, String productId, String effectiveAccountId, List<String> fields, Boolean excludeFields, List<String> mediaGroups, Boolean excludeMedia, Boolean excludeEntitlementDetails, Boolean excludePrimaryProductCategory, Boolean excludeVariationInfo, Boolean excludeAttributeSetInfo, Boolean excludeQuantityRule)
Parameters

`webstoreId`
Type: String
ID of the webstore.

`productId`
Type: String
ID of the product.

`effectiveAccountId`
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

`fields`
Type: List<String>
Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

`excludeFields`
Type: Boolean
Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

`mediaGroups`
Type: List<String>
Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

`excludeMedia`
Type: Boolean
Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

`excludeEntitlementDetails`
Type: Boolean
Specifies whether the entitlement details of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

`excludePrimaryProductCategory`
Type: Boolean
Specifies whether the primary category path of the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

`excludeVariationInfo`
Type: Boolean
Specifies whether the variation information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

`excludeAttributeSetInfo`
Type: Boolean
Specifies whether the attribute set information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.
excludeQuantityRule
Type: Boolean
Specifies whether the quantity rule information for the product is returned (false) or not (true). If unspecified, defaults to false.

Return Value
Type: ConnectApi.ProductDetail

Usage
This method respects buyer View Product entitlements and only users entitled to view product data can access it.

getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo, excludeQuantityRule, excludeProductSellingModels)
Get detailed information for a product, optionally including information about its product selling models.

API Version
56.0

Available to Guest Users
56.0

Requires Chatter
No

Signature
public static ConnectApi.ProductDetail getProduct(String webstoreId, String productId, String effectiveAccountId, List<String> fields, Boolean excludeFields, List<String> mediaGroups, Boolean excludeMedia, Boolean excludeEntitlementDetails, Boolean excludePrimaryProductCategory, Boolean excludeVariationInfo, Boolean excludeAttributeSetInfo, Boolean excludeQuantityRule, Boolean excludeProductSellingModels)

Parameters
webstoreId
Type: String
ID of the webstore.

productId
Type: String
ID of the product.
effectiveAccountId
   Type: String
   ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

fields
   Type: List<String>
   Comma-separated list of field names.
   If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If excludeFields and fields are specified, the excludeFields parameter takes precedence.

excludeFields
   Type: Boolean
   Specifies whether the fields are returned (false) or not (true). If unspecified, defaults to false.

mediaGroups
   Type: List<String>
   Comma-separated list of developer names of media group records.
   If this list is empty or unspecified, all media groups are returned. If excludeMedia and mediaGroups are specified, the excludeMedia parameter takes precedence.

excludeMedia
   Type: Boolean
   Specifies whether the media groups and default images of the product are returned (false) or not (true). If unspecified, defaults to false.

excludeEntitlementDetails
   Type: Boolean
   Specifies whether the entitlement details of the product are returned (false) or not (true). If unspecified, defaults to false.

excludePrimaryProductCategory
   Type: Boolean
   Specifies whether the primary category path of the product is returned (false) or not (true). If unspecified, defaults to false.

excludeVariationInfo
   Type: Boolean
   Specifies whether the variation information for the product is returned (false) or not (true). If unspecified, defaults to false.

excludeAttributeSetInfo
   Type: Boolean
   Specifies whether the attribute set information for the product is returned (false) or not (true). If unspecified, defaults to false.

excludeQuantityRule
   Type: Boolean
   Specifies whether the quantity rule information for the product is returned (false) or not (true). If unspecified, defaults to false.

excludeProductSellingModels
   Type: Boolean
   Specifies whether product selling models are returned or not. The behavior of this parameter depends on whether you turn on the CommerceSubscription permission. If the permission is on, and if you set the parameter to false (or if you omit the parameter), product selling models are returned. If the permission is on, and if you set the parameter to true, product selling models are not
returned. If the permission is off, product selling models are not returned, regardless of whether you omit the parameter or provide a value.

**Return Value**
Type: `ConnectApi.ProductDetail`

**Usage**
This method respects buyer View Product entitlements and only users entitled to view product data can access it.

```java
getProduct(String webstoreId, String productId, String effectiveAccountId, List<String> fields, List<String> mediaGroups, Boolean excludeFields, Boolean excludeMedia, Boolean excludePrimaryProductCategory, Boolean excludeVariationInfo, Boolean excludeAttributeSetInfo, Boolean excludeQuantityRule, Boolean excludeProductSellingModels)
```
Get detailed information for a product without its entitlement information.

**API Version**
57.0

**Available to Guest Users**
57.0

**Requires Chatter**
No

**Signature**
```java
public static ConnectApi.ProductDetail getProduct(String webstoreId, String productId, String effectiveAccountId, List<String> fields, List<String> mediaGroups, Boolean excludeFields, Boolean excludeMedia, Boolean excludePrimaryProductCategory, Boolean excludeVariationInfo, Boolean excludeAttributeSetInfo, Boolean excludeQuantityRule, Boolean excludeProductSellingModels)
```

**Parameters**
- `webstoreId`
  Type: `String`
  ID of the webstore.
- `productId`
  Type: `String`
  ID of the product.
- `effectiveAccountId`
  Type: `String`
ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

**fields**
- **Type**: `List<String>`
- Comma-separated list of field names.
  - If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

**mediaGroups**
- **Type**: `List<String>`
- Comma-separated list of developer names of media group records.
  - If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

**excludeFields**
- **Type**: `Boolean`
- Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

**excludeMedia**
- **Type**: `Boolean`
- Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

**excludePrimaryProductCategory**
- **Type**: `Boolean`
- Specifies whether the primary category path of the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

**excludeVariationInfo**
- **Type**: `Boolean`
- Specifies whether the variation information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

**excludeAttributeSetInfo**
- **Type**: `Boolean`
- Specifies whether the attribute set information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

**excludeQuantityRule**
- **Type**: `Boolean`
- Specifies whether the quantity rule information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

**excludeProductSellingModels**
- **Type**: `Boolean`
- Specifies whether product selling models are returned or not. The behavior of this parameter depends on whether you turn on the CommerceSubscription permission. If the permission is on, and if you set the parameter to `false` (or if you omit the parameter), product selling models are returned. If the permission is on, and if you set the parameter to `true`, product selling models are not returned. If the permission is off, product selling models are not returned, regardless of whether you omit the parameter or provide a value.

**Return Value**
- **Type**: `ConnectApi.ProductDetail`
Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

**getProductCategory(webstoreId, productCategoryId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia)**

Get a product category.

API Version

49.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```java
public static ConnectApi.ProductCategoryDetail getProductCategory(String webstoreId, String productCategoryId, String effectiveAccountId, List<String> fields, Boolean excludeFields, List<String> mediaGroups, Boolean excludeMedia)
```

Parameters

- **webstoreId**
  - Type: String
  - ID of the webstore.

- **productCategoryId**
  - Type: String
  - ID of the product category.

- **effectiveAccountId**
  - Type: String
  - ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

- **fields**
  - Type: List<String>
  - Comma-separated list of field names.

  If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If excludeFields and fields are specified, the excludeFields parameter takes precedence.

- **excludeFields**
  - Type: Boolean
  - Specifies whether the fields are returned (false) or not (true). If unspecified, defaults to false.
mediaGroups
Type: List<String>
Comma-separated list of developer names of media group records.
If this list is empty or unspecified, all media groups are returned. If excludeMedia and mediaGroups are specified, the
excludeMedia parameter takes precedence.

excludeMedia
Type: Boolean
Specifies whether the media groups and default images of the product are returned (false) or not (true). If unspecified, defaults to false.

Return Value
Type: ConnectApi.ProductCategoryDetail

getProductCategoryChildren(webstoreId, effectiveAccountId, parentProductCategoryId, fields, excludeFields, mediaGroups, excludeMedia)
Get product categories.

API Version
52.0

Available to Guest Users
52.0

Requires Chatter
No

Signature
public static ConnectApi.ProductCategoryDetailCollection
getProductCategoryChildren(String webstoreId, String effectiveAccountId, String parentProductCategoryId, List<String> fields, Boolean excludeFields, List<String> mediaGroups, Boolean excludeMedia)

Parameters
webstoreId
Type: String
ID of the webstore.
effectiveAccountId
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.
**parentProductCategoryId**
Type: String
ID of the product category for which you want to get all the children product categories. If `null`, returns all the top-level product categories for the store.

**fields**
Type: List<String>
Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

**excludeFields**
Type: Boolean
Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

**mediaGroups**
Type: List<String>
Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

**excludeMedia**
Type: Boolean
Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

**Return Value**
Type: `ConnectApi.ProductCategoryDetailCollection`

**getProductCategoryPath(webserviceId, productCategoryId)**
Get the product category path from the root category to the current category.

**API Version**
49.0

**Available to Guest Users**
51.0

**Requires Chatter**
No
Signature

```java
public static ConnectApi.ProductCategoryPath getProductCategoryPath(String webstoreId, String productCategoryId)
```

Parameters

- **webstoreId**
  - Type: String
  - ID of the webstore.

- **productCategoryId**
  - Type: String
  - ID of the product category.

Return Value

Type: `ConnectApi.ProductCategoryPath`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

```java
getProductChildCollection(webstoreId, productId, effectiveAccountId, fields, mediaGroups, excludeFields, excludeMedia, excludeAttributeSetInfo, excludeQuantityRule, pageToken, pageSize)
```

Get a collection of child products related to a parent product.

API Version

57.0

Available to Guest Users

57.0

Requires Chatter

No

Signature

```java
public static ConnectApi.ProductChildCollection getProductChildCollection(String webstoreId, String productId, String effectiveAccountId, List<String> fields, List<String> mediaGroups, Boolean excludeFields, Boolean excludeMedia, Boolean excludeAttributeSetInfo, Boolean excludeQuantityRule, String pageToken, Integer pageSize)
```
Parameters

webstoreId
Type: String
ID of the webstore.

productId
Type: String
ID of the product.

effectiveAccountId
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.

fields
Type: List<String>
Comma-separated list of field names.
If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If excludeFields and fields are specified, the excludeFields parameter takes precedence.

mediaGroups
Type: List<String>
Comma-separated list of developer names of media group records.
If this list is empty or unspecified, all media groups are returned. If excludeMedia and mediaGroups are specified, the excludeMedia parameter takes precedence.

excludeFields
Type: Boolean
Specifies whether the fields are returned (false) or not (true). If unspecified, defaults to false.

excludeMedia
Type: Boolean
Specifies whether the media groups and default images of the product are returned (false) or not (true). If unspecified, defaults to false.

excludeAttributeSetInfo
Type: Boolean
Specifies whether the attribute set information for the product is returned (false) or not (true). If unspecified, defaults to false.

excludeQuantityRule
Type: Boolean
Specifies whether the quantity rule information for the product is returned (false) or not (true). If unspecified, defaults to false.

pageToken
Type: String
Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 20.
Return Value
Type: `ConnectApi.ProductChildCollection`

`getProducts(webstoreId, effectiveAccountId, ids, skus, fields, excludeMedia, excludePrices)`
Get fields, prices, and default images for a list of products.

API Version
54.0

Available to Guest Users
54.0

Requires Chatter
No

Signature
`public static ConnectApi.ProductOverviewCollection getProducts(String webstoreId, String effectiveAccountId, List<String> ids, List<String> skus, List<String> fields, Boolean excludeMedia, Boolean excludePrices)`

Parameters

`webstoreId`
Type: `String`
ID of the webstore.

`effectiveAccountId`
Type: `String`
ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.

`ids`
Type: `List<String>`
List of product IDs. Specify either a list of up to 20 product IDs or SKUs, but not both.

`skus`
Type: `List<String>`
List of SKUs. Specify either a list of up to 20 SKUs or product IDs, but not both.

`fields`
Type: `List<String>`
Comma-separated list of field names to return for each product. If the list is empty or not specified, all fields are returned. You can specify any number of fields.
excludeMedia
Type: Boolean
Specifies whether default images are returned for the products (false) or not (true). The default is false.

excludePrices
Type: Boolean
Specifies whether prices are returned for the products (false) or not (true). The default is false.

Note: In version 58.0 and later, prices aren’t returned for products regardless of this parameter. To get pricing information for products in version 58.0 and later, use the CommerceStorePricing Class.

Return Value
Type: ConnectApi.ProductOverviewCollection

getProducts(webstoreId, effectiveAccountId, ids, skus, fields, excludeMedia)
Get fields and default images for a list of products.

API Version
58.0

Available to Guest Users
58.0

Requires Chatter
No

Signature
public static ConnectApi.ProductOverviewCollection getProducts(String warehouseId, String effectiveAccountId, List<String> ids, List<String> skus, List<String> fields, Boolean excludeMedia)

Parameters
webstoreId
Type: String
ID of the webstore.
effectiveAccountId
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.
ids
Type: List<String>
List of product IDs. Specify either a list of up to 20 product IDs or SKUs, but not both.
skus
  Type: List<String>
  List of SKUs. Specify either a list of up to 20 SKUs or product IDs, but not both.

fields
  Type: List<String>
  Comma-separated list of field names to return for each product. If the list is empty or not specified, all fields are returned. You can specify any number of fields.

excludeMedia
  Type: Boolean
  Specifies whether default images are returned. Specifies whether the media groups and default images of the product are returned (false) or not (true). If unspecified, defaults to false.

Return Value
  Type: ConnectApi.ProductOverviewCollection

CommercePromotions Class
Evaluate promotions for Commerce orders. Get coupon code redemption usage.

Namespace
  ConnectApi

CommercePromotions Methods
The following are methods for CommercePromotions. All methods are static.

IN THIS SECTION:
  decreaseRedemption(couponCodeRedemption)
  Get coupon code redemption usage to revert a previously redeemed coupon code.
  evaluate(salesTransaction)
  Determine which promotions the customer is eligible for based on the store and buyer group, and compute the applicable price adjustments based on the coupons and the items in the cart. This API evaluates only the first 50 active manual promotions and first 50 active automatic promotions, based on priority. This API computes and returns applicable price adjustments, but it does not apply those adjustments to the webcart record. If you want to enable promotions based on shipping, contact Salesforce Customer Support.
  increaseRedemption(couponCodeRedemption)
  Get coupon code redemption addition (increase) usage.

**decreaseRedemption**(couponCodeRedemption)
Get coupon code redemption usage to revert a previously redeemed coupon code.
public static ConnectApi.CouponCodeRedemptionCollection
decreaseRedemption(ConnectApi.CouponCodeRedemptionInput couponCodeRedemption)

couponCodeRedemption
Type: ConnectApi.CouponCodeRedemptionInput on page 1579
Tracks each coupon code redemption.

Type: ConnectApi.CouponCodeRedemptionCollection on page 1767

evaluate(salesTransaction)
Determine which promotions the customer is eligible for based on the store and buyer group, and compute the applicable price adjustments based on the coupons and the items in the cart. This API evaluates only the first 50 active manual promotions and first 50 active automatic promotions, based on priority. This API computes and returns applicable price adjustments, but it does not apply those adjustments to the webcart record. If you want to enable promotions based on shipping, contact Salesforce Customer Support.

global static ConnectApi.PromotionEvaluation evaluate (ConnectApi.PromotionEvaluateInput salesTransaction)
Parameters

salesTransaction
Type: ConnectApi.PromotionEvaluateInput
Find promotions that the customer is eligible for and compute their discounts.

Return Value
Type: ConnectApi.PromotionEvaluation

increaseRedemption(couponCodeRedemption)
Get coupon code redemption addition (increase) usage.

API Version
58.0

Available to Guest Users
58.0

Requires Chatter
No

Signature

public static ConnectApi.CouponCodeRedemptionCollection
increaseRedemption(ConnectApi.CouponCodeRedemptionInput couponCodeRedemption)

Parameters

couponCodeRedemption
Type: ConnectApi.CouponCodeRedemptionInput on page 1579
Tracks each coupon code redemption.

Return Value
Type: ConnectApi.CouponCodeRedemptionCollection on page 1767

CommerceSearch Class

Namespace

ConnectApi
CommerceSearch Methods

These methods are for CommerceSearch. All methods are static.

IN THIS SECTION:

getSortRules(webstoreId)
Get sort rules for the live index.

getSuggestions(webstoreId, effectiveAccountId, searchTerm, maxResults)
Get suggestions for product searches.

getSuggestions(webstoreId, effectiveAccountId, searchTerm, maxResults, includeSuggestedProducts, maxSuggestedProducts)
Get suggestions for product searches.

searchProducts(webstoreId, effectiveAccountId, productSearchInput)
Search products.

getSortRules (webstoreId)
Get sort rules for the live index.

API Version
52.0

Available to Guest Users
52.0

Requires Chatter
No

Signature

class ConnectApi.SortRulesCollection
getSortRules(String webstoreId)

Parameters

webstoreId
Type: String
ID of the webstore.

Return Value
Type: ConnectApi.SortRulesCollection

getSuggestions (webstoreId, effectiveAccountId, searchTerm, maxResults)
Get suggestions for product searches.
API Version
52.0

Available to Guest Users
52.0

Requires Chatter
No

Signature
public static ConnectApi.ProductSearchSuggestionsResults getSuggestions(String webstoreId, String effectiveAccountId, String searchTerm, Integer maxResults)

Parameters
webstoreId
Type: String
ID of the webstore.
effectiveAccountId
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.
searchTerm
Type: String
Search term with up to 10 characters. If specified, the service returns autocomplete suggestions from the user’s recent searches. If unspecified, the service returns suggestions from the user’s recent searches.
maxResults
Type: Integer
Maximum number of suggestions. Values are from 1 through 10. If unspecified, defaults to 10.

Return Value
Type: ConnectApi.ProductSearchSuggestionsResults

getSuggestions(webstoreId, effectiveAccountId, searchTerm, maxResults, includeSuggestedProducts, maxSuggestedProducts)
Get suggestions for product searches.

API Version
58.0
Available to Guest Users

$8.0

Requires Chatter

No

Signature

public static ConnectApi.ProductSearchSuggestionsResults getSuggestions(String webstoreId, String effectiveAccountId, String searchTerm, Integer maxResults, Boolean includeSuggestedProducts, Integer maxSuggestedProducts)

Parameters

webstoreId
Type: String
ID of the webstore.

effectiveAccountId
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

searchTerm
Type: String
Search term with up to 10 characters. If specified, the service returns autocomplete suggestions from the user’s recent searches. If unspecified, the service returns suggestions from the user’s recent searches.

maxResults
Type: Integer
Maximum number of suggestions. Values are from 1 through 10. If unspecified, defaults to 10.

includeSuggestedProducts
Type: Boolean
Specifies whether a search term returns product suggestions (true) or not (false). If unspecified, defaults to false. If true, the service returns the suggested product IDs.

maxSuggestedProducts
Type: String
Maximum number of product suggestions. Values are from 1 through 10. If unspecified, defaults to 4.

Return Value

Type: ConnectApi.ProductSearchSuggestionsResults

searchProducts(webstoreId, effectiveAccountId, productSearchInput)
Search products.
API Version
52.0

Available to Guest Users
52.0

Requires Chatter
No

Signature
public static ConnectApi.ProductSearchResults searchProducts(String webstoreId, String effectiveAccountId, ConnectApi.ProductSearchInput productSearchInput)

Parameters
webstoreId
Type: String
ID of the webstore.

effectiveAccountId
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

productSearchInput
Type: ConnectApi.ProductSearchInput
A ConnectApi.ProductSearchInput body with either a category ID or search terms.

Return Value
Type: ConnectApi.ProductSearchResults

Usage
Searching products respects buyer View Product entitlements and only users entitled to view product data can access this resource.

CommerceSearchConnectFamily Class
Search products by search term or category in a webstore.

Namespace
ConnectApi

CommerceSearchConnectFamily Methods
The following are methods for CommerceSearchConnectFamily. All methods are static.
IN THIS SECTION:

```java
searchProducts(webstoreId, searchTerm, categoryId, sortRuleId, grouping, fields, refinements, pageParam, pageSize, effectiveAccountId, includeQuantityRule)
```

Search products by search term or category in a webstore.

**API Version**

58.0

**Available to Guest Users**

58.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.CommerceProductSearchResults searchProducts(String webstoreId, String searchTerm, String categoryId, String sortRuleId, String grouping, List<String> fields, String refinements, Integer pageParam, Integer pageSize, String effectiveAccountId, Boolean includeQuantityRule)
```

**Parameters**

- `webstoreId`
  
  Type: `String`
  
  ID of the webstore.

- `searchTerm`
  
  Type: `String`
  
  List of up to 32 space-separated search terms.

- `categoryId`
  
  Type: `String`
  
  Category ID returns results for products in this category or its subcategories.

- `sortRuleId`
  
  Type: `String`
  
  ID of the sort rule that specifies the order of products in the search results. If unspecified, the default sort type is relevancy.

- `grouping`
  
  Type: `String`
Grouping option for search results. If unspecified, the default is the value specified in **Search > Results Display Settings > Results Grouping**.

**fields**
Type: `List<String>`
Product fields to return in search results. Search results include fields you have access to.

**refinements**
Type: `String`
List up to nine refinements (facets) for search results. Buyers or shoppers can select up to 20 values for each refinement. The `refinements` parameter is encoded as a Base64 string from the JSON representation of `ConnectApi.DistinctValueRefinementInput`.

**pageParam**
Type: `Integer`
Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

**pageSize**
Type: `Integer`
Specifies the number of items per page. Valid values are from 1 through 200. If unspecified, defaults to 20.

**effectiveAccountId**
Type: `String`
ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.

**includeQuantityRule**
Type: `Boolean`
Specifies whether to include purchase quantity rule information for products in search results (`true`) or not (`false`). If unspecified, defaults to `false`.

**Return Value**
Type: `ConnectApi.CommerceProductSearchResults`

**Usage**
Searching products respects buyer View Product entitlements and only users entitled to view product data can access this resource.

**CommerceSearchSettings Class**
Get indexes. Get index logs. Create an index of a product catalog.

**Namespace**
`ConnectApi`

**CommerceSearchSettings Methods**
These methods are for `CommerceSearchSettings`. All methods are static.
IN THIS SECTION:

createCommerceSearchIndex(webstoreId, indexBuildType)
Create an index of a product catalog.

getCommerceSearchIndex(webstoreId, indexId)
Get a Commerce search index.

getCommerceSearchIndexes(webstoreId)
Get Commerce search indexes.

getCommerceSearchIndexLogs(webstoreId)
Get Commerce search index logs.

createCommerceSearchIndex(webstoreId, indexBuildType)
Create an index of a product catalog.

API Version
57.0

Requires Chatter
Yes

Signature
public static ConnectApi.CommerceSearchIndex postCommerceSearchIndex(String webstoreId)

Parameters
webstoreId
Type: String
ID of the webstore.

indexBuildType
Type: ConnectApi.CommerceSearchIndexBuildType
Build type of the index. Values are:

• Full
• Incremental

Return Value
Type: ConnectApi.CommerceSearchIndex

Usage
This method creates a live index that replaces the current live index. Any indexes that are in progress are removed when you manually create an index with this method.
getCommerceSearchIndex(webstoreId, indexId)
Get a Commerce search index.

API Version
52.0

Requires Chatter
Yes

Signature
public static ConnectApi.CommerceSearchIndex getSingleCommerceSearchIndex(String webstoreId, String indexId)

Parameters
webstoreId
Type: String
ID of the webstore.

indexId
Type: String
ID of the index.

Return Value
Type: ConnectApi.CommerceSearchIndex

getCommerceSearchIndexes(webstoreId)
Get Commerce search indexes.

API Version
52.0

Requires Chatter
Yes

Signature
public static ConnectApi.CommerceSearchIndexCollection getCommerceSearchIndexes(String webstoreId)
Parameters

webstoreId
Type: String
ID of the webstore.

Return Value

Type: ConnectApi.CommerceSearchIndexCollection

getCommerceSearchIndexLogs (webstoreId)
Get Commerce search index logs.

API Version

57.0

Requires Chatter

No

Signature

public static ConnectApi.CommerceSearchIndexLogCollection getCommerceSearchIndexLogs(String webstoreId)

Parameters

webstoreId
Type: String
ID of the webstore.

Return Value

Type: ConnectApi.CommerceSearchIndexLogCollection

CommerceStorePricing Class

Get product prices.

Namespace

ConnectApi

CommerceStorePricing Methods

These methods are for CommerceStorePricing. All methods are static.
IN THIS SECTION:

- getProductPrice(webstoreId, productId, effectiveAccountId)
  Get the list and buyer price for a product.
- getProductPrice(webstoreId, productId, effectiveAccountId, productSellingModelIds)
  Get a product's list and buyer price for specified product selling models.
- getProductPrices(webstoreId, effectiveAccountId, pricingInput)
  Get the prices for multiple products.
- getProductPrices(webstoreId, effectiveAccountId, productIds)
  Get the prices for multiple products.

**getProductPrice(webstoreId, productId, effectiveAccountId)**

Get the list and buyer price for a product.

**API Version**

49.0

**Available to Guest Users**

51.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.ProductPrice getProductPrice(String webstoreId, String productId, String effectiveAccountId)
```

**Parameters**

- `webstoreId`
  Type: String
  ID of the webstore.
- `productId`
  Type: String
  ID of the product.
- `effectiveAccountId`
  Type: String
  ID of the buyer account or guest buyer profile for which the request is made.

**Return Value**

Type: `ConnectApi.ProductPrice`
Usage

This method respects buyer entitlements and only users entitled to view product and price data can access it.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper’s locale and returns the appropriate values.

```
getProductPrice(webstoreId, productId, effectiveAccountId, productSellingModelIds)
```

Get a product’s list and buyer price for specified product selling models.

API Version

56.0

Available to Guest Users

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductPrice getProductPrice(String webstoreId, String productId, String effectiveAccountId, List<String> productSellingModelIds)
```

Parameters

`webstoreId`  
Type: String  
ID of the webstore.

`productId`  
Type: String  
ID of the product.

`effectiveAccountId`  
Type: String  
ID of the buyer account or guest buyer profile for which the request is made.

`productSellingModelIds`  
Type: List<String>  
List of product selling model IDs for the product.

Return Value

Type: ConnectApi.ProductPrice
getProductPrices(webstoreId, effectiveAccountId, pricingInput)
Get the prices for multiple products.

API Version
49.0

Available to Guest Users
51.0

Requires Chatter
No

Signature
public static ConnectApi.PricingResult getProductPrices(String webstoreId, String effectiveAccountId, ConnectApi.PricingInput pricingInput)

Parameters
webstoreId
  Type: String
  ID of the webstore.
n
effectiveAccountId
  Type: String
  ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.
n
pricingInput
  Type: ConnectApi.PricingInput
  A ConnectApi.PricingInput body with the list of line items to price.

Return Value
Type: ConnectApi.PricingResult

Usage
This method respects buyer entitlements and only users entitled to view product and price data can access it.
If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper’s locale and returns the appropriate values.

getProductPrices(webstoreId, effectiveAccountId, productIds)
Get the prices for multiple products.
API Version
54.0

Available to Guest Users
54.0

Requires Chatter
No

Signature
public static ConnectApi.PricingResult getProductPrices(String webstoreId, String effectiveAccountId, List<String> productIds)

Parameters
webstoreId
Type: String
ID of the webstore.
effectiveAccountId
Type: String
ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.
productIds
Type: List<String>
List of product IDs for which you want to get prices.

Return Value
Type: ConnectApi.PricingResult

Usage
This method respects buyer entitlements and only users entitled to view product and price data can access it.
If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper’s locale and returns the appropriate values.

CommerceWishlist Class
Get, create, update, and delete wishlists. Add wishlists to carts. Get wishlist items, add items to wishlists, and delete wishlist items.

Namespace
ConnectApi
CommerceWishlist Methods

These methods are for CommerceWishlist. All methods are static.

IN THIS SECTION:

- `addItemToWishlist(webstoreId, wishlistId, wishlistItemInput)`
  Add an item to a wishlist for the context user.

- `addItemToWishlist(webstoreId, effectiveAccountId, wishlistId, wishlistItemInput)`
  Add an item to a wishlist.

- `addWishlistToCart(webstoreId, wishlistId)`
  Add a wishlist to the active cart for the context user.

- `addWishlistToCart(webstoreId, wishlistId, effectiveAccountId)`
  Add a wishlist to the active cart.

- `addWishlistToCartWithCartId(webstoreId, wishlistId, cartId)`
  Add a wishlist to a cart.

- `addWishlistToCartWithCartId(webstoreId, wishlistId, cartId, effectiveAccountId)`
  Add a wishlist to a cart.

- `createWishlist(webstoreId, wishlistInput)`
  Create a wishlist for the context user.

- `createWishlist(webstoreId, effectiveAccountId, wishlistInput)`
  Create a wishlist.

- `deleteWishlist(webstoreId, wishlistId)`
  Delete a wishlist for the context user.

- `deleteWishlist(webstoreId, effectiveAccountId, wishlistId)`
  Delete a wishlist.

- `getWishlist(webstoreId, effectiveAccountId, wishlistId, productFields, sortItemsBy)`
  Get a wishlist with product fields sorted by items.

- `getWishlist(webstoreId, effectiveAccountId, wishlistId, productFields, pageSize, sortItemsBy)`
  Get a wishlist with product fields sorted by items with a specified number of items per page.

- `getWishlistItems(webstoreId, effectiveAccountId, wishlistId, productFields, pageParam, sortItemsBy)`
  Get a page of sorted wishlist items with product fields.

- `getWishlistItems(webstoreId, effectiveAccountId, wishlistId, productFields, pageParam, pageSize, sortItemsBy)`
  Get a page of specified size of sorted wishlist items with product fields.

- `getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList)`
  Get wishlist summaries.

- `getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList, productFields, sortItemsBy)`
  Get wishlist summaries with product fields sorted by items.

- `getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList, productFields, pageSize, sortItemsBy)`
  Get wishlist summaries with product fields sorted by items with a specified number of items per page.

- `removeWishlistItem(webstoreId, effectiveAccountId, wishlistId, wishlistItemId)`
  Remove an item from a wishlist.
updateWishlist(webstoreId, wishlistId, wishlistUpdateInput)
Update the name of a wishlist for the context user.

updateWishlist(webstoreId, effectiveAccountId, wishlistId, wishlistUpdateInput)
Update the name of a wishlist.

addItemToWishlist(webstoreId, wishlistId, wishlistItemInput)
Add an item to a wishlist for the context user.

API Version
49.0

Requires Chatter
No

Signature
public static ConnectApi.WishlistItem addItemToWishlist(String webstoreId, String wishlistId, ConnectApi.WishlistItemInput wishlistItemInput)

Parameters
webstoreId
Type: String
ID of the webstore.

wishlistId
Type: String
ID of the wishlist.

wishlistItemInput
Type: ConnectApi.WishlistItemInput
A ConnectApi.WishlistItemInput body with the item to add to the wishlist.

Return Value
Type: ConnectApi.WishlistItem

Usage
This method respects buyer View Product entitlements and only users entitled to view product data can access it.

addItemToWishlist(webstoreId, effectiveAccountId, wishlistId, wishlistItemInput)
Add an item to a wishlist.
API Version
49.0

Requires Chatter
No

Signature
public static ConnectApi.WishlistItem addItemToWishlist(String webstoreId, String effectiveAccountId, String wishlistId, ConnectApi.WishlistItemInput wishlistItemInput)

Parameters
webstoreId
Type: String
ID of the webstore.
effectiveAccountId
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.
wishlistId
Type: String
ID of the wishlist.
wishlistItemInput
Type: ConnectApi.WishlistItemInput
A ConnectApi.WishlistItemInput body with the item to add to the wishlist.

Return Value
Type: ConnectApi.WishlistItem

Usage
This method respects buyer View Product entitlements and only users entitled to view product data can access it.

addWishlistToCart(webstoreId, wishlistId)
Add a wishlist to the active cart for the context user.

API Version
49.0

Requires Chatter
No
Signature

```java
public static ConnectApi.WishlistToCartResult addWishlistToCart(String webstoreId, String wishlistId)
```

Parameters

- **webstoreId**
  - Type: String
  - ID of the webstore.
- **wishlistId**
  - Type: String
  - ID of the wishlist.

Return Value

Type: `ConnectApi.WishlistToCartResult`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

```java
addWishlistToCart(webstoreId, wishlistId, effectiveAccountId)
```

Add a wishlist to the active cart.

API Version

49.0

Requires Chatter

No

Signature

```java
public static ConnectApi.WishlistToCartResult addWishlistToCart(String webstoreId, String wishlistId, String effectiveAccountId)
```

Parameters

- **webstoreId**
  - Type: String
  - ID of the webstore.
- **wishlistId**
  - Type: String
  - ID of the wishlist.
- **effectiveAccountId**
  - Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

**Return Value**
Type: `ConnectApi.WishlistToCartResult`

**Usage**
This method respects buyer View Product entitlements and only users entitled to view product data can access it.

```java
addWishlistToCartWithCartId(webstoreId, wishlistId, cartId)
```
Add a wishlist to a cart.

**API Version**
49.0

**Requires Chatter**
No

**Signature**
```
public static ConnectApi.WishlistToCartResult addWishlistToCartWithCartId(String webstoreId, String wishlistId, String cartId)
```

**Parameters**
- `webstoreId`
  Type: `String`
  ID of the webstore.
- `wishlistId`
  Type: `String`
  ID of the wishlist.
- `cartId`
  Type: `String`
  ID of the cart. If null, wishlist items are added to the active cart.

**Return Value**
Type: `ConnectApi.WishlistToCartResult`

**Usage**
This method respects buyer View Product entitlements and only users entitled to view product data can access it.
addWishlistToCartWithCartId(webstoreId, wishlistId, cartId, effectiveAccountId)

Add a wishlist to a cart.

API Version
49.0

Requires Chatter
No

Signature
public static ConnectApi.WishlistToCartResult addWishlistToCartWithCartId(String webstoreId, String wishlistId, String cartId, String effectiveAccountId)

Parameters
webstoreId
Type: String
ID of the webstore.

wishlistId
Type: String
ID of the wishlist.

cartId
Type: String
ID of the cart. If null, wishlist items are added to the active cart.

effectiveAccountId
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

Return Value
Type: ConnectApi.WishlistToCartResult

Usage
This method respects buyer View Product entitlements and only users entitled to view product data can access it.

createWishlist(webstoreId, wishlistInput)

Create a wishlist for the context user.

API Version
49.0
Requires Chatter
No

Signature
public static ConnectApi.Wishlist createWishlist(String webstoreId, ConnectApi.WishlistInput wishlistInput)

Parameters
webstoreId
  Type: String
  ID of the webstore.

wishlistInput
  Type: ConnectApi.WishlistInput
  A ConnectApi.WishlistInput body that includes the wishlist name and items.

Return Value
Type: ConnectApi.Wishlist

createWishlist(webstoreId, effectiveAccountId, wishlistInput)
Create a wishlist.

API Version
49.0

Requires Chatter
No

Signature
public static ConnectApi.Wishlist createWishlist(String webstoreId, String effectiveAccountId, ConnectApi.WishlistInput wishlistInput)

Parameters
webstoreId
  Type: String
  ID of the webstore.

effectiveAccountId
  Type: String
  ID of the account for which the request is made. If null, defaults to the account ID for the context user.

wishlistInput
  Type: ConnectApi.WishlistInput
A ConnectApi.WishlistInput body that includes the wishlist name and items.

Return Value
Type: ConnectApi.Wishlist

deleteWishlist(webstoreId, wishlistId)
Delete a wishlist for the context user.

API Version
49.0

Requires Chatter
No

Signature
public static Void deleteWishlist(String webstoreId, String wishlistId)

Parameters
webstoreId
Type: String
ID of the webstore.
wishlistId
Type: String
ID of the wishlist.

Return Value
Type: Void

deleteWishlist(webstoreId, effectiveAccountId, wishlistId)
Delete a wishlist.

API Version
51.0

Requires Chatter
No
Signature

public static Void deleteWishlist(String webstoreId, String effectiveAccountId, String wishlistId)

Parameters

webstoreId
  Type: String
  ID of the webstore.

effectiveAccountId
  Type: String
  ID of the account for which the request is made. If null, defaults to the account ID for the context user.

wishlistId
  Type: String
  ID of the wishlist.

Return Value

Type: Void

gEWishlist(webstoreId, effectiveAccountId, wishlistId, productFields, sortItemsBy)

Get a wishlist with product fields sorted by items.

API Version

S1.0

Requires Chatter

No

Signature

public static ConnectApi.Wishlist getWishlist(String webstoreId, String effectiveAccountId, String wishlistId, String productFields, ConnectApi.WishlistItemSortOrder sortItemsBy)

Parameters

webstoreId
  Type: String
  ID of the webstore.

effectiveAccountId
  Type: String
  ID of the account for which the request is made. If null, defaults to the account ID for the context user.
wishlistId
   Type: String
   ID of the wishlist.

productFields
   Type: String
   Comma-separated list of custom product fields. Fields aren’t case-sensitive. For example, ProductCode and productcode return the same results.

sortItemsBy
   Type: ConnectApi.WishlistItemSortOrder
   Sort order for wishlist items. Values are:
   • CreatedDateAsc—Sorts by oldest creation date.
   • CreatedDateDesc—Sorts by most recent creation date.
   The default sort order is CreatedDateDesc.

Return Value
Type: ConnectApi.Wishlist

getWishlist(webstoreId, effectiveAccountId, wishlistId, productFields, pageSize, sortItemsBy)
Get a wishlist with product fields sorted by items with a specified number of items per page.

API Version
S1.0

Requires Chatter
No

Signature
public static ConnectApi.Wishlist getWishlist(String webstoreId, String effectiveAccountId, String wishlistId, String productFields, Integer pageSize, ConnectApi.WishlistItemSortOrder sortItemsBy)

Parameters
webstoreId
   Type: String
   ID of the webstore.

effectiveAccountId
   Type: String
   ID of the account for which the request is made. If null, defaults to the account ID for the context user.
wishlistId
  Type: String
  ID of the wishlist.

productFields
  Type: String
  Comma-separated list of custom product fields. Fields aren’t case-sensitive. For example, ProductCode and productcode return the same results.

pageSize
  Type: Integer
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortItemsBy
  Type: ConnectApi.WishlistItemSortOrder
  Sort order for wishlist items. Values are:
  • CreatedDateAsc—Sorts by oldest creation date.
  • CreatedDateDesc—Sorts by most recent creation date.
  The default sort order is CreatedDateDesc.

Return Value
  Type: ConnectApi.Wishlist

getWishlistItems(webstoreId, effectiveAccountId, wishlistId, productFields, pageParam, sortItemsBy)
Get a page of sorted wishlist items with product fields.

API Version
51.0

Requires Chatter
No

Signature
public static ConnectApi.WishlistItemCollection getWishlistItems(String webstoreId, String effectiveAccountId, String wishlistId, String productFields, String pageParam, ConnectApi.WishlistItemSortOrder sortItemsBy)

Parameters
webstoreId
  Type: String
  ID of the webstore.
**effectiveAccountId**
Type: **String**
ID of the account for which the request is made. If **null**, defaults to the account ID for the context user.

**wishlistId**
Type: **String**
ID of the wishlist.

**productFields**
Type: **String**
Comma-separated list of custom product fields. Fields aren’t case-sensitive. For example, ProductCode and productcode return the same results.

**pageParam**
Type: **String**
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in **null**, the first page is returned.

**sortItemsBy**
Type: **ConnectApi.WishlistItemSortOrder**
Sort order for wishlist items. Values are:

- **CreatedDateAsc**—Sorts by oldest creation date.
- **CreatedDateDesc**—Sorts by most recent creation date.

The default sort order is **CreatedDateDesc**.

**Return Value**
Type: **ConnectApi.WishlistItemCollection**

**getWishlistItems** *(webstoreId, effectiveAccountId, wishlistId, productFields, pageParam, pageSize, sortItemsBy)*
Get a page of specified size of sorted wishlist items with product fields.

**API Version**
51.0

**Requires Chatter**
No

**Signature**
```
public static ConnectApi.WishlistItemCollection getWishlistItems(String webstoreId, String effectiveAccountId, String wishlistId, String productFields, String pageParam, Integer pageSize, ConnectApi.WishlistItemSortOrder sortItemsBy)
```
Parameters

webstoreId
  Type: String
  ID of the webstore.

effectiveAccountId
  Type: String
  ID of the account for which the request is made. If null, defaults to the account ID for the context user.

wishlistId
  Type: String
  ID of the wishlist.

productFields
  Type: String
  Comma-separated list of custom product fields. Fields aren’t case-sensitive. For example, ProductCode and productcode return the same results.

pageParam
  Type: String
  Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
  Type: Integer
  Specifies the number of items per page. Valid values are from 1 through 200. If you pass in null, the default size is 25.

sortItemsBy
  Type: ConnectApi.WishlistItemSortOrder
  Sort order for wishlist items. Values are:
  • CreatedDateAsc—Sorts by oldest creation date.
  • CreatedDateDesc—Sorts by most recent creation date.
  The default sort order is CreatedDateDesc.

Return Value

Type: ConnectApi.WishlistItemCollection

getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList)

Get wishlist summaries.

API Version

49.0

Requires Chatter

No
Signature

```java
public static ConnectApi.WishlistsSummary getWishlistSummaries(String webstoreId, String effectiveAccountId, Boolean includeDisplayedList)
```

Parameters

- **webstoreId**
  - **Type:** String
  - ID of the webstore.

- **effectiveAccountId**
  - **Type:** String
  - ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

- **includeDisplayedList**
  - **Type:** Boolean
  - Specifies whether to include the displayed list (`true`) or not (`false`). If `null`, defaults to `false`.

Return Value

- **Type:** `ConnectApi.WishlistsSummary`

```java
getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList, productFields, sortItemsBy)
```

Get wishlist summaries with product fields sorted by items.

API Version

- **51.0**

Requires Chatter

- **No**

Signature

```java
public static ConnectApi.WishlistsSummary getWishlistSummaries(String webstoreId, String effectiveAccountId, Boolean includeDisplayedList, String productFields, ConnectApi.WishlistItemSortOrder sortItemsBy)
```

Parameters

- **webstoreId**
  - **Type:** String
  - ID of the webstore.

- **effectiveAccountId**
  - **Type:** String
  - ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.
**includeDisplayedList**
Type: Boolean
Specifies whether to include the displayed list (true) or not (false).

**productFields**
Type: String
Comma-separated list of custom product fields. Fields aren’t case-sensitive. For example, ProductCode and productcode return the same results.

If includeDisplayedList is false, productFields is ignored.

**sortItemsBy**
Type: ConnectApi.WishlistItemSortOrder
Sort order for wishlist items. Values are:
- CreatedDateAsc—Sorts by oldest creation date.
- CreatedDateDesc—Sorts by most recent creation date.

The default sort order is CreatedDateDesc.
If includeDisplayedList is false, sortItemsBy is ignored.

**Return Value**
Type: ConnectApi.WishlistsSummary

**getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList, productFields, pageSize, sortItemsBy)**
Get wishlist summaries with product fields sorted by items with a specified number of items per page.

**API Version**
51.0

**Requires Chatter**
No

**Signature**
public static ConnectApi.WishlistsSummary getWishlistSummaries(String webstoreId, String effectiveAccountId, Boolean includeDisplayedList, Integer pageSize, String productFields, pageSize, ConnectApi.WishlistItemSortOrder sortItemsBy)

**Parameters**
webstoreId
Type: String
ID of the webstore.
effectiveAccountId
    Type: String
    ID of the account for which the request is made. If null, defaults to the account ID for the context user.

includeDisplayedList
    Type: Boolean
    Specifies whether to include the displayed list (true) or not (false).

productFields
    Type: String
    Comma-separated list of custom product fields. Fields aren’t case-sensitive. For example, ProductCode and productcode return the same results.
    If includeDisplayedList is false, productFields is ignored.

pageSize
    Type: Integer
    Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortItemsBy
    Type: ConnectApi.WishlistItemSortOrder
    Sort order for wishlist items. Values are:
    • CreatedDateAsc—Sorts by oldest creation date.
    • CreatedDateDesc—Sorts by most recent creation date.
    The default sort order is CreatedDateDesc.
    If includeDisplayedList is false, sortItemsBy is ignored.

Return Value
    Type: ConnectApi.WishlistsSummary

removeWishlistItem(webstoreId, effectiveAccountId, wishlistId, wishlistItemId)
Remove an item from a wishlist.

API Version
49.0

Requires Chatter
No

Signature
public static Void removeWishlistItem(String webstoreId, String effectiveAccountId, String wishlistId, String wishlistItemId)
Parameters

webstoreId  
Type: String  
ID of the webstore.

effectiveAccountId  
Type: String  
ID of the account for which the request is made. If null, defaults to the account ID for the context user.

wishlistId  
Type: String  
ID of the wishlist.

wishlistItemId  
Type: String  
ID of the wishlist item to remove.

Return Value

Type: Void

updateWishlist(webstoreId, wishlistId, wishlistUpdateInput)

Update the name of a wishlist for the context user.

API Version

50.0

Requires Chatter

No

Signature

public static ConnectApi.WishlistSummary updateWishlist(String webstoreId, String wishlistId, ConnectApi.WishlistUpdateInput wishlistUpdateInput)

Parameters

webstoreId  
Type: String  
ID of the webstore.

wishlistId  
Type: String  
ID of the wishlist.

wishlistUpdateInput  
Type: ConnectApi.WishlistUpdateInput  
A ConnectApi.WishlistUpdateInput body with the wishlist name to update.
Return Value
Type: ConnectApi.WishlistSummary

updateWishlist(webstoreId, effectiveAccountId, wishlistId, wishlistUpdateInput)
Update the name of a wishlist.

API Version
50.0

Requires Chatter
No

Signature
public static ConnectApi.WishlistSummary updateWishlist(String webstoreId, String effectiveAccountId, String wishlistId, ConnectApi.WishlistUpdateInput wishlistUpdateInput)

Parameters
webstoreId
Type: String
ID of the webstore.
effectiveAccountId
Type: String
ID of the account for which the request is made. If null, defaults to the account ID for the context user.
wishlistId
Type: String
ID of the wishlist.
wishlistUpdateInput
Type: ConnectApi.WishlistUpdateInput
A ConnectApi.WishlistUpdateInput body with the wishlist name to update.

Return Value
Type: ConnectApi.WishlistSummary

Communities Class
Get information about Experience Cloud sites in your org.
Namespace
ConnectApi

Communities Methods
The following are methods for Communities. All methods are static.

IN THIS SECTION:
getCommunities()
Get a list of Experience Cloud sites that the context user has access to.
getCommunities(communityStatus)
Get a list of Experience Cloud sites with the specified status that the context user has access to.
getCommunity(communityId)
Get information about an Experience Cloud site.

getCommunities()
Get a list of Experience Cloud sites that the context user has access to.

API Version
28.0

Requires Chatter
No

Signature
public static ConnectApi.CommunityPage getCommunities()

Return Value
Type: ConnectApi.CommunityPage

getCommunities(communityStatus)
Get a list of Experience Cloud sites with the specified status that the context user has access to.

API Version
28.0

Requires Chatter
No
Signature

`public static ConnectApi.CommunityPage getCommunities(ConnectApi.CommunityStatus communityStatus)`

Parameters

`communityStatus`

Type: `ConnectApi.CommunityStatus`

`communityStatus`—Status of the Experience Cloud site. Values are:

- Live
- Inactive
- UnderConstruction

Return Value

Type: `ConnectApi.CommunityPage`

`getCommunity(String communityId)`

Get information about an Experience Cloud site.

API Version

28.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

`public static ConnectApi.Community getCommunity(String communityId)`

Parameters

`communityId`

Type: `String`

ID of an Experience Cloud site. You can’t specify `null` or `internal`.

Return Value

Type: `ConnectApi.Community`
CommunityModeration Class

Get information about flagged feed items and comments in an Experience Cloud site. Add and remove flags from comments and feed items.

Namespace

ConnectApi

CommunityModeration Methods

The following are methods for CommunityModeration. All methods are static.

IN THIS SECTION:

addFlagToComment(communityId, commentId)
Add a moderation flag to a comment.

addFlagToComment(communityId, commentId, visibility)
Add a moderation flag of the specified visibility to a comment.

addFlagToComment(communityId, commentId, type)
Add a moderation flag of the specified type to a comment.

addFlagToComment(communityId, commentId, note)
Add a moderation flag with a note to a comment.

addFlagToComment(communityId, commentId, type, note)
Add a moderation flag of the specified type with a note to a comment.

addFlagToComment(communityId, commentId, type, visibility)
Add a moderation flag of the specified type and visibility to a comment.

addFlagToFeedElement(communityId, feedElementId)
Add a moderation flag to a feed element.

addFlagToFeedElement(communityId, feedElementId, visibility)
Add a moderation flag of the specified visibility to a feed element.

addFlagToFeedElement(communityId, feedElementId, type)
Add a moderation flag of the specified type to a feed element.

addFlagToFeedElement(communityId, feedElementId, note)
Add a moderation flag with a note to a feed element.

addFlagToFeedElement(communityId, feedElementId, type, note)
Add a moderation flag of the specified type with a note to a feed element.

addFlagToFeedElement(communityId, feedElementId, type, visibility)
Add a moderation flag of the specified type and visibility to a feed element.
addFlagToFeedElement(communityId, feedElementId, visibility, note)
Add a moderation flag of the specified visibility with a note to a feed element.

addFlagToFeedElement(communityId, feedElementId, type, visibility, note)
Add a moderation flag of the specified type and visibility with a note to a feed element.

getFlagsOnComment(communityId, commentId)
Get the moderation flags on a comment.

getFlagsOnComment(communityId, commentId, visibility)
Get the moderation flags with specified visibility on a comment.

getFlagsOnComment(communityId, commentId, pageSize, pageParam)
Get a page of moderation flags on a comment.

getFlagsOnComment(communityId, commentId, visibility, pageSize, pageParam)
Get a page of moderation flags with specified visibility on a comment.

getFlagsOnFeedElement(communityId, feedElementId)
Get the moderation flags on a feed element.

getFlagsOnFeedElement(communityId, feedElementId, visibility)
Get the moderation flags with specified visibility on a feed element.

getFlagsOnFeedElement(communityId, feedElementId, pageParam, pageSize)
Get a page of moderation flags on a feed element.

getFlagsOnFeedElement(communityId, feedElementId, visibility, pageParam, pageSize)
Get a page of moderation flags with specified visibility on a feed element.

removeFlagFromComment(communityId, commentId, userId)
Remove a moderation flag from a comment.

removeFlagFromFeedElement(communityId, feedElementId, userId)
Remove a moderation flag from a feed element.

addFlagToComment(communityId, commentId)
Add a moderation flag to a comment.

API Version
29.0

Requires Chatter
Yes

Signature
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId)
Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or null.

- **commentId**
  - Type: `String`
  - ID for a comment.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

**addFlagToComment(communityId, commentId, visibility)**

Add a moderation flag of the specified visibility to a comment.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or null.

- **commentId**
  - Type: `String`
  - ID for a comment.

- **visibility**
  - Type: `ConnectApi.CommunityFlagVisibility`
  - Visibility behavior of a flag for various user types.
  - **ModeratorsOnly**—The flag is visible only to users with moderation permissions on the flagged element or item.
• SelfAndModerators—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value
Type: ConnectApi.ModerationFlags

Usage
To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToComment(communityId, commentId, type)
Add a moderation flag of the specified type to a comment.

API Version
38.0

Requires Chatter
Yes

Signature
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagType type)

Parameters
- communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

- commentId
  Type: String
  ID for a comment.

- type
  Type: ConnectApi.CommunityFlagType
  Type of moderation flag.
  - FlagAsInappropriate—Flag for inappropriate content.
  - FlagAsSpam—Flag for spam.
  If a type isn’t specified, it defaults to FlagAsInappropriate.

Return Value
Type: ConnectApi.ModerationFlags
Usage
To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

`addFlagToComment(communityId, commentId, note)`
Add a moderation flag with a note to a comment.

API Version
38.0

Requires Chatter
Yes

Signature
`public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, String note)`

Parameters
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.
- `commentId`
  Type: `String`
  ID for a comment.
- `note`
  Type: `String`
  A note of up to 4,000 characters about the flag.

Return Value
Type: `ConnectApi.ModerationFlags`

Usage
To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

`addFlagToComment(communityId, commentId, type, note)`
Add a moderation flag of the specified type with a note to a comment.

API Version
38.0
Requires Chatter
Yes

Signature
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagType type, String note)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

commentId
Type: String
ID for a comment.

type
Type: ConnectApi.CommunityFlagType
Type of moderation flag.
- FlagAsInappropriate—Flag for inappropriate content.
- FlagAsSpam—Flag for spam.

If a type isn’t specified, it defaults to FlagAsInappropriate.

note
Type: String
A note of up to 4,000 characters about the flag.

Return Value
Type: ConnectApi.ModerationFlags

Usage
To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToComment(communityId, commentId, type, visibility)
Add a moderation flag of the specified type and visibility to a comment.

API Version
38.0

Requires Chatter
Yes
Signature

```java
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagType type, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **commentId**
  - Type: `String`
  - ID for a comment.

- **type**
  - Type: `ConnectApi.CommunityFlagType`
  - Type of moderation flag.
    - FlagAsInappropriate—Flag for inappropriate content.
    - FlagAsSpam—Flag for spam.

If a type isn't specified, it defaults to FlagAsInappropriate.

- **visibility**
  - Type: `ConnectApi.CommunityFlagVisibility`
  - Visibility behavior of a flag for various user types.
    - ModeratorsOnly—The flag is visible only to users with moderation permissions on the flagged element or item.
    - SelfAndModerators—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

- Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

```java
addFlagToComment(communityId, commentId, visibility, note)
```

Add a moderation flag of the specified visibility with a note to a comment.

API Version

- 38.0

Requires Chatter

- Yes
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagVisibility visibility, String note)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

commentId
Type: String
ID for a comment.

visibility
Type: ConnectApi.CommunityFlagVisibility
Visibility behavior of a flag for various user types.
- ModeratorsOnly—The flag is visible only to users with moderation permissions on the flagged element or item.
- SelfAndModerators—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note
Type: String
A note of up to 4,000 characters about the flag.

Return Value
Type: ConnectApi.ModerationFlags

Usage
To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToComment(communityId, commentId, type, visibility, note)
Add a moderation flag of the specified type and visibility with a note to a comment.

API Version
38.0

Requires Chatter
Yes

Signature
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagType type, ConnectApi.CommunityFlagVisibility visibility, String note)
Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

commentId
  Type: String
  ID for a comment.

type
  Type: ConnectApi.CommunityFlagType
  Type of moderation flag.
  • FlagAsInappropriate—Flag for inappropriate content.
  • FlagAsSpam—Flag for spam.
  If a type isn’t specified, it defaults to FlagAsInappropriate.

visibility
  Type: ConnectApi.CommunityFlagVisibility
  Visibility behavior of a flag for various user types.
  • ModeratorsOnly—The flag is visible only to users with moderation permissions on the flagged element or item.
  • SelfAndModerators—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note
  Type: String
  A note of up to 4,000 characters about the flag.

Return Value

Type: ConnectApi.ModerationFlags

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedElement(communityId, feedElementId)

Add a moderation flag to a feed element.

API Version

31.0

Requires Chatter

Yes
Signature

```java
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId, String feedElementId)
```

Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`feedElementId`
Type: `String`
ID of the feed element.

Return Value
Type: `ConnectApi.ModerationCapability`
If the feed element doesn’t support this capability, the return value is `ConnectApi.NotFoundException`.

Usage
To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

```java
addFlagToFeedElement(communityId, feedElementId, visibility)
```
Add a moderation flag of the specified visibility to a feed element.

API Version
31.0

Requires Chatter
Yes

Signature

```java
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId, String feedElementId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`feedElementId`
Type: `String`
ID of the feed element.
visibility
Type: ConnectApi.CommunityFlagVisibility
Visibility behavior of a flag for various user types. One of these values:
- ModeratorsOnly—The flag is visible only to users with moderation permissions on the flagged element or item.
- SelfAndModerators—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value
Type: ConnectApi.ModerationCapability
If the feed element doesn’t support this capability, the return value is ConnectApi.NotFoundException.

Usage
To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedElement(communityId, feedElementId, type)
Add a moderation flag of the specified type to a feed element.

API Version
38.0

Requires Chatter
Yes

Signature
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId, String feedElementId, ConnectApi.CommunityFlagType type)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

type
Type: ConnectApi.CommunityFlagType
Type of moderation flag.
- FlagAsInappropriate—Flag for inappropriate content.
- FlagAsSpam—Flag for spam.
If a type isn’t specified, it defaults to FlagAsInappropriate.

Return Value
Type: ConnectApi.ModerationCapability

Usage
To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

`addFlagToFeedElement(communityId, feedElementId, note)`
Add a moderation flag with a note to a feed element.

API Version
38.0

Requires Chatter
Yes

Signature
`public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId, String feedElementId, String note)`

Parameters
`communityId`
Type: String
ID for an Experience Cloud site, internal, or null.

`feedElementId`
Type: String
ID of the feed element.

`note`
Type: String
A note of up to 4,000 characters about the flag.

Return Value
Type: ConnectApi.ModerationCapability

Usage
To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.
addFlagToFeedElement(communityId, feedElementId, type, note)
Add a moderation flag of the specified type with a note to a feed element.

API Version
38.0

Requires Chatter
Yes

Signature
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId, String feedElementId, ConnectApi.CommunityFlagType type, String note)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

type
Type: ConnectApi.CommunityFlagType
Type of moderation flag.
• FlagAsInappropriate—Flag for inappropriate content.
• FlagAsSpam—Flag for spam.
If a type isn’t specified, it defaults to FlagAsInappropriate.

note
Type: String
A note of up to 4,000 characters about the flag.

Return Value
Type: ConnectApi.ModerationCapability

Usage
To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedElement(communityId, feedElementId, type, visibility)
Add a moderation flag of the specified type and visibility to a feed element.
API Version
38.0

Requires Chatter
Yes

Signature
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagType type,
ConnectApi.CommunityFlagVisibility visibility)

Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

feedElementId
  Type: String
  ID of the feed element.

type
  Type: ConnectApi.CommunityFlagType
  Type of moderation flag.
    • FlagAsInappropriate—Flag for inappropriate content.
    • FlagAsSpam—Flag for spam.
  If a type isn’t specified, it defaults to FlagAsInappropriate.

visibility
  Type: ConnectApi.CommunityFlagVisibility
  Visibility behavior of a flag for various user types. One of these values:
    • ModeratorsOnly—The flag is visible only to users with moderation permissions on the flagged element or item.
    • SelfAndModerators—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value
Type: ConnectApi.ModerationCapability

Usage
To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedElement (communityId, feedElementId, visibility, note)
Add a moderation flag of the specified visibility with a note to a feed element.
API Version
38.0

Requires Chatter
Yes

Signature
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId, String feedElementId, ConnectApi.CommunityFlagVisibility visibility, String note)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

visibility
Type: ConnectApi.CommunityFlagVisibility
Visibility behavior of a flag for various user types. One of these values:
- ModeratorsOnly—The flag is visible only to users with moderation permissions on the flagged element or item.
- SelfAndModerators—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note
Type: String
A note of up to 4,000 characters about the flag.

Return Value
Type: ConnectApi.ModerationCapability

Usage
To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedElement(communityId, feedElementId, type, visibility, note)
Add a moderation flag of the specified type and visibility with a note to a feed element.

API Version
38.0
Requires Chatter
Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId, String feedElementId, ConnectApi.CommunityFlagType type, ConnectApi.CommunityFlagVisibility visibility, String note)
```

Parameters

customId
Type: String
ID for an Experience Cloud site, internal, or null.

`feedElementId`
Type: String
ID of the feed element.

type
Type: ConnectApi.CommunityFlagType
Type of moderation flag.
- FlagAsInappropriate—Flag for inappropriate content.
- FlagAsSpam—Flag for spam.
If a type isn’t specified, it defaults to FlagAsInappropriate.

visibility
Type: ConnectApi.CommunityFlagVisibility
Visibility behavior of a flag for various user types. One of these values:
- ModeratorsOnly—The flag is visible only to users with moderation permissions on the flagged element or item.
- SelfAndModerators—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

`note`
Type: String
A note of up to 4,000 characters about the flag.

Return Value
Type: ConnectApi.ModerationCapability

Usage
To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

```
getFlagsOnComment(communityId, commentId)
```

Get the moderation flags on a comment.
API Version
29.0

Requires Chatter
Yes

Signature
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String commentId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

commentId
Type: String
ID for a comment.

Return Value
Type: ConnectApi.ModerationFlags

Usage
To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

getFlagsOnComment(communityId, commentId, visibility)
Get the moderation flags with specified visibility on a comment.

API Version
30.0

Requires Chatter
Yes

Signature
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String commentId, ConnectApi.CommunityFlagVisibility visibility)
Parameters

communityId  
Type: String  
ID for an Experience Cloud site, internal, or null.

commentId  
Type: String  
ID for a comment.

visibility  
Type: ConnectApi.CommunityFlagVisibility  
Visibility behavior of a flag for various user types.
- ModeratorsOnly—The flag is visible only to users with moderation permissions on the flagged element or item.
- SelfAndModerators—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: ConnectApi.ModerationFlags

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

getFlagsOnComment(communityId, commentId, pageSize, pageParam)

Get a page of moderation flags on a comment.

API Version

40.0

Requires Chatter

Yes

Signature

public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String commentId, Integer pageSize, String pageParam)

Parameters

communityId  
Type: String  
ID for an Experience Cloud site, internal, or null.

commentId  
Type: String
ID for a comment.

**pageSize**
Type: `Integer`  
Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

**pageParam**  
Type: `String`  
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**Return Value**
Type: `ConnectApi.ModerationFlags`

**Usage**
To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

**getFlagsOnComment(communityId, commentId, visibility, pageSize, pageParam)**
Get a page of moderation flags with specified visibility on a comment.

**API Version**
40.0

**Requires Chatter**
Yes

**Signature**
```java
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String commentId, ConnectApi.CommunityFlagVisibility visibility, Integer pageSize, String pageParam)
```

**Parameters**
**communityId**  
Type: `String`  
ID for an Experience Cloud site, internal, or `null`.

**commentId**  
Type: `String`  
ID for a comment.

**visibility**  
Type: `ConnectApi.CommunityFlagVisibility`  
Visibility behavior of a flag for various user types.
- **ModeratorsOnly**—The flag is visible only to users with moderation permissions on the flagged element or item.
- **SelfAndModerators**—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

**pageSize**
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

**pageParam**
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**Return Value**
Type: `ConnectApi.ModerationFlags`

**Usage**
To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

**getFlagsOnFeedElement(communityId, feedElementId)**
Get the moderation flags on a feed element.

**API Version**
31.0

**Requires Chatter**
Yes

**Signature**

```java
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId, String feedElementId)
```

**Parameters**

- **communityId**
  Type: String
  ID for an Experience Cloud site, `internal`, or `null`.

- **feedElementId**
  Type: String
  ID of the feed element.

**Return Value**
Type: `ConnectApi.ModerationCapability`
If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`. 
Usage
To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`getFlagsOnFeedElement(communityId, feedElementId, visibility)`
Get the moderation flags with specified visibility on a feed element.

API Version
31.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId, String feedElementId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters
- `communityId`: Type: String
  ID for an Experience Cloud site, internal, or null.
- `feedElementId`: Type: String
  ID of the feed element.
- `visibility`: Type: ConnectApi.CommunityFlagVisibility
  Visibility behavior of a flag for various user types. One of these values:
  - ModeratorsOnly—The flag is visible only to users with moderation permissions on the flagged element or item.
  - SelfAndModerators—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value
Type: `ConnectApi.ModerationCapability`
If the feed element doesn’t support this capability, the return value is `ConnectApi.NotFoundException`.

Usage
To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`getFlagsOnFeedElement(communityId, feedElementId, pageParam, pageSize)`
Get a page of moderation flags on a feed element.
API Version
40.0

Requires Chatter
Yes

Signature
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId, String feedElementId, String pageParam, Integer pageSize)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

pageParam
Type: String
Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

Return Value
Type: ConnectApi.ModerationCapability
If the feed element doesn’t support this capability, the return value is ConnectApi.NotFoundException.

Usage
To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

getFlagsOnFeedElement(communityId, feedElementId, visibility, pageSize, pageParam)
Get a page of moderation flags with specified visibility on a feed element.
Requires Chatter
Yes

Signature

```java
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility, Integer pageSize,
String pageParam)
```

Parameters

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **feedElementId**
  - Type: String
  - ID of the feed element.

- **visibility**
  - Type: `ConnectApi.CommunityFlagVisibility`
  - Visibility behavior of a flag for various user types.
    - ModeratorsOnly—The flag is visible only to users with moderation permissions on the flagged element or item.
    - SelfAndModerators—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

- **pageSize**
  - Type: Integer
  - Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

- **pageParam**
  - Type: String
  - Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

Return Value

- Type: `ConnectApi.ModerationCapability`
- If the feed element doesn’t support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

```java
removeFlagFromComment(communityId, commentId, userId)
```

Remove a moderation flag from a comment.
API Version
29.0

Requires Chatter
Yes

Signature
public static ConnectApi.ModerationFlags removeFlagFromComment(String communityId, String commentId, String userId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

commentId
Type: String
ID for a comment.

userId
Type: String
ID of the context user for whom the flag is removed. Specify null to remove the flag for all users.

Return Value
Type: Void

Usage
To remove a moderation flag, the context user must have added the flag or must have the Moderate Experiences Feeds permission.

removeFlagFromFeedElement(communityId, feedElementId, userId)
Remove a moderation flag from a feed element.

API Version
31.0

Requires Chatter
Yes

Signature
public static void removeFlagFromFeedElement(String communityId, String feedElementId, String userId)
Parameters

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **feedElementId**
  - Type: String
  - ID of the feed element.

- **userId**
  - Type: String
  - ID of the context user for whom the flag is removed. Specify null to remove the flag for all users.

Return Value

- Type: `ConnectApi.ModerationCapability`
  - If the feed element doesn’t support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

- To remove a moderation flag, the context user must have added the flag or must have the Moderate Experiences Feeds permission.

Retired CommunityModeration Methods

- The following methods for `CommunityModeration` are retired.

IN THIS SECTION:

- `addFlagToFeedItem(communityId, feedItemIds)`
  - Add a moderation flag to a feed item.

- `addFlagToFeedItem(communityId, feedItemIds, visibility)`
  - Add a moderation flag with specified visibility to a feed item.

- `getFlagsOnFeedItem(communityId, feedItemIds)`
  - Get the moderation flags on a feed item.

- `getFlagsOnFeedItem(communityId, feedItemIds, visibility)`
  - Get the moderation flags with specified visibility on a feed item.

- `removeFlagsOnFeedItem(communityId, feedItemIds, userId)`
  - Remove a moderation flag from a feed item.

- `addFlagToFeedItem(communityId, feedItemIds)`
  - Add a moderation flag to a feed item.

API Version

- 29.0–31.0
**Important:** In version 32.0 and later, use `addFlagToFeedElement(communityId, feedElementId)`.  

Requires Chatter

Yes

**Signature**

```java
public static ConnectApi.ModerationFlags addFlagToFeedItem(String communityId, String feedItemId)
```

**Parameters**

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `feedItemId`
  - Type: `String`
  - ID for a feed item.

**Return Value**

Type: `ConnectApi.ModerationFlags`

**Usage**

To add a flag to a feed item, Allow members to flag content must be selected for an Experience Cloud site.

```java
addFlagToFeedItem(communityId, feedItemId, visibility)
```

Add a moderation flag with specified visibility to a feed item.

**API Version**

30.0–31.0

**Important:** In version 32.0 and later, use `addFlagToFeedElement(communityId, feedElementId, visibility)`.  

Requires Chatter

Yes

**Signature**

```java
public static ConnectApi.ModerationFlags addFlagToFeedItem(String communityId, String feedItemId, ConnectApi.CommunityFlagVisibility visibility)
```
Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `feedItemId`
  - Type: `String`
  - ID for a feed item.

- `visibility`
  - Type: `ConnectApi.CommunityFlagVisibility`
  - Visibility behavior of a flag for various user types.
    - ModeratorsOnly—The flag is visible only to users with moderation permissions on the flagged element or item.
    - SelfAndModerators—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

- Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a feed item, Allow members to flag content must be selected for an Experience Cloud site.

```java
getFlagsOnFeedItem(communityId, feedItemId)
```

Get the moderation flags on a feed item.

API Version

29.0–31.0

**Important:** In version 32.0 and later, use `getFlagsOnFeedElement(communityId, feedElementId)`.

Requires Chatter

Yes

Signature

```java
public static ConnectApi.ModerationFlags getFlagsOnFeedItem(String communityId, String feedItemId)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.
feedItemId
Type: String
ID for a feed item.

Return Value
Type: ConnectApi.ModerationFlags

Usage
To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

getFlagsOnFeedItem(communityId, feedItemId, visibility)
Get the moderation flags with specified visibility on a feed item.

API Version
30.0–31.0

Important: In version 32.0 and later, use getFlagsOnFeedElement(communityId, feedElementId, visibility).

Requires Chatter
Yes

Signature
public static ConnectApi.ModerationFlags getFlagsOnFeedItem(String communityId, String feedItemId, ConnectApi.CommunityFlagVisibility visibility)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedItemId
Type: String
ID for a feed item.

visibility
Type: ConnectApi.CommunityFlagVisibility
Visibility behavior of a flag for various user types. Values are:
• ModeratorsOnly—The flag is visible only to users with moderation permissions on the flagged element or item.
• SelfAndModerators—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.
Return Value
Type: ConnectApi.ModerationFlags

Usage
To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

removeFlagsOnFeedItem(communityId, feedItemId, userId)
Remove a moderation flag from a feed item.

API Version
29.0–31.0

Important: In version 32.0 and later, use removeFlagFromFeedElement(communityId, feedElementId, userId).

Requires Chatter
Yes

Signature
public static ConnectApi.ModerationFlags removeFlagsOnFeedItem(String communityId, String feedItemId, String userId)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedItemId
Type: String
ID for a feed item.

userId
Type: String
ID of the context user for whom the flag is removed. Specify null to remove the flag for all users.

Return Value
Type: Void

Usage
To remove a moderation flag, the context user must have added the flag or must have the Moderate Experiences Feeds permission.
ContentHub Class

Access Files Connect repositories and their files and folders.

Namespace

ConnectApi

ContentHub Methods

The following are methods for ContentHub. All methods are static.

Use ContentHub methods to work with Files Connect repositories.

IN THIS SECTION:

- `addRepositoryItem(repositoryId, repositoryFolderId, file)`
  Add a repository item.

- `addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)`
  Add a repository item in an Experience Cloud site.

- `addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)`
  Add a repository item, including the binary file.

- `addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)`
  Add a repository item, including the binary file, in an Experience Cloud site.

- `getAllowedItemTypes(repositoryId, repositoryFolderId)`
  Get the item types that the context user is allowed to create in the repository folder.

- `getAllowedItemTypes(repositoryId, repositoryFolderId, filter)`
  Get the item types, filtered by type, that the context user is allowed to create in the repository folder.

- `getAllowedItemTypes(communityId, repositoryId, repositoryFolderId)`
  Get the item types that the context user is allowed to create in the repository folder in an Experience Cloud site.

- `getAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter)`
  Get the item types, filtered by type, that the context user is allowed to create in the repository folder in an Experience Cloud site.

- `getFilePreview(repositoryId, repositoryFileId, formatType)`
  Get a repository file preview.

- `getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)`
  Get a page or page range of a repository file preview.

- `getFilePreview(communityId, repositoryId, repositoryFileId, formatType)`
  Get a repository file preview in an Experience Cloud site.

- `getFilePreview(communityId, repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)`
  Get a page or page range of a repository file preview in an Experience Cloud site.

- `getItemType(repositoryId, repositoryItemTypeId)`
  Get information about an item type associated with a repository.

- `getItemType(communityId, repositoryId, repositoryItemTypeId)`
  Get information about an item type associated with a repository in an Experience Cloud site.
getPreviews(repositoryId, repositoryFileId)
Get information about a repository file’s supported previews.

getPreviews(communityId, repositoryId, repositoryFileId)
Get information about a repository file’s supported previews in an Experience Cloud site.

getRepositories()
Get a list of repositories.

getRepositories(communityId)
Get a list of repositories in an Experience Cloud site.

getRepositories(pageParam, pageSize)
Get a page of repositories.

getRepositories(communityId, pageParam, pageSize)
Get a page of repositories in an Experience Cloud site.

getRepository(repositoryId)
Get a repository.

getRepository(communityId, repositoryId)
Get a repository in an Experience Cloud site.

getRepositoryFile(repositoryId, repositoryFileId)
Get a repository file.

getRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)
Get a repository file with or without permissions information.

getRepositoryFile(communityId, repositoryId, repositoryFileId)
Get a repository file in an Experience Cloud site.

getRepositoryFile(communityId, repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)
Get a repository file with or without permissions information in an Experience Cloud site.

getRepositoryFolder(repositoryId, repositoryFolderId)
Get a repository folder.

getRepositoryFolder(communityId, repositoryId, repositoryFolderId)
Get a repository folder in an Experience Cloud site.

getRepositoryFolderItems(repositoryId, repositoryFolderId)
Get repository folder items.

getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId)
Get repository folder items in an Experience Cloud site.

getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize)
Get a page of repository folder items.

getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize)
Get a page of repository folder items in an Experience Cloud site.

updateRepositoryFile(repositoryId, repositoryFileId, file)
Update the name of a repository file.

updateRepositoryFile(repositoryId, repositoryFileId, file, fileData)
Update the content of a repository file.
updateRepositoryFile(communityId, repositoryId, repositoryFileId, file)
Update the name of a repository file in an Experience Cloud site.

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData)
Update the content of a repository file in an Experience Cloud site.

addRepositoryItem(repositoryId, repositoryFolderId, file)
Add a repository item.

API Version
39.0

Requires Chatter
No

Signature
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file)

Parameters
repositoryId
Type: String
The ID of the repository.
repositoryFolderId
Type: String
The ID of the repository folder.
file
Type: ConnectApi.ContentHubItemInput
The item type ID and fields of the item type.

Return Value
Type: ConnectApi.RepositoryFolderItem

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.
Example
This example creates a file without binary content (metadata only) in a Google Drive repository folder. After the file is created, we show the file’s ID, name, description, external URL, and download URL.

```java
final String gDriveRepositoryId = '0XCxx0000000000Dgay', gDriveFolderId = 'folder:0B0lTys1KmM3sSVJ2b1zTGFqSw';

final ConnectApi.ContentHubItemInput newItem = new ConnectApi.ContentHubItemInput();
newItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available for creation/update
newItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
final ConnectApi.ContentHubFieldValueInput fieldValueInput = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInput.name = 'name';
fieldValueInput.value = 'new folder item name.txt';
newItem.fields.add(fieldValueInput);

//Metadata: description field
final ConnectApi.ContentHubFieldValueInput fieldValueInputDesc = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputDesc.name = 'description';
fieldValueInputDesc.value = 'It does describe it';
newItem.fields.add(fieldValueInputDesc);

final ConnectApi.RepositoryFolderItem newFolderItem =
ConnectApi.ContentHub.addRepositoryItem(gDriveRepositoryId, gDriveFolderId, newItem);
final ConnectApi.RepositoryFileSummary newFile = newFolderItem.file;
System.debug(String.format('New file - id: \''{0}'\', name: \''{1}'\', description: \''{2}'\', external URL: \''{3}'\', download URL: \''{4}'\'', new String[]{newFile.id, newFile.name, newFile.description, newFile.externalDocumentUrl, newFile.downloadUrl});
```

SEE ALSO:
- `setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, result)`

*Apex Developer Guide: Testing ConnectApi Code*

`addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)`
Add a repository item in an Experience Cloud site.

API Version
39.0

Requires Chatter
No
Signature

```java
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String communityId,
String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file)
```

Parameters

- `communityId`  
  Type: `String`  
  ID for an Experience Cloud site, internal, or `null`.

- `repositoryId`  
  Type: `String`  
  The ID of the repository.

- `repositoryFolderId`  
  Type: `String`  
  The ID of the repository folder.

- `file`  
  Type: `ConnectApi.ContentHubItemInput`  
  The item type ID and fields of the item type.

Return Value

Type: `ConnectApi.RepositoryFolderItem`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, result)`

  *Apex Developer Guide: Testing ConnectApi Code*

```java
addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)
```

Add a repository item, including the binary file.

API Version

39.0

Requires Chatter

No
**Signature**

```java
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput
fileData)
```

**Parameters**

- `repositoryId`
  - Type: `String`
  - The ID of the repository.

- `repositoryFolderId`
  - Type: `String`
  - The ID of the repository folder.

- `file`
  - Type: `ConnectApi.ContentHubItemInput`
  - The item type ID and fields of the item type.

- `fileData`
  - Type: `ConnectApi.BinaryInput`
  - The binary file.

**Return Value**

Type: `ConnectApi.RepositoryFolderItem`

**Usage**

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**Example**

This example creates a file with binary content and metadata in a Google Drive repository folder. After the file is created, we show the file's ID, name, description, external URL, and download URL.

```java
final String gDriveRepositoryId = '0XCxx00000000ODGAY',  
gDriveFolderId = 'folder:0B01Tys1KmM3sSVJ2bjIzTGFqSWs';

final ConnectApi.ContentHubItemInput newItem = new ConnectApi.ContentHubItemInput();
newItem.itemTypeId = 'document';  //see getAllowedTypes for any file item types available
for creation/update
newItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

final String newFileName = 'new folder item name.txt';
final ConnectApi.ContentHubFieldValueInput fieldValueInput = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInput.name = 'name';
fieldValueInput.value = newFileName;
newItem.fields.add(fieldValueInput);
```
//Metadata: description field
final ConnectApi.ContentHubFieldValueInput fieldValueInputDesc = new ConnectApi.ContentHubFieldValueInput();
fieldValueInputDesc.name = 'description';
fieldValueInputDesc.value = 'It does describe it';
newItem.fields.add(fieldValueInputDesc);

//Binary content
final Blob newFileBlob = Blob.valueOf('awesome content for brand new file');
final String newFileMimeType = 'text/plain';
final ConnectApi.BinaryInput fileBinaryInput = new ConnectApi.BinaryInput(newFileBlob, newFileMimeType, newFileName);

final ConnectApi.RepositoryFolderItem newFolderItem = ConnectApi.ContentHub.addRepositoryItem(gDriveRepositoryId, gDriveFolderId, newItem, fileBinaryInput);
final ConnectApi.RepositoryFileSummary newFile = newFolderItem.file;
System.debug(String.format('New file - id: "{0}", name: "{1}", description: "{2}" 
 external URL: "{3}", download URL: "{4}", new String[]{{newFile.id, newFile.name, newFile.description, newFile.externalDocumentUrl, newFile.downloadUrl}}));

SEE ALSO:
setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, fileData, result)

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)
Add a repository item, including the binary file, in an Experience Cloud site.

API Version
39.0

Requires Chatter
No

Signature
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String communityId, String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput fileData)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

repositoryId
  Type: String
  The ID of the repository.

repositoryFolderId
  Type: String
  The ID of the repository folder.

file
  Type: ConnectApi.ContentHubItemInput
  The item type ID and fields of the item type.

fileData
  Type: ConnectApi.BinaryInput
  The binary file.

Return Value
  Type: ConnectApi.RepositoryFolderItem

Usage
  To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
  setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData, result)

getAllowedItemTypes(repositoryId, repositoryFolderId)
Get the item types that the context user is allowed to create in the repository folder.

API Version
  39.0

Requires Chatter
  No

Signature
  public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String repositoryId, String repositoryFolderId)
Parameters

repositoryId
Type: String
The ID of the repository.

repositoryFolderId
Type: String
The ID of the repository folder.

Return Value
Type: ConnectApi.ContentHubAllowedItemTypeCollection

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, result)

getAllowedItemTypes(repositoryId, repositoryFolderId, filter)
Get the item types, filtered by type, that the context user is allowed to create in the repository folder.

API Version
39.0

Requires Chatter
No

Signature
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String repositoryId, String repositoryFolderId, ConnectApi.ConnectContentHubItemType filter)

Parameters

repositoryId
Type: String
The ID of the repository.

repositoryFolderId
Type: String
The ID of the repository folder.
filter
Type: ConnectApi.ContentHubItemType
Item types. Values are:
• Any—Includes files and folders.
• FilesOnly—Includes files only.
• FoldersOnly—Includes folders only.

Return Value
Type: ConnectApi.ContentHubAllowedItemTypeCollection

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

Example
This example calls getAllowedItemTypes(repositoryId, repositoryFolderId, ConnectApi.ContentHubItemType.FilesOnly) to get the first ConnectApi.ContentHubItemTypeSummary.id of a file. The context user can create allowed files in a repository folder in the external system.

```java
final ConnectApi.ContentHubAllowedItemTypeCollection allowedItemTypesColl = ConnectApi.ContentHub.getAllowedItemTypes(repositoryId, repositoryFolderId, ConnectApi.ContentHubItemType.FilesOnly);
final List<ConnectApi.ContentHubItemTypeSummary> allowedItemTypes = allowedItemTypesColl.allowedItemTypes;
string allowedFileItemTypeIds = null;
if(allowedItemTypes.size() > 0){
    ConnectApi.ContentHubItemTypeSummary allowedItemTypeSummary = allowedItemTypes.get(0);
    allowedFileItemTypeIds = allowedItemTypeSummary.id;
}
```

SEE ALSO:
setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, filter, result)

getAllowedItemTypes(communityId, repositoryId, repositoryFolderId)
Get the item types that the context user is allowed to create in the repository folder in an Experience Cloud site.

API Version
39.0

Requires Chatter
No
**Signature**

```java
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String communityId, String repositoryId, String repositoryFolderId)
```

**Parameters**

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or null.

- **repositoryId**
  - Type: `String`
  - The ID of the repository.

- **repositoryFolderId**
  - Type: `String`
  - The ID of the repository folder.

**Return Value**

Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

**Usage**

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**SEE ALSO:**

- `setTestGetAllowedItemTypes(communityId, repositoryId, repositoryFolderId, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

**getAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter)**

Get the item types, filtered by type, that the context user is allowed to create in the repository folder in an Experience Cloud site.

**API Version**

39.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String communityId, String repositoryId, String repositoryFolderId, ConnectApi.ConnectContentHubItemType filter)
```
Parameters

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **repositoryId**
  - Type: String
  - The ID of the repository.

- **repositoryFolderId**
  - Type: String
  - The ID of the repository folder.

- **filter**
  - Type: ConnectApi.ContentHubItemType
  - Item types. Values are:
    - **Any**—Includes files and folders.
    - **FilesOnly**—Includes files only.
    - **FoldersOnly**—Includes folders only.

Return Value

Type: ConnectApi.ContentHubAllowedItemTypeCollection

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestGetAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

**getFilePreview(repositoryId, repositoryFileId, formatType)**

Get a repository file preview.

API Version

39.0

Requires Chatter

No

Signature

```java
public static ConnectApi.FilePreview getFilePreview(String repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType)
```
Parameters

repositoryId
Type: String
The ID of the repository.

repositoryFileId
Type: String
The ID of the repository file.

formatType
Type: ConnectApi.FilePreviewFormat
Specifies the format of the file preview. Values are:

- Jpg—Preview format is JPG.
- Pdf—Preview format is PDF.
- Svg—Preview format is compressed SVG.
- Thumbnail—Preview format is 240 x 180 PNG.
- ThumbnailBig—Preview format is 720 x 480 PNG.
- ThumbnailTiny—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you’re concerned that feature-rich SVG previews don’t work in your org, choose alternative file previews. To use JPG file previews, enter general in the Quick Find box in Setup. Select General Settings, and then select Display alternative file previews.

Return Value
Type: ConnectApi.FilePreview

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

Example
This example calls getFilePreview(repositoryId, repositoryFileId, ConnectApi.FilePreviewFormat.Thumbnail) to get the thumbnail format preview along with its respective URL and number of thumbnail renditions. For each thumbnail format, we show every rendition URL available.

```java
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId = 'document:1-zcAlBaecQbo2_yNF1HCCk6QJTPmOke4KHFC4TY3rk';final ConnectApi.FilePreview filePreview = ConnectApi.ContentHub.getFilePreview(gDriveRepositoryId, gDriveFileId, ConnectApi.FilePreviewFormat.Thumbnail);System.debug(String.format('Preview - URL: \\
"\"{0}\\", format: \\
"\"{1}\\", nbr of \nrenditions for this format: {2}\n', new String[]{ filePreview.url, filePreview.format.name(),String.valueOf(filePreview.previewUrls.size())});for (ConnectApi.FilePreviewUrl filePreviewUrl : filePreview.previewUrls){
```

1156
SEE ALSO:
   setTestGetFilePreview(repositoryId, repositoryFileId, formatType, result)

getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)
Get a page or page range of a repository file preview.

API Version
39.0

Requires Chatter
No

Signature
public static ConnectApi.FilePreview getFilePreview(String repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType, Integer startPageNumber, Integer endPageNumber)

Parameters
repositoryId
Type: String
The ID of the repository.

repositoryFileId
Type: String
The ID of the repository file.

formatType
Type: ConnectApi.FilePreviewFormat
Specifies the format of the file preview. Values are:
• Jpg—Preview format is JPG.
• Pdf—Preview format is PDF.
• Svg—Preview format is compressed SVG.
• Thumbnail—Preview format is 240 x 180 PNG.
• ThumbnailBig—Preview format is 720 x 480 PNG.
• ThumbnailTiny—Preview format is 120 x 90 PNG.
PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.
If you’re concerned that feature-rich SVG previews don’t work in your org, choose alternative file previews. To use JPG file previews, enter `general` in the Quick Find box in Setup. Select General Settings, and then select Display alternative file previews.

**startPageNumber**
Type: Integer
The starting page number in the range of file preview URLs.

**endPageNumber**
Type: Integer
The ending page number in the range of file preview URLs.

**Return Value**
Type: `ConnectApi.FilePreview`

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
`setTestGetFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber, result)`

getFilePreview(communityId, repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)
Get a page or page range of a repository file preview in an Experience Cloud site.

API Version
39.0

Requires Chatter
No
## Signature

```java
public static ConnectApi.FilePreview getFilePreview(String communityId, String repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType, Integer startPageNumber, Integer endPageNumber)
```

## Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **repositoryId**
  - Type: `String`
  - The ID of the repository.

- **repositoryFileId**
  - Type: `String`
  - The ID of the repository file.

- **formatType**
  - Type: `ConnectApi.FilePreviewFormat`
  - Specifies the format of the file preview. Values are:
    - `Jpg`—Preview format is JPG.
    - `Pdf`—Preview format is PDF.
    - `Svg`—Preview format is compressed SVG.
    - `Thumbnail`—Preview format is 240 x 180 PNG.
    - `ThumbnailBig`—Preview format is 720 x 480 PNG.
    - `ThumbnailTiny`—Preview format is 120 x 90 PNG.

  PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

  If you’re concerned that feature-rich SVG previews don’t work in your org, choose alternative file previews. To use JPG file previews, enter `general` in the Quick Find box in Setup. Select General Settings, and then select Display alternative file previews.

- **startPageNumber**
  - Type: `Integer`
  - The starting page number in the range of file preview URLs.

- **endPageNumber**
  - Type: `Integer`
  - The ending page number in the range of file preview URLs.

## Return Value

Type: `ConnectApi.FilePreview`
Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestGetFilePreview(communityId, repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber, result)`

getItemType(repositoryId, repositoryItemTypeId)
Get information about an item type associated with a repository.

API Version
39.0

Requires Chatter
No

Signature
```
public static ConnectApi.ContentHubItemTypeDetail getItemType(String repositoryId, String repositoryItemTypeId)
```

Parameters
- `repositoryId`
  Type: `String`
  The ID of the repository.
- `repositoryItemTypeId`
  Type: `String`
  The ID of the repository item type.

Return Value
Type: `ConnectApi.ContentHubItemTypeDetail`

Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestGetItemType(repositoryId, repositoryItemTypeId, result)`
**getItemType(communityId, repositoryId, repositoryItemTypeId)**
Get information about an item type associated with a repository in an Experience Cloud site.

**API Version**
39.0

**Requires Chatter**
No

**Signature**
```java
public static ConnectApi.ContentHubItemTypeDetail getItemType(String communityId, String repositoryId, String repositoryItemTypeId)
```

**Parameters**
- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.
- **repositoryId**
  - Type: String
  - The ID of the repository.
- **repositoryItemTypeId**
  - Type: String
  - The ID of the repository item type.

**Return Value**
Type: `ConnectApi.ContentHubItemTypeDetail`

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestGetItemType(communityId, repositoryId, repositoryItemTypeId, result)`

**getPreviews(repositoryId, repositoryFileId)**
Get information about a repository file’s supported previews.
API Version
39.0

Requires Chatter
No

Signature
public static ConnectApi.FilePreviewCollection getPreviews(String repositoryId, String repositoryFileId)

Parameters
repositoryId
Type: String
The ID of the repository.
repositoryFileId
Type: String
The ID of the repository file.

Return Value
Type: ConnectApi.FilePreviewCollection

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

Example
This example gets all supported preview formats and their respective URLs and number of renditions. For each supported preview format, we show every rendition URL available.

```
f finally gDriveRepositoryId = '0Xcxx00000000ODGAY', gDriveFileId =
'document:1-zca1BaeoQbo2_yNFiHCcK6QJTPmOke-kHFC4TYg3r5';
final ConnectApi.ContentHub.getPreviews(gDriveRepositoryId, gDriveFileId);
for (ConnectApi.FilePreview filePreview : previewsCollection.previews)
{ System.debug(String.format('Preview - URL: \'{0}\', format: \'{1}\', nbr of
renditions for this format: {2}', new String[]{ filePreview.url,
filePreview.format.name(),String.valueOf(filePreview.previewUrls.size())}));
    for (ConnectApi.FilePreviewUrl filePreviewUrl : filePreview.previewUrls)
    { System.debug('-----> Rendition URL: ' + filePreviewUrl.previewUrl);
```
SEE ALSO:
    setTestGetPreviews(repositoryId, repositoryFileId, result)

getPreviews(communityId, repositoryId, repositoryFileId)
Get information about a repository file’s supported previews in an Experience Cloud site.

API Version
39.0

Requires Chatter
No

Signature
public static ConnectApi.FilePreviewCollection getPreviews(String communityId, String repositoryId, String repositoryFileId)

Parameters
communityId
    Type: String
    ID for an Experience Cloud site, internal, or null.
repositoryId
    Type: String
    The ID of the repository.
repositoryFileId
    Type: String
    The ID of the repository file.

Return Value
Type: ConnectApi.FilePreviewCollection
Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestGetPreviews(communityId, repositoryId, repositoryFileId, result)`

**getRepositories()**

Get a list of repositories.

API Version

39.0

Requires Chatter

No

Signature

```java
public static ConnectApi.ContentHubRepositoryCollection getRepositories()
```

Return Value

Type: `ConnectApi.ContentHubRepositoryCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

Example gets all repositories and gets the first SharePoint online repository found.

```java
final string sharePointOnlineProviderType = 'ContentHubSharepointOffice365';
final ConnectApi.ContentHubRepositoryCollection repositoryCollection = ConnectApi.ContentHub.getRepositories();
ConnectApi.ContentHubRepository sharePointOnlineRepository = null;
for (ConnectApi.ContentHubRepository repository : repositoryCollection.repositories){
    if(sharePointOnlineProviderType.equalsIgnoreCase(repository.providerType.type)){
        sharePointOnlineRepository = repository;
        break;
    }
```
getRepositories(communityId)
Get a list of repositories in an Experience Cloud site.

API Version
39.0

Requires Chatter
No

Signature
public static ConnectApi.ContentHubRepositoryCollection getRepositories(String communityId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

Return Value
Type: ConnectApi.ContentHubRepositoryCollection

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetRepositories(communityId, result)

getRepositories(pageParam, pageSize)
Get a page of repositories.
API Version
39.0

Requires Chatter
No

Signature
public static ConnectApi.ContentHubRepositoryCollection getRepositories(Integer pageParam, Integer pageSize)

Parameters
pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default page size is 25.

Return Value
Type: ConnectApi.ContentHubRepositoryCollection

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetRepositories(pageParam, pageSize, result)

getRepositories(communityId, pageParam, pageSize)
Get a page of repositories in an Experience Cloud site.

API Version
39.0

Requires Chatter
No
Signature

```java
public static ConnectApi.ContentHubRepositoryCollection getRepositories(String communityId, Integer pageParam, Integer pageSize)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **pageParam**
  - Type: `Integer`
  - Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

- **pageSize**
  - Type: `Integer`
  - Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

Return Value

Type: `ConnectApi.ContentHubRepositoryCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestGetRepositories(communityId, pageParam, pageSize, result)`

### getRepository (repositoryId)

Get a repository.

API Version

369.0

Requires Chatter

No

Signature

```java
public static ConnectApi.ContentHubRepository getRepository(String repositoryId)
```
Parameters
repositoryId
Type: String
The ID of the repository.

Return Value
Type: ConnectApi.ContentHubRepository

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

Example
```
final string repositoryId = '0XCxx0000000123GAA';
final ConnectApi.ContentHubRepository repository = ConnectApi.ContentHub.getRepository(repositoryId);
```

SEE ALSO:
setTestGetRepository(repositoryId, result)

getRepository(communityId, repositoryId)
Get a repository in an Experience Cloud site.

API Version
39.0

Requires Chatter
No

Signature
```
public static ConnectApi.ContentHubRepository getRepository(String communityId, String repositoryId)
```

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

repositoryId
Type: String
The ID of the repository.

**Return Value**
Type: `ConnectApi.ContentHubRepository`

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestGetRepository(communityId, repositoryId, result)`
  *Apex Developer Guide: Testing ConnectApi Code*

**getRepositoryFile** *(repositoryId, repositoryFileId)*
Get a repository file.

**API Version**
39.0

**Requires Chatter**
No

**Signature**

```java
public static ConnectApi.RepositoryFileDetail getRepositoryFile(String repositoryId, String repositoryFileId)
```

**Parameters**

- **repositoryId**
  Type: `String`  
The ID of the repository.

- **repositoryFileId**
  Type: `String`  
The ID of the repository file.

**Return Value**
Type: `ConnectApi.RepositoryFileDetail`

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.
Example

```java
final String gDriveRepositoryId = '0XCxx100000000ODGAY', gDriveFileId = 'file:0B01Tys1KmM3sTmxKNjVJbWZja00';
final ConnectApi.RepositoryFileDetail file = ConnectApi.ContentHub.getRepositoryFile(gDriveRepositoryId, gDriveFileId);
System.debug(String.format('File - name: \'{0}\', size: {1}, external URL: \'{2}\',
  download URL: \'{3}\',
  new String[]{ file.name, String.valueOf(file.contentSize), file.externalDocumentUrl,
  file.downloadUrl});
```

SEE ALSO:

- `setTestGetRepositoryFile(repositoryId, repositoryFileId, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

### getRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)

Get a repository file with or without permissions information.

#### API Version

39.0

#### Requires Chatter

No

#### Signature

```java
public static ConnectApi.RepositoryFileDetail getRepositoryFile(String repositoryId,
  String repositoryFileId, Boolean includeExternalFilePermissionsInfo)
```

#### Parameters

- **repositoryId**
  - Type: `String`
  - The ID of the repository.

- **repositoryFileId**
  - Type: `String`
  - The ID of the repository file.

- **includeExternalFilePermissionsInfo**
  - Type: `Boolean`
  - Specifies whether to include permission information, such as whether the file is shared and what are the available permission types.

  Managing external file permissions is supported for Google Drive, SharePoint Online, and OneDrive for Business.
Return Value

Type: `ConnectApi.RepositoryFileDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

```java
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId = 'file:0B01Tys1KmM3sTmxKN5VJbWZja00';

final ConnectApi.RepositoryFileDetail file = 
    ConnectApi.ContentHub.getRepositoryFile(gDriveRepositoryId, gDriveFileId, true);
System.debug(String.format('File - name: ''{0}'', size: {1}, external URL: ''{2}'',
    download URL: ''{3}''', new String[]{ file.name, String.valueOf(file.contentSize),
    file.externalDocumentUrl, file.downloadUrl}));
final ConnectApi.ExternalFilePermissionInformation externalFilePermInfo =
    file.externalFilePermissionInformation;

//permission types
final List<ConnectApi.ContentHubPermissionType> permissionTypes =
    externalFilePermInfo.externalFilePermissionTypes;
for (ConnectApi.ContentHubPermissionType permissionType : permissionTypes){
    System.debug(String.format('Permission type - id: ''{0}'', label: ''{1}''', new String[]{
        permissionType.id, permissionType.label}));
}

//permission groups
final List<ConnectApi.RepositoryGroupSummary> groups =
    externalFilePermInfo.repositoryPublicGroups;
for (ConnectApi.RepositoryGroupSummary ggroup : groups){
    System.debug(String.format('Group - id: ''{0}'', name: ''{1}'', type:
        ''{2}''', new String[]{
            ggroup.id, ggroup.name, ggroup.type.name()}));
}
```

SEE ALSO:

- `setTestGetRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

`getRepositoryFile(communityId, repositoryId, repositoryFileId)`

Get a repository file in an Experience Cloud site.

API Version

39.0
Requires Chatter
No

Signature

public static ConnectApi.RepositoryFileDetail getRepositoryFile(String communityId, String repositoryId, String repositoryFileId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

repositoryId
Type: String
The ID of the repository.

repositoryFileId
Type: String
The ID of the repository file.

Return Value
Type: ConnectApi.RepositoryFileDetail

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetRepositoryFile(communityId, repositoryId, repositoryFileId, result)

getRepositoryFile(communityId, repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)
Get a repository file with or without permissions information in an Experience Cloud site.

API Version
39.0

Requires Chatter
No
Signature

```java
public static ConnectApi.RepositoryFileDetail getRepositoryFile(String communityId,
String repositoryId, String repositoryFileId, Boolean includeExternalFilePermissionsInfo)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.
- `repositoryId`
  - Type: `String`
  - The ID of the repository.
- `repositoryFileId`
  - Type: `String`
  - The ID of the repository file.
- `includeExternalFilePermissionsInfo`
  - Type: `Boolean`
  - Specifies whether to include permission information, such as whether the file is shared and what are the available permission types. Managing external file permissions is supported for Google Drive, SharePoint Online, and OneDrive for Business.

Return Value

Type: `ConnectApi.RepositoryFileDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestGetRepositoryFile(communityId, repositoryId, repositoryFileId, includeExternalFilePermissionsInfo, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

```
getRepositoryFolder(repositoryId, repositoryFolderId)
```

Get a repository folder.

API Version

39.0

Requires Chatter

No
Signature

```java
public static ConnectApi.RepositoryFolderDetail getRepositoryFolder(String repositoryId, String repositoryFolderId)
```

Parameters

- `repositoryId`
  - **Type:** String
  - The ID of the repository.

- `repositoryFolderId`
  - **Type:** String
  - The ID of the repository folder.

Return Value

- **Type:** `ConnectApi.RepositoryFolderDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

```java
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId = 'folder:0B0lTys1KmM3sSVJ2b1zTGFqSWs';
final ConnectApi.RepositoryFolderDetail folder = ConnectApi.ContentHub.getRepositoryFolder(gDriveRepositoryId, gDriveFolderId);
System.debug(String.format('Folder - name: \'{0}\', description: \'{1}\', external URL: \'{2}\', folder items URL: \'{3}\',
  new String[]{folder.name, folder.description, folder.externalFolderUrl, folder.folderItemsUrl}));
```

SEE ALSO:

- `setTestGetRepositoryFolder(repositoryId, repositoryFolderId, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

**getRepositoryFolder(communityId, repositoryId, repositoryFolderId)**

Get a repository folder in an Experience Cloud site.

**API Version**

39.0

**Requires Chatter**

No
Signature

public static ConnectApi.RepositoryFolderDetail getRepositoryFolder(String communityId, String repositoryId, String repositoryFolderId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

repositoryId
Type: String
The ID of the repository.

repositoryFolderId
Type: String
The ID of the repository folder.

Return Value
Type: ConnectApi.RepositoryFolderDetail

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetRepositoryFolder(communityId, repositoryId, repositoryFolderId, result)

getRepositoryFolderItems (repositoryId, repositoryFolderId)
Get repository folder items.

API Version
39.0

Requires Chatter
No

Signature

public static ConnectApi.RepositoryFolderItemsCollection getRepositoryFolderItems(String repositoryId, String repositoryFolderId)
Parameters

repositoryId
Type: String
The ID of the repository.

repositoryFolderId
Type: String
The ID of the repository folder.

Return Value
Type: ConnectApi.RepositoryFolderItemsCollection

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

Example
This example gets the collection of items in a repository folder. For files, we show the file's name, size, external URL, and download URL. For folders, we show the folder's name, description, and external URL.

```java
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId = 'folder:0B01Tys1KmM3sSVJ2bjIzTGElfSw';
final ConnectApi.ContentHub.getRepositoryFolderItems(gDriveRepositoryId, gDriveFolderId) folderItemsColl =
final List<ConnectApi.RepositoryFolderItem> folderItems = folderItemsColl.items;
System.debug('Number of items in repository folder: ' + folderItems.size());
for(ConnectApi.RepositoryFolderItem item : folderItems){
    ConnectApi.RepositoryFileSummary fileSummary = item.file;
    if(fileSummary != null){
    }else{
        ConnectApi.RepositoryFolderSummary folderSummary = item.folder;
        System.debug(String.format('Folder item - name: ' + folderSummary.name, 'description: ' + folderSummary.description));
    }
}
```

SEE ALSO:
setTestGetRepositoryFolderItems(repositoryId, repositoryFolderId, result)

getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId)
Get repository folder items in an Experience Cloud site.
API Version
39.0

Requires Chatter
No

Signature
public static ConnectApi.RepositoryFolderItemsCollection getRepositoryFolderItems(String communityId, String repositoryId, String repositoryFolderId)

Parameters
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.
repositoryId
  Type: String
  The ID of the repository.
repositoryFolderId
  Type: String
  The ID of the repository folder.

Return Value
Type: ConnectApi.RepositoryFolderItemsCollection

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, result)

getRepositoryFolderItems(repositoryId, repositoryFolderId, pageParam, pageSize)
Get a page of repository folder items.

API Version
39.0
Requires Chatter
No

Signature

```java
public static ConnectApi.RepositoryFolderItemsCollection getRepositoryFolderItems(String repositoryId, String repositoryFolderId, Integer pageParam, Integer pageSize)
```

Parameters

- `repositoryId`
  - Type: `String`
  - The ID of the repository.
- `repositoryFolderId`
  - Type: `String`
  - The ID of the repository folder.
- `pageParam`
  - Type: `Integer`
  - Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.
- `pageSize`
  - Type: `Integer`
  - Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

Return Value

Type: `ConnectApi.RepositoryFolderItemsCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestGetRepositoryFolderItems(repositoryId, repositoryFolderId, pageParam, pageSize, result)`

getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize)

Get a page of repository folder items in an Experience Cloud site.

API Version

39.0
Requires Chatter
No

Signature
public static ConnectApi.RepositoryFolderItemsCollection getRepositoryFolderItems(String communityId, String repositoryId, String repositoryFolderId, Integer pageParam, Integer pageSize)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.
repositoryId
Type: String
The ID of the repository.
repositoryFolderId
Type: String
The ID of the repository folder.
pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.
pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default page size is 25.

Return Value
Type: ConnectApi.RepositoryFolderItemsCollection

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize, result)

updateRepositoryFile(repositoryId, repositoryFileId, file)
Update the name of a repository file.
API Version
39.0

Requires Chatter
No

Signature
```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String repositoryId,
String repositoryFileId, ConnectApi.ContentHubItemInput file)
```

Parameters

repositoryId
Type: String
The ID of the repository.

repositoryFileId
Type: String
The ID of the repository file.

file
Type: ConnectApi.ContentHubItemInput
The item type ID and fields of the item type.
When updating the metadata of a repository file, only the name field can be updated.

Return Value
Type: ConnectApi.RepositoryFileDetail

Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example
This example updates the name of a file in a Google Drive repository. After the file is updated, we show the file’s ID, name, description, external URL, download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
  'folder:OBolTys1KmM3sSVJ2bjiItGFqSWs', gDriveFileId =
  'document:1q9OatVpcyYBR-JWzp_PhR75u1QghwFP15zhkamKrRcQ';

final ConnectApi.ContentHubItemInput updatedItem = new ConnectApi.ContentHubItemInput();
updatedItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
for creation/update
updatedItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
```
```
final ConnectApi.ContentHubFieldValueInput fieldValueInputName = new 
ConnectApi.ContentHubFieldValueInput();
fieldValueInputName.name = 'name';
fieldValueInputName.value = 'updated file name.txt';
updatedItem.fields.add(fieldValueInputName);

final ConnectApi.RepositoryFileDetail updatedFile = 
ConnectApi.ContentHub.updateRepositoryFile(gDriveRepositoryId, gDriveFileId, updatedItem);
System.debug(String.format('Updated file - id: \''{0}''', name: \''{1}''
, description:
\''{2}''
, external URL: \''{3}''
, download URL: \''{4}''
, new String[]{
updatedFile.id, updatedFile.name, updatedFile.description, updatedFile.externalDocumentUrl,
updatedFile.downloadUrl}}));
```

SEE ALSO:

`setTestUpdateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData, result)`

*Apex Developer Guide: Testing ConnectApi Code*

**updateRepositoryFile(repositoryId, repositoryFileId, file, fileData)**

Update the content of a repository file.

**API Version**

39.0

**Requires Chatter**

No

**Signature**

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String repositoryId,
String repositoryFileId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput
fileData)
```

**Parameters**

**repositoryId**

Type: `String`

The ID of the repository.

**repositoryFileId**

Type: `String`

The ID of the repository file.

**file**

Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

When updating the metadata of a repository file, only the name field can be updated.
**fileData**

Type: `ConnectApi.BinaryInput`

The binary file.

### Return Value

Type: `ConnectApi.RepositoryFileDetail`

### Usage

To test code that uses this method, use the matching `setTest` method (prefix the method name with `setTest`). Use the `setTest` method with the same parameters or the code throws an exception.

### Example

This example updates the content and name of a file in a Google Drive repository. After the file is updated, we show the file's ID, name, description, external URL, and download URL.

```java
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId = 'folder:0B0lTys1KmM3sSVJ2bjIzTGFSWw', gDriveFileId = 'document:1q9OatVpcyYBK-JWzp_Phr75ulQghwFP15zhkamKzRcQ';

final ConnectApi.ContentHubItemInput updatedItem = new ConnectApi.ContentHubItemInput();
updatedItem.itemTypeId = 'document'; // see getAllowedTypes for any file item types available for creation/update
updatedItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
final ConnectApi.ContentHubFieldValueInput fieldValueInputName = new ConnectApi.ContentHubFieldValueInput();
fieldValueInputName.name = 'name';
fieldValueInputName.value = 'updated file name.txt';
updatedItem.fields.add(fieldValueInputName);

//Binary content
final Blob updatedFileBlob = Blob.valueOf('even more awesome content for updated file');
final String updatedFileMimeType = 'text/plain';
final ConnectApi.BinaryInput fileBinaryInput = new ConnectApi.BinaryInput(updatedFileBlob, updatedFileMimeType, updatedFileName);
final ConnectApi.RepositoryFileDetail updatedFile = ConnectApi.ContentHub.updateRepositoryFile(gDriveRepositoryId, gDriveFileId, updatedItem);
System.debug(String.format('Updated file - id: \''{0}''\n, name: \''{1}''\n, description: \''{2}''\n, external URL: \''{3}''\n, download URL: \''{4}''\n, new String[]{updatedFile.id, updatedFile.name, updatedFile.description, updatedFile.externalDocumentUrl, updatedFile.downloadUrl}));
```

**SEE ALSO:**

- `setTestUpdateRepositoryFile(repositoryId, repositoryFileId, file, result)`
- *Apex Developer Guide: Testing ConnectApi Code*
updateRepositoryFile(communityId, repositoryId, repositoryFileId, file)

Update the name of a repository file in an Experience Cloud site.

API Version
39.0

Requires Chatter
No

Signature
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String communityId, String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

repositoryId
Type: String
The ID of the repository.

repositoryFileId
Type: String
The ID of the repository file.

file
Type: ConnectApi.ContentHubItemInput
The item type ID and fields of the item type.

When updating the metadata of a repository file, only the name field can be updated.

Return Value
Type: ConnectApi.RepositoryFileDetail

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestUpdateRepositoryFile(repositoryId, repositoryFileId, file, fileData, result)

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData)

Update the content of a repository file in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String communityId, String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput fileData)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

repositoryId
Type: String
The ID of the repository.

repositoryFileId
Type: String
The ID of the repository file.

file
Type: ConnectApi.ContentHubItemInput
The item type ID and fields of the item type.
When updating the metadata of a repository file, only the name field can be updated.

fileData
Type: ConnectApi.BinaryInput
The binary file.

Return Value

Type: ConnectApi.RepositoryFileDetail
Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestUpdateRepositoryFile(communityId, repositoryId, repositoryFileId, file, result)

ContentHub Test Methods
The following are the test methods for ContentHub. All methods are static.
For information about using these methods to test your ConnectApi code, see Testing ConnectApi Code.

setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, result)
Register a ConnectApi.RepositoryFolderItem object to be returned when the matching
addRepositoryItem(repositoryId, repositoryFolderId, file) method is called in a test context. Use the
method with the same parameters or you receive an exception.

API Version
40.0

Signature
public static Void setTestAddRepositoryItem(String repositoryId, String
repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.RepositoryFolderItem
result)

Parameters
repositoryId
Type: String
The ID of the repository.
repositoryFolderId
Type: String
The ID of the repository folder.
file
Type: ConnectApi.ContentHubItemInput
The item type ID and fields of the item type.
result
Type: ConnectApi.RepositoryFolderItem
Object containing test data.
Return Value
Type: Void

SEE ALSO:
addRepositoryItem(repositoryId, repositoryFolderId, file)
*Apex Developer Guide: Testing ConnectApi Code*

**setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, result)**

Register a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
40.0

**Signature**
```java
public static Void setTestAddRepositoryItem(String communityId, String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.RepositoryFolderItem result)
```

**Parameters**
- `communityId`
  - **Type:** String
  - ID for an Experience Cloud site, internal, or null.

- `repositoryId`
  - **Type:** String
  - The ID of the repository.

- `repositoryFolderId`
  - **Type:** String
  - The ID of the repository folder.

- `file`
  - **Type:** `ConnectApi.ContentHubItemInput`
  - The item type ID and fields of the item type.

- `result`
  - **Type:** `ConnectApi.RepositoryFolderItem`
  - Object containing test data.
Return Value
Type: Void

SEE ALSO:
  - addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)
  - *Apex Developer Guide: Testing ConnectApi Code*

```java
setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, fileData, result)
```

Register a `ConnectApi.RepositoryFolderItem` object to be returned when the matching
`addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)` method is called in a test
context. Use the method with the same parameters or you receive an exception.

API Version
40.0

Signature
```
public static Void setTestAddRepositoryItem(String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput fileData, ConnectApi.RepositoryFolderItem result)
```

Parameters
```
repositoryId
  Type: String
  The ID of the repository.
repositoryFolderId
  Type: String
  The ID of the repository folder.

file
  Type: ConnectApi.ContentHubItemInput
  The item type ID and fields of the item type.

fileData
  Type: ConnectApi.BinaryInput
  The binary file.

result
  Type: ConnectApi.RepositoryFolderItem
  Object containing test data.
```
Return Value
Type: Void

SEE ALSO:
addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)

**setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData, result)**

Register a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**
40.0

**Signature**
```java
public static Void setTestAddRepositoryItem(String communityId, String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput fileData, ConnectApi.RepositoryFolderItem result)
```

**Parameters**
- **communityId**
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.
- **repositoryId**
  Type: `String`
  The ID of the repository.
- **repositoryFolderId**
  Type: `String`
  The ID of the repository folder.
- **file**
  Type: `ConnectApi.ContentHubItemInput`
  The item type ID and fields of the item type.
- **fileData**
  Type: `ConnectApi.BinaryInput`
  The binary file.
- **result**
  Type: `ConnectApi.RepositoryFolderItem`
  Object containing test data.
Return Value
Type: Void

SEE ALSO:
- addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)
  *Apex Developer Guide: Testing ConnectApi Code*

**setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, result)**

Register a `ConnectApi.ContentHubAllowedItemTypeCollection` object to be returned when the matching `getAllowedItemTypes(repositoryId, repositoryFolderId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

40.0

**Signature**

```java
public static Void setTestGetAllowedItemTypes(String repositoryId, String repositoryFolderId, ConnectApi.ContentHubAllowedItemTypeCollection result)
```

**Parameters**

- `repositoryId`
  Type: `String`
  The ID of the repository.

- `repositoryFolderId`
  Type: `String`
  The ID of the repository folder.

- `result`
  Type: `ConnectApi.ContentHubAllowedItemTypeCollection`
  Object containing test data.

**Return Value**

Type: Void

SEE ALSO:
- `getAllowedItemTypes(repositoryId, repositoryFolderId)`
  *Apex Developer Guide: Testing ConnectApi Code*
setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, filter, result)

Register a ConnectApi.ContentHubAllowedItemTypeCollection object to be returned when the matching getAllowedItemTypes(repositoryId, repositoryFolderId, filter) method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

public static Void setTestGetAllowedItemTypes(String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemType filter, ConnectApi.ContentHubAllowedItemTypeCollection result)

Parameters

repositoryId
Type: String
The ID of the repository.

repositoryFolderId
Type: String
The ID of the repository folder.

filter
Type: ConnectApi.ContentHubItemType
Item types. Values are:
• Any—Includes files and folders.
• FilesOnly—Includes files only.
• FoldersOnly—Includes folders only.

result
Type: ConnectApi.ContentHubAllowedItemTypeCollection
Object containing test data.

Return Value

Type: Void

SEE ALSO:

getAllowedItemTypes(repositoryId, repositoryFolderId, filter)

**setTestGetAllowedItemTypes(communityId, repositoryId, repositoryFolderId, result)**

Register a `ConnectApi.ContentHubAllowedItemTypeCollection` object to be returned when the matching `getAllowedItemTypes(communityId, repositoryId, repositoryFolderId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

40.0

**Signature**

```java
public static Void setTestGetAllowedItemTypes(String communityId, String repositoryId, String repositoryFolderId, ConnectApi.ContentHubAllowedItemTypeCollection result)
```

**Parameters**

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.
- **repositoryId**
  - Type: `String`
  - The ID of the repository.
- **repositoryFolderId**
  - Type: `String`
  - The ID of the repository folder.
- **result**
  - Type: `ConnectApi.ContentHubAllowedItemTypeCollection`
  - Object containing test data.

**Return Value**

Type: `Void`

**SEE ALSO:**

- `getAllowedItemTypes(communityId, repositoryId, repositoryFolderId)`
- *Apex Developer Guide: Testing ConnectApi Code*

**setTestGetAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter, result)**

Register a `ConnectApi.ContentHubAllowedItemTypeCollection` object to be returned when the matching `getAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter)` method is called in a test context. Use the method with the same parameters or you receive an exception.
API Version
40.0

Signature
public static Void setTestGetAllowedItemTypes(String communityId, String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemType filter, ConnectApi.ContentHubAllowedItemTypeCollection result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.
repositoryId
Type: String
The ID of the repository.
repositoryFolderId
Type: String
The ID of the repository folder.
filter
Type: ConnectApi.ContentHubItemType
Item types. Values are:
• Any—Includes files and folders.
• FilesOnly—Includes files only.
• FoldersOnly—Includes folders only.
result
Type: ConnectApi.ContentHubAllowedItemTypeCollection
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter)

setTestGetFilePreview(repositoryId, repositoryFileId, formatType, result)
Register a ConnectApi.FilePreview object to be returned when the matching getFilePreview(repositoryId, repositoryFileId, formatType) method is called in a test context. Use the method with the same parameters or you receive an exception.
API Version
40.0

Signature
public static Void setTestGetFilePreview(String repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType, ConnectApi.FilePreview result)

Parameters
repositoryId
type: String
The ID of the repository.

repositoryFileId
type: String
The ID of the repository file.

formatType
type: ConnectApi.FilePreviewFormat
Specifies the format of the file preview. Values are:
- Jpg—Preview format is JPG.
- Pdf—Preview format is PDF.
- Svg—Preview format is compressed SVG.
- Thumbnail—Preview format is 240 x 180 PNG.
- ThumbnailBig—Preview format is 720 x 480 PNG.
- ThumbnailTiny—Preview format is 120 x 90 PNG.
PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you’re concerned that feature-rich SVG previews don’t work in your org, choose alternative file previews. To use JPG file previews, enter general in the Quick Find box in Setup. Select General Settings, and then select Display alternative file previews.

result
type: ConnectApi.FilePreview
Object containing test data.

Return Value
Type: Void

SEE ALSO:
- getFilePreview(repositoryId, repositoryFileId, formatType)
setTestGetFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber, result)

Register a ConnectApi.FilePreview object to be returned when the matching getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber) method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

public static Void setTestGetFilePreview(String repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType, Integer startPageNumber, Integer endPageNumber, ConnectApi.FilePreview result)

Parameters

repositoryId
Type: String
The ID of the repository.

repositoryFileId
Type: String
The ID of the repository file.

formatType
Type: ConnectApi.FilePreviewFormat
Specifies the format of the file preview. Values are:
- Jpg—Preview format is JPG.
- Pdf—Preview format is PDF.
- Svg—Preview format is compressed SVG.
- Thumbnail—Preview format is 240 x 180 PNG.
- ThumbnailBig—Preview format is 720 x 480 PNG.
- ThumbnailTiny—Preview format is 120 x 90 PNG.
PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.
If you’re concerned that feature-rich SVG previews don’t work in your org, choose alternative file previews. To use JPG file previews, enter general in the Quick Find box in Setup. Select General Settings, and then select Display alternative file previews.

startPageNumber
Type: Integer
The starting page number in the range of file preview URLs.

endPageNumber
Type: Integer
The ending page number in the range of file preview URLs.
result
   Type: `ConnectApi.FilePreview`
   Object containing test data.

Return Value
Type: Void

SEE ALSO:
   `getFilePreview(communityId, repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)`
   *Apex Developer Guide: Testing ConnectApi Code*

`setTestGetFilePreview(communityId, repositoryId, repositoryFileId, formatType, result)`

Register a `ConnectApi.FilePreview` object to be returned when the matching `getFilePreview(communityId, repositoryId, repositoryFileId, formatType)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
40.0

Signature

```java
public static Void setTestGetFilePreview(String communityId, String repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType, ConnectApi.FilePreview result)
```

Parameters

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or null.

- `repositoryId`
  Type: `String`
  The ID of the repository.

- `repositoryFileId`
  Type: `String`
  The ID of the repository file.

- `formatType`
  Type: `ConnectApi.FilePreviewFormat`
  Specifies the format of the file preview. Values are:
  - `Jpg`—Preview format is JPG.
  - `Pdf`—Preview format is PDF.
• **Svg**—Preview format is compressed SVG.
• **Thumbnail**—Preview format is 240 x 180 PNG.
• **ThumbnailBig**—Preview format is 720 x 480 PNG.
• **ThumbnailTiny**—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you’re concerned that feature-rich SVG previews don’t work in your org, choose alternative file previews. To use JPG file previews, enter `general` in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.

**result**
- Type: `ConnectApi.FilePreview`
- Object containing test data.

**Return Value**
- Type: Void

**SEE ALSO:**
- `getFilePreview(communityId, repositoryId, repositoryFileId, formatType)`
- *Apex Developer Guide: Testing ConnectApi Code*

```java
setTestGetFilePreview(communityId, repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber, result)
```

Register a `ConnectApi.FilePreview` object to be returned when the matching `getFilePreview(communityId, repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**
- 40.0

**Signature**

```java
public static Void setTestGetFilePreview(String communityId, String repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType, Integer startPageNumber, Integer endPageNumber, ConnectApi.FilePreview result)
```

**Parameters**

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **repositoryId**
  - Type: `String`
  - The ID of the repository.
repositoryFileId
   Type: String
   The ID of the repository file.

formatType
   Type: ConnectApi.FilePreviewFormat
   Specifies the format of the file preview. Values are:
   • Jpg—Preview format is JPG.
   • Pdf—Preview format is PDF.
   • Svg—Preview format is compressed SVG.
   • Thumbnail—Preview format is 240 x 180 PNG.
   • ThumbnailBig—Preview format is 720 x 480 PNG.
   • ThumbnailTiny—Preview format is 120 x 90 PNG.
   PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.
   If you’re concerned that feature-rich SVG previews don’t work in your org, choose alternative file previews. To use JPG file previews, enter general in the Quick Find box in Setup. Select General Settings, and then select Display alternative file previews.

startPageNumber
   Type: Integer
   The starting page number in the range of file preview URLs.

d_endPageNumber
   Type: Integer
   The ending page number in the range of file preview URLs.

result
   Type: ConnectApi.FilePreview
   Object containing test data.

Return Value
   Type: Void

SEE ALSO:
   getFilePreview(communityId, repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)

setTestGetType(repositoryId, repositoryItemType, result)
   Register a ConnectApi.ContentHubItemTypeDetail object to be returned when the matching
   getItemType(repositoryId, repositoryItemType) method is called in a test context. Use the method with the
   same parameters or you receive an exception.

API Version
   40.0
Signature

```java
public static Void setTestGetItemType(String repositoryId, String repositoryItemTypeId, ConnectApi.ContentHubItemTypeDetail result)
```

Parameters

- `repositoryId`
  Type: String
  The ID of the repository.

- `repositoryItemTypeId`
  Type: String
  The ID of the repository item type.

- `result`
  Type: `ConnectApi.ContentHubItemTypeDetail`
  Object containing test data.

Return Value

Type: Void

SEE ALSO:

- `getItemType(repositoryId, repositoryItemTypeId)`
- **Apex Developer Guide: Testing ConnectApi Code**

### setTestGetItemType(communityId, repositoryId, repositoryItemTypeId, result)

Register a `ConnectApi.ContentHubItemTypeDetail` object to be returned when the matching `getItemType(communityId, repositoryId, repositoryItemTypeId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```java
public static Void setTestGetItemType(String communityId, String repositoryId, String repositoryItemTypeId, ConnectApi.ContentHubItemTypeDetail result)
```

Parameters

- `communityId`
  Type: String
  ID for an Experience Cloud site, internal, or `null`.

- `repositoryId`
  Type: String
The ID of the repository.
repositoryItemTypeId
Type: String
The ID of the repository item type.
result
Type: ConnectApi.ContentHubItemTypeDetail
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getItemType(communityId, repositoryId, repositoryItemTypeId)

setTestGetPreviews(repositoryId, repositoryFileId, result)
Register a ConnectApi.FilePreviewCollection object to be returned when the matching
getPreviews(repositoryId, repositoryFileId) method is called in a test context. Use the method with the same
parameters or you receive an exception.

API Version
40.0

Signature
public static Void setTestGetPreviews(String repositoryId, String repositoryFileId,
ConnectApi.FilePreviewCollection result)

Parameters
repositoryId
Type: String
The ID of the repository.
repositoryFileId
Type: String
The ID of the repository file.
result
Type: ConnectApi.FilePreviewCollection
Object containing test data.
Return Value
Type: Void

SEE ALSO:
getPreviews(repositoryId, repositoryFileId)

**setTestGetPreviews(communityId, repositoryId, repositoryFileId, result)**

Register a `ConnectApi.FilePreviewCollection` object to be returned when the matching `getPreviews(communityId, repositoryId, repositoryFileId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
40.0

Signature

```java
public static Void setTestGetPreviews(String communityId, String repositoryId, String repositoryFileId, ConnectApi.FilePreviewCollection result)
```

Parameters

- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or null.

- **repositoryId**
  Type: String
  The ID of the repository.

- **repositoryFileId**
  Type: String
  The ID of the repository file.

- **result**
  Type: `ConnectApi.FilePreviewCollection`
  Object containing test data.

Return Value
Type: Void

SEE ALSO:
getPreviews(communityId, repositoryId, repositoryFileId)
**setTestGetRepositories (result)**

Register a `ConnectApi.ContentHubRepositoryCollection` object to be returned when the matching `getRepositories()` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

40.0

**Signature**

```java
public static Void setTestGetRepositories(ConnectApi.ContentHubRepositoryCollection result)
```

**Parameters**

- `result`
  - Type: `ConnectApi.ContentHubRepositoryCollection`
  - Object containing test data.

**Return Value**

Type: Void

**SEE ALSO:**
- `getRepositories()`
- *Apex Developer Guide: Testing ConnectApi Code*

**setTestGetRepositories (communityId, result)**

Register a `getRepositories(communityId)` object to be returned when the matching `ConnectApi.ContentHubRepositoryCollection` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

40.0

**Signature**

```java
public static Void setTestGetRepositories(String communityId, ConnectApi.ContentHubRepositoryCollection result)
```

**Parameters**

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, `internal`, or `null`.
result
   Type: ConnectApi.ContentHubRepositoryCollection
   Object containing test data.

Return Value
Type: Void

SEE ALSO:
   getRepositories(communityId)

setTestGetRepositories(pageParam, pageSize, result)
Register a ConnectApi.ContentHubRepositoryCollection object to be returned when the matching getRepositories(pageParam, pageSize) method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
40.0

Signature
public static Void setTestGetRepositories(Integer pageParam, Integer pageSize, ConnectApi.ContentHubRepositoryCollection result)

Parameters
pageParam
   Type: Integer
   Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
   Type: Integer
   Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default page size is 25.

result
   Type: ConnectApi.ContentHubRepositoryCollection
   Object containing test data.

Return Value
Type: Void

SEE ALSO:
   getRepositories(pageParam, pageSize)
**setTestGetRepositories(communityId, pageParam, pageSize, result)**

Register a `ConnectApi.ContentHubRepositoryCollection` object to be returned when the matching `getRepositories(communityId, pageParam, pageSize)` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

40.0

**Signature**

```java
public static Void setTestGetRepositories(String communityId, Integer pageParam, Integer pageSize, ConnectApi.ContentHubRepositoryCollection result)
```

**Parameters**

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, `internal`, or `null`.

- **pageParam**
  - Type: `Integer`
  - Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

- **pageSize**
  - Type: `Integer`
  - Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

- **result**
  - Type: `ConnectApi.ContentHubRepositoryCollection`
  - Object containing test data.

**Return Value**

Type: Void

**SEE ALSO:**

- `getRepositories(communityId, pageParam, pageSize)`
- *Apex Developer Guide: Testing ConnectApi Code*

**setTestGetRepository(repositoryId, result)**

Register a `ConnectApi.ContentHubRepository` object to be returned when the matching `getRepository(repositoryId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

40.0
Signature

```java
public static Void setTestGetRepository(String repositoryId, ConnectApi.ContentHubRepository result)
```

Parameters

- `repositoryId`  
  Type: `String`  
  The ID of the repository.

- `result`  
  Type: `ConnectApi.ContentHubRepository`  
  Object containing test data.

Return Value

Type: Void

SEE ALSO:

- `getRepository(repositoryId)`

**setTestGetRepository(communityId, repositoryId, result)**

Register a `ConnectApi.ContentHubRepository` object to be returned when the matching `getRepository(communityId, repositoryId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```java
public static Void setTestGetRepository(String communityId, String repositoryId, ConnectApi.ContentHubRepository result)
```

Parameters

- `communityId`  
  Type: `String`  
  ID for an Experience Cloud site, internal, or null.

- `repositoryId`  
  Type: `String`  
  The ID of the repository.

- `result`  
  Type: `ConnectApi.ContentHubRepository`
setTestGetRepositoryFile(repositoryId, repositoryFileId, result)

Register a ConnectApi.RepositoryFileDetail object to be returned when the matching getRepositoryFile(repositoryId, repositoryFileId) method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
40.0

Signature
public static Void setTestGetRepositoryFile(String repositoryId, String repositoryFileId, ConnectApi.RepositoryFileDetail result)

Parameters
repositoryId
Type: String
The ID of the repository.
repositoryFileId
Type: String
The ID of the repository file.
result
Type: ConnectApi.RepositoryFileDetail
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getRepository(communityId, repositoryId)
**setTestGetRepositoryFile***(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo, result)***

Register a ConnectApi.RepositoryFileDetail object to be returned when the matching getRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo) method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

40.0

**Signature**

```
public static Void setTestGetRepositoryFile(String repositoryId, String repositoryFileId, Boolean includeExternalFilePermissionsInfo, ConnectApi.RepositoryFileDetail result)
```

**Parameters**

- **repositoryId**
  
  Type: String
  
  The ID of the repository.

- **repositoryFileId**
  
  Type: String
  
  The ID of the repository file.

- **includeExternalFilePermissionsInfo**
  
  Type: Boolean
  
  Specifies whether to include permission information, such as whether the file is shared and what are the available permission types. Managing external file permissions is supported for Google Drive, SharePoint Online, and OneDrive for Business.

- **result**
  
  Type: ConnectApi.RepositoryFileDetail
  
  Object containing test data.

**Return Value**

Type: Void

SEE ALSO:

- getRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)
- *Apex Developer Guide: Testing ConnectApi Code*

**setTestGetRepositoryFile***(communityId, repositoryId, repositoryFileId, result)***

Register a ConnectApi.RepositoryFileDetail object to be returned when the matching getRepositoryFile(communityId, repositoryId, repositoryFileId) method is called in a test context. Use the method with the same parameters or you receive an exception.
API Version
40.0

Signature
public static Void setTestGetRepositoryFile(String communityId, String repositoryId, String repositoryFileId, ConnectApi.RepositoryFileDetail result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

repositoryId
Type: String
The ID of the repository.

repositoryFileId
Type: String
The ID of the repository file.

result
Type: ConnectApi.RepositoryFileDetail
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getRepositoryFile(communityId, repositoryId, repositoryFileId)

setTestGetRepositoryFile(communityId, repositoryId, repositoryFileId, includeExternalFilePermissionsInfo, result)

Register a ConnectApi.RepositoryFileDetail object to be returned when the matching getRepositoryFile(communityId, repositoryId, repositoryFileId, includeExternalFilePermissionsInfo) method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
40.0
Signature

public static Void setTestGetRepositoryFile(String communityId, String repositoryId, String repositoryFileId, Boolean includeExternalFilePermissionsInfo, ConnectApi.RepositoryFileDetail result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

repositoryId
Type: String
The ID of the repository.

repositoryFileId
Type: String
The ID of the repository file.

includeExternalFilePermissionsInfo
Type: Boolean
Specifies whether to include permission information, such as whether the file is shared and what are the available permission types. Managing external file permissions is supported for Google Drive, SharePoint Online, and OneDrive for Business.

result
Type: ConnectApi.RepositoryFileDetail
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getRepositoryFile(communityId, repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)

setTestGetRepositoryFolder(repositoryId, repositoryFolderId, result)

Register a ConnectApi.RepositoryFolderDetail object to be returned when the matching getRepositoryFolder(repositoryId, repositoryFolderId) method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
40.0
Signature

public static Void setTestGetRepositoryFolder(String repositoryId, String repositoryFolderId, ConnectApi.RepositoryFolderDetail result)

Parameters

repositoryId
Type: String
The ID of the repository.

repositoryFolderId
Type: String
The ID of the repository folder.

result
Type: ConnectApi.RepositoryFolderDetail
Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepositoryFolder(repositoryId, repositoryFolderId)

setTestGetRepositoryFolder(communityId, repositoryId, repositoryFolderId, result)

Register a ConnectApi.RepositoryFolderDetail object to be returned when the matching getRepositoryFolder (communityId, repositoryId, repositoryFolderId) method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

public static Void setTestGetRepositoryFolder(String communityId, String repositoryId, String repositoryFolderId, ConnectApi.RepositoryFolderDetail result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.
repositoryId
   Type: String
   The ID of the repository.
repositoryFolderId
   Type: String
   The ID of the repository folder.
result
   Type: ConnectApi.RepositoryFolderDetail
   Object containing test data.

Return Value
Type: Void

SEE ALSO:
   getRepositoryFolder(communityId, repositoryId, repositoryFolderId)

setTestGetRepositoryFolderItems(repositoryId, repositoryFolderId, result)
Register a ConnectApi.RepositoryFolderItemsCollection object to be returned when the matching
getRepositoryFolderItems(repositoryId, repositoryFolderId) method is called in a test context. Use the
method with the same parameters or you receive an exception.

API Version
40.0

Signature
public static Void setTestGetRepositoryFolderItems(String repositoryId, String
repositoryFolderId, ConnectApi.RepositoryFolderItemsCollection result)

Parameters
repositoryId
   Type: String
   The ID of the repository.
repositoryFolderId
   Type: String
   The ID of the repository folder.
result
   Type: ConnectApi.RepositoryFolderItemsCollection
   Object containing test data.
Return Value
Type: Void

SEE ALSO:
getRepositoryFolderItems(repositoryId, repositoryFolderId)

setTestGetRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, result)

Register a ConnectApi.RepositoryFolderItemsCollection object to be returned when the matching getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId) method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
40.0

Signature
public static Void setTestGetRepositoryFolderItems(String communityId, String repositoryId, String repositoryFolderId, ConnectApi.RepositoryFolderItemsCollection result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

repositoryId
Type: String
The ID of the repository.

repositoryFolderId
Type: String
The ID of the repository folder.

result
Type: ConnectApi.RepositoryFolderItemsCollection
Object containing test data.
Return Value
Type: Void

SEE ALSO:
getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId)

_Apex Developer Guide: Testing ConnectApi Code_

```java
setTestGetRepositoryFolderItems(repositoryId, repositoryFolderId, pageParam, pageSize, result)
```

Register a `ConnectApi.RepositoryFolderItemsCollection` object to be returned when the matching `getRepositoryFolderItems(repositoryId, repositoryFolderId, pageParam, pageSize)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
40.0

Signature

```java
public static Void setTestGetRepositoryFolderItems(String repositoryId, String repositoryFolderId, Integer pageParam, Integer pageSize, ConnectApi.RepositoryFolderItemsCollection result)
```

Parameters

- **repositoryId**
  - Type: `String`
  - The ID of the repository.

- **repositoryFolderId**
  - Type: `String`
  - The ID of the repository folder.

- **pageParam**
  - Type: `Integer`
  - Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

- **pageSize**
  - Type: `Integer`
  - Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

- **result**
  - Type: `ConnectApi.RepositoryFolderItemsCollection`
  - Object containing test data.
Return Value
Type: Void

SEE ALSO:
getRepositoryFolderItems(repositoryId, repositoryFolderId, pageParam, pageSize)
_Apex Developer Guide: Testing ConnectApi Code_

**setTestGetRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize, result)**

Register a `ConnectApi.RepositoryFolderItemsCollection` object to be returned when the matching `getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
40.0

Signature

```java
class Apex Developer Guide
public static Void setTestGetRepositoryFolderItems(String communityId, String repositoryId, String repositoryFolderId, Integer pageParam, Integer pageSize, ConnectApi.RepositoryFolderItemsCollection result)
```

Parameters

- `communityId`
  Type: String
  ID for an Experience Cloud site, internal, or null.

- `repositoryId`
  Type: String
  The ID of the repository.

- `repositoryFolderId`
  Type: String
  The ID of the repository folder.

- `pageParam`
  Type: Integer
  Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

- `pageSize`
  Type: Integer
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default page size is 25.

- `result`
  Type: `ConnectApi.RepositoryFolderItemsCollection`
  Object containing test data.
**Return Value**

Type: Void

SEE ALSO:

getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize)

_Apex Developer Guide: Testing ConnectApi Code_

**setTestUpdateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData, result)**

Register a `ConnectApi.RepositoryFileDetail` object to be returned when the matching `updateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData)` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

40.0

**Signature**

```java
public static Void setTestUpdateRepositoryFile(String communityId, String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput fileData, ConnectApi.RepositoryFileDetail result)
```

**Parameters**

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or null.

- **repositoryId**
  - Type: `String`
  - The ID of the repository.

- **repositoryFileId**
  - Type: `String`
  - The ID of the repository file.

- **file**
  - Type: `ConnectApi.ContentHubItemInput`
  - The item type ID and fields of the item type.

- **fileData**
  - Type: `ConnectApi.BinaryInput`
  - The binary file.

- **result**
  - Type: `ConnectApi.RepositoryFileDetail`
  - Object containing test data.
Return Value
Type: Void

SEE ALSO:
updateRepositoryFile(repositoryId, repositoryFileId, file)

setTestUpdateRepositoryFile(repositoryId, repositoryFileId, file, result)
Register a ConnectApi.RepositoryFileDetail object to be returned when the matching
updateRepositoryFile(repositoryId, repositoryFileId, file) method is called in a test context. Use the
method with the same parameters or you receive an exception.

API Version
40.0

Signature
public static Void setTestUpdateRepositoryFile(String repositoryId, String
repositoryFileId, ConnectApi.ContentHubItemInput file, ConnectApi.RepositoryFileDetail
result)

Parameters
repositoryId
Type: String
The ID of the repository.

repositoryFileId
Type: String
The ID of the repository file.

file
Type: ConnectApi.ContentHubItemInput
The item type ID and fields of the item type.

result
Type: ConnectApi.RepositoryFileDetail
Object containing test data.

Return Value
Type: Void

SEE ALSO:
updateRepositoryFile(repositoryId, repositoryFileId, file, fileData)
**setTestUpdateRepositoryFile** (repositoryId, repositoryFileId, file, fileData, result)

Register a `ConnectApi.RepositoryFileDetail` object to be returned when the matching `updateRepositoryFile` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

40.0

**Signature**

```java
public static Void setTestUpdateRepositoryFile(String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput fileData, ConnectApi.RepositoryFileDetail result)
```

**Parameters**

- **repositoryId**
  - Type: `String`
  - The ID of the repository.

- **repositoryFileId**
  - Type: `String`
  - The ID of the repository file.

- **file**
  - Type: `ConnectApi.ContentHubItemInput`
  - The item type ID and fields of the item type.

- **fileData**
  - Type: `ConnectApi.BinaryInput`
  - The binary file.

- **result**
  - Type: `ConnectApi.RepositoryFileDetail`
  - Object containing test data.

**Return Value**

Type: Void

**SEE ALSO:**

- `updateRepositoryFile(communityId, repositoryId, repositoryFileId, file)`

`setTestUpdateRepositoryFile(communityId, repositoryId, repositoryFileId, file, result)`

Register a `ConnectApi.RepositoryFileDetail` object to be returned when the matching
`updateRepositoryFile(communityId, repositoryId, repositoryFileId, file)` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

40.0

**Signature**

```java
public static Void setTestUpdateRepositoryFile(String communityId, String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file, ConnectApi.RepositoryFileDetail result)
```

**Parameters**

`communityId`

- Type: `String`
- ID for an Experience Cloud site, internal, or `null`.

`repositoryId`

- Type: `String`
- The ID of the repository.

`repositoryFileId`

- Type: `String`
- The ID of the repository file.

`file`

- Type: `ConnectApi.ContentHubItemInput`
- The item type ID and fields of the item type.

`result`

- Type: `ConnectApi.RepositoryFileDetail`
- Object containing test data.

**Return Value**

Type: `Void`

**SEE ALSO:**

`updateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData)`

*Apex Developer Guide: Testing ConnectApi Code*

**ConversationApplicationDefinition Class**

Access information about a conversation application definition.
Namespace

ConnectApi

ConversationApplicationDefinition Methods

The following are methods for ConversationApplicationDefinition. All methods are static.

IN THIS SECTION:

   getConversationApplicationDefinition(integrationName)
       Get information about an integration’s conversation application definition and the associated bot.

getConversationApplicationDefinition(integrationName)

Get information about an integration’s conversation application definition and the associated bot.

API Version

54.0

Requires Chatter

No

Signature

public static ConnectApi.ConversationApplicationDefinitionDetailRespresentation getConversationApplicationDefinition(String integrationName)

Parameters

integrationName
   Type: String
   Name of the conversation application.

Return Value

Type: ConnectApi.ConversationApplicationDefinitionDetailRespresentation

Usage

To access this method, enable the bot feature, and the user must be an admin or have the Manage Bots or Manage Bots Training Data user permissions.

Datacloud Class

Purchase Data.com contact or company records, and retrieve purchase information.
Namespace

ConnectApi

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers’ needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

IN THIS SECTION:

Datacloud Methods
The following are methods for Datacloud. All methods are static.

Datacloud Methods
The following are methods for Datacloud. All methods are static.

IN THIS SECTION:

getCompaniesFromOrder(orderId, pageSize, page)
Get a list of purchased company records for an order.

getCompany(companyId)
Get a company record.

getchContact(contactId)
Get a contact.

getContactsFromOrder(orderId, page, pageSize)
Get a list of purchased contacts for an order.

getAddress(orderId)
Get an order.

getUsage(userId)
Get purchase usage information for a user.

postOrder(orderInput)
Purchase records that are listed in an input file.

getCompaniesFromOrder(orderId, pageSize, page)
Get a list of purchased company records for an order.

API Version
32.0

Requires Chatter
No
Signature

public static ConnectApi.DatacloudCompanies getCompaniesFromOrder(String orderId, String pageSize, String page)

Parameters

orderId
Type: String
ID of an order.

page
Type: Integer
Number of the page that you want returned.

pageSize
Type: Integer
Number of companies to show on a page. The default pageSize is 25.

Return Value
Type: ConnectApi.DatacloudCompanies

getCompany (companyId)
Get a company record.

API Version
32.0

Requires Chatter
No

Signature

public static ConnectApi.DatacloudCompany getCompany(String companyId)

Parameters

companyId
Type: String
ID of a company in the Data.com database.

Return Value
Type: ConnectApi.DatacloudCompany
**getContact(contactId)**
Get a contact.

**API Version**
32.0

**Requires Chatter**
No

**Signature**
```
public static ConnectApi.DatacloudContact getContact(String contactId)
```

**Parameters**
- **contactId**
  Type: String
  ID of a contact in the Data.com database.

**Return Value**
Type: `ConnectApi.DatacloudContact`

**getContactsFromOrder(orderId, page, pageSize)**
Get a list of purchased contacts for an order.

**API Version**
32.0

**Requires Chatter**
No

**Signature**
```
public static ConnectApi.DatacloudContacts getContactsFromOrder(String orderId, String page, String pageSize)
```

**Parameters**
- **orderId**
  Type: String
  ID of an order.
- **page**
  Type: Integer
Number of the page that you want returned.

`pageSize`
Type: `Integer`
Number of contacts to show on a page. The default `pageSize` is 25.

Return Value
Type: `ConnectApi.DatacloudContacts`

`getOrder(orderId)`
Get an order.

API Version
32.0

Requires Chatter
No

Signature
```java
public static ConnectApi.DatacloudOrder getOrder(String orderId)
```

Parameters
`orderId`
Type: `String`
ID of an order.

Return Value
Type: `ConnectApi.DatacloudOrder`

`getUsage(userId)`
Get purchase usage information for a user.

API Version
32.0

Requires Chatter
No

Signature
```java
public static ConnectApi.DatacloudPurchaseUsage getUsage(String userId)
```
Parameters

userId
  Type: String
  ID of a user.

Return Value

Type: ConnectApi.DatacloudPurchaseUsage

**postOrder(orderInput)**

Purchase records that are listed in an input file.

API Version

32.0

Requires Chatter

No

Signature

```java
public static ConnectApi.DatacloudOrder postOrder(ConnectApi.DatacloudOrderInput orderInput)
```

Parameters

**orderInput**

  Type: ConnectApi.DatacloudOrderInput

  A list that contains IDs for the contacts or companies that you want to see.

Return Value

Type: ConnectApi.DatacloudOrder

Example

```java
ConnectApi.DatacloudOrderInput inputOrder=new ConnectApi.DatacloudOrderInput();
List<String> ids=new List<String>();
ids.add('1234');
inputOrder.companyIds=ids;
ConnectApi.DatacloudOrder datacloudOrderRep = ConnectApi.Datacloud.postOrder(inputOrder);
```

**EmailMergeFieldService Class**

Extract a list of merge fields for an object. A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.
Namespace

ConnectApi

EmailMergeFieldService Methods

The following are methods for EmailMergeFieldService. All methods are static.

IN THIS SECTION:

getMergeFields(objectApiNames)

Extract the merge fields for a specific object.

**getMergeFields (objectApiNames)**

Extract the merge fields for a specific object.

API Version

39.0

Requires Chatter

No

Signature

public static ConnectApi.EmailMergeFieldInfo getMergeFields(List<String> objectApiNames)

Parameters

objectApiNames

Type: List<String>

The API names for the objects being referenced.

Return Value

Type: ConnectApi.EmailMergeFieldInfo

EmployeeProfiles Class

Get, set and crop, and delete employee banner photos and photos.

Namespace

ConnectApi
EmployeeProfiles Methods

These methods are for EmployeeProfiles. All methods are static.

IN THIS SECTION:

- deleteBannerPhoto(employeeId)
  Delete an employee’s banner photo.
- deletePhoto(employeeId)
  Delete an employee’s photo.
- getBannerPhoto(employeeId)
  Get an employee’s banner photo.
- getPhoto(employeeId)
  Get an employee’s photo.
- setBannerPhoto(employeeId, fileId, versionNumber)
  Set an uploaded file as an employee’s banner photo.
- setBannerPhoto(employeeId, fileUpload)
  Set a file that hasn’t been uploaded as an employee’s banner photo.
- setBannerPhotoWithAttributes(employeeId, bannerPhoto)
  Set and crop an uploaded file as an employee’s banner photo.
- setBannerPhotoWithAttributes(employeeId, bannerPhoto, fileUpload)
  Set and crop a file that hasn’t been uploaded as an employee’s banner photo.
- setPhoto(employeeId, fileId, versionNumber)
  Set an uploaded file as an employee’s photo.
- setPhoto(employeeId, fileUpload)
  Set a file that hasn’t been uploaded as an employee’s photo.
- setPhotoWithAttributes(employeeId, photo)
  Set and crop an uploaded file as an employee’s photo.
- setPhotoWithAttributes(employeeId, photo, fileUpload)
  Set and crop a file that hasn’t been uploaded as an employee’s photo.

**deleteBannerPhoto(employeeId)**

Delete an employee’s banner photo.

**API Version**

51.0

**Requires Chatter**

No
Signature

```java
public static Void deleteBannerPhoto(String employeeId)
```

Parameters

- `employeeId`
  - Type: `String`
  - ID of the employee.

Return Value

Type: `Void`

```
deletePhoto(employeeId)
```
Delete an employee’s photo.

API Version

51.0

Requires Chatter

No

Signature

```java
public static Void deletePhoto(String employeeId)
```

Parameters

- `employeeId`
  - Type: `String`
  - ID of the employee.

Return Value

Type: `Void`

```
getBannerPhoto(employeeId)
```
Get an employee’s banner photo.

API Version

51.0

Requires Chatter

No
Signature

```java
public static ConnectApi.BannerPhoto getBannerPhoto(String employeeId)
```

Parameters

- `employeeId`
  - Type: `String`
  - ID of the employee.

Return Value

Type: `ConnectApi.BannerPhoto`

```java
getPhoto(employeeId)
```

Get an employee’s photo.

API Version

51.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```java
public static ConnectApi.Photo getPhoto(String employeeId)
```

Parameters

- `employeeId`
  - Type: `String`
  - ID of the employee.

Return Value

Type: `ConnectApi.Photo`

```java
setBannerPhoto(employeeId, fileId, versionNumber)
```

Set an uploaded file as an employee’s banner photo.

API Version

51.0
Requires Chatter
No

Signature
public static ConnectApi.BannerPhoto setBannerPhoto(String employeeId, String fileId, Integer versionNumber)

Parameters
employeeId
Type: String
ID of the employee.

fileId
Type: String
ID of the uploaded file to use as the employee banner photo. The file must be an image and be smaller than 2 GB.

versionNumber
Type: Integer
Version number of the file. Specify an existing version number or, to get the latest version, specify null.

Return Value
Type: ConnectApi.BannerPhoto

setBannerPhoto(employeeId, fileUpload)
Set a file that hasn't been uploaded as an employee's banner photo.

API Version
51.0

Requires Chatter
No

Signature
public static ConnectApi.BannerPhoto setBannerPhoto(String employeeId, ConnectApi.BinaryInput fileUpload)

Parameters
employeeId
Type: String
ID of the employee.

fileUpload
Type: ConnectApi.BinaryInput
File to use as the photo. The content type must be usable as an image.

Return Value
Type: ConnectApi.BannerPhoto

Usage
Photos are processed asynchronously and might not be visible right away.

setBannerPhotoWithAttributes(employeeId, bannerPhoto)
Set and crop an uploaded file as an employee's banner photo.

API Version
51.0

Requires Chatter
No

Signature
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String employeeId, ConnectApi.BannerPhotoInput bannerPhoto)

Parameters
employeeId
  Type: String
  ID of the employee.

bannerPhoto
  Type: ConnectApi.BannerPhotoInput
  A ConnectApi.BannerPhotoInput object that specifies the ID and version of the file, and how to crop the file.

Return Value
Type: ConnectApi.BannerPhoto

Usage
Photos are processed asynchronously and might not be visible right away.

setBannerPhotoWithAttributes(employeeId, bannerPhoto, fileUpload)
Set and crop a file that hasn't been uploaded as an employee's banner photo.
**API Version**

$1.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String employeeId,
    ConnectApi.BannerPhotoInput bannerPhoto, ConnectApi.BinaryInput fileUpload)
```

**Parameters**

- `employeeId`
  - Type: `String`
  - ID of the employee.

- `bannerPhoto`
  - Type: `ConnectApi.BannerPhotoInput`
  - A `ConnectApi.BannerPhotoInput` object specifying the cropping parameters.

- `fileUpload`
  - Type: `ConnectApi.BinaryInput`
  - File to use as the photo. The content type must be usable as an image.

**Return Value**

Type: `ConnectApi.BannerPhoto`

**Usage**

Photos are processed asynchronously and might not be visible right away.

**setPhoto(employeeId, fileId, versionNumber)**

Set an uploaded file as an employee’s photo.

**API Version**

$1.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.Photo setPhoto(String employeeId, String fileId, Integer
    versionNumber)
```
Parameters

employeeId
Type: String
ID of the employee.

fileId
Type: String
ID of the uploaded file to use as the employee photo. The file must be an image and be smaller than 2 GB.

versionNumber
Type: Integer
Version number of the file. Specify an existing version number or, to get the latest version, specify null.

Return Value
Type: ConnectApi.Photo

Usage
Photos are processed asynchronously and might not be visible right away.

setPhoto(employeeId, fileId)
Set a file that hasn’t been uploaded as an employee’s photo.

API Version
51.0

Requires Chatter
No

Signature
public static ConnectApi.Photo setPhoto(String employeeId, ConnectApi.BinaryInput fileUpload)

Parameters

employeeId
Type: String
ID of the employee.

fileUpload
Type: ConnectApi.BinaryInput
File to use as the photo. The content type must be usable as an image.
Return Value
Type: ConnectApi.Photo

Usage
Photos are processed asynchronously and might not be visible right away.

**setPhotoWithAttributes(employeeId, photo)**
Set and crop an uploaded file as an employee's photo.

API Version
51.0

Requires Chatter
No

Signature
```
public static ConnectApi.Photo setPhotoWithAttributes(String employeeId,
ConnectApi.PhotoInput photo)
```

Parameters
- **employeeId**
  Type: String
  ID of the employee.
- **photo**
  Type: ConnectApi.PhotoInput
  A ConnectApi.PhotoInput object specifying the file ID, version number, and cropping parameters.

Return Value
Type: ConnectApi.Photo

Usage
Photos are processed asynchronously and might not be visible right away.

**setPhotoWithAttributes(employeeId, photo, fileUpload)**
Set and crop a file that hasn't been uploaded as an employee's photo.

API Version
51.0
Requires Chatter
No

Signature
public static ConnectApi.Photo setPhotoWithAttributes(String employeeId, ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)

Parameters
employeeId
Type: String
ID of the employee.

photo
Type: ConnectApi.PhotoInput
A ConnectApi.PhotoInput object specifying the cropping parameters.

fileUpload
Type: ConnectApi.BinaryInput
File to use as the photo. The content type must be usable as an image.

Return Value
Type: ConnectApi.Photo

Usage
Photos are processed asynchronously and might not be visible right away.

ExternalEmailServices Class
Access information about integration with external email services, such as sending email within Salesforce through an external email account.

Namespace
ConnectApi

External Email Services Methods
The following are methods for ExternalEmailService. All methods are static.

IN THIS SECTION:
  getUserOauthInfo(landingPage)
  Get information about whether an external email service has been authorized to send email on behalf of a user.
**getUserOauthInfo (landingPage)**
Get information about whether an external email service has been authorized to send email on behalf of a user.

**API Version**
37.0

**Requires Chatter**
No

**Signature**
```java
public static getUserOauthInfo(String landingPage)
```

**Parameters**
- `landingPage`
  - **Type:** String
  - The landing page that the user starts on when they are finished with the OAuth authorization process.

**Return Value**
Type: `ConnectApi.UserOauthInfo`

**SEE ALSO:**
- *Apex Developer Guide: Testing ConnectApi Code*

---

**ExternalManagedAccount Class**
Get externally managed accounts.

**Namespace**
`ConnectApi`

**ExternalManagedAccount Methods**
These methods are for `ExternalManagedAccount`. All methods are static.

**IN THIS SECTION:**
- `getCommunitiesExternalManagedAccounts(communityId)`
  Get externally managed accounts available to the context user across all Experience Cloud sites.
- `getCommunitiesExternalManagedAccounts(communityId, includeMyAccount)`
  Get externally managed accounts available to the context user, including the context user’s account, across all Experience Cloud sites.
getExternalManagedAccounts(webstoreId)
Get externally managed accounts for a store.

ggetExternalManagedAccounts(webstoreId, includeMyAccount)
Get externally managed accounts, including the context user’s account, for a store.

gCommunitiesExternalManagedAccounts (communityId)
Get externally managed accounts available to the context user across all Experience Cloud sites.

API Version
50.0

Requires Chatter
No

Signature

public static ConnectApi.ExternalManagedAccountCollectionOutput getCommunitiesExternalManagedAccounts(String communityId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

Note: Regardless of the ID specified, this method returns externally managed accounts available to the context user across all Experience Cloud sites.

Return Value
Type: ConnectApi.ExternalManagedAccountCollectionOutput

gCommunitiesExternalManagedAccounts (communityId, includeMyAccount)
Get externally managed accounts available to the context user, including the context user’s account, across all Experience Cloud sites.

API Version
53.0

Requires Chatter
No
public static ConnectApi.ExternalManagedAccountCollectionOutput getCommunitiesExternalManagedAccounts(String communityId, Boolean includeMyAccount)

Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

ℹ️ **Note:** Regardless of the ID specified, this method returns externally managed accounts available to the context user across all Experience Cloud sites.

`includeMyAccount`
Type: `Boolean`
Specifies whether to return the context user’s account (`true`) or not (`false`). The default value is `false`.

Return Value
Type: `ConnectApi.ExternalManagedAccountCollectionOutput`

```java
getExternalManagedAccounts(String webstoreId)
```
Get externally managed accounts for a store.

API Version
49.0

Requires Chatter
No

Signature
public static ConnectApi.ExternalManagedAccountCollectionOutput getExternalManagedAccounts(String webstoreId)

Parameters

`webstoreId`
Type: `String`
ID of the webstore.

Return Value
Type: `ConnectApi.ExternalManagedAccountCollectionOutput`
getExternalManagedAccounts (webstoreId, includeMyAccount)
Get externally managed accounts, including the context user's account, for a store.

API Version
53.0

Requires Chatter
No

Signature
public static ConnectApi.ExternalManagedAccountCollectionOutput getExternalManagedAccounts(String webstoreId, Boolean includeMyAccount)

Parameters
webstoreId
Type: String
ID of the webstore.

includeMyAccount
Type: Boolean
Specifies whether to return the context user's account (true) or not (false). The default value is false.

Return Value
Type: ConnectApi.ExternalManagedAccountCollectionOutput

FieldService Class
Preview and create shifts from a pattern or filter fields on recordset filter criteria.

Namespace
ConnectApi

FieldService Methods
These methods are for FieldService. All methods are static.

IN THIS SECTION:
createShiftsFromPattern(shiftsFromPatternInput, shiftPatternId)
Create up to 2,000 shifts from a pattern.

evaluateRecordsetFilterCriteria(recordsetFilterCriteriaInput)
Filter records on recordset filter criteria.
previewShiftsFromPattern(shiftsFromPatternInput, shiftPatternId)
Preview up to 2,000 shifts from a pattern.

createShiftsFromPattern(shiftsFromPatternInput, shiftPatternId)
Create up to 2,000 shifts from a pattern.

API Version
S1.0

Requires Chatter
Yes

Signature
public static ConnectApi.ShiftsFromPattern createShiftsFromPattern(ConnectApi.ShiftsFromPatternInput shiftsFromPatternInput, String shiftPatternId)

Parameters
shiftsFromPatternInput
Type: ConnectApi.ShiftsFromPatternInput
A ConnectApi.ShiftsFromPatternInput object providing the pattern.

shiftPatternId
Type: String
ID of the shift pattern.

Return Value
Type: ConnectApi.ShiftsFromPattern

evaluateRecordsetFilterCriteria(recordsetFilterCriteriaInput)
Filter records on recordset filter criteria.

API Version
S3.0

Requires Chatter
No
Signature

```java
public static ConnectApi.RecordsetFilterCriteriaOutput
evaluateRecordsetFilterCriteria(ConnectApi.RecordsetFilterCriteriaInput
recordsetFilterCriteriaInput)
```

Parameters

```java
recordsetFilterCriteriaInput
Type: ConnectApi.RecordsetFilterCriteriaInput
An ConnectApi.RecordsetFilterCriteriaInput object providing a set of recordset filter criteria and records.
```

Return Value

```java
Type: ConnectApi.RecordsetFilterCriteriaOutput
```

Usage

Field service must be enabled.

```java
previewShiftsFromPattern(shiftsFromPatternInput, shiftPatternId)
```

Preview up to 2,000 shifts from a pattern.

API Version

51.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.ShiftsFromPattern
previewShiftsFromPattern(ConnectApi.ShiftsFromPatternInput shiftsFromPatternInput,
String shiftPatternId)
```

Parameters

```java
shiftsFromPatternInput
Type: ConnectApi.ShiftsFromPatternInput
A ConnectApi.ShiftsFromPatternInput object providing the pattern.

shiftPatternId
Type: String
ID of the shift pattern.
```

Return Value

```java
Type: ConnectApi.ShiftsFromPattern
```
FulfillmentOrder Class

Fulfill orders in Order Management.

Namespace

ConnectApi

FulfillmentOrder Methods

The following are methods for FulfillmentOrder. All methods are static.

IN THIS SECTION:

- cancelFulfillmentOrderLineItems(fulfillmentOrderId, cancelFulfillmentOrderLineItemsInput)
  Cancel FulfillmentOrderLineItems from a FulfillmentOrder. This action doesn’t cancel the associated OrderItemSummaries, so reallocate the canceled quantities to a new FulfillmentOrder.

- createFulfillmentOrders(fulfillmentOrderInput)
  Create one or more FulfillmentOrders and FulfillmentOrderLineItems for an OrderDeliveryGroupSummary, which defines a delivery method and recipient for an OrderSummary. You specify the OrderItemSummaries to allocate, which can be fulfilled from different locations. Specifying multiple fulfillment groups creates one FulfillmentOrder for each location. For each OrderItemSummary, a FulfillmentOrderLineItem is created and assigned to the corresponding FulfillmentOrder.

- createInvoice(fulfillmentOrderId, invoiceInput)
  Create an invoice for a FulfillmentOrder that doesn’t have one.

- createMultipleFulfillmentOrder(multipleFulfillmentOrderInput)
  Create FulfillmentOrders for multiple OrderDeliveryGroups in a single request.

- createMultipleInvoices(invoicesInput)
  Create Invoices for multiple FulfillmentOrders.

#### cancelFulfillmentOrderLineItems (fulfillmentOrderId, cancelFulfillmentOrderLineItemsInput)

Cancel FulfillmentOrderLineItems from a FulfillmentOrder. This action doesn’t cancel the associated OrderItemSummaries, so reallocate the canceled quantities to a new FulfillmentOrder.

**API Version**

48.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.FulfillmentOrderCancelLineItemsOutputRepresentation cancelFulfillmentOrderLineItems(String fulfillmentOrderId,
```

1241
ConnectApi.FulfillmentOrderLineItemsToCancelInputRepresentation
cancelFulfillmentOrderLineItemsInput)

Parameters

fulfillmentOrderId
  Type: String
  ID of the FulfillmentOrder.

cancelFulfillmentOrderLineItemsInput
  Type: ConnectApi.FulfillmentOrderLineItemsToCancelInputRepresentation
  List of FulfillmentOrderLineItems to cancel.

Return Value

Type: ConnectApi.FulfillmentOrderCancelLineItemsOutputRepresentation

Example

```java
String fulfillmentOrderId = '0a3xx0000000085AAA';
List<ConnectApi.FulfillmentOrderLineItemInputRepresentation> itemToCancelList = new
List<ConnectApi.FulfillmentOrderLineItemInputRepresentation>);

for(FulfillmentOrderLineItem fulfillmentOrderLineItem :
fulfillmentOrder.FulfillmentOrderLineItems)
  {
    ConnectApi.FulfillmentOrderLineItemInputRepresentation itemToCancel = new
    ConnectApi.FulfillmentOrderLineItemInputRepresentation();
    itemToCancel.fulfillmentOrderLineItemId = fulfillmentOrderLineItem.Id;
    itemToCancel.quantity = 1;
    itemToCancelList.add(itemToCancel);
  }

ConnectAPI.FulfillmentOrderLineItemsToCancelInputRepresentation input = new
ConnectAPI.FulfillmentOrderLineItemsToCancelInputRepresentation();
input.fulfillmentOrderLineItemsToCancel = itemToCancelList;

ConnectAPI.FulfillmentOrderCancelLineItemsOutputRepresentation result =
ConnectAPI.FulfillmentOrder.cancelFulfillmentOrderLineItems(fulfillmentOrderId, input);
```

createFulfillmentOrders(fulfillmentOrderInput)

Create one or more FulfillmentOrders and FulfillmentOrderLineItems for an OrderDeliveryGroupSummary, which defines a delivery method and recipient for an OrderSummary. You specify the OrderItemSummaries to allocate, which can be fulfilled from different locations. Specifying multiple fulfillment groups creates one FulfillmentOrder for each location. For each OrderItemSummary, a FulfillmentOrderLineItem is created and assigned to the corresponding FulfillmentOrder.

API Version

48.0
Requires Chatter
No

Signature

```java
public static ConnectApi.FulfillmentOrderOutputRepresentation createFulfillmentOrders(ConnectApi.FulfillmentOrderInputRepresentation fulfillmentOrderInput)
```

Parameters

`fulfillmentOrderInput`
- Type: `ConnectApi.FulfillmentOrderInputRepresentation`
  - OrderItemSummaries to allocate, with location and delivery information.

Return Value

Type: `ConnectApi.FulfillmentOrderOutputRepresentation`

Example

```java
String orderSummaryId = '1Osx0000004CCG';
String fulfillmentType = 'warehouse';
String warehouseFromLocationId = (SELECT Id from Location WHERE LocationType='Warehouse' LIMIT 1).Id;

ConnectApi.FulfillmentOrderInputRepresentation fulfillmentOrderInput = new ConnectApi.FulfillmentOrderInputRepresentation();
fulfillmentOrderInput.orderSummaryId = orderSummaryId;
List<OrderDeliveryGroupSummary> orderDeliveryGroupSummaryList = (SELECT Id FROM OrderDeliveryGroupSummary WHERE OrderSummaryId =: orderSummaryId);

for (OrderDeliveryGroupSummary orderDeliveryGroupSummary: orderDeliveryGroupSummaryList){

  fulfillmentOrderInput.orderDeliveryGroupSummaryId = orderDeliveryGroupSummary.Id;
  List<ConnectApi.FulfillmentGroupInputRepresentation> fulfillmentGroups = new List<ConnectApi.FulfillmentGroupInputRepresentation>();
  ConnectApi.FulfillmentGroupInputRepresentation fulfillmentGroup = new ConnectApi.FulfillmentGroupInputRepresentation();
  fulfillmentGroup.fulfilledFromLocationId = warehouseFromLocationId;
  fulfillmentGroup.fulfillmentType = fulfillmentType;
  fulfillmentGroups.add(fulfillmentGroup);

  List<ConnectApi.OrderItemSummaryInputRepresentation> orderItemSummaries = new List<ConnectApi.OrderItemSummaryInputRepresentation>();
  List<OrderItemSummary> orderItemSummaryList = (Select Id, quantity FROM OrderItemSummary WHERE OrderSummaryId =: orderSummaryId AND OrderDeliveryGroupSummaryId =: orderDeliveryGroupSummary.Id);
  for(OrderItemSummary orderItemSummary : orderItemSummaryList){
```
createInvoice(fulfillmentOrderId, invoiceInput)

Create an invoice for a FulfillmentOrder that doesn’t have one.

API Version
48.0

Requires Chatter
No

Signature
public static ConnectApi.FulfillmentOrderInvoiceOutputRepresentation createInvoice(String fulfillmentOrderId, ConnectApi.FulfillmentOrderInvoiceInputRepresentation invoiceInput)

Parameters
fulfillmentOrderId
Type: String
ID of the FulfillmentOrder.

invoiceInput
Type: ConnectApi.FulfillmentOrderInvoiceInputRepresentation
Required input with no data.

Return Value
Type: ConnectApi.FulfillmentOrderInvoiceOutputRepresentation

Example
String fulfillmentOrderId = '0a3xx0000000085AAA';
createMultipleFulfillmentOrder (multipleFulfillmentOrderInput)
Create FulfillmentOrders for multiple OrderDeliveryGroups in a single request.

API Version
50.0

Requires Chatter
No

Signature
public static ConnectApi.MultipleFulfillmentOrderOutputRepresentation createMultipleFulfillmentOrder(ConnectApi.MultipleFulfillmentOrderInputRepresentation multipleFulfillmentOrderInput)

Parameters
multipleFulfillmentOrderInput
Type: ConnectApi.MultipleFulfillmentOrderInputRepresentation
Wraps a list of inputs for creating fulfillment orders.

Return Value
Type: ConnectApi.MultipleFulfillmentOrderOutputRepresentation

createMultipleInvoices (invoicesInput)
Create Invoices for multiple FulfillmentOrders.

API Version
52.0

Requires Chatter
No

Signature
public static ConnectApi.MultipleFulfillmentOrderInvoicesOutputRepresentation createMultipleInvoices(ConnectApi.MultipleFulfillmentOrderInvoicesInputRepresentation invoicesInput)
Parameters

`invoicesInput`
Type: `ConnectApi.MultipleFulfillmentOrderInvoicesInputRepresentation`

The FulfillmentOrders to create Invoices for.

Return Value

Type: `ConnectApi.MultipleFulfillmentOrderInvoicesOutputRepresentation`

Knowledge Class

Get information about trending articles in Experience Cloud sites.

Namespace

`ConnectApi`

Knowledge Methods

The following are methods for `Knowledge`. All methods are static.

IN THIS SECTION:

- `getTopViewedArticlesForTopic(communityId, topicId, maxResults)`
  Get the top viewed articles for a topic.
- `getTrendingArticles(communityId, maxResults)`
  Get trending articles for an Experience Cloud site.
- `getTrendingArticlesForTopic(communityId, topicId, maxResults)`
  Get the trending articles for a topic in an Experience Cloud site.

`getTopViewedArticlesForTopic(communityId, topicId, maxResults)`
Get the top viewed articles for a topic.

API Version

41.0

Available to Guest Users

41.0

Requires Chatter

No
Signature

```java
public static ConnectApi.KnowledgeArticleVersionCollection getTopViewedArticlesForTopic(String communityId, String topicId, Integer maxResults)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **topicId**
  - Type: `String`
  - ID of the topic.

- **maxResults**
  - Type: `Integer`
  - The maximum number of articles returned for each topic ID. Values can be from 1 to 25. The default value is 5.

Return Value

Type: `ConnectApi.KnowledgeArticleVersionCollection`

```java
getTrendingArticles(communityId, maxResults)
```

Get trending articles for an Experience Cloud site.

API Version

36.0

Available to Guest Users

36.0

Requires Chatter

No

Signature

```java
public static ConnectApi.KnowledgeArticleVersionCollection getTrendingArticles(String communityId, Integer maxResults)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **maxResults**
  - Type: `Integer`
The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

**Return Value**
Type: `ConnectApi.KnowledgeArticleVersionCollection`

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestGetTrendingArticles(communityId, maxResults, result)`

- *Apex Developer Guide: Testing ConnectApi Code*

Knowledge Test Methods
The following are the test methods for `Knowledge`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see *Testing ConnectApi Code*.

`setTestGetTrendingArticles(communityId, maxResults, result)`
Register a `ConnectApi.KnowledgeVersionArticleCollection` object to be returned when the matching `ConnectApi.getTrendingArticles` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
36.0

Signature
```
public static Void setTestGetTrendingArticles(String communityId, Integer maxResults, ConnectApi.KnowledgeArticleVersionCollection result)
```

Parameters
- **communityId**
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.
- **maxResults**
  Type: `Integer`
  The maximum number of articles returned. Values can be from 0 to 25. Default is 5.
- **result**
  Type: `ConnectApi.KnowledgeArticleVersionCollection`
  Object containing test data.
setTestGetTrendingArticlesForTopic(communityId, topicId, maxResults, result)

Register a ConnectApi.KnowledgeVersionArticleCollection object to be returned when the matching ConnectApi.getTrendingArticlesForTopic method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
36.0

Signature
public static Void setTestGetTrendingArticlesForTopic(String communityId, String topicId, Integer maxResults, ConnectApi.KnowledgeArticleVersionCollection result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

topicId
Type: String
ID of the topic.

maxResults
Type: Integer
The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

result
Type: ConnectApi.KnowledgeArticleVersionCollection
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getTrendingArticles(communityId, maxResults)
LightningScheduler Class
Create and update service appointments.

Namespace
ConnectApi

LightningScheduler Methods
The following are methods for LightningScheduler. All methods are static.

IN THIS SECTION:
createServiceAppointment(createServiceAppointmentInput)
Create a service appointment.
updateServiceAppointment(updateServiceAppointmentInput)
Update a service appointment.

createServiceAppointment (createServiceAppointmentInput)
Create a service appointment.

API Version
53.0

Requires Chatter
No

Signature
public static ConnectApi.ServiceAppointmentOutput createServiceAppointment (ConnectApi.CreateServiceAppointmentInput createServiceAppointmentInput)

Parameters
createServiceAppointmentInput
   Type: ConnectApi.CreateServiceAppointmentInput
   Input parameters to create a service appointment.

Return Value
Type: ConnectApi.ServiceAppointmentOutput
Usage

Considerations for using engagement channel types with the service-appointments resource:

- Enable **Schedule Appointments Using Engagement Channels** in Salesforce Scheduler Settings in your Salesforce org.

- When you create or modify appointments, shifts must be defined in the scheduling policy. For more information on setting up shifts in the scheduling policy, see **Define Shift Rules in Scheduling Policy**.

  **Note:** Engagement channel types are not supported with operating hours rules in the scheduling policy.

- When you use engagement channel type and shifts to create a service appointment, Salesforce Scheduler considers the default value for the Appointment Type (if not specified). However, Salesforce Scheduler only considers the engagement channel type and Appointment Type is ignored.

Example

For an account (existing user):

```java
ConnectApi.ExtendedFieldInput extendedFieldEmail = new ConnectApi.ExtendedFieldInput();
extendedFieldEmail.name = 'Email';
extendedFieldEmail.value = 'rachael.adams@salesforce.com';

ConnectApi.ExtendedFieldInput extendedFieldPhone = new ConnectApi.ExtendedFieldInput();
extendedFieldPhone.name = 'Phone';
extendedFieldPhone.value = '1234567890';

List<ConnectApi.ExtendedFieldInput> extendedFieldList = new List<ConnectApi.ExtendedFieldInput>();
extendedFieldList.add(extendedFieldEmail);
extendedFieldList.add(extendedFieldPhone);

ConnectApi.ServiceAppointmentInput serviceAppInput = new ConnectApi.ServiceAppointmentInput();
serviceAppInput.extendedFields = extendedFieldList;
serviceAppInput.engagementChannelTypeId = '0eFRM00000000Bv2AI';
serviceAppInput.serviceTerritoryId = '0Hhx000000000004C92CAE';
serviceAppInput.workTypeId = '08qx000000000C92AAE';
serviceAppInput.parentRecordId = '001xx0000003GYR1AAO';
serviceAppInput.schedStartTime = DateTime.valueOf('2021-05-28 12:15:00');
serviceAppInput.schedEndTime = DateTime.valueOf('2021-05-28 12:45:00');

ConnectApi.AssignedResourcesInput asResourceInput = new ConnectApi.AssignedResourcesInput();
asResourceInput.serviceResourceId = '0Hnxx000000000004CAiCAM';
asResourceInput.isRequiredResource = true;
asResourceInput.isPrimaryResource = true;

List<ConnectApi.AssignedResourcesInput> asResourceInputList = new List<ConnectApi.AssignedResourcesInput>();
asResourceInputList.add(asResourceInput);

ConnectApi.CreateServiceAppointmentInput createInput = new ConnectApi.CreateServiceAppointmentInput();
createInput.serviceAppointment = serviceAppInput;
createInput.assignedResources = asResourceInputList;
```
try{
    ConnectApi.ServiceAppointmentOutput appointmentResult =
    ConnectApi.LightningScheduler.createServiceAppointment(createInput);
    String serviceAppointmentId = appointmentResult.result.serviceAppointmentId;
    List<String> assignedResourceIds = appointmentResult.result.assignedResourceIds;
}catch(ConnectApi.ConnectApiException ex){
    //Handle Exception
}

For a lead (authenticated guest user):

ConnectApi.LeadInput leadInput = new ConnectApi.LeadInput();
leadInput.firstName = 'Rachel';
leadInput.lastName = 'Adams';
leadInput.phone = '012-345-6789';
leadInput.email = 'rachel.adams@salesforce.com';
leadInput.company = 'Salesforce';

ConnectApi.ExtendedFieldInput extendedFieldEmail = new ConnectApi.ExtendedFieldInput();
extendedFieldEmail.name = 'Email';
extendedFieldEmail.value = 'rachael.adams@salesforce.com';

ConnectApi.ExtendedFieldInput extendedFieldPhone = new ConnectApi.ExtendedFieldInput();
extendedFieldPhone.name = 'Phone';
extendedFieldPhone.value = '1234567890';

List<ConnectApi.ExtendedFieldInput> extendedFieldList = new List<ConnectApi.ExtendedFieldInput>();
extendedFieldList.add(extendedFieldEmail);
extendedFieldList.add(extendedFieldPhone);

ConnectApi.ServiceAppointmentInput serviceAppInput = new ConnectApi.ServiceAppointmentInput();
serviceAppInput.extendedFields = extendedFieldList;
serviceAppInput.engagementChannelTypeId = '0eFRM00000000Bv2AI';
serviceAppInput.serviceTerritoryId = '0Hhxx0000004C92CAE';
serviceAppInput.workTypeId = '08qxx000000004C92AAE';
serviceAppInput.schedStartTime = DateTime.valueOf('2021-05-28 12:15:00');
serviceAppInput.schedEndTime = DateTime.valueOf('2021-05-28 12:45:00');

ConnectApi.AssignedResourcesInput asResourceInput = new ConnectApi.AssignedResourcesInput();
asResourceInput.serviceResourceId = '0Hnxx0000004CAiCAM';
asResourceInput.isRequiredResource = true;
asResourceInput.isPrimaryResource = true;

List<ConnectApi.AssignedResourcesInput> asResourceInputList = new List<ConnectApi.AssignedResourcesInput>();
asResourceInputList.add(asResourceInput);

ConnectApi.CreateServiceAppointmentInput createInput = new ConnectApi.CreateServiceAppointmentInput();
createInput.serviceAppointment = serviceAppInput;
createInput.assignedResources = asResourceInputList;
createInput.lead = leadInput;

try{
  ConnectApi.ServiceAppointmentOutput appointmentResult =
  ConnectApi.LightningScheduler.createServiceAppointment(createInput);
  String serviceAppointmentId = appointmentResult.result.serviceAppointmentId;
  List<String> assignedResourceIds = appointmentResult.result.assignedResourceIds;
}catch(ConnectApi.ConnectApiException ex){
  //Handle Exception
}

SEE ALSO:
  Service Appointments

**updateServiceAppointment(updateServiceAppointmentInput)**

Update a service appointment.

**API Version**

S3.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.ServiceAppointmentOutput
updateServiceAppointment(ConnectApi.UpdateServiceAppointmentInput
updateServiceAppointmentInput)
```

**Parameters**

`updateServiceAppointmentInput`  
Type: `ConnectApi.UpdateServiceAppointmentInput`  
Input parameters to update a service appointment.

**Return Value**

Type: `ConnectApi.ServiceAppointmentOutput`

**Usage**

Considerations for using engagement channel types with the `service-appointments` resource:

- Enable **Schedule Appointments Using Engagement Channels** in Salesforce Scheduler Settings in your Salesforce org.
- When you create or modify appointments, shifts must be defined in the scheduling policy. For more information on setting up shifts in the scheduling policy, see **Define Shift Rules in Scheduling Policy**.
Note: Engagement channel types are not supported with operating hours rules in the scheduling policy.

- When you use engagement channel type and shifts to modify an appointment, Salesforce Scheduler considers the default value for the Appointment Type (if not specified). However, Salesforce Scheduler only considers the engagement channel type and Appointment Type is ignored.

Example

```java
ConnectApi.ExtendedFieldInput extendedFieldEmail = new ConnectApi.ExtendedFieldInput();
extendedFieldEmail.name = 'Email';
extendedFieldEmail.value = 'rachel.adams@salesforce.com.example';

ConnectApi.ExtendedFieldInput extendedFieldPhone = new ConnectApi.ExtendedFieldInput();
extendedFieldPhone.name = 'Phone';
extendedFieldPhone.value = '0123456789';

ConnectApi.ExtendedFieldInput extendedFieldStatus = new ConnectApi.ExtendedFieldInput();
extendedFieldStatus.name = 'Status';
extendedFieldStatus.value = 'None';

List<ConnectApi.ExtendedFieldInput> extendedFieldList = new List<ConnectApi.ExtendedFieldInput>();
extendedFieldList.add(extendedFieldEmail);
extendedFieldList.add(extendedFieldPhone);
extendedFieldList.add(extendedFieldStatus);

ConnectApi.ServiceAppointmentInput serviceAppInput = new ConnectApi.ServiceAppointmentInput();
serviceAppInput.extendedFields = extendedFieldList;
serviceAppInput.serviceTerritoryId = '0Hhx00000004C92CAE';
serviceAppInput.workTypeId = '08qx00000004C92AAE';
serviceAppInput.schedStartTime = DateTime.valueOf('2021-05-28 12:15:00');
serviceAppInput.schedEndTime = DateTime.valueOf('2021-05-28 12:45:00');

ConnectApi.AssignedResourcesInput asResourceInput = new ConnectApi.AssignedResourcesInput();
asResourceInput.serviceResourceId = '0Hnx00000004CAiCAM';
asResourceInput.isRequiredResource = true;
asResourceInput.isPrimaryResource = true;

//Multi-resource
ConnectApi.AssignedResourcesInput asResourceInputReq = new ConnectApi.AssignedResourcesInput();
asResourceInputReq.serviceResourceId = '0Hnx00000004CAgCAM';
asResourceInputReq.isRequiredResource = true;
asResourceInputReq.isPrimaryResource = false;

List<ConnectApi.AssignedResourcesInput> asResourceInputList = new List<ConnectApi.AssignedResourcesInput>();
asResourceInputList.add(asResourceInput);
asResourceInputList.add(asResourceInputReq);

ConnectApi.UpdateServiceAppointmentInput updateInput = new ConnectApi.UpdateServiceAppointmentInput();
```
ConnectApi.UpdateServiceAppointmentInput();
updateInput.serviceAppointment = serviceAppInput;
updateInput.assignedResources = asResourceInputList;
updateInput.serviceAppointmentId = '08pxx0000004CYqAAM';

try{
    ConnectApi.ServiceAppointmentOutput appointmentResult =
    ConnectApi.LightningScheduler.updateServiceAppointment(updateInput);
    String serviceAppointmentId = appointmentResult.result.serviceAppointmentId;
    List<String> assignedResourceIds = appointmentResult.result.assignedResourceIds;
}catch(ConnectApi.ConnectApiException ex){
    //Handle Exception
}

Requires Chatter

No

Signature

```java
public static ConnectApi.ManagedContentVersionCollection getAllContent(String channelId,
Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean
includeMetadata, String startDate, String endDate)
```

Parameters

- **channelId**
  Type: String
  ID of the channel.

- **pageParam**
  Type: Integer
  Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

- **pageSize**
  Type: Integer
  Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

- **language**
  Type: String
  Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

- **managedContentType**
  Type: String
  Developer name of the content type, such as `cms_document` or `cms_image`.

- **includeMetadata**
  Type: Boolean
  Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

- **startDate**
  Type: String
  Publish start date in ISO 8601 format, for example, `2011-02-25T18:24:31.000Z`.

- **endDate**
  Type: String
  Publish end date in ISO 8601 format, for example, `2011-02-25T18:24:31.000Z`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`
getAllContent(channelId, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)

Get all managed content versions for a channel with absolute URLs.

API Version
50.0

Requires Chatter
No

Signature
public static ConnectApi.ManagedContentVersionCollection getAllContent(String channelId, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean includeMetadata, String startDate, String endDate, Boolean showAbsoluteUrl)

Parameters

channelId
  Type: String
  ID of the channel.

pageParam
  Type: Integer
  Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
  Type: Integer
  Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in null, the default size is 25.

language
  Type: String
  Language locale for the managed content, for example, en_US. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
  Type: String
  Developer name of the content type, such as cms_document or cms_image.

includeMetadata
  Type: Boolean
  Specifies whether to include metadata in the response (true) or not (false). The default value is false.
**startDate**

Type: String

Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

**endDate**

Type: String

Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

**showAbsoluteUrl**

Type: Boolean

Specifies whether to show absolute URLs in the output class (true) or not (false). The default value is false.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in null, the default size is 25.

language
Type: String
Language locale for the managed content, for example, en_US. If the requested translation isn’t available, the language defaults to the context user’s language. If the context user’s language isn’t available, the language defaults to the content type’s original language.

managedContentType
Type: String
Developer name of the content type, such as cms_document or cms_image.

Return Value
Type: ConnectApi.ManagedContentVersionCollection
getAllManagedContent(communityId, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get all managed content versions for an Experience Cloud site with absolute URLs.

API Version
50.0

Available to Guest Users
50.0

Requires Chatter
No

Signature
public static ConnectApi.ManagedContentVersionCollection getAllManagedContent(String communityId, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean showAbsoluteUrl)

Parameters

communityId
  Type: String
  ID of the Experience Cloud site.

pageParam
  Type: Integer
  Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
  Type: Integer
  Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in null, the default size is 25.

language
  Type: String
  Language locale for the managed content, for example, en_US. If the requested translation isn’t available, the language defaults to the context user’s language. If the context user’s language isn’t available, the language defaults to the content type’s original language.

managedContentType
  Type: String
  Developer name of the content type, such as cms_document or cms_image.

showAbsoluteUrl
  Type: Boolean
  Specifies whether to show absolute URLs in the output class (true) or not (false). The default value is false.
Return Value
Type: `ConnectApi.ManagedContentVersionCollection`

`getContentByContentKeys(channelId, contentKeys, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)`
Get managed content versions for a channel using a list of content keys.

API Version
51.0

Available to Guest Users
51.0

Requires Chatter
No

Signature
```
public static ConnectApi.ManagedContentVersionCollection getContentByContentKeys(String
channelId, List<String> contentKeys, Integer pageParam, Integer pageSize, String
language, String managedContentType, Boolean includeMetadata, String startDate, String
date, Boolean showAbsoluteUrl)
```

Parameters
```
channelId
  Type: String
  ID of the channel.

contentKeys
  Type: List<String>
  List of up to 50 content keys for the managed content. A content key is a universally unique identifier (UUID) such as MCA4CV5QS28ABSH7YRCPWCWGZQ.

pageParam
  Type: Integer
  Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
  Type: Integer
  Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in null, the default size is 25.

language
  Type: String
Language locale for the managed content, for example, en_US. If the requested translation isn’t available, the language defaults to the context user’s language. If the context user’s language isn’t available, the language defaults to the content type’s original language.

managedContentType
Type: String
Developer name of the content type, such as cms_document or cms_image.

includeMetadata
Type: Boolean
Specifies whether to include metadata in the response (true) or not (false). The default value is false.

startDate
Type: String
Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

date
Type: String
Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

showAbsoluteUrl
Type: Boolean
Specifies whether to show absolute URLs in the output class (true) or not (false). The default value is false.

Return Value
Type: ConnectApi.ManagedContentVersionCollection

getContentByIds(channelId, managedContentIds, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate)
Get managed content versions for a channel using a list of managed content IDs.

API Version

Requires Chatter
No

Signature
public static ConnectApi.ManagedContentVersionCollection getContentByIds(String
channelId, List<String> managedContentIds, Integer pageParam, Integer pageSize, String
language, String managedContentType, Boolean includeMetadata, String startDate, String
endDate)
Parameters

`channelId`
Type: `String`
ID of the channel.

`managedContentIds`
Type: `List<String>`
Comma-separated list of managed content IDs.

`pageParam`
Type: `Integer`
Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: `Integer`
Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

`language`
Type: `String`
Language locale for the managed content, for example, `en_US`. If the requested translation isn’t available, the language defaults to the context user’s language. If the context user’s language isn’t available, the language defaults to the content type’s original language.

`managedContentType`
Type: `String`
Developer name of the content type, such as `cms_document` or `cms_image`.

`includeMetadata`
Type: `Boolean`
Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

`startDate`
Type: `String`
Publish start date in ISO 8601 format, for example, `2011-02-25T18:24:31.000Z`.

`endDate`
Type: `String`
Publish end date in ISO 8601 format, for example, `2011-02-25T18:24:31.000Z`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

`getContentByIds(channelId, managedContentIds, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)`

Get managed content versions for a channel with absolute URLs using a list of managed content IDs.

```
public static ConnectApi.ManagedContentVersionCollection getContentByIds(String channelId, List<String> managedContentIds, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean includeMetadata, String startDate, String endDate, Boolean showAbsoluteUrl)
```

Parameters

**channelId**
Type: String
ID of the channel.

**managedContentIds**
Type: List<String>
Comma-separated list of managed content IDs.

**pageParam**
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

**pageSize**
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

**language**
Type: String
Language locale for the managed content, for example, en_US. If the requested translation isn’t available, the language defaults to the context user’s language. If the context user’s language isn’t available, the language defaults to the content type’s original language.

**managedContentType**
Type: String
Developer name of the content type, such as cms_document or cms_image.

**includeMetadata**
Type: Boolean
Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`. 
**startDate**
Type: `String`
Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

**endDate**
Type: `String`
Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

**showAbsoluteUrl**
Type: `Boolean`
Specifies whether to show absolute URLs in the output class (true) or not (false). The default value is false.

**Return Value**
Type: `ConnectApi.ManagedContentVersionCollection`

**getManagedContentByContentKeys(communityId, contentKeys, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)**
Get managed content versions for an Experience Cloud site using a list of content keys.

```java
public static ConnectApi.ManagedContentVersionCollection
getManagedContentByContentKeys(String communityId, List<String> contentKeys, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean showAbsoluteUrl)
```

**Parameters**

**communityId**
Type: `String`
ID of the Experience Cloud site.

**contentKeys**
Type: `List<String>`
List of up to 50 content keys for the managed content. A content key is a universally unique identifier (UUID) such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.
getPageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in \texttt{null} or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in \texttt{null}, the default size is 25.

language
Type: String
Language locale for the managed content, for example, \texttt{en-US}. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String
Developer name of the content type, such as \texttt{cms_document} or \texttt{cms_image}.

showAbsoluteUrl
Type: Boolean
Specifies whether to show absolute URLs in the output class (\texttt{true}) or not (\texttt{false}). The default value is \texttt{false}.

Return Value
Type: \texttt{ConnectApi.ManagedContentVersionCollection}

getManagedContentByIds(communityId, managedContentIds, pageParam, pageSize, language, managedContentType)
Get managed content versions for an Experience Cloud site using a list of managed content IDs.

Signature
\texttt{public static ConnectApi.ManagedContentVersionCollection getManagedContentByIds(String communityId, List<String> managedContentIds, Integer pageParam, Integer pageSize, String language, String managedContentType)}
Parameters

- **communityId**
  - Type: `String`
  - ID of the Experience Cloud site.

- **managedContentIds**
  - Type: `List<String>`
  - Comma-separated list of managed content IDs.

- **pageParam**
  - Type: `Integer`
  - Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

- **pageSize**
  - Type: `Integer`
  - Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

- **language**
  - Type: `String`
  - Language locale for the managed content, for example, `en_US`. If the requested translation isn’t available, the language defaults to the context user’s language. If the context user’s language isn’t available, the language defaults to the content type’s original language.

- **managedContentType**
  - Type: `String`
  - Developer name of the content type, such as `cms_document` or `cms_image`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

`getManagedContentByIds(communityId, managedContentIds, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)`

Get managed content versions for an Experience Cloud site with absolute URLs using a list of managed content IDs.

ManagedContentDelivery Class
Get collection items. Get a managed content channel. Get managed content.

Namespace
ConnectApi

ManagedContentDelivery Methods
The following are methods for ManagedContentDelivery. All methods are static.

IN THIS SECTION:
  - getCollectionItemsForChannel(channelId, collectionKeyOrId, language)
    Get collection items for a channel.
  - getCollectionItemsForSite(siteId, collectionKeyOrId, language)
    Get collection items for an Experience Cloud site.
  - getManagedContentChannel(channelId)
    Get a managed content channel.
  - getManagedContentForChannel(channelId, contentKeyOrId, showAbsoluteUrl)
    Get a piece of published content for a channel.
  - getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl)
    Get a piece of published content in a specified language for a channel.
  - getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)
    Get a piece of published content in a specified language with references for a channel.
get Managed Content for Site(siteId, contentKeyOrId, showAbsoluteUrl)
Get a piece of published content for an Experience Cloud site.

get Managed Content for Site(siteId, contentKeyOrId, language, showAbsoluteUrl)
Get a piece of published content in a specified language for an Experience Cloud site.

get Managed Content for Site(siteId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)
Get a piece of published content in a specified language with references for an Experience Cloud site.

get Managed Contents for Channel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize, showAbsoluteUrl)
Get a collection of published contents for a channel.

get Managed Contents for Site(siteId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize, showAbsoluteUrl)
Get a collection of published contents for an Experience Cloud site.

get Collection Items for Channel(channelId, collectionKeyOrId, language)
Get collection items for a channel.

API Version
56.0

Available to Guest Users
56.0

Requires Chatter
No

Signature
public static ConnectApi.ManagedContentCollectionItems
getCollectionItemsForChannel(String channelId, String collectionKeyOrId, String language)

Parameters
channelId
Type: String
ID of the channel.

collectionKeyOrId
Type: String
Collection key or ID of the collection. A collection key is a unique identifier such as MCA4CV5QS2BABS7YRCRPTCIGZQ.

language
Type: String
Language locale for the managed content, for example, en-US. If the requested translation isn’t available, the language defaults to the channel or site’s default language. If the channel or site’s default language isn’t available, the language defaults to the primary language of the content space.

Return Value
Type: ConnectApi.ManagedContentCollectionItems

getCollectionItemsForSite(siteId, collectionKeyOrId, language)
Get collection items for an Experience Cloud site.

API Version
56.0

Available to Guest Users
56.0

Requires Chatter
No

Signature
public static ConnectApi.ManagedContentCollectionItems getCollectionItemsForSite(String siteId, String collectionKeyOrId, String language)

Parameters
siteId
Type: String
ID for the Experience Cloud site.

collectionKeyOrId
Type: String
Collection key or ID of the collection. A collection key is a unique identifier such as MCA4CCV5QS2BAB5H7YCRPTCWGZQ.

language
Type: String
Language locale for the managed content, for example, en-US. If the requested translation isn’t available, the language defaults to the channel or site’s default language. If the channel or site’s default language isn’t available, the language defaults to the primary language of the content space.

Return Value
Type: ConnectApi.ManagedContentCollectionItems
getManagedContentChannel(channelId)
Get a managed content channel.

API Version
54.0

Available to Guest Users
54.0

Requires Chatter
No

Signature
public static ConnectApi.ManagedContentChannelDetail getManagedContentChannel(String channelId)

Parameters
channelId
Type: String
ID of the channel.

Return Value
Type: ConnectApi.ManagedContentChannelDetail

getManagedContentForChannel(channelId, contentKeyOrId, showAbsoluteUrl)
Get a piece of published content for a channel.

API Version
54.0

Available to Guest Users
54.0

Requires Chatter
No
Signature

public static ConnectApi.ManagedContentDeliveryDocument
getManagedContentForChannel(String channelId, String contentKeyOrId, Boolean showAbsoluteUrl)

Parameters

channelId
  Type: String
  ID of the channel.

contentKeyOrId
  Type: String
  Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

showAbsoluteUrl
  Type: Boolean
  For public channels only, specifies whether to return the absolute unauthenticatedUrl in the output class. The default value is false.

Return Value

Type: ConnectApi.ManagedContentDeliveryDocument

Usage

This method returns content only if it's published in the default language of the channel. If you request content that isn’t published in the default language of the channel, you get a ConnectApi.NotFoundException. To get content for a channel in another language use getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl) or getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList) on page 1282.

getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl)
Get a piece of published content in a specified language for a channel.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No
Signature

```java
public static ConnectApi.ManagedContentDeliveryDocument
getManagedContentForChannel(String channelId, String contentKeyOrId, String language,
Boolean showAbsoluteUrl)
```

Parameters

- `channelId`  
  Type: `String`  
  ID of the channel.
- `contentKeyOrId`  
  Type: `String`  
  Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.
- `language`  
  Type: `String`  
  Language locale for the managed content, for example, `en_US`. The requested language must be added to the channel, otherwise, you get a `ConnectApi.NotFoundException`. If the requested translation isn’t available, the language defaults to the channel or site’s default language. If the channel or site’s default language isn’t available, the language defaults to the primary language of the content space.
- `showAbsoluteUrl`  
  Type: `Boolean`  
  For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

```java
getManagedContentForChannel(channelId, contentKeyOrId, language,
showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)
```

Get a piece of published content in a specified language with references for a channel.

API Version

Signature

public static ConnectApi.ManagedContentDeliveryDocument getManagedContentForChannel(String channelId, String contentKeyOrId, String language, Boolean showAbsoluteUrl, Integer referenceDepth, Boolean expandReferences, Boolean referencesAsList)

Parameters

channelId
Type: String
ID of the channel.

contentKeyOrId
Type: String
Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String
Language locale for the managed content, for example, en_US. The requested language must be added to the channel, otherwise, you get a ConnectApi.NotFoundException. If the requested translation isn’t available, the language defaults to the channel or site’s default language. If the channel or site’s default language isn’t available, the language defaults to the primary language of the content space.

showAbsoluteUrl
Type: Boolean
For public channels only, specifies whether to return the absolute unauthenticatedUrl in the output class. The default value is false.

referenceDepth
Type: Integer
An integer 0–3 specifying the depth of references. If you specify 0, the references property of the ConnectApi.ManagedContentDeliveryDocument output class is null. If unspecified, the default value is 0.

expandReferences
Type: Boolean
Specifies whether to include details of references (true) or summaries of references (false) in the output class. If unspecified, the default value is false.

referencesAsList
Type: Boolean
Specifies whether to return the references as a list in the referencesList property of the ConnectApi.ManagedContentDeliveryDocument output class (true). If you specify false, the references are returned as key value pairs in the references property. If unspecified, the default value is false.

Return Value

Type: ConnectApi.ManagedContentDeliveryDocument

getManagedContentForSite(siteId, contentKeyOrId, showAbsoluteUrl)
Get a piece of published content for an Experience Cloud site.
API Version
54.0

Available to Guest Users
54.0

Requires Chatter
No

Signature
```
public static ConnectApi.ManagedContentDeliveryDocument getManagedContentForSite(String siteId, String contentKeyOrId, Boolean showAbsoluteUrl)
```

Parameters
- **siteId**
  
  Type: String
  
  ID for the Experience Cloud site.

- **contentKeyOrId**
  
  Type: String
  
  Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YCRPTCWGZQ.

- **showAbsoluteUrl**
  
  Type: Boolean
  
  For public channels only, specifies whether to return the absolute unauthenticatedUrl in the output class. The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

```
getManagedContentForSite(siteId, contentKeyOrId, language, showAbsoluteUrl)
```

Get a piece of published content in a specified language for an Experience Cloud site.
public static ConnectApi.ManagedContentDeliveryDocument getManagedContentForSite(String siteId, String contentKeyOrId, String language, Boolean showAbsoluteUrl)

Parameters

siteId
Type: String
ID for the Experience Cloud site.

contentKeyOrId
Type: String
Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String
Language locale for the managed content, for example, en_US. If the requested translation isn’t available, the language defaults to the channel or site’s default language. If the channel or site’s default language isn’t available, the language defaults to the primary language of the content space.

showAbsoluteUrl
Type: Boolean
For public channels only, specifies whether to return the absolute unauthenticatedUrl in the output class. The default value is false.

Return Value
Type: ConnectApi.ManagedContentDeliveryDocument

getManagedContentForSite(siteId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)
Get a piece of published content in a specified language with references for an Experience Cloud site.

API Version
54.0

Available to Guest Users
54.0

Requires Chatter
No
Signature

```java
public static ConnectApi.ManagedContentDeliveryDocument getManagedContentForSite(String siteId, String contentKeyOrId, String language, Boolean showAbsoluteUrl, Integer referenceDepth, Boolean expandReferences, Boolean referencesAsList)
```

Parameters

- **siteId**
  - Type: String
  - ID for the Experience Cloud site.

- **contentKeyOrId**
  - Type: String
  - Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPCTCWGZQ.

- **language**
  - Type: String
  - Language locale for the managed content, for example, `en_US`. If the requested translation isn’t available, the language defaults to the channel or site’s default language. If the channel or site’s default language isn’t available, the language defaults to the primary language of the content space.

- **showAbsoluteUrl**
  - Type: Boolean
  - For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

- **referenceDepth**
  - Type: Integer
  - An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocument` output class is null. If unspecified, the default value is 0.

- **expandReferences**
  - Type: Boolean
  - Specifies whether to include details of references (true) or summaries of references (false) in the output class. If unspecified, the default value is false.

- **referencesAsList**
  - Type: Boolean
  - Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocument` output class (true). If you specify false, the references are returned as key value pairs in the `references` property. If unspecified, the default value is false.

Return Value

- Type: `ConnectApi.ManagedContentDeliveryDocument`

```java
getManagedContentsForChannel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate,
```
Get a collection of published contents for a channel.

**API Version**
58.0

**Available to Guest Users**
58.0

**Requires Chatter**
No

**Signature**

```java
public static ConnectApi.ManagedContentDeliveryDocumentCollection getManagedContentsForChannel(String channelId, List<String> managedContentIds, List<String> contentKeys, String contentTypeFQN, String language, String publishStartDate, String publishEndDate, Boolean includeContentBody, Integer referenceDepth, Boolean expandReferences, Boolean referencesAsList, Integer pageParam, Integer pageSize, Boolean showAbsoluteUrl)
```

**Parameters**

- **channelId**
  Type: String
  ID of the channel.

- **managedContentIds**
  Type: List<String>
  Comma-separated list of up to 100 managed content IDs. Specify either managed content IDs or content keys.

- **contentKeys**
  Type: List<String>
  Comma-separated list of up to 50 content keys. Specify either managed content IDs or content keys.

- **contentTypeFQN**
  Type: String
  Fully qualified name of the managed content type.

- **language**
  Type: String
  Language locale for the managed content, for example, en_US. If the requested translation isn’t available, the language defaults to the configured fallback language or the channel's default language. If the content isn’t available in the fallback language and the channel's default language, we return an error.

- **publishStartDate**
  Type: String

- **publishEndDate**
  Type: String

- **includeContentBody**
  Type: Boolean

- **referenceDepth**
  Type: Integer

- **expandReferences**
  Type: Boolean

- **referencesAsList**
  Type: Boolean

- **pageParam**
  Type: Integer

- **pageSize**
  Type: Integer

- **showAbsoluteUrl**
  Type: Boolean
ISO 8601 formatted publish start date.

`publishEndDate`
Type: String
ISO 8601 formatted publish end date.

`includeContentBody`
Type: Boolean
Specifies whether to return the content body (true) or the content summary (false). If unspecified, the default value is false.

`referenceDepth`
Type: Integer
An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class is null. If unspecified, the default value is 0.

`expandReferences`
Type: Boolean
Specifies whether to include details of references (true) or summaries of references (false) in the output class. If unspecified, the default value is false.

`referencesAsList`
Type: Boolean
Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class (true). If you specify false, the references are returned as key value pairs in the `references` property. If unspecified, the default value is false.

`pageParam`
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

`pageSize`
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 250. If you pass in null, the default size is 25. If you specify true for `expandReferences` or `includeContentBody`, the maximum page size you can specify is 25.

`showAbsoluteUrl`
Type: Boolean
Specifies whether to show absolute URLs in the output class (true) or not (false). The default value is false.

Return Value
Type: `ConnectApi.ManagedContentDeliveryDocumentCollection`

`getManagedContentsForSite(siteId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize, showAbsoluteUrl)`

Get a collection of published contents for an Experience Cloud site.
API Version

Signature

public static ConnectApi.ManagedContentDeliveryDocumentCollection
getManagedContentsForSite(String siteId, List<String> managedContentIds, List<String> contentKeys, String contentTypeFQN, String language, String publishStartDate, String publishEndDate, Boolean includeContentBody, Integer referenceDepth, Boolean expandReferences, Boolean referencesAsList, Integer pageParam, Integer pageSize, Boolean showAbsoluteUrl)

Parameters

siteId
Type: String

ID for the Experience Cloud site.

managedContentIds
Type: List<String>

Comma-separated list of up to 100 managed content IDs. Specify either managed content IDs or content keys.

contentKeys
Type: List<String>

Comma-separated list of up to 50 content keys. Specify either managed content IDs or content keys.

customTypeFQN
Type: String

Fully qualified name of the managed content type.

language
Type: String

Language locale for the managed content, for example, en_US. If the requested translation isn’t available, the language defaults to the configured fallback language or the channel’s default language. If the content isn’t available in the fallback language and the channel’s default language, we return an error.

publishStartDate
Type: String

ISO 8601 formatted publish start date.

publishEndDate
Type: String

ISO 8601 formatted publish end date.
**includeContentBody**
Type: Boolean
Specifies whether to return the content body (true) or the content summary (false). If unspecified, the default value is false.

**referenceDepth**
Type: Integer
An integer 0–3 specifying the depth of references. If you specify 0, the references property of the ConnectApi.ManagedContentDeliveryDocumentCollection output class is null. If unspecified, the default value is 0.

**expandReferences**
Type: Boolean
Specifies whether to include details of references (true) or summaries of references (false) in the output class. If unspecified, the default value is false.

**referencesAsList**
Type: Boolean
Specifies whether to return the references as a list in the referencesList property of the ConnectApi.ManagedContentDeliveryDocumentCollection output class (true). If you specify false, the references are returned as key value pairs in the references property. If unspecified, the default value is false.

**pageParam**
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

**pageSize**
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 250. If you pass in null, the default size is 25. If you specify true for expandReferences or includeContentBody, the maximum page size you can specify is 25.

**showAbsoluteUrl**
Type: Boolean
Specifies whether to show absolute URLs in the output class (true) or not (false). The default value is false.

**Return Value**
Type: ConnectApi.ManagedContentDeliveryDocumentCollection

**Retired ManagedContentDelivery Methods**
These methods for ManagedContentDelivery are retired.

_IN THIS SECTION:_

`getManagedContentsForChannel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize)`
Get a collection of published contents for a channel.

`getManagedContentsForSite(siteId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize)`
Get a collection of published contents for an Experience Cloud site.
getManagedContentsForChannel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize)

Get a collection of published contents for a channel.

API Version
55.0—57.0
In version 58.0 and later, use getManagedContentsForChannel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize, showAbsoluteUrl).

Parameters

channelId
Type: String
ID of the channel.

managedContentIds
Type: List<String>
Comma-separated list of up to 100 managed content IDs. Specify either managed content IDs or content keys.

ccontentKeys
Type: List<String>
Comma-separated list of up to 50 content keys. Specify either managed content IDs or content keys.

contentTypeFQN
Type: String
Fully qualified name of the managed content type.
language
  Type: String
  Language locale for the managed content, for example, en_US. If the requested translation isn’t available, the language defaults to the configured fallback language or the channel’s default language. If the content isn’t available in the fallback language and the channel’s default language, we return an error.

publishStartDate
  Type: String
  ISO 8601 formatted publish start date.

publishEndDate
  Type: String
  ISO 8601 formatted publish end date.

includeContentBody
  Type: Boolean
  Specifies whether to return the content body (true) or the content summary (false). If unspecified, the default value is false.

referenceDepth
  Type: Integer
  An integer 0–3 specifying the depth of references. If you specify 0, the references property of the ConnectApi.ManagedContentDeliveryDocumentCollection output class is null. If unspecified, the default value is 0.

expandReferences
  Type: Boolean
  Specifies whether to include details of references (true) or summaries of references (false) in the output class. If unspecified, the default value is false.

referencesAsList
  Type: Boolean
  Specifies whether to return the references as a list in the referencesList property of the ConnectApi.ManagedContentDeliveryDocumentCollection output class (true). If you specify false, the references are returned as key value pairs in the references property. If unspecified, the default value is false.

pageParam
  Type: Integer
  Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
  Type: Integer
  Specifies the number of items per page. Valid values are from 1 through 250. If you pass in null, the default size is 25. If you specify true for expandReferences or includeContentBody, the maximum page size you can specify is 25.

Return Value

```

**Parameters**

- `siteId`
  Type: `String`
  ID for the Experience Cloud site.

- `managedContentIds`
  Type: `List<String>`
  Comma-separated list of up to 100 managed content IDs. Specify either managed content IDs or content keys.

- `contentKeys`
  Type: `List<String>`
  Comma-separated list of up to 50 content keys. Specify either managed content IDs or content keys.

- `contentTypeFQN`
  Type: `String`
  Fully qualified name of the managed content type.

- `language`
  Type: `String`
  Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the configured fallback language or the channel's default language. If the content isn't available in the fallback language and the channel's default language, we return an error.
publishStartDate
  Type: String
  ISO 8601 formatted publish start date.

publishEndDate
  Type: String
  ISO 8601 formatted publish end date.

includeContentBody
  Type: Boolean
  Specifies whether to return the content body (true) or the content summary (false). If unspecified, the default value is false.

referenceDepth
  Type: Integer
  An integer 0–3 specifying the depth of references. If you specify 0, the references property of the
  ConnectApi.ManagedContentDeliveryDocumentCollection output class is null. If unspecified, the default value is 0.

expandReferences
  Type: Boolean
  Specifies whether to include details of references (true) or summaries of references (false) in the output class. If unspecified, the default value is false.

referencesAsList
  Type: Boolean
  Specifies whether to return the references as a list in the referencesList property of the
  ConnectApi.ManagedContentDeliveryDocumentCollection output class (true). If you specify false, the
  references are returned as key value pairs in the references property. If unspecified, the default value is false.

pageParam
  Type: Integer
  Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
  Type: Integer
  Specifies the number of items per page. Valid values are from 1 through 250. If you pass in null, the default size is 25. If you specify true for expandReferences or includeContentBody, the maximum page size you can specify is 25.

Return Value
Type: ConnectApi.ManagedContentDeliveryDocumentCollection

ManagedTopics Class
Get managed topics in an Experience Cloud site. Create, delete, and reorder managed topics.

Namespace
ConnectApi
ManagedTopics Methods

The following are methods for ManagedTopics. All methods are static.

IN THIS SECTION:

createManagedTopic(communityId, recordId, managedTopicType)
Create a managed topic of a specific type for an Experience Cloud site.

createManagedTopic(communityId, recordId, managedTopicType, parentId)
Create a child managed topic for an Experience Cloud site.

createManagedTopicByName(communityId, name, managedTopicType)
Create a managed topic of a specific type by name for an Experience Cloud site.

createManagedTopicByName(communityId, name, managedTopicType, parentId)
Create a child managed topic by name for an Experience Cloud site.

deleteManagedTopic(communityId, managedTopicId)
Delete a managed topic from an Experience Cloud site.

getManagedTopic(communityId, managedTopicId)
Get a managed topic in an Experience Cloud site.

getManagedTopic(communityId, managedTopicId, depth)
Get a managed topic, including its parent and children managed topics, in an Experience Cloud site.

getManagedTopics(communityId)
Get the featured and navigational managed topics for an Experience Cloud site.

getManagedTopics(communityId, managedTopicType)
Get managed topics of the specified type for an Experience Cloud site.

getManagedTopics(communityId, managedTopicType, depth)
Get managed topics of the specified type, including their parent and children managed topics, in an Experience Cloud site.

getManagedTopics(communityId, managedTopicType, recordIds, depth)
Get managed topics of the specified type, including their parent and children managed topics, that are associated with topics in an Experience Cloud site.

getManagedTopics(communityId, managedTopicType, pageParam, pageSize)
Get a page of managed topics.

reorderManagedTopics(communityId, managedTopicPositionCollection)
Reorder the relative positions of managed topics in an Experience Cloud site.

createManagedTopic(communityId, recordId, managedTopicType)
Create a managed topic of a specific type for an Experience Cloud site.

API Version

32.0

Requires Chatter

No
public static ConnectApi.ManagedTopic createManagedTopic(String communityId, String recordId, ConnectApi.ManagedTopicType managedTopicType)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

recordId
Type: String
ID of the topic.

managedTopicType
Type: ConnectApi.ManagedTopicType
Specify the type of managed topic.

- Content—Topics that are associated with native content.
- Featured—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- Navigational—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a Featured, Navigational, and Content topic.

You can create up to 25 Featured and 5,000 Content topics. You can create up to eight levels of Navigational managed topics with 25 top-level topics and 10 children topics per level for a maximum of 2,775 Navigational topics.

Return Value
Type: ConnectApi.ManagedTopic

Usage
Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

createManagedTopic(communityId, recordId, managedTopicType, parentId)
Create a child managed topic for an Experience Cloud site.

API Version
35.0

Requires Chatter
No
Signature

public static ConnectApi.ManagedTopic createManagedTopic(String communityId, String recordId, ConnectApi.ManagedTopicType managedTopicType, String parentId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

recordId
Type: String
ID of the topic.

managedTopicType
Type: ConnectApi.ManagedTopicType
Specify Navigational for the type of managed topic to create a child managed topic.
You can create up to 25 Featured and 5,000 Content topics. You can create up to eight levels of Navigational managed topics with 25 top-level topics and 10 children topics per level for a maximum of 2,775 Navigational topics.

parentId
Type: String
ID of the parent managed topic.
You can create up to eight levels (parent, direct children, their children, etc.) of managed topics and up to 10 children managed topics per managed topic.

Return Value

Type: ConnectApi.ManagedTopic

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

createManagedTopicByName(communityId, name, managedTopicType)
Create a managed topic of a specific type by name for an Experience Cloud site.

API Version

32.0

Requires Chatter

No
Signature

```java
public static ConnectApi.ManagedTopic createManagedTopicByName(String communityId,
String name, ConnectApi.ManagedTopicType managedTopicType)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **name**
  - Type: `String`
  - Name of the topic.

- **managedTopicType**
  - Type: `ConnectApi.ManagedTopicType`
  - Specify the type of managed topic.
    - **Content**—Topics that are associated with native content.
    - **Featured**—Topics that are featured, for example, on the Experience Cloud site home page, but don’t provide overall navigation.
    - **Navigational**—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

You can create up to 25 `Featured` and 5,000 `Content` topics. You can create up to eight levels of `Navigational` managed topics with 25 top-level topics and 10 children topics per level for a maximum of 2,775 `Navigational` topics.

Return Value

- **Type**: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

```java
createManagedTopicByName(communityId, name, managedTopicType, parentId)
```

Create a child managed topic by name for an Experience Cloud site.

API Version

- **35.0**

Requires Chatter

- **No**
Signature

```java
public static ConnectApi.ManagedTopic createManagedTopicByName(String communityId, String name, ConnectApi.ManagedTopicType managedTopicType, String parentId)
```

Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`name`
Type: `String`
Name of the topic.

managedTopicType
Type: `ConnectApi.ManagedTopicType`
Specify `Navigational` for the type of managed topic to create a child managed topic.

You can create up to 25 `Featured` and 5,000 `Content` topics. You can create up to eight levels of `Navigational` managed topics with 25 top-level topics and 10 children topics per level for a maximum of 2,775 `Navigational` topics.

`parentId`
Type: `String`
ID of the parent managed topic.

You can create up to eight levels (parent, direct children, their children, etc.) of managed topics and up to 10 children managed topics per managed topic.

Return Value
Type: `ConnectApi.ManagedTopic`

Usage
Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

`deleteManagedTopic(communityId, managedTopicId)`
Delete a managed topic from an Experience Cloud site.

API Version
32.0

Requires Chatter
No

Signature

```java
public static deleteManagedTopic(String communityId, String managedTopicId)
```
Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

managedTopicId
Type: String
ID of managed topic.

Return Value
Type: Void

Usage
Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can delete managed topics.

getManagedTopic(communityId, managedTopicId)
Get a managed topic in an Experience Cloud site.

API Version
32.0

Available to Guest Users
32.0

Requires Chatter
No

Signature
public static ConnectApi.ManagedTopic getManagedTopic(String communityId, String managedTopicId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

managedTopicId
Type: String
ID of managed topic.
Return Value
Type: `ConnectApi.ManagedTopic`

`getManagedTopic(communityId, managedTopicId, depth)`
Get a managed topic, including its parent and children managed topics, in an Experience Cloud site.

API Version
35.0

Available to Guest Users
35.0

Requires Chatter
No

Signature
`public static ConnectApi.ManagedTopic getManagedTopic(String communityId, String managedTopicId, Integer depth)`

Parameters
- `communityId`  
  Type: `String`  
  ID for an Experience Cloud site, internal, or `null`.
- `managedTopicId`  
  Type: `String`  
  ID of managed topic.
- `depth`  
  Type: `Integer`  
  Specify an integer 1–8. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn’t specified, it defaults to 1.

Return Value
Type: `ConnectApi.ManagedTopic`

`getManagedTopics(communityId)`
Get the featured and navigational managed topics for an Experience Cloud site.

To get the content topics for an Experience Cloud site, use `getManagedTopics(communityId, managedTopicType)`. 
API Version
32.0

Available to Guest Users
32.0

Requires Chatter
No

Signature
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

Return Value
Type: ConnectApi.ManagedTopicCollection

getManagedTopics(communityId, managedTopicType)
Get managed topics of the specified type for an Experience Cloud site.
ID for an Experience Cloud site, internal, or null.

managedTopicType
Type: ConnectApi.ManagedTopicType
Type of managed topic.
  • Content—Topics that are associated with native content.
  • Featured—Topics that are featured, for example, on the Experience Cloud site home page, but don’t provide overall navigation.
  • Navigational—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a Featured, Navigational, and Content topic.

If you specify Content, up to 50 topics are returned. If you want more than 50 Content topics, use getManagedTopics(communityId, managedTopicType, pageParam, pageSize).

Return Value
Type: ConnectApi.ManagedTopicCollection

getManagedTopics(communityId, managedTopicType, depth)
Get managed topics of the specified type, including their parent and children managed topics, in an Experience Cloud site.

API Version
35.0

Available to Guest Users
35.0

Requires Chatter
No

Signature
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId, ConnectApi.ManagedTopicType managedTopicType, Integer depth)

Parameters
communityId
  Type: String

managedTopicType
  Type: ConnectApi.ManagedTopicType
  Type of managed topic.
  • Content—Topics that are associated with native content.
• Featured—Topics that are featured, for example, on the Experience Cloud site home page, but don’t provide overall navigation.
• Navigational—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a Featured, Navigational, and Content topic.

depth
Type: Integer
Specify an integer 1–8. If you specify 1, the children property of the ConnectApi.ManagedTopic output class is null. If you specify 2, the children property of the ConnectApi.ManagedTopic output class contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn’t specified, it defaults to 1.

Return Value
Type: ConnectApi.ManagedTopicCollection

getManagedTopics(communityId, managedTopicType, recordIds, depth)
Get managed topics of the specified type, including their parent and children managed topics, that are associated with topics in an Experience Cloud site.

API Version
38.0

Available to Guest Users
38.0

Requires Chatter
No

Signature
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId, ConnectApi.ManagedTopicType managedTopicType, List<String> recordIds, Integer depth)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

managedTopicType
Type: ConnectApi.ManagedTopicType
Type of managed topic.
• Content—Topics that are associated with native content.
• Featured—Topics that are featured, for example, on the Experience Cloud site home page, but don’t provide overall navigation.
• Navigational—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a Featured, Navigational, and Content topic.

**recordIds**
Type: List<String>
A list of up to 100 topic IDs associated with the managed topics.
If you list more than 10 topic IDs, you can't specify 2–8 for **depth**.

**depth**
Type: Integer
Specify an integer 1–8. If you specify 1, the children property of the ConnectApi.ManagedTopic output class is **null**. If you specify 2, the children property of the ConnectApi.ManagedTopic output class contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

**Return Value**
Type: ConnectApi.ManagedTopicCollection

**getManagedTopics(communityId, managedTopicType, pageParam, pageSize)**
Get a page of managed topics.

**API Version**
44.0

**Available to Guest Users**
44.0

**Requires Chatter**
No

**Signature**
```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
                     ConnectApi.ManagedTopicType managedTopicType, Integer pageParam, Integer pageSize)
```

**Parameters**

**communityId**
Type: String
ID for an Experience Cloud site, internal, or **null**.

**managedTopicType**
Type: ConnectApi.ManagedTopicType
Type of managed topic.
• Content—Topics that are associated with native content.
• Featured—Topics that are featured, for example, on the Experience Cloud site home page, but don’t provide overall navigation.
• Navigational—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a Featured, Navigational, and Content topic.

`pageParam`  
Type: Integer  
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

`pageSize`  
Type: Integer  
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 50.

Return Value  
Type: ConnectApi.ManagedTopicCollection

`reorderManagedTopics(communityId, managedTopicPositionCollection)`  
Reorder the relative positions of managed topics in an Experience Cloud site.

API Version  
32.0

Requires Chatter  
No

Signature  
`public static ConnectApi.ManagedTopicCollection reorderManagedTopics(String communityId, ConnectApi.ManagedTopicPositionCollectionInput managedTopicPositionCollection)`

Parameters  
`communityId`  
Type: String  
ID for an Experience Cloud site, internal, or null.

`managedTopicPositionCollection`  
Type: ConnectApi.ManagedTopicPositionCollectionInput  
A collection of relative positions of managed topics. This collection can include only Featured and Navigational topics and doesn’t have to include all managed topics.

Return Value  
Type: ConnectApi.ManagedTopicCollection
Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can reorder managed topics.

You can reorder parent managed topics or children managed topics with the same parent. If you don't include all managed topics in the `ConnectApi.ManagedTopicPositionCollectionInput`, the managed topics are reordered by respecting the positions indicated in the `ConnectApi.ManagedTopicPositionCollectionInput` and then by pushing down any managed topics that aren't included in the `ConnectApi.ManagedTopicPositionCollectionInput` to the next available position.

Example

If you have these managed topics:

<table>
<thead>
<tr>
<th>Managed Topic</th>
<th>Position</th>
</tr>
</thead>
<tbody>
<tr>
<td>ManagedTopicA</td>
<td>0</td>
</tr>
<tr>
<td>ManagedTopicB</td>
<td>1</td>
</tr>
<tr>
<td>ManagedTopicC</td>
<td>2</td>
</tr>
<tr>
<td>ManagedTopicD</td>
<td>3</td>
</tr>
<tr>
<td>ManagedTopicE</td>
<td>4</td>
</tr>
</tbody>
</table>

And you reorder managed topics by including this information in `ConnectApi.ManagedTopicPositionCollectionInput`:

<table>
<thead>
<tr>
<th>Managed Topic</th>
<th>Position</th>
</tr>
</thead>
<tbody>
<tr>
<td>ManagedTopicD</td>
<td>0</td>
</tr>
<tr>
<td>ManagedTopicE</td>
<td>2</td>
</tr>
</tbody>
</table>

The result is:

<table>
<thead>
<tr>
<th>Managed Topic</th>
<th>Position</th>
</tr>
</thead>
<tbody>
<tr>
<td>ManagedTopicD</td>
<td>0</td>
</tr>
<tr>
<td>ManagedTopicA</td>
<td>1</td>
</tr>
<tr>
<td>ManagedTopicE</td>
<td>2</td>
</tr>
<tr>
<td>ManagedTopicB</td>
<td>3</td>
</tr>
<tr>
<td>ManagedTopicC</td>
<td>4</td>
</tr>
</tbody>
</table>

Retired ManagedTopics Methods

The following methods for `ManagedTopics` are retired.
getManagedTopics(communityId, managedTopicType, recordId, depth)

Get managed topics of the specified type, including their parent and children managed topics, that are associated with a given topic in an Experience Cloud site.

API Version
35.0–37.0

Important: In version 38.0 and later, use getManagedTopics(communityId, managedTopicType, recordIds, depth).

Available to Guest Users
35.0

Requires Chatter
No

Signature

public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId, ConnectApi.ManagedTopicType managedTopicType, String recordId, Integer depth)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

managedTopicType
Type: ConnectApi.ManagedTopicType
Type of managed topic.
- Content—Topics that are associated with native content.
- Featured—Topics that are featured, for example, on the Experience Cloud site home page, but don’t provide overall navigation.
- Navigational—Topics that display in a navigational menu in the Experience Cloud site.
A topic can be associated with all three managed topic types, so a topic can be a Featured, Navigational, and Content topic.

recordId
Type: String
ID of the topic associated with the managed topics.
depth
Type: Integer
Specify an integer 1–8. If you specify 1, the children property of the ConnectApi.ManagedTopic output class is null. If you specify 2, the children property of the ConnectApi.ManagedTopic output class contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn’t specified, it defaults to 1.

Return Value
Type: ConnectApi.ManagedTopicCollection

MarketingIntegration Class
Get, save, and submit a microsites marketing integration form for an Experience Cloud site.

Namespace
ConnectApi

MarketingIntegration Methods
The following are methods for MarketingIntegration. All methods are static.
MarketingIntegration methods make calls to Marketing Cloud REST APIs to create, query, and insert data to the data extension object. If Marketing Cloud REST APIs return errors, ConnectinApex error messages include the error code and message from Marketing Cloud.

IN THIS SECTION:
getForm(siteId, formId)
Get a marketing integration form for an Experience Cloud site.
saveForm(siteId, formInput)
Save a marketing integration form for an Experience Cloud site.
submitForm(siteId, formId, formSubmissionInput)
Submit a marketing integration form for an Experience Cloud site.

getForm(siteId, formId)
Get a marketing integration form for an Experience Cloud site.

API Version
53.0

Requires Chatter
No
**Signature**

```
public static ConnectApi.Form getForm(String siteId, String formId)
```

**Parameters**

- `siteId`
  - Type: `String`
  - ID for the Experience Cloud site.

- `formId`
  - Type: `String`
  - ID of the form.

**Return Value**

Type: `ConnectApi.Form`

---

**saveForm(siteId, formInput)**

Save a marketing integration form for an Experience Cloud site.

**API Version**

S3.0

**Requires Chatter**

No

**Signature**

```
public static ConnectApi.Form saveForm(String siteId, ConnectApi.FormInput formInput)
```

**Parameters**

- `siteId`
  - Type: `String`
  - ID for the Experience Cloud site.

- `formInput`
  - Type: `ConnectApi.FormInput`
  - A `ConnectApi.FormInput` object to save.

**Return Value**

Type: `ConnectApi.Form`
Usage
This method attempts to create a read-only data extension in Marketing Cloud. A Marketing Cloud admin can change the read-only setting. We recommend keeping the data extension as read-only to maintain schema consistency with the form.

submitForm(siteId, formId, formSubmissionInput)
Submit a marketing integration form for an Experience Cloud site.

API Version
53.0

Available to Guest Users
53.0

Requires Chatter
No

Signature
public static ConnectApi.FormSubmission submitForm(String siteId, String formId, ConnectApi.FormSubmissionInput formSubmissionInput)

Parameters

siteId
 Type: String
 ID for the Experience Cloud site.

formId
 Type: String
 ID of the form.

formSubmissionInput
 Type: ConnectApi.FormSubmissionInput
 A ConnectApi.FormSubmissionInput object to submit.

Return Value
Type: ConnectApi.FormSubmission

Mentions Class
Access information about mentions. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.
Namespace

ConnectApi

Mentions Methods

The following are methods for Mentions. All methods are static.

IN THIS SECTION:

getMentionCompletions(communityId, q, contextId)
Get the first page of possible users and groups to mention in a feed item body or comment body.

getMentionCompletions(communityId, q, contextId, type, pageParam, pageSize)
Get a page of possible mention proposals of the specified type.

getMentionValidations(communityId, parentId, recordIds, visibility)
Get information about whether the mentions are valid for the context user.

getMentionCompletions(communityId, q, contextId)
Get the first page of possible users and groups to mention in a feed item body or comment body.

API Version

29.0

Requires Chatter

Yes

Signature

public static ConnectApi.MentionCompletionPage getMentionCompletions (String communityId, String q, String contextId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn’t require a minimum number of characters. This parameter does not support wildcards.

customId
Type: String
A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.
Return Value
Type: `ConnectApi.MentionCompletionPage`

Usage
Call this method to generate a page of proposed mentions that a user can choose from when they enter characters after `@` in a feed item body or a comment body.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestGetMentionCompletions(communityId, q, contextId, result)`
  
  *Apex Developer Guide: Testing ConnectApi Code*

```
getMentionCompletions(communityId, q, contextId, type, pageParam, pageSize)
```
Get a page of possible mention proposals of the specified type.

API Version
29.0

Requires Chatter
Yes

Signature
```
public static ConnectApi.Mentions getMentionCompletions (String communityId, String q, String contextId, ConnectApi.MentionCompletionType type, Integer pageParam, Integer pageSize)
```

Parameters
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, `internal`, or `null`.

- `q`
  Type: `String`
  A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

- `contextId`
  Type: `String`
  A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.
**Type**

Type: `ConnectApi.MentionCompletionType`

Type of mention completion.

- **All**—All mention completions, regardless of the type of record to which the mention refers.
- **Group**—Mention completions for groups.
- **User**—Mention completions for users.

**pageParam**

Type: `Integer`

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

**pageSize**

Type: `Integer`

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**Return Value**

Type: `ConnectApi.MentionCompletionPage`

**Usage**

Call this method to generate a page of proposed mentions that a user can choose from when they enter characters after @ in a feed item body or a comment body.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestGetMentionCompletions(communityId, q, contextId, type, pageParam, pageSize, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

**getMentionValidations(communityId, parentId, recordIds, visibility)**

Get information about whether the mentions are valid for the context user.

**API Version**

29.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.Mentions getMentionValidations(String communityId, String parentId, List<String> recordIds, ConnectApi.FeedItemVisibilityType visibility)
```
Parameters

- **communityId**
  - Type: **String**
  - ID for an Experience Cloud site, internal, or **null**.

- **parentId**
  - Type: **String**
  - The feed item parent ID.

- **recordIds**
  - Type: List<String>
  - A comma-separated list of IDs to be mentioned. The maximum value is 25.

- **visibility**
  - Type: ConnectApi.FeedItemVisibilityType
  - Type of users who can see a feed item.
    - AllUsers—Visibility is not limited to internal users.
    - InternalUsers—Visibility is limited to internal users.

Return Value

- Type: **ConnectApi.MentionValidations**

Usage

Call this method to check whether the record IDs returned from a call to ConnectApi.Mentions.getMentionCompletions are valid for the context user. For example, the context users can’t mention private groups they don’t belong to. If such a group were included in the list of mention validations, the ConnectApi.MentionValidations.hasErrors property would be **true** and the group would have a ConnectApi.MentionValidation.validationStatus of Disallowed.

Mentions Test Methods

These are the test methods for Mentions. All methods are static.

For information about using these methods to test your ConnectApi code, see Testing ConnectApi Code.

**setTestGetMentionCompletions(communityId, q, contextId, result)**

Register a ConnectApi.MentionCompletionPage object to be returned when getMentionCompletions(String, String, String) is called in a test context.

API Version

29.0

Signature

public static Void setTestGetMentionCompletions (String communityId, String q, String contextId, ConnectApi.MentionCompletionPage result)
Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn’t require a minimum number of characters. This parameter does not support wildcards.

contextId
Type: String
A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

result
Type: ConnectApi.MentionCompletionPage
A ConnectApi.MentionCompletionPage object containing test data.

Return Value
Type: Void

SEE ALSO:
getMentionCompletions(communityId, q, contextId)

setTestGetMentionCompletions(communityId, q, contextId, type, pageParam, pageSize, result)
Register a ConnectApi.MentionCompletionPage object to be returned when getMentionCompletions(String, String, String, ConnectApi.MentionCompletionType, Integer, Integer) is called in a test context.

API Version
29.0

Signature
public static Void setTestGetMentionCompletions(String communityId, String q, String contextId, ConnectApi.MentionCompletionType type, Integer pageParam, Integer pageSize, ConnectApi.MentionCompletionPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.
q
Type: String
A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn’t require a minimum number of characters. This parameter does not support wildcards.

contextId
Type: String
A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

type
Type: ConnectApi.MentionCompletionType
Type of mention completion.
• All—All mention completions, regardless of the type of record to which the mention refers.
• Group—Mention completions for groups.
• User—Mention completions for users.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

result
Type: ConnectApi.MentionCompletionPage
A ConnectApi.MentionCompletionPage object containing test data.

Return Value
Type: Void

SEE ALSO:
getMentionCompletions(communityId, q, contextId, type, pageParam, pageSize)

Missions Class
Export and purge mission activity for users. Get a user’s mission progress. Update mission activity counts for users.

Namespace
ConnectApi

Missions Methods
The following are methods for Missions. All methods are static.
IN THIS SECTION:

exportUserMissionsActivities(communityId, userId)
Export mission activity for a user.

ggetUserMissionsProgress(communityId, userId)
Get mission activity progress for a user.

purgeUserMissionsActivities(communityId, userId)
Start a job to purge mission activity for a user.

purgeUserMissionsActivities(communityId)
Start a job to purge mission activity for all users.

updateUserMissionActivityCount(activityType, activityCount, communityId, userId)
Update the mission activity count for a user.

---

**exportUserMissionsActivities(communityId, userId)**

Export mission activity for a user.

**API Version**

45.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.UserMissionActivitiesJob exportUserMissionsActivities(String communityId, String userId)
```

**Parameters**

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `userId`
  - Type: `String`
  - ID of the user.

**Return Value**

Type: `ConnectApi.UserMissionActivitiesJob`

**Usage**

You can export these activities with this method.

- `FeedItemAnswerAQuestion`—User answered a question.
• FeedItemLikeSomething—User liked a post or comment.
• FeedItemMarkAnswerAsBest—User marked an answer as the best answer.
• FeedItemPostQuestion—User posted a question.
• FeedItemReceiveAComment—User received a comment on a post.
• FeedItemReceiveALike—User received a like on a post or comment.
• FeedItemReceiveAnAnswer—User received an answer to a question.
• FeedItemWriteAComment—User commented on a post.
• FeedItemWriteAPost—User made a post.
• FeedItemYourAnswerMarkedBest—User’s answer was marked as the best answer.

getUserMissionsProgress(communityId, userId)
Get mission activity progress for a user.

API Version
46.0

Requires Chatter
Yes

Signature
public static ConnectApi.UserMissionActivityCollection getUserMissionsProgress(String communityId, String userId)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID of the user.

Return Value
Type: ConnectApi.UserMissionActivityCollection

purgeUserMissionsActivities(communityId, userId)
Start a job to purge mission activity for a user.

API Version
45.0
Requires Chatter
Yes

Signature
public static ConnectApi.UserMissionActivitiesJob purgeUserMissionsActivities(String communityId, String userId)

Parameters
communityId
    Type: String
    ID for an Experience Cloud site, internal, or null.

userId
    Type: String
    ID of the user.

Return Value
Type: ConnectApi.UserMissionActivitiesJob

Usage
This method purges these activities.
- FeedItemAnswerAQuestion—User answered a question.
- FeedItemLikeSomething—User liked a post or comment.
- FeedItemMarkAnswerAsBest—User marked an answer as the best answer.
- FeedItemPostQuestion—User posted a question.
- FeedItemReceiveAComment—User received a comment on a post.
- FeedItemReceiveALike—User received a like on a post or comment.
- FeedItemReceiveAnAnswer—User received an answer to a question.
- FeedItemWriteAComment—User commented on a post.
- FeedItemWriteAPost—User made a post.
- FeedItemYourAnswerMarkedBest—User’s answer was marked as the best answer.

purgeUserMissionsActivities(communityId)
Start a job to purge mission activity for all users.

API Version
49.0

Requires Chatter
Yes
public static ConnectApi.UserMissionActivitiesJob purgeUserMissionsActivities(String communityId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

Return Value
Type: ConnectApi.UserMissionActivitiesJob

Usage
This method purges these activities.

- FeedItemAnswerAQuestion — User answered a question.
- FeedItemLikeSomething — User liked a post or comment.
- FeedItemMarkAnswerAsBest — User marked an answer as the best answer.
- FeedItemPostQuestion — User posted a question.
- FeedItemReceiveAComment — User received a comment on a post.
- FeedItemReceiveALike — User received a like on a post or comment.
- FeedItemReceiveAnAnswer — User received an answer to a question.
- FeedItemWriteAComment — User commented on a post.
- FeedItemWriteAPost — User made a post.
- FeedItemYourAnswerMarkedBest — User’s answer was marked as the best answer.

updateUserMissionActivityCount(activityType, activityCount, communityId, userId)
Update the mission activity count for a user.

API Version
45.0

Requires Chatter
Yes

Signature
public static ConnectApi.UserMissionActivityStatus updateUserMissionActivityCount(ConnectApi.UserMissionActivityType activityType, Integer activityCount, String communityId, String userId)
Parameters

**activityType**
   Type: **ConnectApi.UserMissionActivityType**
   Type of mission activity for a user. Values are:
   - **FeedItemAnswerAQuestion**—User answered a question.
   - **FeedItemLikeSomething**—User liked a post or comment.
   - **FeedItemMarkAnswerAsBest**—User marked an answer as the best answer.
   - **FeedItemPostQuestion**—User posted a question.
   - **FeedItemReceiveAComment**—User received a comment on a post.
   - **FeedItemReceiveALike**—User received a like on a post or comment.
   - **FeedItemReceiveAnAnswer**—User received an answer to a question.
   - **FeedItemWriteAComment**—User commented on a post.
   - **FeedItemWriteAPost**—User made a post.
   - **FeedItemYourAnswerMarkedBest**—User’s answer was marked as the best answer.

**activityCount**
   Type: **Integer**
   Number of mission activities of the specified type for the user.

**communityId**
   Type: **String**
   ID for an Experience Cloud site, internal, or null.

**userId**
   Type: **String**
   ID of the user.

Return Value
Type: **ConnectApi.UserMissionActivityStatus**

**NamedCredentials Class**

Create, refresh, get, delete, replace, and update credentials. Create and get external credentials. Create and get named credentials. Get the URL for the OAuth token flow for an external credential.

**Note:** Managed packages can access only the named credentials and external credentials that are included in or created from the package’s Apex code. If a managed package tries to access non-packaged named credentials and external credentials that a Salesforce admin created in the org, an error occurs.

**Namespace**

ConnectApi

**NamedCredentials Methods**

The following are methods for **NamedCredentials**. All methods are static.
IN THIS SECTION:

createCredential(requestBody)
Create a credential.

createCredential(requestBody, action)
Refresh an OAuth or AWS Roles Anywhere credential.

createExternalCredential(requestBody)
Create an external credential.

createNamedCredential(requestBody)
Create a named credential.

deleteCredential(externalCredential, principalName, principalType)
Delete a credential.

deleteCredential(externalCredential, principalName, principalType, authenticationParameters)
Delete a credential with authentication parameters.

getCredential(externalCredential, principalName, principalType)
Get a credential.

getExternalCredential(developerName)
Get an external credential, including the named credentials and principals associated with it and the type and status of each principal.

getExternalCredentials()
Get external credentials that the user can authenticate to.

getNamedCredential(developerName)
Get a named credential.

getNamedCredentials()
Get a list of named credentials for the org.

getOAuthCredentialAuthUrl(requestBody)
Get the URL for the OAuth token flow for an external credential.

patchCredential(requestBody)
Update custom credentials.

updateCredential(requestBody)
Replace a credential.

createCredential (requestBody)
Create a credential.

API Version
56.0

Requires Chatter
No
public static ConnectApi.Credential createCredential(ConnectApi.CredentialInput requestBody)

Parameters
requestBody
Type: ConnectApi.CredentialInput
A ConnectApi.CredentialInput class.

Return Value
Type: ConnectApi.Credential

createCredential(requestBody, action)
Refresh an OAuth or AWS Roles Anywhere credential.

API Version
58.0

Requires Chatter
No

Signature
public static ConnectApi.Credential createCredential(ConnectApi.CredentialInput requestBody, ConnectApi.CreateCredentialAction action)

Parameters
requestBody
Type: ConnectApi.CredentialInput
A ConnectApi.CredentialInput class.
action
Type: ConnectApi.CreateCredentialAction
Action to take when creating the credential. Value is:
• Refresh

Return Value
Type: ConnectApi.Credential

createExternalCredential(requestBody)
Create an external credential.
API Version
58.0

Requires Chatter
No

Signature
public static ConnectApi.ExternalCredential createExternalCredential(ConnectApi.ExternalCredentialInput requestBody)

Parameters
requestBody
  Type: ConnectApi.ExternalCredentialInput
  Input used to create or update an external credential.

Return Value
Type: ConnectApi.ExternalCredential

createNamedCredential(requestBody)
Create a named credential.

API Version
58.0

Requires Chatter
No

Signature
public static ConnectApi.NamedCredential createNamedCredential(ConnectApi.NamedCredentialInput requestBody)

Parameters
requestBody
  Type: ConnectApi.NamedCredentialInput
  Input used to create or update a named credential.

Return Value
Type: ConnectApi.NamedCredential
deleteCredential(externalCredential, principalName, principalType)
Delete a credential.

API Version
56.0

Requires Chatter
No

Signature
public static Void deleteCredential(String externalCredential, String principalName, ConnectApi.CredentialPrincipalType principalType)

Parameters

externalCredential
Type: String
Fully qualified developer name of the external credential.

principalName
Type: String
Name of the external credential named principal.

principalType
Type: ConnectApi.CredentialPrincipalType
Type of credential principal. Values are:
• AwsStsPrincipal
• NamedPrincipal
• PerUserPrincipal

Return Value
Type: Void

deleteCredential(externalCredential, principalName, principalType, authenticationParameters)
Delete a credential with authentication parameters.

API Version
59.0

Requires Chatter
No
**Signature**

```java
public static Void deleteCredential(String externalCredential, String principalName,
ConnectApi.CredentialPrincipalType principalType, List<String> authenticationParameters)
```

**Parameters**

- `externalCredential`
  - Type: `String`
  - Fully qualified developer name of the external credential.

- `principalName`
  - Type: `String`
  - Name of the external credential named principal.

- `principalType`
  - Type: `ConnectApi.CredentialPrincipalType`
  - Type of credential principal. Values are:
    - `AwsStsPrincipal`
    - `NamedPrincipal`
    - `PerUserPrincipal`

- `authenticationParameters`
  - Type: `List<String>`
  - List of authentication parameters only for custom protocols, for example `myApiKey, myApiSecret`. If unspecified, all credentials are deleted.

**Return Value**

Type: `Void`

**getCredential(externalCredential, principalName, principalType)**

Get a credential.

**API Version**

56.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.Credential getCredential(String externalCredential, String
principalName, ConnectApi.CredentialPrincipalType principalType)
```
Parameters

externalCredential
Type: String
Fully qualified developer name of the external credential.

principalName
Type: String
Name of the external credential named principal.

principalType
Type: ConnectApi.CredentialPrincipalType
Type of credential principal. Values are:
- AwsStsPrincipal
- NamedPrincipal
- PerUserPrincipal

Return Value
Type: ConnectApi.Credential

getExternalCredential('developerName')
Get an external credential, including the named credentials and principals associated with it and the type and status of each principal.

API Version
56.0

Requires Chatter
No

Signature
public static ConnectApi.ExternalCredential getExternalCredential(String 'developerName')

Parameters
developerName
Type: String
Fully qualified developer name of the external credential.

Return Value
Type: ConnectApi.ExternalCredential

getExternalCredentials()
Get external credentials that the user can authenticate to.
API Version
56.0

Requires Chatter
No

Signature
public static ConnectApi.ExternalCredentialList getExternalCredentials()

Return Value
Type: ConnectApi.ExternalCredentialList

getNamedCredential(developerName)
Get a named credential.

API Version
59.0

Requires Chatter
No

Signature
public static ConnectApi.NamedCredential getNamedCredential(String developerName)

Parameters
developerName
Type: String
Fully qualified developer name of the named credential.

Return Value
Type: ConnectApi.NamedCredential

getNamedCredentials()
Get a list of named credentials for the org.

API Version
59.0
Required Chatter
No

Signature

```java
public static ConnectApi.NamedCredentialList getNamedCredentials()
```

Return Value
Type: `ConnectApi.NamedCredentialList`

```java
getOAuthCredentialAuthUrl(requestBody)
```
Get the URL for the OAuth token flow for an external credential.

API Version
56.0

Requires Chatter
No

Signature

```java
public static ConnectApi.OAuthCredentialAuthUrl getOAuthCredentialAuthUrl(ConnectApi.OAuthCredentialAuthUrlInput requestBody)
```

Parameters

- **requestBody**
  Type: `ConnectApi.OAuthCredentialAuthUrlInput`
  A `ConnectApi.OAuthCredentialAuthUrlInput` class indicating the OAuth authentication flow.

Return Value
Type: `ConnectApi.OAuthCredentialAuthUrl`

Usage
Accepts input parameters representing a specific external credential and, optionally, a named principal. Returns the URL a user must visit to begin the authentication flow, ultimately returning authentication tokens to Salesforce. Use this method as part of building a customized or branded user interface to help users initiate authentication.

Example

```java
ConnectApi.OAuthCredentialAuthUrlInput input = new ConnectApi.OAuthCredentialAuthUrlInput();
input.externalCredential = 'MyExternalCredentialDeveloperName';
input.principalType = ConnectApi.CredentialPrincipalType.PerUserPrincipal;
```
input.principalName = 'MyPrincipal'; // Only required when principalType = NamedPrincipal

ConnectApi.OAuthCredentialAuthUrl output =
ConnectApi.NamedCredentials.getOAuthCredentialAuthUrl(input);

String authenticationUrl = output.authenticationUrl; // Redirect users to this URL to authenticate in the browser

**patchCredential** *(requestBody)*

Update custom credentials.
This method updates custom credentials. To replace a credential, use **updateCredential** *(requestBody)* .

**API Version**
$9.0

**Requires Chatter**
No

**Signature**

```
public static ConnectApi.Credential patchCredential(ConnectApi.CredentialInput requestBody)
```

**Parameters**

*requestBody*
Type: **ConnectApi.CredentialInput**
A ConnectApi.CredentialInput class. Only the custom credentials in the input class are updated.

**Return Value**
Type: **ConnectApi.Credential**

**updateCredential** *(requestBody)*

Replace a credential.
This method replaces a credential. To update a credential, use **patchCredential** *(requestBody)* .

**API Version**
$6.0

**Requires Chatter**
No
Signature

```java
public static ConnectApi.Credential updateCredential(ConnectApi.CredentialInput requestBody)
```

Parameters

```java
requestBody
  Type: ConnectApi.CredentialInput
  A ConnectApi.CredentialInput class.
```

Return Value

Type: ConnectApi.Credential

NavigationMenu Class

Get navigation menu items for an Experience Cloud site.

Namespace

ConnectApi

NavigationMenu Methods

These methods are for NavigationMenu. All methods are static.

IN THIS SECTION:

```java
getCommunityNavigationMenu(communityId, navigationLinkSetId, navigationLinkSetDeveloperName, publishStatus, includeImageUrl, addHomeMenuItem, menuItemTypesToSkip)
Get navigation menu items for an Experience Cloud site.

getCommunityNavigationMenu(communityId, navigationLinkSetId, navigationLinkSetDeveloperName, publishStatus, includeImageUrl, addHomeMenuItem, menuItemTypesToSkip, effectiveAccountId)
Get navigation menu items for an Experience Cloud based on an effective account.
```

```java
getCommunityNavigationMenu(communityId, navigationLinkSetId, navigationLinkSetDeveloperName, publishStatus, includeImageUrl, addHomeMenuItem, menuItemTypesToSkip)
Get navigation menu items for an Experience Cloud site.
```

API Version

52.0

Available to Guest Users

52.0
Requires Chatter
No

Signature

public static ConnectApi.NavigationMenuItemCollection getCommunityNavigationMenu(String communityId, String navigationLinkSetId, String navigationLinkSetDeveloperName, ConnectApi.PublishStatus publishStatus, Boolean includeImageUrl, Boolean addHomeMenuItem, List<ConnectApi.NavigationMenuItemType> menuItemTypesToSkip)

Parameters

communityId
Type: String
ID of an Experience Cloud site.

navigationLinkSetId
Type: String
ID of the navigation link set.

navigationLinkSetDeveloperName
Type: String
Developer name of the navigation link set.

publishStatus
Type: ConnectApi.PublishStatus
Publish status of the navigation menu item. Values are:
- Draft
- Live

includeImageUrl
Type: Boolean
Specifies whether to include the image URL with the menu item (true) or not (false).

addHomeMenuItem
Type: Boolean
Specifies whether to add the Home menu item (true) or not (false).

menuItemTypesToSkip
Type: List<ConnectApi.NavigationMenuItemType>
List of menu item types to filter out of the results. Values are:
- DataSourceDriven—Menu items dynamically added from a data source.
- Event—Event, such as logging in, logging out, or switching accounts.
- ExternalLink—URL outside of your site.
- GlobalAction—Lets users create records that aren’t related to other records.
- InternalLink—Relative URL inside your site.
- MenuLabel—Menu label.
- Modal—Modal, such as Account Switcher.
- NavigationalTopic—Dropdown list with links to the navigational topics in your site.
- SalesforceObject—Objects such as accounts, cases, contacts, and custom objects.
- SystemLink—System link, such as a link to Builder, Workspaces, or Setup.

**Return Value**

Type: `ConnectApi.NavigationMenuItemCollection`

**Usage**

Supported navigation menu item types are:

- DataSourceDriven—Menu items dynamically added from a data source.
- Event—Event, such as logging in, logging out, or switching accounts.
- ExternalLink—URL outside of your site.
- GlobalAction—Lets users create records that aren't related to other records.
- InternalLink—Relative URL inside your site.
- MenuLabel—Menu label.
- Modal—Modal, such as Account Switcher.
- NavigationalTopic—Dropdown list with links to the navigational topics in your site.
- SalesforceObject—Objects such as accounts, cases, contacts, and custom objects.
- SystemLink—System link, such as a link to Builder, Workspaces, or Setup.

```java
getCommunityNavigationMenu(String communityId, String navigationLinkSetId, String navigationLinkSetDeveloperName, ConnectApi.PublishStatus publishStatus, Boolean includeImageUrl, Boolean addHomeMenuItem, List<ConnectApi.NavigationMenuItemType> menuItemTypesToSkip, String effectiveAccountId)
```

Get navigation menu items for an Experience Cloud based on an effective account.

**API Version**

54.0

**Available to Guest Users**

54.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.NavigationMenuItemCollection getCommunityNavigationMenu(String communityId, String navigationLinkSetId, String navigationLinkSetDeveloperName, ConnectApi.PublishStatus publishStatus, Boolean includeImageUrl, Boolean addHomeMenuItem, List<ConnectApi.NavigationMenuItemType> menuItemTypesToSkip, String effectiveAccountId)
```
Parameters

communityId
Type: String
ID of an Experience Cloud site.

navigationLinkSetId
Type: String
ID of the navigation link set.

navigationLinkSetDeveloperName
Type: String
Developer name of the navigation link set.

publishStatus
Type: ConnectApi.PublishStatus
Publish status of the navigation menu item. Values are:
- Draft
- Live

includeImageUrl
Type: Boolean
Specifies whether to include the image URL with the menu item (true) or not (false).

addHomeMenuItem
Type: Boolean
Specifies whether to add the Home menu item (true) or not (false).

menuItemTypesToSkip
Type: List<ConnectApi.NavigationMenuItemType>
List of menu item types to filter out of the results. Values are:
- DataSourceDriven—Menu items dynamically added from a data source.
- Event—Event, such as logging in, logging out, or switching accounts.
- ExternalLink—URL outside of your site.
- GlobalAction—Lets users create records that aren’t related to other records.
- InternalLink—Relative URL inside your site.
- MenuLabel—Menu label.
- Modal—Modal, such as Account Switcher.
- NavigationalTopic—Dropdown list with links to the navigational topics in your site.
- SalesforceObject—Objects such as accounts, cases, contacts, and custom objects.
- SystemLink—System link, such as a link to Builder, Workspaces, or Setup.

effectiveAccountId
Type: String
ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user.

Return Value
Type: ConnectApi.NavigationMenuItemCollection
Usage

Supported navigation menu item types are:

- **DataSourceDriven**—Menu items dynamically added from a data source.
- **Event**—Event, such as logging in, logging out, or switching accounts.
- **ExternalLink**—URL outside of your site.
- **GlobalAction**—Lets users create records that aren’t related to other records.
- **InternalLink**—Relative URL inside your site.
- **MenuLabel**—Menu label.
- **Modal**—Modal, such as Account Switcher.
- **NavigationalTopic**—Dropdown list with links to the navigational topics in your site.
- **SalesforceObject**—Objects such as accounts, cases, contacts, and custom objects.
- **SystemLink**—System link, such as a link to Builder, Workspaces, or Setup.

**NextBestAction Class**

Execute recommendation strategies, get recommendations, manage recommendation reactions.

**Namespace**

ConnectApi

**Usage**

Community users can’t access this class. Portal and guest users can access strategies only through the Suggested Actions component.

**NextBestAction Methods**

The following are methods for NextBestAction. All methods are static.

<table>
<thead>
<tr>
<th>Method Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>deleteRecommendationReaction(reactionId)</code></td>
<td>Delete a recommendation reaction.</td>
</tr>
<tr>
<td><code>executeStrategy(strategyName, maxResults, contextRecordId)</code></td>
<td>Execute a strategy.</td>
</tr>
<tr>
<td><code>executeStrategy(strategyName, maxResults, contextRecordId, debugTrace)</code></td>
<td>Execute a strategy and request a trace.</td>
</tr>
<tr>
<td><code>executeStrategy(strategyName, strategyInput)</code></td>
<td>Execute a strategy using an input class.</td>
</tr>
<tr>
<td><code>getRecommendation(recommendationId)</code></td>
<td>Get a recommendation.</td>
</tr>
<tr>
<td><code>getRecommendationReaction(reactionId)</code></td>
<td>Get a recommendation reaction.</td>
</tr>
</tbody>
</table>
getRecommendationReactions(onBehalfOfId, createdById, targetId, contextRecordId, pageParam, pageSize)
Get recommendation reactions.

setRecommendationReaction(reaction)
Record user reactions to recommendations.

deleteRecommendationReaction(reactionId)
Delete a recommendation reaction.

API Version
45.0

Requires Chatter
No

Signature
public static Void deleteRecommendationReaction(String reactionId)

Parameters
reactionId
Type: String
ID of the recommendation reaction.

Return Value
Type: Void

Usage
Users with the Manage Next Best Action Recommendations or Modify All Data permission can delete recommendation reactions.

executeStrategy(strategyName, maxResults, contextRecordId)
Execute a strategy.

API Version
45.0

Available to Guest Users
45.0

Requires Chatter
No
Signature

```java
public static ConnectApi.NBARecommendations executeStrategy(String strategyName, Integer maxResults, String contextRecordId)
```

Parameters

- `strategyName`
  - Type: `String`
  - Name of the strategy.

- `maxResults`
  - Type: `Integer`
  - Maximum number of results. Valid values are from 1 to 25. The default is 3.

- `contextRecordId`
  - Type: `String`
  - ID of the context record. For example, if the next best action is on a case detail page, the ID of the case.

Return Value

Type: `ConnectApi.NBARecommendations`

```java
executeStrategy(strategyName, maxResults, contextRecordId, debugTrace)
```

Execute a strategy and request a trace.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

No

Signature

```java
public static ConnectApi.NBARecommendations executeStrategy(String strategyName, Integer maxResults, String contextRecordId, Boolean debugTrace)
```

Parameters

- `strategyName`
  - Type: `String`
  - Name of the strategy.

- `maxResults`
  - Type: `Integer`
  - Maximum number of results. Valid values are from 1 to 25. The default is 3.
Maximum number of results. Valid values are from 1 to 25. The default is 3.

**contextRecordId**
Type: String

ID of the context record. For example, if the next best action is on a case detail page, the ID of the case.

**debugTrace**
Type: Boolean

Specifies whether to return trace and debug information in the response (true) or not (false).

### Return Value
Type: `ConnectApi.NBARecommendations`

#### executeStrategy(strategyName, strategyInput)
Execute a strategy using an input class.

### API Version
45.0

### Available to Guest Users
45.0

### Requires Chatter
No

### Signature

```java
public static ConnectApi.NBARecommendations executeStrategy(String strategyName, ConnectApi.NBAStrategyInput strategyInput)
```

### Parameters

- **strategyName**
  Type: String
  Name of the strategy.

- **strategyInput**
  Type: `ConnectApi.NBAStrategyInput`
  A `ConnectApi.NBAStrategyInput` body.

### Return Value
Type: `ConnectApi.NBARecommendations`
**getRecommendation(recommendationId)**
Get a recommendation.

**API Version**
45.0

**Requires Chatter**
No

**Signature**
```
public static ConnectApi.Recommendation getRecommendation(String recommendationId)
```

**Parameters**
- `recommendationId`
  - Type: `String`
  - ID of the recommendation.

**Return Value**
Type: `ConnectApi.Recommendation`

---

**getRecommendationReaction(reactionId)**
Get a recommendation reaction.

**API Version**
45.0

**Requires Chatter**
No

**Signature**
```
public static ConnectApi.RecommendationReaction getRecommendationReaction(String reactionId)
```

**Parameters**
- `reactionId`
  - Type: `String`
  - ID of the recommendation reaction.
Return Value
Type: `ConnectApi.RecommendationReaction`

Usage
Users with the Manage Next Best Action Recommendations or Modify All Data permission can get recommendation reactions.

`getRecommendationReactions(onBehalfOfId, createdById, targetId, contextRecordId, pageParam, pageSize)`
Get recommendation reactions.

API Version
45.0

Requires Chatter
No

Signature
`public static ConnectApi.RecommendationReactions getRecommendationReactions(String onBehalfOfId, String createdById, String targetId, String contextRecordId, Integer pageParam, Integer pageSize)`

Parameters
`onBehalfOfId`
Type: `String`
Use the ID of the user who is indirectly reacting to the recommendation to filter the results.

`createdById`
Type: `String`
Use the ID of the user or record that created the recommendation reaction to filter the results.

`targetId`
Type: `String`
Use the ID of the target to filter the results.

`contextRecordId`
Type: `String`
Use the ID of a context record to filter the results.

`pageParam`
Type: `Integer`
Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: `Integer`
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.
Return Value
Type: ConnectApi.RecommendationReaction

Usage
Users with the Manage Next Best Action Recommendations or Modify All Data permission can get recommendation reactions.

setRecommendationReaction(reaction)
Record user reactions to recommendations.

API Version
45.0

Available to Guest Users
48.0

Requires Chatter
No

Signature
public static ConnectApi.RecommendationReaction setRecommendationReaction(ConnectApi.RecommendationReactionInput reaction)

Parameters
reaction
Type: ConnectApi.RecommendationReactionInput
A ConnectApi.RecommendationReactionInput object representing a reaction to a recommendation produced by a recommendation strategy.

Return Value
Type: ConnectApi.RecommendationReaction

OmnichannelInventoryService Class
Route orders to inventory locations in Order Management.

Namespace
ConnectApi
OmnichannelInventoryService Methods

The following are methods for OmnichannelInventoryService. All methods are static.

**IN THIS SECTION:**
- `createReservation(createReservationInputRepresentation)`
- `fulfillReservation(fulfillReservationInputRepresentation)`
- `getInventoryAvailability(inventoryAvailabilityInputRepresentation)`
- `getInventoryAvailabilityUploadStatus(uploadId)`
- `getPublishLocationStructureStatus(uploadId)`
- `publishLocationStructure()`
- `releaseReservation(releaseReservationInputRepresentation)`
- `submitInventoryAvailabilityUpload(fileUpload)`
- `transferReservation(transferReservationInputRepresentation)`

---

### `createReservation(createReservationInputRepresentation)`
Create an inventory reservation in Omnichannel Inventory.

**API Version**
51.0

**Requires Chatter**
No

**Signature**

```java
public static ConnectApi.OCICreateReservationOutputRepresentation createReservation(ConnectApi.OCICreateReservationInputRepresentation)
```
Parameters

createReservationInputRepresentation

Type: ConnectApi.OCICreateReservationInputRepresentation

Data to reserve inventory at one or more Omnichannel Inventory locations or location groups.

Return Value

Type: ConnectApi.OCICreateReservationOutputRepresentation

fulfillReservation(fulfillReservationInputRepresentation)

Fulfill one or more inventory reservations.

API Version

$1.0

Requires Chatter

No

Signature

public static ConnectApi.OCIFulfillReservationOutputRepresentation fulfillReservation(ConnectApi.OCIFulfillReservationInputRepresentation fulfillReservationInputRepresentation)

Parameters

fulfillReservationInputRepresentation

Type: ConnectApi.OCIFulfillReservationInputRepresentation

Wraps a list of inventory reservations to fulfill.

Return Value

Type: ConnectApi.OCIFulfillReservationOutputRepresentation

getInventoryAvailability(inventoryAvailabilityInputRepresentation)

Retrieve inventory availability data for one or more products at one or more inventory locations or location groups.

API Version

$1.0

Requires Chatter

No
Signature

```java
public static ConnectApi.OCIGetInventoryAvailabilityOutputRepresentation
getInventoryAvailability(ConnectApi.OCIGetInventoryAvailabilityInputRepresentation
inventoryAvailabilityInputRepresentation)
```

Parameters

`inventoryAvailabilityInputRepresentation`
Type: `ConnectApi.OCIGetInventoryAvailabilityInputRepresentation`
Details of a request to retrieve inventory availability.

Return Value
Type: `ConnectApi.OCIGetInventoryAvailabilityOutputRepresentation`

```java
getInventoryAvailabilityUploadStatus(uploadId)
```

Retrieve the status of an inventory availability upload job.

API Version
5.0

Requires Chatter
No

Signature

```java
public static ConnectApi.OCIUploadInventoryAvailabilityStatusOutputRepresentation
getInventoryAvailabilityUploadStatus(String uploadId)
```

Parameters

`uploadId`
Type: `String`
The upload ID of the upload job.

Return Value
Type: `ConnectApi.OCIUploadInventoryAvailabilityStatusOutputRepresentation`

```java
getPublishLocationStructureStatus(uploadId)
```

Retrieve the status of a publish location structure job.

API Version
5.0
Requires Chatter
No

Signature

public static ConnectApi.OCIPublishLocationStructureStatusOutputRepresentation
getPublishLocationStructureStatus(String uploadId)

Parameters

uploadId
  Type: String
  The upload ID of the publish job.

Return Value

Type: ConnectApi.OCIPublishLocationStructureStatusOutputRepresentation

publishLocationStructure()

Asynchronously publish information about your inventory locations and location groups to Omnichannel Inventory. The publish includes records whose isEnabled and ShouldSyncWithOci fields are both true. This method returns an ID that you can use to retrieve the status of the publish job.

API Version
S1.0

Requires Chatter
No

Signature

public static ConnectApi.OCIPublishLocationStructureOutputRepresentation
publishLocationStructure()

Return Value

Type: ConnectApi.OCIPublishLocationStructureOutputRepresentation

releaseReservation(releaseReservationInputRepresentation)

Release one or more existing inventory reservations to free up that inventory.

API Version
S1.0
Requires Chatter
No

Signature
public static ConnectApi.OCIReleaseReservationOutputRepresentation
releaseReservation(ConnectApi.OCIReleaseReservationInputRepresentation
releaseReservationInputRepresentation)

Parameters
releaseReservationInputRepresentation
  Type: ConnectApi.OCIReleaseReservationInputRepresentation
  Details of one or more inventory reservations to release.

Return Value
Type: ConnectApi.OCIReleaseReservationOutputRepresentation

submitInventoryAvailabilityUpload(fileUpload)
Upload an inventory availability data file to Omnichannel Inventory.

API Version
51.0

Requires Chatter
No

Signature
public static ConnectApi.OCIUploadInventoryAvailabilityOutputRepresentation
submitInventoryAvailabilityUpload(ConnectApi.BinaryInput fileUpload)

Parameters
fileUpload
  Type: ConnectApi.BinaryInput
  JSON file containing inventory availability data.

Return Value
Type: ConnectApi.OCIUploadInventoryAvailabilityOutputRepresentation

Usage
To create an inventory data file, format the data as a series of JSON entries representing locations and individual inventory records.
Inventory Import Data Considerations:

- Separate the top-level entries with line feeds, not commas. Each entry must be on a single line.
- When the system reads a location entry, it assigns the subsequent inventory entries to that location until it reads another location entry.
- For each location entry, specify "mode": "UPDATE".
- Each inventory record entry requires a unique recordId. Best practice is to use a UUID. The recordId protects against importing duplicate data.
- Each inventory record entry requires an effectiveDate.
- Each futures entry requires a nonzero quantity and a future expectedDate.
- The system only creates or updates entries that are included in the data. It doesn’t delete entries that aren’t included. However, if an included entry has an empty value, that value is deleted.

Note: The file size limit is 10 MB, and it must be in JSON format. For larger data sets, you can use the headless Commerce API or split the data into multiple files. The headless Commerce API accepts GZIP or JSON files up to 100 MB in size.

This example illustrates the data format:

Note: For readability, this example shows the first few entries on multiple lines. In the import file, each location and inventory record entry must be on a single line.

```json
{
"location":"Warehouse-A", // location identifier
"mode":"UPDATE" // must be UPDATE (other operations might be available in future releases)
}
{
"recordId":"0a87539d-f3dd-47bc-91c7-9c752e39dbe0", // unique identifier for the inventory record
"onHand":10,
"sku":"12389156",
"effectiveDate":"2020-12-08T14:05:22.790896-07:00",
"futures": [ // list of future restocks
{ "quantity":1,
 "expectedDate":"2021-04-18T14:05:22.781-07:00"
 },
 { "quantity":5,
 "expectedDate":"2021-05-18T14:05:22.781-07:00"
 }
],
"safetyStockCount":0
}
{
"recordId":"0a87539d-f3dd-47bc-91c7-9c752e312345",
"onHand":10,
"sku":"9485728",
"effectiveDate":"2020-12-08T14:05:22.790896-07:00",
"futures": [ // list of future restocks
{ "quantity":10,
 "expectedDate":"2021-04-18T14:05:22.781-07:00"
 }
]
```
transferReservation(transferReservationInputRepresentation)

Transfer one or more inventory reservations between locations or location groups. This API doesn't change physical quantities, but reduces the reserved quantity at the source and increases it at the destination.

API Version
51.0

Requires Chatter
No

Signature
public static ConnectApi.OCITransferReservationOutputRepresentation transferReservation(ConnectApi.OCITransferReservationInputRepresentation transferReservationInputRepresentation)

Parameters

transferReservationInputRepresentation
Type: ConnectApi.OCITransferReservationInputRepresentation
Wraps a list of inventory reservation transfers and specifies whether a single failure cancels the entire list.

Return Value
Type: ConnectApi.OCITransferReservationOutputRepresentation

Orchestration Class
Get orchestration instances.

Namespace
ConnectApi

Orchestration Methods
The following are methods for Orchestration. All methods are static.
IN THIS SECTION:

getOrchestrationInstanceCollection(relatedRecordId)
Get orchestration instances associated with a Salesforce record that’s configured as a context record for orchestration interactive steps.

getOrchestrationInstanceCollection(relatedRecordId)
Get orchestration instances associated with a Salesforce record that’s configured as a context record for orchestration interactive steps.

API Version
54.0

Requires Chatter
No

Signature
public static ConnectApi.OrchestrationInstanceCollection getOrchestrationInstanceCollection(String relatedRecordId)

Parameters
relatedRecordId
Type: String
The ID of a record configured as a context record for orchestration interactive steps.

Return Value
Type: ConnectApi.OrchestrationInstanceCollection

OrderPaymentSummary Class
Work with payments in Order Management.

Namespace
ConnectApi

OrderPaymentSummary Methods
The following are methods for OrderPaymentSummary. All methods are static.
IN THIS SECTION:

createOrderPaymentSummary(orderPaymentSummaryInput)

Create an OrderPaymentSummary for an OrderSummary. Specify a payment authorization or payments that share the same payment method. In an org with the multicurrency feature enabled, the OrderPaymentSummary inherits the CurrencyIsoCode value from the OrderSummary.

createOrderPaymentSummary(orderPaymentSummaryInput)

Create an OrderPaymentSummary for an OrderSummary. Specify a payment authorization or payments that share the same payment method. In an org with the multicurrency feature enabled, the OrderPaymentSummary inherits the CurrencyIsoCode value from the OrderSummary.

API Version

48.0

Requires Chatter

No

Signature

public static ConnectApi.CreateOrderPaymentSummaryOutputRepresentation createOrderPaymentSummary(ConnectApi.CreateOrderPaymentSummaryInputRepresentation orderPaymentSummaryInput)

Parameters

orderPaymentSummaryInput

Type: ConnectApi.CreateOrderPaymentSummaryInputRepresentation

The OrderSummary and payment authorization or payments.

Return Value

Type: ConnectApi.CreateOrderPaymentSummaryOutputRepresentation

Example

String orderSummaryId = '1Osxx0000004CCG';
String paymentId1 = '0a3xx0000000085AAA';
String paymentId2 = '0a3xx0000000085BBB';

ConnectApi.CreateOrderPaymentSummaryInputRepresentation orderPaymentSummaryInput = new
ConnectApi.CreateOrderPaymentSummaryInputRepresentation();
orderPaymentSummaryInput.orderSummaryId = orderSummaryId;
List<String> paymentList = new List<String>();
paymentList.add(paymentId1);
paymentList.add(paymentId2);
orderPaymentSummaryInput.paymentIds = paymentList;
ConnectApi.CreateOrderPaymentSummaryOutputRepresentation result =
  ConnectAPI.OrderPaymentSummary.createOrderPaymentSummary(orderPaymentSummaryInput);

OrderSummary Class

Work with orders in Order Management.

Namespace

ConnectApi

OrderSummary Methods

The following are methods for OrderSummary. All methods are static.

IN THIS SECTION:

  adjustPreview(orderSummaryId, adjustInput)
  Retrieve the expected results of adjusting the price of one or more OrderItemSummaries from an OrderSummary, without actually
  executing the adjustment. The response data contains the financial changes that would result from submitting the proposed
  adjustment.

  adjustSubmit(orderSummaryId, adjustInput)
  Adjust the price of one or more OrderItemSummaries from an OrderSummary, and create corresponding change orders.

  createCreditMemo(orderSummaryId, creditMemoInput)
  Create a credit memo to represent the refund for one or more change orders associated with an OrderSummary.

  createMultipleInvoices(invoicesInput)
  Create Invoices to represent the charges for one or more change orders. Create Invoices for change orders that increase order
  amounts, such as for return fees. When you ensure the refund for a return, include the invoices for any associated return fees in the
  request.

  ensureFundsAsync(orderSummaryId, ensureFundsInput)
  Ensure funds for an Invoice and apply them to it. If needed, capture authorized funds by sending a request to a payment provider.
  This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track
  its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

  ensureRefundsAsync(orderSummaryId, ensureRefundsInput)
  Ensure refunds for a CreditMemo or excess funds by sending a request to a payment provider. This method inserts a background
  operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses
  appear in the payment gateway log and do not affect the background operation status.

  multipleEnsureFundsAsync(multipleEnsureFundsInput)
  Ensure and apply funds for one or more Invoices. If needed, capture authorized funds by sending a request to a payment provider.
  This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track
  its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

  previewCancel(orderSummaryId, changeInput)
  Retrieve the expected change order values for canceling one or more OrderItemSummaries from an OrderSummary, without actually
  executing the cancel.
previewReturn(orderSummaryId, changelInput)
Retrieve the expected change order values for a simple return of one or more OrderItemSummaries from an OrderSummary, without actually executing the return.

submitCancel(orderSummaryId, changelInput)
Cancel one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order.

submitReturn(orderSummaryId, changelInput)
Return one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order. This return is a simple return that creates a change order but not a ReturnOrder.

adjustPreview(orderSummaryId, adjustInput)
Retrieve the expected results of adjusting the price of one or more OrderItemSummaries from an OrderSummary, without actually executing the adjustment. The response data contains the financial changes that would result from submitting the proposed adjustment.

API Version
49.0

Requires Chatter
No

Signature
public static ConnectApi.AdjustOrderSummaryOutputRepresentation adjustPreview(String orderSummaryId, ConnectApi.AdjustOrderItemSummaryInputRepresentation adjustInput)

Parameters
orderSummaryId
Type: String
ID of the OrderSummary.

adjustInput
Type: ConnectApi.AdjustOrderItemSummaryInputRepresentation
Price adjustments to OrderItemSummaries that together make up a price adjustment to an order, with options for adjusting items in the process of being fulfilled.

Return Value
Type: ConnectApi.AdjustOrderSummaryOutputRepresentation

Usage
When a price adjustment is applied to an OrderItemSummary, its quantities are considered in three groups:

Pre-fulfillment
QuantityAvailableToFulfill, which is equal to QuantityOrdered - QuantityCanceled - QuantityAllocated
In-fulfillment
  QuantityAllocated - QuantityFulfilled

Post-fulfillment
  QuantityAvailableToReturn, which is equal to QuantityFulfilled - QuantityReturnInitiated

You can apply adjustments to these groups in three different ways, controlled by the allocatedItemsChangeOrderType input property:

- Distribute the adjustment evenly between pre-fulfillment and post-fulfillment quantities. Ignore in-fulfillment quantities. Submitting the adjustment would create one change order for the adjustments to pre-fulfillment quantities and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Submitting the adjustment would create one change order for the adjustments to both pre-fulfillment and in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Submitting the adjustment would create one change order for the adjustments to pre-fulfillment quantities, one change order for the adjustments to in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.

SEE ALSO:
  createCreditMemo(orderSummaryId, creditMemoInput)
  ensureRefundsAsync(orderSummaryId, ensureRefundsInput)
  adjustSubmit(orderSummaryId, adjustInput)

adjustSubmit(orderSummaryId, adjustInput)

Adjust the price of one or more OrderItemSummaries from an OrderSummary, and create corresponding change orders.

API Version
49.0

Requires Chatter
No

Signature
public static ConnectApi.AdjustOrderSummaryOutputRepresentation adjustSubmit(String orderSummaryId, ConnectApi.AdjustOrderItemSummaryInputRepresentation adjustInput)

Parameters
  orderSummaryId
    Type: String
    ID of the OrderSummary.
  adjustInput
    Type: ConnectApi.AdjustOrderItemSummaryInputRepresentation
Price adjustments to OrderItemSummaries that together make up a price adjustment to an order, with options for adjusting items in the process of being fulfilled.

Return Value
Type: `ConnectApi.AdjustOrderSummaryOutputRepresentation`

Usage
When a price adjustment is applied to an OrderItemSummary, its quantities are considered in three groups:

**Pre-fulfillment**
QuantityAvailableToFulfill, which is equal to QuantityOrdered - QuantityCanceled - QuantityAllocated

**In-fulfillment**
QuantityAllocated - QuantityFulfilled

**Post-fulfillment**
QuantityAvailableToReturn, which is equal to QuantityFulfilled - QuantityReturnInitiated

You can apply adjustments to these groups in three different ways, controlled by the `allocatedItemsChangeOrderType` input property:

- Distribute the adjustment evenly between pre-fulfillment and post-fulfillment quantities. Ignore in-fulfillment quantities. Create one change order for the adjustments to pre-fulfillment quantities and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Create one change order for the adjustments to both pre-fulfillment and in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Create one change order for the adjustments to pre-fulfillment quantities, one change order for the adjustments to in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.

After submitting a price adjustment, process refunds as appropriate:

- If the discount only applied to OrderItemSummaries for which payment hasn’t been captured, it doesn’t require a refund. This situation normally applies to OrderItemSummaries in the US that haven’t been fulfilled.
- If the discount applied to OrderItemSummaries that haven’t been fulfilled and for which payment has been captured, process a refund. In this case, pass the `totalExcessFundsAmount` from the output representation to the `ensureRefundsAsync()` method.
- If the discount applied to OrderItemSummaries that have been fulfilled, process a refund. Pass the `postFulfillmentChangeOrderId` from the output representation to the `createCreditMemo()` method, then pass the CreditMemo to the `ensureRefundsAsync()` method.
- If the discount applied to both fulfilled and unfulfilled OrderItemSummaries for which payment has been captured, process both refunds. Pass the `postFulfillmentChangeOrderId` from the output representation to the `createCreditMemo()` method, then pass the credit memo and the `totalExcessFundsAmount` from the output representation to the `ensureRefundsAsync()` method.

SEE ALSO:
- `createCreditMemo(orderSummaryId, creditMemoInput)`
- `ensureRefundsAsync(orderSummaryId, ensureRefundsInput)`
- `adjustPreview(orderSummaryId, adjustInput)`
createCreditMemo(orderSummaryId, creditMemoInput)
Create a credit memo to represent the refund for one or more change orders associated with an OrderSummary.

API Version
48.0

Requires Chatter
No

Signature
public static ConnectApi.CreateCreditMemoOutputRepresentation createCreditMemo(String orderSummaryId, ConnectApi.CreateCreditMemoInputRepresentation creditMemoInput)

Parameters
orderSummaryId
Type: String
ID of the OrderSummary.

creditMemoInput
Type: ConnectApi.CreateCreditMemoInputRepresentation
The list of change order IDs.

Return Value
Type: ConnectApi.CreateCreditMemoOutputRepresentation

createMultipleInvoices(invoicesInput)
Create Invoices to represent the charges for one or more change orders. Create Invoices for change orders that increase order amounts, such as for return fees. When you ensure the refund for a return, include the invoices for any associated return fees in the request.

API Version
56.0

Requires Chatter
No

Signature
public static ConnectApi.CreateMultipleInvoicesFromChangeOrdersOutputRepresentation createMultipleInvoices(ConnectApi.CreateMultipleInvoicesFromChangeOrdersInputRepresentation invoicesInput)
Parameters

`invoicesInput`
- **Type:** `ConnectApi.CreateMultipleInvoicesFromChangeOrdersInputRepresentation`
  - Data about the change orders to create Invoices for.

Return Value

- **Type:** `ConnectApi.CreateMultipleInvoicesFromChangeOrdersOutputRepresentation`

SEE ALSO:
- `ensureRefundsAsync(orderSummaryId, ensureRefundsInput)`
- `createReturnOrder(returnOrderInput)`
- `returnItems(returnOrderId, returnItemsInput)`

`ensureFundsAsync(orderSummaryId, ensureFundsInput)`

Ensure funds for an Invoice and apply them to it. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

**API Version**

- 48.0

**Requires Chatter**

- No

**Signature**

```java
public static ConnectApi.EnsureFundsAsyncOutputRepresentation ensureFundsAsync(String orderSummaryId, ConnectApi.EnsureFundsAsyncInputRepresentation ensureFundsInput)
```

Parameters

- **orderSummaryId**
  - **Type:** `String`
  - ID of the OrderSummary.

- **ensureFundsInput**
  - **Type:** `ConnectApi.EnsureFundsAsyncInputRepresentation`
  - The ID of the Invoice.

Return Value

- **Type:** `ConnectApi.EnsureFundsAsyncOutputRepresentation`
Usage
This method checks the OrderPaymentSummaries associated with the specified OrderSummary for funds to apply to the Invoice balance following this logic:

- **Note:** If multiple OrderPaymentSummaries have equal BalanceAmount values, their order of selection is random.

1. Verify that the Invoice balance doesn't exceed the total BalanceAmount of all the OrderPaymentSummaries associated with the OrderSummary.
2. If an OrderPaymentSummary has a BalanceAmount equal to the Invoice balance, apply the funds from that OrderPaymentSummary.
3. If no exact match was found, apply funds from the OrderPaymentSummary with the largest BalanceAmount.
4. If the Invoice still has a balance to ensure, repeat steps 2 and 3 until the full balance is ensured or no captured funds remain.
5. If the Invoice still has a balance, look for an OrderPaymentSummary with an authorized amount equal to the remaining Invoice balance. If one exists, capture and apply the funds from that OrderPaymentSummary.
6. If no exact match was found, capture and apply funds from the OrderPaymentSummary with the largest authorized amount.
7. If the Invoice still has a balance to ensure, repeat steps 5 and 6 until the full balance is ensured.

- **Note:** If the method creates a payment, the payment record's ClientContext value isn't predictable. Don't use it in custom logic.

SEE ALSO:
- `multipleEnsureFundsAsync(multipleEnsureFundsInput)`
- `ensureRefundsAsync(orderSummaryId, ensureRefundsInput)`

**ensureRefundsAsync(orderSummaryId, ensureRefundsInput)**
Ensure refunds for a CreditMemo or excess funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

**API Version**
48.0

**Requires Chatter**
No

**Signature**
```java
public static ConnectApi.EnsureRefundsAsyncOutputRepresentation ensureRefundsAsync(String orderSummaryId, ConnectApi.EnsureRefundsAsyncInputRepresentation ensureRefundsInput)
```

**Parameters**
- `orderId`  
  Type: String  
  ID of the OrderSummary.
**ensureRefundsInput**
Type: `ConnectApi.EnsureRefundsAsyncInputRepresentation`

ID of a credit memo to ensure refunds for, an amount of excess funds to refund, or both. At least one is required. Also includes any invoices for fees that reduce the refund amount, such as return fees. If multiple payment methods are available, you can specify how to distribute the refund.

**Return Value**
Type: `ConnectApi.EnsureRefundsAsyncOutputRepresentation`

**Usage**
This method applies the refund to the OrderPaymentSummaries associated with the specified OrderSummary following this logic.

- **Note:** If multiple OrderPaymentSummaries have equal AvailableToRefund amounts, their order of selection is random.

1. Verify that the CreditMemo balance and excess funds amount don’t exceed the total AvailableToRefund amount of all the OrderPaymentSummaries associated with the OrderSummary.

2. If `sequences` is specified, follow these steps.
   - a. Traverse the `sequences` list in order and apply the specified refund amounts to the specified OrderPaymentSummaries.
   - b. If the specified CreditMemo and excess funds are fully refunded, or if `isAllowPartial` is true, then the action stops here.

3. If a CreditMemo is specified, follow these steps.
   - a. If an OrderPaymentSummary has an AvailableToRefund amount matching the CreditMemo’s remaining balance, apply the refund to that payment.
   - b. If no exact match was found, apply the refund to the OrderPaymentSummary with the largest AvailableToRefund amount.
   - c. If the CreditMemo has any remaining balance, repeat steps a and b until that balance is fully refunded.

4. If an excess funds amount is specified, follow these steps.
   - a. Examine those OrderPaymentSummaries. If one has an AvailableToRefund amount matching the excess funds amount, apply the refund to that payment.
   - b. If no exact match was found, apply the refund to the OrderPaymentSummary with the largest AvailableToRefund amount.
   - c. If any excess funds amount remains, repeat steps a and b until it’s fully refunded.

- **Note:** If the method creates a refund, the refund record’s ClientContext value isn’t predictable. Don’t use it in custom logic.

**SEE ALSO:**
- `createReturnOrder(returnOrderInput)`
- `returnItems(returnOrderId, returnItemsInput)`
- `createMultipleInvoices(invoicesInput)`
**multipleEnsureFundsAsync(multipleEnsureFundsInput)**

Ensure and apply funds for one or more Invoices. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

**API Version**

56.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.MultipleAsyncOutputRepresentation multipleEnsureFundsAsync(ConnectApi.MultipleEnsureFundsAsyncInputRepresentation multipleEnsureFundsInput)
```

**Parameters**

`multipleEnsureFundsInput`

- **Type**: `ConnectApi.MultipleEnsureFundsAsyncInputRepresentation`
  - List of Invoices and the associated OrderSummaries.

**Return Value**

- **Type**: `ConnectApi.MultipleAsyncOutputRepresentation`

**Usage**

For each Invoice in the request, this method checks the OrderPaymentSummaries associated with the specified OrderSummary for funds to apply to the Invoice balance following this logic.

**Note**: If multiple OrderPaymentSummaries have equal `BalanceAmount` values, their order of selection is random.

1. Verify that the Invoice balance doesn’t exceed the total `BalanceAmount` of all the OrderPaymentSummaries associated with the OrderSummary.
2. If an OrderPaymentSummary has a `BalanceAmount` equal to the invoice balance, apply the funds from that OrderPaymentSummary.
3. If no exact match was found, apply funds from the OrderPaymentSummary with the largest `BalanceAmount`.
4. If the Invoice still has a balance to ensure, repeat steps 2 and 3 until the full balance is ensured or no captured funds remain.
5. If the Invoice still has a balance, look for an OrderPaymentSummary with an authorized amount equal to the remaining Invoice balance. If one exists, capture and apply the funds from that OrderPaymentSummary.
6. If no exact match was found, capture and apply funds from the OrderPaymentSummary with the largest authorized amount.
7. If the Invoice still has a balance to ensure, repeat steps 5 and 6 until the full balance is ensured.
Note: If the method creates a payment, the payment record’s ClientContext value isn’t predictable. Don’t use it in custom logic.

SEE ALSO:
  ensureFundsAsync(orderSummaryId, ensureFundsInput)

previewCancel(orderSummaryId, changeInput)
Retrieve the expected change order values for canceling one or more OrderItemSummaries from an OrderSummary, without actually executing the cancel.

API Version
48.0

Requires Chatter
No

Signature
public static ConnectApi.PreviewCancelOutputRepresentation previewCancel(String orderSummaryId, ConnectApi.ChangeInputRepresentation changeInput)

Parameters
orderSummaryId
  Type: String
  ID of the OrderSummary.

crateInput
  Type: ConnectApi.ChangeInputRepresentation
  A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Return Value
Type: ConnectApi.PreviewCancelOutputRepresentation

SEE ALSO:
  createCreditMemo(orderSummaryId, creditMemoInput)
  ensureRefundsAsync(orderSummaryId, ensureRefundsInput)
  submitCancel(orderSummaryId, changeInput)

previewReturn(orderSummaryId, changeInput)
Retrieve the expected change order values for a simple return of one or more OrderItemSummaries from an OrderSummary, without actually executing the return.
API Version
48.0

Requires Chatter
No

Signature
public static ConnectApi.PreviewReturnOutputRepresentation previewReturn(String orderSummaryId, ConnectApi.ChangeInputRepresentation changeInput)

Parameters
orderSummaryId
   Type: String
   ID of the OrderSummary.
changeInput
   Type: ConnectApi.ChangeInputRepresentation
   A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Return Value
Type: ConnectApi.PreviewReturnOutputRepresentation

SEE ALSO:
   createCreditMemo(orderSummaryId, creditMemoInput)
   ensureRefundsAsync(orderSummaryId, ensureRefundsInput)
   submitReturn(orderSummaryId, changeInput)

submitCancel(orderSummaryId, changeInput)
Cancel one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order.

API Version
48.0

Requires Chatter
No

Signature
public static ConnectApi.SubmitCancelOutputRepresentation submitCancel(String orderSummaryId, ConnectApi.ChangeInputRepresentation changeInput)
Parameters

orderSummaryId
Type: String
ID of the OrderSummary.

changeInput
Type: ConnectApi.ChangeInputRepresentation
A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Return Value
Type: ConnectApi.SubmitCancelOutputRepresentation

SEE ALSO:
createCreditMemo(orderSummaryId, creditMemoInput)
ensureRefundsAsync(orderSummaryId, ensureRefundsInput)
previewCancel(orderSummaryId, changeInput)

submitReturn(orderSummaryId, changeInput)
Return one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order. This return is a simple return that creates a change order but not a ReturnOrder.

API Version
48.0

Requires Chatter
No

Signature
public static ConnectApi.SubmitReturnOutputRepresentation submitReturn(String orderSummaryId, ConnectApi.ChangeInputRepresentation changeInput)

Parameters

orderSummaryId
Type: String
ID of the OrderSummary.

changeInput
Type: ConnectApi.ChangeInputRepresentation
A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Return Value
Type: ConnectApi.SubmitReturnOutputRepresentation
Usage

After submitting a return, process a refund. Pass the `changeOrderId` from the output representation to the `createCreditMemo()` method, then pass the credit memo to the `ensureRefundsAsync()` method.

SEE ALSO:
- `createCreditMemo(orderSummaryId, creditMemoInput)`
- `ensureRefundsAsync(orderSummaryId, ensureRefundsInput)`
- `previewReturn(orderSummaryId, changeInput)`

OrderSummaryCreation Class

Create Order Summaries in Order Management.

Namespace

ConnectApi

OrderSummaryCreation Methods

The following are methods for `OrderSummaryCreation`. All methods are static.

IN THIS SECTION:
- `createOrderSummary(orderSummaryInput)`

`createOrderSummary(orderSummaryInput)`

Create an OrderSummary based on an order. That order is considered the original order for the OrderSummary. Subsequent change orders that apply to the OrderSummary are also represented as orders. You can specify whether the order is managed in Salesforce Order Management or by an external system. Most Salesforce Order Management APIs can run only on orders that it manages.

API Version

48.0

Requires Chatter

No

Signature

```java
public static ConnectApi.OrderSummaryOutputRepresentation createOrderSummary(ConnectApi.OrderSummaryInputRepresentation orderSummaryInput)
```
Parameters

orderSummaryInput
Type: ConnectApi.OrderSummaryInputRepresenation
Input object that wraps the ID of the source order.

Return Value
Type: ConnectApi.OrderSummaryOutputRepresentation

Organization Class
Access information about an org.

Namespace
ConnectApi

Organization Methods
The following are methods for Organization. All methods are static.

IN THIS SECTION:

getSettings()
Get information about the context user and the org, including which features are enabled.

getSettings()
Get information about the context user and the org, including which features are enabled.

API Version
28.0

Requires Chatter
No

Signature
public static ConnectApi. OrganizationSettings getSettings()

Return Value
Type: ConnectApi.OrganizationSettings

PardotBusinessUnitContext Class
Get the Pardot business units the context user has access to.
Namespace

ConnectApi

PardotBusinessUnitContext Methods

The following are methods for PardotBusinessUnitContext. All methods are static.

IN THIS SECTION:

- `getBusinessUnitContext()`: Get the Pardot business units the context user has access to.
- `getBusinessUnitContextByIsCurrentStatus(isCurrent)`: Get the Pardot business units the context user has access to by specifying the current status.

`getBusinessUnitContext()`

Get the Pardot business units the context user has access to.

API Version

55.0

Requires Chatter

No

Signature

`public static ConnectApi.PardotBusinessUnitContextOutput getBusinessUnitContext()`

Return Value

Type: `ConnectApi.PardotBusinessUnitContextOutput`

`getBusinessUnitContextByIsCurrentStatus(isCurrent)`

Get the Pardot business units the context user has access to by specifying the current status.

API Version

55.0

Requires Chatter

No
Signature

```java
public static ConnectApi.PardotBusinessUnitContextOutput
getBusinessUnitContextByIsCurrentStatus(Boolean isCurrent)
```

Parameters

```java
isCurrent
Type: Boolean
```
Specifies whether to return only the business unit that’s selected as the context user’s current business unit context in the business unit switcher of the Pardot Lightning app (true) or to return only the business units that aren’t selected as the context user’s current business unit context (false).

Return Value

Type: `ConnectApi.PardotBusinessUnitContextOutput`

Payments Class

Authorize a payment, capture an authorized payment, and refund an authorized payment.

Namespace

`ConnectApi`

Payments Methods

The following are methods for `Payments`. All methods are static.

IN THIS SECTION:

```java
authorize(authorizePayment)
Authorize a payment.

postAuth(postAuthorizePayment)
Confirms that the merchant is ready to capture payment of an existing pre-authorized transaction.

reverseAuthorization(AuthReversalInput, authorizationId)
Reverses a payment authorization.

capture(AuthCaptureInput, authorizationId)
Capture an authorized payment.

refund(ReferencedRefundInput, paymentId)
Refund an authorized payment.

sale(sale)
