Captures a payment without any prior authorization and creates a payment entity. The payment sale transaction is a combination of an `Authorize` transaction and `Capture` transaction. This payment sale method allows merchants to request that the funds are transferred to the merchant account in a single command, with no further action (such as charging a credit card) from the merchant.
```
**tokenizePaymentMethod(tokenizePaymentMethodInput)**

Method to take the input parameters of the payment method you want to tokenize and then pass them to the payment gateway’s tokenization service. The results of the tokenization request are returned as a response from the payment gateway.

**authorize(authorizePayment)**

Authorize a payment.

**API Version**

51.0

**Requires Chatter**

No

**Signature**

```
global static ConnectApi.AuthorizationResponse authorize(ConnectApi.AuthorizationRequest authorizePayment)
```

**Parameters**

`authorizePayment`

Type: `ConnectApi.AuthorizationRequest`

Represents a payment authorization.

**Return Value**

Type: `ConnectApi.AuthorizationResponse`

**postAuth(postAuthorizePayment)**

Confirms that the merchant is ready to capture payment of an existing pre-authorized transaction.

**API Version**

54.0

**Requires Chatter**

No

**Signature**

```
global static ConnectApi.PostAuthorizationResponse postAuth(ConnectApi.PostAuthRequest postAuthorizePayment)
```
Parameters

`postAuthorizePayment`
- Type: `ConnectApi.PostAuthRequest`
  - Information about the payment, payment method, and payment gateway from the original payment authorization.

Return Value

Type: `ConnectApi.PostAuthorizationResponse`

`reverseAuthorization(AuthReversalInput, authorizationId)`
Reverses a payment authorization.

API Version

51.0

Requires Chatter

No

Signature

```java
```

Parameters

`AuthReversalInput`
- Type: `ConnectApi.AuthorizationReversalRequest`
  - Input information for the payment authorization reversal.

`authorizationId`
- Type: `String`
  - The ID of the payment authorization to be reversed.

Return Value

Type: `ConnectApi.AuthorizationReversalResponse`

`capture(AuthCaptureInput, authorizationId)`
Capture an authorized payment.

To access Payments methods, you need these permissions.

- Salesforce Order Management License
- PaymentsAPIUser user permission. This permission is available with the Salesforce Order Management License. Your Salesforce admin assigns it to your profile.
API Version
50.0

Requires Chatter
No

Signature
global static ConnectApi.CaptureResponse capture(ConnectApi.CaptureRequest AuthCaptureInput, String authorizationId)

Parameters
AuthCaptureInput
Type: ConnectApi.CaptureRequest
A ConnectApi.CaptureRequest object with information about the payment capture.

authorizationId
Type: String
ID of the payment authorization. Required.

Return Value
Type: ConnectApi.CaptureResponse

refund(ReferencedRefundInput, paymentId)
Refund an authorized payment.

To access Payments methods, you need these permissions.
- Salesforce Order Management License
- PaymentsAPIUser user permission. This permission is available with the Salesforce Order Management License. Your Salesforce admin assigns it to your profile.

API Version
50.0

Requires Chatter
No

Signature
global static ConnectApi.ReferencedRefundResponse refund(ConnectApi.ReferencedRefundRequest ReferencedRefundInput, String paymentId)
Parameters

ReferencedRefundInput

Type: ConnectApi.ReferencedRefundRequest

A ConnectApi.ReferencedRefundRequest object with information about the refund.

paymentId

Type: String

ID of the payment to be refunded. Required.

Return Value

Type: ConnectApi.ReferencedRefundResponse

sale(sale)

Captures a payment without any prior authorization and creates a payment entity. The payment sale transaction is a combination of an Authorize transaction and Capture transaction. This payment sale method allows merchants to request that the funds are transferred to the merchant account in a single command, with no further action (such as charging a credit card) from the merchant.

API Version

S4.0

Requires Chatter

No

Signature

global static ConnectApi.SaleResponse sale(ConnectApi.SaleRequest sale)

Parameters

sale

Type: ConnectApi.SaleRequest

Payment sale input class.

Return Value

Type: ConnectApi.SaleResponse

tokenizePaymentMethod(tokenizePaymentMethodInput)

Method to take the input parameters of the payment method you want to tokenize and then pass them to the payment gateway's tokenization service. The results of the tokenization request are returned as a response from the payment gateway.

API Version

S2.0
Requires Chatter

No

Signature

global static ConnectApi.PaymentMethodTokenizationResponse tokenizePaymentMethod(ConnectApi.PaymentMethodTokenizationRequest tokenizePaymentMethodInput)

Parameters

tokenizePaymentMethodInput
Type: ConnectApi.PaymentMethodTokenizationRequest
Information about the payment method to be tokenized.

Return Value
Type: ConnectApi.PaymentMethodTokenizationResponse

Usage
Accepts input parameters representing a payment method and passes them in a tokenization request to the payment gateway. The results of the tokenization request are returned as a response from the payment gateway. If the tokenization was successful, the response contains the tokenized value and details about the tokenization process. Otherwise, the response contains an error message and details about the error.

Example

ConnectApi.PaymentMethodTokenizationRequest request = new 
ConnectApi.PaymentMethodTokenizationRequest();
request.paymentGatewayId = '0b0xx0000001Ja5AAE';
ConnectApi.CardPaymentMethodRequest cpmRequest = new ConnectApi.CardPaymentMethodRequest();
cpmRequest.cardHolderName = 'Jo Manager';
cpmRequest.expiryMonth = 11;
cpmRequest.expiryYear = 2222;
cpmRequest.cardNumber = '4111111111111111';
cpmRequest.cvv = '111';
cpmRequest.cardCategory = ConnectApi.CardCategory.CreditCard;
cpmRequest.cardType = ConnectApi.CardType.Visa.name();
request.cardPaymentMethod = cpmRequest;
ConnectApi.PaymentMethodTokenizationResponse response =
ConnectApi.Payments.tokenizePaymentMethod(request);

Personalization Class

Get assigned personalization audiences that match the user context. Create, get, update, and delete an audience. Get personalization targets that match the user context, based on the assigned audiences that include the user. Create and update targets. Get and delete a target.
Namespace

ConnectApi

Note: Personalization varies what the user can see in the browser but doesn’t secure data in any way. To prevent users accessing sensitive data, use standard Salesforce security features, such as sharing rules and permission sets.

Personalization Methods

The following are methods for Personalization. All methods are static.

IN THIS SECTION:

createAudience(communityId, audience)
Create an audience.

createTargets(communityId, target)
Create targets.

deleteAudience(communityId, audienceId)
Delete an audience.

deleteTarget(communityId, targetId)
Delete a target.

getAudience(communityId, audienceId, includeAudienceCriteria)
Get an audience.

getAudienceBatch(communityId, audienceIds)
Get audience information for a comma-separated list of audience IDs.

getAudiences(communityId, ipAddress, domain, userId, publishStatus, includeAudienceCriteria, targetTypes, recordId)
Get a list of assigned audiences that match the user context and record information.

getAudiences(communityId, ipAddress, domain, userId, publishStatus, includeAudienceCriteria, targetTypes)
Get a list of assigned audiences that match the user context.

getTarget(communityId, targetId)
Get a target.

getTargetBatch(communityId, targetIds)
Get target information for a comma-separated list of target IDs.

getTargets(communityId, ipAddress, domain, userId, publishStatus, recordId, targetTypes, includeAudience, includeAllMatchingTargetsWithinGroup, groupNames)
Get a list of targets that match the user context, based on the assigned audiences that include the user.

updateAudience(communityId, audienceId, audience)
Update an audience.

updateTargets(communityId, target)
Update targets.

createAudience(communityId, audience)

Create an audience.
API Version
48.0

Requires Chatter
No

Signature
public static ConnectApi.Audience createAudience(String communityId,
ConnectApi.AudienceInput audience)

Parameters

communityId
Type: String
ID of the Experience Cloud site.

audience
Type: ConnectApi.AudienceInput
A ConnectApi.AudienceInput object that defines the audience.

Return Value
Type: ConnectApi.Audience

createTargets(communityId, target)
Create targets.

API Version
48.0

Requires Chatter
No

Signature
public static ConnectApi.TargetCollection createTargets(String communityId,
ConnectApi.TargetCollectionInput target)

Parameters

communityId
Type: String
ID of the Experience Cloud site.
target
   Type: ConnectApi.TargetCollectionInput
   A ConnectApi.TargetCollectionInput object that defines the targets.

Return Value
Type: ConnectApi.TargetCollection

deleteAudience(communityId, audienceId)
Delete an audience.

API Version
48.0

Requires Chatter
No

Signature
public static Void deleteAudience(String communityId, String audienceId)

Parameters
communityId
   Type: String
   ID of the Experience Cloud site.

audienceId
   Type: String
   ID of the audience.

Return Value
Type: Void

deleteTarget(communityId, targetId)
Delete a target.

API Version
48.0

Requires Chatter
No
Signature

```java
public static Void deleteTarget(String communityId, String targetId)
```

Parameters

- `communityId`
  - Type: `String`
  - ID of the Experience Cloud site.
- `targetId`
  - Type: `String`
  - ID of the target.

Return Value

Type: Void

---

```java
getAudience(communityId, audienceId, includeAudienceCriteria)
```

Get an audience.

**API Version**

48.0

- **Available to Guest Users**
  - 48.0
- **Requires Chatter**
  - No

Signature

```java
public static ConnectApi.Audience getAudience(String communityId, String audienceId, Boolean includeAudienceCriteria)
```

Parameters

- `communityId`
  - Type: `String`
  - ID of the Experience Cloud site.
- `audienceId`
  - Type: `String`
  - ID of the audience.
- `includeAudienceCriteria`
  - Type: `Boolean`
Specifies whether to include audience criteria (true) or not (false). If unspecified, defaults to false.

Return Value
Type: ConnectApi.Audience

getAudienceBatch(communityId, audienceIds)
Get audience information for a comma-separated list of audience IDs.

API Version
48.0

Available to Guest Users
48.0

Requires Chatter
No

Signature
public static ConnectApi.BatchResult[] getAudienceBatch(String communityId, List<String> audienceIds)

Parameters
communityId
Type: String
ID of the Experience Cloud site.
audienceIds
Type: List<String>
Comma-separated list of audience IDs.

Return Value
Type: ConnectApi.BatchResult[]
The ConnectApi.BatchResult.getResult() method returns a ConnectApi.Audience object and errors for audiences that didn’t load.

getAudiences(communityId, ipAddress, domain, userId, publishStatus, includeAudienceCriteria, targetTypes, recordId)
Get a list of assigned audiences that match the user context and record information.
API Version
51.0

Available to Guest Users
51.0

Requires Chatter
No

Signature
public static ConnectApi.AudienceCollection getAudiences(String communityId, String ipAddress, String domain, String userId, ConnectApi.PublishStatus publishStatus, Boolean includeAudienceCriteria, List<String> targetTypes, String recordId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

ipAddress
Type: String
IP address of the user. If null, no audiences with location criteria are returned.

domain
Type: String
Name of the user's Salesforce custom domain. If null, no audiences with domain criteria are returned.

userId
Type: String
ID of the user. If null, defaults to the ID of the context user.

publishStatus
Type: ConnectApi.PublishStatus
Publish status of the audience. Values are:
• Draft
• Live
If null, defaults to Live.

includeAudienceCriteria
Type: Boolean
Specifies whether to include audience criteria (true) or not (false). If unspecified, defaults to false.

targetTypes
Type: List<String>
Comma-separated list of target types to filter the results. Supported values include:
• ExperienceVariation (version 48.0 and later)
- Custom object API names, such as `CustomObjectName__c` (version 48.0 and later)
- NavigationLinkSet (version 49.0 and later)
- Topic (version 49.0 and later)
- CollaborationGroup (version 49.0 and later)
- KnowledgeArticle (version 49.0 and later)
- ContentDocument (version 49.0 and later)
- ManagedContent (version 49.0 and later)
- Report (version 49.0 and later)
- Dashboard (version 49.0 and later)

If `null`, all target types are returned.

`recordId`
- Type: `String`
  - ID of the record for field based criteria. If `null`, all applicable audiences with field based criteria are returned.

**Return Value**
Type: `ConnectApi.AudienceCollection`

```java
getAudiences(communityId, ipAddress, domain, userId, publishStatus, includeAudienceCriteria, targetTypes)
```

Get a list of assigned audiences that match the user context.

**API Version**
48.0

**Available to Guest Users**
48.0

**Requires Chatter**
No

**Signature**
```java
public static ConnectApi.AudienceCollection getAudiences(String communityId, String ipAddress, String domain, String userId, ConnectApi.PublishStatus publishStatus, Boolean includeAudienceCriteria, List<String> targetTypes)
```

**Parameters**

- `communityId`
  - Type: `String`
  - ID of the Experience Cloud site.
**ipAddress**
- **Type:** String
  - IP address of the user. If null, no audiences with location criteria are returned.

**domain**
- **Type:** String
  - Name of the user's Salesforce custom domain. If null, no audiences with domain criteria are returned.

**userId**
- **Type:** String
  - ID of the user. If null, defaults to the ID of the context user.

**publishStatus**
- **Type:** ConnectApi.PublishStatus
  - Publish status of the audience. Values are:
    - Draft
    - Live
  - If null, defaults to Live.

**includeAudienceCriteria**
- **Type:** Boolean
  - Specifies whether to include audience criteria (true) or not (false). If unspecified, defaults to false.

**targetTypes**
- **Type:** List<String>
  - Comma-separated list of target types to filter the results. Supported values include:
    - ExperienceVariation (version 48.0 and later)
    - Custom object API names, such as CustomObjectAName__c (version 48.0 and later)
    - NavigationLinkSet (version 49.0 and later)
    - Topic (version 49.0 and later)
    - CollaborationGroup (version 49.0 and later)
    - KnowledgeArticle (version 49.0 and later)
    - ContentDocument (version 49.0 and later)
    - ManagedContent (version 49.0 and later)
    - Report (version 49.0 and later)
    - Dashboard (version 49.0 and later)
  - If null, all target types are returned.

**Return Value**
- **Type:** ConnectApi.AudienceCollection

**getTarget(communityId, targetId)**
- Get a target.
API Version
48.0

Available to Guest Users
48.0

Requires Chatter
No

Signature
public static ConnectApi.Target getTarget(String communityId, String targetId)

Parameters

communityId
Type: String
ID of the Experience Cloud site.

targetId
Type: String
ID of the target.

Return Value
Type: ConnectApi.Target

getTargetBatch(communityId, targetIds)
Get target information for a comma-separated list of target IDs.

API Version
48.0

Available to Guest Users
48.0

Requires Chatter
No

Signature
public static ConnectApi.BatchResult[] getTargetBatch(String communityId, List<String> targetIds)
Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

targetIds
  Type: List<String>
  Comma-separated list of target IDs.

Return Value

Type: ConnectApi.BatchResult
The ConnectApi.BatchResult.getResult() method returns a ConnectApi.Target object and errors for targets that didn't load.

getTargets(communityId, ipAddress, domain, userId, publishStatus, recordId, targetTypes, includeAudience, includeAllMatchingTargetsWithinGroup, groupNames)
Get a list of targets that match the user context, based on the assigned audiences that include the user.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

public static ConnectApi.TargetCollection getTargets(String communityId, String ipAddress, String domain, String userId, ConnectApi.PublishStatus publishStatus, String recordId, List<String> targetTypes, Boolean includeAudience, Boolean includeAllMatchingTargetsWithinGroup, List<String> groupNames)

Parameters

communityId
  Type: String
  ID of the Experience Cloud site.

ipAddress
  Type: String
  IP address of the user. If null, no audiences with location criteria are returned.
domain
Type: String
Name of the user's Salesforce custom domain. If null, no audiences with domain criteria are returned.

userId
Type: String
ID of the user. If null, the default is the ID of the context user.

publishStatus
Type: ConnectApi.PublishStatus
Publish status of the target. Values are:
- Draft
- Live

recordId
Type: String
ID of the record, if you want to specify field based criteria in audiences.

targetTypes
Type: List<String>
Comma-separated list of target types to filter the results. Supported values include:
- ExperienceVariation (version 48.0 and later)
- Custom object API names, such as CustomObjectName__c (version 48.0 and later)
- NavigationLinkSet (version 49.0 and later)
- Topic (version 49.0 and later)
- CollaborationGroup (version 49.0 and later)
- KnowledgeArticle (version 49.0 and later)
- ContentDocument (version 49.0 and later)
- ManagedContent (version 49.0 and later)
- Report (version 49.0 and later)
- Dashboard (version 49.0 and later)
If null, all target types are returned.

includeAudience
Type: Boolean
Specifies whether to include the matching audience (true) or not (false). If null, the default is false.

includeAllMatchingTargetsWithinGroup
Type: Boolean
Specifies whether to include all the matching targets within a target group (true) or not (false). If null, the default is false.
If false, the first matching target within each group, based on priority within the group, is returned.

groupNames
Type: List<String>
A comma-separated list of group names. Groups bundle related target and audience pairs.
Return Value
Type: ConnectApi.TargetCollection

updateAudience(communityId, audienceId, audience)
Update an audience.

API Version
48.0

Requires Chatter
No

Signature
public static ConnectApi.Audience updateAudience(String communityId, String audienceId, ConnectApi.AudienceInput audience)

Parameters
communityId
  Type: String
  ID of the Experience Cloud site.

audienceId
  Type: String
  ID of the audience.

audience
  Type: ConnectApi.AudienceInput
  A ConnectApi.AudienceInput object that defines the updates to the audience.

Return Value
Type: ConnectApi.Audience

updateTargets(communityId, target)
Update targets.

API Version
48.0

Requires Chatter
No
Signature

public static ConnectApi.TargetCollection updateTargets(String communityId, ConnectApi.TargetCollectionUpdateInput target)

Parameters

communityId
Type: String
ID of the Experience Cloud site.

target
Type: ConnectApi.TargetCollectionUpdateInput
A ConnectApi.TargetCollectionUpdateInput object that defines the updates for the targets.

Return Value
Type: ConnectApi.TargetCollection

PickTicket Class

Create tickets to fulfill orders.

Namespace

ConnectApi

Pick Ticket Methods

These methods are for Pick Tickets. All methods are static.

IN THIS SECTION:

distributePickedQuantities(distributePickedQuantitiesInput)
Distribute picked quantities among orders in a pick ticket.

distributePickedQuantities (distributePickedQuantitiesInput)
Distribute picked quantities among orders in a pick ticket.

API Version
58.0

Requires Chatter
No
Signature

```java
public static ConnectApi.DistributePickedQuantitiesOutputRepresentation
distributePickedQuantities(ConnectApi.DistributePickedQuantitiesInputRepresentation
distributePickedQuantitiesInput)
```

Parameters

distributePickedQuantitiesInput
  Type: ConnectApi.DistributePickedQuantitiesInputRepresentation
  Input to distribute picked quantities.

Return Value

Type: ConnectApi.DistributePickedQuantitiesOutputRepresentation

**QuestionAndAnswers Class**

*Access question and answers suggestions.*

**Namespace**

*ConnectApi*

**IN THIS SECTION:**

**QuestionAndAnswers Methods**

The following are methods for **QuestionAndAnswers**. All methods are static.

**QuestionAndAnswers Methods**

The following are methods for **QuestionAndAnswers**. All methods are static.

**IN THIS SECTION:**

- `getSuggestions(communityId, q, subjectId, includeArticles, maxResults)`
  Get question and answers suggestions.

- `setTestGetSuggestions(communityId, q, subjectId, includeArticles, maxResults, result)`
  Register a `ConnectApi.QuestionAndAnswersSuggestions` object to be returned when `getSuggestions` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

- `updateQuestionAndAnswers(communityId, feedElementId, questionAndAnswersCapability)`
  Choose or change the best answer for a question.

**getSuggestions(communityId, q, subjectId, includeArticles, maxResults)**

Get question and answers suggestions.
API Version
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.QuestionAndAnswersSuggestions getSuggestions(String communityId, String q, String subjectId, Boolean includeArticles, Integer maxResults)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Required and can’t be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

subjectId
Type: String
Specify a subject ID to search only questions on that object. If the ID is a topic or a user, the ID is ignored.

includeArticles
Type: Boolean
Specify true to include knowledge articles in the search results. To return only questions, specify false.

maxResults
Type: Integer
The maximum number of results to return for each type of item. Possible values are 1–10. The default value is 5.

Return Value
Type: ConnectApi.QuestionAndAnswersSuggestions

Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetSuggestions(communityId, q, subjectId, includeArticles, maxResults, result)
**setTestGetSuggestions(communityId, q, subjectId, includeArticles, maxResults, result)**

Register a `ConnectApi.QuestionAndAnswersSuggestions` object to be returned when `getSuggestions` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

**API Version**

32.0

**Signature**

```java
public static Void setTestGetSuggestions(String communityId, String q, String subjectId, Boolean includeArticles, Integer maxResults, ConnectApi.QuestionAndAnswersSuggestions result)
```

**Parameters**

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **q**
  - Type: `String`
  - Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

- **subjectId**
  - Type: `String`
  - Specify a subject ID to search only questions on that object. If the ID is a topic or a user, the ID is ignored.

- **includeArticles**
  - Type: `Boolean`
  - Specify `true` to include knowledge articles in the search results. To return only questions, specify `false`.

- **maxResults**
  - Type: `Integer`
  - The maximum number of results to return for each type of item. Possible values are 1–10. The default value is 5.

- **result**
  - Type: `ConnectApi.QuestionAndAnswersSuggestions`
  - Object containing test data.

**Return Value**

Type: `Void`  

**SEE ALSO:**

- `getSuggestions(communityId, q, subjectId, includeArticles, maxResults)`
- [Apex Developer Guide: Testing ConnectApi Code](#)
updateQuestionAndAnswers(communityId, feedElementId, questionAndAnswersCapability)

Choose or change the best answer for a question.

API Version
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.QuestionAndAnswersCapability updateQuestionAndAnswers(String communityId, String feedElementId, ConnectApi.QuestionAndAnswersCapabilityInput questionAndAnswersCapability)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String
ID of the feed element.

questionAndAnswersCapability
Type: ConnectApi.QuestionAndAnswersCapabilityInput
Specify the best answer (comment ID) for the question.

Return Value
Type: ConnectApi.QuestionAndAnswersCapability
If the feed element doesn’t support this capability, the return value is ConnectApi.NotFoundException.

Example

ConnectApi.QuestionAndAnswersCapabilityInput qaInput = new ConnectApi.QuestionAndAnswersCapabilityInput();
qaInput.bestAnswerId = '0D7D00000000lMAKAY';

ConnectApi.QuestionAndAnswersCapability qa =
ConnectApi.QuestionAndAnswers.updateQuestionAndAnswers(null, '0D5D0000000XZjJ', qaInput);
Recommendations Class

Get and reject Chatter, custom, and static recommendations. Create, get, update, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

For Next Best Action recommendations, see NextBestAction Class.

Namespace

ConnectApi

Recommendations Methods

The following are methods for Recommendations. All methods are static.

IN THIS SECTION:

- createRecommendationAudience(communityId, recommendationAudience)
  Create an audience for a custom recommendation.
- createRecommendationAudience(communityId, name)
  Create an audience for a custom recommendation.
- createRecommendationDefinition(communityId, recommendationDefinition)
  Create a custom recommendation definition.
- createRecommendationDefinition(communityId, name, title, actionUrl, actionUrlName, explanation)
  Create a custom recommendation definition with the specified parameters.
- createScheduledRecommendation(communityId, scheduledRecommendation)
  Create a scheduled custom recommendation.
- createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId, channel)
  Create a scheduled custom recommendation with the specified parameters.
- deleteRecommendationAudience(communityId, recommendationAudienceId)
  Delete a custom recommendation audience.
- deleteRecommendationDefinition(communityId, recommendationDefinitionId)
  Delete a custom recommendation definition.
- deleteRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)
  Delete a custom recommendation definition photo.
- deleteScheduledRecommendation(communityId, scheduledRecommendationId, deleteDefinitionIfLast)
  Delete a scheduled custom recommendation.
- getRecommendationAudience(communityId, recommendationAudienceId)
  Get information about a custom recommendation audience.
- getRecommendationAudienceMembership(communityId, recommendationAudienceId)
  Get the members of a custom recommendation audience.
- getRecommendationAudienceMembership(communityId, recommendationAudienceId, pageParam, pageSize)
  Get a page of custom recommendation audience members.
getRecommendationAudiences(communityId)
Get custom recommendation audiences.

getRecommendationAudiences(communityId, pageParam, pageSize)
Get a page of custom recommendation audiences.

getRecommendationDefinition(communityId, recommendationDefinitionId)
Get a custom recommendation definition.

getRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)
Get a custom recommendation definition photo.

getRecommendationDefinitions(communityId)
Get custom recommendation definitions.

getRecommendationForUser(communityId, userId, action, objectId)
Get the Chatter, custom, or static recommendation for the context user for the specified action and object ID.

getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)
Get the Chatter recommendations, such as user, group, file, article, record, and topic recommendations for the context user. Get the custom and static recommendations for the context user.

getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)
Get the Chatter, custom, and static recommendations for the context user for the specified action.

getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)
Get the Chatter, custom, and static recommendations for the context user for the specified action and object category.

getScheduledRecommendation(communityId, scheduledRecommendationId)
Get a scheduled custom recommendation.

getScheduledRecommendations(communityId, channel)
Get scheduled custom recommendations.

rejectRecommendationForUser(communityId, userId, action, objectId)
Reject a Chatter, custom, or static recommendation for the context user for the specified action and object ID.

rejectRecommendationForUser(communityId, userId, action, objectEnum)
Reject a static recommendation for the context user.

updateRecommendationAudience(communityId, recommendationAudienceId, recommendationAudience)
Update a custom recommendation audience.

updateRecommendationDefinition(communityId, recommendationDefinitionId, name, title, actionUrl, actionUrlName, explanation)
Update a custom recommendation definition with the specified parameters.

updateRecommendationDefinition(communityId, recommendationDefinitionId, recommendationDefinition)
Update a custom recommendation definition.

updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileUpload)
Update a custom recommendation definition photo with a file that hasn’t been uploaded.

updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileId, versionNumber)
Update a custom recommendation definition photo with an uploaded file.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo)
Update a custom recommendation definition photo with an uploaded file that requires cropping.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo, fileUpload)
Update a custom recommendation definition photo with a file that hasn’t been uploaded and requires cropping.
**updateScheduledRecommendation(communityId, scheduledRecommendationId, scheduledRecommendation)**

Update a scheduled custom recommendation.

**updateScheduledRecommendation(communityId, scheduledRecommendationId, rank, enabled, recommendationAudienceId)**

Update a scheduled custom recommendation with the specified parameters.

---

**createRecommendationAudience(communityId, recommendationAudience)**

Create an audience for a custom recommendation.

**API Version**

35.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.RecommendationAudience createRecommendationAudience(String communityId, ConnectApi.RecommendationAudienceInput recommendationAudience)
```

**Parameters**

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or null.

- **recommendationAudience**
  - Type: `ConnectApi.RecommendationAudienceInput`

**Return Value**

Type: `ConnectApi.RecommendationAudience`

**Usage**

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

**createRecommendationAudience(communityId, name)**

Create an audience for a custom recommendation.

**API Version**

35.0
Requires Chatter
Yes

Signature

```java
public static ConnectApi.RecommendationAudience createRecommendationAudience(String communityId, String name)
```  

Parameters

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.

- `name`
  Type: `String`
  Name of the audience.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

```java
createRecommendationDefinition(communityId, recommendationDefinition)
```

Create a custom recommendation definition.

API Version

35.0

Requires Chatter
Yes

Signature

```java
public static ConnectApi.RecommendationDefinition createRecommendationDefinition(String communityId, ConnectApi.RecommendationDefinitionInput recommendationDefinition)
```  

Parameters

- `communityId`
  Type: `String`
ID for an Experience Cloud site, internal, or null.

**recommendationDefinition**
Type: `ConnectApi.RecommendationDefinitionInput`  
A `ConnectApi.RecommendationDefinitionInput` object.

**Return Value**
Type: `ConnectApi.RecommendationDefinition`

**Usage**
Recommendation definitions allow you to create custom recommendations that appear in Experience Cloud sites, encouraging users to watch videos, take training and more.

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

These recommendations appear by default on the Customer Service template. They appear on the home and question detail pages and in the feed in Salesforce mobile web. They also appear anywhere community managers add recommendations using Experience Builder in the Customer Service template.

So that users don’t see the same recommendations all the time, Salesforce periodically removes and brings back custom recommendations that haven’t been accepted or dismissed.

```java
createRecommendationDefinition(communityId, name, title, actionUrl, actionUrlName, explanation)
```
Create a custom recommendation definition with the specified parameters.

**API Version**
35.0

**Requires Chatter**
Yes

**Signature**
```java
public static ConnectApi.RecommendationDefinition createRecommendationDefinition(String communityId, String name, String title, String actionUrl, String actionUrlName, String explanation)
```

**Parameters**
- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.  

name
Type: String
Name of the custom recommendation definition. The name is displayed in Setup.

title
Type: String
Title of the custom recommendation definition.

actionUrl
Type: String
URL for acting on the custom recommendation, for example, the URL to join a group.

actionUrlName
Type: String
Text label for the action URL in the user interface, for example, “Launch.”

explanation
Type: String
Explanation, or body, of the custom recommendation.

Return Value
Type: ConnectApi.RecommendationDefinition

Usage
Recommendation definitions allow you to create custom recommendations that appear in Experience Cloud sites, encouraging users to watch videos, take training and more.

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

These recommendations appear by default on the Customer Service template. They appear on the home and question detail pages and in the feed in Salesforce mobile web. They also appear anywhere community managers add recommendations using Experience Builder in the Customer Service template.

So that users don’t see the same recommendations all the time, Salesforce periodically removes and brings back custom recommendations that haven’t been accepted or dismissed.

createScheduledRecommendation(communityId, scheduledRecommendation)
Create a scheduled custom recommendation.

API Version
35.0

Requires Chatter
Yes
Signature

```java
public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String communityId, ConnectApi.ScheduledRecommendationInput scheduledRecommendation)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or null.

- `scheduledRecommendation`
  - Type: `ConnectApi.ScheduledRecommendationInput`

Return Value

- Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

```java
createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId, channel)
```
Create a scheduled custom recommendation with the specified parameters.

API Version

36.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String communityId, String recommendationDefinitionId, Integer rank, Boolean enabled, String recommendationAudienceId, ConnectApi.RecommendationChannel channel)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or null.
**recommendationDefinitionId**

Type: **String**

ID of the custom recommendation definition.

**rank**

Type: **Integer**

Relative rank of the scheduled custom recommendation indicated by ascending whole numbers starting with 1.

Setting the rank is comparable to an insertion into an ordered list. The scheduled custom recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled custom recommendations after it is pushed down. See Ranking scheduled custom recommendations example.

If the specified `rank` is larger than the size of the list, the scheduled custom recommendation is put at the end of the list. The `rank` of the scheduled custom recommendation is the size of the list, instead of the one specified.

If a `rank` is not specified, the scheduled custom recommendation is put at the end of the list.

**enabled**

Type: **Boolean**

Indicates whether scheduling is enabled. If `true`, the custom recommendation is enabled and appears in Experience Cloud sites. If `false`, custom recommendations in feeds in Salesforce mobile web aren’t removed, but no new custom recommendations appear. In Customer Service and Partner Central sites, disabled custom recommendations no longer appear.

**recommendationAudienceId**

Type: **String**

ID of the custom recommendation definition that this scheduled recommendation schedules.

**channel**

Type: **ConnectApi.RecommendationChannel**

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- **CustomChannel1**—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- **CustomChannel2**—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- **CustomChannel3**—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- **CustomChannel4**—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- **CustomChannel5**—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- **DefaultChannel**—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

Use these channel values; you can’t rename or create other channels.

**Return Value**

Type: **ConnectApi.ScheduledRecommendation**
**Usage**

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

**Ranking scheduled custom recommendations example**

If you have these scheduled custom recommendations:

<table>
<thead>
<tr>
<th>Scheduled Recommendations</th>
<th>Rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScheduledRecommendationA</td>
<td>1</td>
</tr>
<tr>
<td>ScheduledRecommendationB</td>
<td>2</td>
</tr>
<tr>
<td>ScheduledRecommendationC</td>
<td>3</td>
</tr>
</tbody>
</table>

And you include this information in the Scheduled Custom Recommendation Input:

<table>
<thead>
<tr>
<th>Scheduled Recommendation</th>
<th>Rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScheduledRecommendationD</td>
<td>2</td>
</tr>
</tbody>
</table>

The result is:

<table>
<thead>
<tr>
<th>Scheduled Recommendation</th>
<th>Rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScheduledRecommendationA</td>
<td>1</td>
</tr>
<tr>
<td>ScheduledRecommendationD</td>
<td>2</td>
</tr>
<tr>
<td>ScheduledRecommendationB</td>
<td>3</td>
</tr>
<tr>
<td>ScheduledRecommendationC</td>
<td>4</td>
</tr>
</tbody>
</table>

**deleteRecommendationAudience(communityId, recommendationAudienceId)**

Delete a custom recommendation audience.

**API Version**

35.0

**Requires Chatter**

Yes
Signature

```java
public static Void deleteRecommendationAudience(String communityId, String recommendationAudienceId)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **recommendationAudienceId**
  - Type: `String`
  - ID of the custom recommendation audience.

Return Value

Type: `Void`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

**deleteRecommendationDefinition(String communityId, String recommendationDefinitionId)**

Delete a custom recommendation definition.

API Version

35.0

Requires Chatter

Yes

Signature

```java
public static Void deleteRecommendationDefinition(String communityId, String recommendationDefinitionId)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **recommendationDefinitionId**
  - Type: `String`
ID of the custom recommendation definition.

Return Value
Type: Void

Usage
Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

deleteRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)
Delete a custom recommendation definition photo.

API Version
35.0

Requires Chatter
Yes

Signature
public static Void deleteRecommendationDefinitionPhoto(String communityId, String recommendationDefinitionId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

recommendationDefinitionId
Type: String
ID of the custom recommendation definition.

Return Value
Type: Void

Usage
Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.
deleteScheduledRecommendation(communityId, scheduledRecommendationId, deleteDefinitionIfLast)

Delete a scheduled custom recommendation.

API Version
35.0

Requires Chatter
Yes

Signature
public static Void deleteScheduledRecommendation(String communityId, String scheduledRecommendationId, Boolean deleteDefinitionIfLast)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

scheduledRecommendationId
Type: String
ID of the scheduled custom recommendation.

deleteDefinitionIfLast
Type: Boolean
If true and if this is the last scheduled custom recommendation of a custom recommendation definition, deletes the custom recommendation definition. Default is false.

Return Value
Type: Void

Usage
Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Deleting a scheduled custom recommendation is comparable to a deletion in an ordered list. All scheduled custom recommendations after the deleted scheduled custom recommendation receive a new, higher rank automatically.

getRecommendationAudience(communityId, recommendationAudienceId)

Get information about a custom recommendation audience.
API Version
35.0

Requires Chatter
Yes

Signature
public static ConnectApi.RecommendationAudience getRecommendationAudience(String communityId, String recommendationAudienceId)

Parameters
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.
recommendationAudienceId
  Type: String
  ID of the custom recommendation audience.

Return Value
Type: ConnectApi.RecommendationAudience

Usage
Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

getRecommendationAudienceMembership(communityId, recommendationAudienceId)
Get the members of a custom recommendation audience.

API Version
35.0

Requires Chatter
Yes

Signature
public static ConnectApi.UserReferencePage getRecommendationAudienceMembership(String communityId, String recommendationAudienceId)
Parameters

`communityId`

Type: `String`

ID for an Experience Cloud site, internal, or null.

`recommendationAudienceId`

Type: `String`

ID of the custom recommendation audience.

Return Value

Type: `ConnectApi.UserReferencePage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationAudienceMembership(communityId, recommendationAudienceId, pageParam, pageSize)`

Get a page of custom recommendation audience members.

API Version

35.0

Requires Chatter

Yes

Signature

`public static ConnectApi.UserReferencePage getRecommendationAudienceMembership(String communityId, String recommendationAudienceId, Integer pageParam, Integer pageSize)`

Parameters

`communityId`

Type: `String`

ID for an Experience Cloud site, internal, or null.

`recommendationAudienceId`

Type: `String`

ID of the custom recommendation audience.

`pageParam`

Type: `Integer`
Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: `Integer`
Specifies the number of members per page.

Return Value
Type: `ConnectApi.UserReferencePage`

Usage
Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationAudiences(communityId)`
Get custom recommendation audiences.

API Version
35.0

Requires Chatter
Yes

Signature
```java
public static ConnectApi.RecommendationAudiencePage getRecommendationAudiences(String communityId)
```

Parameters
`communityId`
Type: `String`
ID for an Experience Cloud site, `internal`, or `null`.

Return Value
Type: `ConnectApi.RecommendationAudiencePage`

Usage
Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.
getRecommendationAudiences(communityId, pageParam, pageSize)

Get a page of custom recommendation audiences.

API Version
35.0

Requires Chatter
Yes

Signature
public static ConnectApi.RecommendationAudiencePage getRecommendationAudiences(String communityId, Integer pageParam, Integer pageSize)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of audiences per page.

Return Value
Type: ConnectApi.RecommendationAudiencePage

Usage
Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

getRecommendationDefinition(communityId, recommendationDefinitionId)

Get a custom recommendation definition.

API Version
35.0
Requires Chatter
Yes

Signature

```java
public static ConnectApi.RecommendationDefinition getRecommendationDefinition(String communityId, String recommendationDefinitionId)
```

Parameters

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.
- **recommendationDefinitionId**
  - Type: String
  - ID of the custom recommendation definition.

Return Value

Type: ConnectApi.RecommendationDefinition

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

getRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)

Get a custom recommendation definition photo.

API Version

35.0

Requires Chatter
Yes

Signature

```java
public static ConnectApi.Photo getRecommendationDefinitionPhoto(String communityId, String recommendationDefinitionId)
```

Parameters

- **communityId**
  - Type: String
ID for an Experience Cloud site, internal, or null.

`recommendationDefinitionId`

Type: `String`

ID of the custom recommendation definition.

**Return Value**

Type: `ConnectApi.RecommendationDefinitionPage`

**Usage**

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

### `getRecommendationDefinitions(communityId)`

Get custom recommendation definitions.

**API Version**

35.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.RecommendationDefinitionPage getRecommendationDefinitions(String communityId)
```

**Parameters**

`communityId`

Type: `String`

ID for an Experience Cloud site, internal, or null.

**Return Value**

Type: `ConnectApi.RecommendationDefinitionPage`

**Usage**

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.
getRecommendationForUser(communityId, userId, action, objectId)
Get the Chatter, custom, or static recommendation for the context user for the specified action and object ID.

API Version
33.0

Requires Chatter
Yes

Signature
public static ConnectApi.RecommendationCollection getRecommendationForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, String objectId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID for the context user or the keyword me.

action
Type: ConnectApi.RecommendationActionType
Specifies the action to take on a recommendation.
- follow—Follow a file, record, topic, or user.
- join—Join a group.
- view—View a file, group, article, record, user, custom, or static recommendation.

objectId
Type: String
Specifies the object to act on.
- If action is follow, objectId is a user ID, file ID, record ID, or topic ID (version 36.0 and later).
- If action is join, objectId is a group ID.
- If action is view, objectId is a user ID, file ID, group ID, record ID, custom recommendation ID (version 34.0 and later), the enum Today for static recommendations (version 35.0 and later), or an article ID (version 37.0 and later).

Return Value
Type: ConnectApi.RecommendationCollection
**Usage**

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

---

**getRecommendationsForUser**

```java
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType contextAction, String contextObjectId, ConnectApi.RecommendationChannel channel, Integer maxResults)
```

Get the Chatter recommendations, such as user, group, file, article, record, and topic recommendations for the context user. Get the custom and static recommendations for the context user.

---

**API Version**

36.0

---

**Available to Guest Users**

38.0

⚠️ **Note:** Only article and file recommendations are available to guest users.

---

**Requires Chatter**

Yes

---

**Signature**

```java
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType contextAction, String contextObjectId, ConnectApi.RecommendationChannel channel, Integer maxResults)
```

**Parameters**

- **communityId**
  - **Type:** `String`
  - ID for an Experience Cloud site, internal, or null.

- **userId**
  - **Type:** `String`
  - ID for the context user or the keyword `me`.

- **contextAction**
  - **Type:** `ConnectApi.RecommendationActionType`
  - Action that the context user just performed. Supported values are:
    - `follow`
• view

Use contextAction and contextObjectId together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify null.

contextObjectId
Type: String
ID of the object that the context user just performed an action on.
• If contextAction is follow, contextObjectId is a user ID, file ID, record ID, or topic ID.
• If contextAction is view, contextObjectId is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use contextAction and contextObjectId together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify null.

channel
Type: ConnectApi.RecommendationChannel
A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:
• CustomChannel1—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
• CustomChannel2—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
• CustomChannel3—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
• CustomChannel4—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
• CustomChannel5—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
• DefaultChannel—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

maxResults
Type: Integer
Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

Return Value
Type: ConnectApi.RecommendationCollection

Usage
If you want to get recommendations based on a recent action performed, such as following a user, use contextAction and contextObjectId together. For example, if you just followed Pam, you specify follow for contextAction and Pam’s user ID for contextObjectId.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults, result)

getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)
Get the Chatter, custom, and static recommendations for the context user for the specified action.

API Version
36.0

Available to Guest Users
38.0

Note: Only article and file recommendations are available to guest users.

Requires Chatter
Yes

Signature
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, ConnectApi.RecommendationActionType contextAction, String contextObjectId, ConnectApi.RecommendationChannel channel, Integer maxResults)

Parameters
  communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.
  userId
  Type: String
  ID for the context user or the keyword me.
  action
  Type: ConnectApi.RecommendationActionType
  Specifies the action to take on a recommendation.
  • follow—Follow a file, record, topic, or user.
  • join—Join a group.
  • view—View a file, group, article, record, user, custom, or static recommendation.
**contextAction**

Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- follow
- view

Use `contextAction` and `contextObjectId` together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify `null`.

**contextObjectId**

Type: `String`

ID of the object that the context user just performed an action on.

- If `contextAction` is `follow`, `contextObjectId` is a user ID, file ID, record ID, or topic ID.
- If `contextAction` is `view`, `contextObjectId` is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use `contextAction` and `contextObjectId` together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify `null`.

**channel**

Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- CustomChannel1—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- CustomChannel2—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- CustomChannel3—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- CustomChannel4—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- CustomChannel5—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.

**maxResults**

Type: `Integer`

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

**Return Value**

Type: `ConnectApi.RecommendationCollection`
Usage
If you want to get recommendations based on a recent action performed, such as following a user, use `contextAction` and `contextObjectId` together. For example, if you just followed Pam, you specify `follow` for `contextAction` and Pam’s user ID for `contextObjectId`.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

*Apex Developer Guide: Testing ConnectApi Code*

### getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)

Get the Chatter, custom, and static recommendations for the context user for the specified action and object category.

**API Version**

36.0

**Available to Guest Users**

38.0

⚠️ **Note:** Only article and file recommendations are available to guest users.

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, String objectCategory, ConnectApi.RecommendationActionType contextAction, String contextObjectId, ConnectApi.RecommendationChannel channel, Integer maxResults)
```

**Parameters**

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, `internal`, or `null`.

- `userId`
  - Type: `String`
  - ID for the context user or the keyword `me`.
action
Type: ConnectApi.RecommendationActionType
Specifies the action to take on a recommendation.
• follow—Follow a file, record, topic, or user.
• join—Join a group.
• view—View a file, group, article, record, user, custom, or static recommendation.

objectCategory
Type: String
• If action is follow, objectCategory is users, files, topics, or records.
• If action is join, objectCategory is groups.
• If action is view, objectCategory is users, files, groups, records, custom, apps, or articles (version 37.0 and later).

You can also specify a key prefix, the first three characters of the object ID, as the objectCategory. Valid values are:
• If action is follow, objectCategory is 005 (users), 069 (files), 0TO (topics), or 001 (accounts), for example.
• If action is join, objectCategory is 0F9 (groups).
• If action is view, objectCategory is 005 (users), 069 (files), 0F9 (groups), 0RD (custom recommendations), T (static recommendations), 001 (accounts), or kA0 (articles), for example, (version 37.0 and later).

collectionAction
Type: ConnectApi.RecommendationActionType
Action that the context user just performed. Supported values are:
• follow
• view

Use contextAction and contextObjectId together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify null.

collectionObjectId
Type: String
ID of the object that the context user just performed an action on.
• If contextAction is follow, collectionObjectId is a user ID, file ID, record ID, or topic ID.
• If contextAction is view, collectionObjectId is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use contextAction and contextObjectId together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify null.

channel
Type: ConnectApi.RecommendationChannel
A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:
• CustomChannel1—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
• CustomChannel2—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
• CustomChannel3—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
• CustomChannel4—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
• CustomChannel5—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
• DefaultChannel—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

maxResults
Type: Integer
Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

Return Value
Type: ConnectApi.RecommendationCollection

Usage
If you want to get recommendations based on a recent action performed, such as following a user, use contextAction and contextObjectId together. For example, if you just followed Pam, you specify follow for contextAction and Pam’s user ID for contextObjectId.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

  *Apex Developer Guide: Testing ConnectApi Code*

---

**getScheduledRecommendation(communityId, scheduledRecommendationId)**

Get a scheduled custom recommendation.

**API Version**

35.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.ScheduledRecommendation getScheduledRecommendation(String communityId, String scheduledRecommendationId)
```

**Parameters**

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or `null`.

- **scheduledRecommendationId**
  - Type: String
  - ID of the scheduled custom recommendation.

**Return Value**

Type: `ConnectApi.ScheduledRecommendation`

**Usage**

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

---

**getScheduledRecommendations(communityId, channel)**

Get scheduled custom recommendations.
API Version
36.0

Requires Chatter
Yes

Signature
public static ConnectApi.ScheduledRecommendationPage getScheduledRecommendations(String communityId, ConnectApi.RecommendationChannel channel)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.
channel
Type: ConnectApi.RecommendationChannel
A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:
• CustomChannel1—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
• CustomChannel2—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
• CustomChannel3—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
• CustomChannel4—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
• CustomChannel5—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
• DefaultChannel—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

Return Value
Type: ConnectApi.ScheduledRecommendationPage

Usage
Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.
rejectRecommendationForUser(communityId, userId, action, objectId)
Reject a Chatter, custom, or static recommendation for the context user for the specified action and object ID.

API Version
33.0

Requires Chatter
Yes

Signature
public static rejectRecommendationForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, String objectId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID for the context user or the keyword me.

action
Type: ConnectApi.RecommendationActionType
Specifies the action to take on a recommendation. Supported values are:
• follow—Follow a file, record, topic, or user.
• join—Join a group.
• view—View a file, group, article, record, user, custom, or static recommendation.

objectId
Type: String
Specifies the object to take action on.
• If action is follow, objectId is a user ID, file ID, record ID, or topic ID (version 36.0 and later).
• If action is join, objectId is a group ID.
• If action is view, objectId is a custom recommendation ID, the enum Today for static recommendations, or an article ID (version 37.0 and later).

Return Value
Type: Void

rejectRecommendationForUser(communityId, userId, action, objectEnum)
Reject a static recommendation for the context user.
API Version
34.0

Requires Chatter
Yes

Signature

```java
public static rejectRecommendationForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, ConnectApi.RecommendedObjectType objectEnum)
```

Parameters

- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or `null`.
- **userId**
  Type: String
  ID for the context user or the keyword `me`.
- **action**
  Type: ConnectApi.RecommendationActionType
  Specifies the action to take on a recommendation. Supported values are:
  - `view`—View a static recommendation.
- **objectEnum**
  Type: ConnectApi.RecommendedObjectType
  Specifies the object type to take action on.
  - `Today`—Static recommendations that don't have an ID, for example, the Today app recommendation.

Return Value

Type: Void

```java
updateRecommendationAudience(communityId, recommendationAudienceId, recommendationAudience)
```

Update a custom recommendation audience.

API Version
35.0

Requires Chatter
Yes
Signature

```java
public static ConnectApi.RecommendationAudience updateRecommendationAudience(String communityId, String recommendationAudienceId, ConnectApi.RecommendationAudienceInput recommendationAudience)
```

Parameters

- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- **recommendationAudienceId**
  - Type: `String`
  - ID of the custom recommendation audience.

- **recommendationAudience**
  - Type: `ConnectApi.RecommendationAudienceInput`

Return Value

- Type: `ConnectApi.RecommendationAudience`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

```java
updateRecommendationDefinition(communityId, recommendationDefinitionId, name, title, actionUrl, actionUrlName, explanation)
```

Update a custom recommendation definition with the specified parameters.

API Version

35.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.RecommendationDefinition updateRecommendationDefinition(String communityId, String recommendationDefinitionId, String name, String title, String actionUrl, String actionUrlName, String explanation recommendationDefinition)
```
Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`recommendationDefinitionId`
Type: `String`
ID of the custom recommendation definition.

`name`
Type: `String`
Name of the custom recommendation definition. The name is displayed in Setup.

`title`
Type: `String`
Title of the custom recommendation definition.

`actionUrl`
Type: `String`
URL for acting on the custom recommendation, for example, the URL to join a group.

`actionUrlName`
Type: `String`
Text label for the action URL in the user interface, for example, “Launch.”

`explanation`
Type: `String`
Explanation, or body, of the custom recommendation.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`updateRecommendationDefinition(communityId, recommendationDefinitionId, recommendationDefinition)`
Update a custom recommendation definition.

API Version

35.0
Requires Chatter
Yes

Signature
public static ConnectApi.RecommendationDefinition updateRecommendationDefinition(String communityId, String recommendationDefinitionId, ConnectApi.RecommendationDefinitionInput recommendationDefinition)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

recommendationDefinitionId
Type: String
ID of the custom recommendation definition.

recommendationDefinition
Type: ConnectApi.RecommendationDefinitionInput
A ConnectApi.RecommendationDefinitionInput object containing the properties to update.

Return Value
Type: ConnectApi.RecommendationDefinition

Usage
Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileUpload)
Update a custom recommendation definition photo with a file that hasn't been uploaded.

API Version
35.0

Requires Chatter
Yes
public static ConnectApi.Photo updateRecommendationDefinitionPhoto(String communityId, String recommendationDefinitionId, ConnectApi.BinaryInput fileUpload)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

recommendationDefinitionId
Type: String
ID of the custom recommendation definition.

fileUpload
Type: ConnectApi.BinaryInput
File to use as the photo. The content type must be usable as an image.

Return Value
Type: ConnectApi.Photo

Usage
Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileId, versionNumber)
Update a custom recommendation definition photo with an uploaded file.

API Version
35.0

Requires Chatter
Yes

Signature
public static ConnectApi.Photo updateRecommendationDefinitionPhoto(String communityId, String recommendationDefinitionId, String fileId, Integer versionNumber)
Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

recommendationDefinitionId
  Type: String
  ID of the custom recommendation definition.

fileId
  Type: String
  ID of a file already uploaded. The file must be an image, and be smaller than 2 GB.

versionNumber
  Type: Integer
  Version number of the existing file. Specify either an existing version number, or null to get the latest version.

Return Value

Type: ConnectApi.Photo

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo)

Update a custom recommendation definition photo with an uploaded file that requires cropping.

API Version

35.0

Requires Chatter

Yes

Signature

public static ConnectApi.Photo updateRecommendationDefinitionPhotoWithAttributes(String communityId, String recommendationDefinitionId, ConnectApi.PhotoInput photo)
ID for an Experience Cloud site, internal, or null.

**recommendationDefinitionId**
Type: **String**
ID of the custom recommendation definition.

**photo**
Type: **ConnectApi.PhotoInput**
A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

**Return Value**
Type: **ConnectApi.Photo**

**Usage**
Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

**updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo, fileUpload)**
Update a custom recommendation definition photo with a file that hasn’t been uploaded and requires cropping.

**API Version**
35.0

**Requires Chatter**
Yes

**Signature**
```java
public static ConnectApi.Photo updateRecommendationDefinitionPhotoWithAttributes(String
communityId, String recommendationDefinitionId, ConnectApi.PhotoInput photo,
ConnectApi.BinaryInput fileUpload)
```

**Parameters**

**communityId**
Type: **String**
ID for an Experience Cloud site, internal, or null.

**recommendationDefinitionId**
Type: **String**
ID of the custom recommendation definition.
photo
   Type: ConnectApi.PhotoInput
   A ConnectApi.PhotoInput object specifying the cropping parameters.
fileUpload
   Type: ConnectApi.BinaryInput
   File to use as the photo. The content type must be usable as an image.

Return Value
Type: ConnectApi.Photo

Usage
Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

updateScheduledRecommendation(communityId, scheduledRecommendationId, scheduledRecommendation)
Update a scheduled custom recommendation.

API Version
35.0

Requires Chatter
Yes

Signature
public static ConnectApi.ScheduledRecommendation updateScheduledRecommendation(String communityId, String scheduledRecommendationId, ConnectApi.ScheduledRecommendationInput scheduledRecommendation)

Parameters
communityId
   Type: String
   ID for an Experience Cloud site, internal, or null.
scheduledRecommendationId
   Type: String
   ID of the scheduled custom recommendation.
scheduledRecommendation
   Type: ConnectApi.ScheduledRecommendationInput
A `ConnectApi.ScheduledRecommendationInput` object containing the properties to update.

**Return Value**

Type: `ConnectApi.ScheduledRecommendation`

**Usage**

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

**Ranking scheduled custom recommendations example**

If you have these scheduled custom recommendations:

<table>
<thead>
<tr>
<th>Scheduled Recommendations</th>
<th>Rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScheduledRecommendationA</td>
<td>1</td>
</tr>
<tr>
<td>ScheduledRecommendationB</td>
<td>2</td>
</tr>
<tr>
<td>ScheduledRecommendationC</td>
<td>3</td>
</tr>
</tbody>
</table>

And you include this information in the Scheduled Custom Recommendation Input:

<table>
<thead>
<tr>
<th>Scheduled Recommendation</th>
<th>Rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScheduledRecommendationD</td>
<td>2</td>
</tr>
</tbody>
</table>

The result is:

<table>
<thead>
<tr>
<th>Scheduled Recommendation</th>
<th>Rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScheduledRecommendationA</td>
<td>1</td>
</tr>
<tr>
<td>ScheduledRecommendationD</td>
<td>2</td>
</tr>
<tr>
<td>ScheduledRecommendationB</td>
<td>3</td>
</tr>
<tr>
<td>ScheduledRecommendationC</td>
<td>4</td>
</tr>
</tbody>
</table>

**updateScheduledRecommendation(communityId, scheduledRecommendationId, rank, enabled, recommendationAudienceId)**

Update a scheduled custom recommendation with the specified parameters.

**API Version**

35.0
Requires Chatter
Yes

Signature

public static ConnectApi.ScheduledRecommendation updateScheduledRecommendation(String communityId, String scheduledRecommendationId, Integer rank, Boolean enabled, String recommendationAudienceId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

scheduledRecommendationId
Type: String
ID of the scheduled custom recommendation.

rank
Type: Integer
Relative rank of the scheduled custom recommendation indicated by ascending whole numbers starting with 1.
Setting the rank is comparable to an insertion into an ordered list. The scheduled custom recommendation is inserted into the position specified by the rank. The rank of all the scheduled custom recommendations after it is pushed down. See Ranking scheduled custom recommendations example.
If the specified rank is larger than the size of the list, the scheduled custom recommendation is put at the end of the list. The rank of the scheduled custom recommendation is the size of the list, instead of the one specified.
If a rank is not specified, the scheduled custom recommendation is put at the end of the list.

enabled
Type: Boolean
Indicates whether scheduling is enabled. If true, the custom recommendation is enabled and appears in Experience Cloud sites. If false, custom recommendations in feeds in Salesforce mobile web aren’t removed, but no new custom recommendations appear. In Customer Service and Partner Central sites, disabled custom recommendations no longer appear.

recommendationAudienceId
Type: String
ID of the custom recommendation definition that this scheduled recommendation schedules.

Return Value
Type: ConnectApi.ScheduledRecommendation

Usage
Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.
Ranking scheduled custom recommendations example

If you have these scheduled custom recommendations:

<table>
<thead>
<tr>
<th>Scheduled Recommendations</th>
<th>Rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScheduledRecommendationA</td>
<td>1</td>
</tr>
<tr>
<td>ScheduledRecommendationB</td>
<td>2</td>
</tr>
<tr>
<td>ScheduledRecommendationC</td>
<td>3</td>
</tr>
</tbody>
</table>

And you include this information in the Scheduled Custom Recommendation Input:

<table>
<thead>
<tr>
<th>Scheduled Recommendation</th>
<th>Rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScheduledRecommendationD</td>
<td>2</td>
</tr>
</tbody>
</table>

The result is:

<table>
<thead>
<tr>
<th>Scheduled Recommendation</th>
<th>Rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScheduledRecommendationA</td>
<td>1</td>
</tr>
<tr>
<td>ScheduledRecommendationD</td>
<td>2</td>
</tr>
<tr>
<td>ScheduledRecommendationB</td>
<td>3</td>
</tr>
<tr>
<td>ScheduledRecommendationC</td>
<td>4</td>
</tr>
</tbody>
</table>

Recommendations Test Methods

The following are the test methods for Recommendations. All methods are static.

For information about using these methods to test your ConnectApi code, see Testing ConnectApi Code.

IN THIS SECTION:

`setTestGetRecommendationForUser(communityId, userId, action, objectId, result)`
Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

`setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults, result)`
Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

`setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults, result)`
Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.
setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults, result)

Register a ConnectApi.RecommendationCollection object to be returned when getRecommendationsForUser is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationForUser(communityId, userId, action, objectId, result)

Register a ConnectApi.RecommendationCollection object to be returned when getRecommendationForUser is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
33.0

Requires Chatter
Yes

Signature
public static Void setTestGetRecommendationForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, String objectId, ConnectApi.RecommendationCollection result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID for the context user or the keyword me.

action
Type: ConnectApi.RecommendationActionType
Specifies the action to take on a recommendation.
• follow—Follow a file, record, topic, or user.
• join—Join a group.
• view—View a file, group, article, record, user, custom, or static recommendation.

objectId
Type: String
Specifies the object to take action on.
• If action is follow, objectId is a user ID, file ID, record ID, or topic ID (version 36.0 and later).
• If action is join, objectId is a group ID.
• If action is view, objectId is a user ID, file ID, group ID, record ID, custom recommendation ID, the enum Today for static recommendations, or an article ID (version 37.0 and later).
result
    Type: `ConnectApi.RecommendationCollection`
    Object containing test data.

Return Value
Type: Void

SEE ALSO:
    getRecommendationForUser(communityId, userId, action, objectId)
    *Apex Developer Guide: Testing ConnectApi Code*

`setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults, result)`
Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
36.0

Requires Chatter
Yes

Signature
```
public static Void setTestGetRecommendationsForUser(String communityId, String userId, 
    ConnectApi.RecommendationActionType contextAction, String contextObjectId, 
    ConnectApi.RecommendationChannel channel, Integer maxResults, 
    ConnectApi.RecommendationCollection result)
```

Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`userId`
Type: `String`
ID for the context user or the keyword `me`.

`contextAction`
Type: `ConnectApi.RecommendationActionType`
Action that the context user just performed. Supported values are:
- `follow`
- `view`
Use `contextAction` and `contextObjectId` together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify `null`.

**contextObjectId**
Type: `String`
ID of the object that the context user just performed an action on.
- If `contextAction` is `follow`, `contextObjectId` is a user ID, file ID, record ID, or topic ID.
- If `contextAction` is `view`, `contextObjectId` is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use `contextAction` and `contextObjectId` together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify `null`.

**channel**
Type: `ConnectApi.RecommendationChannel`
A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:
- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.

**maxResults**
Type: `Integer`
Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

**result**
Type: `ConnectApi.RecommendationCollection`
Object containing test data.

**Return Value**
Type: `Void`

**SEE ALSO:**
- `getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)`
- *Apex Developer Guide: Testing ConnectApi Code*
setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults, result)

Register a ConnectApi.RecommendationCollection object to be returned when getRecommendationsForUser is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
36.0

Requires Chatter
Yes

Signature
public static Void setTestGetRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, ConnectApi.RecommendationActionType contextAction, String contextObjectId, ConnectApi.RecommendationChannel channel, Integer maxResults, ConnectApi.RecommendationCollection result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID for the context user or the keyword me.

action
Type: ConnectApi.RecommendationActionType
Specifies the action to take on a recommendation.
• follow—Follow a file, record, topic, or user.
• join—Join a group.
• view—View a file, group, article, record, user, custom, or static recommendation.

contextAction
Type: ConnectApi.RecommendationActionType
Action that the context user just performed. Supported values are:
• follow
• view

Use contextAction and contextObjectId together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify null.

contextObjectId
Type: String
ID of the object that the context user just performed an action on.
- If `contextAction` is `follow`, `contextObjectId` is a user ID, file ID, record ID, or topic ID.
- If `contextAction` is `view`, `contextObjectId` is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use `contextAction` and `contextObjectId` together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

**channel**

Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- **CustomChannel1**—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- **CustomChannel2**—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- **CustomChannel3**—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- **CustomChannel4**—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- **CustomChannel5**—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- **DefaultChannel**—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

**maxResults**

Type: `Integer`

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

**result**

Type: `ConnectApi.RecommendationCollection`

Object containing test data.

**Return Value**

Type: Void

SEE ALSO:

- `getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)`

- `setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults, result)`

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.
API Version
36.0

Requires Chatter
Yes

Signature
public static Void setTestGetRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, String objectCategory, ConnectApi.RecommendationActionType contextAction, String contextObjectId, ConnectApi.RecommendationChannel channel, Integer maxResults, ConnectApi.RecommendationCollection result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID for the context user or the keyword me.

action
Type: ConnectApi.RecommendationActionType
Specifies the action to take on a recommendation.
• follow—Follow a file, record, topic, or user.
• join—Join a group.
• view—View a file, group, article, record, user, custom, or static recommendation.

objectCategory
Type: String
• If action is follow, objectCategory is users, files, records, or topics.
• If action is join, objectCategory is groups.
• If action is view, objectCategory is users, files, groups, records, custom, apps, or articles (version 37.0 and later).

You can also specify a key prefix, the first three characters of the object ID, as the objectCategory. Valid values are:
• If action is follow, objectCategory is 005 (users), 069 (files), 0TO (topics), or 001 (accounts), for example.
• If action is join, objectCategory is 0F9 (groups).
• If action is view, objectCategory is 005 (users), 069 (files), 0F9 (groups), 0RD (custom recommendations), T (static recommendations), 001 (accounts), or kA0 (articles), for example, (version 370 and later).

contextAction
Type: ConnectApi.RecommendationActionType
Action that the context user just performed. Supported values are:
• follow
• view

Use `contextAction` and `contextObjectId` together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify `null`.

`contextObjectId`  
Type: `String`  
ID of the object that the context user just performed an action on.  
- If `contextAction` is `follow`, `contextObjectId` is a user ID, file ID, record ID, or topic ID.  
- If `contextAction` is `view`, `contextObjectId` is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use `contextAction` and `contextObjectId` together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify `null`.

`channel`  
Type: `ConnectApi.RecommendationChannel`  
A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:  
- `CustomChannel1` — Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.  
- `CustomChannel2` — Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.  
- `CustomChannel3` — Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.  
- `CustomChannel4` — Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.  
- `CustomChannel5` — Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.  

`maxResults`  
Type: `Integer`  
Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

`result`  
Type: `ConnectApi.RecommendationCollection`  
Object containing test data.

**Return Value**

Type: `Void`

SEE ALSO:  
`getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)`  
*Apex Developer Guide: Testing ConnectApi Code*
## Retired Recommendations Methods

The following methods for Recommendations are retired.

### IN THIS SECTION:

- `createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId)`: Create a scheduled custom recommendation with the specified parameters.
- `getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults)`: Get the Chatter recommendations, such as user, group, file, and record recommendations for the context user. Get the custom and static recommendations for the context user.
- `getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults)`: Get the Chatter, custom, and static recommendations for the context user for the specified action.
- `getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults)`: Get the Chatter, custom, and static recommendations for the context user for the specified action and object category.
- `getScheduledRecommendations(communityId)`: Get scheduled custom recommendations.
- `setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults, result)`: Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>createScheduledRecommendation</code></td>
<td>Create a scheduled custom recommendation with the specified parameters.</td>
</tr>
<tr>
<td><code>getRecommendationsForUser</code></td>
<td>Get the Chatter recommendations, such as user, group, file, and record recommendations for the context user. Get the custom and static recommendations for the context user.</td>
</tr>
<tr>
<td><code>getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults)</code></td>
<td>Get the Chatter, custom, and static recommendations for the context user for the specified action.</td>
</tr>
<tr>
<td><code>setTestGetRecommendationsForUser</code></td>
<td>Register a <code>ConnectApi.RecommendationCollection</code> object to be returned when <code>getRecommendationsForUser</code> is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.</td>
</tr>
</tbody>
</table>

### API Version

35.0 only

**Important:** In version 36.0 and later, use `createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId, channel)`.

### Requires Chatter

Yes
Signature

public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String communityId, String recommendationDefinitionId, Integer rank, Boolean enabled, String recommendationAudienceId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

recommendationDefinitionId
Type: String
ID of the custom recommendation definition.

rank
Type: Integer
Relative rank of the scheduled custom recommendation indicated by ascending whole numbers starting with 1.
Setting the rank is comparable to an insertion into an ordered list. The scheduled custom recommendation is inserted into the position specified by the rank. The rank of all the scheduled custom recommendations after it is pushed down. See Ranking scheduled custom recommendations example.
If the specified rank is larger than the size of the list, the scheduled custom recommendation is put at the end of the list. The rank of the scheduled custom recommendation is the size of the list, instead of the one specified.
If a rank is not specified, the scheduled custom recommendation is put at the end of the list.

enabled
Type: Boolean
Indicates whether scheduling is enabled. If true, the custom recommendation is enabled and appears in Experience Cloud sites. If false, custom recommendations in feeds in Salesforce mobile web aren’t removed, but no new custom recommendations appear. In Customer Service and Partner Central sites, disabled custom recommendations no longer appear.

recommendationAudienceId
Type: String
ID of the custom recommendation definition that this scheduled recommendation schedules.

Return Value

Type: ConnectApi.ScheduledRecommendation

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Ranking scheduled custom recommendations example

If you have these scheduled custom recommendations:
And you include this information in the Scheduled Custom Recommendation Input:

<table>
<thead>
<tr>
<th>Scheduled Recommendation</th>
<th>Rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScheduledRecommendationA</td>
<td>1</td>
</tr>
<tr>
<td>ScheduledRecommendationB</td>
<td>2</td>
</tr>
<tr>
<td>ScheduledRecommendationC</td>
<td>3</td>
</tr>
</tbody>
</table>

The result is:

<table>
<thead>
<tr>
<th>Scheduled Recommendation</th>
<th>Rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScheduledRecommendationA</td>
<td>1</td>
</tr>
<tr>
<td>ScheduledRecommendationD</td>
<td>2</td>
</tr>
<tr>
<td>ScheduledRecommendationB</td>
<td>3</td>
</tr>
<tr>
<td>ScheduledRecommendationC</td>
<td>4</td>
</tr>
</tbody>
</table>

getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults)

Get the Chatter recommendations, such as user, group, file, and record recommendations for the context user. Get the custom and static recommendations for the context user.

API Version

33.0–35.0

Important: In version 36.0 and later, use getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults).

Requires Chatter

Yes

Signature

public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer maxResults)
Parameters

*communityId*
Type: String
ID for an Experience Cloud site, internal, or null.

*userId*
Type: String
ID for the context user or the keyword me.

*contextAction*
Type: ConnectApi.RecommendationActionType
Action that the context user just performed. Supported values are:
- follow
- view

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed.
If you don’t want recommendations based on a recent action, specify null.

*contextObjectId*
Type: String
ID of the object that the context user just performed an action on.
- If *contextAction* is follow, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is view, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed.
If you don’t want recommendations based on a recent action, specify null.

*maxResults*
Type: Integer
Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

Return Value

Type: ConnectApi.RecommendationCollection

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *contextAction* and *contextObjectId* together. For example, if you just followed Pam, you specify follow for *contextAction* and Pam’s user ID for *contextObjectId*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

* setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults, result)

1440
getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults)

Get the Chatter, custom, and static recommendations for the context user for the specified action.

API Version

33.0–35.0

⚠️ Important: In version 36.0 and later, use getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults).

Requires Chatter

Yes

Signature

public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer maxResults)

Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

userId
  Type: String
  ID for the context user or the keyword me.

action
  Type: ConnectApi.RecommendationActionType
  Specifies the action to take on a recommendation.
  • follow—Follow a file, record, topic, or user.
  • join—Join a group.
  • view—View a file, group, article, record, user, custom, or static recommendation.

contextAction
  Type: ConnectApi.RecommendationActionType
  Action that the context user just performed. Supported values are:
  • follow
  • view
  Use contextAction and contextObjectId together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify null.

contextObjectId
  Type: String
ID of the object that the context user just performed an action on.

- If `contextAction` is `follow`, `contextObjectId` is a user ID, file ID, or record ID.
- If `contextAction` is `view`, `contextObjectId` is a user ID, file ID, group ID, or record ID.

Use `contextAction` and `contextObjectId` together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify `null`.

`maxResults`

  
  Type: `Integer`

  Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

**Return Value**

Type: `ConnectApi.RecommendationCollection`

**Usage**

If you want to get recommendations based on a recent action performed, such as following a user, use `contextAction` and `contextObjectId` together. For example, if you just followed Pam, you specify `follow` for `contextAction` and Pam’s user ID for `contextObjectId`.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

- *Apex Developer Guide: Testing ConnectApi Code*

```
getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults)
```

Get the Chatter, custom, and static recommendations for the context user for the specified action and object category.

**API Version**

33.0–35.0

**Important:** In version 36.0 and later, use `getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)`.

**Requires Chatter**

Yes

**Signature**

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, String
```
objectCategory, ConnectApi.RecommendationActionType contextAction, String
contextObjectId, Integer maxResults)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID for the context user or the keyword me.

action
Type: ConnectApi.RecommendationActionType
Specifies the action to take on a recommendation.
- follow—Follow a file, record, topic, or user.
- join—Join a group.
- view—View a file, group, article, record, user, custom, or static recommendation.

objectCategory
Type: String
- If action is follow, objectCategory is users, files, or records.
- If action is join, objectCategory is groups.
- If action is view, objectCategory is users, files, groups, records, custom, or apps.
You can also specify a key prefix, the first three characters of the object ID, as the objectCategory. Valid values are:
- If action is follow, objectCategory is 005 (users), 069 (files), or 001 (accounts), for example.
- If action is join, objectCategory is 0F9 (groups).
- If action is view, objectCategory is 005 (users), 069 (files), 0F9 (groups), 0RD (custom recommendations), T (static recommendations), or 001 (accounts), for example.

customAction
Type: ConnectApi.RecommendationActionType
Action that the context user just performed. Supported values are:
- follow
- view

Use contextAction and contextObjectId together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify null.

customObjectId
Type: String
ID of the object that the context user just performed an action on.
- If contextAction is follow, contextObjectId is a user ID, file ID, or record ID.
- If contextAction is view, contextObjectId is a user ID, file ID, group ID, or record ID.

Use contextAction and contextObjectId together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify null.
**maxResults**

Type: `Integer`

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

**Return Value**

Type: `ConnectApi.RecommendationCollection`

**Usage**

If you want to get recommendations based on a recent action performed, such as following a user, use `contextAction` and `contextObjectId` together. For example, if you just followed Pam, you specify `follow` for `contextAction` and Pam’s user ID for `contextObjectId`.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**SEE ALSO:**

- `setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

**getScheduledRecommendations(communityId)**

Get scheduled custom recommendations.

**API Version**

35.0 only
Important: In version 36.0 and later, use `getScheduledRecommendations(communityId, channel)`.

Requires Chatter
Yes

Signature

```java
public static ConnectApi.ScheduledRecommendationPage getScheduledRecommendations(String communityId)
```

Parameters

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.

Return Value

Type: `ConnectApi.ScheduledRecommendationPage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

```java
setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults, result)
```

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

33.0–35.0

Requires Chatter
Yes

Signature

```java
public static Void setTestGetRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer maxResults, ConnectApi.RecommendationCollection result)
```
Parameters

`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`userId`
Type: `String`
ID for the context user or the keyword `me`.

`contextAction`
Type: `ConnectApi.RecommendationActionType`
Action that the context user just performed. Supported values are:
- `follow`
- `view`

Use `contextAction` and `contextObjectId` together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify `null`.

`contextObjectId`
Type: `String`
ID of the object that the context user just performed an action on.
- If `contextAction` is `follow`, `contextObjectId` is a user ID, file ID, or record ID.
- If `contextAction` is `view`, `contextObjectId` is a user ID, file ID, group ID, or record ID.

Use `contextAction` and `contextObjectId` together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify `null`.

`maxResults`
Type: `Integer`
Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

`result`
Type: `ConnectApi.RecommendationCollection`
Object containing test data.

Return Value
Type: Void

SEE ALSO:
- `getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults)`

`setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults, result)`
Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.
API Version

33.0–35.0

Requires Chatter

Yes

Signature

public static Void setTestGetRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer maxResults, ConnectApi.RecommendationCollection result)

Parameters

communityId

Type: String

ID for an Experience Cloud site, internal, or null.

userId

Type: String

ID for the context user or the keyword me.

action

Type: ConnectApi.RecommendationActionType

Specifies the action to take on a recommendation.
  • follow—Follow a file, record, topic, or user.
  • join—Join a group.
  • view—View a file, group, article, record, user, custom, or static recommendation.

contextAction

Type: ConnectApi.RecommendationActionType

Action that the context user just performed. Supported values are:
  • follow
  • view

Use contextAction and contextObjectId together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify null.

contextObjectId

Type: String

ID of the object that the context user just performed an action on.
  • If contextAction is follow, contextObjectId is a user ID, file ID, or record ID.
  • If contextAction is view, contextObjectId is a user ID, file ID, group ID, or record ID.

Use contextAction and contextObjectId together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify null.
maxResults
  Type: Integer
  Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result
  Type: ConnectApi.RecommendationCollection
  Object containing test data.

Return Value
  Type: Void

SEE ALSO:
  getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults)

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults, result)

Register a ConnectApi.RecommendationCollection object to be returned when getRecommendationsForUser is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version
  33.0–35.0

Requires Chatter
  Yes

Signature
  public static Void setTestGetRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, String objectCategory, ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer maxResults, ConnectApi.RecommendationCollection result)

Parameters
  communityId
    Type: String
    ID for an Experience Cloud site, internal, or null.
  userId
    Type: String
    ID for the context user or the keyword me.
  action
    Type: ConnectApi.RecommendationActionType
Specifies the action to take on a recommendation.
- **follow**—Follow a file, record, topic, or user.
- **join**—Join a group.
- **view**—View a file, group, article, record, user, custom, or static recommendation.

**objectCategory**
Type: String
- If **action** is **follow**, **objectCategory** is users, files, or records.
- If **action** is **join**, **objectCategory** is groups.
- If **action** is **view**, **objectCategory** is users, files, groups, records, custom, or apps.

You can also specify a key prefix, the first three characters of the object ID, as the **objectCategory**. Valid values are:
- If **action** is **follow**, **objectCategory** is 005 (users), 069 (files), or 001 (accounts), for example.
- If **action** is **join**, **objectCategory** is 0F9 (groups).
- If **action** is **view**, **objectCategory** is 005 (users), 069 (files), 0F9 (groups), 0RD (custom recommendations), T (static recommendations), or 001 (accounts), for example.

**contextAction**
Type: ConnectApi.RecommendationActionType
Action that the context user just performed. Supported values are:
- **follow**
- **view**

Use **contextAction** and **contextObjectId** together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify null.

**contextObjectId**
Type: String
ID of the object that the context user just performed an action on.
- If **contextAction** is **follow**, **contextObjectId** is a user ID, file ID, or record ID.
- If **contextAction** is **view**, **contextObjectId** is a user ID, file ID, group ID, or record ID.

Use **contextAction** and **contextObjectId** together to get new recommendations based on the action just performed. If you don’t want recommendations based on a recent action, specify null.

**maxResults**
Type: Integer
Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

**result**
Type: ConnectApi.RecommendationCollection
Object containing test data.
Records Class
Access information about record motifs, which are small icons used to distinguish record types in the Salesforce UI.

Namespace
ConnectApi

Records Methods
The following are methods for Records. All methods are static.

IN THIS SECTION:
- getMotif(communityId, idOrPrefix)
  Get a motif that contains the URLs for a set of small, medium, and large motif icons for a record. It can also contain a base color for the record.
- getMotifBatch(communityId, idOrPrefixList)
  Get a motif for a list of objects.

getMotif(communityId, idOrPrefix)
Get a motif that contains the URLs for a set of small, medium, and large motif icons for a record. It can also contain a base color for the record.

API Version
28.0

Requires Chatter
No

Signature
```
public static ConnectApi.Motif getMotif(String communityId, String idOrPrefix)
```

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

$idOrPrefix
Type: String
An ID or key prefix.

Return Value
Type: ConnectApi.Motif

Usage
Each Salesforce record type has its own set of motif icons.

getMotifBatch(communityId, idOrPrefixList)
Get a motif for a list of objects.

API Version
31.0

Requires Chatter
No

Signature
public static ConnectApi.BatchResult[] getMotifBatch(String communityId, List<String> idOrPrefixList)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

idOrPrefixList
Type: List<String>
A list of object IDs or prefixes.

Return Value
Type: ConnectApi.BatchResult[]
Example

```java
String communityId = null;
List<String> prefixIds = new List<String> { '001', '01Z', '069' };

// Get info about the motifs of all records in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.Records.getMotifBatch(communityId, prefixIds);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the color of each motif.
        ConnectApi.Motif motif;
        if (batchResult.getResult() instanceof ConnectApi.Motif) {
            motif = (ConnectApi.Motif) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(motif.color);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

Repricing Class

Perform functions related to repricing orders in Order Management.

Namespace

ConnectApi

Repricing Methods

The following are methods for Repricing. All methods are static.

IN THIS SECTION:

- `productDetails(webstoreId, skuOrProductId, effectiveAccountId, currencyCode, locale)`
  Get details of a product in a web store.

- `searchProducts(webstoreId, searchTerm, pageParam, pageSize, effectiveAccountId, facets)`
  Search products in a webstore.

- `productDetails(webstoreId, skuOrProductId, effectiveAccountId, currencyCode, locale)`
  Get details of a product in a web store.
API Version
55.0

Requires Chatter
No

Signature
public static ConnectApi.ProductDetailsOutputRepresentation productDetails(String webstoreId, String skuOrProductId, String effectiveAccountId, String currencyCode, String locale)

Parameters

webstoreId
Type: String
ID of the WebStore.

skuOrProductId
Type: String
SKU or ID of the Product.

effectiveAccountId
Type: String
Effective Account ID. Required for B2B stores. For other stores, pass null.

currencyCode
Type: String
ISO currency code. If you pass null, the default store value is used.

locale
Type: String
Locale. If you pass null, the default store value is used.

excludeAttributeSetInfo
Type: String
Specifies whether the attribute set information for the product is returned.

excludeMedia
Type: String
Specifies whether the media groups and default images of the product are returned.

excludeQuantityRule
Type: String
Specifies whether the quantity rule information for the product is returned.

excludeVariationInfo
Type: String
Specifies whether the variation information for the product is returned.
excludePrices
  Type: String
  Specifies whether the prices for the product is returned.

Return Value
Type: ConnectApi.ProductDetailsOutputRepresentation

searchProducts(webstoreId, searchTerm, pageParam, pageSize, effectiveAccountId, facets)
Search products in a webstore.

API Version
59.0

Requires Chatter
No

Signature
public static ConnectApi.ProductSearchOutputRepresentation searchProducts(String webstoreId, String searchTerm, Integer pageParam, Integer pageSize, String effectiveAccountId, String facets)

Parameters
webstoreId
  Type: String
  ID of the webstore.

searchTerm
  Type: String
  Term used for the search.

pageParam
  Type: Integer
  Maximum number of search results pages to return. If you don't specify a value, the default is 1.

pageSize
  Type: Integer
  Number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 20.

effectiveAccountId
  Type: String
  ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user.

facets
  Type: String
A list of facet names to filter the search. For example, ["size_medium", "color_red"] is encoded to WyJzaXplX21lZGl1bSIsICJjb2xvcl9yZWQiXQ==

Return Value
Type: `ConnectApi.ProductSearchOutputRepresentation` on page 1922

ReturnOrder Class
Process ReturnOrders in Order Management.

Namespace
`ConnectApi`

ReturnOrder Methods
The following are methods for `ReturnOrder`. All methods are static.

IN THIS SECTION:
- `createReturnOrder(returnOrderInput)`
  - Create a ReturnOrder and ReturnOrderLineItems for items belonging to an OrderSummary.
- `returnItems(returnOrderId, returnItemsInput)`
  - Process ReturnOrderLineItems belonging to a ReturnOrder. Processing a ReturnOrderLineItem generates a change Order and makes that ReturnOrderLineItem read-only. The change order for a returned item or delivery charge has a positive amount and should be used to create a credit memo. The change order for a return fee has a negative amount and should be used to create an invoice. If a processed ReturnOrderLineItem has any remaining expected quantity, then the API creates a separate ReturnOrderLineItem representing that quantity.

`createReturnOrder(returnOrderInput)`
Create a ReturnOrder and ReturnOrderLineItems for items belonging to an OrderSummary.

API Version
50.0

Requires Chatter
No

Signature
```java
public static ConnectApi.ReturnOrderOutputRepresentation createReturnOrder(ConnectApi.ReturnOrderInputRepresentation returnOrderInput)
```
Parameters

`returnOrderInput`
Type: `ConnectApi.ReturnOrderInputRepresentation`
Data for creating a ReturnOrder and ReturnOrderLineItems.

Return Value

Type: `ConnectApi.ReturnOrderOutputRepresentation`

SEE ALSO:

`returnItems(returnOrderId, returnItemsInput)`

`returnItems(returnOrderId, returnItemsInput)`
Process ReturnOrderLineItems belonging to a ReturnOrder. Processing a ReturnOrderLineItem generates a change Order and makes that ReturnOrderLineItem read-only. The change order for a returned item or delivery charge has a positive amount and should be used to create a credit memo. The change order for a return fee has a negative amount and should be used to create an invoice. If a processed ReturnOrderLineItem has any remaining expected quantity, then the API creates a separate ReturnOrderLineItem representing that quantity.

API Version

$2.0

Requires Chatter

No

Signature

```java
public static ConnectApi.ReturnItemsOutputRepresentation returnItems(String returnOrderId, ConnectApi.ReturnItemsInputRepresentation returnItemsInput)
```

Parameters

`returnOrderId`
Type: `String`
ID of the ReturnOrder.

`returnItemsInput`
Type: `ConnectApi.ReturnItemsInputRepresentation`
Data about products and delivery charges to return, as well as associated return fees.
Return Value
Type: \texttt{ConnectApi.ReturnItemsOutputRepresentation}

SEE ALSO:
- createMultipleInvoices(invoicesInput)
- ensureRefundsAsync(orderSummaryId, ensureRefundsInput)
- createReturnOrder(returnOrderInput)

Routing Class
Route orders to inventory locations in Order Management.

Namespace
\texttt{ConnectApi}

Routing Methods
The following are methods for \texttt{Routing}. All methods are static.

\textbf{IN THIS SECTION:}
- confirmHeldFOCapacity(confirmHeldFOCapacityInput)
  Confirm held fulfillment order capacity at one or more locations. This call decreases a location's held capacity and increases its assigned fulfillment order count. Confirm held capacity when you assign a fulfillment order to a location.
- findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)
  Returns combinations of inventory locations that can fulfill an order within a specified limit of shipment splits. By default, checks up to 1,000,000 potential routes, returning a maximum of 10,000 results.
- findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)
  For one or more order summaries, find inventory availability using Omnichannel Inventory and identify the fulfillment routes with fewest splits. By default, checks up to 1,000,000 potential routes, returning a maximum of 10,000 results. This method combines the functionality of the getInventoryAvailability() and findRoutesWithFewestSplits() methods.
- getFOCapacityValues(getFOCapacityValuesInput)
  Get information about the current fulfillment order capacity of one or more locations.
- holdFOCapacity(holdFOCapacityInput)
  Hold fulfillment order capacity at a location. Holding capacity at a location reserves a space for a fulfillment order that you'll assign to it.
- rankAverageDistance(rankAverageDistanceInputRepresentation)
  Calculates the average distance from sets of inventory locations to an order recipient, and ranks them. Use this method to compare the average shipping distances for different sets of locations that can fulfill an order.
- releaseHeldFOCapacity(releaseHeldFOCapacityInput)
  Release held fulfillment order capacity at one or more locations. This call decreases a location's held capacity without changing its assigned fulfillment order count. Release held capacity when you cancel the assignment of a fulfillment order to a location.
confirmHeldFOCapacity(confirmHeldFOCapacityInput)

Confirm held fulfillment order capacity at one or more locations. This call decreases a location’s held capacity and increases its assigned fulfillment order count. Confirm held capacity when you assign a fulfillment order to a location.

API Version

55.0

Requires Chatter

No

Signature

public static ConnectApi.ConfirmHeldFOCapacityOutputRepresentation confirmHeldFOCapacity(ConnectApi.ConfirmHeldFOCapacityInputRepresentation confirmHeldFOCapacityInput)

Parameters

confirmHeldFOCapacityInput

Type: ConnectApi.ConfirmHeldFOCapacityInputRepresentation

The input includes, for each fulfillment order, the location where capacity is held for it.

Return Value

Type: ConnectApi.ConfirmHeldFOCapacityOutputRepresentation

findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)

Returns combinations of inventory locations that can fulfill an order within a specified limit of shipment splits. By default, checks up to 1,000,000 potential routes, returning a maximum of 10,000 results.

API Version

51.0

Requires Chatter

No

Signature

public static ConnectApi.FindRoutesWithFewestSplitsOutputRepresentation findRoutesWithFewestSplits(ConnectApi.FindRoutesWithFewestSplitsInputRepresentation findRoutesWithFewestSplitsInputRepresentation)
Parameters

`findRoutesWithFewestSplitsInputRepresentation`
Type: `ConnectApi.FindRoutesWithFewestSplitsInputRepresentation`

The input includes the ordered item quantities, data about available inventory, and, optionally, a maximum allowable number of shipment splits.

Return Value
Type: `ConnectApi.FindRoutesWithFewestSplitsOutputRepresentation`

`findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)`

For one or more order summaries, find inventory availability using Omnichannel Inventory and identify the fulfillment routes with fewest splits. By default, checks up to 1,000,000 potential routes, returning a maximum of 10,000 results. This method combines the functionality of the `getInventoryAvailability()` and `findRoutesWithFewestSplits()` methods.

API Version

54.0

Requires Chatter

No

Signature

`public static ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation findRoutesWithFewestSplitsUsingOCI(ConnectApi.FindRoutesWithFewestSplitsUsingOCIInputRepresentation findRoutesWithFewestSplitsUsingOCIInput)`

Parameters

`findRoutesWithFewestSplitsUsingOCIInput`
Type: `ConnectApi.FindRoutesWithFewestSplitsUsingOCIInputRepresentation`

The input includes, for each order, the ordered item quantities, the assigned location group or locations, and, optionally, a maximum allowable number of shipment splits and a list of locations to exclude from the calculation.

Return Value
Type: `ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation`

SEE ALSO:
- `getInventoryAvailability(inventoryAvailabilityInputRepresentation)`
- `findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)`
- `getFOCapacityValues(getFOCapacityValuesInput)`

Get information about the current fulfillment order capacity of one or more locations.
API Version
55.0

Requires Chatter
No

Signature
public static ConnectApi.GetFOCapacityValuesOutputRepresentation
getFOCapacityValues(ConnectApi.GetFOCapacityValuesRequestInputRepresentation
getFOCapacityValuesInput)

Parameters
getFOCapacityValuesInput
Type: ConnectApi.GetFOCapacityValuesRequestInputRepresentation
Locations to get fulfillment order capacity information about.

Return Value
Type: ConnectApi.GetFOCapacityValuesOutputRepresentation

holdFOCapacity(holdFOCapacityInput)
Hold fulfillment order capacity at a location. Holding capacity at a location reserves a space for a fulfillment order that you’ll assign to it.

API Version
55.0

Requires Chatter
No

Signature
public static ConnectApi.HoldFOCapacityOutputRepresentation
holdFOCapacity(ConnectApi.HoldFOCapacityInputRepresentation holdFOCapacityInput)

Parameters
holdFOCapacityInput
Type: ConnectApi.HoldFOCapacityInputRepresentation
The input includes, for each fulfillment order, the location to hold capacity for it.

Return Value
Type: ConnectApi.HoldFOCapacityOutputRepresentation
rankAverageDistance(rankAverageDistanceInputRepresentation)
Calculates the average distance from sets of inventory locations to an order recipient, and ranks them. Use this method to compare the average shipping distances for different sets of locations that can fulfill an order.

API Version
51.0

Requires Chatter
No

Signature
public static ConnectApi.RankAverageDistanceOutputRepresentation rankAverageDistance(ConnectApi.RankAverageDistanceInputRepresentation rankAverageDistanceInputRepresentation)

Parameters
rankAverageDistanceInputRepresentation
Type: ConnectApi.RankAverageDistanceInputRepresentation
An order recipient’s geographic location and information about sets of inventory locations that can fulfill the order.

Return Value
Type: ConnectApi.RankAverageDistanceOutputRepresentation

releaseHeldFOCapacity(releaseHeldFOCapacityInput)
Release held fulfillment order capacity at one or more locations. This call decreases a location’s held capacity without changing its assigned fulfillment order count. Release held capacity when you cancel the assignment of a fulfillment order to a location.

API Version
55.0

Requires Chatter
No

Signature
public static ConnectApi.ReleaseHeldFOCapacityOutputRepresentation releaseHeldFOCapacity(ConnectApi.ReleaseHeldFOCapacityInputRepresentation releaseHeldFOCapacityInput)
Parameters

releaseHeldFOCapacityInput
  Type: ConnectApi.ReleaseHeldFOCapacityInputRepresentation
  The input includes, for each fulfillment order, the location that holds the capacity to release.

Return Value

Type: ConnectApi.ReleaseHeldFOCapacityOutputRepresentation

SalesforceInbox Class

Access information about Automated Activity Capture, which is available in Einstein and Salesforce Inbox.

Namespace

ConnectApi

SalesforceInbox Methods

The following are methods for SalesforceInbox. All methods are static.

IN THIS SECTION:

  shareActivity(activityId, sharingInfo)
  Share emails or events with certain groups of users.

shareActivity(activityId, sharingInfo)

Share emails or events with certain groups of users.

API Version

39.0

Requires Chatter

No

Signature

public static ConnectApi.ActivitySharingResult shareActivity(String activityId, ConnectApi.ActivitySharingInput sharingInfo)

Parameters

activityId
  Type: String
  The ID of the activity.
**sharingInfo**

Type: `ConnectApi.ActivitySharingInput`

A `ConnectApi.ActivitySharingInput` object.

**Return Value**

Type: `ConnectApi.ActivitySharingResult`

**Usage**

This method is a feature of both Sales Cloud Einstein and Inbox. It lets users connect their email and calendar to Salesforce. Then, their emails and events are automatically added to related Salesforce records. Users can specify who their individual emails and events are shared with.

**Sites Class**

Search an Experience Cloud site.

**Namespace**

`ConnectApi`

**Sites Methods**

The following are methods for `Sites`. All methods are static.

**IN THIS SECTION:**

- `searchSite(siteId, queryTerm, pageToken, pageSize, language)`
  Search an Experience Cloud site.

**searchSite**(siteId, queryTerm, pageToken, pageSize, language)

Search an Experience Cloud site.

**API Version**

54.0

**Available to Guest Users**

54.0

**Requires Chatter**

No
Signature

public static ConnectApi.SiteSearchResult searchSite(String siteId, String queryTerm, String pageToken, Integer pageSize, String language)

Parameters

siteId
Type: String
ID for the Experience Cloud site.

queryTerm
Type: String
White-space separated words used to search for relevant content. Provide a maximum of 1024 characters, composed of up to 32 words and white spaces. Logical operators aren’t supported.

pageToken
Type: String
Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 240. If you pass in null, the default size is 25.

language
Type: String
Language locale for the context user. If unspecified or if the specified language locale isn’t available, the default value is en_US.

Return Value
Type: ConnectApi.SiteSearchResult

SmartDataDiscovery Class
Get predictions on Salesforce objects.
Use the ConnectApi.SmardDataDiscovery.predict method to get predictions on Salesforce objects. For more information, see Get Predictions in Apex.

SocialEngagement Class
Manage information about social accounts or fan pages for social networks.

Namespace
ConnectApi

SocialEngagement Methods
The following are methods for SocialEngagement. All methods are static.
IN THIS SECTION:

- `deleteSocialPost(socialPostId, socialAccountId)`
  Delete a social post from its social network.

- `followSocialPersona(socialPersonaId, socialAccountId)`
  Follow a social persona in its social network.

- `followSocialPostPersona(socialPostId, socialAccountId)`
  Follow a social persona on a social post in its social network.

- `getIntents(socialPostId)`
  Get available intents for a social post.

- `getManagedSocialAccount(id)`
  Get a managed social account that is in the org and assigned to the user.

- `getManagedSocialAccounts()`
  Gets a list of managed social accounts that are in the org and assigned to the user.

- `getManagedSocialAccounts(socialNetwork)`
  Get a list of managed social accounts that are in the org and assigned to the user.

- `getRelationship(id, socialPersonaId)`
  Get the follow relationship between a managed social account and a social persona.

- `hideSocialPost(socialPostId, socialAccountId)`
  Hide a social post in its social network.

- `likeSocialPost(socialPostId, socialAccountId)`
  Like a social post in its social network.

- `massApprove(massApproval)`
  Approve or reject the publishing of a large number of social posts.

- `recallApproval(socialPostId)`
  Recall an approval request to publish a social post.

- `unfollowSocialPersona(socialPersonaId, socialAccountId)`
  Stop following a social persona in its social network.

- `unfollowSocialPostPersona(socialPostId, socialAccountId)`
  Stop following a social persona of a social post in its social network.

- `unhideSocialPost(socialPostId, socialAccountId)`
  Unhide a social post in its social network.

- `unlikeSocialPost(socialPostId, socialAccountId)`
  Unlike a social post in its social network.

---

**deleteSocialPost(socialPostId, socialAccountId)**

Delete a social post from its social network.

**Note:** Deleting a social post from its social network doesn’t delete the record from Salesforce.
**API Version**

46.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.DeleteSocialPostIntent deleteSocialPost(String socialPostId, String socialAccountId)
```

**Parameters**

- **socialPostId**
  - Type: String
  - ID of the social post to delete.

- **socialAccountId**
  - Type: String
  - ID of the social account that deletes the post.

**Return Value**

Type: `ConnectApi.DeleteSocialPostIntent`

**followSocialPersona(socialPersonaId, socialAccountId)**

Follow a social persona in its social network.

**API Version**

45.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.FollowSocialPersonaIntent followSocialPersona(String socialPersonaId, String socialAccountId)
```

**Parameters**

- **socialPersonaId**
  - Type: String
  - ID of the social persona to follow.
socialAccountId

Type: **String**

ID of the social account that follows the social persona.

**Return Value**

Type: **ConnectApi.FollowSocialPersonaIntent**

```java
followSocialPostPersona(socialPostId, socialAccountId)
```

Follow a social persona on a social post in its social network.

**API Version**

45.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.FollowSocialPersonaIntent followSocialPostPersona(String socialPostId, String socialAccountId)
```

**Parameters**

`socailPostId`

Type: **String**

ID of the social post authored by the social persona to follow.

`socialAccountId`

Type: **String**

ID of the social account that follows the social persona.

**Return Value**

Type: **ConnectApi.FollowSocialPersonaIntent**

```java
getIntents(socialPostId)
```

Get available intents for a social post.

**API Version**

45.0

**Requires Chatter**

No
Signature
public static ConnectApi.SocialPostIntents getIntents(String socialPostId)

Parameters
socialPostId
Type: String
ID of a social post.

Return Value
Type: ConnectApi.SocialPostIntents

getManagedSocialAccount(id)
Get a managed social account that is in the org and assigned to the user.

API Version
44.0

Requires Chatter
No

Signature
public static ConnectApi.ManagedSocialAccount getManagedSocialAccount(String id)

Parameters
id
Type: String
Description: Internal SFDC ID for this managed social account.

Return Value
Type: ConnectApi.ManagedSocialAccount

getManagedSocialAccounts()
Gets a list of managed social accounts that are in the org and assigned to the user.

API Version
44.0

Requires Chatter
No
**Signature**

```java
public static ConnectApi.ManagedSocialAccounts getManagedSocialAccounts()
```

**Return Value**

Type: `ConnectApi.ManagedSocialAccounts`

**getManagedSocialAccounts(socialNetwork)**

Get a list of managed social accounts that are in the org and assigned to the user.

**API Version**

44.0

**Requires Chatter**

No

**Signature**

```java
public static ConnectApi.ManagedSocialAccounts getManagedSocialAccounts(ConnectApi.SocialNetworkProvider socialNetwork)
```

**Parameters**

`socialNetwork`

Type: `ConnectApi.SocialNetworkProvider`

Description: Filters results based on the social network. Values are:

- Facebook
- GooglePlus
- Instagram
- InstagramBusiness
- KakaoTalk
- Kik
- Line
- LinkedIn
- Messenger
- Other
- Pinterest
- QQ
- Rypple
- SinaWeibo
- SMS
- Snapchat
Return Value
Type: ConnectApi.ManagedSocialAccounts

getRelationship(id, socialPersonaId)
Get the follow relationship between a managed social account and a social persona.

API Version
46.0

Requires Chatter
No

Signature
public static ConnectApi.SocialAccountRelationship getRelationship(String id, String socialPersonaId)

Parameters
id
Type: String
ID of the managed social account.

socialPersonaId
Type: String
ID of the social persona.

Return Value
Type: ConnectApi.SocialAccountRelationship

hideSocialPost(socialPostId, socialAccountId)
Hide a social post in its social network.

API Version
46.0
Requires Chatter
No

Signature

public static ConnectApi.HideSocialPostIntent hideSocialPost(String socialPostId, String socialAccountId)

Parameters

socialPostId
Type: String
ID of the social post to hide.
socialAccountId
Type: String
ID of the social account that hides the post.

Return Value
Type: ConnectApi.HideSocialPostIntent

likeSocialPost(socialPostId, socialAccountId)
Like a social post in its social network.

API Version
46.0

Requires Chatter
No

Signature

public static ConnectApi.LikeSocialPostIntent likeSocialPost(String socialPostId, String socialAccountId)

Parameters

socialPostId
Type: String
ID of the social post to like.
socialAccountId
Type: String
ID of the social account that likes the post.
Return Value
Type: `ConnectApi.LikeSocialPostIntent`

```java
massApprove(massApproval)
```
Approve or reject the publishing of a large number of social posts.

**API Version**
46.0

**Requires Chatter**
No

**Signature**
```java
public static ConnectApi.SocialPostMassApprovalOutput
massApprove(ConnectApi.SocialPostMassApprovalInput massApproval)
```

**Parameters**
- `massApproval`
  Type: `ConnectApi.SocialPostMassApprovalInput`
  A `ConnectApi.SocialPostMassApprovalInput` body that includes a list of social post IDs and the action to approve or reject publishing them.

**Return Value**
Type: `ConnectApi.SocialPostMassApprovalOutput`

```java
recallApproval(socialPostId)
```
Recall an approval request to publish a social post.

**API Version**
46.0

**Requires Chatter**
No

**Signature**
```java
public static Void recallApproval(String socialPostId)
```
Parameters

socialPostId
Type: String
ID of the social post.

Return Value
Type: Void

unfollowSocialPersona(socialPersonaId, socialAccountId)
Stop following a social persona in its social network.

API Version
45.0

Requires Chatter
No

Signature
public static Void unfollowSocialPersona(String socialPersonaId, String socialAccountId)

Parameters

socialPersonaId
Type: String
ID of the social persona to stop following.

socialAccountId
Type: String
ID of the social account that stops following the social persona.

Return Value
Type: Void

unfollowSocialPostPersona(socialPostId, socialAccountId)
Stop following a social persona of a social post in its social network.

API Version
45.0

Requires Chatter
No
**unfollowSocialPostPersona**

**Signature**

```java
public static Void unfollowSocialPostPersona(String socialPostId, String socialAccountId)
```

**Parameters**

- `socialPostId`
  - Type: `String`
  - ID of the social post authored by the social persona to stop following.
- `socialAccountId`
  - Type: `String`
  - ID of the social account that stops following the social persona.

**Return Value**

Type: Void

**unhideSocialPost**

**Signature**

```java
public static Void unhideSocialPost(String socialPostId, String socialAccountId)
```

**Parameters**

- `socialPostId`
  - Type: `String`
  - ID of the social post to unhide.
- `socialAccountId`
  - Type: `String`
  - ID of the social account that unhides the post.

**Return Value**

Type: Void

**unlikeSocialPost**

**Signature**

```java
public static Void unlikeSocialPost(String socialPostId, String socialAccountId)
```

**Parameters**

- `socialPostId`
  - Type: `String`
  - ID of the social post in its social network.

**API Version**

46.0

**Requires Chatter**

No
API Version
46.0

Requires Chatter
No

Signature
public static Void unlikeSocialPost(String socialPostId, String socialAccountId)

Parameters
socialPostId
Type: String
ID of the social post to unlike.
socialAccountId
Type: String
ID of the social account that unlikes the post.

Return Value
Type: Void

Surveys Class
Send survey invitations by email.

Namespace
ConnectApi

Surveys Methods
These methods are for Surveys. All methods are static.

IN THIS SECTION:

sendSurveyInvitationEmail(surveyID, SurveyEmailInput)
Email survey invitations to up to 300 participants. You can email either leads, contacts, or users in your org. Either a link to launch the survey or a question can be embedded in the email invitations.

sendSurveyInvitationEmail(surveyID, SurveyEmailInput)
Email survey invitations to up to 300 participants. You can email either leads, contacts, or users in your org. Either a link to launch the survey or a question can be embedded in the email invitations.
API Version
50.0

Requires Chatter
No

Signature
public static ConnectApi.SurveyInvitationEmailOutput sendSurveyInvitationEmail(String surveyID, ConnectApi.SurveyInvitationEmailInput SurveyEmailInput)

Parameters
surveym
  Type: String
  ID of the survey.
SurveyEmailInput
  Type: ConnectApi.SurveyInvitationEmailInput
  A ConnectApi.SurveyInvitationEmailInput object.

Return Value
Type: ConnectApi.SurveyInvitationEmailOutput

TaxPlatform Class
Apply or cancel tax.

Namespace
ConnectApi

TaxPlatform Methods
The following are methods for TaxPlatform. All methods are static.

IN THIS SECTION:
calculateTax(calculateTax)
  Apply tax or cancel tax.

calculateTax(calculateTax)
  Apply tax or cancel tax.
API Version
55.0

Requires Chatter
No

Signature
global static ConnectApi.CalculateTaxResponse calculateTax(ConnectApi.CalculateTaxRequest calculateTax)

Parameters
calculateTax
Type: ConnectApi.CalculateTaxRequest
Represents a request to calculate tax for one or more line items.

Return Value
Type: ConnectApi.CalculateTaxResponse

Topics Class
Access information about topics, such as their descriptions, the number of people talking about them, related topics, and information about groups contributing to the topic. Update a topic’s name or description, merge topics, and add and remove topics from records and feed items.

Namespace
ConnectApi

Topics Methods
The following are methods for Topics. All methods are static.

IN THIS SECTION:
assignTopic(communityld, recordld, topicId)
Assign a topic to a record or feed item.
assignTopicByName(communityld, recordld, topicName)
Assign a topic to a record or feed item.
createTopic(communityld, name, description)
Create a topic.
createTopicDataCategoryRules(communityld, dataCategoryGroup, dataCategory, topicNames)
Create topic and article assignment rules by data category.
deleteTopic(communityId, topicId)
Delete a topic.

getGroupsRecentlyTalkingAboutTopic(communityId, topicId)
Get information about the five groups that most recently contributed to a topic.

getRecentlyTalkingAboutTopicsForGroup(communityId, groupId)
Get up to five topics most recently used in a group.

getRecentlyTalkingAboutTopicsForUser(communityId, userId)
Get up to five topics most recently used by a user.

getRelatedTopics(communityId, topicId)
Get up to five topics most closely related to a topic.

getTopic(communityId, topicId)
Get a topic.

getTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory)
Get topic and article assignment rules by data category.

getTopics(communityId, recordId)
Get the first page of topics assigned to a record or feed item.

getTopics(communityId)
Get the first page of topics for the org or Experience Cloud site.

getTopics(communityId, sortParam)
Get the first page of sorted topics for the org or community.

getTopics(communityId, pageParam, pageSize)
Get a page of topics.

getTopics(communityId, pageParam, pageSize, sortParam)
Get a page of sorted topics.

getTopics(communityId, q, sortParam)
Get the sorted topics that match the search criteria.

getTopics(communityId, q, pageParam, pageSize)
Get a page of topics that match the search criteria.

getTopics(communityId, q, pageParam, pageSize, sortParam)
Get a page of sorted topics that match the search criteria.

getTopics(communityId, q, exactMatch)
Get the topic that matches the exact, case-insensitive name.

getTopicsOrFallbackToRenamedTopics(communityId, q, exactMatch, fallBackToRenamedTopics)
Get the most recent renamed topic match, if there isn't an exact match.

getTopicSuggestions(communityId, recordId, maxResults)
Get up to a specified number of suggested topics for a record or feed item.

getTopicSuggestions(communityId, recordId)
Get suggested topics for a record or feed item.

getTopicSuggestionsForText(communityId, text, maxResults)
Get up to a specified number of suggested topics for a string of text.
getTopicSuggestionsForText(communityId, text)
Get suggested topics for a string of text.

getTrendingTopics(communityId)
Get trending topics for the org or Experience Cloud site.

getTrendingTopics(communityId, maxResults)
Get up to a specified number of trending topics for the org or Experience Cloud site.

mergeTopics(communityId, topicId, idsToMerge)
Merge up to five secondary topics with a primary topic.

reassignTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory, topicNames)
Reassign topic and article assignment rules by data category by deleting the existing rules and creating new rules.

reassignTopicsByName(communityId, recordId, topicNames)
Reassign all the topics on a record or feed item, that is, remove all the assigned topics on a record or feed item and add topics. Optionally, provide a list of suggested topics to assign to a record or feed item to improve future topic suggestions.

unassignTopic(communityId, recordId, topicId)
Remove a topic from a record or feed item.

updateTopic(communityId, topicId, topic)
Update the description or name of a topic or merge up to five secondary topics with a primary topic.

updateTopicsForArticlesInDataCategory(communityId, dataCategoryGroup, dataCategory, articleTopicAssignmentJob)
Assign topics to articles and unassign topics from articles in a data category.

### assignTopic(communityId, recordId, topicId)
Assign a topic to a record or feed item.

#### API Version
29.0

#### Requires Chatter
No

#### Signature
```java
public static ConnectApi.Topic assignTopic(String communityId, String recordId, String topicId)
```

#### Parameters
- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.
- **recordId**
  - Type: `String`
  - ID for a record or feed item.
**topicId**  
Type: **String**  
ID for a topic.

**Return Value**  
Type: **ConnectApi.Topic**

**Usage**  
Only users with the Assign Topics permission can add existing topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

**assignTopicByName** (communityId, recordId, topicName)

Assign a topic to a record or feed item.

**API Version**  
29.0

**Requires Chatter**  
No

**Signature**

```java
public static ConnectApi.Topic assignTopicByName(String communityId, String recordId, String topicName)
```

**Parameters**

- **communityId**  
  Type: **String**  
  ID for an Experience Cloud site, internal, or null.

- **recordId**  
  Type: **String**  
  The ID of the record or feed item to which to assign the topic.

- **topicName**  
  Type: **String**  
  The name of a new or existing topic.

**Return Value**  
Type: **ConnectApi.Topic**
Usage
Only users with the Assign Topics permission can add existing topics to records or feed items. Only users with the Create Topics permission can add new topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

`createTopic(communityId, name, description)`
Create a topic.

API Version
36.0

Requires Chatter
No

Signature
`public static ConnectApi.Topic createTopic(String communityId, String name, String description)`

Parameters
- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, internal, or null.
- **name**
  - Type: `String`
  - The name of the topic.
- **description**
  - Type: `String`
  - The description of the topic.

Return Value
Type: `ConnectApi.Topic`

Usage
Only users with the Create Topics permission can create a topic.

`createTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory, topicNames)`
Create topic and article assignment rules by data category.
API Version
40.0

Requires Chatter
No

Signature
public static ConnectApi.TopicPage createTopicDataCategoryRules(String communityId,
String dataCategoryGroup, String dataCategory, ConnectApi.TopicNamesInput topicNames)

Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

dataCategoryGroup
  Type: String
  The data category group used by articles.

dataCategory
  Type: String
  The data category used by articles.

topicNames
  Type: ConnectApi.TopicNamesInput
  A ConnectApi.TopicNamesInput object with the names of topics to assign to articles in a data category.

Return Value
Type: ConnectApi.TopicPage

deleteTopic(communityId, topicId)
Delete a topic.

API Version
29.0

Requires Chatter
No

Signature
public static Void deleteTopic(String communityId, String topicId)
Parameters

communityId
Type: String,
ID for an Experience Cloud site, internal, or null.

topicId
Type: String
ID for a topic.

Return Value
Type: Void

Usage
Only users with the Delete Topics or Modify All Data permission can delete topics.

Topic deletion is asynchronous. If a topic is requested before the deletion completes, the response is successful and the isBeingDeleted property of ConnectApi.Topic is true in version 33.0 and later. If a topic is requested after the deletion completes, the response is ConnectApi.NotFoundException.

groupsRecentlyTalkingAboutTopic(communityId, topicId)
Get information about the five groups that most recently contributed to a topic.

API Version
29.0

Available to Guest Users
32.0

Requires Chatter
Yes

Signature
public static ConnectApi.ChatterGroupSummaryPage getGroupsRecentlyTalkingAboutTopic(String communityId, String topicId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

topicId
Type: String
ID for a topic.
Return Value

Type: ConnectApi.ChatterGroupSummaryPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- setTestGetGroupsRecentlyTalkingAboutTopic(communityId, topicId, result)

getRecentlyTalkingAboutTopicsForGroup(communityId, groupId)

Get up to five topics most recently used in a group.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

public static ConnectApi.TopicPage getRecentlyTalkingAboutTopicsForGroup(String communityId, String groupId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

groupId
Type: String
ID for a group.

Return Value

Type: ConnectApi.TopicPage
Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestGetRecentlyTalkingAboutTopicsForGroup(communityId, groupId, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

getRecentlyTalkingAboutTopicsForUser(communityId, userId)
Get up to five topics most recently used by a user.

API Version
29.0

Available to Guest Users
32.0

Requires Chatter
Yes

Signature
```
public static ConnectApi.TopicPage getRecentlyTalkingAboutTopicsForUser(String communityId, String userId)
```

Parameters
- `communityId`
  Type: String
  ID for an Experience Cloud site, internal, or `null`.
- `userId`
  Type: String
  ID for a user.

Return Value
Type: `ConnectApi.TopicPage`
Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestGetRecentlyTalkingAboutTopicsForUser(communityId, userId, result)`
  - *Apex Developer Guide: Testing ConnectApi Code*

**getRelatedTopics(communityId, topicId)**
Get up to five topics most closely related to a topic.
Two topics that are assigned to the same feed item at least three times are related.

**API Version**
29.0

**Available to Guest Users**
32.0

**Requires Chatter**
No

**Signature**
```java
public static ConnectApi.TopicPage getRelatedTopics(String communityId, String topicId)
```

**Parameters**
- `communityId`
  - Type: String
  - ID for an Experience Cloud site, internal, or null.
- `topicId`
  - Type: String
  - ID for a topic.

**Return Value**
Type: `ConnectApi.TopicPage`
Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestGetRelatedTopics(communityId, topicId, result)

getTopic(communityId, topicId)
Get a topic.

API Version
29.0

Available to Guest Users
32.0

Requires Chatter
No

Signature
public static ConnectApi.Topic getTopic(String communityId, String topicId)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

topicId
Type: String
ID for a topic.

Return Value
Type: ConnectApi.Topic

getTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory)
Get topic and article assignment rules by data category.

API Version
40.0
Requires Chatter
No

Signature
public static ConnectApi.TopicPage getTopicDataCategoryRules(String communityId, String dataCategoryGroup, String dataCategory)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

dataCategoryGroup
Type: String
The data category group used by articles.

dataCategory
Type: String
The data category used by articles.

Return Value
Type: ConnectApi.TopicPage

getTopics(communityId, recordId)
Get the first page of topics assigned to a record or feed item.

API Version
29.0

Available to Guest Users
32.0

Requires Chatter
No

Signature
public static ConnectApi.TopicPage getTopics(String communityId, String recordId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

recordId
   Type: String
   ID for a record or feed item.

Return Value
Type: ConnectApi.TopicPage

Usage
Administrators must enable topics for objects before users can add topics to records of that object type.

getTopics(communityId)
Get the first page of topics for the org or Experience Cloud site.

API Version
29.0

Available to Guest Users
32.0

Requires Chatter
No

Signature
public static ConnectApi.TopicPage getTopics(String communityId)

Parameters
communityId
   Type: String
   ID for an Experience Cloud site, internal, or null.

Return Value
Type: ConnectApi.TopicPage

getTopics(communityId, sortParam)
Get the first page of sorted topics for the org or community.

API Version
29.0
Available to Guest Users
32.0

Requires Chatter
No

Signature
public static ConnectApi.TopicPage getTopics(String communityId, ConnectApi.TopicSort sortParam)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

sortParam
Type: ConnectApi.TopicSort
Values are:
- popularDesc—Sorts topics by popularity with the most popular first. This value is the default.
- alphaAsc—Sorts topics alphabetically.

Return Value
Type: ConnectApi.TopicPage

getTopics(communityId, pageParam, pageSize)
Get a page of topics.

API Version
29.0

Available to Guest Users
32.0

Requires Chatter
No

Signature
public static ConnectApi.TopicPage getTopics(String communityId, Integer pageParam, Integer pageSize)
Parameters

* **communityId**
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.

* **pageParam**
  Type: `Integer`
  Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

* **pageSize**
  Type: `Integer`
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.TopicPage`

`getTopics(communityId, pageParam, pageSize, sortParam)`

Get a page of sorted topics.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

`public static ConnectApi.TopicPage getTopics(String communityId, Integer pageParam, Integer pageSize, ConnectApi.TopicSort sortParam)`

Parameters

* **communityId**
  Type: `String`
  ID for an Experience Cloud site, internal, or `null`.

* **pageParam**
  Type: `Integer`
  Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

* **pageSize**
  Type: `Integer`
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
- Type: `ConnectApi.TopicSort`
- Values are:
  - `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
  - `alphaAsc`—Sorts topics alphabetically.

Return Value
- Type: `ConnectApi.TopicPage`

`getTopics(communityId, q, sortParam)`
Get the sorted topics that match the search criteria.

API Version
- 29.0

Available to Guest Users
- 32.0

Requires Chatter
- No

Signature
```
public static ConnectApi.TopicPage getTopics(String communityId, String q, ConnectApi.TopicSort sortParam)
```

Parameters
- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, `internal`, or `null`.

- `q`
  - Type: `String`
  - Specifies the string to search. The string must contain at least two characters, not including wildcards.

- `sortParam`
  - Type: `ConnectApi.TopicSort`
  - Values are:
    - `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
    - `alphaAsc`—Sorts topics alphabetically.
Return Value
Type: ConnectApi.TopicPage

getTopics(communityId, q, pageParam, pageSize)
Get a page of topics that match the search criteria.

API Version
29.0

Available to Guest Users
32.0

Requires Chatter
No

Signature
public static ConnectApi.TopicPage getTopics(String communityId, String q, Integer pageParam, Integer pageSize)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Specifies the string to search. The string must contain at least two characters, not including wildcards.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: ConnectApi.TopicPage

getTopics(communityId, q, pageParam, pageSize, sortParam)
Get a page of sorted topics that match the search criteria.
API Version
29.0

Available to Guest Users
32.0

Requires Chatter
No

Signature
public static ConnectApi.TopicPage getTopics(String communityId, String q, Integer pageParam, Integer pageSize, ConnectApi.TopicSort sortParam)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Specifies the string to search. The string must contain at least two characters, not including wildcards.

pageParam
Type: Integer
Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.TopicSort
Values are:
• popularDesc—Sorts topics by popularity with the most popular first. This value is the default.
• alphaAsc—Sorts topics alphabetically.

Return Value
Type: ConnectApi.TopicPage

g getTopics(communityId, q, exactMatch)
Get the topic that matches the exact, case-insensitive name.
**API Version**
33.0

**Available to Guest Users**
33.0

**Requires Chatter**
No

**Signature**
```
public static ConnectApi.TopicPage getTopics(String communityId, String q, Boolean exactMatch)
```

**Parameters**
- **communityId**
  - Type: `String`
  - ID for an Experience Cloud site, `internal`, or `null`.
- **q**
  - Type: `String`
  - Specifies the string to search. The string must contain at least two characters, not including wildcards.
- **exactMatch**
  - Type: `Boolean`
  - Specify `true` to find a topic by its exact, case-insensitive name.

**Return Value**
Type: `ConnectApi.TopicPage`

**getTopicsOrFallBackToRenamedTopics(communityId, q, exactMatch, fallBackToRenamedTopics)**
Get the most recent renamed topic match, if there isn’t an exact match.

**API Version**
35.0

**Available to Guest Users**
35.0

**Requires Chatter**
No
public static ConnectApi.TopicPage getTopicsOrFallBackToRenamedTopics(String communityId, String q, Boolean exactMatch, Boolean fallBackToRenamedTopics)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

q
Type: String
Specifies the string to search. The string must contain at least two characters, not including wildcards.

exactMatch
Type: Boolean
Specify true to find a topic by its exact, case-insensitive name or to find the most recent renamed topic match if there isn’t an exact match.

fallBackToRenamedTopics
Type: Boolean
Specify true and if there isn’t an exact match, the most recent renamed topic match is returned. If there are multiple renamed topic matches, only the most recent is returned. If there are no renamed topic matches, an empty collection is returned.

Return Value
Type: ConnectApi.TopicPage

getTopicSuggestions(communityId, recordId, maxResults)
Get up to a specified number of suggested topics for a record or feed item.

API Version
29.0

Requires Chatter
No

public static ConnectApi.TopicSuggestionPage getTopicSuggestions(String communityId, String recordId, Integer maxResults)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.
recordId
  Type: String
  ID for a record or feed item.
maxResults
  Type: Integer
  Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

Return Value
Type: ConnectApi.TopicSuggestionPage

Usage
Administrators must enable topics for objects before users can see suggested topics for records of that object type.
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
  setTestGetTopicSuggestions(communityId, recordId, maxResults, result)

getTopicSuggestions(communityId, recordId)
Get suggested topics for a record or feed item.

API Version
29.0

Requires Chatter
No

Signature
public static ConnectApi.TopicSuggestionPage getTopicSuggestions(String communityId, String recordId)

Parameters
  communityId
    Type: String
    ID for an Experience Cloud site, internal, or null.
  recordId
    Type: String
    ID for a record or feed item.
Return Value
Type: ConnectApi.TopicSuggestionPage

Usage
Administrators must enable topics for objects before users can see suggested topics for records of that object type.
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestGetTopicSuggestions(communityId, recordId, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

getTopicSuggestionsForText(communityId, text, maxResults)
Get up to a specified number of suggested topics for a string of text.

API Version
29.0

Requires Chatter
No

Signature
public static ConnectApi.TopicSuggestionPage getTopicSuggestionsForText(String communityId, String text, Integer maxResults)

Parameters
- `communityId`
  Type: String
  ID for an Experience Cloud site, internal, or null.
- `text`
  Type: String
  String of text.
- `maxResults`
  Type: Integer
  Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

Return Value
Type: ConnectApi.TopicSuggestionPage
Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestGetTopicSuggestionsForText(communityId, text, maxResults, result)`
  *Apex Developer Guide: Testing ConnectApi Code*

`getTopicSuggestionsForText(communityId, text)`
Get suggested topics for a string of text.

API Version
29.0

Requires Chatter
No

Signature
```java
public static ConnectApi.TopicSuggestionPage getTopicSuggestionsForText(String communityId, String text)
```

Parameters
- `communityId`
  *Type: String*
  
  ID for an Experience Cloud site, `internal`, or `null`.

- `text`
  *Type: String*
  
  String of text.

Return Value
- Type: `ConnectApi.TopicSuggestionPage`

Usage
To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
- `setTestGetTopicSuggestionsForText(communityId, text, result)`
  *Apex Developer Guide: Testing ConnectApi Code*
**getTrendingTopics(communityId)**
Get trending topics for the org or Experience Cloud site.

**API Version**
29.0

**Available to Guest Users**
32.0

**Requires Chatter**
No

**Signature**
```
public static ConnectApi.TopicPage getTrendingTopics(String communityId)
```

**Parameters**

- `communityId`
  
  Type: `String`
  
  ID for an Experience Cloud site, `internal`, or `null`.

**Return Value**
Type: `ConnectApi.TopicPage`

**Usage**
The more frequently people add a specific topic to their posts and comments and comment on or like posts with the same topic over a short period, the more likely it is to become a trending topic. For example, if your coworkers are attending the upcoming Dreamforce conference and have started discussing it in Chatter, you might see a trending topic for Dreamforce. A trending topic is not solely based on popularity and usually relates to a one-time or infrequent event that has a spike in activity, such as a conference or a project deadline.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

**SEE ALSO:**
- `setTestGetTrendingTopics(communityId, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

**getTrendingTopics(communityId, maxResults)**
Get up to a specified number of trending topics for the org or Experience Cloud site.

**API Version**
29.0
Available to Guest Users
32.0

Requires Chatter
No

Signature

public static ConnectApi.TopicPage getTrendingTopics(String communityId, Integer maxResults)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

maxResults
Type: Integer
Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

Return Value
Type: ConnectApi.TopicPage

Usage

The more frequently people add a specific topic to their posts and comments and comment on or like posts with the same topic over a short period, the more likely it is to become a trending topic. For example, if your coworkers are attending the upcoming Dreamforce conference and have started discussing it in Chatter, you might see a trending topic for Dreamforce. A trending topic is not solely based on popularity and usually relates to a one-time or infrequent event that has a spike in activity, such as a conference or a project deadline.

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTrendingTopics(communityId, maxResults, result)

mergeTopics(communityId, topicId, idsToMerge)

Merge up to five secondary topics with a primary topic.

API Version
33.0
Requires Chatter
No

Signature
```
public static ConnectApi.Topic mergeTopics(String communityId, String topicId,
List<String> idsToMerge)
```

Parameters
```
communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

topicId
  Type: String
  The ID for the primary topic for the merge. If this topic is a managed topic, it retains its topic type, topic images, and children topics.

idsToMerge
  Type: List<String>
  A list of up to five comma-separated secondary topic IDs to merge with the primary topic. If any of the secondary topics are navigational or featured topics, they lose their topic type, topic images, and children topics. Their feed items are reassigned to the primary topic. If you merge a topic with a content topic, the content associations are preserved. If you merge a topic with an inactive endorsee, the endorsement isn’t mapped to the primary topic.
```

Return Value
```
Type: ConnectApi.Topic
```

Usage
Only users with the Delete Topics or Modify All Data permission can merge topics.

```
reassignTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory,
topicNames)
```

Reassign topic and article assignment rules by data category by deleting the existing rules and creating new rules.

API Version
40.0

Requires Chatter
No

Signature
```
public static ConnectApi.TopicPage reassignTopicDataCategoryRules(String communityId,
String dataCategoryGroup, String dataCategory, ConnectApi.TopicNamesInput topicNames)
```
Parameters

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **dataCategoryGroup**
  - Type: String
  - The data category group used by articles.

- **dataCategory**
  - Type: String
  - The data category used by articles.

- **topicNames**
  - Type: ConnectApi.TopicNamesInput
  - A ConnectApi.TopicNamesInput object with the names of topics to reassign to articles in a data category.

Return Value

Type: ConnectApi.TopicPage

**reassignTopicsByName(communityId, recordId, topicNames)**

Reassign all the topics on a record or feed item, that is, remove all the assigned topics on a record or feed item and add topics. Optionally, provide a list of suggested topics to assign to a record or feed item to improve future topic suggestions.

API Version

35.0

Requires Chatter

No

Signature

public static ConnectApi.TopicPage reassignTopicsByName(String communityId, String recordId, ConnectApi.TopicNamesInput topicNames)

Parameters

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or null.

- **recordId**
  - Type: String
  - The ID of the record or feed item to which to assign the topic.

- **topicNames**
  - Type: ConnectApi.TopicNamesInput
A list of topics to replace the currently assigned topics. Optionally, a list of suggested topics to assign to improve future topic suggestions.

**Return Value**
Type: `ConnectApi.TopicPage`

**Usage**
Only users with the Assign Topics permission can remove topics from records or feed items and add existing topics to records or feed items. Only users with the Create Topics permission can add new topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

### `unassignTopic(communityId, recordId, topicId)`
Remove a topic from a record or feed item.

**API Version**
29.0

**Requires Chatter**
No

**Signature**

```java
public static Void unassignTopic(String communityId, String recordId, String topicId)
```

**Parameters**

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, internal, or null.

- `recordId`
  Type: `String`
  ID for a record or feed item.

- `topicId`
  Type: `String`
  ID for a topic.

**Return Value**
Type: Void

**Usage**
Only users with the Assign Topics permission can remove topics from feed items or records. Administrators must enable topics for objects before users can add topics to records of that object type.
updateTopic(communityId, topicId, topic)
Update the description or name of a topic or merge up to five secondary topics with a primary topic.

API Version
29.0

Requires Chatter
No

Signature
public static ConnectApi.Topic updateTopic(String communityId, String topicId, ConnectApi.TopicInput topic)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

topicId
Type: String
ID for a topic.

topic
Type: ConnectApi.TopicInput
A ConnectApi.TopicInput object containing the name and description of the topic or up to five comma-separated secondary topic IDs to merge with the primary topic.

Return Value
Type: ConnectApi.Topic

Usage
Only users with the Edit Topics or Modify All Data permission can update topic names and descriptions. Only users with the Delete Topics or Modify All Data permission can merge topics.

updateTopicsForArticlesInDataCategory(communityId, dataCategoryGroup, dataCategory, articleTopicAssignmentJob)
Assign topics to articles and unassign topics from articles in a data category.

API Version
40.0
Requires Chatter
No

Signature
public static ConnectApi.TopicPage updateTopicsForArticlesInDataCategory(String
communityId, String dataCategoryGroup, String dataCategory,
ConnectApi.ArticleTopicAssignmentJobInput articleTopicAssignmentJob)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.
dataCategoryGroup
Type: String
The data category group used by articles.
dataCategory
Type: String
The data category used by articles.
articleTopicAssignmentJob
Type: ConnectApi.ArticleTopicAssignmentJobInput
A ConnectApi.ArticleTopicAssignmentJobInput object that indicates the operation to take on which topics.

Return Value
Type: ConnectApi.TopicPage

Topics Test Methods
The following are the test methods for Topics. All methods are static.
For information about using these methods to test your ConnectApi code, see Testing ConnectApi Code.

setTestGetGroupsRecentlyTalkingAboutTopic(communityId, topicId, result)
Register a ConnectApi.ChatterGroupSummaryPage object to be returned when the matching
ConnectApi.getGroupsRecentlyTalkingAboutTopic method is called in a test context. Use the method with the
same parameters or you receive an exception.

API Version
29.0

Signature
public static Void setTestGetGroupsRecentlyTalkingAboutTopic(String communityId, String
topicId, ConnectApi.ChatterGroupSummaryPage result)
Parameters

communityId  
Type: String
ID for an Experience Cloud site, internal, or null.

topicId  
Type: String
ID for a topic.

result  
Type: ConnectApi.ChatterGroupSummaryPage
Object containing test data.

Return Value

Type: Void

SEE ALSO:
getGroupsRecentlyTalkingAboutTopic(communityId, topicId)  

setTestGetRecentlyTalkingAboutTopicsForGroup(communityId, groupId, result)
Register a ConnectApi.TopicPage object to be returned when the matching
ConnectApi.getRecentlyTalkingAboutTopicsForGroup method is called in a test context. Use the method with
the same parameters or you receive an exception.

API Version

29.0

Signature

public static Void setTestGetRecentlyTalkingAboutTopicsForGroup(String communityId, 
String groupId, ConnectApi.TopicPage result)

Parameters

communityId  
Type: String
ID for an Experience Cloud site, internal, or null.

groupId  
Type: String
ID for a group.

result  
Type: ConnectApi.TopicPage
Object containing test data.
Return Value
Type: Void

SEE ALSO:
getRecentlyTalkingAboutTopicsForGroup(communityId, groupId)

**setTestGetRecentlyTalkingAboutTopicsForUser(communityId, userId, result)**
Register a ConnectApi.TopicPage object to be returned when the matching ConnectApi.getRecentlyTalkingAboutTopicsForUser method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
29.0

Signature
public static Void setTestGetRecentlyTalkingAboutTopicsForUser(String communityId, String userId, ConnectApi.TopicPage result)

Parameters
- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or null.
- **userId**
  Type: String
  ID for a user.
- **result**
  Type: ConnectApi.TopicPage
  Specify the test topics page.

Return Value
Type: Void

SEE ALSO:
getRecentlyTalkingAboutTopicsForUser(communityId, userId)

**setTestGetRelatedTopics(communityId, topicId, result)**
Register a ConnectApi.TopicPage object to be returned when the matching ConnectApi.getRelatedTopics method is called in a test context. Use the method with the same parameters or you receive an exception.
**API Version**

29.0

**Signature**

```java
public static Void setTestGetRelatedTopics(String communityId, String topicId,
ConnectApi.TopicPage result)
```

**Parameters**

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `topicId`
  - Type: `String`
  - ID for a topic.

- `result`
  - Type: `ConnectApi.TopicPage`
  - Object containing test data.

**Return Value**

Type: `Void`

**SEE ALSO:**

- `getRelatedTopics(communityId, topicId)`

---

**setTestGetTopicSuggestions(communityId, recordId, maxResults, result)**

Register a `ConnectApi.TopicSuggestionPage` object to be returned when the matching `ConnectApi.getTopicSuggestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

29.0

**Signature**

```java
public static Void setTestGetTopicSuggestions(String communityId, String recordId,
Integer maxResults, ConnectApi.TopicSuggestionPage result)
```

**Parameters**

- `communityId`
  - Type: `String`
ID for an Experience Cloud site, internal, or null.

recordId
Type: String
ID for a record or feed item.

maxResults
Type: Integer
Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

result
Type: ConnectApi.TopicSuggestionPage
Specify the test topic suggestions page.

Return Value
Type: Void

SEE ALSO:
- getTopicSuggestions(communityId, recordId, maxResults)

setTestGetTopicSuggestions(communityId, recordId, result)
Register a ConnectApi.TopicSuggestionPage object to be returned when the matching ConnectApi.getTopicSuggestions method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
29.0

Signature
public static Void setTestGetTopicSuggestions(String communityId, String recordId, ConnectApi.TopicSuggestionPage result)

Parameters
communityId
Type: String
ID for an Experience Cloud site, internal, or null.

recordId
Type: String
ID for a record or feed item.

result
Type: ConnectApi.TopicSuggestionPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getTopicSuggestions(communityId, recordId)

setTestGetTopicSuggestionsForText(communityId, text, maxResults, result)
Register a ConnectApi.TopicSuggestionPage object to be returned when the matching ConnectApi.getTopicSuggestionsForText method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version
29.0

Signature
public static Void setTestGetTopicSuggestionsForText(String communityId, String text, Integer maxResults, ConnectApi.TopicSuggestionPage result)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

text
Type: String
String of text.

maxResults
Type: Integer
Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

result
Type: ConnectApi.TopicSuggestionPage
Object containing test data.
Return Value
Type: Void

SEE ALSO:
getTopicSuggestionsForText(communityId, text, maxResults)

**setTestGetTopicSuggestionsForText(communityId, text, result)**

Register a ConnectApi.TopicSuggestionPage object to be returned when the matching ConnectApi.getTopicSuggestionsForText method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**
29.0

**Signature**

```
public static Void setTestGetTopicSuggestionsForText(String communityId, String text, ConnectApi.TopicSuggestionPage result)
```

**Parameters**

- **communityId**
  Type: String
  ID for an Experience Cloud site, internal, or null.

- **text**
  Type: String
  String of text.

- **result**
  Type: ConnectApi.TopicSuggestionPage
  Object containing test data.

**Return Value**
Type: Void

SEE ALSO:
getTopicSuggestionsForText(communityId, text)

**setTestGetTrendingTopics(communityId, result)**

Register a ConnectApi.TopicPage object to be returned when the matching ConnectApi.getTrendingTopics method is called in a test context. Use the method with the same parameters or you receive an exception.
**setTestGetTrendingTopics(String communityId, ConnectApi.TopicPage result)**

**Parameters**

- **communityId**
  
  Type: String
  
  ID for an Experience Cloud site, internal, or null.

- **result**
  
  Type: ConnectApi.TopicPage
  
  Object containing test data.

**Return Value**

Type: Void

**SEE ALSO:**

- getTrendingTopics(communityId)

**setTestGetTrendingTopics(String communityId, maxResults, result)**

Register a ConnectApi.TopicPage object to be returned when the matching ConnectApi.getTrendingTopics method is called in a test context. Use the method with the same parameters or you receive an exception.

**API Version**

29.0

**Signature**

```java
public static Void setTestGetTrendingTopics(String communityId, Integer maxResults, ConnectApi.TopicPage result)
```

**Parameters**

- **communityId**
  
  Type: String
  
  ID for an Experience Cloud site, internal, or null.

- **maxResults**
  
  Type: Integer
Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

result
Type: ConnectApi.TopicPage
Object containing test data.

Return Value
Type: Void

SEE ALSO:
getTrendingTopics(communityId, maxResults)

UserProfiles Class
Access user profile data. The user profile data populates the profile page (also called the Chatter profile page). This data includes user information (such as address, manager, and phone number), some user capabilities (permissions), and a set of subtab apps, which are custom tabs on the profile page.

Namespace
ConnectApi

UserProfiles Methods
The following are methods for UserProfiles. All methods are static.

IN THIS SECTION:

deleteBannerPhoto(communityId, userId)
Delete a user’s banner photo.

deletePhoto(communityId, userId)
Delete a user’s photo.

getBannerPhoto(communityId, userId)
Get a user’s banner photo.

getPhoto(communityId, userId)
Get a user’s photo.

getUserProfile(communityId, userId)
Get the user profile of the context user.

setBannerPhoto(communityId, userId, fileId, versionNumber)
Set an uploaded file as a user’s banner photo.

setBannerPhoto(communityId, userId, fileUpload)
Set a file that hasn’t been uploaded as a user’s banner photo.
**deleteBannerPhoto(communityId, userId)**

Delete a user's banner photo.

**API Version**

36.0

**Requires Chatter**

Yes

**Signature**

```java
public static Void deleteBannerPhoto(String communityId, String userId)
```

**Parameters**

- **communityId**
  - Type: **String**
  - ID for an Experience Cloud site, internal, or `null`.

- **userId**
  - Type: **String**
  - ID of the user.

**Return Value**

Type: **Void**

**deletePhoto(communityId, userId)**

Delete a user's photo.
API Version
35.0

Requires Chatter
Yes

Signature
public static Void deletePhoto(String communityId, String userId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID for the context user or the keyword me.

Return Value
Type: Void

getBannerPhoto(communityId, userId)
Get a user's banner photo.

API Version
36.0

Requires Chatter
Yes

Signature
public static ConnectApi.BannerPhoto getBannerPhoto(String communityId, String userId)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID of the user.
Return Value
Type: `ConnectApi.BannerPhoto`

`getPhoto(communityId, userId)`
Get a user's photo.

API Version
35.0

Available to Guest Users
35.0

Requires Chatter
Yes

Signature
public static ConnectApi.Photo getPhoto(String communityId, String userId)

Parameters
`communityId`
Type: `String`
ID for an Experience Cloud site, internal, or `null`.

`userId`
Type: `String`
ID for a user.

Return Value
Type: `ConnectApi.Photo`

`getUserProfile(communityId, userId)`
Get the user profile of the context user.

API Version
29.0

Requires Chatter
Yes
Signature

```java
public static ConnectApi.UserProfile getUserProfile(String communityId, String userId)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.
- `userId`
  - Type: `String`
  - ID for a user.

Return Value

Type: `ConnectApi.UserProfile`

`setBannerPhoto(communityId, userId, fileId, versionNumber)`

Set an uploaded file as a user's banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String userId, String fileId, Integer versionNumber)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.
- `userId`
  - Type: `String`
  - ID of the user.
- `fileId`
  - Type: `String`
  - ID of the uploaded file to use as the user banner. The key prefix must be 069, and the image must be smaller than 8 MB.
- `versionNumber`
  - Type: `Integer`
Version number of the file. Specify an existing version number or, to get the latest version, specify null.

Return Value
Type: ConnectApi.BannerPhoto

Usage
Photos are processed asynchronously and might not be visible right away.

setBannerPhoto(communityId, userId, fileUpload)
Set a file that hasn’t been uploaded as a user’s banner photo.

API Version
36.0

Requires Chatter
Yes

Signature
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String userId, ConnectApi.BinaryInput fileUpload)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID of the user.

fileUpload
Type: ConnectApi.BinaryInput
File to use as the photo. The content type must be usable as an image.

Return Value
Type: ConnectApi.BannerPhoto

Usage
Photos are processed asynchronously and might not be visible right away.
**setBannerPhotoWithAttributes(communityId, userId, bannerPhoto)**

Set and crop an uploaded file as a user’s banner photo.

**API Version**

36.0

**Requires Chatter**

Yes

**Signature**

```java
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,
String userId, ConnectApi.BannerPhotoInput bannerPhoto)
```

**Parameters**

- **communityId**
  - Type: String
  - ID for an Experience Cloud site, internal, or **null**.

- **userId**
  - Type: String
  - ID of the user.

- **bannerPhoto**
  - Type: ConnectApi.BannerPhotoInput
  - A `ConnectApi.BannerPhotoInput` object that specifies the ID and version of the file, and how to crop the file.

**Return Value**

Type: `ConnectApi.BannerPhoto`

**Usage**

Photos are processed asynchronously and might not be visible right away.

**setBannerPhotoWithAttributes(communityId, userId, bannerPhoto, fileUpload)**

Set and crop a file that hasn’t been uploaded as a user’s banner photo.

**API Version**

36.0

**Requires Chatter**

Yes
Signature

public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId, String userId, ConnectApi.BannerPhotoInput bannerPhoto, ConnectApi.BinaryInput fileUpload)

Parameters

communityId
  Type: String
  ID for an Experience Cloud site, internal, or null.

userId
  Type: String
  ID of the user.

bannerPhoto
  Type: ConnectApi.BannerPhotoInput
  A ConnectApi.BannerPhotoInput object specifying the cropping parameters.

fileUpload
  Type: ConnectApi.BinaryInput
  File to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.BannerPhoto

Usage

Photos are processed asynchronously and might not be visible right away.

setPhoto(communityId, userId, fileId, versionNumber)

Set an uploaded file as a user’s photo.

API Version

35.0

Requires Chatter

Yes

Signature

public static ConnectApi.Photo setPhoto(String communityId, String userId, String fileId, Integer versionNumber)
Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID for the context user or the keyword me.

fileId
Type: String
ID of an uploaded file. The file must be an image, and be smaller than 2 GB.

versionNumber
Type: Integer
Version number of the existing file. Specify either an existing version number, or null to get the latest version.

Return Value
Type: ConnectApi.Photo

Usage
Photos are processed asynchronously and might not be visible right away.

setPhoto(communityId, userId, fileUpload)
Set a file that hasn’t been uploaded as a user’s photo.

API Version
35.0

Requires Chatter
Yes

Signature
public static ConnectApi.Photo setPhoto(String communityId, String userId, ConnectApi.BinaryInput fileUpload)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

userId
Type: String
ID for the context user or the keyword `me`.

`fileUpload`
Type: `ConnectApi.BinaryInput`
File to use as the photo. The content type must be usable as an image.

**Return Value**
Type: `ConnectApi.Photo`

**Usage**
Photos are processed asynchronously and might not be visible right away.

`setPhotoWithAttributes(communityId, userId, photo)`
Set and crop an uploaded file as a user’s photo.

**API Version**
35.0

**Requires Chatter**
Yes

**Signature**
```java
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId, ConnectApi.PhotoInput photo)
```

**Parameters**

- `communityId`
  Type: `String`
  ID for an Experience Cloud site, `internal`, or `null`.

- `userId`
  Type: `String`
  ID for the context user or the keyword `me`.

- `photo`
  Type: `ConnectApi.PhotoInput`
  A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

**Return Value**
Type: `ConnectApi.Photo`
Usage
Photos are processed asynchronously and might not be visible right away.

**setPhotoWithAttributes(communityId, userId, photo, fileUpload)**
Set and crop a file that hasn't been uploaded as a user's photo.

API Version
35.0

Requires Chatter
Yes

Signature
```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters
- **communityId**
  - Type: *String*
  - ID for an Experience Cloud site, internal, or null.
- **userId**
  - Type: *String*
  - ID for the context user or the keyword me.
- **photo**
  - Type: *ConnectApi.PhotoInput*
  - A ConnectApi.PhotoInput object specifying the cropping parameters.
- **fileUpload**
  - Type: *ConnectApi.BinaryInput*
  - File to use as the photo. The content type must be usable as an image.

Return Value
Type: *ConnectApi.Photo*

Usage
Photos are processed asynchronously and might not be visible right away.

Zones Class
Access information about Chatter Answers zones in your organization. Zones organize questions into logical groups, with each zone having its own focus and unique questions.
Note: With the Spring ’18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring ’18.

Namespace

ConnectApi

Zones Methods

The following are methods for Zones. All methods are static.

IN THIS SECTION:

getZone(communityId, zoneId)
Get a zone.

getZones(communityId)
Get a list of zones.

getZones(communityId; pageParam, pageSize)
Get a page of zones.

searchInZone(communityId, zoneId, q, filter)
Search articles or questions in a zone.

searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)
Search a page of articles or questions in a zone.

searchInZone(communityId, zoneId, q, filter, language)
Search articles or questions in a zone, and specify the language of the results.

getZone(communityId, zoneId)
Get a zone.

Note: With the Spring ’18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring ’18.

API Version

29.0

Requires Chatter

Yes

Signature

public static ConnectApi.Zone getZone(String communityId, String zoneId)
Parameters

`communityId`
Type: String
ID for an Experience Cloud site, internal, or null.

`zoneId`
Type: String
The ID of a zone.

Return Value

Type: `ConnectApi.Zone`

**getZones (communityId)**

Get a list of zones.

⚠️ Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version

29.0

Requires Chatter

Yes

Signature

```java
public static ConnectApi.ZonePage getZones(String communityId)
```

Parameters

`communityId`
Type: String
ID for an Experience Cloud site, internal, or null.

Return Value

Type: `ConnectApi.ZonePage`

**getZones (communityId, pageParam, pageSize)**

Get a page of zones.

⚠️ Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.
API Version
29.0

Requires Chatter
Yes

Signature
```
public static ConnectApi.Zone getZones(String communityId, Integer pageParam, Integer pageSize)
```

Parameters
- `communityId`  
  Type: String  
  ID for an Experience Cloud site, internal, or null.
- `pageParam`  
  Type: Integer  
  Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.
- `pageSize`  
  Type: Integer  
  Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: `ConnectApi.ZonePage`

`searchInZone(communityId, zoneId, q, filter)`
Search articles or questions in a zone.

Note: With the Spring ’18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring ’18.
Signature

```java
public static ConnectApi.ZoneSearchPage searchInZone(String communityId, String zoneId, String q, ConnectApi.ZoneSearchResultType filter)
```

Parameters

- `communityId`
  - Type: `String`
  - ID for an Experience Cloud site, internal, or `null`.

- `zoneId`
  - Type: `String`
  - ID of a zone.

- `q`
  - Type: `String`
  - Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

- `filter`
  - Type: `ConnectApi.ZoneSearchResultType`
  - A `ZoneSearchResultType` enum value. One of the following:
    - Article—Search results contain only articles.
    - Question—Search results contain only questions.

Return Value

- Type: `ConnectApi.ZoneSearchPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- `setTestSearchInZone(communityId, zoneId, q, filter, result)`
- *Apex Developer Guide: Testing ConnectApi Code*

**searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)**

Search a page of articles or questions in a zone.

**Note:** With the Spring ’18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see [End of Support for Chatter Answers in Spring ’18](#).

API Version

- 29.0
Available to Guest Users
37.0

Requires Chatter
Yes

Signature
public static ConnectApi.ZoneSearchPage searchInZone(String communityId, String zoneId, String q, ConnectApi.ZoneSearchResultType filter, String pageParam, Integer pageSize)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

zoneId
Type: String
ID of a zone.

q
Type: String
Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: ConnectApi.ZoneSearchResultType
A ZoneSearchResultType enum value. One of the following:
• Article—Search results contain only articles.
• Question—Search results contain only questions.

pageParam
Type: String
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

Return Value
Type: ConnectApi.ZoneSearchPage
Usage
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
  setTestSearchInZone(communityId, zoneId, q, filter, pageParam, pageSize, result)

searchInZone(communityId, zoneId, q, filter, language)
Search articles or questions in a zone, and specify the language of the results.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version
36.0

Available to Guest Users
37.0

Requires Chatter
Yes

Signature
public static ConnectApi.ZoneSearchPage searchInZone(String communityId, String zoneId, String q, ConnectApi.ZoneSearchResultType filter, String language)

Parameters

communityId
Type: String
ID for an Experience Cloud site, internal, or null.

zoneId
Type: String
ID of a zone.

q
Type: String
Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: ConnectApi.ZoneSearchResultType
- Article—Search results contain only articles.
• Question—Search results contain only questions.

**language**
Type: String

The language of the articles or questions. The value must be a Salesforce supported locale code.

**Return Value**
Type: ConnectApi.ZoneSearchPage

**Usage**
To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:
setTestSearchInZone(communityId, zoneId, q, filter, language, result)

**Zones Test Methods**
The following are the test methods for Zones. All methods are static.
For information about using these methods to test your ConnectApi code, see Testing ConnectApi Code.

**setTestSearchInZone(communityId, zoneId, q, filter, result)**
Register a ConnectApi.ZoneSearchPage object to be returned when searchInZone(communityId, zoneId, q, filter) is called in a test context. Use the method with the same parameters or you receive an exception.

⚠️ Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

**API Version**
29.0

**Signature**
public static Void setTestSearchInZone(String communityId, String zoneId, String q, ConnectApi.ZoneSearchResultType filter, ConnectApi.ZoneSearchPage result)

**Parameters**

- **communityId**
  Type: String
  Use either the ID for an Experience Cloud site, internal, or null.

- **zoneId**
  Type: String
  The ID of a zone.
q
  Type: String
  Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
  Type: ConnectApi.ZoneSearchResultType
  A ZoneSearchResultType enum value. One of the following:
  • Article—Search results contain only articles.
  • Question—Search results contain only questions.

result
  Type: ConnectApi.ZoneSearchPage
  The object containing test data.

Return Value
Type: Void

SEE ALSO:
  searchInZone(communityId, zoneId, q, filter)

setTestSearchInZone(communityId, zoneId, q, filter, pageParam, pageSize, result)
Register a ConnectApi.ZoneSearchPage object to be returned when searchInZone(communityId, zoneId, q, filter, pageParam, pageSize) is called in a test context. Use the method with the same parameters or you receive an exception.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version
29.0

Signature
public static Void setTestSearchInZone(String communityId, String zoneId, String q, ConnectApi.ZoneSearchResultType filter, String pageParam, Integer pageSize, ConnectApi.ZoneSearchPage result)

Parameters
communityId
  Type: String
  Use either the ID for an Experience Cloud site, internal, or null.
**zoneId**
Type: String
The ID of a zone.

**q**
Type: String
Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

**filter**
Type: `ConnectApi.ZoneSearchResultType`
A `ZoneSearchResultType` enum value. One of the following:
- Article—Search results contain only articles.
- Question—Search results contain only questions.

**pageParam**
Type: String
Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

**pageSize**
Type: Integer
Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

**result**
Type: `ConnectApi.ZoneSearchPage`
The object containing test data.

**Return Value**
Type: Void

**SEE ALSO:**
- `searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)`

**setTestSearchInZone(communityId, zoneId, q, filter, language, result)**
Register a `ConnectApi.ZoneSearchPage` object to be returned when `searchInZone(communityId, zoneId, q, filter, language)` is called in a test context. Use the method with the same parameters or you receive an exception.

**Note:** With the Spring ’18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring ’18.

**API Version**
36.0
public static Void setTestSearchInZone(String communityId, String zoneId, String q, ConnectApi.ZoneSearchResultType filter, String language, ConnectApi.ZoneSearchPage result)

Parameters

communityId
Type: String
Use either the ID for an Experience Cloud site, internal, or null.

zoneId
Type: String
The ID of a zone.

q
Type: String
Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: ConnectApi.ZoneSearchResultType
- Article—Search results contain only articles.
- Question—Search results contain only questions.

language
Type: String
The language of the articles or questions. The value must be a Salesforce supported locale code. In an <apex:page>, the default value is the language of the page. Otherwise, the default value is the user’s locale.

result
Type: ConnectApi.ZoneSearchPage
The object containing test data.

Return Value
Type: Void

SEE ALSO:
- searchInZone(communityId, zoneId, q, filter, language)

ConnectApi Input Classes

Some ConnectApi methods take arguments that are instances of ConnectApi input classes. Input classes are concrete unless marked abstract in this documentation. Concrete input classes have public constructors that have no parameters. Some methods have parameters that are typed with an abstract class. You must pass in an instance of a concrete child class for these parameters.
Most input class properties can be set. Read-only properties are noted in this documentation.

**ConnectApi.ActionLinkDefinitionInput**

The definition of an action link. An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can drive productivity and accelerate innovation.

**Usage**

You can use context variables in the `actionUrl`, `headers`, and `requestBody` properties. Use context variables to pass information about the user who executed the action link to your server-side code. Salesforce substitutes the value when the action link is executed.

The available context variables are:

<table>
<thead>
<tr>
<th>Context Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>{!actionLinkId}</td>
<td>The ID of the action link the user executed.</td>
</tr>
<tr>
<td>{!actionLinkGroupId}</td>
<td>The ID of the action link group containing the action link the user executed.</td>
</tr>
<tr>
<td>{!communityId}</td>
<td>The ID of the site in which the user executed the action link. The value for your internal org is the empty key &quot;000000000000000000&quot;.</td>
</tr>
<tr>
<td>{!communityUrl}</td>
<td>The URL of the site in which the user executed the action link. The value for your internal org is empty string &quot;&quot;.</td>
</tr>
<tr>
<td>{!orgId}</td>
<td>The ID of the org in which the user executed the action link.</td>
</tr>
<tr>
<td>{!userId}</td>
<td>The ID of the user that executed the action link.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>actionType</td>
<td><code>ConnectApi.ActionLinkType</code></td>
<td>Defines the type of action link. Values are:</td>
<td>Required</td>
<td>33.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>Api</strong>—The action link calls a synchronous API at the action URL. Salesforce sets the status to <code>SuccessfulStatus</code> or <code>FailedStatus</code> based on the HTTP status code returned by your server.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
|                 |                             | - **ApiAsync**—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to `/connect/action-links/{actionLinkId}` to set the status to
<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>actionUrl</td>
<td>String</td>
<td>The action link URL. For example, a Ui action link URL is a Web page. A Download action link URL is a link to the file to download. Ui and Download action link URLs are provided to clients. An Api or ApiAsync action link URL is a REST resource. Api and ApiAsync action link URLs aren’t provided to clients. Links to Salesforce can be relative. All other links must be absolute and start with https://.</td>
<td>Required</td>
<td>33.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Tip: To avoid issues due to upgrades or changing functionality in your API, we recommend using a versioned API for actionUrl, for example, <a href="https://www.example.com/api/v1/exampleResource">https://www.example.com/api/v1/exampleResource</a>. If your API isn’t versioned, you can use the expirationDate property of the ConnectApi.ActionLinkGroup DefinitionInput class to</td>

See ALSO:

`ConnectApi.ActionLinkGroupDefinitionInput`

**ConnectApi.ActionLinkGroupDefinitionInput**

The definition of an action link group. All action links must belong to a group. Action links in a group are mutually exclusive and share some properties. Define standalone actions in their own action group.

Action link definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

</tr>
</tbody>
</table>
the date and time this action link group is removed from associated feed items and can no longer be executed. The expirationDate must be within one year of the creation date.

If the action link group definition includes an OAuth token, it is a good idea to set the expiration date of the action link group to the same value as the expiration date of the OAuth token so that users can’t execute the action link and get an OAuth error.

To set a date when instantiating from a template, see Set the Action Link Group Expiration Time in Design Action Link Templates.

To instantiate without a template, don’t specify a value.

Required to instantiate this action link group from a template.

A collection of key-value pairs to fill in binding variable values or a custom user alias from an action link template. To instantiate this action link group from an action link template that uses binding variables, you must provide values for all the variables. See Define Binding Variables in Design Action Link Templates.

A key-value pair to fill in a binding variable value from an action link template.

<td>49.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>on the Reason field of the OrderItemSummaryChange object.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**ConnectApi.AdjustOrderItemSummaryInputRepresentation**

Price adjustments to OrderItemSummaries that together make up a price adjustment to an order, with options for adjusting items in the process of being fulfilled.
### Available Version

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjustItems</td>
<td>List of price adjustments to OrderItemSummaries.</td>
<td>Required</td>
<td>49.0</td>
</tr>
<tr>
<td>allocatedItems</td>
<td>Process to use for OrderItemSummary quantities that are currently being fulfilled, defined as ( \text{QuantityAllocated} - \text{QuantityFulfilled} ). Values are:</td>
<td>Optional</td>
<td>55.0</td>
</tr>
</tbody>
</table>
| ChangeOrderType | • Disallowed—When distributing the adjustment, ignore any quantities being fulfilled. If an OrderItemSummary’s entire quantity is being fulfilled, return an error. This is the default value.  
• InFulfillment—When distributing the adjustment, include quantities being fulfilled. Create a separate change order for the adjustments made to those quantities.  
• PreFulfillment—When distributing the adjustment, include quantities being fulfilled. Include the adjustments made to those quantities in the change order for pre-fulfillment quantity adjustments. | | |

### ConnectApi.AlternativeInput

Alternative representation for an extension on a feed element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>Text representation of the extension.</td>
<td>Required</td>
<td>40.0</td>
</tr>
<tr>
<td>thumbnailUrl</td>
<td>Thumbnail URL to the extension.</td>
<td>Optional</td>
<td>40.0</td>
</tr>
<tr>
<td>title</td>
<td>Title of the extension.</td>
<td>Optional</td>
<td>40.0</td>
</tr>
</tbody>
</table>

### ConnectApi.AnnouncementInput

An announcement.
<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available</th>
</tr>
</thead>
<tbody>
<tr>
<td>body</td>
<td>ConnectApi.MessageBodyInput</td>
<td>Text of the announcement.</td>
<td>Required</td>
<td>31.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Optional</td>
<td></td>
</tr>
<tr>
<td>expirationDate</td>
<td>Datetime</td>
<td>The Salesforce UI displays an announcement until 11:59 p.m. on this date unless another announcement is posted first. The Salesforce UI ignores the time value in the expirationDate. However, you can use the time value to create your own display logic in your own UI.</td>
<td>Required for creating an announcement</td>
<td>31.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Optional for updating an announcement</td>
<td></td>
</tr>
<tr>
<td>feedItemId</td>
<td>String</td>
<td>ID of an AdvancedTextPost feed item that is the body of the announcement.</td>
<td>Required</td>
<td>36.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Optional</td>
<td></td>
</tr>
<tr>
<td>isArchived</td>
<td>Boolean</td>
<td>Specifies whether the announcement is archived.</td>
<td>Optional</td>
<td>36.0</td>
</tr>
<tr>
<td>parentId</td>
<td>String</td>
<td>ID of the parent entity for the announcement, that is, a group ID when the announcement appears in a group.</td>
<td>Required</td>
<td>36.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Optional</td>
<td></td>
</tr>
</tbody>
</table>
**sendEmails**  
*Boolean*  
Specifies whether the announcement is sent as an email to all group members regardless of their email setting for the group. If Chatter emails aren’t enabled for the organization, announcement emails aren’t sent. Default value is *false*.

Optional for creating an announcement
Don’t specify for updating an announcement

### ConnectApi.ArticleTopicAssignmentJobInput

An article and topic assignment job.

**operation**  
*ConnectApi.ArticleTopicJobType*  
Type of operation to perform on articles and topics. Values are:
- AssignTopicsToArticle—Assign topics to articles in a data category.
- UnassignTopicsFromArticle—Unassign topics from articles in a data category.

**topicNames**  
*ConnectApi.TopicNamesInput*  
List of topic names to assign to or unassign from articles.

### ConnectApi.AssociatedActionsCapabilityInput

A list of action link groups to associate with a feed element. To associate an action link group with a feed element, the call must be made from the Apex namespace that created the action link definition. In addition, the user making the call must have created the definition or have View All Data permission.

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can drive productivity and accelerate innovation.

**SEE ALSO:**  
`postAnnouncement(communityId, groupId, announcement)`
### ConnectApi.AuditCommitInput

Custom audit commit criteria type.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

**Superclass for:**
- ConnectApi.AuditCustomEmailAddressInput
- ConnectApi.AuditCustomEmailAddressInput
- ConnectApi.AuditCustomIdentityInput
- ConnectApi.AuditCustomPhoneInput

### ConnectApi.AuditEmailInput

Custom audit email criteria type.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

**Superclass for:**
- ConnectApi.AuditCustomEmailAddressInput
- ConnectApi.AuditCustomEmailAddressInput
- ConnectApi.AuditCustomIdentityInput
- ConnectApi.AuditCustomPhoneInput

### ConnectApi.AuditIdentityInput

Custom audit identity criteria type.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

**Superclass for:**
- ConnectApi.AuditCustomEmailAddressInput
- ConnectApi.AuditCustomEmailAddressInput
- ConnectApi.AuditCustomIdentityInput
- ConnectApi.AuditCustomPhoneInput

### ConnectApi.AuditPhoneInput

Custom audit phone criteria type.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

**Superclass for:**
- ConnectApi.AuditCustomEmailAddressInput
- ConnectApi.AuditCustomEmailAddressInput
- ConnectApi.AuditCustomIdentityInput
- ConnectApi.AuditCustomPhoneInput

### ConnectApi.AuditPhoneInput

Custom audit phone criteria type.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

**Superclass for:**
- ConnectApi.AuditCustomEmailAddressInput
- ConnectApi.AuditCustomEmailAddressInput
- ConnectApi.AuditCustomIdentityInput
- ConnectApi.AuditCustomPhoneInput

---

<td>Optional</td>
<td>51.0</td>
</tr>
<tr>
<td>amount</td>
<td>Double</td>
<td>Amount of adjustment applied to the payment authorization.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>comments</td>
<td>String</td>
<td>Users can add comments to provide additional details about a record. Maximum of 1,000 characters.</td>
<td>Optional</td>
<td>51.0</td>
</tr>
<tr>
<td>effectiveDate</td>
<td>Datetime</td>
<td>Date that the adjustment takes effect on the authorization.</td>
<td>Required</td>
<td>51.0</td>
</tr>
</tbody>
</table>

**ConnectApi.AuthorizationRequest**

Payment Authorization input consumed by Payment Authorization service.

Subclass of `ConnectApi.BaseRequest`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>accountId</td>
<td>String</td>
<td>Salesforce account that contains the payment transaction being authorized.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>amount</td>
<td>Double</td>
<td>Authorization amount.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>comments</td>
<td>String</td>
<td>Optional comments for the payment authorization.</td>
<td>Optional</td>
<td>51.0</td>
</tr>
<tr>
<td>currencyIsoCode</td>
<td>String</td>
<td>Three-letter ISO 4217 currency code associated with the payment group record.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>effectiveDate</td>
<td>Datetime</td>
<td>Date that the authorization will be applied to the transaction.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>paymentGatewayId</td>
<td>String</td>
<td>Payment gateway that processes the authorization.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>paymentGroup</td>
<td><code>ConnectApi.PaymentGroupRequest</code></td>
<td>Payment group for the authorization. The payload must reference either a paymentGroup or a paymentGroupId, but not both.</td>
<td>Optional</td>
<td>51.0</td>
</tr>
<tr>
<td>paymentMethod</td>
<td><code>ConnectApi.AuthApiPaymentMethodRequest</code></td>
<td>Payment method used in the payment gateway for the authorization transaction.</td>
<td>Required</td>
<td>51.0</td>
</tr>
</tbody>
</table>
**ConnectApi.BannerPhotoInput**

A banner photo.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>cropHeight</td>
<td>Integer</td>
<td>Height of the crop rectangle in pixels.</td>
<td>Optional</td>
<td>36.0</td>
</tr>
<tr>
<td>cropWidth</td>
<td>Integer</td>
<td>Width of the crop rectangle in pixels.</td>
<td>Optional</td>
<td>36.0</td>
</tr>
<tr>
<td>cropX</td>
<td>Integer</td>
<td>X position of the crop rectangle from the left edge of the image in pixels.</td>
<td>Optional</td>
<td>36.0</td>
</tr>
<tr>
<td>cropY</td>
<td>Integer</td>
<td>Y position of the crop rectangle from the top edge of the image in pixels.</td>
<td>Optional</td>
<td>36.0</td>
</tr>
<tr>
<td>fileId</td>
<td>String</td>
<td>18 character ID of an existing file. The key prefix must be 069 and the file must be an image and be smaller than 2 GB.</td>
<td>Required</td>
<td>36.0</td>
</tr>
</tbody>
</table>

**Note:** Images uploaded on the Group page and on the User page don’t have file IDs and therefore can’t be used.

| versionNumber | Integer | Version number of an existing file. If not provided, the latest version is used. | Optional | 36.0 |

**ConnectApi.BaseRequest**

Base parameters for making a request to the payment gateway.

This class is abstract.

Subclass of **ConnectApi.AuditParamsRequest**.

Superclass of:

- ConnectApi.AuthorizationRequest
- ConnectApi.AuthorizationReversalRequest
- ConnectApi.CaptureRequest
- ConnectApi.PaymentMethodTokenizationRequest
- ConnectApi.PostAuthRequest
- ConnectApi.RefundRequest
- ConnectApi.SaleRequest
### ConnectApi.BaseApiPaymentMethodRequest

Payment method API input representation.

This class is abstract.

Superclass of:
- ConnectApi.AuthApiPaymentMethodRequest
- ConnectApi.PostAuthApiPaymentMethodRequest
- ConnectApi.SaleApiPaymentMethodRequest

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>address</td>
<td>ConnectApi.AddressRequest</td>
<td>Payment method address.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>Payment method record ID. Used in payment transactions.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>saveForFuture</td>
<td>Boolean</td>
<td>Shows whether Salesforce saves the payment method for future use.</td>
<td>Required</td>
<td>51.0</td>
</tr>
</tbody>
</table>

### ConnectApi.BasePaymentMethodRequest

Base payment method input representation.

This class is abstract.

Superclass of:
- ConnectApi.AlternativePaymentMethod
- ConnectApi.CardPaymentMethodRequest

No additional properties.

### ConnectApi.BatchInput

Construct a set of inputs to be passed into a method at the same time.

Use this constructor when there isn’t a binary input:

```java
ConnectApi.BatchInput(Object input)
```
Use this constructor to pass one binary input:

```java
ConnectApi.BatchInput(Object input, ConnectApi.BinaryInput binary)
```

Use this constructor to pass multiple binary inputs:

```java
ConnectApi.BatchInput(Object input, List<ConnectApi.BinaryInput> binaries)
```

The constructors takes these parameters:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Object</td>
<td>An individual input object to be used in the batch operation. For example, for <code>postFeedElementBatch()</code>, this should be <code>ConnectApi.FeedElementInput</code>.</td>
<td>32.0</td>
</tr>
<tr>
<td>binary</td>
<td><code>ConnectApi.BinaryInput</code></td>
<td>A binary file to associate with the input object.</td>
<td>32.0</td>
</tr>
<tr>
<td>binaries</td>
<td><code>List&lt;ConnectApi.BinaryInput&gt;</code></td>
<td>A list of binary files to associate with the input object.</td>
<td>32.0</td>
</tr>
</tbody>
</table>

SEE ALSO:

- Post a Batch of Feed Elements
- Post a Batch of Feed Elements with a New (Binary) File

**ConnectApi.BinaryInput**

Create a `ConnectApi.BinaryInput` object to attach files to feed items and comments and to add repository files.

The constructor is:

```java
ConnectApi.BinaryInput(blob, contentType, filename)
```

The constructor takes these arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>blob</td>
<td>Blob</td>
<td>Contents of the file to be used for input</td>
<td>28.0</td>
</tr>
<tr>
<td>contentType</td>
<td>String</td>
<td>MIME type description of the content, such as <code>image/jpg</code></td>
<td>28.0</td>
</tr>
<tr>
<td>filename</td>
<td>String</td>
<td>File name with the file extension, such as <code>UserPhoto.jpg</code></td>
<td>28.0</td>
</tr>
</tbody>
</table>

SEE ALSO:

- Post a Feed Element with a New File (Binary) Attachment
- Post a Comment with a New File
- `ConnectApi.BatchInput`
ConnectApi.BookmarksCapabilityInput
Create or update a bookmark on a feed element.
This class is a subclass of ConnectApi.FeedElementCapabilityInput.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isBookmarked ByCurrentUser</td>
<td>Boolean</td>
<td>Specifies if the feed element should be bookmarked for the user (true) or not (false).</td>
<td>No</td>
<td>32.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
ConnectApi.FeedElementCapabilitiesInput

ConnectApi.BotVersionActivationInput
Activation status of the bot version.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>ConnectApi.BotVersionActivationStatus</td>
<td>Activation status of the bot version. Values are:</td>
<td>Optional</td>
<td>50.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Active</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Inactive</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Activation status must be specified in the status or postBody parameter.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

ConnectApi.CanvasCapabilityInput
Create or update a canvas app associated with a feed element.
This class is a subclass of ConnectApi.FeedElementCapabilityInput.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>String</td>
<td>A description of the canvas app. The maximum size is 255 characters.</td>
<td>Optional</td>
<td>32.0</td>
</tr>
<tr>
<td>developerName</td>
<td>String</td>
<td>The API name (developer name) of the connected app.</td>
<td>Required</td>
<td>32.0</td>
</tr>
<tr>
<td>height</td>
<td>String</td>
<td>The height of the canvas app in pixels.</td>
<td>Optional</td>
<td>32.0</td>
</tr>
<tr>
<td>namespacePrefix</td>
<td>String</td>
<td>A unique namespace prefix for the canvas app.</td>
<td>Optional</td>
<td>32.0</td>
</tr>
<tr>
<td>parameters</td>
<td>String</td>
<td>JSON parameters passed to the canvas app.</td>
<td>Optional</td>
<td>32.0</td>
</tr>
</tbody>
</table>
### ConnectApi.CapacityRequestInputRepresentation

Request related to a location’s fulfillment order capacity.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>actionRequestId</td>
<td>String</td>
<td>Unique string that identifies the request. Can be a UUID. Use the action request IDs in response data to identify which requests succeeded or failed.</td>
<td>Required</td>
<td>55.0</td>
</tr>
<tr>
<td>locationId</td>
<td>String</td>
<td>ID of the location associated with the request.</td>
<td>Required</td>
<td>55.0</td>
</tr>
</tbody>
</table>

### ConnectApi.CaptureRequest

Payment capture input consumed by the payment capture service. Subclass of ConnectApi.BaseRequest.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>accountId</td>
<td>String</td>
<td>ID of the account linked to the capture request.</td>
<td>Optional</td>
<td>50.0</td>
</tr>
<tr>
<td>amount</td>
<td>Double</td>
<td>Amount captured from the previous authorization.</td>
<td>Required</td>
<td>50.0</td>
</tr>
<tr>
<td>clientContext</td>
<td>String</td>
<td>Context for payment APIs. Used for a payment caller to re-establish context.</td>
<td>Optional</td>
<td>50.0</td>
</tr>
<tr>
<td>comments</td>
<td>String</td>
<td>Comments for the payment capture.</td>
<td>Optional</td>
<td>50.0</td>
</tr>
<tr>
<td>effectiveDate</td>
<td>Datetime</td>
<td>Date when the payment becomes effective.</td>
<td>Optional</td>
<td>50.0</td>
</tr>
<tr>
<td>paymentGroup</td>
<td>ConnectApi. PaymentGroupRequest</td>
<td>Details about the payment group record associated with the payment request.</td>
<td>Optional</td>
<td>50.0</td>
</tr>
</tbody>
</table>
ConnectApi.AlternativePaymentMethod

A payment method that doesn’t have a defined Salesforce entity such as CardPaymentMethod or DigitalWallet. Common examples of alternative payment methods include CashOnDeliver, Klarna, and Direct Debit. AlternativePaymentMethod functions the same as any other type of payment method for processing transactions in the payment gateway.

Subclass of ConnectApi.BasePaymentMethodRequest

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>accountId</td>
<td>String</td>
<td>Salesforce Payments account to which this payment method is linked.</td>
<td>Required</td>
<td>54.0</td>
</tr>
<tr>
<td>comments</td>
<td>String</td>
<td>Details about a record added by a user. Maximum of 1,000 characters.</td>
<td>Optional</td>
<td>54.0</td>
</tr>
<tr>
<td>email</td>
<td>String</td>
<td>Email address of the card holder.</td>
<td>Optional</td>
<td>54.0</td>
</tr>
<tr>
<td>gatewayToken</td>
<td>String</td>
<td>A unique, alphanumeric ID, called a token, that a payment gateway generates when it first processes a payment. The token replaces the actual payment data so that the data is kept secure. This token is stored as encrypted text, and can be used for recurring payments.</td>
<td>Required</td>
<td>54.0</td>
</tr>
<tr>
<td>gatewayToken Details</td>
<td>String</td>
<td>Detailed information about the gateway token.</td>
<td>Required</td>
<td>54.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name that you assign to the payment method object.</td>
<td>Optional</td>
<td>54.0</td>
</tr>
</tbody>
</table>

ConnectApi.CardPaymentMethodRequest

Card payment method input representation.

Subclass of ConnectApi.BasePaymentMethodRequest.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>accountId</td>
<td>String</td>
<td>Salesforce Payments account to which this payment method is linked.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>autoPay</td>
<td>Boolean</td>
<td>Indicates whether a token for recurring payments is being requested (true) or not (false). The token lets the payment method be used for recurring payments.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>cardCategory</td>
<td>ConnectApi.CardCategory</td>
<td>Card processing type. Valid values are: • CreditCard • DebitCard</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>Property</td>
<td>Type</td>
<td>Description</td>
<td>Required or Optional</td>
<td>Available Version</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------</td>
<td>--------------------------------------------------</td>
<td>-----------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>cardHolder</td>
<td>String</td>
<td>First name of the card holder.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>FirstName</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>cardHolder</td>
<td>String</td>
<td>Last name of the card holder.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>LastName</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>cardHolderName</td>
<td>String</td>
<td>Full name of the card holder.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>cardNumber</td>
<td>String</td>
<td>Card number.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>cardType</td>
<td>String</td>
<td>Card network type. Valid values are: AmericanExpress, DinersClub, JCB, MasterCard, Maestro, Visa</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>comments</td>
<td>String</td>
<td>Optional comments for the card payment method.</td>
<td>Optional</td>
<td>51.0</td>
</tr>
<tr>
<td>cvv</td>
<td>String</td>
<td>Card Verification Value.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>email</td>
<td>String</td>
<td>Email address of the card holder.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>expiryMonth</td>
<td>Integer</td>
<td>Card expiration month.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>expiryYear</td>
<td>Integer</td>
<td>Card expiration year.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>nickName</td>
<td>String</td>
<td>Optional nickname for the card.</td>
<td>Optional</td>
<td>51.0</td>
</tr>
<tr>
<td>startMonth</td>
<td>Integer</td>
<td>Month the card becomes active.</td>
<td>Optional</td>
<td>51.0</td>
</tr>
<tr>
<td>startYear</td>
<td>Integer</td>
<td>Year the card becomes active.</td>
<td>Optional</td>
<td>51.0</td>
</tr>
</tbody>
</table>

**ConnectApi.CartInput**

A cart.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>currencyIsoCode</td>
<td>String</td>
<td>Currency ISO code of the cart.</td>
<td>Optional</td>
<td>57.0</td>
</tr>
<tr>
<td>effectiveAccountId</td>
<td>String</td>
<td>ID of the buyer account or guest buyer profile for which the request is made.</td>
<td>Optional</td>
<td>49.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If unspecified, the default value is determined from context.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Property</td>
<td>Type</td>
<td>Description</td>
<td>Required or Optional</td>
<td>Available Version</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>isSecondary</td>
<td>Boolean</td>
<td>Specifies whether the cart is secondary (true) or not (false). If unspecified, defaults to false.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the cart. The name can have up to 250 Unicode characters. If unspecified, defaults to the generated name.</td>
<td>Optional</td>
<td>49.0</td>
</tr>
<tr>
<td>orderOwnerId</td>
<td>String</td>
<td>ID of the owner of the order.</td>
<td>Optional</td>
<td>58.0</td>
</tr>
<tr>
<td>type</td>
<td>ConnectApi.CartType</td>
<td>Type of cart. Vaues are:</td>
<td>Optional</td>
<td>49.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Cart—Cart created by a customer.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ReadOnly—Clone of a Template cart that the customer can check out with.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Template—Cart created by an internal user.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>If unspecified, defaults to Cart.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>typeAsString</td>
<td>String</td>
<td>Type of the cart provided as a string.</td>
<td>Optional</td>
<td>59.0</td>
</tr>
</tbody>
</table>

ConnectApi.cartCouponInput

Cart coupon input.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>couponCode</td>
<td>String</td>
<td>The coupon code.</td>
<td>Required</td>
<td>54.0</td>
</tr>
</tbody>
</table>

ConnectApi.CartInventoryReservationInputRepresentation (Pilot)

Input representation to create or update a reservation.

**Note:** This feature is not generally available and is being piloted with certain Customers subject to additional terms and conditions. It is not part of your purchased Services. This feature is subject to change, may be discontinued with no notice at any time in Salesforce's sole discretion, and Salesforce may never make this feature generally available. <table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>durationInSeconds</td>
<td>Integer</td>
<td>Reservation duration in seconds.</td>
<td>Required</td>
<td>58.0</td>
</tr>
</tbody>
</table>
## ConnectApi.CartItemInput

An item in a cart.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>cartDeliveryGroupId</td>
<td>String</td>
<td>ID of the cart delivery group.</td>
<td>Optional</td>
<td>59.0</td>
</tr>
<tr>
<td>productId</td>
<td>String</td>
<td>ID of the product.</td>
<td>Required when adding an item to a cart</td>
<td>49.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Not supported when updating a cart item</td>
<td></td>
</tr>
<tr>
<td>quantity</td>
<td>String</td>
<td>Quantity of the cart item. Use a value that can be converted to BigDecimal.</td>
<td>Required</td>
<td>49.0</td>
</tr>
</tbody>
</table>
| type                 | ConnectApi.CartItemType | Type of item in a cart. Value is Product.  
- DeliveryCharge  
- Product | Required when adding an item to a cart | 49.0              |
|                      |          |                                                                             | Not supported when updating a cart item |                  |

## ConnectApi.CartItemPromotionCollectionInputRepresentation

Promotions for a cart item.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>items</td>
<td>List&lt;ConnectApi.CartItemPromotionInputRepresentation&gt;</td>
<td>List of cart items to get the associated promotions.</td>
<td>Required</td>
<td>52.0</td>
</tr>
</tbody>
</table>

## ConnectApi.CartItemPromotionInputRepresentation

ID of a cart item associated with a promotion.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>cartItemId</td>
<td>String</td>
<td>ID of the item associated with the cart.</td>
<td>Optional</td>
<td>52.0</td>
</tr>
</tbody>
</table>

## ConnectApi.CartMessagesVisibilityInput

Set the visibility for cart messages.
### ConnectApi.CartToWishlistInput

Copy products from a cart to a wishlist.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>wishlistId</td>
<td>String</td>
<td>ID of the wishlist to copy cart products to.</td>
<td>Required</td>
<td>50.0</td>
</tr>
</tbody>
</table>

### ConnectApi.CdpCalculatedInsightInput

Input representation for a calculated insight.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiName</td>
<td>String</td>
<td>API name of the calculated insight with suffix __cio.</td>
<td>Required for creating a calculated insight</td>
<td>57.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Optional for updating a calculated insight</td>
<td></td>
</tr>
<tr>
<td>createdFrom Package</td>
<td>Boolean</td>
<td>Specifies whether the calculated insight was created from an installed package (true) or not (false).</td>
<td>Optional</td>
<td>57.0</td>
</tr>
<tr>
<td>dataSpaceName</td>
<td>String</td>
<td>Name of the data space.</td>
<td>Optional</td>
<td>57.0</td>
</tr>
</tbody>
</table>
| definitionType            | ConnectApi.CalculatedInsightDefinitionTypeEnum | Definition type of the calculated insight. Values are: 
- CalculatedMetric 
- ExternalMetric 
- StreamingMetric | Required for creating a calculated insight | 57.0              |
|                          |                     |                                                                             | Optional for updating a calculated insight |                  |
| description               | String              | Calculated insight description.                                            | Optional             | 57.0              |
| displayName               | String              | Calculated insight display name.                                           | Required for creating a calculated insight | 57.0              |
|                          |                     |                                                                             | Optional for updating a calculated insight |                  |
### Available Version

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>draft</td>
<td>Boolean</td>
<td>Specifies whether to save the calculated insight as draft (<strong>true</strong>) or not (<strong>false</strong>).</td>
<td>Optional</td>
<td>57.0</td>
</tr>
<tr>
<td>expression</td>
<td>String</td>
<td>Calculated insight ANSI SQL expression.</td>
<td>Required for creating a calculated insight</td>
<td>57.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Optional for updating a calculated insight</td>
<td></td>
</tr>
</tbody>
</table>

### ConnectApi.CdpIdentityResolutionConfigInput

Input representation for creating an identity resolution ruleset.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>configurationType</td>
<td>ConnectApi.CdpIdentityResolutionConfigurationType</td>
<td>Source object for an identity resolution ruleset. Values are: • Account • Individual</td>
<td>Required</td>
<td>57.0</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the identity resolution ruleset.</td>
<td>Optional</td>
<td>57.0</td>
</tr>
<tr>
<td>doesRunAutomatically</td>
<td>Boolean</td>
<td>Specifies whether automatic job run scheduling is enabled for the ruleset (<strong>true</strong>) or not (<strong>false</strong>). If unspecified, defaults to <strong>false</strong>.</td>
<td>Optional</td>
<td>57.0</td>
</tr>
<tr>
<td>label</td>
<td>String</td>
<td>User friendly name of the identity resolution ruleset.</td>
<td>Required</td>
<td>57.0</td>
</tr>
<tr>
<td>rulesetId</td>
<td>String</td>
<td>Extended ID of the ruleset used to differentiate between rulesets created for comparison. The ruleset ID must be unique and can't be longer than 4 characters.</td>
<td>Optional</td>
<td>57.0</td>
</tr>
</tbody>
</table>
**ConnectApi.CdpIdentityResolutionConfigPatchInput**

Input representation for updating an identity resolution ruleset.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the identity resolution ruleset.</td>
<td>Optional</td>
<td>57.0</td>
</tr>
<tr>
<td>doesRunAutomatically</td>
<td>Boolean</td>
<td>Specifies whether automatic job run scheduling is enabled for the ruleset (true) or not (false). If unspecified, defaults to false.</td>
<td>Optional</td>
<td>57.0</td>
</tr>
<tr>
<td>label</td>
<td>String</td>
<td>User friendly name of the identity resolution ruleset.</td>
<td>Required</td>
<td>57.0</td>
</tr>
<tr>
<td>matchRules</td>
<td>List&lt;String&gt;</td>

|                   |                               | - SourceSequence                                                            |
| shouldIgnoreEmptyValue | Boolean                     | Specifies whether to ignore an empty value (true) or not (false).          |
| sources           | List<ConnectApi.CdpIdentityResolutionReconciliationSource> | If ruleType is SourceSequence, a prioritized list of data sources.          |

**Available Version**: Required or Optional

#### ConnectApi.CdpIdentityResolutionReconciliationRule

Input representation for an identity resolution ruleset’s default reconciliation rule for an object.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>entityName</td>
<td>String</td>
<td>API name of the Data Model Object the reconciliation rule applies to.</td>
</tr>
</tbody>
</table>

**Available Version**: Required or Optional
**Available Version**

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>fields</td>
<td>List&lt;ConnectApi.CdpIdentityResolutionReconciliationFieldRule&gt;</td>
<td>Field-specific reconciliation rules that override this default rule for the specified field.</td>
<td>Optional</td>
<td>57.0</td>
</tr>
</tbody>
</table>
| ruleType                  | ConnectApi.CdpIdentityResolutionReconciliationRuleType | Default reconciliation rule applied to fields in the object the reconciliation rule applies to. Values are:  
  - LastUpdated  
  - MostFrequent  
  - SourceSequence | Required             | 57.0              |
| shouldIgnoreEmptyValue    | Boolean                                | Specifies whether to ignore an empty value (true) or not (false).            | Required             | 57.0              |
| sources                   | List<ConnectApi.CdpIdentityResolutionReconciliationSource> | If ruleType is SourceSequence, a list of data sources in priority order.      | Required if ruleType is SourceSequence | 57.0              |

**SEE ALSO:**
- ConnectApi.CdpIdentityResolutionConfigInput

### ConnectApi.CdpSegmentInput

Segment input.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalMetadata</td>
<td>Map&lt;String, String&gt;</td>
<td>Map of additional metadata.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>dataSpace</td>
<td>String</td>
<td>Segment dataspace. In API version 59.0 and later, this property is not available. Use the dataspace request parameter instead.</td>
<td>Optional</td>
<td>57.0–58.0</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Segment description.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>developerName</td>
<td>String</td>
<td>Segment developer name.</td>
<td>Required</td>
<td>55.0</td>
</tr>
<tr>
<td>displayName</td>
<td>String</td>
<td>Segment display name.</td>
<td>Optional</td>
<td>57.0</td>
</tr>
<tr>
<td>includeDbt</td>
<td>ConnectApi.CdpSegmentDbtInput</td>
<td>Segment data build tool.</td>
<td>Required</td>
<td>55.0</td>
</tr>
<tr>
<td>publishSchedule</td>
<td>ConnectApi.PublishSchedule</td>
<td>Publish refresh schedule. Values are: one—Refreshes every hour. Used to rapidly publish UI and DBT-based segments.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
</tbody>
</table>
Available Version | Required or Optional
--- | ---
Four—Refreshes every four hours. Used to rapidly publish UI and DBT-based segments. | Optional if publishSchedule isn’t specified
Twelve—Refreshes every twelve hours. |
TwentyFour—Refreshes every twenty-four hours. |

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>publishScheduleEndDate</td>
<td>String</td>
<td>Date indicating the end of the publish schedule.</td>
<td>Optional if publishSchedule isn’t specified</td>
<td>55.0</td>
</tr>
<tr>
<td>publishScheduleStartDateTime</td>
<td>String</td>
<td>Datetime indicating the start of the publish schedule.</td>
<td>Optional if publishSchedule isn’t specified</td>
<td>55.0</td>
</tr>
<tr>
<td>segmentOnApiName</td>
<td>String</td>
<td>API name of the SegmentOn entity.</td>
<td>Optional</td>
<td>57.0</td>
</tr>
</tbody>
</table>
| segmentType | ConnectApi.SegmentType | Type of segment. Value is:  
- Dbt—Data build tool  
After a segment is created, the segment type can’t be changed. | Required for creating a segment  
Not supported for updating a segment | 55.0 |

**ConnectApi.ChangeInputRepresentation**

A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>changeItems</td>
<td>List&lt;ConnectApi.ChangeItemInputRepresentation&gt;</td>
<td>List of changes to OrderItemSummaries.</td>
<td>Required</td>
<td>48.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**

`previewCancel(orderSummaryId, changelInput)`  
`previewReturn(orderSummaryId, changelInput)`  
`submitCancel(orderSummaryId, changelInput)`  
`submitReturn(orderSummaryId, changelInput)`

**ConnectApi.ChangeItemInputRepresentation**

Change to an OrderItemSummary, such as a return or cancel. You specify whether to prorate the associated shipping charge based on the price change. The OrderItemSummary can’t be a shipping charge.
### Change Item Fee Input Representation

Input representation for Change Item Fee Input

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>amount</td>
<td>Double</td>
<td>Positive value used to calculate the fee amount, as described by the amountType.</td>
<td>Required</td>
<td>57.0</td>
</tr>
<tr>
<td>amountType</td>
<td>String</td>
<td>Describes how the fee is calculated. Valid values are:</td>
<td>Required</td>
<td>57.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• AmountWithTax—Value of amount. is the fee amount, including tax.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• AmountWithoutTax—Value of amount. is the fee amount, not including tax. Tax is calculated on the value and added.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Description

- **Percentage**—Value of amount is a percentage. To determine the fee amount, `amount` is divided by 100, and then multiplied by the TotalPrice and TotalTaxAmount of the associated OrderItemSummary, prorated for the quantity being returned.

- **PercentageGross**—Value of amount is a percentage. To determine the fee amount, `amount` is divided by 100, and then multiplied by the TotalLineAmountWithTax of the associated OrderItemSummary, prorated for the quantity being returned.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the fee.</td>
<td>Optional</td>
<td>57.0</td>
</tr>
<tr>
<td>priceBookEntryId</td>
<td>String</td>
<td>ID of the price book entry associated with the fee product.</td>
<td>Required unless price books are optional in the org</td>
<td>57.0</td>
</tr>
<tr>
<td>product2Id</td>
<td>String</td>
<td>ID of the product representing the fee.</td>
<td>Required</td>
<td>57.0</td>
</tr>
<tr>
<td>reason</td>
<td>String</td>
<td>Reason for the fee. The value must match an entry in the OrderProductSummaryChange object’s Reason picklist.</td>
<td>Required</td>
<td>57.0</td>
</tr>
</tbody>
</table>

ConnectApi.CommentInput

**ConnectApi.CommentInput**

Comment input used to add rich comments, for example, comments that include mentions or file attachments.
<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachment</td>
<td>ConnectApi. FeedItem AttachmentInput</td>
<td>Specifies an attachment for the comment. Valid values are: • ContentAttachmentInput • NewFileAttachmentInput LinkAttachmentInput is not permitted for comments.</td>
<td>Optional</td>
<td>28.0–31.0</td>
</tr>
<tr>
<td>body</td>
<td>ConnectApi. MessageBodyInput</td>
<td>Description of message body. The body can contain up to 10,000 characters and 25 mentions. Because the character limit can change, clients should make a <code>describeSObjects()</code> call on the FeedItem or FeedComment object and look at the length of the <code>Body</code> or <code>CommentBody</code> field to determine the maximum number of allowed characters. To edit this property in a comment, use <code>updateComment(communityId, commentId, comment)</code>. Editing comments is supported in version 34.0 and later. Rich text and inline images are supported in comment bodies in version 35.0 and later. Entity links are supported in version 43.0 and later.</td>
<td>Required</td>
<td>28.0</td>
</tr>
<tr>
<td>capabilities</td>
<td>ConnectApi. CommentCapability Input</td>
<td>Specifies any capabilities for the comment, such as a file attachment.</td>
<td>Optional</td>
<td>32.0</td>
</tr>
<tr>
<td>threadParentId</td>
<td>String</td>
<td>ID of the parent comment for a threaded comment.</td>
<td>Optional</td>
<td>44.0</td>
</tr>
</tbody>
</table>

<td>Optional</td>
<td>54.0–58.0</td>
</tr>
<tr>
<td>street</td>
<td>String</td>
<td>The address street.</td>
<td>Optional</td>
<td>54.0</td>
</tr>
</tbody>
</table>

### ConnectApi.CommerceAddressFieldInput

Commerce address field input. This is used to reference custom fields for the address.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataName</td>
<td>String</td>
<td>The name of the custom address field.</td>
<td>Required</td>
<td>54.0</td>
</tr>
<tr>
<td>text</td>
<td>String</td>
<td>The value of the custom address field.</td>
<td>Optional</td>
<td>54.0</td>
</tr>
</tbody>
</table>
### ConnectApi.ConfirmHeldFOCapacityInputRepresentation

Request to confirm held fulfillment order capacity at one or more locations. Can correspond to one action call.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>confirmHeldFOCapacityRequests</td>
<td>List&lt;ConnectApi.ConfirmHeldFOCapacityRequestInputRepresentation&gt;</td>

<td>55.0</td>
</tr>
</tbody>
</table>

### ConnectApi.ConfirmHeldFOCapacityRequestInputRepresentation

Request to confirm held fulfillment order capacity at one or more locations.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>allOrNothing</td>
<td>Boolean</td>
<td>Controls whether a single failed request cancels all other requests in the list (true) or whether some requests can succeed if others fail (false). The default value is false.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>capacityRequests</td>
<td>List&lt;ConnectApi.CapacityRequestInputRepresentation&gt;</td>
<td>List of requests to confirm held fulfillment order capacity. Each request is for one fulfillment order assigned to one location.</td>
<td>Required</td>
<td>55.0</td>
</tr>
</tbody>
</table>

### ConnectApi.ContentCapabilityInput

Attach or update a file on a comment. Use this class to attach a new file or update a file that has already been uploaded to Salesforce.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

To attach or remove files from a feed post (instead of a comment) in version 36.0 and later, use ConnectApi.FilesCapabilityInput.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>contentDocumentId</td>
<td>String</td>
<td>ID of the existing content.</td>

**SEE ALSO:**

`createOrderPaymentSummary(orderPaymentSummaryInput)`

## ConnectApi.CreateServiceAppointmentInput

Contains information to create a service appointment.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>assignedResources</td>
<td><a href="#">ConnectApi.AssignedResources</a></td>
<td>Represents the service resources to be assigned to a service appointment.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
</tbody>
</table>

**Note:** When creating an appointment, use `extendedFields` to add values to any of the fields, including custom fields, in `assignedResources` as long as you have edit access to those fields.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>lead</td>
<td><a href="#">ConnectApi.LeadInput</a></td>
<td>Represents a prospect or lead.</td>
<td>Required if <code>serviceAppointment</code> isn't provided.</td>
<td>53.0</td>
</tr>
</tbody>
</table>

**Note:** Required to create a service appointment for unauthenticated guest users.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedulingPolicyId</td>
<td>String</td>
<td>The ID of the <code>AppointmentSchedulingPolicy</code> object. If no scheduling policy is passed in the request body, the default configurations are used. The only scheduling policy configuration that is used in determining time slots is the enforcement of account visiting hours.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
</tbody>
</table>
### ServiceAppointment

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>serviceAppointment</td>
<td>ConnectApi.ServiceAppointmentInput</td>
<td>Represents the service appointment details to book an appointment.</td>
<td>Required if lead isn’t provided.</td>
<td>53.0</td>
</tr>
</tbody>
</table>

**Note:** When creating an appointment, use `extendedFields` to add values to any of the fields, including custom fields, in `assignedResources` as long as you have edit access to those fields.

### ConnectApi.CredentialInput

Credential input.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>authenticationProtocol</td>
<td>ConnectApi.Credential.AuthenticationProtocol</td>
<td>Authentication protocol of the external credential. Values are:</td>
<td>Required</td>
<td>56.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• AwsSv4</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>

<td></td>
<td>• AwsSv4_STS—AWS Signature Version 4 with Security Token Service.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ClientCredentials.ClientSecret—OAuth 2.0 Client Credentials client secret.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ClientCredentialsJwtAssertion—OAuth 2.0 Client Credentials JSON Web Token assertion.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• JwtBearer—OAuth 2.0 JSON Web Token bearer flow.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• NoAuthentication—No authentication.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• RolesAnywhere—AWS Signature Version 4 with Identity and Access Management (IAM) Roles Anywhere.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Application Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>credentials</td>
<td>Map&lt;String, ConnectApi.Credential CredentialValueInput&gt;</td>
<td>Map of protocol-specific credentials. Authentication protocols have credential allowlists and encryption rules.</td>
<td>Required</td>
<td>56.0</td>
</tr>
<tr>
<td>• AwsSv4</td>
<td></td>
<td>awsAccessKeyId (not encrypted), awsSecretAccessKey (encrypted), awsRoleArn (not encrypted)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Custom</td>
<td></td>
<td>Any credential name is valid (user sets encryption rules)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>externalCredential</td>
<td>String</td>
<td>Fully qualified developer name of the external credential.</td>
<td>Required</td>
<td>56.0</td>
</tr>
<tr>
<td>principalName</td>
<td>String</td>
<td>Name of the external credential named principal.</td>
<td>Required if principalType is NamedPrincipal</td>
<td>56.0</td>
</tr>
<tr>
<td>principalType</td>
<td>ConnectApi.CredentialPrincipalType</td>
<td>Type of credential principal. Values are:</td>
<td>Required</td>
<td>56.0</td>
</tr>
<tr>
<td>• AwsStsPrincipal</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• NamedPrincipal</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• PerUserPrincipal</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### ConnectApi.CredentialCustomHeaderInput

Credential custom header input.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>headerName</td>
<td>String</td>
<td>Header name.</td>
<td>Required</td>
<td>58.0</td>
</tr>
<tr>
<td>headerValue</td>
<td>String</td>
<td>Header value.</td>
<td>Required</td>
<td>58.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>Header ID.</td>
<td>Optional</td>
<td>58.0</td>
</tr>
</tbody>
</table>
### ConnectApi.CredentialValueInput

Credential value input.

Authentication protocols have credential allowlists and encryption rules.

- **AwsSv4**—**awsAccessKeyId** (not encrypted), **awsSecretAccessKey** (encrypted), **awsRoleArn** (not encrypted)
- **Custom**—Any credential name is valid (user sets encryption rules)

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>encrypted</td>
<td>Boolean</td>
<td>Specifies whether the value of the credential is encrypted (<code>true</code>) or not (<code>false</code>).</td>
<td>Required</td>
<td>56.0</td>
</tr>
<tr>
<td>revision</td>
<td>Integer</td>
<td>Revision number of a short-lived credential, such as OAuthToken. If the provided revision isn’t the latest version, the authentication endpoint refreshes the credential.</td>
<td>Optional</td>
<td>58.0</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>Value of the credential.</td>
<td>Required</td>
<td>56.0</td>
</tr>
</tbody>
</table>

### ConnectApi.CustomListAudienceCriteriaInput

Criteria for the custom list type of custom recommendation audience.

Subclass of **ConnectApi.AudienceCriteriaInput**.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
</table>
| member OperationType | **ConnectApi.RecommendationAudienceMemberOperationType** | The operation to carry out on the audience members. Values are:  
- Add—Adds specified members to the audience.  
- Remove—Removes specified members from the audience. | Required to update a recommendation audience  
Don’t use or specify `null` to create a recommendation audience | 36.0              |
### ConnectApi.DirectMessageCapabilityInput

Create or update the members of a direct message.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>membersToAdd</td>
<td>List&lt;String&gt;</td>
<td>List of user IDs for members to include in the direct message.</td>
<td>Required when creating a direct message (POST)</td>
<td>39.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Optional when updating a direct message (PATCH)</td>
<td></td>
</tr>
<tr>
<td>membersToRemove</td>
<td>List&lt;String&gt;</td>
<td>List of user IDs for members to remove from the direct message.</td>
<td>Optional when updating a direct message (PATCH)</td>
<td>40.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Not supported when creating a direct message (POST)</td>
<td></td>
</tr>
<tr>
<td>subject</td>
<td>String</td>
<td>Subject of the direct message.</td>
<td>Optional when creating a direct message (POST)</td>
<td>39.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Not supported when updating a direct message (PATCH)</td>
<td></td>
</tr>
</tbody>
</table>

SEE ALSO:
- ConnectApi.FeedElementCapabilitiesInput
- ConnectApi.DistinctValueRefinementInput

### ConnectApi.DistinctValueRefinementInput

Attribute-based refinement with distinct values for product search.
This class is a subclass of ConnectApi.RefinementInput.
### ConnectApi.EnsureFundsAsyncInputRepresentation

ID of an Invoice to ensure funds for and apply them to.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>invoiceId</td>
<td>String</td>
<td>ID of the Invoice.</td>
<td>Required</td>
<td>48.0</td>
</tr>
</tbody>
</table>

SEE ALSO:

`ensureFundsAsync(orderSummaryId, ensureFundsInput)`

### ConnectApi.EnsureRefundsAsyncInputRepresentation

ID of a credit memo to ensure refunds for, an amount of excess funds to refund, or both. At least one is required. Also includes any invoices for fees that reduce the refund amount, such as return fees. If multiple payment methods are available, you can specify how to distribute the refund.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>creditMemoId</td>
<td>String</td>
<td>ID of the credit memo that represents a refund amount.</td>
<td>Either</td>
<td>48.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>creditMemoId or excessFunds Amount is required</td>
<td></td>
<td></td>
</tr>
<tr>
<td>excessFunds</td>
<td>Double</td>
<td>Amount of excess funds to refund.</td>
<td>Either</td>
<td>49.0</td>
</tr>
<tr>
<td>Amount</td>
<td></td>
<td>excessFunds Amount or creditMemoId is required</td>
<td></td>
<td></td>
</tr>
<tr>
<td>invoicesToPay</td>
<td>List&lt;String&gt;</td>
<td>List of invoices for any fees that reduce the refund, such as return fees.</td>
<td>Optional</td>
<td>56.0</td>
</tr>
<tr>
<td>isAllowPartial</td>
<td>Boolean</td>
<td>This value controls the behavior when the amounts included in the sequences list don't cover the entire refund amount. If this value is false, then the default refund logic is applied to ensure the remaining refund amount. If this value is true, then the unpinned balance remains on the credit memo. If you don't specify a sequences</td>
<td>Optional</td>
<td>56.0</td>
</tr>
</tbody>
</table>
Available Version | Required or Optional | Description
--- | --- | ---
56.0 | Optional | Ordered list of refund amounts and OrderPaymentSummaries to apply them to. The process traverses this list in order and stops when it’s refunded the full amount.

**sequences**

- Type: List<ConnectApi.Sequence.OrderPaymentSummary.InputRepresentation>
- Description: List, this value is ignored and the default refund logic is applied. The default value is false.

SEE ALSO:

`ensureRefundsAsync(orderSummaryId, ensureRefundsInput)`

**ConnectApi.EntityLinkSegmentInput**

An entity link segment.

Subclass of ConnectApi.MessageSegmentInput.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>entityId</td>
<td>String</td>
<td>ID of the entity to link to. Only users with access to the entity see it. It’s hidden for users without access.</td>
<td>Required</td>
<td>43.0</td>
</tr>
</tbody>
</table>

**ConnectApi.ExtendedFieldInput**

Contains information about the extended field.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the field, including custom field.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The value of the field.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
</tbody>
</table>

**ConnectApi.ExtensionInput**

An extension.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>alternative</td>
<td>ConnectApi.AlternativeInput</td>
<td>Alternative representation of the extension.</td>
<td>Required</td>
<td>40.0</td>
</tr>
</tbody>
</table>
### ConnectApi.ExtensionsCapabilityInput

Create or update extensions associated with a feed element.

This class is a subclass of `ConnectApi.FeedElementCapabilityInput`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>extensionId</code></td>
<td><code>String</code></td>
<td>ID of the extension.</td>
<td>Required</td>
<td>40.0</td>
</tr>
<tr>
<td><code>payload</code></td>
<td><code>String</code></td>
<td>Payload associated with the extension.</td>
<td>Required</td>
<td>40.0</td>
</tr>
<tr>
<td><code>payloadVersion</code></td>
<td><code>String</code></td>
<td>Payload version that identifies the structure of the payload associated with the extension.</td>
<td>Optional</td>
<td>40.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- `ConnectApi.ExtensionsCapabilityInput`

### ConnectApi.ExternalCredentialInput

Input used to create or update an external credential.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.
<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>

ConnectApi.FeedElementInput

ConnectApi.FeedElementCapabilityInput
A feed element capability.

In API version 30.0 and earlier, most feed items can have comments, likes, topics, and so on. In version 31.0 and later, every feed item (and feed element) can have a unique set of capabilities. If a capability property exists on a feed element, that capability is available, even if the capability property doesn’t have a value. For example, if the ChatterLikes capability property exists on a feed element (with or without a value), the context user can like that feed element. If the capability property doesn’t exist, it isn’t possible to like that feed element. A capability can also contain associated data. For example, the Moderation capability contains data about moderation flags.
This class is abstract and has no public constructor. You can make an instance only of a subclass.

This class is a superclass of:

- ConnectApi.AssociatedActionsCapabilityInput
- ConnectApi.BookmarksCapabilityInput
- ConnectApi.CanvasCapabilityInput
- ConnectApi.ContentCapabilityInput
- ConnectApi.DirectMessageCapabilityInput
- ConnectApi.ExtensionsCapabilityInput
- ConnectApi.FeedEntityShareCapabilityInput
- ConnectApi.FilesCapabilityInput
- ConnectApi.LinkCapabilityInput
- ConnectApi.MuteCapabilityInput
- ConnectApi.PollCapabilityInput
- ConnectApi.QuestionAndAnswersCapabilityInput
- ConnectApi.ReadByCapabilityInput
- ConnectApi.RecordCapabilityInput
- ConnectApi.StatusCapabilityInput
- ConnectApi.TopicsCapabilityInput

ConnectApi.FeedElementInput

Feed elements are the top-level items that a feed contains. Feeds are feed element containers.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass of ConnectApi.FeedItemInput.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>capabilities</td>
<td>ConnectApi.FeedElementCapabilitiesInput</td>
<td>The capabilities that define auxiliary information on this feed element.</td>
<td>Optional</td>
<td>31.0</td>
</tr>
</tbody>
</table>
| feedElementType   | ConnectApi.FeedElementType                | The type of feed element this input represents.                             | Required when creating a feed element
                                                                Optional when updating a feed element | 31.0              |
### ConnectApi.FeedEntityShareCapabilityInput

Share a feed entity with a feed post or comment.

This class is a subclass of `ConnectApi.FeedElementCapabilityInput`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>feedEntityId</td>
<td>String</td>
<td>ID of the feed entity to share with the feed post or comment.</td>
<td>Required</td>
<td>39.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**

- `ConnectApi.FeedElementCapabilitiesInput`

### ConnectApi.FeedItemInput

Used to create rich feed items, for example, feed items that include @mentions or files.

Subclass of `ConnectApi.FeedElementInput` as of version 31.0.
<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachment</td>
<td>ConnectApi.FeedItemAttachmentInput</td>
<td>Specifies the attachment for the feed item. The feed item type is inferred based on the provided attachment. Important: As of API version 32.0, use the inherited capabilities property.</td>
<td>Optional</td>
<td>28.0–31.0</td>
</tr>
<tr>
<td>body</td>
<td>ConnectApi.MessageBodyInput</td>
<td>Message body. The body can contain up to 10,000 characters and 25 mentions. Because the character limit can change, clients should make a describeSObjects() call on the FeedItem or FeedComment object and look at the length of the Body or CommentBody field to determine the maximum number of allowed characters. If you specify originalFeedElementId to share a feed item, use the body property to add the first comment to the feed item. To edit this property in a feed item, use updateFeedElement(communityId, feedElementId, feedElement). Editing feed posts is supported in version 34.0 and later.</td>
<td>Required unless the feed item has a link capability or a content capability.</td>
<td>28.0</td>
</tr>
<tr>
<td>isBookmarkedByCurrentUser</td>
<td>Boolean</td>
<td>Specifies if the new feed item should be bookmarked for the user (true) or not (false). Important: As of API version 32.0, use the capabilities.bookmarks.isBookmarkedByCurrentUser property.</td>
<td>Optional</td>
<td>28.0–31.0</td>
</tr>
<tr>
<td>originalFeedElementId</td>
<td>String</td>
<td>To share a feed element, specify its 18-character ID. Important: As of API version 39.0, use the capabilities.feedEntityShare.feedEntityId property.</td>
<td>Optional</td>
<td>31.0–38.0</td>
</tr>
<tr>
<td>originalFeedItemId</td>
<td>String</td>
<td>To share a feed item, specify its 18-character ID. Important: In API version 32.0–38.0, use the originalFeedElementId property. In API version 39.0 and later, use the capabilities.feedEntityShare.feedEntityId property.</td>
<td>Optional</td>
<td>28.0–31.0</td>
</tr>
<tr>
<td>visibility</td>
<td>ConnectApi.FeedItemVisibilityTypeEnum</td>
<td>Type of users who can see a feed item. • AllUsers—Visibility is not limited to internal users. • InternalUsers—Visibility is limited to internal users.</td>
<td>Optional</td>
<td>28.0</td>
</tr>
</tbody>
</table>
Default values:

- For external users, the default value is AllUsers. External users must use this value to see their posts.
- For internal users, the default value is InternalUsers. Internal users can accept this value or use the value AllUsers to allow external users to see their posts.

If the parent of the feed item is a user, group, or direct message, the visibility of the feed item must be AllUsers.

---

**ConnectApi.FileInput**

Attach a file that has already been uploaded or remove a file from a feed element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
<td>ID of a file that has already been uploaded.</td>
<td>Required</td>
<td>36.0</td>
</tr>
<tr>
<td>operationType</td>
<td>ConnectApi.OperationType</td>
<td>Operation to carry out on the file. Values are: Add—Adds the file to the feed element. Remove—Removes the file from the feed element. Remove operations are processed before Add operations. Adding content that is already added and removing content that is already removed result in no operation.</td>
<td>Optional</td>
<td>36.0</td>
</tr>
</tbody>
</table>

ConnectApi.FilesCapabilityInput

---

**ConnectApi.FindRoutesWithFewestSplitsInputRepresentation**

Data used to calculate order fulfillment routes involving the fewest number of shipment splits.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>locationAvailableInventory</td>
<td>List&lt;ConnectApi.LocationAvailabilityInputRepresentation&gt;</td>
<td>Each list element represents the available quantity of a product at an inventory location.</td>
<td>At least one element is required</td>
<td>51.0</td>
</tr>
</tbody>
</table>
### maximumNumberOfSplits

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>maximumNumberOfSplits</td>
<td>Integer</td>
<td>The maximum allowable number of shipment splits. Routing options that involve more than this number of splits are not returned.</td>
<td>Optional</td>
<td>51.0</td>
</tr>
</tbody>
</table>

*Note:* Each split represents an additional shipment. Specifying a maximum of 0 returns only locations that can fulfill the entire order in a single shipment. A maximum of 1 returns combinations of locations that can fulfill the order in one or two shipments, and so on.

### orderedQuantities

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>orderedQuantities</td>
<td>List&lt;ConnectApi.QuantityWithSkuInputRepresentation&gt;</td>
<td>Each list element represents a quantity of a product to be routed for fulfillment.</td>
<td>At least one element is required</td>
<td>51.0</td>
</tr>
</tbody>
</table>

*findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)*

### ConnectApi.FindRoutesWithFewestSplitsGroupUsingOCInputRepresentation

Data used to calculate inventory availability and fulfillment routes for one order involving the fewest number of shipment splits.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>excludeLocations</td>
<td>List&lt;String&gt;</td>
<td>List of locations to exclude from the routing calculations.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>maximumNumberOfSplits</td>
<td>Integer</td>
<td>Maximum allowable number of shipment splits. Routing options that involve more than this number of splits are not returned.</td>
<td>Optional</td>
<td>54.0</td>
</tr>
</tbody>
</table>

*Note:* Each split represents an additional shipment. Specifying a maximum of 0 returns only locations that can fulfill the entire order in a single shipment. A maximum of 1 returns combinations of locations that can fulfill the order in one or two shipments, and so on.
### orderedItems

- **Type**: List<ConnectApi.FindRoutesWithFewestSplitsUsingOCIItemInputRepresentation>
- **Description**: Each list element represents a quantity of a product to be routed for fulfillment and the assigned location group or location.
- **Required or Optional**: At least one element is required

**Available Version**: 54.0

**SEE ALSO**: findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

### ConnectApi.FindRoutesWithFewestSplitsUsingOCIInputRepresentation

Data used to calculate order fulfillment routes involving the fewest number of shipment splits, taking into account inventory availability.

- **Property**: findRoutesWithFewestSplitsUsingOCIInputs
- **Type**: List<ConnectApi.FindRoutesWithFewestSplitsGroupUsingOCIInputRepresentation>
- **Description**: Each list element represents a routing request for one order.
- **Required or Optional**: At least one element is required

**Available Version**: 54.0

**SEE ALSO**: findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

### ConnectApi.FindRoutesWithFewestSplitsUsingOCIItemInputRepresentation

A quantity of a product and a location group or location assigned to fulfill it.

- **Property**: locationGroupIdentifier
  - **Type**: String
  - **Description**: The External Reference of the location group or location assigned to the order item. If you specify a location group, inventory is considered for all locations belonging to that group.
  - **Required or Optional**: Required

- **Property**: quantity
  - **Type**: Double
  - **Description**: Quantity of the product.
  - **Required or Optional**: Required

**Available Version**: 54.0
### stockKeepingUnit

**Type:** String  
SKU of the product.  
**Required or Optional:** Required  
**Available Version:** 54.0

ConnectApi.FulfillmentGroupInputRepresentation
A list of OrderItemSummaries to be fulfilled together, and the fulfillment location to handle them. The fulfillment type is one of the values defined for the Type field on the FulfillmentOrder object, such as "Warehouse" or "Retail Store." The specified type is assigned to the FulfillmentOrder for this fulfillment group.
## ConnectApi.FulfillmentOrderInputRepresentation

An OrderDeliveryGroupSummary that defines a delivery method and recipient, and a list of fulfillment groups to assign to FulfillmentOrders. Each fulfillment group is a set of OrderItemSummaries that match the OrderDeliveryGroupSummary and share the same fulfillment location. The method creates a FulfillmentOrder for each fulfillment group and a FulfillmentOrderLineItem for each OrderItemSummary.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>fulfilledFromLocationId</td>
<td>String</td>
<td>ID of the fulfillment location.</td>
<td>Required</td>
<td>48.0</td>

## ConnectApi.FulfillmentOrderInvoiceInputRepresentation

Instantiate and include this object with no properties when creating an invoice.
This input class has no properties.

SEE ALSO:
createInvoice(fulfillmentOrderId, invoiceInput)

**ConnectApi.FulfillmentOrderLineItemInputRepresentation**

A FulfillmentOrderLineItem and quantity to cancel. You can cancel less than the full quantity, in which case you reallocate the canceled quantity to a different FulfillmentOrder.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>fulfillmentOrderLineItemId</td>
<td>String</td>
<td>ID of the FulfillmentOrderLineItem.</td>
<td>Required</td>
<td>48.0</td>
</tr>
<tr>
<td>quantity</td>
<td>Double</td>
<td>Quantity to cancel.</td>
<td>Required</td>
<td>48.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
ConnectApi.FulfillmentOrderLineItemsToCancelInputRepresentation
cancelFulfillmentOrderLineItems(fulfillmentOrderId, cancelFulfillmentOrderLineItemsInput)

**ConnectApi.FulfillmentOrderLineItemsToCancelInputRepresentation**

A list of FulfillmentOrderLineItems and quantities to cancel.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>fulfillmentOrderLineItemsToCancel</td>
<td>List&lt;ConnectApi.FulfillmentOrderLineItemInput&gt;</td>
<td>List of FulfillmentOrderLineItems and quantities.</td>
<td>Required</td>
<td>48.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
cancelFulfillmentOrderLineItems(fulfillmentOrderId, cancelFulfillmentOrderLineItemsInput)

**ConnectApi.BaseRequest**

Base parameters for making a request to the payment gateway.

This class is abstract.

Subclass of ConnectApi.AuditParamsRequest.

Superclass of:
- ConnectApi.AuthorizationRequest
- ConnectApi.AuthorizationReversalRequest
- `ConnectApi.CaptureRequest`
- `ConnectApi.PaymentMethodTokenizationRequest`
- `ConnectApi.PostAuthRequest`
- `ConnectApi.RefundRequest`
- `ConnectApi.SaleRequest`

### `ConnectApi.GetFOCapacityValuesRequestInputRepresentation`

Locations to get fulfillment order capacity information for.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>locationIds</td>
<td><code>List&lt;String&gt;</code></td>
<td>List of IDs of the locations to get fulfillment order capacity information for.</td>
<td>Required</td>
<td>55.0</td>
</tr>
</tbody>
</table>

### `ConnectApi.GroupInformationInput`

Chatter group information input.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td><code>String</code></td>
<td>The text in the “Information” section of a group.</td>
<td>28.0</td>
</tr>
<tr>
<td>title</td>
<td><code>String</code></td>
<td>The title of the “Information” section of a group.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- `ConnectApi.ChatterGroupInput`

### `ConnectApi.HashtagSegmentInput`

Include a hashtag in a feed item or comment.

Subclass of `ConnectApi.MessageSegmentInput`. 
### ConnectApi.HoldFOCapacityInputRepresentation

Request to hold fulfillment order capacity at one or more locations. Can correspond to one action call.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>holdFOCapacity Requests</td>
<td>List&lt;ConnectApi.HoldFOCapacityRequestInputRepresentation&gt;</td>
<td>List of requests to hold fulfillment order capacity at one or more locations.</td>
<td>Required</td>
<td>55.0</td>
</tr>
</tbody>
</table>

### ConnectApi.HoldFOCapacityRequestInputRepresentation

Request to hold fulfillment order capacity at one or more locations.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>allOrNothing</td>
<td>Boolean</td>
<td>Controls whether a single failed request cancels all other requests in the list (true) or whether some requests can succeed if others fail (false). The default value is false.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>capacityRequests</td>
<td>List&lt;ConnectApi.CapacityRequestInputRepresentation&gt;</td>
<td>List of requests to hold fulfillment order capacity. Each request is for one fulfillment order at one location.</td>
<td>Required</td>
<td>55.0</td>
</tr>
</tbody>
</table>

### ConnectApi.InlineImageSegmentInput

An inline image segment.
Subclass of ConnectApi.MessageSegmentInput.
### Available Version

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>altText</td>
<td>String</td>
<td>Alt text for the inline image.</td>
<td>Optional</td>
<td>35.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If not specified, the title of the inline image file is used as the alt text.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>fileId</td>
<td>String</td>
<td>ID of the inline image file.</td>
<td>Required</td>
<td>35.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- [Post a Rich-Text Feed Element with Inline Image](#)
- [ConnectApi.MessageBodyInput](#)

### ConnectApi.InnerEnsureFundsAsyncInputRepresentation

ID of an Invoice and ID of the associated OrderSummary.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>invoiceId</td>
<td>String</td>
<td>ID of the Invoice to ensure funds for.</td>
<td>Required</td>
<td>56.0</td>
</tr>
<tr>
<td>orderSummaryId</td>
<td>String</td>
<td>ID of the OrderSummary associated with the Invoice.</td>
<td>Required</td>
<td>56.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- [multipleEnsureFundsAsync(multipleEnsureFundsInput)](#)
- [ConnectApi.MultipleEnsureFundsAsyncInputRepresentation](#)

### ConnectApi.InviteInput

An invitation.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>invitees</td>
<td>List&lt;String&gt;</td>
<td>List of email addresses to send the invitation to.</td>
<td>Required</td>
<td>39.0</td>
</tr>
<tr>
<td>message</td>
<td>String</td>
<td>Message to include in the invitation.</td>
<td>Optional</td>
<td>39.0</td>
</tr>
</tbody>
</table>

### ConnectApi.InvoiceToPayInputRepresentation

Invoice for a fee.
### InvoiceId

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>invoiceId</td>
<td>String</td>
<td>ID of the invoice for a fee.</td>
<td>Required</td>
<td>56.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- `ensureRefundsAsync(orderSummaryId, ensureRefundsInput)`

### ConnectApi.LeadInput

Contains information about a lead or guest user.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>company</td>
<td>String</td>
<td>The company of the lead.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>email</td>
<td>String</td>
<td>The email address of the lead.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>extendedFields</td>
<td>List&lt;ConnectApi.ExtendedFieldInput&gt;</td>
<td>Use to add values to any of the fields, including custom fields.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>firstName</td>
<td>String</td>
<td>The first name of the lead.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>lastName</td>
<td>String</td>
<td>The last name of the lead.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>phone</td>
<td>String</td>
<td>The phone number of the lead.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
</tbody>
</table>

### ConnectApi.LinkCapabilityInput

Create or update a link on a feed element.

This class is a subclass of `ConnectApi.FeedElementCapabilityInput`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>String</td>
<td>Link URL. The URL can be to an external site.</td>
<td>Required</td>
<td>32.0</td>
</tr>
<tr>
<td>urlName</td>
<td>String</td>
<td>Description of the link.</td>
<td>Optional</td>
<td>32.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- `ConnectApi.FeedElementCapabilitiesInput`

### ConnectApi.LinkSegmentInput

Include a link segment in a feed item or comment.

Subclass of `ConnectApi.MessageSegmentInput`.
SEE ALSO:
ConnectApi.MessageBodyInput

ConnectApi.LocationInputRepresentation
Inventory location data used to calculate shipping distance.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>countryCode</td>
<td>String</td>
<td>The country code of the location.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>locationIdentifier</td>
<td>String</td>
<td>The identifier of the location.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>postalCode</td>
<td>String</td>
<td>The postal code of the location.</td>
<td>Required</td>
<td>51.0</td>
</tr>
</tbody>
</table>

ConnectApi.LocationAvailabilityInputRepresentation
The available quantity of a product at an inventory location.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>externalReferenceId</td>
<td>String</td>
<td>The external reference ID of the inventory location.</td>
<td>Optional</td>
<td>51.0</td>
</tr>
<tr>
<td>quantity</td>
<td>Double</td>
<td>The available quantity of the product.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>stockKeepingUnit</td>
<td>String</td>
<td>The Stock Keeping Unit of the product.</td>
<td>Required</td>
<td>51.0</td>
</tr>
</tbody>
</table>

ConnectApi.ManagedTopicPositionCollectionInput
A collection of relative positions of managed topics.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>managedTopicPositions</td>
<td>List&lt;ConnectApi.ManagedTopicPositionInput&gt;</td>
<td>List of relative positions of managed topics. This list can include Featured and Navigational managed topics and doesn’t need to include all managed topics. For more information about reordering managed topics, see the example in reorderManagedTopics(communityId, managedTopicPositionCollection).</td>
<td>Required</td>
<td>32.0</td>
</tr>
</tbody>
</table>
ConnectApi.ManagedTopicPositionInput

Relative position of a managed topic.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>managedTopicId</td>
<td>String</td>
<td>ID of existing managed topic.</td>
<td>Required</td>
<td>32.0</td>
</tr>
<tr>
<td>position</td>
<td>Integer</td>
<td>Relative position of the managed topic, indicated by zero-indexed, ascending whole numbers.</td>
<td>Required</td>
<td>32.0</td>
</tr>
</tbody>
</table>

<tr>
<td></td>
<td></td>
<td>• OrderedList—Ordered list tag.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Paragraph—Paragraph tag.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Strikethrough—Strikethrough tag.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Underline—Underline tag.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• UnorderedList—Unordered list tag.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Markup segments with a markupType of Code can include only text segments.
**ConnectApiMarkupEndSegmentInput**

The end tag for rich text markup.

Subclass of ConnectApiMessageSegmentInput

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>markupType</td>

- ConnectApi.MessageBodyInput

**ConnectApiMentionSegmentInput**

Include an @mention of a user or group in a feed post or comment. When creating a feed post or comment, you can include up to 25 mentions.

Subclass of ConnectApi.MessageSegmentInput.
### Property Description

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the user or group to mention. To mention a user, use either id or username. You can’t include both. To mention a group, you must use id.</td>
<td>28.0</td>
</tr>
<tr>
<td>username</td>
<td>String</td>
<td>User name of the user to mention. To mention a user, use either id or username. You can’t include both.</td>
<td>38.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**

- ConnectApi.AnnouncementInput

### ConnectApi.MessageSegmentInput

Used to add rich message segments to feed items and comments.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass for:
- ConnectApi.EntityLinkSegmentInput
- ConnectApi.HashtagSegmentInput
- ConnectApi.InlineImageSegmentInput
- ConnectApi.LinkSegmentInput
- ConnectApi.MarkupBeginSegmentInput
- ConnectApi.MarkupEndSegmentInput
- ConnectApi.MentionSegmentInput
- ConnectApi.TextSegmentInput
Use the [ConnectApiHelper repository on GitHub](https://github.com/ConnectApiHelper) to simplify many of the tasks accomplished with `ConnectApi.MessageSegmentInput`, such as posting with inline images, rich text, and mentions.

<tr>
<td>calloutUrl</td>
<td>String</td>
<td>URL of the named credential in a callout.</td>
<td>Required</td>
<td>58.0</td>
</tr>
</tbody>
</table>
### customHeaders

**List<ConnectApi.CredentialCustomHeaderInput>**

- **Description**: Custom HTTP headers.
- **Required or Optional**: Optional
- **Available Version**: 58.0

### developerName

**String**

- **Description**: Named credential developer name.
- **Required or Optional**: Required for creating a named credential. Optional for updating a named credential
- **Available Version**: 58.0

### externalCredentials

**List<ConnectApi.ExternalCredentialInput>**

- **Description**: External credentials used by the named credential. In version 58.0 and later only one external credential is supported.
- **Required or Optional**: Required
- **Available Version**: 58.0

### masterLabel

**String**

- **Description**: Named credential label.
- **Required or Optional**: Required
- **Available Version**: 58.0

### networkConnection

**ConnectApi.NetworkConnectionInput**

- **Description**: PrivateConnect outbound network connection.
- **Required or Optional**: Optional depending on type
- **Available Version**: 58.0

### parameters

**List<ConnectApi.NamedCredentialParameterInput>**

- **Description**: Named credential parameters.
- **Required or Optional**: Optional
- **Available Version**: 58.0

### type

**ConnectApi.NamedCredentialType**

- **Description**: Type of named credential. Values are:
  - PrivateEndpoint
  - SecuredEndpoint
- **Required or Optional**: Required
- **Available Version**: 58.0

---

**ConnectApi.NamedCredentialCalloutOptionsInput**

Named credential callout options input.

<table>

</tr>
<tr>
<td>------------------------</td>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
<td>----------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>maxResults</td>
<td>Integer</td>
<td>Maximum number of results. Valid values are from 1 to 25. The default is 3.</td>
<td>Optional</td>
<td>45.0</td>
</tr>
<tr>
<td>strategyContext</td>
<td>Map&lt;String, String&gt;</td>
<td>Variable and value mappings for the strategy.</td>
<td>Optional</td>
<td>45.0</td>
</tr>
<tr>
<td>debugTrace</td>
<td>Boolean</td>
<td>Specifies whether to return trace and debug information in the response (true) or not (false). If unspecified, the default is false.</td>
<td>Optional</td>
<td>45.0</td>
</tr>
</tbody>
</table>

**ConnectApi.NewUserAudienceCriteriaInput**

Criteria for the new members type of custom recommendation audience.

Subclass of `ConnectApi.AudienceCriteriaInput`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Double</td>
<td>The maximum number of days since a user became a site member. For example, if you specify 30, anyone who became a site member in the last 30 days is included in the new members audience.</td>
<td>Required</td>
<td>36.0</td>
</tr>
</tbody>
</table>

**ConnectApi.OAuthCredentialAuthUrlInput**

OAuth authentication flow.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>external Credential</td>
<td>String</td>
<td>Fully qualified developer name of the external credential.</td>
<td>Required</td>
<td>56.0</td>
</tr>
<tr>
<td>principalName</td>
<td>String</td>
<td>Name of the external credential named principal.</td>
<td>Required if principalType is NamedPrincipal</td>
<td>56.0</td>
</tr>
</tbody>
</table>
| principalType          | ConnectApi.CredentialPrincipalType | Type of credential principal. Values are:  
  * AwsStsPrincipal  
  * NamedPrincipal  
  * PerUserPrincipal | Required | 56.0 |
### returnUrl
**Type:** String  
**Description:** Return URL to apply to the authentication URL.  
**Required or Optional:** Optional  
**Available Version:** 56.0

### ConnectApi.OCICreateReservationInputRepresentation
Data to reserve inventory at one or more Omnichannel Inventory locations or location groups.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>actionRequestId</td>
<td>String</td>
<td>A UUID that identifies the request. Use the action request IDs in response data to identify which requests succeeded or failed.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>allowPartial</td>
<td>Boolean</td>
<td>When true, if the system can’t create the entire reservation, then it attempts to create a partial reservation.</td>

</tr>
</tbody>
</table>

### ConnectApi.OCIReservationSingleInputRepresentation

An inventory reservation to fulfill.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>actionRequestId</td>
<td>String</td>
<td>A UUID that identifies the request. Use the action request IDs in response data to identify which requests succeeded or failed.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>externalRefId</td>
<td>String</td>
<td>The external reference ID of the location that’s fulfilling the reservation.</td>
<td>Optional</td>
<td>51.0</td>
</tr>
<tr>
<td>locationIdentifier</td>
<td>String</td>
<td>The identifier of the location that’s fulfilling the reservation.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>quantity</td>
<td>Double</td>
<td>The quantity being fulfilled.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>stockKeepingUnit</td>
<td>String</td>
<td>The SKU of the product being fulfilled.</td>
<td>Required</td>
<td>51.0</td>
</tr>
</tbody>
</table>

### ConnectApi.OCIGetInventoryAvailabilityInputRepresentation

Details of a request to retrieve inventory availability.
<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>locationGroupId</code></td>
<td><code>String</code></td>
<td>The External Reference of a location group to retrieve inventory availability data for. Specifying this value retrieves inventory data for all locations belonging to this group.</td>
<td>Optional; can't combine with <code>locationGroupIdentifiers</code> or <code>locationIdentifiers</code></td>
<td>51.0</td>
</tr>
<tr>
<td><code>locationGroupIdentifiers</code></td>
<td><code>List&lt;String&gt;</code></td>

</tbody>
</table>

### ConnectApi.OrderItemSummaryInputRepresentation

An OrderItemSummary and quantity.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>orderItemSummaryId</td>
<td>String</td>
<td>ID of the OrderItemSummary.</td>
<td>Required</td>
<td>48.0</td>
</tr>
</tbody>
</table>
### ConnectApi.FulfillmentGroupInputRepresentation

**Available Version**

**Required or Optional**

**Available Version**

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>quantity</td>
<td>Double</td>
<td>Quantity to include.</td>
<td>Required</td>
<td>48.0</td>
</tr>
</tbody>
</table>

### ConnectApi.OrderItemSummaryAdjustmentCollectionInput

Collection of order item summaries.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>orderItemSummaries</td>
<td>List&lt;ConnectApi.OrderItemSummaryAdjustmentInput&gt;</td>
<td>List of order item summaries.</td>
<td>Required</td>
<td>53.0</td>
</tr>
</tbody>
</table>

### ConnectApi.OrderSummaryInputRepresentation

An order from which to create an OrderSummary. Optionally, you can specify OrderSummary-specific information such as its Status and whether it is managed in Salesforce Order Management.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>businessModel</td>
<td>String</td>
<td>The order’s business model. It can have one of these values:</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• B2B</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• B2C</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Available Version Required or Optional Description Type Property

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>externalReference Identifier</td>
<td>String</td>
<td>Used internally to prevent duplicate records. This value is case-sensitive.</td>
<td>Optional</td>
<td>56.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Specifies an OrderNumber to assign to the order summary.</td>
<td>Optional</td>
<td>50.0</td>
</tr>
<tr>
<td>orderId</td>
<td>String</td>
<td>ID of the original order.</td>
<td>Required</td>
<td>48.0</td>
</tr>
</tbody>
</table>
| orderLifeCycleType              | String | Specifies whether the order is managed in Salesforce Order Management or by an external system. It can have one of these values:  
  - MANAGED—Managed in Salesforce Order Management.  
  - UNMANAGED—Managed by an external system.  
  If no value is specified, the default is MANAGED. | Optional              | 49.0              |
| sourceProcess                   | String | Describes the order process creating the OrderSummary. It can have one of these values:  
  - OrderOnBehalf—An Order on Behalf Of process.  
  - Standard—Any process other than Order on Behalf Of.  
  If no value is specified, the default is Standard. | Optional              | 57.0              |
| status                          | String | Specifies a status to assign to the order summary. The value must match one of the picklist values on the Status field of the OrderSummary object. | Optional              | 50.0              |

ConnectApi.OrderSummaryLookupInput

Order summary lookup input.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>orderSummaryIdOrRefNumber</td>
<td>String</td>
<td>Either the order summary ID or reference number value.</td>
<td>Required</td>
<td>58.0</td>
</tr>
<tr>
<td>verification</td>
<td>ConnectApi.OrderSummaryVerificationInput</td>
<td>Verification attributes for guest shoppers.</td>
<td>Optional</td>
<td>58.0</td>
</tr>
</tbody>
</table>

ConnectApi.OrderSummaryVerificationInput

Order summary verification input.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>email</td>
<td>String</td>
<td>Guest shopper or registered buyer’s email address.</td>
<td>Optional</td>
<td>58.0</td>
</tr>
<tr>
<td>lastName</td>
<td>String</td>
<td>Guest shopper or registered buyer’s last name.</td>
<td>Optional</td>
<td>58.0</td>
</tr>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>Guest shopper or registered buyer’s phone number.</td>
<td>Optional</td>
<td>58.0</td>
</tr>
</tbody>
</table>

ConnectApi.OrderToCartInput

Input for action adding an order to a cart.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>cartStateOrId</td>
<td>String</td>
<td>Cart state (active or current) or the ID of the cart to which the products from an order are to be copied.</td>
<td>Required</td>
<td>57.0</td>
</tr>
</tbody>
</table>

ConnectApi.PaymentGroupRequest

Payment group input consumed by a payment group service.
### ConnectApi.PaymentMethodTokenizationRequest

Payment method tokenization input consumed by the payment tokenization service.
Subclass of `ConnectApi.BaseRequest`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>address</code></td>
<td><code>ConnectApi.AddressRequest</code></td>
<td>Address of the payment method.</td>
<td>Required</td>
<td>52.0</td>
</tr>
<tr>
<td><code>cardPaymentMethod</code></td>
<td><code>ConnectApi.CardPaymentMethodRequest</code></td>
<td>Object representation of the card payment method.</td>
<td>Required</td>
<td>52.0</td>
</tr>
<tr>
<td><code>paymentGatewayId</code></td>
<td><code>String</code></td>
<td>ID of the card payment method's payment gateway.</td>
<td>Required</td>
<td>52.0</td>
</tr>
</tbody>
</table>

### ConnectApi.PhotoInput

Specify how to crop a photo that has already been uploaded.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Available version</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cropSize</code></td>
<td><code>Integer</code></td>
<td>The length, in pixels, of any edge of the crop square.</td>
<td>29.0</td>
</tr>
<tr>
<td><code>cropX</code></td>
<td><code>Integer</code></td>
<td>The position X, in pixels, from the left edge of the image to the start of the crop square. Top left is position (0,0).</td>
<td>29.0</td>
</tr>
<tr>
<td><code>cropY</code></td>
<td><code>Integer</code></td>
<td>The position Y, in pixels, from the top edge of the image to the start of the crop square. Top left is position (0,0).</td>
<td>29.0</td>
</tr>
<tr>
<td><code>fileId</code></td>
<td><code>String</code></td>
<td>18 character ID of an existing file. The key prefix must be 069 and the file must be an image and be smaller than 2 GB.</td>
<td>25.0</td>
</tr>
</tbody>
</table>

**Note:** Images uploaded on the Group page and on the User page don’t have file IDs and therefore can’t be used.
### ConnectApi.PinCapabilityInput

Pin or unpin a feed element to a feed.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>entityId</td>
<td>String</td>
<td>ID of the entity to pin or unpin. In version 41.0 and later, entityId must be a feed item ID. In version 41.0–42.0, only one feed item can be pinned per feed. In version 43.0 and later, three feed items can be pinned per feed.</td>
<td>Required</td>
<td>41.0</td>
</tr>
<tr>
<td>isPinned</td>
<td>Boolean</td>
<td>Specifies whether to pin (true) or unpin (false) the entity.</td>
<td>Required</td>
<td>41.0</td>
</tr>
</tbody>
</table>

### ConnectApi.PollCapabilityInput

Create, update, or vote on a poll on a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>choices</td>
<td>List&lt;String&gt;</td>
<td>The choices used to create a new poll. You must specify 2–10 poll choices for each poll.</td>
<td>Required for creating a poll</td>
<td>32.0</td>
</tr>
<tr>
<td>myChoiceId</td>
<td>String</td>
<td>ID of an existing choice on the feed poll. Used to vote on an existing poll.</td>
<td>Required for voting on a poll</td>
<td>32.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**

ConnectApi.FeedElementCapabilitiesInput
**ConnectApi.PostAuthRequest**

Payment post authorization input consumed by the payment post authorization service.

Subclass of `ConnectApi.BaseRequest`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>accountId</td>
<td>String</td>
<td>ID of the account of the customer for the authorized payment.</td>
<td>Required</td>
<td>54.0</td>
</tr>
<tr>
<td>amount</td>
<td>Double</td>
<td>Amount of the post authorization.</td>
<td>Required</td>
<td>54.0</td>
</tr>
<tr>
<td>comments</td>
<td>String</td>
<td>Comments for payment post authorization. Maximum of 1000 characters.</td>
<td>Optional</td>
<td>54.0</td>
</tr>
<tr>
<td>currencyIsoCode</td>
<td>String</td>
<td>Three-letter ISO 4217 currency code associated with the payment group record.</td>
<td>Optional</td>
<td>54.0</td>
</tr>
<tr>
<td>effectiveDate</td>
<td>Datetime</td>
<td>Date that the payment post authorization occurs.</td>
<td>Required</td>
<td>54.0</td>
</tr>
<tr>
<td>paymentGatewayId</td>
<td>String</td>
<td>Payment gateway that evaluates the post authorization.</td>
<td>Required</td>
<td>54.0</td>
</tr>
<tr>
<td>paymentGroup</td>
<td>`ConnectApi.</td>
<td>Payment group associated with or to be created for the request. Request must</td>
<td>Optional</td>
<td>54.0</td>
</tr>
<tr>
<td></td>
<td>PaymentGroupRequest`</td>
<td>contain either a paymentGroupId or paymentGroup, but not both.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>paymentMethod</td>
<td>`ConnectApi.</td>
<td>Payment method sent for the post authorization.</td>
<td>Required</td>
<td>54.0</td>
</tr>
<tr>
<td></td>
<td>PostAuthApi</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>PaymentMethodRequest`</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**ConnectApi.PostAuthApiPaymentMethodRequest**

Payment method input for post authorization.

Subclass of `ConnectApi.BaseApiPaymentMethodRequest`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>alternativePaymentMethod</td>
<td><code>ConnectApi. AlternativePaymentMethod</code></td>
<td>Alternative payment method.</td>
<td>Required</td>
<td>54.0</td>
</tr>
<tr>
<td>cardPaymentMethod</td>
<td><code>ConnectApi. CardPaymentMethodRequest</code></td>
<td>Card payment method.</td>
<td>Required</td>
<td>54.0</td>
</tr>
</tbody>
</table>
### ConnectApi.PricingInput

Pricing for multiple products.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>pricingLineItems</td>
<td>List&lt;ConnectApi.PricingLineItemInput&gt;</td>
<td>Up to 500 line items for pricing.</td>
<td>Required</td>
<td>49.0</td>
</tr>
</tbody>
</table>

### ConnectApi.PricingLineItemInput

Pricing line item.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>productId</td>
<td>String</td>
<td>ID of the product to price.</td>
<td>Required</td>
<td>49.0</td>
</tr>
</tbody>
</table>

### ConnectApi.ProductSearchGroupingInput

Grouping information for product search results.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupingOption</td>
<td>ConnectApi.CommerceSearch.GroupingOption</td>
<td>Grouping option for search results. Values are:</td>
<td>Required</td>
<td>52.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- NoGrouping—Search results aren’t grouped.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- VariationParent—Search results are grouped by the variation parent.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>topProductType</td>
<td>ConnectApi.CommerceSearch.TopProductType</td>
<td>Type of the top product to return for each product group in search results.</td>
<td>Optional</td>
<td>52.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Value is:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- VariationParent</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>If NoGrouping is specified for groupingOption, topProductType is ignored.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### ConnectApi.ProductSearchInput

Product search.
<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>categoryId</td>
<td>String</td>
<td>Category ID returns results for products in this category or its subcategories.</td>
<td>52.0</td>
</tr>
<tr>
<td>fields</td>
<td>List&lt;String&gt;</td>
<td>Product fields to return in search results. Search results include fields you have access to. If unspecified, returns the Name, Description, StockKeepingUnit, ProductCode, and Family fields.</td>
<td>52.0</td>
</tr>
<tr>
<td>grouping</td>
<td>ConnectApi.ProductSearchGroupingInput</td>
<td>Specifies whether to group products in search results and how to group them. If unspecified, the default is the value specified in Search &gt; Results Display Settings &gt; Results Grouping.</td>
<td>52.0</td>
</tr>
<tr>
<td>includePrices</td>
<td>Boolean</td>
<td>Specifies whether to include prices for products in search results (true) or not (false). If unspecified, defaults to false.</td>
<td>52.0</td>
</tr>
<tr>
<td>includeQuantityRule</td>
<td>Boolean</td>
<td>Specifies whether to include purchase quantity rule information for products in search results (true) or not (false). If unspecified, defaults to false.</td>
<td>52.0</td>
</tr>
<tr>
<td>page</td>
<td>Integer</td>
<td>Number of the page you want returned. Starts at 0. If you pass in null or 0, the first page is returned.</td>
<td>52.0</td>
</tr>
<tr>
<td>pageSize</td>
<td>Integer</td>
<td>Specifies the number of items per page. Valid values are from 1 through 200. If unspecified, the default is the value specified in Results per Page in Search &gt; Results Display Settings.</td>
<td>52.0</td>
</tr>
<tr>
<td>refinements</td>
<td>List&lt;ConnectApi.RefinementInput&gt;</td>
<td>List up to nine refinements (facets) for search results. Buyers or shoppers can select up to 20 values for each refinement.</td>
<td>52.0</td>
</tr>
<tr>
<td>searchTerm</td>
<td>String</td>
<td>List of up to 32 space-separated search terms.</td>
<td>52.0</td>
</tr>
<tr>
<td>sortRuleId</td>
<td>String</td>
<td>ID of the sort rule that specifies the order of products in the search results.</td>
<td>52.0</td>
</tr>
</tbody>
</table>

**ConnectApi.PromotionCartInput**

Cart during promotion evaluation.
### ConnectApi.PromotionCartInput

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>

<td>Specify <code>mi</code> or <code>km</code> to return average distances in miles or kilometers, respectively.</td>
<td>51.0</td>
<td></td>
</tr>
<tr>
<td>sortResult</td>
<td>String</td>
<td>Specify <code>ASC</code> or <code>DESC</code> to rank the results by average shipping distance in ascending or descending order, respectively.</td>
<td>51.0</td>
<td></td>
</tr>
<tr>
<td>targetLocations</td>
<td>List&lt;<code>ConnectApi.TargetLocationInputRepresentation&gt;</code></td>
<td>Each element is a set of inventory locations that can combine to fulfill the order.</td>
<td>At least one element is required</td>
<td>51.0</td>
</tr>
</tbody>
</table>

### ConnectApi.ReadByCapabilityInput

Mark feed elements as read by the context user.

This class is a subclass of `ConnectApi.FeedElementCapabilityInput`. 
### isReadByMe
- **Type:** Boolean
- **Description:** Specifies to mark the feed element as read (true) for the context user.
- **Required or Optional:** Required
- **Available Version:** 40.0

### lastReadDateByMe
- **Type:** Datetime
- **Description:** Specifies the last date, in ISO 8601 format, when the feed element is marked as read for the context user. If you don’t specify a date or you specify a future date, the current system date is used.
- **Required or Optional:** Optional
- **Available Version:** 40.0

### ConnectApi.SequenceOrderPaymentSummaryInputRepresentation

Amount to apply to specified OrderPaymentSummary as part of a payment or refund.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>amount</td>
<td>Double</td>
<td>Amount to apply to the OrderPaymentSummary.</td>
<td>Optional</td>
<td>56.0</td>
</tr>
<tr>
<td>orderPaymentSummaryId</td>
<td>String</td>
<td>ID of the OrderPaymentSummary to apply the Amount to.</td>
<td>Required</td>
<td>56.0</td>
</tr>
</tbody>
</table>

### ConnectApi.RecipientEngagementContextInput

Context based on which the survey invitation is sent to a participant.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>recipientEngagementContext</td>
<td>Map&lt;String, String&gt;</td>
<td>Map each recipient with the context based on which the survey invitation is emailed.</td>
<td>Required</td>
<td>50.0</td>
</tr>
</tbody>
</table>
## ConnectApi.RecommendationAudienceInput

A custom recommendation audience.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>recipientId</td>
<td>String</td>
<td>Participant ID with whom the engagement context should be associated.</td>
<td>Required</td>
<td>50.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- `ConnectApi.SurveyInvitationEmailInput`

### ConnectApi.RecommendationAudienceInput

A custom recommendation audience.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>criteria</td>
<td><code>ConnectApi.AudienceCriteriaInput</code></td>
<td>The criteria for the custom recommendation audience type.</td>
<td>Optional</td>
<td>36.0</td>
</tr>
</tbody>
</table>

**Important:** This property is only available in version 35.0. In version 36.0 and later, use `ConnectApi.CustomListAudienceCriteriaInput`.

<table>
<thead>
<tr>
<th>memberOperation Type</th>
<th><code>ConnectApi.RecommendationAudienceMemberOperationType</code></th>
<th>The operation to carry out on the audience members.</th>
<th>Required</th>
<th>35.0 only</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>• Add—Adds specified members to the audience.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Remove—Removes specified members from the audience.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Important:** This property is available only in version 35.0. In version 36.0 and later, use `ConnectApi.CustomListAudienceCriteriaInput`.

| members                   | `List<String>` | A collection of user IDs. When updating an audience, you can include up to 100 members. An audience can have up to 100,000 members, and each | Required             | 35.0 only         |

**Important:** This property is available only in version 35.0. In version 36.0 and later, use `ConnectApi.CustomListAudienceCriteriaInput`.
Experience Cloud site can have up to 100 audiences.

<table>

createRecommendationDefinition(communityId, recommendationDefinition)

### ConnectApi.RecommendationReactionInput
A reaction to a recommendation produced by a recommendation strategy.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>aiModel</td>
<td>String</td>
<td>Reserved for future use.</td>
<td>Optional</td>
<td>47.0</td>
</tr>
<tr>
<td>contextRecordId</td>
<td>String</td>
<td>ID of the context record. For example, if the next best action is on a case detail page, the ID of the case.</td>
<td>Optional</td>
<td>45.0</td>
</tr>
<tr>
<td>executionId</td>
<td>String</td>
<td>ID of the original recommendation strategy execution.</td>
<td>Optional</td>
<td>45.0</td>
</tr>
<tr>
<td>externalId</td>
<td>String</td>
<td>External ID of the recommendation. This ID doesn't need to be a Salesforce 18-character ID. For example, it can be a product number from an external system.</td>
<td>Optional</td>
<td>46.0</td>
</tr>
<tr>
<td>onBehalfOfId</td>
<td>String</td>
<td>ID of the user or entity for which the reaction took place.</td>
<td>Optional</td>
<td>45.0</td>
</tr>
<tr>
<td>reactionType</td>
<td>ConnectApi.RecommendationReactionType</td>
<td>Type of reaction to a recommendation. Values are:</td>
<td>Required</td>
<td>45.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Accepted</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Rejected</td>
<td></td>
<td></td>
</tr>
<tr>
<td>recommendationMode</td>
<td>String</td>
<td>Reserved for future use.</td>
<td>Optional</td>
<td>46.0</td>
</tr>
<tr>
<td>recommendationScore</td>
<td>Double</td>
<td>Reserved for future use.</td>
<td>Optional</td>
<td>46.0</td>
</tr>
</tbody>
</table>
### ConnectApi.RecordCapabilityInput

Attach an existing knowledge article to a comment.

This class is a subclass of `ConnectApi.FeedElementCapabilityInput`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>recordId</td>
<td>String</td>
<td>ID of the existing knowledge article to attach.</td>
<td>Required</td>
<td>42.0</td>
</tr>
</tbody>
</table>

### ConnectApi.RecordsetFilterCriteriaInput

A set of recordset filter criteria applied to records, such as service appointment records.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>criteriaIds</td>
<td>List&lt;String&gt;</td>
<td>Recordset filter criteria IDs.</td>
<td>Required</td>
<td>53.0</td>
</tr>
<tr>
<td>enforceSharing</td>
<td>Boolean</td>
<td>Determines whether record sharing checks are enforced (true) or not (false) during the execution of this call.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>filteredObjectName</td>
<td>String</td>
<td>Object that the filter is applied to.</td>
<td>Required</td>
<td>53.0</td>
</tr>
<tr>
<td>recordIds</td>
<td>List&lt;String&gt;</td>
<td>List of record IDs of the filtered object.</td>
<td>Required</td>
<td>53.0</td>
</tr>
</tbody>
</table>

### ConnectApi.ReferencedRefundRequest

Referenced refund input.

Subclass of `ConnectApi.RefundRequest`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>accountId</td>
<td>String</td>
<td>ID of the account linked to the referenced refund request.</td>
<td>Optional</td>
<td>50.0</td>
</tr>
</tbody>
</table>
### ConnectApi.RefinementInput

Attribute-based refinement input for product search.

This class is abstract and is a superclass of `ConnectApi.DistinctValueRefinementInput`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>attributeType</td>
<td><code>ConnectApi.CommerceSearch.AttributeType</code></td>
<td>Search attribute type.</td>
<td>Required</td>
<td>52.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Custom</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- ProductAttribute</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Standard</td>
<td></td>
<td></td>
</tr>
<tr>
<td>nameOrId</td>
<td>String</td>
<td>Developer name of the attribute.</td>
<td>Required</td>
<td>52.0</td>
</tr>
<tr>
<td>type</td>
<td><code>ConnectApi.CommerceSearch.FacetType</code></td>
<td>Search facet type. Value is:</td>
<td>Required</td>
<td>52.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- DistinctValue</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### ConnectApi.RefundRequest

Refund input.

This class is abstract.

This class is a subclass of `ConnectApi.BaseRequest`.

No additional properties.

This class is a superclass of `ConnectApi.ReferencedRefundRequest`.

### ConnectApi.ReleaseHeldFOCapacityInputRepresentation

Request to release held fulfillment order capacity at one or more locations. Can correspond to one action call.
### ConnectApi.ReleaseHeldFOCapacityRequestInputRepresentation

Request to release held fulfillment order capacity at one or more locations.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>releaseHeldFOCapacityRequests</td>
<td>List&lt;ConnectApi.ReleaseHeldFOCapacityRequestInputRepresentation&gt;</td>
<td>List of requests to release held fulfillment order capacity at one or more locations.</td>
<td>Required</td>
<td>55.0</td>
</tr>
<tr>
<td>allOrNothing</td>
<td>Boolean</td>
<td>Controls whether a single failed request cancels all other requests in the list (<code>true</code>) or whether some requests can succeed if others fail (<code>false</code>). The default value is <code>false</code>.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>capacityRequests</td>
<td>List&lt;ConnectApi.CapacityRequestInputRepresentation&gt;</td>
<td>List of requests to release held fulfillment order capacity. Each request is for capacity for one fulfillment order held at one location.</td>
<td>Required</td>
<td>55.0</td>
</tr>
</tbody>
</table>

### ConnectApi.RequestHeaderInput

An HTTP request header name and value pair.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the request header.</td>
<td>Required</td>
<td>33.0</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The value of the request header.</td>
<td>Required</td>
<td>33.0</td>
</tr>
</tbody>
</table>

Define an Action Link and Post with a Feed Element

### ConnectApi.ReturnItemsInputRepresentation

Data about products and delivery charges to return, as well as associated return fees.
### ConnectApi.ReturnOrderInputRepresentation

Data for creating a ReturnOrder and ReturnOrderLineItems.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>orderSummaryId</td>
<td>String</td>
<td>ID of the OrderSummary containing the items to be returned. The OrderSummary’s OrderLifeCycleType must be Managed.</td>
<td>Required</td>
<td>50.0</td>
</tr>
<tr>
<td>returnOrderLifeCycleType</td>
<td>String</td>
<td>The LifeCycleType of the ReturnOrder. Possible values are:</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Managed—Process the ReturnOrder using the APIs and actions. It can generate change orders and affects financial fields and rollup calculations.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Unmanaged—The ReturnOrder is for tracking purposes only. It isn’t involved in any financial calculations and doesn’t generate any change orders. The system doesn’t prevent the creation of duplicate ReturnOrderLineItems in an unmanaged ReturnOrder for the same OrderItem.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>returnOrderLineItems</td>
<td>List&lt;String&gt;</td>
<td>List of data for creating ReturnOrderLineItems.</td>
<td>At least one element is required</td>
<td>50.0</td>
</tr>
<tr>
<td>Property</td>
<td>Type</td>
<td>Description</td>
<td>Required or Optional</td>
<td>Available Version</td>
</tr>
<tr>
<td>---------------</td>
<td>------------</td>
<td>------------------------------------------------------------------------------</td>
<td>----------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>status</td>
<td>String</td>
<td>Status to assign the ReturnOrder. This value must match an entry in the ReturnOrder object’s Status picklist.</td>
<td>Required</td>
<td>51.0</td>
</tr>
</tbody>
</table>

SEE ALSO:

createReturnOrder(returnOrderInput)

**ConnectApi.ReturnOrderItemInputRepresentation**

ID of a ReturnOrderLineItem and instructions for updating it. After the update, the ReturnOrderLineItem is read-only. Any remaining quantity to be returned is added to a new ReturnOrderLineItem.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>quantityReceived</td>
<td>Double</td>
<td>The quantity of the ReturnOrderLineItem that has been received. The value must be zero or greater. This value isn’t used by any standard features, but is provided for use in customizations.</td>
<td>Required</td>
<td>52.0</td>
</tr>
<tr>
<td>quantityRejected</td>
<td>Double</td>
<td>The quantity of the ReturnOrderLineItem that has been rejected for return. The value must be zero or greater. This value isn’t used by any standard features, but is provided for use in customizations.</td>
<td>Required</td>
<td>52.0</td>
</tr>
<tr>
<td>quantityReturned</td>
<td>Double</td>
<td>The quantity of the ReturnOrderLineItem that has been returned. The value must be greater than zero. If this value plus quantityToCancel is less than the expected return quantity, then the remaining quantity to be returned is added to a new ReturnOrderLineItem.</td>
<td>Required</td>
<td>52.0</td>
</tr>
<tr>
<td>quantityToCancel</td>
<td>Double</td>
<td>The quantity of the ReturnOrderLineItem to remove because it’s not being returned. The value must be zero or greater. If this value plus quantityReturned is less than the expected return quantity, then the remaining quantity to be returned is added to a new ReturnOrderLineItem.</td>
<td>Required</td>
<td>52.0</td>
</tr>
<tr>
<td>reasonForRejection</td>
<td>String</td>
<td>The reason why the rejected quantity, if any, was rejected. This value isn’t used by any standard features, but is provided for use in customizations.</td>
<td>Optional</td>
<td>52.0</td>
</tr>
</tbody>
</table>
### ConnectApi.ReturnOrderLineItemDeliveryChargeInputRepresentation

ID of a ReturnOrderLineItem representing a delivery charge.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>returnOrderLineItemId</td>
<td>String</td>
<td>ID of a ReturnOrderLineItem to return.</td>
<td>Required</td>
<td>52.0</td>
</tr>
</tbody>
</table>

### ConnectApi.ReturnOrderItemFeeInputRepresentation

ID of a ReturnOrderLineItem representing a return fee, and instructions for updating it. After the update, the ReturnOrderLineItem is read-only. Any remaining quantity of the fee to be processed is added to a new ReturnOrderLineItem.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>quantityReturned</td>
<td>Double</td>
<td>Quantity of the ReturnOrderLineItem to process. When the fee is a fixed amount, the charge is determined by multiplying the total fee amount by this value divided by the expected quantity. For example, if the fee amount is $10 and the expected quantity is 2, then if the quantityReturned is 1, $5 is charged. This value normally equals the quantity returned of the ReturnOrderLineItem for the returned item that the fee applies to. The value must be greater than zero. If this value plus quantityToCancel is less than the expected quantity, then the remaining</td>
<td>Required</td>
<td>56.0</td>
</tr>
<tr>
<td>Property</td>
<td>Type</td>
<td>Description</td>
<td>Required or Optional</td>
<td>Available Version</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>quantityToCancel</td>
<td>Double</td>
<td>Quantity of the ReturnOrderLineItem to remove. This value normally equals the quantity canceled of the ReturnOrderLineItem for the returned item that the fee applies to. This value can also be used to cancel a portion of the fee. The value must be zero or greater. If this value plus quantityReturned is less than the expected quantity, then the remaining quantity to be returned is added to a new ReturnOrderLineItem.</td>
<td>Required</td>
<td>56.0</td>
</tr>
<tr>
<td>returnOrderLineItemId</td>
<td>String</td>
<td>ID of the ReturnOrderLineItem representing the return fee.</td>
<td>Required</td>
<td>56.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- `ConnectApi.ReturnItemsInputRepresentation`
- `returnItems(returnOrderId, returnItemsInput)`

### ConnectApi.ReturnOrderLineItemInputRepresentation

Data for creating a ReturnOrderLineItem for an order item being returned, including data to create ReturnOrderLineItems representing any return fees associated with it.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>canReduceShipping</td>
<td>Boolean</td>
<td>Whether to refund any associated shipping charge.</td>
<td>Required</td>
<td>50.0</td>
</tr>
<tr>
<td>orderItemSummaryId</td>
<td>String</td>
<td>ID of the associated OrderItemSummary. If the OrderItemSummary already has an associated ReturnOrderLineItem, then you must specify a different reasonForReturn. Duplicating the reason breaks the financial calculations.</td>
<td>Required</td>
<td>50.0</td>
</tr>
<tr>
<td>quantityExpected</td>
<td>Double</td>
<td>Quantity expected to be returned. This value also applies to any fees specified in returnOrderLineItemFees.</td>
<td>Required</td>
<td>50.0</td>
</tr>
<tr>
<td>quantityReceived</td>
<td>Double</td>
<td>Quantity already physically returned.</td>
<td>Optional</td>
<td>50.0</td>
</tr>
</tbody>
</table>
## reasonForReturn

**Type:** String  
**Description:** Reason for the return. The value must match an entry in both the OrderSummaryChange Reason field and the ReturnOrderLineItem object's ReasonForReturn picklist.  
**Required or Optional:** Required if the returnOrder LifeCycleType is MANAGED.  
**Available Version:** 50.0

## returnOrderLineItemFees

**Type:** List\<\<ConnectApi.ReturnOrderLineItemFeeInputRepresentation\>>  
**Description:** List of input data for return fees associated with the order item being returned. A ReturnOrderLineItem of Type Fee is created to represent each fee.  
**Required or Optional:** Optional  
**Available Version:** 56.0

---

<tr>
<td></td>
<td></td>
<td>on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder. Use these channel values; you can’t rename or create other channels.</td>
<td>Optional</td>
<td>35.0</td>
</tr>
<tr>
<td>enabled</td>
<td>Boolean</td>
<td>Indicates whether scheduling is enabled. If true, the custom recommendation is enabled and appears in Experience Cloud sites. If false, custom recommendations in feeds in Salesforce mobile web aren’t removed, but no new custom recommendations appear. In Customer Service and Partner Central sites, disabled custom recommendations no longer appear.</td>
<td>Optional</td>
<td>35.0</td>
</tr>
<tr>
<td>rank</td>
<td>Integer</td>
<td>Relative rank of the scheduled custom recommendation indicated by ascending whole numbers starting with 1. Setting the rank is comparable to an insertion into an ordered list. The scheduled custom recommendation is inserted into the position specified by the rank. The rank of all the scheduled custom recommendations after it is pushed down. See Ranking scheduled custom recommendations example. If the specified rank is larger than the size of the list, the scheduled custom recommendation is put at the end of the list. The rank of the scheduled custom recommendation is the size of the list, instead of the one specified. If a rank is not specified, the scheduled custom recommendation is put at the end of the list.</td>
<td>Optional</td>
<td>35.0</td>
</tr>
<tr>
<td>recommendation AudienceId</td>
<td>String</td>
<td>ID of the audience for this scheduled custom recommendation. When updating a scheduled custom recommendation, specify ALL to remove the association between a</td>
<td>Optional</td>
<td>35.0</td>
</tr>
</tbody>
</table>
custom recommendation audience and a scheduled custom recommendation.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>recommendation</td>
<td>String</td>
<td>ID of the custom recommendation definition that this scheduled recommendation schedules.</td>
<td>Required to create a scheduled recommendation. You can't specify a recommendation DefinitionId when updating a scheduled recommendation.</td>
<td>35.0</td>
</tr>
<tr>
<td>DefinitionId</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Ranking scheduled custom recommendations example

If you have these scheduled custom recommendations:

<table>
<thead>
<tr>
<th>Scheduled Recommendations</th>
<th>Rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScheduledRecommendationA</td>
<td>1</td>
</tr>
<tr>
<td>ScheduledRecommendationB</td>
<td>2</td>
</tr>
<tr>
<td>ScheduledRecommendationC</td>
<td>3</td>
</tr>
</tbody>
</table>

And you include this information in the Scheduled Custom Recommendation Input:

<table>
<thead>
<tr>
<th>Scheduled Recommendation</th>
<th>Rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScheduledRecommendationD</td>
<td>2</td>
</tr>
</tbody>
</table>

The result is:

<table>
<thead>
<tr>
<th>Scheduled Recommendation</th>
<th>Rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScheduledRecommendationA</td>
<td>1</td>
</tr>
<tr>
<td>ScheduledRecommendationD</td>
<td>2</td>
</tr>
<tr>
<td>ScheduledRecommendationB</td>
<td>3</td>
</tr>
<tr>
<td>ScheduledRecommendationC</td>
<td>4</td>
</tr>
</tbody>
</table>

SEE ALSO:
createScheduledRecommendation(communityId, scheduledRecommendation)
**ConnectApi.SellerDetailsRequest**

Seller details for the tax calculation

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>code</td>
<td>String</td>
<td>Code used to identify the seller of the taxed items.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
</tbody>
</table>

**ConnectApi.ServiceAppointmentInput**

Contains information about the service appointment.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalInformation</td>
<td>String</td>
<td>The extra information about the service appointment.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>appointmentType</td>
<td>String</td>
<td>The type of the appointment.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>city</td>
<td>String</td>
<td>The name of the city.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>comments</td>
<td>String</td>
<td>The comments about the appointment.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>contactId</td>
<td>String</td>
<td>The ID of the contact associated with the parent record.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>country</td>
<td>String</td>
<td>The name of the country.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>The description of the appointment.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>engagementChannelTypeId</td>
<td>String</td>
<td>ID of the engagement channel type to associate with the appointment.</td>
<td>Optional</td>
<td>56.0</td>
</tr>
</tbody>
</table>

You can use engagement channel type only if:

- **Schedule Appointments Using Engagement Channels** is enabled in Salesforce Scheduler Settings in your Salesforce org.
- Shifts are defined in the scheduling policy. For more information on setting up shifts in the scheduling policy, see Define Shift Rules in Scheduling Policy.

**Note:** Engagement channel types are not supported with operating hours rules in the scheduling policy.
### ConnectApi.ShiftsFromPatternInput

Shifts from a pattern.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedulingEndDate</td>
<td>String</td>
<td>Scheduling end date in YYYY-MM-DD format. Provide schedulingEndDate or schedulingOccurrences. Don't provide both.</td>
<td>Required if schedulingOccurrences isn't provided</td>
<td>51.0</td>
</tr>
<tr>
<td>schedulingOccurrences</td>
<td>Integer</td>
<td>Number of scheduling occurrences. Provide schedulingEndDate or schedulingOccurrences. Don't provide both.</td>
<td>Required if schedulingEndDate isn't provided</td>
<td>51.0</td>
</tr>
<tr>
<td>schedulingStartDate</td>
<td>String</td>
<td>Scheduling start date in YYYY-MM-DD format.</td>
<td>Required</td>
<td>51.0</td>
</tr>
<tr>
<td>Property</td>
<td>Type</td>
<td>Description</td>
<td>Required or Optional</td>
<td>Available Version</td>
</tr>
<tr>
<td>------------------------</td>
<td>------------</td>
<td>------------------------------------------------------------------------------</td>
<td>----------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>serviceResourceId</td>
<td>String</td>
<td>ID of the service resource to assign shifts to. In version 53.0 and later, use serviceResourceIdList.</td>
<td>Optional</td>
<td>51.0–52.0</td>
</tr>
<tr>
<td>serviceResourceId</td>
<td>List&lt;String&gt;</td>
<td>List of service resource IDs to assign shifts to.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>serviceTerritoryId</td>
<td>String</td>
<td>ID of the service territory to assign shifts to.</td>
<td>Optional</td>
<td>51.0</td>
</tr>
<tr>
<td>shiftStatus</td>
<td>String</td>
<td>Status of the shifts. Default values are: Confirmed, Published, Tentative. Additional status values can be created.</td>
<td>Optional</td>
<td>52.0</td>
</tr>
</tbody>
</table>

**ConnectApi.SocialPostMassApprovalInput**

List of social post ids and the action to approve or reject publishing them.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isApproved</td>
<td>Boolean</td>
<td>Specifies whether to approve (true) or reject (false) publishing the social posts. If unspecified, defaults to false.</td>
<td>Optional</td>
<td>46.0</td>
</tr>
<tr>
<td>socialPostIdList</td>
<td>List&lt;String&gt;</td>
<td>A list of up to 200 social post IDs.</td>
<td>Required</td>
<td>46.0</td>
</tr>
</tbody>
</table>

**ConnectApi.StatusCapabilityInput**

Change the status of a feed post or comment.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.
### Available Version

<table>
<thead>
<tr>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required</td>
<td>37.0</td>
</tr>
</tbody>
</table>

### Description

- **ConnectApi.FeedEntityStatus**

  Status of the feed post or comment. Values are:

  - **Draft** — The feed post isn’t published but is visible to the author and users with Modify All Data or View All Data permission. Comments can’t be drafts.
  - **PendingReview** — The feed post or comment isn’t approved yet and therefore isn’t published or visible.
  - **Published** — The feed post or comment is approved and visible.

  Posts that have a status of PendingReview or Published can’t be changed to a status of Draft and vice versa.

### ConnectApi.StreamSubscriptionInput

An entity to subscribe to for a Chatter feed stream.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>entityId</td>
<td>String</td>
<td>The ID of any feed-enabled entity, such as a group, record, or user, that the context user can access. When subscribed, the entity’s feed is included in the feed stream.</td>
<td>Required</td>
<td>39.0</td>
</tr>
</tbody>
</table>

### ConnectApi.SurveyInvitationEmailInput

Survey invitation email.

### ConnectApi.Input Classes

**Apex Reference Guide**

<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>targets</td>
<td>List&lt;ConnectApi.TargetUpdateInput&gt;</td>
<td>List of targets to update.</td>
<td>Required</td>
<td>48.0</td>
</tr>
</tbody>
</table>

**ConnectApi.TargetLocationInputRepresentation**

A set of inventory locations that together can fulfill an order.
<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>locations</td>
<td>List&lt;ConnectApi.LocationInput&gt;</td>
<td>A list of locations with information about their country and postal codes.</td>
<td>Required</td>
<td>51.0</td>
</tr>
</tbody>
</table>

**ConnectApi.TargetInput**

Target to create.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audienceId</td>
<td>String</td>
<td>ID of the audience to assign to the target.</td>
</tr>
<tr>
<td>groupName</td>
<td>String</td>
<td>Group name of the target. Groups bundle related target and audience pairs. You can have up to 2,000 groups and 500 targets per group. To determine the group name for targets of type ExperienceVariation, see Personalization Target Developer and Group Names in the Experience Cloud Developer Guide.</td>
</tr>
<tr>
<td>priority</td>
<td>Integer</td>
<td>Priority of the target. Within a group, priority determines which target is returned if the user matches more than one audience.</td>
</tr>
<tr>
<td>publishStatus</td>
<td>ConnectApi.PublishStatus</td>
<td>The publish status of the target. Values are: Draft, Live. We recommend setting the publish status to Draft. If you specify Live, your changes revert after you publish the site.</td>
</tr>
<tr>
<td>targetType</td>
<td>String</td>
<td>Type of target, indicating the nature of the data being targeted. Supported values include: ExperienceVariation (version 48.0 and later), Custom object API names, such as CustomObjectName__c (version 48.0 and later), NavigationLinkSet (version 49.0 and later), Topic (version 49.0 and later)</td>
</tr>
</tbody>
</table>
Available Version Required or Optional Description

- **CollaborationGroup** (version 49.0 and later)
- **KnowledgeArticle** (version 49.0 and later)
- **ContentDocument** (version 49.0 and later)
- **ManagedContent** (version 49.0 and later)
- **Report** (version 49.0 and later)
- **Dashboard** (version 49.0 and later)

You can have up to 2,500 ExperienceVariation targets and 25,000 record targets.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>targetValue</strong></td>
<td><strong>String</strong></td>
<td>Value of the target. If <code>targetType</code> is <code>ExperienceVariation</code>, <code>targetValue</code> is the developer name of the experience variation. If <code>targetType</code> is <code>CustomObjectName__c</code>, <code>targetValue</code> is the ID of the custom object. To determine the developer name for targets of type <code>ExperienceVariation</code>, see <a href="#">Personalization Target Developer and Group Names</a> in the Experience Cloud Developer Guide.</td>
<td>Required</td>
<td>48.0</td>
</tr>
</tbody>
</table>

<td>48.0</td>
</tr>
</tbody>
</table>

#### ConnectApi.CalculateTaxRequest

Request to sent through the tax adapter to the external tax engine. Inputs with a `TaxTransactionType` of Debit represent a tax calculation request. Inputs with a `TaxTransactionType` of Credit represent a tax cancellation request.

Subclass of `ConnectApi.TaxTransactionRequest`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isCommit</td>
<td>Boolean</td>
<td>Commits the transaction for tax calculation.</td>
<td>Required</td>
<td>55.0</td>
</tr>
<tr>
<td>taxEngineId</td>
<td>String</td>
<td>ID of the Salesforce tax engine entity used to represent the external tax engine.</td>
<td>Required</td>
<td>55.0</td>
</tr>
</tbody>
</table>
| taxTransactionType     | `ConnectApi.TaxTransaction.Type` | Type of tax transaction. Values are:  
• Credit—Transaction is a credit transaction.  
• Debit—Transaction is a debit transaction. | Required             | 55.0              |
| taxType                | `ConnectApi.CalculateTax.Type` | Type of tax calculation. Values are:  
• Actual—Calculated tax represents the final taxed amount for the transaction.  
• Estimated—Calculated tax represents only an estimated value before the transaction is finalized. | Required             | 55.0              |

#### ConnectApi.TaxAddressRequest

Address input representation for tax calculation.
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>city</td>
<td>String</td>
<td>City.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>country</td>
<td>String</td>
<td>Country.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>latitude</td>
<td>Double</td>
<td>Latitude.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>locationCode</td>
<td>String</td>
<td>Location code.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>longitude</td>
<td>Double</td>
<td>Longitude.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>postalCode</td>
<td>String</td>
<td>Postal code.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>state</td>
<td>String</td>
<td>State.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>street</td>
<td>String</td>
<td>Street.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
</tbody>
</table>

**ConnectApi.TaxAddressesRequest**

Addresses, including the Bill To address, Ship From address, Ship to address, and Sold To address.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>billTo</td>
<td>ConnectApi.TaxAddressRequest</td>
<td>Bill To address.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>shipFrom</td>
<td>ConnectApi.TaxAddressRequest</td>
<td>Ship From address.</td>
<td>Optional</td>

<td>55.0</td>
</tr>
<tr>
<td>soldTo</td>
<td>ConnectApi.TaxAddressRequest</td>
<td>Sold To address.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
</tbody>
</table>

**ConnectApi.TaxCustomerDetailsRequest**

Customer details for the tax calculation.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>accountId</td>
<td>String</td>
<td>ID of the customer's account.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>code</td>
<td>String</td>
<td>Customer code.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>exemptionNo</td>
<td>String</td>
<td>Tax exemption number.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
</tbody>
</table>
### ConnectApi.TaxLineItemRequest

A list of line items passed to the tax engine for tax calculation.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>exemptionReason</td>
<td>String</td>
<td>Tax exemption reason.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>addresses</td>
<td>ConnectApi.TaxAddressesRequest</td>
<td>Addresses, including the Bill To address, Ship From address, Ship To address, and Sold To address.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>amount</td>
<td>Double</td>
<td>Amount of the line item.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the line item.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>effectiveDate</td>
<td>Datetime</td>
<td>Date to apply the tax calculation to the line item.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>lineNumber</td>
<td>String</td>
<td>Line number of the line item.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>productCode</td>
<td>String</td>
<td>Product code of the line item.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>quantity</td>
<td>Double</td>
<td>Quantity of the line item.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>taxCode</td>
<td>String</td>
<td>Tax code for the line item.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
</tbody>
</table>

### ConnectApi.TaxTransactionRequest

Information about the tax transaction sent to the tax adapter as part of a tax calculation request.

This class is abstract.

Superclass of `ConnectApi.CalculateTaxRequest`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>addresses</td>
<td>ConnectApi.TaxAddressesRequest</td>
<td>Addresses, including the Bill To address, Ship From address, Ship To address, and Sold To address.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>currencyIsoCode</td>
<td>String</td>
<td>Three-letter ISO 4217 currency code associated with the payment group record.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>customerDetails</td>
<td>ConnectApi.TaxCustomerDetailsRequest</td>
<td>Customer details for the tax calculation.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>Property</td>
<td>Type</td>
<td>Description</td>
<td>Required or Optional</td>
<td>Available Version</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------</td>
<td>------------------------------------------------------------------------------</td>
<td>----------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Information about whether the tax transaction failed or was successful.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>documentCode</td>
<td>String</td>
<td>Document code.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>effectiveDate</td>
<td>Datetime</td>
<td>The date that tax is applied to the taxed entity.</td>
<td>Required</td>
<td>55.0</td>
</tr>
<tr>
<td>lineItems</td>
<td>List&lt;ConnectApi.TaxLineItemRequest&gt;</td>
<td>The line items on which tax was calculated.</td>
<td>Required</td>
<td>55.0</td>
</tr>
<tr>
<td>referenceDocumentCode</td>
<td>String</td>
<td>The original document code. Used in case of subsequent transactions such as credit tax.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>referenceEntityId</td>
<td>String</td>
<td>ID of the reference entity used during tax calculation.</td>
<td>Optional</td>
<td>55.0</td>
</tr>
<tr>
<td>transactionDate</td>
<td>Datetime</td>
<td>The date that the tax transaction occurred.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
</tbody>
</table>

**ConnectApi.TextSegmentInput**

Include a text segment in a feed item or comment.
Subclass of ConnectApi.MessageSegmentInput.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>String</td>
<td>Plain text for this segment. If hashtags or links are detected in text, they're included in the comment as hashtag and link segments. Mentions aren't detected in text and aren't separated out of the text. Mentions require ConnectApi.MentionSegmentInput.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- Edit a Comment
- Edit a Feed Element
- Edit a Question Title and Post
- Post a Rich-Text Feed Element with Inline Image
- ConnectApi.MessageBodyInput

**ConnectApi.TopicInput**

Update a topic's name or description or merge topics.
### ConnectApi.TopicNamesInput

A list of topic names to replace currently assigned topics. Also a list of suggested topics to assign.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>topicNames</td>
<td>List&lt;String&gt;</td>
<td>A list of up to 10 topic names for a feed item or 100 topic names for a record.</td>
<td>Required</td>
<td>35.0</td>
</tr>
<tr>
<td>topicSuggestions</td>
<td>List&lt;String&gt;</td>
<td>A list of suggested topics to assign to a record or feed item to improve future topic suggestions.</td>
<td>Optional</td>
<td>37.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- `updateTopic(communityId, topicId, topic)`
- `reassignTopicsByName(communityId, recordId, topicNames)`
- `ConnectApi.ArticleTopicAssignmentJobInput`

### ConnectApi.TopicsCapabilityInput

Assign topics to a feed element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>contextTopic</td>
<td>String</td>
<td>Name of the parent topic in the site to which the feed element belongs.</td>
<td>Optional</td>
<td>38.0</td>
</tr>
</tbody>
</table>
### ConnectApi.FeedElementCapabilitiesInput

List of topics to assign to the feed element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>topics</td>
<td>List&lt;String&gt;</td>
<td>List of topics to assign to the feed element.</td>
<td>Required</td>
<td>38.0</td>
</tr>
</tbody>
</table>

See Also:

ConnectApi.FeedElementCapabilitiesInput

### ConnectApi.UpDownVoteCapabilityInput

Upvote or downvote a feed element or a comment.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>vote</td>
<td>ConnectApi.UpDownVoteValue</td>
<td>Type of vote for a feed element or comment. Values are: Down, None, Up.</td>
<td>Required</td>
<td>41.0</td>
</tr>
</tbody>
</table>

### ConnectApi.UpdateServiceAppointmentInput

Contains information to update a service appointment.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>serviceAppointmentId</td>
<td>String</td>
<td>The ID of the service appointment to be modified.</td>
<td>Required</td>
<td>53.0</td>
</tr>
</tbody>
</table>
| assignedResources   | List<ConnectApi.AssignedResourcesInput> | Represents the service resources who are assigned to a service appointment. When updating an appointment, pass the complete list of required resources. If you don't pass a resource who is already assigned to the appointment, the API deletes that assigned resource. For example, suppose that an existing service appointment has assigned resources: A and B and you pass B and C in assigned resources in the PATCH request. The API checks the resource availability of B and C for existing work type and service territory, and if both are available, the service appointment gets updated with:
• Resource A—Deleted | Optional             | 53.0 |
<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>lead</td>
<td>ConnectApi.LeadInput</td>
<td>Represents a prospect or lead.</td>
<td>Required if serviceAppointment isn't provided.</td>
<td>53.0</td>
</tr>
<tr>
<td>schedulingPolicyId</td>
<td>String</td>
<td>The ID of the AppointmentSchedulingPolicy object. If no scheduling policy is passed in the request body, the default configurations are used. The only scheduling policy configuration that is used in determining time slots is the enforcement of account visiting hours.</td>
<td>Optional</td>
<td>53.0</td>
</tr>
<tr>
<td>serviceAppointment</td>
<td>ConnectApi.ServiceAppointmentInput</td>
<td>Represents the service appointment details to book an appointment. When updating an appointment, pass only the fields that must be updated.</td>
<td>Required if lead isn't provided.</td>
<td>53.0</td>
</tr>
</tbody>
</table>

**ConnectApi.UserInput**

Update a user’s About Me information.
### ConnectApi.UserDetail.output

The `aboutMe` property of a `ConnectApi.UserDetail` output object. This property populates the About Me section of the user profile, which is visible to all members of an Experience Cloud site or org.

**Available Version**: 29.0

**Description**: String

**SEE ALSO**: `updateUser(communityId, userId, userInput)`

---

### ConnectApi.WishlistInput

Create a wishlist.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the wishlist.</td>
<td>Required</td>
<td>49.0</td>
</tr>
<tr>
<td>products</td>
<td>List&lt;ConnectApi.WishlistItemInput&gt;</td>
<td>List of products to add to the wishlist.</td>
<td>Optional</td>
<td>49.0</td>
</tr>
</tbody>
</table>

**SEE ALSO**: `ConnectApi.WishlistInput`, `ConnectApi.WishlistUpdateInput`

---

### ConnectApi.WishlistItemInput

Item to update or add to a wishlist.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>productId</td>
<td>String</td>
<td>ID of the product to update or add to the wishlist.</td>
<td>Required</td>
<td>49.0</td>
</tr>
</tbody>
</table>

**SEE ALSO**: `ConnectApi.WishlistInput`

---

### ConnectApi.WishlistUpdateInput

Update a wishlist name.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Wishlist name to update.</td>
<td>Required</td>
<td>50.0</td>
</tr>
</tbody>
</table>

---

### Retired ConnectApi Input Classes

These `ConnectApi` input classes are retired.
IN THIS SECTION:

- **ConnectApi.CanvasAttachmentInput**
  Used to attach a canvas app to a feed item.

- **ConnectApi.ContentAttachmentInput**
  Used to attach existing content to a comment or feed item.

- **ConnectApi.DatacloudOrderInput**
  Input representation for a Datacloud order to purchase contacts or companies and retrieve purchase information.

- **ConnectApi.FeedItemAttachmentInput**
  Used to attach a file to a feed item.

- **ConnectApi.LinkAttachmentInput**
  Add links to a feed item.

- **ConnectApi.NewFileAttachmentInput**
  Attach a new file to a feed item.

- **ConnectApi.PollAttachmentInput**
  Attach a poll to a feed item.

**ConnectApi.CanvasAttachmentInput**

Used to attach a canvas app to a feed item.

**Important:** This class isn’t available in version 32.0 and later. In version 32.0 and later, use **ConnectApi.CanvasCapabilityInput**.

Subclass of **ConnectApi.FeedItemAttachmentInput**.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>String</td>
<td>Optional. The description of the canvas app.</td>
<td>29.0–31.0</td>
</tr>
<tr>
<td>developerName</td>
<td>String</td>
<td>The developer name (API name) of the canvas app</td>
<td>29.0–31.0</td>
</tr>
<tr>
<td>height</td>
<td>String</td>
<td>Optional. The height of the canvas app in pixels. Default height is 200 pixels.</td>
<td>29.0–31.0</td>
</tr>
<tr>
<td>namespacePrefix</td>
<td>String</td>
<td>Optional. The namespace prefix of the Developer Edition organization in which the canvas app was created.</td>
<td>29.0–31.0</td>
</tr>
<tr>
<td>parameters</td>
<td>String</td>
<td>Optional. Parameters passed to the canvas app in JSON format. Example:</td>
<td>29.0–31.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>{&quot;isUpdated&quot;:&quot;true&quot;}</td>
<td></td>
</tr>
<tr>
<td>thumbnailUrl</td>
<td>String</td>
<td>Optional. A URL to a thumbnail image for the canvas app. Maximum dimensions are 120x120 pixels.</td>
<td>29.0–31.0</td>
</tr>
<tr>
<td>title</td>
<td>String</td>
<td>The title of the link used to call the canvas app.</td>
<td>29.0–31.0</td>
</tr>
</tbody>
</table>

**ConnectApi.ContentAttachmentInput**

Used to attach existing content to a comment or feed item.
**Important:** This class isn’t available in version 32.0 and later. In version 32.0 and later, use `ConnectApi.ContentCapabilityInput`.

Subclass of `ConnectApi.FeedItemAttachmentInput`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>contentDocumentId</td>
<td>String</td>
<td>ID of the existing content.</td>
<td>28.0–31.0</td>
</tr>
</tbody>
</table>

**ConnectApi.DatacloudOrderInput**

Input representation for a Datacloud order to purchase contacts or companies and retrieve purchase information.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Required or Optional</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>companyIds</td>
<td>String</td>
<td>A comma-separated list of identification numbers for the companies to be purchased. You can’t include any contact IDs or your purchase fails.</td>
<td>Required to purchase companies</td>
<td>32.0</td>
</tr>
<tr>
<td>contactIds</td>
<td>String</td>
<td>A comma-separated list of identification numbers for the contacts to be purchased. You can’t include any company IDs or your purchase fails.</td>
<td>Required to purchase contacts</td>
<td>32.0</td>
</tr>
<tr>
<td>userType</td>
<td>ConnectDatacloudUserTypeEnum</td>
<td>Indicates the Data.com user type to be used. There are two user types. • Monthly (default) • Listpool</td>
<td>Optional</td>
<td>32.0</td>
</tr>
</tbody>
</table>

SEE ALSO:

`postOrder(orderInput)`

**ConnectApi.FeedItemAttachmentInput**

Used to attach a file to a feed item.

**Important:** This class isn’t available in version 32.0 and later. In version 32.0 and later, use `ConnectApi.FeedElementCapabilityInput`.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass for:

- `ConnectApi.CanvasAttachmentInput`
- `ConnectApi.ContentAttachmentInput`
- `ConnectApi.LinkAttachmentInput`
ConnectApi.LinkAttachmentInput

Add links to a feed item.

**Important:** This class isn’t available in version 32.0 and later. In version 32.0 and later, use ConnectApi.LinkCapabilityInput.

Subclass of ConnectApi.FeedItemAttachmentInput.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>String</td>
<td>URL to be used for the link</td>
<td>28.0–31.0</td>
</tr>
<tr>
<td>urlName</td>
<td>String</td>
<td>Title of the link</td>
<td>28.0–31.0</td>
</tr>
</tbody>
</table>

ConnectApi.NewFileAttachmentInput

Attach a new file to a feed item.

**Important:** This class isn’t available in version 32.0 and later. In version 32.0 and later, use ConnectApi.ContentCapabilityInput.

The actual binary file, that is the attachment, is provided as part of the BinaryInput in the method that takes this attachment input, such as postFeedItem or postComment.

Subclass of ConnectApi.FeedItemAttachmentInput.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the file to be uploaded.</td>
<td>28.0–31.0</td>
</tr>
<tr>
<td>title</td>
<td>String</td>
<td>The title of the file. This value is required and is also used as the file name. For example, if the title is My Title, and the file is a .txt file, the file name is My Title.txt.</td>
<td>28.0–31.0</td>
</tr>
</tbody>
</table>

ConnectApi.PollAttachmentInput

Attach a poll to a feed item.

**Important:** This class isn’t available in version 32.0 and later. In version 32.0 and later, use ConnectApi.PollCapabilityInput.

Subclass of ConnectApi.FeedItemAttachmentInput.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>pollChoices</td>
<td>List&lt;String&gt;</td>
<td>The text labels for the poll items. Polls must contain between 2 to 10 poll choices.</td>
<td>28.0–31.0</td>
</tr>
</tbody>
</table>

ConnectApi Output Classes

Most ConnectApi methods return instances of ConnectApi output classes.
All properties are read-only, except for instances of output classes created within test code.
All output classes are concrete unless marked abstract in this documentation.
All concrete output classes have no-argument constructors that you can invoke only from test code. See Testing ConnectApi Code.

**ConnectApi.AbstractCartItem**

A cart item.
This class is abstract.
Superclass of:
- ConnectApi.CartItem
- ConnectApi.CartItemWithoutPrice

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>billingFrequency</td>
<td>ConnectApi.BillingFrequency</td>
<td>Reserved for future use.</td>
<td>59.0</td>
</tr>
<tr>
<td>cartId</td>
<td>String</td>
<td>ID of the cart.</td>
<td>49.0</td>
</tr>
<tr>
<td>cartItemId</td>
<td>String</td>
<td>ID of the item.</td>
<td>49.0</td>
</tr>
<tr>
<td>messagesSummary</td>
<td>ConnectApi.CartMessagesSummary</td>
<td>Messages summary for the item.</td>
<td>49.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the item.</td>
<td></td>
</tr>
<tr>
<td>productDetails</td>
<td>ConnectApi.CartItemProduct</td>
<td>Summary of the product details.</td>
<td>49.0</td>
</tr>
<tr>
<td>productId</td>
<td>String</td>
<td>ID of the product.</td>
<td>49.0</td>
</tr>
<tr>
<td>productSellingModelId</td>
<td>String</td>
<td>Reserved for future use.</td>
<td>59.0</td>
</tr>
<tr>
<td>quantity</td>
<td>String</td>
<td>Quantity of the item.</td>
<td>49.0</td>
</tr>
<tr>
<td>subscriptionTerm</td>
<td>Integer on page 3125</td>
<td>Reserved for future use.</td>
<td>59.0</td>
</tr>
<tr>
<td>type</td>
<td>ConnectApi.CartItemType</td>
<td>Type of item in a cart. Values are:</td>
<td>49.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• DeliveryCharge</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Product</td>
<td></td>
</tr>
</tbody>
</table>

SEE ALSO:
ConnectApi.CartItemResult

**ConnectApi.AbstractContentHubItemType**

An item type associated with a repository folder.
This class is abstract.
Superclass of:
ConnectApi.ContentHubItemTypeDetail
ConnectApi.ContentHubItemTypeSummary

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>contentStreamSupport</td>
<td>ConnectApi.ContentHubStreamSupport</td>
<td>Support for content streaming. Values are:</td>
<td>39.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ContentStreamAllowed</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ContentStreamNotAllowed</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ContentStreamRequired</td>
<td></td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the item type.</td>
<td>39.0</td>
</tr>
<tr>
<td>displayName</td>
<td>String</td>
<td>Display name of the item type.</td>
<td>39.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the item type.</td>
<td>39.0</td>
</tr>
<tr>
<td>isVersionable</td>
<td>Boolean</td>
<td>Indicates whether the item type can have versions.</td>
<td>39.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>URL to the detailed information of the item type.</td>
<td>39.0</td>
</tr>
</tbody>
</table>

ConnectApi.AbstractDirectoryEntrySummary

A directory entry with summary information.
This class is abstract.
Superclass of:
• ConnectApi.RepositoryGroupSummary
• ConnectApi.RepositoryUserSummary

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>domain</td>
<td>String</td>
<td>Domain of the directory entry.</td>
<td>39.0</td>
</tr>
<tr>
<td>email</td>
<td>String</td>
<td>Email of the directory entry.</td>
<td>39.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the directory entry.</td>
<td>39.0</td>
</tr>
<tr>
<td>type</td>
<td>ConnectApi.ContentHubDirectoryEntryType</td>
<td>Type of directory entry. Values are:</td>
<td>39.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• GroupEntry</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• UserEntry</td>
<td></td>
</tr>
</tbody>
</table>

ConnectApi.AbstractExtensionInformation

Extension information.
This class is abstract.
Superclass of ConnectApi.LightningExtensionInformation.
<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td><code>extensionInformationType</code></td>
<td>Information type of the extension. Values are:</td>
<td>40.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Lightning</td>
<td></td>
</tr>
</tbody>
</table>

**ConnectApi.AbstractGatewayCommonResponse**

Payment gateway response fields commonly used in payment services.

This class is abstract.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>gatewayAvsCode</td>
<td><code>String</code></td>
<td>Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.</td>
<td>50.0</td>
</tr>
<tr>
<td>gatewayDate</td>
<td><code>Datetime</code></td>
<td>Date when the notification occurred. Some gateways don’t send this value.</td>
<td>50.0</td>
</tr>
<tr>
<td>gatewayMessage</td>
<td><code>String</code></td>
<td>Error messages that the gateway returned for the notification request. Maximum length of 255 characters.</td>
<td>50.0</td>
</tr>
<tr>
<td>gatewayResultCode</td>
<td><code>String</code></td>
<td>Gateway-specific result code. You can map the result code to a Salesforce-specific result code. Maximum length of 64 characters.</td>
<td>50.0</td>
</tr>
<tr>
<td>gatewayResultCodeDescription</td>
<td><code>String</code></td>
<td>A description of the gateway-specific result code that a payment gateway returned. Maximum length of 1,000 characters.</td>
<td>50.0</td>
</tr>
<tr>
<td>salesforceResultCode</td>
<td><code>String</code></td>
<td>The Salesforce result code for the gateway result code.</td>
<td>50.0</td>
</tr>
</tbody>
</table>

**ConnectApi.AbstractGatewayResponse**

Payment gateway response fields used in sale, authorization, and capture services.

This class is abstract.

Subclass of `ConnectApi.AbstractGatewayCommonResponse`.

Superclass of:
- `ConnectApi.AuthReversalGatewayResponse`
- `ConnectApi.AuthorizationGatewayResponse`
- `ConnectApi.AuthorizationReversalResponse`
- `ConnectApi.CaptureGatewayResponse`
- `ConnectApi.PaymentMethodTokenizationGatewayResponse`
ConnectApi.PostAuthGatewayResponse
ConnectApi.RefundGatewayResponse
ConnectApi.SaleGatewayResponse

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>gatewayReferenceDetails</td>
<td>String</td>
<td>Provides information about the gateway communication.</td>
<td>50.0</td>
</tr>
<tr>
<td>gatewayReferenceNumber</td>
<td>String</td>
<td>Unique transaction ID created by the payment gateway.</td>
<td>50.0</td>
</tr>
</tbody>
</table>

ConnectApi.AbstractManagedContentDeliveryDocument

Managed content delivery document.
This class is abstract.
Superclass of:
- ConnectApi.ManagedContentDeliveryDocument
- ConnectApi.ManagedContentDeliveryDocumentSummary

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>contentKey</td>
<td>String</td>
<td>Globally unique identifier (GUID) for the managed content.</td>
<td>55.0</td>
</tr>
<tr>
<td>contentType</td>
<td>ConnectApi.ManagedContentTypeSummary</td>
<td>Type of managed content.</td>
<td>55.0</td>
</tr>
<tr>
<td>language</td>
<td>String</td>
<td>Language locale of the managed content.</td>
<td>55.0</td>
</tr>
<tr>
<td>managedContentId</td>
<td>String</td>
<td>ID of the managed content.</td>
<td>55.0</td>
</tr>
<tr>
<td>publishedDate</td>
<td>Datetime</td>
<td>Most recent publish date of the managed content.</td>
<td>55.0</td>
</tr>
<tr>
<td>resourceUrl</td>
<td>String</td>
<td>URL to the single content delivery resource.</td>
<td>55.0</td>
</tr>
<tr>
<td>title</td>
<td>String</td>
<td>Title of the managed content.</td>
<td>55.0</td>
</tr>
<tr>
<td>unauthenticatedUrl</td>
<td>String</td>
<td>Public URL for the managed content.</td>
<td>55.0</td>
</tr>
<tr>
<td>urlName</td>
<td>String</td>
<td>URL name of the managed content.</td>
<td>55.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- ConnectApi.ManagedContentDeliveryDocumentCollection

ConnectApi.AbstractManagedContentReference

Managed content reference.
This class is abstract.
Superclass of:
- ConnectApi.ManagedContentReference
- ConnectApi.ManagedContentReferenceSummary

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>contentKey</td>
<td>String</td>
<td>Unique identifier for the managed content reference.</td>
<td>54.0</td>
</tr>
<tr>
<td>managedContentId</td>
<td>String</td>
<td>ID of the managed content reference.</td>
<td>54.0</td>
</tr>
<tr>
<td>resourceUrl</td>
<td>String</td>
<td>URL to the single content delivery resource.</td>
<td>55.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- ConnectApi.ManagedContentDeliveryDocumentCollection

**ConnectApi.AbstractMessageBody**

Abstract message body.
This class is abstract.
Superclass of:
- ConnectApi.FeedBody
- ConnectApi.MessageBody

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isRichText</td>
<td>Boolean</td>
<td>Indicates whether the body is rich text.</td>
<td>35.0</td>
</tr>
<tr>
<td>messageSegments</td>
<td>List&lt;ConnectApi.MessageSegment&gt;</td>
<td>List of message segments</td>
<td>28.0</td>
</tr>
<tr>
<td>text</td>
<td>String</td>
<td>Display-ready text. Use this text if you don't want to process the message segments.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

**ConnectApi.AbstractNBAAction**

A recommended action of recommendation strategy.
This class is abstract.
Superclass of ConnectApi.NBAFlowAction.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameters</td>
<td>List&lt;ConnectApi.NBAActionParameter&gt;</td>
<td>List of parameters to pass to the action.</td>
<td>45.0</td>
</tr>
</tbody>
</table>
**Available Version**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
</table>
| type          | ConnectApi.NBAActionType | Type of action. Values are:  
- Flow—Automated process tool with multiple subtypes. | 45.0 |

SEE ALSO:

ConnectApi.NBARecommendation

**ConnectApi.AbstractNBATarget**

A recommendation target of a recommendation strategy.

This class is abstract.

Superclass of ConnectApi.NBANativeRecommendation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
</table>
| type          | ConnectApi.NBATargetType | Type of target. Values are:  
- Recommendation | 45.0 |

SEE ALSO:

ConnectApi.NBARecommendation

**ConnectApi.AbstractRecommendation**

A Chatter, custom, or static recommendation.

This class is abstract.

Superclass of:

- ConnectApi.EntityRecommendation
- ConnectApi.NonEntityRecommendation

ConnectApi.NonEntityRecommendation isn’t used in version 34.0 and later. In version 34.0 and later, ConnectApi.EntityRecommendation is used for all recommendations.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>explanation</td>
<td>ConnectApi.RecommendationExplanation</td>
<td>The Chatter, custom, or static recommendation explanation.</td>
<td>32.0</td>
</tr>
<tr>
<td>platformActionGroup</td>
<td>ConnectApi.PlatformActionGroup</td>
<td>A platform action group instance with state appropriate for the context user.</td>
<td>34.0</td>
</tr>
</tbody>
</table>
### ConnectApi.AbstractRecommendationExplanation

Explanation for a Chatter recommendation.

This class is abstract.

Superclass of `ConnectApi.RecommendationExplanation`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>summary</td>
<td>String</td>
<td>Summary explanation for the Chatter recommendation.</td>
<td>32.0</td>
</tr>
<tr>
<td>type</td>
<td><code>ConnectApi.RecommendationExplanationType</code></td>
<td>Indicates the reason for the Chatter recommendation.</td>
<td>32.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ArticleHasRelatedContent—Articles with related content to a context article.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ArticleViewedTogether—Articles often viewed together with the article that the context user just viewed.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ArticleViewedTogetherWithViewers—Articles often viewed together with other records that the context user views.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Custom—Custom recommendations.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• FilePopular—Files with many followers or views.</td>
<td></td>
</tr>

</tbody>
</table>

**ConnectApi.AbstractRecordField**

A field on a record.

This class is abstract.

Superclass of:

- ConnectApi.BlankRecordField
ConnectApi.LabeledRecordField

Message segments in a feed item are typed as ConnectApi.MessageSegment. Feed item capabilities are typed as ConnectApi.FeedItemCapability. Record fields are typed as ConnectApi.AbstractRecordField. These classes are all abstract and have several concrete subclasses. At runtime you can use instanceof to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

Important: The composition of a feed can change between releases. Write your code to handle instances of unknown subclasses.

ConnectApi.ActionLinkDefinition

The definition of an action link. Action link definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.
<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>actionUrl</td>
<td>String</td>
<td>The action link URL. For example, a <strong>Ui</strong> action link URL is a Web page. A <strong>Download</strong> action link URL is a link to the file to download. <strong>Ui</strong> and <strong>Download</strong> action link URLs are provided to clients. An <strong>Api</strong> or <strong>ApiAsync</strong> action link URL is a REST resource. <strong>Api</strong> and <strong>ApiAsync</strong> action link URLs aren’t provided to clients. Links to Salesforce can be relative. All other links must be absolute and start with <code>https://</code>.</td>
<td>33.0</td>
</tr>
<tr>
<td>createdDate</td>
<td>Datetime</td>
<td>ISO 8601 format date string, for example, <code>2011-02-25T18:24:31.000Z</code>.</td>
<td>33.0</td>
</tr>
<tr>
<td>excludedUserId</td>
<td>String</td>
<td>ID of a single user to exclude from performing the action. If you specify an <code>excludedUserId</code>, you can’t specify an <code>userId</code>.</td>
<td>33.0</td>
</tr>
<tr>
<td>groupDefault</td>
<td>Boolean</td>
<td><code>true</code> if this action is the default action link in the action link group; <code>false</code> otherwise. There can be only one default action link per action link group. The default action link gets distinct styling in the Salesforce UI.</td>
<td>33.0</td>
</tr>
<tr>
<td>headers</td>
<td>List&lt;ConnectApi. RequestHeader&gt;</td>
<td>The request headers for the <strong>Api</strong> and <strong>ApiAsync</strong> action link types.</td>
<td>33.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>The 18-character ID for the action link definition.</td>
<td>33.0</td>
</tr>
</tbody>
</table>
| label         | String    | A custom label to display on the action link button. A `label` value can be set only in an action link template.  

Action links have four statuses: **NewStatus**, **PendingStatus**, **SuccessStatus**, and **FailedStatus**. These strings are appended to the label for each status:  
- `label`  
- `label Pending`  
- `label Success`  
- `label Failed`  

For example, if the value of `label` is “See Example,” the values of the four action link states are: See Example, See Example Pending, See Example Success, and See Example Failed.  

An action link can use either `label` or `labelKey` to generate label names, it can’t use both. If `label` has a value, the value of `labelKey` is `None`. If `labelKey` has a value other than `None`, the value of `label` is `null`. | 34.0 |
<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>labelKey</td>
<td>String</td>
<td>Key for the set of labels to show in the user interface. A set includes labels for these states: NewStatus, PendingStatus, SuccessStatus, FailedStatus. For example, if you use the Approve key, you get these labels: Approve, Pending, Approved, Failed. For a complete list of label keys, see Action Links Labels in the Connect REST API Developer Guide.</td>
<td>33.0</td>
</tr>
</tbody>
</table>
| method          | ConnectApi.HttpRequestMethod | The HTTP method. One of these values:  
  - HttpDelete—Returns HTTP 204 on success. Response body or output class is empty.  
  - HttpGet—Returns HTTP 200 on success.  
  - HttpHead—Returns HTTP 200 on success. Response body or output class is empty.  
  - HttpPatch—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty.  
  - HttpPost—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success.  
  - HttpPut—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty. | 33.0              |
| modifiedDate    | Datetime                  | ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z. | 33.0              |
| requestBody     | String                    | The request body for Api and ApiAsync action link types. **Note:** Escape quotation mark characters in the requestBody value.                                                                 | 33.0              |
| requiresConfirmation | Boolean                  | true to require the user to confirm the action; false otherwise.                                                                                                                                              | 33.0              |
| templateId      | String                    | The ID of the action link template from which to instantiate this action link. If the action link isn’t associated with a template, the value is null.                                                           | 33.0              |
| type            | ConnectApi.ActionLinkType | Defines the type of action link. Values are:  
  - Api—The action link calls a synchronous API at the action URL. Salesforce sets the status to SuccessfulStatus or FailedStatus. | 33.0              |
### ConnectApi.ActionLinkDiagnosticInfo

Any diagnostic information that may exist for an executed action link. Diagnostic info is provided only for users who can access the action link.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>diagnosticInfo</td>
<td>String</td>
<td>Any diagnostic information returned when an action link is executed. Diagnostic information is provided only for users who can access the action link.</td>
<td>33.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>The URL for this action link diagnostic information.</td>
<td>33.0</td>
</tr>
</tbody>
</table>
The definition of an action link group. Information in the action link group definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link group definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>actionLinks</td>
<td>List&lt;ConnectApi.ActionLinkDefinition&gt;</td>
<td>A collection of action link definitions that make up the action link group. Within an action link group, action links are displayed in the order listed in the actionLinks property of the ConnectApi.ActionLinkGroupDefinitionInput class. Within a feed item, action link groups are displayed in the order specified in the actionLinkGroupIds property of the ConnectApi.AssociatedActionsCapabilityInput class.</td>
<td>33.0</td>
</tr>
<tr>
<td>category</td>
<td>ConnectApi.PlatformActionGroupCategory</td>
<td>Indicates the priority and location of the action links. Values are: • Primary—The action link group is displayed in the body of the feed element. • Overflow—The action link group is displayed in the overflow menu of the feed element.</td>
<td>33.0</td>
</tr>
<tr>
<td>createdDate</td>
<td>Datetime</td>
<td>ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.</td>
<td>33.0</td>
</tr>
<tr>
<td>executions Allowed</td>
<td>ConnectApi.ActionLinkExecutionsAllowed</td>
<td>Defines the number of times an action link can be executed. Values are: • Once—An action link can be executed only one time across all users. • OncePerUser—An action link can be executed only one time for each user. • Unlimited—An action link can be executed an unlimited number of times by each user. If the action link’s actionType is Api or ApiAsync, you can’t use this value.</td>
<td>33.0</td>
</tr>
<tr>
<td>expirationDate</td>
<td>Datetime</td>
<td>ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z, that represents the date and time this action group expires and can no longer be executed. If the value is null, there isn’t an expiration date.</td>
<td>33.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>18-character ID of the action link group definition.</td>
<td>33.0</td>
</tr>
<tr>
<td>modifiedDate</td>
<td>Datetime</td>
<td>ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.</td>
<td>33.0</td>
</tr>
</tbody>
</table>
ConnectApi.ActionLinkGroup

The ID of the action link group template from which to instantiate this action link group, or null if this group isn't associated with a template.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>

<td>String</td>
<td>The ID of the action link group template from which to instantiate this action link group, or null if this group isn't associated with a template.</td>
<td>33.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>The URL for this action link group definition.</td>
<td>33.0</td>
</tr>
</tbody>
</table>

ConnectApi.ActivitySharingResult

The results of sharing a captured email or event.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>Boolean</td>
<td>Whether the share operation succeeded or not.</td>
<td>39.0</td>
</tr>
</tbody>
</table>

ConnectApi.Actor

Actor.

This class is abstract.

Superclass of:
- ConnectApi.ActorWithId
- ConnectApi.RecommendedObject
- ConnectApi.UnauthenticatedUser

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>

### ConnectApi.AdjustOrderSummaryOutputRepresentation

Output representation of the financial changes for an adjust items action. For a preview action, these values are the expected output. For a submit action, these values are the actual output.

Subclass of ConnectApi.BaseOutputRepresentation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>changeBalances</td>
<td>ConnectApi.ChangeItemOutputRepresentation</td>
<td>Expected (for preview) or actual (for submit) financial values for the price adjustment action. Most of the values match the change order values. If two change</td>
<td>49.0</td>
</tr>
</tbody>
</table>
orders are returned, then these values combine them. The sign of a value in this output is the opposite of the corresponding value on a change order record. For example, a discount is a positive value in changeBalances and a negative value on a change order record.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>inFulfillment ChangeOrderId</td>
<td>String</td>
<td>ID of the change Order that holds the financial changes applicable to OrderItemSummary quantities that are in the process of being fulfilled. This change Order is only created for a request that specified an allocatedItemsChangeOrderType of InFulfillment. For an adjustPreview call, this value is always null.</td>
<td>55.0</td>
</tr>
<tr>
<td>orderSummaryId</td>
<td>String</td>
<td>ID of the OrderSummary.</td>
<td>49.0</td>
</tr>
<tr>
<td>postFulfillment ChangeOrderId</td>
<td>String</td>
<td>ID of the change Order that holds the financial changes applicable to OrderItemSummary quantities that have been fulfilled. For an adjustPreview call, this value is always null.</td>
<td>49.0</td>
</tr>
<tr>
<td>preFulfillment ChangeOrderId</td>
<td>String</td>
<td>ID of the change Order that holds the financial changes applicable to OrderItemSummary quantities that have not been fulfilled. If the request specified an allocatedItemsChangeOrderType of PreFulfillment, this change Order also includes the changes applicable to OrderItemSummary quantities that are in the process of being fulfilled. For an adjustPreview call, this value is always null.</td>
<td>49.0</td>
</tr>
</tbody>
</table>

**ConnectApi.Alternative**

Alternative representation for an extension on a feed element.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>text Representation</td>
<td>String</td>
<td>Text representation of the extension.</td>
<td>40.0</td>
</tr>
<tr>
<td>thumbnailUrl</td>
<td>String</td>
<td>Thumbnail URL to the extension.</td>
<td>40.0</td>
</tr>
<tr>
<td>title</td>
<td>String</td>
<td>Title of the extension.</td>
<td>40.0</td>
</tr>
</tbody>
</table>

**ConnectApi.AlternativePaymentMethodOutput**

Alternative payment method details output.
### Property Name

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>accountId</td>
<td>String</td>
<td>Salesforce Payments account to which this payment method is linked.</td>
<td>56.0</td>
</tr>
<tr>
<td>comments</td>
<td>String</td>
<td>Details about a record added by a user. Maximum of 1,000 characters.</td>
<td>56.0</td>
</tr>
<tr>
<td>email</td>
<td>String</td>
<td>Email address of the card holder.</td>
<td>56.0</td>
</tr>
<tr>
<td>gatewayToken</td>
<td>String</td>
<td>A unique, alphanumeric ID, called a token, that a payment gateway generates when it first processes a payment. The token replaces the actual payment data so that the data is kept secure. This token is stored as encrypted text, and can be used for recurring payments.</td>
<td>56.0</td>
</tr>
<tr>
<td>gatewayTokenDetails</td>
<td>String</td>
<td>Detailed information about the gateway token.</td>
<td>56.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name that you assign to the payment method object.</td>
<td>56.0</td>
</tr>
</tbody>
</table>

### ConnectApi.Announcement

An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>

### Available Version

**Property Name** | **Type** | **Description** | **Available Version**
--- | --- | --- | ---
errors &nbsp; | List<ConnectApi.ErrorResponse> &nbsp; | Any errors that were returned. | 48.0 |
success &nbsp; | Boolean &nbsp; | Indicates whether the transaction was successful. | 48.0 |

---

### ConnectApi.BatchResult

The result of an operation returned by a batch method.

#### Usage

Calls to batch methods return a list of BatchResult objects. Each element in the BatchResult list corresponds to the strings in the list parameter passed to the batch method. The first element in the BatchResult list matches the first string passed in the list parameter, the second element corresponds with the second string, and so on. If only one string is passed, the BatchResult list contains a single element.

#### Example

The following example shows how to obtain and iterate through the returned ConnectApi.BatchResult objects. The code adds two group IDs to a list. One of group IDs is incorrect, which causes a failure when the code calls the batch method. After it calls the batch method, it iterates through the results to determine whether the operation was successful or not for each group ID in the list. The code writes the ID of every group that was processed successfully to the debug log. The code writes an error message for every failed group.

This example generates one successful operation and one failure.

```java
List<String> myList = new List<String>(){
    // Add one correct group ID.
    myList.add('0F9D00000000oOT');
    // Add one incorrect group ID.
    myList.add('0F9D00000000izf');

    ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterGroups.getGroupBatch(null, myList);

    // Iterate through each returned result.
    for (ConnectApi.BatchResult batchResult : batchResults) {
        if (batchResult.isSuccess()) {
            // Operation was successful.
            // Print the group ID.
            ConnectApi.ChatterGroupSummary groupSummary;
            if(batchResult.getResult() instanceof ConnectApi.ChatterGroupSummary) {
                groupSummary = (ConnectApi.ChatterGroupSummary) batchResult.getResult();
            }
            System.debug('SUCCESS');
            System.debug(groupSummary.id);
        } else {
            // Operation failed. Print errors.
            System.debug('FAILURE');
        }
    }
};
```
IN THIS SECTION:

**BatchResult Methods**

These are instance methods for **BatchResult**.

**getError()**

If an error occurred, returns a **ConnectApi.ConnectApiException** object providing the error code and description.

**getErrorMessage()**

Returns a String that contains an error message.

**getErrorTypeName()**

Returns a String that contains the name of the error type.

**getResult()**

Returns an object that contains the results of the batch operation. The object is typed according to the batch method. For example, if you call `getMembershipBatch()`, a successful call to BatchResult `getResult()` returns a **ConnectApi.GroupMembership** object.

**isSuccess()**

Returns a Boolean that is set to `true` if the batch operation was successful for this object, `false` otherwise.

**getError()**

If an error occurred, returns a **ConnectApi.ConnectApiException** object providing the error code and description.

**getErrorMessage()**

Returns a String that contains an error message.

**getErrorTypeName()**

Returns a String that contains the name of the error type.

**getResult()**

Returns an object that contains the results of the batch operation. The object is typed according to the batch method. For example, if you call `getMembershipBatch()`, a successful call to BatchResult `getResult()` returns a **ConnectApi.GroupMembership** object.

**isSuccess()**

Returns a Boolean that is set to `true` if the batch operation was successful for this object, `false` otherwise.
Usage
The error message doesn't make a round trip through a Visualforce view state, because exceptions can't be serialized.

getErrorTypeName()
Returns a String that contains the name of the error type.

Signature

```java
public String getErrorTypeName()
```

ReturnValue
Type: String

getResult()
Returns an object that contains the results of the batch operation. The object is typed according to the batch method. For example, if you call `getMembershipBatch()`, a successful call to `BatchResult getResult()` returns a `ConnectApi.GroupMembership` object.

Signature

```java
public Object getResult()
```

ReturnValue
Type: Object

isSuccess()
Returns a Boolean that is set to `true` if the batch operation was successful for this object, `false` otherwise.

Signature

```java
public Boolean isSuccess()
```

ReturnValue
Type: Boolean

ConnectApi.BlankRecordField
Record field displayed as a place holder in a grid of fields.
Subclass of `ConnectApi.AbstractRecordField`. 
**ConnectApi.BookmarksCapability**

If a feed element has this capability, the context user can bookmark it.
Subclass of `ConnectApi.FeedElementCapability`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isBookmarkedByCurrentUser</td>
<td>Boolean</td>
<td>Indicates whether the feed element has been bookmarked by the context user (true) or not (false).</td>
<td>32.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- `ConnectApi.FeedElementCapabilities`

**ConnectApi.BookmarkSummary**

Summary of a bookmark.
Subclass of `ConnectApi.UserFeedEntityActivitySummary`.
No additional properties.

**ConnectApi.BotInfoRepresentation**

Information about the bot associated with the conversation application.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>botId</td>
<td>String</td>
<td>ID of the bot.</td>
<td>54.0</td>
</tr>
<tr>
<td>botName</td>
<td>String</td>
<td>Name of the bot.</td>
<td>54.0</td>
</tr>
<tr>
<td>lastModifiedDate</td>
<td>Datetime</td>
<td>Last modified date of the bot definition.</td>
<td>54.0</td>
</tr>
</tbody>
</table>

**ConnectApi.BotVersionActivationInfo**

Success or failure information of the bot version activation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isActivated</td>
<td>Boolean</td>
<td>Indicates whether the bot is active or not.</td>
<td>51.0</td>
</tr>
<tr>
<td>messages</td>
<td>List&lt;String&gt;</td>
<td>Failure messages.</td>
<td>50.0</td>
</tr>
<tr>
<td>success</td>
<td>Boolean</td>
<td>Indicates whether the activation was successful or not.</td>
<td>50.0</td>
</tr>
</tbody>
</table>

**ConnectApi.BundleCapability**

If a feed element has this capability, it has a container of feed elements called a **bundle**.
This class is abstract.

Subclass of `ConnectApi.FeedElementCapability`.

Superclass of:
- `ConnectApi.GenericBundleCapability`
- `ConnectApi.TrackedChangeBundleCapability`

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>bundleType</td>
<td><code>ConnectApi.BundleType</code></td>
<td>Defines this feed element’s bundle type. The bundle type determines what additional information appears in the bundle.</td>
<td>31.0</td>
</tr>
<tr>
<td>page</td>
<td><code>ConnectApi.FeedElementPage</code></td>
<td>A collection of feed elements.</td>
<td>31.0</td>
</tr>
<tr>
<td>totalElements</td>
<td><code>Integer</code></td>
<td>The total number of feed elements that this bundle aggregates.</td>
<td>31.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- `ConnectApi.FeedElementCapabilities`

### ConnectApi.CallCollaborationCapability

If a feed element has this capability, it has a recording comment.

Subclass of `ConnectApi.FeedElementCapability`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>commentEndTime</td>
<td><code>Integer</code></td>
<td>End time of the comment on the media player, in seconds.</td>
<td>51.0</td>
</tr>
<tr>
<td>commentStartTime</td>
<td><code>Integer</code></td>
<td>Start time of the comment on the media player, in seconds.</td>
<td>51.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- `ConnectApi.FeedElementCapabilities`

### ConnectApi.CandidateAnswersStatus

The status of candidate answers on a feed element.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>hasCandidateAnswers</td>
<td><code>Boolean</code></td>
<td>Indicates whether candidate answers are available for a question.</td>
<td>41.0</td>
</tr>
<tr>
<td>hasCandidateAnswersPublished</td>
<td><code>Boolean</code></td>
<td>Indicates whether any candidate answers are published.</td>
<td>41.0</td>
</tr>
</tbody>
</table>
### ConnectApi.CanvasCapability

If a feed element has this capability, it renders a canvas app.

Subclass of `ConnectApi.FeedElementCapability`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>String</td>
<td>A description of the canvas app. The maximum size is 255 characters.</td>
<td>32.0</td>
</tr>
<tr>
<td>developerName</td>
<td>String</td>
<td>The API name (developer name) of the connected app.</td>
<td>32.0</td>
</tr>
<tr>
<td>height</td>
<td>String</td>
<td>The height of the canvas app in pixels.</td>
<td>32.0</td>
</tr>
<tr>
<td>icon</td>
<td>ConnectApi.Icon</td>
<td>The icon for the canvas app.</td>
<td>32.0</td>
</tr>
<tr>
<td>namespacePrefix</td>
<td>String</td>
<td>A unique namespace prefix for the canvas app.</td>
<td>32.0</td>
</tr>
<tr>
<td>parameters</td>
<td>String</td>
<td>JSON parameters passed to the canvas app.</td>
<td>32.0</td>
</tr>
<tr>
<td>thumbnailUrl</td>
<td>String</td>
<td>A thumbnail URL to a preview image. The maximum thumbnail size is 120 pixels</td>
<td>32.0</td>
</tr>
<tr>
<td>title</td>
<td>String</td>
<td>A title for the canvas link.</td>
<td>32.0</td>
</tr>
</tbody>
</table>

SEE ALSO:

- `ConnectApi.QuestionAndAnswersCapability`
- `ConnectApi.FeedElementCapabilities`

### ConnectApi.CapacityResponseOutputRepresentation

Response to a request related to a location’s fulfillment capacity.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>actionRequestId</td>
<td>String</td>
<td>Unique string that identifies the original capacity request.</td>
<td>55.0</td>
</tr>
<tr>
<td>error</td>
<td>ConnectApi.ErrorResponse</td>
<td>Error returned by the request, if any.</td>
<td>55.0</td>
</tr>
<tr>
<td>success</td>
<td>Boolean</td>
<td>Indicates whether the request was successful.</td>
<td>55.0</td>
</tr>
</tbody>
</table>
ConnectApi.CaptureGatewayResponse

Gateway capture response.
No additional properties.

ConnectApi.CaptureResponse

Capture output.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>ConnectApi.ErrorResponse</td>
<td>Error response representation for an authorization capture.</td>
<td>50.0</td>
</tr>
<tr>
<td>gatewayResponse</td>
<td>ConnectApi.CaptureGatewayResponse</td>
<td>Gateway log response containing details about gateway logs created during the process of the capture request.</td>
<td>50.0</td>
</tr>
<tr>
<td>payment</td>
<td>ConnectApi.PaymentResponse</td>
<td>Payment response object for the capture request. Contains the information related to a payment object created during request processing.</td>
<td>50.0</td>
</tr>
<tr>
<td>paymentGatewayLogs</td>
<td>List&lt;ConnectApi.GatewayLogResponse&gt;</td>
<td>Gateway log collection for an authorization capture.</td>
<td>50.0</td>
</tr>
<tr>
<td>paymentGroup</td>
<td>ConnectApi.PaymentGroupResponse</td>
<td>Payment group associated with the capture request.</td>
<td>50.0</td>
</tr>
</tbody>
</table>

ConnectApi.CardPaymentMethodOutput

Card payment method details output.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>accountId</td>
<td>String</td>
<td>Salesforce Payments account to which this payment method is linked.</td>
<td>56.0</td>
</tr>
<tr>
<td>autoPay</td>
<td>Boolean</td>
<td>Indicates whether a token for recurring payments is being requested (true) or not (false). The token lets the payment method be used for recurring payments.</td>
<td>56.0</td>
</tr>
<tr>
<td>cardBin</td>
<td>String</td>
<td>Bank Identification Number (BIN). The BIN is the first 4-6 numbers on a payment card that identifies the card issuer.</td>
<td>56.0</td>
</tr>
<tr>
<td>cardCategory</td>
<td>ConnectApi.CardCategory</td>
<td>• CreditCard • DebitCard</td>
<td>56.0</td>
</tr>
<tr>
<td>cardHolderFirstName</td>
<td>String</td>
<td>First name of the card holder</td>
<td>56.0</td>
</tr>
</tbody>
</table>
### Available Version

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>cardHolderLastName</td>
<td>String</td>
<td>Last name of the card holder</td>
<td>56.0</td>
</tr>
<tr>
<td>cardHolderName</td>
<td>String</td>
<td>Full name of card holder</td>
<td>56.0</td>
</tr>
<tr>
<td>cardLastFour</td>
<td>String</td>
<td>Last four digits on a card</td>
<td>56.0</td>
</tr>
<tr>
<td>cardType</td>
<td>ConnectApi.CardType</td>
<td>Credit card issuer.</td>
<td>56.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• AmericanExpress</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• DinersClub</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• JCB</td>
<td></td>
</tr>
<tr>
<td></td>

<td>• MasterCard</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Visa</td>
<td></td>
</tr>
<tr>
<td>comments</td>
<td>String</td>
<td>Details about a record added by a user. Maximum of 1,000 characters.</td>
<td>56.0</td>
</tr>
<tr>
<td>displayCardNumber</td>
<td>String</td>
<td>Card displayed number</td>
<td>56.0</td>
</tr>
<tr>
<td>email</td>
<td>String</td>
<td>Email address of the card holder</td>
<td>56.0</td>
</tr>
<tr>
<td>expiryMonth</td>
<td>Integer</td>
<td>Card expiration month</td>
<td>56.0</td>
</tr>
<tr>
<td>expiryYear</td>
<td>Integer</td>
<td>Card expiration year</td>
<td>56.0</td>
</tr>
<tr>
<td>nickName</td>
<td>String</td>
<td>Optional card nickname</td>
<td>56.0</td>
</tr>
<tr>
<td>startMonth</td>
<td>Integer</td>
<td>Month when card becomes active</td>
<td>56.0</td>
</tr>
<tr>
<td>startYear</td>
<td>Integer</td>
<td>Year when card becomes active</td>
<td>56.0</td>
</tr>
</tbody>
</table>

#### ConnectApi.CartCoupon

Cart Coupon representation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>cartCouponId</td>
<td>String</td>
<td>ID of the cart coupon code.</td>
<td>54.0</td>
</tr>
<tr>
<td>couponCode</td>
<td>String</td>
<td>The coupon code a buyer can use to manually apply a promotion to the cart.</td>
<td>54.0</td>
</tr>
</tbody>
</table>

#### ConnectApi.CartCouponCollection

Collection of coupons related to a cart.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>cartCoupons</td>
<td>ConnectApi.CartCouponList&gt;</td>
<td>Collection of coupons.</td>
<td>54.0</td>
</tr>
<tr>
<td>Property Name</td>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>--------------------------</td>
<td>-------------</td>
<td></td>
</tr>
<tr>
<td>cartId</td>
<td>String</td>
<td>ID of the cart.</td>
<td>54.0</td>
</tr>
<tr>
<td>cartStatus</td>
<td>ConnectApi.CartStatus</td>
<td>Status of the cart. Values are:</td>
<td>54.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Active—Cart is created and available for modifications, like adding or removing products or promotions.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Checkout—Cart is in checkout. If the customer modifies the cart, the current checkout session is canceled.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Closed—Checkout is complete and an order was created. The cart cannot be modified.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- PendingClosed—Cart is marked to be closed, but the request isn’t completed yet. The cart can’t be modified. This value is available in API version 57.0 and later.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- PendingDelete—Cart is marked for delete, but the request isn’t completed yet. The cart can’t be modified.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Processing—Cart is processing. For example, taxes are being calculated. The cart can’t be modified.</td>
<td></td>
</tr>
<tr>
<td>ownerId</td>
<td>String</td>
<td>ID of the user who owns the cart.</td>
<td>54.0</td>
</tr>
</tbody>
</table>

### ConnectApi.CartCouponList

List of coupons for a cart.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>coupons</td>
<td>List&lt;ConnectApi.CartCoupon&gt;</td>
<td>List of coupons associated with a cart.</td>
</tr>
</tbody>
</table>

### ConnectApi.CartInventoryItemReservationOutputRepresentation (Pilot)

Inventory item reservation.

**Note:** This feature is not generally available and is being piloted with certain Customers subject to additional terms and conditions. It is not part of your purchased Services. This feature is subject to change, may be discontinued with no notice at any time in Salesforce’s sole discretion, and Salesforce may never make this feature generally available. ### ConnectApi.CartItemWithoutPrice

An item without price information in a cart.

Subclass of ConnectApi.AbstractCartItem.

No additional properties.

### ConnectApi.CartMessage

Cart message.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>Cart message.</td>
<td>49.0</td>
</tr>
<tr>
<td>messageId</td>
<td>String</td>
<td>ID of the object supplying the message.</td>
<td>49.0</td>
</tr>
<tr>
<td>relatedEntityId</td>
<td>String</td>
<td>ID of the entity, for example, cart, cart item, or cart tax, associated with the message.</td>
<td>49.0</td>
</tr>
<tr>
<td>severity</td>
<td>ConnectApi.CartMessageSeverity</td>
<td>Severity of cart message. Values are:</td>
<td>49.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Error</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Info</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Warning</td>
<td></td>
</tr>
</tbody>
</table>
### ConnectApi.CartMessagesSummary

Cart messages summary.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorCount</td>
<td>Integer</td>
<td>In <code>ConnectApi.CartItemResult</code>, the count of messages with the Error severity level.</td>
<td>49.0</td>
</tr>
<tr>
<td>hasErrors</td>
<td>Boolean</td>
<td>Specifies whether there are messages related to the entity (<code>true</code>) or not (<code>false</code>).</td>
<td>49.0</td>
</tr>
<tr>
<td>limitedMessages</td>
<td>List&lt;<code>ConnectApi.CartMessage</code>&gt;</td>
<td>In <code>ConnectApi.CartItemResult</code>, a limited list of messages related to the cart item. In <code>ConnectApi.CartSummary</code>, each message can be related to the cart or to another cart-related entity.</td>
<td>49.0</td>
</tr>
<tr>
<td>relatedEntityId</td>
<td>String</td>
<td>In <code>ConnectApi.CartItemResult</code>, the ID of the related cart item. In <code>ConnectApi.CartSummary</code>, each message can be related to the cart or to another cart-related entity.</td>
<td>49.0</td>
</tr>
<tr>
<td>totalLineItemsWithErrors</td>
<td>Integer</td>
<td>In <code>ConnectApi.CartItemResult</code>, either <code>null</code> if the cart item has no errors or 1 if the cart item has errors. In <code>ConnectApi.CartSummary</code>, the total number of product line items that contain errors.</td>
<td>50.0</td>
</tr>
</tbody>
</table>

<td></td>
<td></td>
<td>• <strong>Processing</strong>—Cart is processing. For example, taxes are being calculated. The cart can’t be modified.</td>
<td></td>
</tr>
</tbody>
</table>
### ConnectApi.CartPromotionList
A list of promotions for a cart.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>promotions</td>
<td>List&lt;ConnectApi.CartPromotionList&gt;</td>
<td>Promotions associated with a cart.</td>
<td>54.0</td>
</tr>
</tbody>
</table>

### ConnectApi.CartPromotionOutputRepresentation
A promotion associated with a cart.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjustmentAmount</td>
<td>String</td>
<td>Adjustment amount out of the promotion.</td>
<td>53.0</td>
</tr>
<tr>
<td>couponCode</td>
<td>String</td>
<td>Coupon code for a promotion. A coupon code is available only for manual promotions, not for automatic promotions.</td>
<td>54.0</td>
</tr>
<tr>
<td>currencyIsoCode</td>
<td>String</td>
<td>Currency ISO code associated with the cart.</td>
<td>57.0</td>
</tr>
<tr>
<td>displayName</td>
<td>String</td>
<td>Localized display name of the promotion.</td>
<td>52.0</td>
</tr>
<tr>
<td>promotionId</td>
<td>String</td>
<td>ID of the promotion.</td>
<td>53.0</td>
</tr>
</tbody>
</table>
| targetType | ConnectApi.CartPromotionType | Promotion target type. Values are:
- Cart—Promotion targets a cart.
- Item—Promotion targets an item in a cart. | 53.0 |
| termsAndConditions | String | Localized terms and conditions for the promotion. | 53.0 |

### ConnectApi.CartSummary
A cart summary.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>accountId</td>
<td>String</td>
<td>ID of the account for the cart.</td>
<td>49.0</td>
</tr>
<tr>
<td>Property Name</td>
<td>Type</td>
<td>Description</td>
<td>Available Version</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>asyncOperationStatus</td>
<td>String</td>
<td>Asynchronous processing status of the cart, if asynchronous processing is enabled for the store. This property returns Completed in Apex, because Apex operations always run synchronously.</td>
<td>59.0</td>
</tr>
<tr>
<td>cartId</td>
<td>String</td>
<td>ID of the cart.</td>
<td>49.0</td>
</tr>
<tr>
<td>currencyIsoCode</td>
<td>String</td>
<td>Three-letter ISO 4217 currency code associated with the cart.</td>
<td>49.0</td>
</tr>
<tr>
<td>grandTotalAmount</td>
<td>String</td>
<td>Grand total amount including shipping and tax for items in the cart, in the currency of the cart.</td>
<td>49.0</td>
</tr>
<tr>
<td>isSecondary</td>
<td>Boolean</td>
<td>Specifies whether the cart is secondary (true) or not (false).</td>
<td>53.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the cart.</td>
<td>49.0</td>
</tr>
<tr>
<td>ownerId</td>
<td>String</td>
<td>ID of the owner of the cart.</td>
<td>49.0</td>
</tr>
<tr>
<td>ownerOrderId</td>
<td>String</td>
<td>ID of the owner of the order.</td>
<td>58.0</td>
</tr>
<tr>
<td>purchaseOrderNumber</td>
<td>String</td>
<td>Purchase order for the cart.</td>
<td>50.0</td>
</tr>
<tr>
<td>status</td>
<td>ConnectApi.CartStatus</td>
<td>Status of the cart. Values are:</td>
<td>49.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Active—Cart is created and available for modifications, like adding or removing products or promotions.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Checkout—Cart is in checkout. If the customer modifies the cart, the current checkout session is canceled.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Closed—Checkout is complete and an order was created. The cart cannot be modified.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• PendingClosed—Cart is marked to be closed, but the request isn’t completed yet. The cart can’t be modified. This value is available in API version 57.0 and later.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• PendingDelete—Cart is marked for delete, but the request isn’t completed yet. The cart can’t be modified.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Processing—Cart is processing. For example, taxes are being calculated. The cart can’t be modified.</td>
<td></td>
</tr>
<tr>
<td>taxType</td>
<td>String</td>
<td>Tax type of the cart.</td>
<td>55.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Gross—Gross taxation policy.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Net—Net taxation policy.</td>
<td></td>
</tr>
<tr>
<td>Property Name</td>
<td>Type</td>
<td>Description</td>
<td>Available Version</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------</td>
<td>------------------------------------------------------------------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>totalChargeAmount</td>
<td>String</td>
<td>Total amount for shipping and other charges in the currency of the cart.</td>
<td>49.0</td>
</tr>
<tr>
<td>totalListPrice</td>
<td>String</td>
<td>Total list price for the cart.</td>
<td>49.0</td>
</tr>
<tr>
<td>totalProductAmount</td>
<td>String</td>
<td>Total amount including discounts, but excluding shipping and tax, for product items in the cart.</td>
<td>49.0</td>
</tr>
<tr>
<td>totalProductAmountAfterAdjustments</td>
<td>String</td>
<td>Total product amount, including promotions.</td>
<td>52.0</td>
</tr>
<tr>
<td>totalProductCount</td>
<td>String</td>
<td>Total count of items in the cart.</td>
<td>49.0</td>
</tr>
<tr>
<td>totalProductListAmount</td>
<td>String</td>
<td>Total list amount for products in the cart.</td>
<td>59.0</td>
</tr>
<tr>
<td>totalPromotionalAdjustmentAmount</td>
<td>String</td>
<td>Total promotional adjustment amount for items in the cart.</td>
<td>52.0</td>
</tr>
<tr>
<td>totalTaxAmount</td>
<td>String</td>
<td>Total tax amount for the cart, including tax on shipping, if applicable.</td>
<td>49.0</td>
</tr>
</tbody>
</table>
| type                  | ConnectApi.CartType | Type of cart. Values are:  
• Cart—Cart created by a customer.  
• ReadOnly—Clone of a Template cart that the customer can check out with.  
• Template—Cart created by an internal user. | 49.0              |
| uniqueProductCount    | Integer       | Total count of unique items, or SKUs, in the cart.                          | 49.0              |
| webstoreId            | String        | ID of the webstore of the cart.                                             | 49.0              |

ConnectApi.CartItemCollection

**ConnectApi.CartToWishlistResult**

Result of copying products from a cart to a wishlist.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>productsAddedCount</td>
<td>Integer</td>
<td>Number of products copied from the cart to the wishlist.</td>
<td>50.0</td>
</tr>
<tr>
<td>wishlistId</td>
<td>String</td>
<td>ID of the wishlist that cart products were copied to.</td>
<td>50.0</td>
</tr>
</tbody>
</table>

**ConnectApi.CaseCommentCapability**

If a feed element has this capability, it has a case comment on the case feed.  
Subclass of ConnectApi.FeedElementCapability.
### Available Version

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>actorType</td>
<td><code>ConnectApi.CaseActorType</code></td>
<td>Specifies the type of user who made the comment.</td>
<td>32.0</td>
</tr>
<tr>
<td>createdBy</td>
<td><code>ConnectApi.Actor</code></td>
<td>Information about the user who created the comment.</td>
<td>32.0</td>
</tr>
<tr>
<td>createdDate</td>
<td><code>Datetime</code></td>
<td>ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.</td>
<td>32.0</td>
</tr>
<tr>
<td>eventType</td>
<td><code>ConnectApi.CaseCommentEventType</code></td>
<td>Specifies an event type for a comment in the case feed.</td>
<td>32.0</td>
</tr>
<tr>
<td>id</td>
<td><code>String</code></td>
<td>18-character ID of case comment.</td>
<td>32.0</td>
</tr>
<tr>
<td>published</td>
<td><code>Boolean</code></td>
<td>Specifies whether the comment has been published.</td>
<td>32.0</td>
</tr>
<tr>
<td>text</td>
<td><code>String</code></td>
<td>Text of the case comment.</td>
<td>32.0</td>
</tr>
</tbody>
</table>

### ConnectApi.CdpActionResponse

Customer Data Platform action response.

This class is abstract.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>errors</td>
<td><code>List&lt;ConnectApi.CdpErrorResponse&gt;</code></td>
<td>List of errors that resulted from the action.</td>
<td>57.0</td>
</tr>
<tr>
<td>success</td>
<td><code>Boolean</code></td>
<td>Indicates whether the call was successful (<code>true</code>) or not (<code>false</code>).</td>
<td>57.0</td>
</tr>
</tbody>
</table>

### ConnectApi.CdpCalculatedInsightPage

Collection of calculated insights.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>collection</td>
<td><code>ConnectApi.CdpCalculatedInsightPageData</code></td>
<td>Collection of calculated insights.</td>
<td>57.0</td>
</tr>
</tbody>
</table>
ConnectApi.CdpCalculatedInsightPageData

Calculated insight collection data.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>Integer</td>
<td>Number of results returned in the page.</td>
<td>57.0</td>
</tr>
<tr>
<td>currentPageToken</td>
<td>String</td>
<td>Token identifying the current page.</td>
<td>57.0</td>
</tr>
<tr>
<td>currentPageUrl</td>
<td>String</td>
<td>Connect REST API URL identifying the current page.</td>
<td>57.0</td>
</tr>
<tr>
<td>items</td>
<td>List</td>
<td>List of calculated insights.</td>
<td>57.0</td>
</tr>
<tr>
<td>nextPageToken</td>
<td>String</td>
<td>Token identifying the next page, or null if there isn't a next page.</td>
<td>57.0</td>
</tr>
<tr>
<td>nextPageUrl</td>
<td>String</td>
<td>Connect REST API URL identifying the next page, or null if there isn't a next page.</td>
<td>57.0</td>
</tr>
<tr>
<td>previousPageToken</td>
<td>String</td>
<td>Token identifying the previous page, or null if there isn't a previous page.</td>
<td>57.0</td>
</tr>
<tr>
<td>previousPageUrl</td>
<td>String</td>
<td>Connect REST API URL identifying the previous page, or null if there isn't a previous page.</td>
<td>57.0</td>
</tr>
<tr>
<td>total</td>
<td>Integer</td>
<td>Total row count of calculated insights.</td>
<td>57.0</td>
</tr>
</tbody>
</table>

### ConnectApi.ChangeltemOutputRepresentation

The financial changes resulting from a change to one or more OrderItemSummaries. Most of the values represent the deltas of the values on the associated OrderSummary. The sign of each value is the opposite of the corresponding value on a change order record. For example, a discount is a positive value here and a negative value on a change order record.

<table>
<thead>
<tr>
<th>Property Name</th>

<td>String</td>
<td>URL to the next page of streams.</td>
<td>39.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>In version 39.0, all streams are included in currentPageUrl and nextPageUrl is null.</td>
<td></td>
</tr>
<tr>
<td>total</td>
<td>Integer</td>
<td>Total number of streams in the collection.</td>
<td>39.0</td>
</tr>
</tbody>
</table>

### ConnectApi.ClientInfo

Client information.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>applicationName</td>
<td>String</td>
<td>Name of the connected app used for authentication.</td>
<td>28.0</td>
</tr>
<tr>
<td>applicationUrl</td>
<td>String</td>
<td>Value from the Info URL field of the connected app used for authentication.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

### ConnectApi.CloseCapability

If a feed element has this capability, users with permission can close it.

Users can’t edit (specifically the feed item body or title), comment on, or delete a closed feed element. If the closed feed element is a poll, users can’t vote on it. Users can’t edit (specifically the comment body) or delete a comment on a closed feed element or select or remove it as best answer.
Admins and moderators can edit and delete closed feed elements and comments on closed feed elements. Admins and moderators can select or remove the best answer status on comments on closed feed elements.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>canContextUser</td>
<td>Boolean</td>
<td>Specifies whether the context user has permission to set the feed element to closed (true) or not (false).</td>
<td>43.0</td>
</tr>
<tr>
<td>UpdateIsClosed</td>
<td>Boolean</td>
<td></td>
<td></td>
</tr>
<tr>
<td>isClosed</td>
<td>Boolean</td>
<td>Specifies whether the feed element is closed (true) or not (false).</td>
<td>43.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- ConnectApi.FeedElementCapabilities

### ConnectApi.Comment

A comment.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachment</td>
<td>ConnectApi.FeedItem.Attachment</td>
<td>If the comment contains an attachment, property value is ContentAttachment. If the comment does not contain an attachment, it is null.</td>
<td>28.0–31.0</td>
</tr>
<tr>
<td>body</td>
<td>ConnectApi.FeedBody</td>
<td>Body of the comment.</td>
<td>28.0</td>
</tr>
<tr>
<td>capabilities</td>
<td>ConnectApi.CommentCapabilities</td>
<td>Capabilities associated with the comment, such as any file attachments.</td>
<td>32.0</td>
</tr>
<tr>
<td>clientInfo</td>
<td>ConnectApi.ClientInfo</td>
<td>Information about the connected app used to authenticate the connection.</td>
<td>28.0</td>
</tr>
<tr>
<td>createdDate</td>
<td>Datetime</td>
<td>ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.</td>
<td>28.0</td>
</tr>
<tr>
<td>feedElement</td>
<td>ConnectApi.Reference</td>
<td>Feed element on which the comment is posted.</td>
<td>28.0–31.0</td>
</tr>
<tr>
<td>feedItem</td>
<td>ConnectApi.Reference</td>
<td>Feed item on which the comment is posted.</td>
<td>28.0–31.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>Comment’s 18-character ID.</td>
<td>28.0</td>
</tr>
<tr>
<td>isDelete</td>
<td>Boolean</td>
<td>If this property is true, the context user can’t delete the comment. If this property is false, the context user might be able to delete the comment.</td>
<td>28.0</td>

### ConnectApi.CommentPage

A page of comments.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>comments</td>
<td>List&lt;ConnectApi.Comment&gt;</td>
<td>Collection of comments.</td>
<td>28.0–31.0</td>
</tr>
<tr>
<td></td>
<td>Important:</td>
<td>As of version 32.0, use the <code>items</code> property.</td>
<td></td>
</tr>
<tr>
<td>currentPageToken</td>
<td>String</td>
<td>Token identifying the current page.</td>
<td>28.0</td>
</tr>
<tr>
<td>currentPageUrl</td>
<td>String</td>
<td>Connect REST API URL identifying the current page.</td>
<td>28.0</td>
</tr>
<tr>
<td>items</td>
<td>List&lt;ConnectApi.Comment&gt;</td>
<td>Collection of comments for this feed element.</td>
<td>32.0</td>
</tr>
</tbody>
</table>
### ConnectApi.CommentsCapability

Summary of the comment.

Subclass of `ConnectApi.UserActivitySummary`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>commentId</td>
<td>String</td>
<td>ID of the comment.</td>
<td>42.0</td>
</tr>
</tbody>
</table>

### ConnectApi.CommentsCapability

If a feed element or comment has this capability, the context user can add a comment to it.

Subclass of `ConnectApi.FeedElementCapability`. 

---

**Available Version**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>nextPageToken</td>
<td>String</td>
<td>Token identifying the next page, or <code>null</code> if there isn’t a next page.</td>

### ConnectApi.CommerceActionResult

Result of executing a commerce action.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isSuccess</td>
<td>Boolean</td>
<td>Specifies whether the action is a success (true) or not (false).</td>
<td>53.0</td>
</tr>
<tr>
<td>message</td>
<td>String</td>
<td>Action result message.</td>
<td>53.0</td>
</tr>
</tbody>
</table>

### ConnectApi.CommerceAddressCollection

A collection of Commerce addresses.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>Integer</td>
<td>Count of addresses.</td>
<td>54.0</td>
</tr>
<tr>
<td>currentPageToken</td>
<td>String</td>
<td>Token to the current page of addresses.</td>
<td>54.0</td>
</tr>
<tr>
<td>currentPageUrl</td>
<td>String</td>
<td>URL to the current page of addresses.</td>
<td>54.0</td>
</tr>
<tr>
<td>items</td>
<td>AddressDetails</td>
<td>Address Details</td>
<td>54.0</td>
</tr>
<tr>
<td>nextPageToken</td>
<td>String</td>
<td>Token to the next page of addresses.</td>
<td>54.0</td>
</tr>
<tr>
<td>nextPageUrl</td>
<td>String</td>
<td>URL to the next page of addresses.</td>
<td>54.0</td>
</tr>
<tr>
<td>pageSize</td>
<td>Integer</td>
<td>Page size for addresses.</td>
<td>54.0</td>
</tr>
<tr>
<td>previousPageToken</td>
<td>String</td>
<td>Token to previous page of addresses.</td>
<td>54.0</td>
</tr>
<tr>
<td>previousPageUrl</td>
<td>String</td>
<td>URL to the previous page of addresses.</td>
<td>54.0</td>
</tr>
<tr>
<td>sortOrder</td>
<td>CommerceAddressSort</td>
<td>Sort order for Commerce addresses.</td>
<td>54.0</td>
</tr>
</tbody>
</table>
- CreatedDateAsc—Sort in ascending order of created date.
- CreatedDateDesc—Sort in descending order of created date.
- NameAsc—Sort in ascending order of name.
ConnectApi.CommerceAddressOutput

Address for a Commerce account.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>addressId</td>
<td>String</td>
<td>ID of the address.</td>

SEE ALSO:
ConnectApi.FilesCapability

**ConnectApi.ContentCapability**

If a comment has this capability, it has a file attachment.
Subclass of ConnectApi.FeedElementCapability.
For files attached to a feed post (instead of a comment) in version 36.0 and later, use ConnectApi.FilesCapability.
If content is deleted from a feed element after it's posted or if the access to the content is changed to private, the ConnectApi.ContentCapability exists, however most of its properties are null.
<table>

*String*  
URL to the list of items in the repository root folder.  
39.0

**SEE ALSO:**  
ConnectApi.ContentHubRepositoryCollection

### ConnectApi.ContentHubRepositoryAuthentication

Authentication information for a repository.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
</table>
| authFlowUrl         | String              | Depends on the authProtocol.  
• NoAuthentication—null.  
• Oauth—URL to start the OAuth flow.  
• Password—URL to the authentication settings for external systems. | 40.0              |

| authProtocol        | ConnectApi.         | Authentication protocol used for the repository.  
Values are:  
• NoAuthentication—Repository doesn’t require authentication.  
• Oauth—Repository uses OAuth authentication protocol.  
• Password—Repository uses user name and password authentication protocol. | 40.0              |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>userHasAuthSettings</td>
<td>Boolean</td>
<td>Specifies whether the user has credentials or the administrator configured the external data source to use the same set of credentials for every user (true). Otherwise, false.</td>
<td>40.0</td>
</tr>
</tbody>
</table>

- ConnectApi.ContentHubRepository

### ConnectApi.ContentImageFileDetails

Image file details.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>Integer</td>
<td>Image’s height in pixels.</td>
<td>40.0</td>
</tr>
<tr>
<td>imageFormat</td>
<td>String</td>
<td>Image’s format.</td>
<td>40.0</td>
</tr>
<tr>
<td>orientation</td>
<td>String</td>
<td>Image’s EXIF orientation value, if present.</td>
<td>40.0</td>
</tr>
<tr>
<td>width</td>
<td>Integer</td>
<td>Image’s width in pixels.</td>
<td>40.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- ConnectApi.InlineImageSegment

### ConnectApi.ContractOutputRepresentation

Contract list.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>List&lt;String&gt;</td>
<td>Record IDs of the contacts.</td>
<td>56.0</td>
</tr>
</tbody>
</table>
ConnectApi.ConversationApplicationDefinitionDetailRepresentation

Information about the conversation application definition.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>botInfo</td>
<td>ConnectApi.BotInfoRepresenta</td>
<td>Basic information of the bot associated with this conversation application.</td>
<td>54.0</td>
</tr>
<tr>
<td>errorMessage</td>
<td>String</td>
<td>Error message for the failed get operation.</td>
<td>54.0</td>
</tr>
<tr>
<td>integration</td>
<td>ConnectApi.ConversationAppli</td>
<td>Conversation application integration types. Values are:</td>
<td>54.0</td>
</tr>
<tr>
<td>integrationName</td>
<td>String</td>
<td>Name of the conversation application.</td>
<td>54.0</td>
</tr>
<tr>
<td>isSuccess</td>
<td>Boolean</td>
<td>Success indicator of the get operation.</td>
<td>54.0</td>
</tr>
<tr>
<td>runtimeUrl</td>
<td>String</td>
<td>Base URL of the bot runtime API.</td>
<td>54.0</td>
</tr>
</tbody>
</table>

ConnectApi.CouponCodeRedemptionResult

Coupon code redemption result.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>availableRedemptions</td>
<td>Integer</td>
<td>Number of coupon code redemptions available.</td>
<td>58.0</td>
</tr>
<tr>
<td>couponCode</td>
<td>String</td>
<td>Coupon code.</td>
<td>58.0</td>
</tr>
<tr>
<td>errorMsg</td>
<td>String</td>
<td>Error message when coupon code redemption isn’t successful.</td>
<td>58.0</td>
</tr>
<tr>
<td>isSuccess</td>
<td>Boolean</td>
<td>Specifies whether increasing or decreasing the coupon code redemption is successful (true) or not (false).</td>
<td>58.0</td>
</tr>
<tr>
<td>redemptionLimit</td>
<td>Integer</td>
<td>Number of coupon code redemptions allowed.</td>
<td>58.0</td>
</tr>
</tbody>
</table>

ConnectApi.CouponCodeRedemptionCollection

Collection of coupon code redemption results.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>couponCode</td>
<td>List&lt;ConnectApi.CouponCodeRedemptionResult&gt;</td>
<td>List of coupon code redemption results.</td>
<td>58.0</td>
</tr>
</tbody>
</table>
**ConnectApi.CreateCreditMemoOutputRepresentation**

ID of a created Credit Memo.

Subclass of `ConnectApi.BaseOutputRepresentation`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>creditMemoId</td>
<td>String</td>
<td>ID of the created Credit Memo.</td>
<td>48.0</td>
</tr>
</tbody>
</table>

**ConnectApi.ChangeOrdersInvoiceOutputRepresentation**

List of IDs of invoices created for change orders.

Subclass of `ConnectApi.BaseInvoiceOutputRepresentation`.

No additional properties.

SEE ALSO:

- `createMultipleInvoices(invoicesInput)`
- `ConnectApi.CreateMultipleInvoicesFromChangeOrdersOutputRepresentation`

**ConnectApi.CreateMultipleInvoicesFromChangeOrdersOutputRepresentation**

List of lists of invoices created from change orders for fees.

Subclass of `ConnectApi.BaseOutputRepresentation`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>invoices</td>
<td>List&lt;<code>ConnectApi.ChangeOrdersInvoiceOutputRepresentation</code>&gt;</td>
<td>List of IDs of invoices created from change orders for fees. Include these invoice IDs when calling Ensure Refunds for the return that the fees applied to.</td>
<td>56.0</td>
</tr>
</tbody>
</table>

SEE ALSO:

- `createMultipleInvoices(invoicesInput)`

**ConnectApi.CreateOrderPaymentSummaryOutputRepresentation**

ID of the created Order Payment Summary.

Subclass of `ConnectApi.BaseOutputRepresentation`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>orderPaymentSummaryId</td>
<td>String</td>
<td>ID of the Order Payment Summary.</td>
<td>48.0</td>
</tr>
</tbody>
</table>
# ConnectApi.Credential

**Credential.**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>authentication Protocol</td>
<td>ConnectApi. CredentialAuthentication Protocol</td>
<td>Authentication protocol of the external credential. Values are:</td>
<td>56.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• AwsSv4</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Custom</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Jwt</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• OAuth</td>
<td></td>
</tr>
<tr>
<td>authentication ProtocolVariant</td>
<td>ConnectApi. CredentialAuthentication ProtocolVariant</td>
<td>Authentication protocol variant of the external credential. Values are:</td>
<td>57.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• AwsSv4_STS—AWS Signature Version 4 with Security Token Service.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ClientCredentialsClientSecret—OAuth 2.0 Client Credentials client secret.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ClientCredentialsJwtAssertion—OAuth 2.0 Client Credentials JSON Web Token assertion.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• JwtBearer—OAuth 2.0 JSON Web Token bearer flow.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• NoAuthentication—No authentication.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• RolesAnywhere—AWS Signature Version 4 with Identity and Access Management (IAM) Roles Anywhere.</td>
<td></td>
</tr>
<tr>
<td>authentication Status</td>
<td>ConnectApi. CredentialAuthentication Status</td>
<td>Status of the credential authentication. Values are:</td>
<td>56.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Configured—Credential has all required credentials for at least one principal.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• NotConfigured—Credential isn’t configured.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Unknown—Credential status can’t be determined because the authentication protocol is custom.</td>
<td></td>
</tr>
<tr>
<td>credentials</td>
<td>Map&lt;String, ConnectApi. CredentialValue&gt;</td>
<td>Map of protocol-specific credentials.</td>
<td>56.0</td>
</tr>
<tr>
<td>externalCredential</td>
<td>String</td>
<td>Fully qualified developer name of the external credential.</td>
<td>56.0</td>
</tr>
<tr>
<td>principalName</td>
<td>String</td>
<td>Name of the external credential named principal.</td>
<td>56.0</td>
</tr>
</tbody>
</table>
### ConnectApi.CredentialPrincipal

**Property Name** | **Type** | **Description** | **Available Version**
--- | --- | --- | ---
principalType | ConnectApi.CredentialPrincipal Type | Type of credential principal. Values are: 
- AwsStsPrincipal 
- NamedPrincipal 
- PerUserPrincipal | 56.0

### ConnectApi.CredentialCustomHeader

Credential custom header.

**Property Name** | **Type** | **Description** | **Available Version**
--- | --- | --- | ---
headerName | String | Header name. | 57.0
headerValue | String | Header value that can contain formulas. | 57.0
id | String | ID of the customer header parameter. | 58.0
sequenceNumber | Integer | Sequence number of the header. The sequence number determines the order of the header. | 57.0

**SEE ALSO:**
- ConnectApi.ExternalCredential
- ConnectApi.NamedCredential

### ConnectApi.CredentialValue

Credential value.

**Property Name** | **Type** | **Description** | **Available Version**
--- | --- | --- | ---
encrypted | Boolean | Specifies whether the credential value is encrypted (true) or not (false). | 56.0
revision | Integer | Revision number of a short-lived credential. | 58.0
value | String | Value of the credential. | 56.0

**SEE ALSO:**
- ConnectApi.Credential

### ConnectApi.CurrencyRecordField

Record field containing a currency value.

Subclass of ConnectApi.LabeledRecordField.
**ConnectApi.CustomListAudienceCriteria**

Criteria for the custom list type of custom recommendation audience.
Subclass of `ConnectApi.AudienceCriteria`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>memberCount</td>
<td>Integer</td>
<td>Total number of members in the custom recommendation audience.</td>
<td>36.0</td>
</tr>
<tr>
<td>members</td>
<td><code>ConnectApi.UserReferencePage</code></td>
<td>Members of the custom recommendation audience.</td>
<td>36.0</td>
</tr>
</tbody>
</table>

**ConnectApi.DashboardComponentSnapshot**

Represents both dashboard component snapshots and alerts you receive when a dashboard component value crosses a threshold.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>componentId</td>
<td>String</td>
<td>18-character ID of the dashboard component.</td>
<td>32.0</td>
</tr>
<tr>
<td>componentName</td>
<td>String</td>
<td>The dashboard component name.</td>
<td>32.0</td>
</tr>
<tr>
<td>dashboardBodyText</td>
<td>String</td>
<td>Display this text next to the actor in the feed element. Use this text in place of the default body text.</td>
<td>32.0</td>
</tr>
<tr>
<td>dashboardId</td>
<td>String</td>
<td>18-character ID of the dashboard.</td>
<td>32.0</td>
</tr>
<tr>
<td>dashboardName</td>
<td>String</td>
<td>The name of the dashboard.</td>
<td>32.0</td>
</tr>
<tr>
<td>fullSizeImageUrl</td>
<td>String</td>
<td>The source URL to retrieve the full-size image of a snapshot. Access this URL with OAuth credentials.</td>
<td>32.0</td>
</tr>
<tr>
<td>lastRefreshDate</td>
<td>Datetime</td>
<td>ISO 8601 date specifying when this dashboard component was last refreshed.</td>
<td>32.0</td>
</tr>
<tr>
<td>lastRefreshDateDisplayText</td>
<td>String</td>
<td>Display text for the last refresh date, for example, “Last Refreshed on October 31, 2013.”</td>
<td>32.0</td>
</tr>
<tr>
<td>runningUser</td>
<td><code>ConnectApi.UserSummary</code></td>
<td>The running user of the dashboard at the time the snapshot was posted. This value may be <code>null</code>. Each dashboard has a running user, whose security settings determine which data to display in a dashboard.</td>
<td>32.0</td>
</tr>
<tr>
<td>thumbnailUrl</td>
<td>String</td>
<td>The source URL to retrieve the thumbnail image of a snapshot. Access this URL with OAuth credentials.</td>
<td>32.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- `ConnectApi.DashboardComponentSnapshotCapability`
- `ConnectApi.DatacloudCompanies`
ConnectApi.DashboardComponentSnapshotCapability

If a feed element has this capability, it has a dashboard component snapshot. A snapshot is a static image of a dashboard component at a specific point in time.

Subclass of ConnectApi.FeedElementCapability.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>dashboardComponent Snapshot</td>
<td>ConnectApi.DashboardComponentSnapshot</td>
<td>The dashboard component snapshot.</td>
<td>32.0</td>
</tr>
</tbody>
</table>

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.DateRecordField

Record field containing a date.

Subclass of ConnectApi.LabeledRecordField.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>dateValue</td>
<td>Datetime</td>
<td>Date that a machine can read. Ignore the trailing 00:00:00.000Z characters.</td>
<td>29.0</td>
</tr>
</tbody>
</table>

ConnectApi.DeleteIntent

Delete intent for a social post.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>managedSocialAccount</td>
<td>ConnectApi. ManagedSocialAccount</td>
<td>Managed social account that deletes the social post.</td>
<td>45.0</td>
</tr>
</tbody>
</table>

SEE ALSO:

ConnectApi.DeleteIntents

ConnectApi.DeleteIntents

List of delete intents for a social post.
### ConnectApi.DeleteSocialPostIntent
Delete intent for the social post.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>socialAccountId</td>
<td>String</td>
<td>ID of the social account that deletes the social post.</td>
<td>46.0</td>
</tr>
<tr>
<td>socialPostId</td>
<td>String</td>
<td>ID of the social post to delete.</td>
<td>46.0</td>
</tr>
</tbody>
</table>

### ConnectApi.DigestJob
Represents a successfully enqueued API digest job request.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
</table>
| period | ConnectApi.DigestPeriod | Time period that's included in a Chatter email digest. Values are:  
• DailyDigest—The email includes up to the 50 latest posts from the previous day.  
• WeeklyDigest—The email includes up to the 50 latest posts from the previous week. | 37.0 |

### ConnectApi.DirectMessageCapability
If a feed element has this capability, it’s a direct message.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>memberChanges</td>
<td>ConnectApi.DirectMessageMemberActivityPage</td>
<td>Member activities of the direct message, with the most recent activity first.</td>
<td>40.0</td>
</tr>
<tr>
<td>members</td>
<td>ConnectApi.DirectMessageMemberPage</td>
<td>Members included in the direct message.</td>
<td>39.0</td>
</tr>
<tr>
<td>originalMembers</td>
<td>ConnectApi.DirectMessageMemberPage</td>
<td>Original members of the direct message.</td>
<td>40.0</td>
</tr>
</tbody>
</table>
### ConnectApi.DirectMessageMemberActivity

Direct message member activity.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>activityDate</td>
<td>Datetime</td>
<td>Direct message member activity date.</td>
<td>40.0</td>
</tr>
<tr>
<td>actor</td>
<td>ConnectApi.UserSummary</td>
<td>User who changed the direct message membership.</td>
<td>40.0</td>
</tr>
<tr>
<td>membersAdded</td>
<td>ConnectApi.DirectMessageMemberPage</td>
<td>Members added to the direct message as part of the activity.</td>
<td>40.0</td>
</tr>
<tr>
<td>membersRemoved</td>
<td>ConnectApi.DirectMessageMemberPage</td>
<td>Members removed from the direct message as part of the activity.</td>
<td>40.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- ConnectApi.DirectMessageMemberActivityPage

### ConnectApi.DirectMessageMemberActivityPage

A page of direct message member activities.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>activities</td>
<td>List&lt;ConnectApi.DirectMessageMemberActivity&gt;</td>
<td>Collection of direct message member activities.</td>
<td>40.0</td>
</tr>
<tr>
<td>currentPageToken</td>
<td>String</td>
<td>Token identifying the current page.</td>
<td>40.0</td>
</tr>
<tr>
<td>currentPageUrl</td>
<td>String</td>
<td>Connect REST API URL identifying the current page.</td>
<td>40.0</td>
</tr>
<tr>
<td>nextPageToken</td>
<td>String</td>
<td>Token identifying the next page, or null if there isn't a next page.</td>
<td>40.0</td>
</tr>
</tbody>
</table>
### ConnectApi.DirectMessageMemberPage

A collection of direct message members.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>currentPageToken</td>
<td>String</td>
<td>Page token to access the current page of direct message members.</td>
<td>39.0</td>
</tr>
<tr>
<td>currentPageUrl</td>
<td>String</td>
<td>URL to the current page of direct message members.</td>
<td>39.0</td>
</tr>
<tr>
<td>nextPageToken</td>
<td>String</td>
<td>Page token to access the next page of direct message members.</td>
<td>39.0</td>
</tr>
<tr>
<td>nextPageUrl</td>
<td>String</td>
<td>URL to the next page of direct message members.</td>
<td>39.0</td>
</tr>
<tr>
<td>users</td>
<td>List&lt;ConnectApi.UserSummary&gt;</td>
<td>Collection of direct message members.</td>
<td>39.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- ConnectApi.DirectMessageCapability
- ConnectApi.DirectMessageCapability
- ConnectApi.DirectMessageMemberActivity

### ConnectApi.DistanceCalculationOutputRepresentation

Shipping distance data for a set of inventory locations.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>averageDistance</td>
<td>Double</td>
<td>The average distance from the locations to the order recipient.</td>
<td>51.0</td>
</tr>
<tr>
<td>locations</td>
<td>List&lt;ConnectApi.LocationOutputRepresentation&gt;</td>
<td>The list of locations and their distances to the order recipient.</td>
<td>51.0</td>
</tr>
<tr>
<td>rank</td>
<td>Integer</td>
<td>This result’s rank among all results by average distance to the order recipient.</td>
<td>51.0</td>
</tr>
</tbody>
</table>
ConnectApi.DistinctFacetValue

Distinct facet value.
This class is a subclass of ConnectApi.FacetValue.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>displayName</td>
<td>String</td>
<td>Display name of the facet value.</td>
<td>52.0</td>
</tr>
<tr>
<td>nameOrId</td>
<td>String</td>
<td>Developer name of the attribute.</td>
<td>52.0</td>
</tr>
<tr>
<td>productCount</td>
<td>Long</td>
<td>Number of products in the search result that match the facet value.</td>
<td>52.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
ConnectApi.DistinctValueSearchFacet

ConnectApi.DistinctValueSearchFacet

Facet with distinct values in product search results.
This class is a subclass of ConnectApi.SearchFacet.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>values</td>
<td>List&lt;ConnectApi.DistinctFacetValue&gt;</td>
<td>Values of the facet found in the search result. Sorted by display name in alphabetical order.</td>
<td>52.0</td>
</tr>
</tbody>
</table>

ConnectApi.DownVoteSummary

Summary of a downvote.
Subclass of ConnectApi.UserFeedEntityActivitySummary.
No additional properties.

ConnectApi.EditCapability

If a feed element or comment has this capability, users who have permission can edit it.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isEditRestricted</td>
<td>Boolean</td>
<td>Specifies whether editing this feed element or comment is restricted. If true, the context user can’t edit this feed element or comment. If false, the context user may or may not have permission to edit this feed element or comment. To determine if the context user can edit a feed element or comment, use the isFeedElementEditableByMe(communityId, feedElementId) or</td>
<td>34.0</td>
</tr>
</tbody>
</table>
### isCommentEditableByMe(communityId, commentId) method.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isEditableByMeUrl</td>
<td>String</td>
<td>The URL to check if the context user is able to edit this feed element or comment.</td>
<td>34.0</td>
</tr>
<tr>
<td>lastEditedBy</td>
<td>ConnectApi.Actor</td>
<td>Who last edited this feed element or comment.</td>
<td>34.0</td>
</tr>
<tr>
<td>lastEditedDate</td>
<td>Datetime</td>
<td>The most recent edit date of this feed element or comment.</td>
<td>34.0</td>
</tr>
<tr>
<td>latestRevision</td>
<td>Integer</td>
<td>The most recent revision of this feed element or comment.</td>
<td>34.0</td>
</tr>
<tr>
<td>relativeLastEditedDate</td>
<td>String</td>
<td>Relative last edited date, for example, “2h ago.”</td>
<td>34.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- ConnectApi.CommentCapabilities

## ConnectApi.EmailAddress

Email address.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>displayName</td>
<td>String</td>
<td>The display name for the email address.</td>
<td>29.0</td>
</tr>
<tr>
<td>emailAddress</td>
<td>String</td>
<td>The email address.</td>
<td>29.0</td>
</tr>
<tr>
<td>relatedRecord</td>
<td>ConnectApi.RecordSummary</td>
<td>The summary of a related record, for example, a contact or user summary.</td>
<td>36.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- ConnectApi.EmailMessageCapability

## ConnectApi.EmailAttachment

An email attachment in an email message.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachment</td>
<td>ConnectApi.RecordSummary</td>
<td>Record summary of the attachment.</td>
<td>36.0</td>
</tr>
<tr>
<td>contentType</td>
<td>String</td>
<td>Type of attachment.</td>
<td>36.0</td>
</tr>
</tbody>
</table>
## ConnectApi.EmailMessageCapability

If a feed element has this capability, it has an email message from a case.

Subclass of **ConnectApi.FeedElementCapability**.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachments</td>
<td>List&lt;ConnectApi.EmailAttachment&gt;</td>
<td>Attachments in the email message.</td>
<td>36.0</td>
</tr>
<tr>
<td>bccAddresses</td>
<td>List&lt;ConnectApi.EmailAddress&gt;</td>
<td>BCC addresses for the email message.</td>
<td>36.0</td>
</tr>
<tr>
<td>body</td>
<td>String</td>
<td>Body of the email message.</td>
<td>36.0</td>
</tr>
<tr>
<td>ccAddresses</td>
<td>List&lt;ConnectApi.EmailAddress&gt;</td>
<td>CC addresses for the email message.</td>
<td>36.0</td>
</tr>
</tbody>
</table>
| direction     | ConnectApi.EmailMessageDirection | Direction of the email message. Values are:
|               |      | - Inbound—An inbound message (sent by a customer). | 32.0 |

### SEE ALSO:

**ConnectApi.EmailMergeFieldCollectionInfo**

The merge fields for an object.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>mergeFields</td>
<td>List&lt;String&gt;</td>
<td>List of merge fields for a single object.</td>
<td>39.0</td>
</tr>
</tbody>
</table>

### SEE ALSO:

**ConnectApi.EmailMergeFieldInfo**

The map for objects and their merge fields.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>entityToMergeFieldsMap</td>
<td>Map&lt;String, ConnectApi.EmailMergeFieldCollectionInfo&gt;</td>
<td>Map for multiple objects and their merge field collections.</td>
<td>39.0</td>
</tr>
</tbody>
</table>
## Available Version

### Description

- **Outbound**—An outbound message (sent to a customer by a support agent).

### Type

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>emailMessageId</td>
<td>String</td>
<td>ID of the email message.</td>
<td>32.0</td>
</tr>
<tr>
<td>fromAddress</td>
<td>ConnectApi.EmailAddress</td>
<td>From address for the email message.</td>
<td>36.0</td>
</tr>
<tr>
<td>htmlExpand</td>
<td>Integer</td>
<td>Start location of previous email thread.</td>
<td>47.0</td>
</tr>
<tr>
<td>isRichText</td>
<td>Boolean</td>
<td>Indicates whether the body of the email message is in rich text format.</td>
<td>36.0</td>
</tr>
<tr>
<td>status</td>
<td>ConnectApi.EmailMessageStatus</td>
<td>Status of an email message on a case. Values are:</td>
<td>47.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- DraftStatus</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>

<td></td>
<td>- SentStatus</td>
<td></td>
</tr>
<tr>
<td>subject</td>
<td>String</td>
<td>Subject of the email message.</td>
<td>32.0</td>
</tr>
<tr>
<td>textBody</td>
<td>String</td>
<td>Body of the email message.</td>
<td>32.0–35.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Important:</strong> In version 36.0 and later, use the body property.</td>
<td></td>
</tr>
<tr>
<td>toAddresses</td>
<td>List&lt;ConnectApi.EmailAddress&gt;</td>
<td>To addresses of the email message.</td>
<td>32.0</td>
</tr>
<tr>
<td>totalAttachments</td>
<td>Integer</td>
<td>Total number of attachments in the email message.</td>
<td>38.0</td>
</tr>
</tbody>
</table>

### SEE ALSO:

- ConnectApi.FeedElementCapabilities

## ConnectApi.Emoji

An emoji.

### Property Name

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>category</td>
<td>String</td>
<td>Emoji category.</td>
<td>39.0</td>
</tr>
<tr>
<td>shortcut</td>
<td>String</td>
<td>Emoji shortcut.</td>
<td>39.0</td>
</tr>
</tbody>
</table>
**ConnectApi.EmojiCollection**

A collection of emoji.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>emojis</td>
<td>List&lt;ConnectApi.Emoji&gt;</td>
<td>A collection of emoji.</td>
<td>39.0</td>
</tr>
</tbody>
</table>

**ConnectApi.EnhancedLinkCapability**

If a feed element has this capability, it has a link that may contain supplemental information like an icon, a title, and a description.

Subclass of ConnectApi.FeedElementCapability.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>String</td>
<td>A description with a 500 character limit.</td>
<td>32.0</td>
</tr>
<tr>
<td>icon</td>
<td>ConnectApi.Icon</td>
<td>A icon.</td>
<td>32.0</td>

<tr>
<td>linkUrl</td>
<td>String</td>
<td>A link URL to a detail page if available content can't display inline.</td>
<td>32.0</td>
</tr>
<tr>
<td>title</td>
<td>String</td>
<td>A title to a detail page.</td>
<td>32.0</td>
</tr>
</tbody>
</table>

**ConnectApi.EnsureFundsAsyncOutputRepresentation**

ID of the asynchronous background operation. This output only includes the operation ID, regardless of whether a call is made to an external payment gateway. It doesn't include any errors from the operation.

Subclass of ConnectApi.BaseAsyncOutputRepresentation.
No additional properties.

SEE ALSO:
ensureFundsAsync(orderSummaryId, ensureFundsInput)

ConnectApi.EnsureRefundsAsyncOutputRepresentation
ID of the asynchronous background operation. This output only includes the operation ID, regardless of whether a call is made to an external payment gateway. It doesn’t include any errors from the operation.
Subclass of ConnectApi.BaseAsyncOutputRepresentation.
No additional properties.

SEE ALSO:
ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

ConnectApi.EntityLabel
An entity’s label.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>String</td>
<td>Localized singular label of the entity.</td>
<td>40.0</td>
</tr>
<tr>
<td>labelPlural</td>
<td>String</td>
<td>Localized plural label of the entity.</td>
<td>40.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
ConnectApi.RecordSummary

ConnectApi.EntityLinkSegment
Entity link segment.
Subclass of ConnectApi.MessageSegment.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>motif</td>
<td>ConnectApi.Motif Class</td>
<td>A set of small, medium, and large icons that indicate whether the entity is a file, group, record, or user. The motif can also contain the object’s base color.</td>
<td>28.0</td>
</tr>
<tr>
<td>reference</td>
<td>ConnectApi.Reference</td>
<td>A reference to the link object if applicable, otherwise, null.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

ConnectApi.EntityRecommendation
A Chatter, custom, or static recommendation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>actOnUrl</td>
<td>String</td>
<td>For user, file, group, topic, and record entity types, use this Connect REST URL with a POST request to take action on the recommendation. For <code>ConnectApi.RecommendedObject</code> entity types, such as custom recommendations, use the <code>actionUrl</code> property of the <code>ConnectApi.PlatformAction</code> to take action on the recommendation.</td>
<td>32.0</td>
</tr>
</tbody>
</table>
| action         | `ConnectApi.RecommendationActionType` | Specifies the action to take on a recommendation.  
- follow—Follow a file, record, topic, or user.  
- join—Join a group.  
- view—View a file, group, article, record, user, custom, or static recommendation. | 32.0              |
| entity         | `ConnectApi.Actor`  | The entity with which the receiver is recommended to take action.                                                                                                                                                                                                                                                                         | 32.0              |

**ConnectApi.ErrorResponse**

Base error response.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorCode</td>
<td>String</td>
<td>Error code.</td>
<td>48.0</td>
</tr>
<tr>
<td>message</td>
<td>String</td>
<td>More error detail, if available.</td>
<td>48.0</td>
</tr>
</tbody>
</table>

<tr>
<td>attachmentId</td>
<td>String</td>
<td>Attachment ID of the extension.</td>
<td>41.0</td>
</tr>
<tr>
<td>extensionId</td>
<td>String</td>
<td>ID of the extension.</td>
<td>40.0</td>
</tr>
<tr>
<td>payload</td>
<td>String</td>
<td>Payload associated with the extension.</td>
<td>40.0</td>
</tr>
</tbody>
</table>
### payloadVersion
- **Type:** String
- **Description:** Payload version that identifies the structure of the payload associated with the extension.
- **Available Version:** 40.0

**SEE ALSO:**
- ConnectApi.ExtensionsCapability

### ConnectApi.ExtensionDefinition

An extension’s definition.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>canAccess</td>
<td>Boolean</td>
<td>Indicates whether users can access the extension when it’s associated with a feed element.</td>
<td>40.0</td>
</tr>
<tr>
<td>canCreate</td>
<td>Boolean</td>
<td>Indicates whether users can create a feed element with the extension in the org.</td>
<td>40.0</td>
</tr>
<tr>
<td>createdDate</td>
<td>Datetime</td>
<td>Date when the extension was created.</td>
<td>40.0</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the extension.</td>
<td>40.0</td>
</tr>
<tr>
<td>iconUrl</td>
<td>String</td>
<td>URL to the icon for the extension.</td>
<td>40.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the extension.</td>
<td>40.0</td>
</tr>
<tr>
<td>information</td>
<td>List&lt;ConnectApi.AbstractExtensionInformation&gt;</td>

<td>40.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**

- `ConnectApi.FeedElementCapabilities`

### ConnectApi.ExternalCredential

External credential, including the named credentials and principals associated with it and the type and status of each principal.

If you don’t have the View Setup and Configuration permission, some properties are empty or show limited information.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>authenticationProtocol</td>
<td>ConnectApi.CredentialAuthenticationProtocol</td>
<td>Authentication protocol of the external credential.</td>
<td>56.0</td>
</tr>
</tbody>
</table>

Values are:
- AwsSv4
- Custom
- Jwt
- OAuth
<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>authenticationStatus</td>
<td>ConnectApi.CredentialAuthenticationStatus</td>
<td>Status of the credential authentication. Values are:   - Configured—Credential has all required credentials for at least one principal. - NotConfigured—Credential isn’t configured. - Unknown—Credential status can’t be determined because the authentication protocol is custom.</td>
<td>56.0</td>
</tr>
<tr>
<td>createdByNamespace</td>
<td>String</td>
<td>Namespace of the package that created the external credential.</td>
<td>59.0</td>
</tr>
<tr>
<td>customHeaders</td>
<td>List&lt;ConnectApi.CredentialCustomHeader&gt;</td>
<td>List of custom headers.</td>
<td>57.0</td>
</tr>
<tr>
<td>developerName</td>
<td>String</td>
<td>Fully qualified developer name of the external credential.</td>
<td>56.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>External credential ID.</td>
<td>58.0</td>
</tr>
<tr>
<td>masterLabel</td>
<td>String</td>
<td>External credential label.</td>
<td>56.0</td>
</tr>

<td>ExternalCredentialPrincipalAccess&gt;</td>
<td></td>
<td></td>
</tr>
<tr>
<td>principalName</td>
<td><strong>String</strong></td>
<td>Name of the external credential named principal.</td>
<td>56.0</td>
</tr>
</tbody>
</table>
### ConnectApi.ExternalCredentialPrincipal

External credential principal.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
</table>
| principalType | ConnectApi.CredentialPrincipalType | Type of credential principal. Values are:  
  - AwsStsPrincipal  
  - NamedPrincipal  
  - PerUserPrincipal | 56.0               |
| sequenceNumber| Integer           | Sequence number of the external credential principal.                        | 58.0               |

**SEE ALSO:**

- ConnectApi.ExternalCredential

### ConnectApi.ExternalCredentialPrincipalAccess

External credential principal access.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>developerName</td>
<td>String</td>
<td>Developer name of the associated access entity.</td>
<td>58.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the associated access entity.</td>
<td>58.0</td>
</tr>
</tbody>
</table>
| type                | ConnectApi.ExternalCredentialPrincipalAccessType | Access type of the external credential principal. Values are:  
  - PermissionSet  
  - PermissionSetGroup  
  - Profile          | 58.0               |

**SEE ALSO:**

- ConnectApi.ExternalCredentialPrincipal

### ConnectApi.ExternalFilePermissionInformation

External file permission information.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>

<td>30.0</td>
</tr>
</tbody>
</table>

### ConnectApi.FeedDirectoryItem

Definition of a feed.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>feedElementsUrl</td>
<td>String</td>
<td>Connect REST API resource URL for the feed elements.</td>
<td></td>
</tr>
<tr>
<td>feedItemsUrl</td>
<td>String</td>
<td>Connect REST API resource URL for the feed items of a specific feed.</td>
<td>30.0–31.0</td>
</tr>
<tr>
<td>feedType</td>
<td>ConnectApi.FeedTypeEnum</td>
<td>The feed type. One of these values:</td>
<td>30.0</td>
</tr>
<tr>
<td></td>
<td>• Bookmarks—Contains all feed items saved as bookmarks by the context user.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Company—Contains all feed items except feed items of type TrackedChange. To see the feed item, the user must have sharing access to its parent.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• DirectMessageModeration—Contains all direct messages that are flagged for moderation. The Direct Message Moderation feed is available only to users with Moderate Experiences Chatter Messages permissions.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• DirectMessages—Contains all feed items of the context user's direct messages.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Draft—Contains all the feed items that the context user drafted.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Files—Contains all feed items that contain files posted by people or groups that the context user follows.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Filter—Contains the news feed filtered to contain feed items whose parent is a specified object type.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Groups—Contains all feed items from all groups the context user either owns or is a member of.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Home—Contains all feed items associated with any managed topic in an Experience Cloud site.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Landing—Contains all feed items that best drive user engagement when the feed is requested. Allows clients to avoid an empty feed when there aren't many personalized feed items.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
- **Moderation**—Contains all feed items that are flagged for moderation, except direct messages. The moderation feed is available only to users with Moderate Experiences Feeds permissions.
- **Mute**—Contains all feed items that the context user muted.
- **News**—Contains all updates for people the context user follows, groups the user is a member of, and files and records the user is following. Contains all updates for records whose parent is the context user.
- **PendingReview**—Contains all feed items and comments that are pending review.
- **People**—Contains all feed items posted by all people the context user follows.
- **Record**—Contains all feed items whose parent is a specified record, which could be a group, user, object, file, or any other standard or custom object. When the record is a group, the feed also contains feed items that mention the group. When the record is a user, the feed contains only feed items on that user. You can get another user's record feed.
- **Streams**—Contains all feed items for any combination of up to 25 feed-enabled entities that the context user subscribes to in a stream. Examples of feed-enabled entities include people, groups, and records.
- **To**—Contains all feed items with mentions of the context user. Contains feed items the context user commented on and feed items created by the context user that are commented on.
- **Topics**—Contains all feed items that include the specified topic.
- **UserProfile**—Contains feed items created when a user changes records that can be tracked in a feed. Contains feed items whose parent is the user and feed items that @mention the user. This feed is different than the news feed, which returns more feed items, including group updates. You can get another user's user profile feed.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>feedUrl</td>
<td>String</td>
<td>Connect REST API resource URL for a specific feed</td>
</tr>
<tr>
<td>keyPrefix</td>
<td>String</td>
<td>A key prefix is the first three characters of a record ID, which specifies the object type. For filter feeds, this value is the key prefix associated with the object type used to filter this feed. All feed items in this feed have a parent whose object type matches this key prefix value. For non-filter feeds, this value is null.</td>
</tr>
</tbody>
</table>
## ConnectApi.FeedElement

Feed elements are the top-level items that a feed contains. Feeds are feed element containers.

This class is abstract.

Superclass of:
- ConnectApi.FeedItem
- ConnectApi.GenericFeedElement

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>body</td>
<td>ConnectApi.FeedBody</td>
<td>Information about the feed element.</td>

<tr>
<td>feedElementType</td>
<td>ConnectApi.FeedElementType</td>
<td>Feed elements are the top-level objects that a feed contains. The feed element type describes the characteristics of that feed element. One of these values:</td>
<td>31.0</td>
</tr>
</tbody>
</table>

- **Bundle**—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values.
- **FeedItem**—A feed item has a single parent and is scoped to one Experience Cloud site or across all Experience Cloud sites. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values.
### Recommendation

- **Recommendation**—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
### ConnectApi.FeedElementCapability

A feed element capability, which defines the characteristics of a feed element.

In API version 30.0 and earlier, most feed items can have comments, likes, topics, and so on. In version 31.0 and later, every feed item (and feed element) can have a unique set of capabilities. If a capability property exists on a feed element, that capability is available, even if the capability property doesn’t have a value. For example, if the ChatterLikes capability property exists on a feed element (with or without a value), the context user can like that feed element. If the capability property doesn’t exist, it isn’t possible to like that feed element. A capability can also contain associated data. For example, the Moderation capability contains data about moderation flags.

This class is abstract.

This class is a superclass of:
- ConnectApi.AssociatedActionsCapability
- ConnectApi.ApprovalCapability
- ConnectApi.BannerCapability
- ConnectApi.BookmarksCapability
- ConnectApi.BundleCapability
- ConnectApi.CallCollaborationCapability
- ConnectApi.CanvasCapability
- ConnectApi.CaseCommentCapability
- ConnectApi.ChatterLikesCapability
- ConnectApi.CloseCapability
ConnectApi.FeedElementPage

A paged collection of ConnectApi.FeedElement objects.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>currentPageToken</td>
<td>String</td>
<td>Token identifying the current page.</td>
<td>31.0</td>
</tr>
<tr>
<td>currentPageUrl</td>
<td>String</td>
<td>Connect REST API URL identifying the current page.</td>
<td>31.0</td>
</tr>
<tr>
<td>elements</td>
<td>List&lt;ConnectApi.FeedElement&gt;</td>
<td>Collection of feed elements.</td>
<td>31.0</td>
</tr>
</tbody>
</table>

This class doesn't have any properties.
<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isModifiedToken</td>
<td>String</td>
<td>Opaque polling token to use in the <code>since</code> parameter of the <code>ChatterFeeds.isModified</code> method. The token describes when the feed was last modified.</td>
<td>31.0</td>
</tr>
<tr>
<td>isModifiedUrl</td>
<td>String</td>
<td>Connect REST API URL with a <code>since</code> request parameter that contains an opaque token that describes when the feed was last modified. Returns <code>null</code> if the feed isn’t a news feed. Use this URL to poll a news feed for updates.</td>
<td>31.0</td>
</tr>
<tr>
<td>nextPageToken</td>
<td>String</td>
<td>Token identifying the next page, or <code>null</code> if there isn’t a next page.</td>
<td>31.0</td>
</tr>
<tr>
<td>nextPageUrl</td>
<td>String</td>
<td>Connect REST API URL identifying the next page, or <code>null</code> if there isn’t a next page.</td>
<td>31.0</td>

<td>A token to use in a request to the <code>ConnectApi.ChatterFeeds.getFeedElementsUpdatedSince</code> method.</td>
<td>31.0</td>
</tr>
<tr>
<td>updatesUrl</td>
<td>String</td>
<td>Connect REST API feed resource containing the feed elements that have been updated since the feed was refreshed. If the feed doesn’t support this feature, the value is <code>null</code>.</td>
<td>31.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- `ConnectApi.BundleCapability`
- `ConnectApi.Feed`

**ConnectApi.FeedEnabledEntity**

An entity that can have feeds associated with it.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
<td>The 18-character ID of the record.</td>
<td>39.0</td>
</tr>
</tbody>
</table>
Available Version | Description | Type | Property Name
--- | --- | --- | ---
39.0 | Small, medium, and large icons indicating the record’s type. | ConnectApi.Motif | motif
39.0 | The localized name of the record. | String | name
39.0 | The type of the record. | String | type
39.0 | URL to the record. | String | url

SEE ALSO:
ConnectApi.ChatterStream

**ConnectApi.FeedEntityIsEditable**
Indicates if the context user can edit a feed element or comment.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>areAttachmentsEditableByMe</td>
<td>Boolean</td>
<td><strong>true</strong> if the context user can add and remove attachments on the feed element or comment, <strong>false</strong> otherwise.</td>
<td>36.0</td>
</tr>
<tr>
<td>feedEntityUrl</td>
<td>String</td>
<td>URL of the feed element or comment.</td>
<td>34.0</td>
</tr>
<tr>
<td>isEditableByMe</td>
<td>Boolean</td>
<td><strong>true</strong> if the context user can edit the feed element or comment, <strong>false</strong> otherwise.</td>
<td>34.0</td>
</tr>
</tbody>
</table>

**ConnectApi.FeedEntityNotAvailableSummary**
A summary when the feed entity isn’t available.
Subclass of ConnectApi.FeedEntitySummary.
No additional properties.

**ConnectApi.FeedEntityReadSummary**
Summary of the feed post or comment that was read.
Subclass of ConnectApi.UserFeedEntityActivitySummary.
No additional properties.

**ConnectApi.FeedEntityShareCapability**
If a feed element or comment has this capability, a feed entity is shared with it.
Subclass of ConnectApi.FeedElementCapability.
**ConnectApi.FeedEntitySummary**

The summary of a feed entity that is shared with a feed element.

This class is abstract.

Superclass of:
- ConnectApi.FeedItemSummary
- ConnectApi.FeedEntityNotAvailableSummary

---

<table>
<thead>
<tr>
<th>Property Name</th>

### isEntityAvailable

**Type:** Boolean

**Description:** Specifies whether the entity is available. If `false`, either the user doesn’t have access to the entity or the entity was deleted.

**Available Version:** 39.0

### parent

**Type:** `ConnectApi.ActorWithId`

**Description:** Parent of the feed entity.

**Available Version:** 39.0

### relativeCreatedDate

**Type:** String

**Description:** Relative created date, for example, “2h ago.”

**Available Version:** 39.0

### url

**Type:** String

**Description:** URL to the feed entity.

**Available Version:** 39.0

---

**SEE ALSO:**

<td>Integer</td>
<td>Total number of favorites.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

### ConnectApi.FeedItem

Feed item.

Subclass of ConnectApi.FeedElement Class as of version 31.0.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>actor</td>
<td>ConnectApi.Actor</td>
<td>The entity that created the feed item.</td>
<td>28.0</td>
</tr>
<tr>
<td>attachment</td>
<td>ConnectApi.FeedItemAttachment</td>
<td>Information about the attachment. If there is no attachment, returns null.</td>
<td>28.0–31.0</td>
</tr>
</tbody>
</table>

⚠️ **Important:** As of version 32.0, use the inherited `capabilities` property.

| canShare    | Boolean                   | Indicates whether the feed item can be shared. If a feed item has multiple file attachments and at least one attachment has been deleted or is inaccessible, the feed item can’t be shared. The `canShare` value is incorrectly set to `true` in these cases. | 28.0–38.0         |

⚠️ **Important:** As of version 39.0, use the `isSharable` property.

<p>| clientInfo | ConnectApi.ClientInfo     | Information about the connected app used to authenticate the connection. | 28.0              |</p>
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>comments</td>
<td><code>ConnectApi.CommentPage</code></td>
<td>First page of comments for this feed item.</td>
<td>28.0–31.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Important:</strong> As of version 32.0, use the inherited <code>capabilities.comments.page</code> property.</td>
<td></td>
</tr>
<tr>
<td>event</td>
<td><code>Boolean</code></td>
<td><code>true</code> if feed item is created due to an event change, <code>false</code> otherwise.</td>
<td>22.0</td>
</tr>
<tr>
<td>hasVerified Comment</td>
<td><code>Boolean</code></td>
<td><code>true</code> if the feed item has a verified comment, otherwise <code>false</code>.</td>
<td>41.0</td>
</tr>
<tr>
<td>isBookmarked ByCurrentUser</td>
<td><code>Boolean</code></td>
<td><code>true</code> if the context user has bookmarked this feed item, otherwise, <code>false</code>.</td>
<td>28.0–31.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Important:</strong> As of version 32.0, use the inherited <code>capabilities.bookmarks.isBookmarkedByCurrentUser</code> property.</td>

</tr>
<tr>
<td>--------------</td>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>type</td>
<td>ConnectApi.FeedItemType</td>
<td>Type of feed item.</td>
<td></td>
</tr>
</tbody>
</table>

**Important:** As of API version 32.0, use the `capabilities` property to determine what can be done with a feed item. See *Working with Feeds and Feed Elements*.

One of these values:

- **ActivityEvent**—Feed item generated in Case Feed when an event or task associated with a parent record with a feed enabled is created or updated.
- **AdvancedTextPost**—A feed item with advanced text formatting, such as a group announcement post.
- **ApprovalPost**—Feed item with an approval capability. Approvers can act on the feed item parent.
- **AttachArticleEvent**—Feed item generated when an article is attached to a case in Case Feed.
- **BasicTemplateFeedItem**—Feed item with an enhanced link capability.
- **CallLogPost**—Feed item generated when a call log is saved to a case in Case Feed.
- **CanvasPost**—Feed item generated by a canvas app in the publisher or from Connect REST API or Connect in Apex. The post itself is a link to a canvas app.
- **CaseCommentPost**—Feed item generated when a case comment is saved in Case Feed.
- **ChangeStatusPost**—Feed item generated when the status of a case is changed in Case Feed.
- **ChatTranscriptionPost**—Feed item generated in Case Feed when a Live Agent chat transcript is saved to a case.
- **CollaborationGroupCreated**—Feed item generated when a new public group is created. Contains a link to the new group.
- **CollaborationGroupUnarchived**—Deprecated. Feed item generated when an archived group is activated.
- **ContentPost**—Feed item with a content capability.
<table>
<thead>
<tr>

ConnectApi.FeedItemSummary

A feed item summary.

Subclass of `ConnectApi.FeedEntitySummary`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>capabilities</td>
<td><code>ConnectApi.FeedElementCapabilities</code></td>
<td>Container for all capabilities that can be included with a feed item.</td>
<td>39.0</td>
</tr>
<tr>
<td>header</td>
<td><code>ConnectApi.MessageBody</code></td>
<td>Title of the post. This property contains renderable plain text for all the message segments. If a client doesn’t know how to render a feed element type, it should render this text.</td>
<td>39.0</td>
</tr>
<tr>
<td>modifiedDate</td>
<td><code>Datetime</code></td>
<td>When the feed item was modified in the form of an ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.</td>
<td>39.0</td>
</tr>
<tr>

<td><code>ConnectApi.FeedItemVisibility</code></td>
<td>Specifies who can see a feed item.</td>
<td>39.0</td>
</tr>
</tbody>
</table>

- `InternalUsers`—Visibility is limited to internal users.
- `AllUsers`—Visibility is not limited to internal users.

ConnectApi.FeedModifiedInfo

Feed modified information.

⚠️ **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.
### isModified

`isModified` is a boolean that returns `true` if the news feed has been modified since the last time it was polled; `false` otherwise. Returns `null` if the feed is not a news feed.

**Type:** Boolean

**Available Version:** 28.0

### isModifiedToken

`isModifiedToken` is an opaque polling token to use in the `since` parameter of the `ChatterFeeds.isModified` method. The token describes when the feed was last modified.

**Type:** String

**Available Version:** 28.0

### nextPollUrl

`nextPollUrl` is a Connect REST API URL with a `since` request parameter that contains an opaque token that describes when the feed was last modified. Returns `null` if the feed isn’t a news feed. Use this URL to poll a news feed for updates.

**Type:** String

**Available Version:** 28.0

---

### ConnectApi.FeedPollChoice

Feed poll choice.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
<td>Poll choice ID.</td>
<td>28.0</td>
</tr>
<tr>
<td>position</td>
<td>Integer</td>
<td>The location in the poll where this poll choice exists.</td>
<td>28.0</td>
</tr>
<tr>
<td>text</td>
<td>String</td>
<td>Label text associated with the poll choice.</td>
<td>28.0</td>
</tr>
<tr>
<td>voteCount</td>
<td>Integer</td>
<td>Total number of votes for this poll choice.</td>
<td>28.0</td>
</tr>
<tr>
<td>voteCountRatio</td>
<td>Double</td>
<td>The ratio of total number of votes for this poll choice to all votes cast in the poll. Multiply the ratio by 100 to get the percentage of votes cast for this poll choice.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

SEE ALSO: 
- [ConnectApi.PollCapability](#)

### ConnectApi.FeedPostSummary

Summary of the post.

Subclass of [ConnectApi.UserActivitySummary](#).

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>feedItemId</td>
<td>String</td>
<td>ID of the post.</td>
<td>42.0</td>
</tr>
</tbody>
</table>

### ConnectApi.FeedReadSummary

Summary of the feed that was read.
Subclass of `ConnectApi.UserActivitySummary`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>containerId</td>
<td>String</td>
<td>ID of the parent of the feed.</td>
<td>42.0</td>
</tr>
<tr>
<td>feedType</td>
<td><code>ConnectApi.FeedType</code></td>
<td>Type of feed.</td>
<td>42.0</td>
</tr>
</tbody>
</table>

- **Bookmarks**—Contains all feed items saved as bookmarks by the context user.
- **Company**—Contains all feed items except feed items of type `TrackedChange`. To see the feed item, the user must have sharing access to its parent.
- **DirectMessageModeration**—Contains all direct messages that are flagged for moderation. The Direct Message Moderation feed is available only to users with Moderate Experiences Chatter Messages permissions.
- **DirectMessages**—Contains all feed items of the context user’s direct messages.
- **Draft**—Contains all the feed items that the context user drafted.
- **Files**—Contains all feed items that contain files posted by people or groups that the context user follows.
- **Filter**—Contains the news feed filtered to contain feed items whose parent is a specified object type.
- **Groups**—Contains all feed items from all groups the context user either owns or is a member of.
- **Home**—Contains all feed items associated with any managed topic in an Experience Cloud site.
- **Landing**—Contains all feed items that best drive user engagement when the feed is requested. Allows clients to avoid an empty feed when there aren’t many personalized feed items.
- **Moderation**—Contains all feed items that are flagged for moderation, except direct messages. The moderation feed is available only to users with Moderate Experiences Feeds permissions.
- **Mute**—Contains all feed items that the context user muted.
- **News**—Contains all updates for people the context user follows, groups the user is a member of, and files and records the user is following.
<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contains all updates for records whose parent is the context user.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>PendingReview—Contains all feed items and comments that are pending review.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>People—Contains all feed items posted by all people the context user follows.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Record—Contains all feed items whose parent is a specified record, which could be a group, user, object, file, or any other standard or custom object. When the record is a group, the feed also contains feed items that mention the group. When the record is a user, the feed contains only feed items on that user. You can get another user’s record feed.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Streams—Contains all feed items for any combination of up to 25 feed-enabled entities that the context user subscribes to in a stream. Examples of feed-enabled entities include people, groups, and records.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>To—Contains all feed items with mentions of the context user. Contains feed items the context user commented on and feed items created by the context user that are commented on.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Topics—Contains all feed items that include the specified topic.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>UserProfile—Contains feed items created when a user changes records that can be tracked in a feed. Contains feed items whose parent is the user and feed items that @mention the user. This feed is different than the news feed, which returns more feed items, including group updates. You can get another user’s user profile feed.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**ConnectApi.FieldChangeSegment**

Field change segment.

Subclass of **ConnectApi.ComplexSegment**.

No additional properties.

SEE ALSO:  
**ConnectApi.MoreChangesSegment**
ConnectApi.FieldChangeNameSegment
Field change name segment.
Subclass of ConnectApi.MessageSegment.
No additional properties.

ConnectApi.FieldChangeValueSegment
Field change value segment.
Subclass of ConnectApi.MessageSegment.

</thead>
</table>

### ConnectApi.FileAsset

An asset file.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseAssetUrl</td>
<td>String</td>
<td>Base download URL of the asset.</td>
<td>45.0</td>
</tr>
<tr>
<td>baseUnauthenticatedAssetUrl</td>
<td>String</td>
<td>Base download URL of the asset for unauthenticated users if isVisibleByExternalUsers is true, otherwise null.</td>
<td>45.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the asset.</td>
<td>45.0</td>
</tr>
<tr>
<td>isVisibleByExternalUsers</td>
<td>Boolean</td>
<td>Indicates whether unauthenticated users can see the asset file (true) or not (false).</td>
<td>45.0</td>
</tr>
<tr>
<td>masterLabel</td>
<td>String</td>
<td>Label of the asset.</td>
<td>45.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Unique name of the asset.</td>
<td>45.0</td>
</tr>
<tr>
<td>namespacePrefix</td>
<td>String</td>
<td>Namespace prefix of the package containing the asset.</td>
<td>45.0</td>
</tr>
</tbody>
</table>
### Property Name | Type | Description | Available Version
--- | --- | --- | ---
type | String | Type of asset. | 45.0

## ConnectApi.FilePreview

A file preview.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
</table>
| format | ConnectApi.FilePreviewFormat | The format of the preview. Values are:  
  - Jpg—Preview format is JPG.  
  - Pdf—Preview format is PDF.  
  - Svg—Preview format is compressed SVG.  
  - Thumbnail—Preview format is 240 x 180 PNG.  
  - ThumbnailBig—Preview format is 720 x 480 PNG.  
  - ThumbnailTiny—Preview format is 120 x 90 PNG. | 39.0 |
| previewUrlCount | Integer | The total number of preview URLs for this preview format. | 39.0 |
| previewUrls | List<ConnectApi.FilePreviewUrl> | A list of file preview URLs. | 39.0 |
| status | ConnectApi.FilePreviewStatus | The availability status of the preview. Values are:  
  - Available—Preview is available.  
  - InProgress—Preview is being processed.  
  - NotAvailable—Preview is unavailable.  
  - NotScheduled—Generation of the preview isn’t scheduled yet. | 39.0 |
| url | String | The URL for the file preview. | 39.0 |

SEE ALSO:
- ConnectApi.FilePreviewCollection

## ConnectApi.FilePreviewCollection

A collection of file previews.
### ConnectApi.FilePreviewUrl

A URL to a file preview.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>pageNumber</td>
<td>Integer</td>
<td>Preview page number starting from zero, or null for PDF files.</td>
<td>39.0</td>
</tr>
<tr>
<td>previewUrl</td>
<td>String</td>
<td>File preview URL.</td>
<td>39.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- ConnectApi.FilePreview

### ConnectApi.FilesCapability

If a feed element has this capability, it has one or more file attachments.

Subclass of ConnectApi.FeedElementCapability.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>items</td>
<td>List&lt;ConnectApi.Content&gt;</td>
<td>Collection of files.</td>
<td>36.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- ConnectApi.FeedElementCapabilities

### ConnectApi.FileSummary

A file summary.

Subclass of ConnectApi.File.

No additional properties.
ConnectApi.FindRoutesWithFewestSplitsOutputRepresentation

A list of inventory location combinations that can fulfill an order without exceeding the maximum number of shipments.
Subclass of ConnectApi.BaseOutputRepresentation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>targetLocations</td>
<td>List&lt;ConnectApi.AvailableLocationOutputRepresentation&gt;</td>
<td>Each element of the list is a set of inventory locations that together can fulfill the order being routed.</td>
<td>51.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)

ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation

A list of order fulfillment routes with inventory availability information.
Subclass of ConnectApi.BaseOutputRepresentation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>results</td>
<td>List&lt;ConnectApi.FindRoutesWithFewestSplitsWithInventoryOutputRepresentation&gt;</td>
<td>Each element of the list is the response for one element of the input list.</td>
<td>54.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

ConnectApi.FindRoutesWithFewestSplitsWithInventoryOutputRepresentation

Sets of inventory locations that can combine to fulfill an order, with availability data for those locations.
Subclass of ConnectApi.BaseOutputRepresentation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>inventory</td>
<td>ConnectApi.OCIGetInventoryAvailabilityOutputRepresentation</td>
<td>Inventory availability data for the location groups and locations specified in the input.</td>

**ConnectApi.FollowerPage**

Page of followers.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>currentPageUrl</td>
<td>String</td>
<td>Connect REST API URL identifying the current page.</td>
<td>28.0</td>
</tr>
<tr>
<td>followers</td>
<td>List&lt;ConnectApi.Subscription&gt;</td>
<td>List of subscriptions.</td>
<td>28.0</td>
</tr>
<tr>
<td>nextPageUrl</td>
<td>String</td>
<td>Connect REST API URL identifying the next page, or null if there isn’t a next page.</td>
<td>28.0</td>
</tr>
<tr>
<td>previousPageUrl</td>
<td>String</td>
<td>Connect REST API URL identifying the previous page, or null if there isn’t a previous page.</td>
<td>28.0</td>
</tr>
<tr>
<td>total</td>
<td>Integer</td>
<td>Total number of followers across all pages.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

**ConnectApi.FollowingCounts**

Following counts.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>people</td>
<td>Integer</td>
<td>Number of people user is following.</td>
<td>28.0</td>
</tr>
<tr>
<td>records</td>
<td>Integer</td>
<td>Number of records user is following. Topics are a type of record that can be followed as of version 29.0.</td>
<td>28.0</td>
</tr>
<tr>
<td>total</td>
<td>Integer</td>
<td>Total number of items user is following.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- ConnectApi.UserDetail

**ConnectApi.FollowingPage**

Page of following subscriptions.
### ConnectApi.FollowIntents

A list of follow intents for a social persona.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>follows</td>
<td>List&lt;ConnectApi.FollowSocialPersonaIntent&gt;</td>
<td>List of follow intents for the social persona.</td>
<td>45.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- ConnectApi.SocialPostIntents

### ConnectApi.FollowSocialPersonaIntent

Follow intent on a social persona.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>managedSocialAccount</td>
<td>ConnectApi.ManagedSocialAccount</td>
<td>Managed social account that follows the social persona.</td>
<td>45.0</td>
</tr>
<tr>
<td>socialPersonaId</td>
<td>String</td>
<td>ID of the social persona to follow.</td>
<td>45.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- ConnectApi.FollowIntents

### ConnectApi.Form

Marketing integration form.
Available Version | Description | Type | Property Name
---|---|---|---
53.0 | ID of the data extension associated with the marketing integration form. | String | dataExtensionId
53.0 | List of form fields associated with the marketing integration form. | ConnectApi.FormFields | formFieldsList
53.0 | ID of the marketing integration form. | String | formId
53.0 | Name of the marketing integration form. | String | formName

### ConnectApi.FormField
Marketing integration form field.

| Property Name | Type | Description | Available Version
---|---|---|---
name | String | Name of the marketing integration form field. | 53.0

*SEE ALSO:* [ConnectApi.FormFields](#)

### ConnectApi.FormFields
List of marketing integration form fields.

| Property Name | Type | Description | Available Version
---|---|---|---
formFields | List<ConnectApi.FormField> | List of form fields associated with the marketing integration form. | 53.0

*SEE ALSO:* [ConnectApi.Form](#)

### ConnectApi.FormSubmission
Marketing integration form submission.
### ConnectApi.FormulaScope

Formula scope for a target.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>contextValues</td>
<td>Map&lt;String, String&gt;</td>
<td>Map of context values for the scope.</td>
<td>50.0–51.0</td>
</tr>
<tr>
<td>contextValuesMap</td>
<td>Map&lt;String, Object&gt;</td>
<td>Map of context values for the scope.</td>
<td>52.0</td>
</tr>
<tr>
<td>fields</td>
<td>List&lt;String&gt;</td>
<td>List of fields of the scope.</td>
<td>50.0</td>
</tr>
<tr>
<td>formula</td>
<td>String</td>
<td>Formula of the scope.</td>
<td>50.0</td>
</tr>
</tbody>
</table>

**Note:** In version 52.0 and later, use the `contextValuesMap` property.

### ConnectApi.FulfillmentGroupOutputRepresentation

Information about one FulfillmentOrder from a request to create fulfillment orders from multiple OrderDeliveryGroupSummaries. If the FulfillmentOrder was created, then its ID is returned. If it failed, then data from the input is returned so you can resubmit it.

Subclass of `ConnectApi.BaseOutputRepresentation`.

| Property Name                          | Type                                                                 | Description                                                                 | Available Version |
|----------------------------------------|                                                                     |                                                                            |                  |
| fulfilledFromLocationId                | String                                                              | (Creation failed) The input FulfilledFromLocationId.                        | 50.0              |
| fulfillmentOrderId                     | String                                                              | The FulfillmentOrderId from the successfully created FulfillmentOrder.     | 50.0              |
| fulfillmentType                        | String                                                              | (Creation failed) The input FulfillmentType.                               | 50.0              |
| orderDeliveryGroupSummaryId            | String                                                              | (Creation failed) The input OrderDeliveryGroupSummaryId.                   | 50.0              |
| orderItemSummaries                     | List<ConnectApi.OrderItemSummaryOutputRepresentation>               | (Creation failed) The input list of OrderItemSummaries.                     | 50.0              |
| orderSummaryId                         | String                                                              | (Creation failed) The input OrderSummaryId.                                | 50.0              |
### ConnectApi.FulfillmentOrderCancelLineItemsOutputRepresentation

Wraps the base output.

Subclass of `ConnectApi.BaseOutputRepresentation`.

No additional properties.

### ConnectApi.FulfillmentOrderInvoiceOutputRepresentation

ID of the created invoice.

Subclass of `ConnectApi.BaseOutputRepresentation`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>invoiceId</td>
<td>String</td>
<td>ID of the created invoice.</td>
<td>48.0</td>
</tr>
</tbody>
</table>

### ConnectApi.FulfillmentOrderOutputRepresentation

A list of IDs of the created FulfillmentOrders.

Subclass of `ConnectApi.BaseOutputRepresentation`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>fulfillment</td>
<td>List&lt;String&gt;</td>
<td>A list of IDs of created Fulfillment Orders.</td>
<td>48.0</td>
</tr>
<tr>
<td>OrderIds</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### ConnectApi.GatewayLogResponse

Gateway log output.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>createdDate</td>
<td>Datetime</td>
<td>Date when the gateway log was created.</td>
<td>50.0</td>
</tr>
<tr>
<td>gatewayResultCode</td>
<td>String</td>
<td>Result codes that show the status of a transaction as it is passed to the financial institution and then returned to the client.</td>
<td>50.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the gateway log record.</td>
<td>50.0</td>
</tr>
<tr>
<td>interactionStatus</td>
<td>String</td>
<td>Gateway interaction status. It can be SUCCESS, FAILED, or TIMEOUT.</td>
<td>50.0</td>
</tr>
</tbody>
</table>
ConnectApi.GenericBundleCapability

If a feed element has this capability, the feed element has a group of other feed elements condensed into one feed element. This group is called a bundle.

Subclass of ConnectApi.BundleCapability.

ConnectApi.GenericFeedElement

A concrete implementation of the abstract ConnectApi.FeedElement class.

Subclass of ConnectApi.FeedElement.

ConnectApi.GetFOCapacityValuesOutputRepresentation

Response to a request for fulfillment order capacity values for one or more locations.

Subclass of ConnectApi.BaseOutputRepresentation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>locations</td>
<td>List&lt;ConnectApi.LocationCapacityOutputRepresentation&gt;</td>
<td>List of fulfillment order capacity values for one or more locations.</td>
<td>55.0</td>
</tr>
</tbody>
</table>

ConnectApi.GlobalInfluence

Chatter influence.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>percentile</td>
<td>String</td>
<td>Percentile value for the user's influence rank within the org or Experience Cloud site.</td>
<td>28.0</td>
</tr>
<tr>
<td>rank</td>
<td>Integer</td>
<td>Number indicating the user's influence rank, relative to all other users within the org or Experience Cloud site.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

SEE ALSO:

ConnectApi.UserDetail

ConnectApi.GroupChatterSettings

A user's Chatter settings for a specific group.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>emailFrequency</td>
<td>ConnectApi.GroupEmailFrequency</td>
<td>The frequency with which a group member receives email from a group.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

1828
**ConnectApi.GroupInformation**

Describes the Information section of the group. If the group is private, this section is visible only to members.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>String</td>
<td>The text of the “Information” section of the group.</td>
<td>28.0</td>
</tr>
<tr>
<td>title</td>
<td>String</td>
<td>The title of the “Information” section of the group.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- ConnectApi.ChatterGroupDetail

**ConnectApi.GroupMember**

Member of a group.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
<td>User’s 18-character ID.</td>
<td>28.0</td>
</tr>
<tr>
<td>lastFeed</td>
<td>Datetime</td>
<td>The date and time at which the group member last accessed the group feed.</td>
<td>31.0</td>
</tr>
<tr>
<td>role</td>
<td>ConnectApi.GroupMembership Type Enum</td>
<td>Type of membership the user has with the group.</td>
<td>28.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• GroupOwner</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• GroupManager</td>
<td></td>

<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• NotAMemberPrivateRequested</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• StandardMember</td>
<td></td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>Connect REST API URL to this membership.</td>
<td>28.0</td>
</tr>
<tr>
<td>user</td>
<td>ConnectApi.User Summary</td>
<td>Information about the user who is subscribed to this group.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- ConnectApi.GroupMemberPage

**ConnectApi.GroupMemberPage**

Page of group members.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>currentPageUrl</td>
<td>String</td>
<td>Connect REST API URL identifying the current page.</td>
<td>28.0</td>
</tr>
</tbody>
</table>
### ConnectApi.GroupMembership

Request to become a group member.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>createdDate</td>
<td>Datetime</td>
<td>ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.</td>
<td>28.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID for the group membership request object.</td>
<td>28.0</td>
</tr>
<tr>
<td>lastUpdateDate</td>
<td>Datetime</td>
<td>ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.</td>
<td>28.0</td>
</tr>
<tr>
<td>requestedGroup</td>
<td>ConnectApi. Reference</td>
<td>Information about the group the context user is requesting to join.</td>
<td>28.0</td>
</tr>
<tr>
<td>responseMessage</td>
<td>String</td>
<td>A message for the user if their membership request is declined. The value of this property is used only when the value of the status property is Declined. The maximum length is 756 characters.</td>
<td>28.0</td>
</tr>
<tr>
<td>status</td>
<td>ConnectApi. GroupMembershipRequestStatusEnum</td>
<td>Status of a request to join a private group. Values are:</td>
<td>28.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Accepted</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Declined</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Pending</td>
<td></td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>URL of the group membership request object.</td>
<td>28.0</td>
</tr>
<tr>
<td>user</td>
<td>ConnectApi.UserSummary</td>
<td>Information about the user requesting membership in a group.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**

[ConnectApi.GroupMembershipRequests](#)
ConnectApi.GroupMembershipRequests

Requests to become group members.

<td>Total number of records associated with the group.</td>
<td>33.0</td>
</tr>
</tbody>
</table>
### ConnectApi.HashtagSegment

Hashtag segment.
Subclass of ConnectApi.MessageSegment.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>String</td>
<td>Text of the topic without the hash symbol (#).</td>
<td>28.0</td>
</tr>
<tr>
<td>topicUrl</td>
<td>String</td>
<td>Connect REST API Topics resource that searches for the topic:</td>
<td>28.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>/services/data/v59.0/chatter/topics?exactMatch=true&amp;q=topic</td>
<td></td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>Connect REST API Feed Items resource URL that searches for the topic in all feed items in an organization:</td>
<td>28.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>/services/data/v59.0/chatter/feed-items?q=topic</td>
<td></td>
</tr>
</tbody>
</table>

### ConnectApi.HideSocialPostIntent

Hide intent for a social post.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isHidden</td>
<td>Boolean</td>
<td>Specifies whether the managed social account hid the social post (true) or not (false).</td>
<td>45.0</td>
</tr>
<tr>
<td>managedSocialAccount</td>
<td>ConnectApi.ManagedSocialAccount</td>
<td>Managed social account that hides the social post.</td>
<td>45.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- ConnectApi.SocialPostIntents

### ConnectApi.HoldFOCapacityOutputRepresentation

Response to a request to hold fulfillment order capacity at one or more locations. Can correspond to one action call.
Subclass of ConnectApi.BaseOutputRepresentation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>holdFOCapacityResponses</td>
<td>List&lt;ConnectApi.HoldFOCapacityResponseOutputRepresentation&gt;</td>
<td>List of responses to the requests to hold fulfillment order capacity at one or more locations.</td>
<td>55.0</td>
</tr>
</tbody>
</table>
ConnectApi.HoldFOCapacityResponseOutputRepresentation

Response to a request to hold fulfillment order capacity at one or more locations.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>capacityResponses</td>
<td>List&lt;ConnectApi.CAPACITYRESPONSEOUTPUTREPRESENTATION&gt;</td>
<td>List of responses to the requests to hold fulfillment order capacity at individual locations.</td>
<td>55.0</td>
</tr>
</tbody>
</table>

ConnectApi.Icon

Icon.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>Integer</td>
<td>The height of the icon in pixels.</td>
<td>28.0</td>
</tr>
<tr>
<td>width</td>
<td>Integer</td>
<td>The width of the icon in pixels.</td>
<td>28.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>The URL of the icon. This URL is available to unauthenticated users. This URL does not expire.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- ConnectApi.CanvasCapability
- ConnectApi.EnhancedLinkCapability
- ConnectApi.SocialPostCapability

ConnectApi.InlineImageSegment

An inline image in the feed body.

Subclass of ConnectApi.MessageSegment.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>altText</td>
<td>String</td>
<td>Alt text for the inline image.</td>
<td>35.0</td>
</tr>
<tr>
<td>contentSize</td>
<td>Integer</td>
<td>Size of the file in bytes.</td>
<td>35.0</td>
</tr>
<tr>
<td>fileExtension</td>
<td>String</td>
<td>Extension of the file, such as gif.</td>
<td>37.0</td>
</tr>
<tr>
<td>thumbnails</td>
<td>ConnectApi.FilePreviewCollection</td>
<td>Information about the available thumbnails for the image.</td>
<td>35.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>URL to the latest version of the inline image.</td>
<td>35.0</td>
</tr>
</tbody>
</table>

ConnectApi.InteractionsCapability

If a feed element has this capability, it has information about user interactions.
Subclass of `ConnectApi.FeedElementCapability`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>Long</td>
<td>The number of individual views, likes, and comments on a feed post.</td>
<td>37.0</td>
</tr>
</tbody>
</table>

**Note:** This count appears in the UI under the feed post as the number of views, for example, “5 views.”

### ConnectApi.Invitation

An invitation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>email</td>
<td>String</td>
<td>Email address of the user.</td>
<td>39.0</td>
</tr>
</tbody>
</table>
| status        | `ConnectApi.GroupViralInvitationsStatus` | Specifies the status of an invitation to join a group. Values are:  
- ActedUponUser—The user was added to the group. An email was sent asking the user to visit the group.
- Invited—An email was sent asking the user to sign up for the org.
- MaxedOutUsers—The group has the maximum allowed members.
- MultipleError—The user wasn’t invited due to multiple errors.
- NoActionNeededUser—The user is already a member of the group.
- NotVisibleToExternalInviter—The user is not accessible to the user sending the invitation.
- Unhandled—The user couldn’t be added to the group for an unknown reason. | 39.0              |
| userId        | String         | ID of the user.                                                             | 39.0              |

**SEE ALSO:**
- `ConnectApi.Invitations`
ConnectApi.Invitations
A collection of invitations.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>invitations</td>
<td>List&lt;ConnectApi.Invitation&gt;</td>
<td>Collection of invitations.</td>
<td>39.0</td>
</tr>
</tbody>
</table>

ConnectApi.KnowledgeArticleVersion
A knowledge article version.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>articleType</td>
<td>String</td>
<td>Type of the knowledge article.</td>
<td>36.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the knowledge article version.</td>
<td>36.0</td>
</tr>
<tr>
<td>knowledgeArticleId</td>
<td>String</td>
<td>ID of the corresponding knowledge article.</td>
<td>36.0</td>
</tr>
<tr>
<td>lastPublishedDate</td>
<td>Datetime</td>
<td>Last published date of the knowledge article.</td>
<td>36.0</td>
</tr>
<tr>
<td>summary</td>
<td>String</td>
<td>Summary of the knowledge article contents.</td>
<td>36.0</td>
</tr>
<tr>
<td>title</td>
<td>String</td>
<td>Title of the knowledge article.</td>
<td>36.0</td>
</tr>
<tr>
<td>urlName</td>
<td>String</td>
<td>URL name of the knowledge article.</td>
<td>36.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
ConnectApi.KnowledgeArticleVersionCollection

ConnectApi.KnowledgeArticleVersionCollection
A collection of knowledge article versions.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>items</td>
<td>List&lt;ConnectApi.KnowledgeArticleVersion&gt;</td>
<td>A collection of knowledge article versions.</td>
<td>36.0</td>
</tr>
</tbody>
</table>

ConnectApi.LabeledRecordField
Record field containing a label and a text value.
This class is abstract.
Subclass of ConnectApi.AbstractRecordField.
Superclass of:
- ConnectApi.CompoundRecordField
- ConnectApi.CurrencyRecordField
- ConnectApi.DateRecordField
ConnectApi.PercentRecordField
ConnectApi.PicklistRecordField
ConnectApi.RecordField
ConnectApi.ReferenceField
ConnectApi.ReferenceWithDateRecordField

**Important:** The composition of a feed can change between releases. Write your code to handle instances of unknown subclasses.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>String</td>
<td>Localized string describing the record field.</td>
<td>29.0</td>
</tr>
<tr>
<td>text</td>
<td>String</td>
<td>Text value of the record field. All record fields have a text value. To ensure that all clients can consume new content, inspect the record field’s type property. If it isn’t recognized, render the text value as the default case.</td>
<td>29.0</td>
</tr>
</tbody>
</table>

**ConnectApi.LightningExtensionInformation**

Lightning extension information.
Subclass of ConnectApi.AbstractExtensionInformation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>compositionComponent</td>
<td>String</td>
<td>Component to use in compose state.</td>
<td>40.0</td>
</tr>
<tr>
<td>headerTextLabel</td>
<td>String</td>
<td>Label for the extension’s header.</td>
<td>40.0</td>
</tr>
<tr>
<td>hoverTextLabel</td>
<td>String</td>
<td>Label for hovering over the extension.</td>
<td>40.0</td>
</tr>
<tr>
<td>renderComponent</td>
<td>String</td>
<td>Component to use in render or preview state.</td>
<td>40.0</td>
</tr>
</tbody>
</table>

SEE ALSO:

ConnectApi.ExtensionDefinition

**ConnectApi.LikeIntent**

Like intent for a social post.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isLiked</td>
<td>Boolean</td>
<td>Specifies whether the managed social account liked the social post (true) or not (false).</td>
<td>45.0</td>
</tr>
</tbody>
</table>
### ConnectApi.LikeIntents

List of like intents for a social post.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>likes</td>
<td>List&lt;ConnectApi.LikeIntent&gt;</td>
<td>List of like intents for the social post.</td>
<td>45.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- ConnectApi.SocialPostIntents

### ConnectApi.LikeSocialPostIntent

Like intent on a social post.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>socialAccountId</td>
<td>String</td>
<td>ID of the social account that likes the social post.</td>
<td>46.0</td>
</tr>
<tr>
<td>socialPostId</td>
<td>String</td>
<td>ID of the social post to like.</td>
<td>46.0</td>
</tr>
</tbody>
</table>

### ConnectApi.LikeSummary

Summary of a like.
Subclass of ConnectApi.UserFeedEntityActivitySummary.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>likeId</td>
<td>String</td>
<td>ID of the like.</td>
<td>42.0</td>
</tr>
</tbody>
</table>

### ConnectApi.LinkCapability

If a feed element has this capability, it has a link.
Subclass of ConnectApi.FeedElementCapability.
### Available Version
<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>String</td>
<td>Link URL. The URL can be to an external site.</td>
<td>32.0</td>
</tr>
<tr>
<td>urlName</td>
<td>String</td>
<td>Description of the link.</td>
<td>32.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- [ConnectApi.FeedElementCapabilities](#)

### ConnectApi.LinkMetadata

Metadata for a link.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the link.</td>
<td>42.0</td>
</tr>
<tr>
<td>frameSource</td>
<td>String</td>
<td>HTML required to display the resource.</td>
<td>42.0</td>
</tr>
<tr>
<td>height</td>
<td>Integer</td>
<td>Height required to display the HTML.</td>
<td>42.0</td>
</tr>
<tr>
<td>originalUrl</td>
<td>String</td>
<td>Original URL that was used to request the metadata.</td>
<td>42.0</td>
</tr>
<tr>
<td>providerUrl</td>
<td>String</td>
<td>URL of the provider that the information is retrieved from.</td>
<td>42.0</td>
</tr>
<tr>
<td>source</td>
<td><a href="#">ConnectApi.LinkMetadataSource</a></td>
<td>Source of the link metadata. Values are:</td>
<td>42.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- None—Link metadata wasn’t retrieved.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- SfDc—Salesforce is the source.</td>
<td></td>
</tr>
<tr>
<td>thumbnailUrl</td>
<td>String</td>
<td>Thumbnail of the resource.</td>
<td>42.0</td>
</tr>
<tr>
<td>title</td>
<td>String</td>
<td>Title of the link.</td>
<td>42.0</td>
</tr>
<tr>
<td>type</td>
<td><a href="#">ConnectApi.LinkMetadataType</a></td>
<td>Type of link that the metadata represents. Values are:</td>
<td>42.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Error—Link metadata couldn’t be retrieved.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Link—Represents a link.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- None—Link metadata wasn’t retrieved because the link isn’t an allowed domain.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Photo—Represents a photo.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Rich—Represents rich content, typically HTML content.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Unknown—Link metadata was retrieved, but the type is unknown.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Video—Represents a video.</td>
<td></td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>URL of the image to display, if one is available.</td>
<td>42.0</td>
</tr>
<tr>
<td>Property Name</td>
<td>Type</td>
<td>Description</td>
<td>Available Version</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------</td>
<td>------------------------------------------------------------------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>width</td>
<td>Integer</td>
<td>Width required to display the HTML.</td>
<td>42.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
*ConnectApi.LinkMetadataCollection*

**ConnectApi.LinkMetadataCollection**

Collection of link metadata.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>linkMetadataList</td>
<td>List</td>
<td>List of metadata for links.</td>
<td>42.0</td>
</tr>
</tbody>
</table>

**ConnectApi.LinkSegment**

Link segment.
Subclass of *ConnectApi.MessageSegment*.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>String</td>
<td>The link URL.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

**ConnectApi.LocationOutputRepresentation**

An inventory location’s distance to an order recipient.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>distance</td>
<td>Double</td>
<td>The distance from the location to the order recipient.</td>
<td>51.0</td>
</tr>
<tr>
<td>locationIdentifier</td>
<td>String</td>
<td>The location identifier.</td>
<td>51.0</td>
</tr>
</tbody>
</table>

**ConnectApi.LocationCapacityOutputRepresentation**

Fulfillment order capacity values for a location.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>assigned</td>
<td>Integer</td>
<td>Value of the location’s Assigned Fulfillment Order Count.</td>
<td>55.0</td>
</tr>
<tr>
<td>capacity</td>
<td>Integer</td>
<td>Value of the location’s Fulfillment Order Capacity. This property represents the location’s maximum capacity.</td>
<td>55.0</td>
</tr>
</tbody>
</table>
### ConnectApi.ErrorResponse

Error returned by the request, if any.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>ConnectApi.ErrorResponse</td>
<td></td>
<td>55.0</td>
</tr>
</tbody>
</table>

### ConnectApi.heldCapacity

Number of fulfillment orders that the location is holding capacity for.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>heldCapacity</td>
<td>Integer</td>
<td></td>
<td>55.0</td>
</tr>
</tbody>
</table>

### ConnectApi.locationId

ID of the location.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>locationId</td>
<td>String</td>
<td></td>
<td>55.0</td>
</tr>
</tbody>
</table>

### ConnectApi.MaintenanceInfo

Information about the upcoming scheduled maintenance for the organization.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the maintenance.</td>
<td>34.0</td>
</tr>
<tr>
<td>maintenanceTitle</td>
<td>String</td>
<td>Title of the maintenance.</td>
<td>34.0</td>
</tr>
<tr>
<td>maintenanceType</td>
<td>ConnectApi.MaintenanceType</td>
<td>Type of maintenance. Values are:</td>
<td>34.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Downtime—Downtime maintenance.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• GenerallyAvailable—Maintenance with generally available mode.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• MaintenanceWithDowntime—Scheduled maintenance with downtime.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>•ReadOnly—Maintenance with read-only mode.</td>
<td></td>
</tr>
<tr>
<td>message</td>
<td>Datetime</td>
<td>Effective time when users start seeing the maintenance message.</td>
<td>34.0</td>
</tr>
<tr>
<td>EffectiveTime</td>
<td>Datetime</td>
<td></td>
<td></td>
</tr>
<tr>
<td>message</td>
<td>Datetime</td>
<td>Expiration time of the maintenance message.</td>
<td>34.0</td>
</tr>
<tr>
<td>ExpirationTime</td>
<td>Datetime</td>
<td></td>
<td></td>
</tr>
<tr>
<td>scheduledEnd</td>
<td>Datetime</td>
<td>Scheduled end of downtime. null for GenerallyAvailable and ReadOnly maintenance types.</td>
<td>34.0</td>
</tr>
<tr>
<td>Downtime</td>
<td>Datetime</td>
<td></td>
<td></td>
</tr>
<tr>
<td>scheduledEnd</td>
<td>Datetime</td>
<td>Scheduled end of maintenance. null for Downtime maintenance type.</td>
<td>34.0</td>
</tr>
<tr>
<td>MaintenanceTime</td>
<td>Datetime</td>
<td></td>
<td></td>
</tr>
<tr>
<td>scheduledStart</td>
<td>Datetime</td>
<td>Scheduled start of downtime. null for GenerallyAvailable and ReadOnly maintenance types.</td>
<td>34.0</td>
</tr>
<tr>
<td>Downtime</td>
<td>Datetime</td>
<td></td>
<td></td>
</tr>
<tr>
<td>scheduledStart</td>
<td>Datetime</td>
<td>Scheduled start time of maintenance. null for Downtime maintenance type.</td>
<td>34.0</td>
</tr>
<tr>
<td>MaintenanceTime</td>
<td>Datetime</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<td>htmlTag</td>
<td>String</td>
<td>The HTML tag for this markup.</td>
<td>35.0</td>
</tr>
<tr>
<td>markupType</td>
<td>ConnectApi. MarkupType</td>
<td>Type of rich text markup.</td>
<td>35.0</td>
</tr>
</tbody>
</table>

- **Bold**—Bold tag.
- **Code**—Code tag.
### ConnectApiMarkupEndSegment

The end of rich text markup.

Subclass of `ConnectApi.MessageSegment`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>url</code></td>
<td><code>String</code></td>
<td>URL to the segment, if available.</td>
<td>45.0</td>
</tr>
</tbody>
</table>

### ConnectApiMediaReference

A media reference.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mediaUrl</code></td>
<td><code>String</code></td>
<td>URL to stream or download the media.</td>
<td>41.0</td>
</tr>
</tbody>
</table>
### ConnectApi.MediaReferenceCapability

If a feed element has this capability, it has one or more media references.

Subclass of `ConnectApi.FeedElementCapability`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>media</td>
<td>List&lt;ConnectApi.MediaReference&gt;</td>
<td>Collection of media references.</td>
<td>41.0</td>
</tr>
</tbody>
</table>

### ConnectApi.MentionCompletion

Information about a record that could be used to @mention a user or group.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalLabel</td>
<td>String</td>
<td>If one exists, an additional label for the record represented by this completion, for example, “(Customer)” or “(Acme Corporation)”.</td>
<td>29.0</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>A description of the record represented by this completion.</td>
<td>29.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the record represented by this completion. The name is localized, if possible.</td>
<td>29.0</td>
</tr>
<tr>
<td>outOfOffice</td>
<td>ConnectApi.OutOfOffice</td>
<td>If the record represented by this completion is a user, an additional out-of-office message, if one exists, for the user.</td>
<td>40.0</td>
</tr>
<tr>
<td>photoUrl</td>
<td>String</td>
<td>A URL to the photo or icon of the record represented by this completion.</td>
<td>29.0</td>
</tr>
<tr>
<td>recordId</td>
<td>String</td>
<td>The ID of the record represented by this completion.</td>
<td>29.0</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
<td>Available Version</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>

</tbody>
</table>

ConnectApi.MentionValidation

Information about whether a proposed mention is valid for the context user.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>recordId</td>
<td>String</td>
<td>The ID of the mentioned record.</td>
<td>29.0</td>
</tr>
<tr>
<td>validationStatus</td>
<td>ConnectApi.MentionValidation Status Enum</td>
<td>Type of validation error for a proposed mention, if any.</td>
<td>29.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Disallowed—The proposed mention is invalid and is rejected because the context user is trying to mention something that is not allowed. For example, a user who is not a member of a private group is trying to mention the private group.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Inaccessible—The proposed mention is allowed, but the user or record being mentioned isn’t notified. They don’t have access to the parent record that’s being discussed.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Ok—There is no validation error for this proposed mention.</td>
<td></td>
</tr>
</tbody>
</table>

**ConnectApi.MessageBody**

Message body.
No additional properties.

SEE ALSO:
- ConnectApi.ChatterLikesCapability
- ConnectApi.ChatterMessage
- ConnectApi.Comment
- ConnectApi.FeedElement
- ConnectApi.FeedItemSummary

**ConnectApi.MessageSegment**

Message segment.
This class is abstract.
Superclass of:
- ConnectApi.ComplexSegment
- ConnectApi.EntityLinkSegment
- ConnectApi.FieldChangeSegment
- ConnectApi.FieldChangeNameSegment
- ConnectApi.FieldChangeValueSegment
- ConnectApi.HashtagSegment
- ConnectApi.InlineImageSegment
- ConnectApi.LinkSegment
- ConnectApi.MarkupBeginSegment
- ConnectApi.MarkupEndSegment
- ConnectApi.MoreChangesSegment
- ConnectApi.ResourceLinkSegment
- ConnectApi.TextSegment
Message segments in a feed item are typed as `ConnectApi.MessageSegment`. Feed item capabilities are typed as `ConnectApi.FeedItemCapability`. Record fields are typed as `ConnectApi.AbstractRecordField`. These classes are all abstract and have several concrete subclasses. At runtime you can use `instanceof` to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

**Important:** The composition of a feed can change between releases. Write your code to handle instances of unknown subclasses.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td><code>String</code></td>
<td>Text-only rendition of this segment. If a client encounters an unknown message segment type, it can render this value.</td>

</tr>
</thead>
<tbody>
<tr>
<td>moreChanges</td>
<td>List&lt;ConnectApi.FieldChange Segment&gt;</td>
<td>Complete list of tracked changes.</td>
<td>29.0</td>
</tr>
</tbody>
</table>
### ConnectApi.Motif

The motif properties contain URLs for small, medium, and large icons that indicate the Salesforce record type. Common record types are files, users, and groups, but all record types have a set of motif icons. Custom object records use their tab style icon. All icons are available to unauthenticated users so that, for example, you can display the motif icons in an email. The motif can also contain the record type’s base color.

The motif images are icons, not user uploaded images or photos. For example, every user has the same set of motif icons.

Custom object records use their tab style icon, for example, the following custom object uses the “boat” tab style:

```json
"motif": {
  "color": "8C004C",
  "largeIconUrl": "/img/icon/custom51_100/boat64.png",
  "mediumIconUrl": "/img/icon/custom51_100/boat32.png",
  "smallIconUrl": "/img/icon/custom51_100/boat16.png",
  "svgIconUrl": null
},
```

Users use the following icons:

```json
"motif": {
  "color": "1797C0",
  "largeIconUrl": "/img/icon/profile64.png",
  "mediumIconUrl": "/img/icon/profile32.png",
  "smallIconUrl": "/img/icon/profile16.png",
  "svgIconUrl": null
},
```

Groups use the following icons:

```json
"motif": {
  "color": "1797C0",
  "largeIconUrl": "/img/icon/groups64.png",
  "mediumIconUrl": "/img/icon/groups32.png",
  "smallIconUrl": "/img/icon/groups16.png",
  "svgIconUrl": null
},
```

Files use the following icons:

```json
"motif": {
  "color": "1797C0",
  "largeIconUrl": "/img/content/content64.png",
  "mediumIconUrl": "/img/content/content32.png",
  "smallIconUrl": "/img/icon/files16.png",
  "svgIconUrl": null
},
```

**Note:** To view the icons in the previous examples, preface the URL with https://instance_name. For example, https://instance_name/img/icon/profile64.png.

<table>
<thead>
<tr>

</tbody>
</table>
ConnectApi.NetworkConnection

External network connection.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>developerName</td>
<td>String</td>
<td>Name of the network connection.</td>
<td>58.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the network connection.</td>
<td>58.0</td>
</tr>
<tr>
<td>masterLabel</td>
<td>String</td>
<td>Label of the network connection.</td>
<td>58.0</td>
</tr>
<tr>
<td>namespacePrefix</td>
<td>String</td>
<td>Namespace prefix of the network connection.</td>
<td>58.0</td>
</tr>
</tbody>
</table>

SEE ALSO:

ConnectApi.NamedCredential

ConnectApi.NewUserAudienceCriteria

Criteria for the new members type of custom recommendation audience.

Subclass of ConnectApi.AudienceCriteria.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxDaysInCommunity</td>
<td>Double</td>
<td>The maximum number of days since a user became a site member.</td>
<td>36.0</td>
</tr>
</tbody>
</table>

ConnectApi.OAuthCredentialAuthUrl

OAuth authentication URL for a credential.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>authenticationUrl</td>
<td>String</td>
<td>Authentication URL for the user external credential. Authentication URLs have encoded and escaped special characters. Before using the URL, undo the encoded and escaped characters.</td>
<td>56.0</td>
</tr>
<tr>
<td>externalCredential</td>
<td>String</td>
<td>Fully qualified developer name of the external credential.</td>
<td>56.0</td>
</tr>
<tr>
<td>principalName</td>
<td>String</td>
<td>Name of the external credential named principal.</td>
<td>56.0</td>
</tr>
</tbody>
</table>
| principalType                  | ConnectApi.CredentialPrincipal | Type of credential principal. Values are:  
  • AwsStsPrincipal
  • NamedPrincipal
  • PerUserPrincipal           | 56.0              |
ConnectApi.OauthProviderInfo

OAuth provider information.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>authorizationUrl</td>
<td>String</td>
<td>The URL used for authorization.</td>
<td>37.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the OAuth service provider.</td>
<td>37.0</td>
</tr>
</tbody>
</table>

</thead>
<tbody>
<tr>
<td>errors</td>
<td>List&lt;ConnectApi.ErrorResponse&gt;</td>
<td>Any errors that were returned.</td>
<td>51.0</td>
</tr>
<tr>
<td>success</td>
<td>Boolean</td>
<td>Indicates whether the request was successful.</td>
<td>51.0</td>
</tr>
</tbody>
</table>

ConnectApi.OCICreateReservationErrorOutputRepresentation

Error returned from an attempt to create an Omnichannel Inventory reservation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorCode</td>
<td>String</td>
<td>The error code.</td>
<td>51.0</td>
</tr>
<tr>
<td>message</td>
<td>String</td>
<td>Details of the error, if available.</td>
<td>51.0</td>
</tr>
</tbody>
</table>

ConnectApi.OCICreateReservationOutputRepresentation

Result of an Omnichannel Inventory reservation creation request.
### ConnectApi.OCICreateReservationSingleOutputRepresentation

Details of an inventory reservation for one product.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorCode</td>
<td>String</td>
<td>The error code, if any.</td>
<td>51.0</td>
</tr>
<tr>
<td>locationGroupIdentifier</td>
<td>String</td>
<td>Identifier of the location group where the inventory is reserved.</td>
<td>51.0</td>
</tr>
<tr>
<td>locationIdentifier</td>
<td>String</td>
<td>Identifier of the location where the inventory is reserved.</td>
<td>51.0</td>
</tr>
<tr>
<td>quantity</td>
<td>Double</td>
<td>The reserved quantity of the product.</td>
<td>51.0</td>
</tr>
<tr>
<td>stockKeepingUnit</td>
<td>String</td>
<td>The SKU of the reserved product.</td>
<td>51.0</td>
</tr>
</tbody>
</table>

### ConnectApi.OCIConsumeReservationErrorOutputRepresentation

Response to a request to consume one inventory reservation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>details</td>
<td>ConnectApi.OCIConsumeReservationSingleOutputRepresentation</td>

<td>51.0</td>
</tr>
<tr>
<td>message</td>
<td>String</td>
<td>Details of the error, if available.</td>
<td>51.0</td>
</tr>
</tbody>
</table>
### ConnectApi.OCIFulfillReservationSingleOutputRepresentation

Details of a single fulfilled reservation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>actionRequestId</td>
<td>String</td>
<td>The UUID that identifies the original fulfill reservation request.</td>
<td>5.1.0</td>
</tr>
<tr>
<td>externalRefId</td>
<td>String</td>
<td>The external reference ID of the location that fulfilled the reservation.</td>
<td>5.1.0</td>
</tr>
<tr>
<td>locationIdentifier</td>
<td>String</td>
<td>The identifier of the location that fulfilled the reservation.</td>
<td>5.1.0</td>
</tr>
<tr>
<td>quantity</td>
<td>Double</td>
<td>The fulfilled quantity.</td>
<td>5.1.0</td>
</tr>
<tr>
<td>stockKeepingUnit</td>
<td>String</td>
<td>The SKU of the fulfilled product.</td>
<td>5.1.0</td>
</tr>
</tbody>
</table>

### ConnectApi.OCIFutureInventoryOutputRepresentation

An expected future inventory restock.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>expectedDate</td>
<td>Datetime</td>
<td>Date when the future inventory is expected.</td>
<td>5.1.0</td>
</tr>
<tr>
<td>quantity</td>
<td>Double</td>
<td>Quantity of the future inventory.</td>
<td>5.1.0</td>
</tr>
</tbody>
</table>

### ConnectApi.OCIGetInventoryAvailabilityOutputRepresentation

Response to a request for inventory availability data.

Subclass of `ConnectApi.OCIBaseOutputRepresentation`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>locationGroups</td>
<td>List&lt;ConnectApi.OCILocationGroupAvailabilityOutputRepresentation&gt;</td>
<td>A list of inventory availability data for individual location groups.</td>
<td>5.1.0</td>
</tr>
</tbody>
</table>
# Inventory Availability Data

## ConnectApi.OCIInventoryRecordOutputRepresentation

Inventory availability data for a product.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>availableToFulfill</td>
<td>Double</td>
<td>The Available To Fulfill quantity.</td>
<td>51.0</td>
</tr>
<tr>
<td>availableToOrder</td>
<td>Double</td>
<td>The Available To Order quantity.</td>
<td>51.0</td>
</tr>
<tr>
<td>effectiveDate</td>
<td>Datetime</td>
<td>The effective date of the inventory.</td>
<td>51.0</td>
</tr>
<tr>
<td>futures</td>
<td>List&lt;ConnectApi.OCIFutureInventoryOutputRepresentation&gt;</td>
<td>A list of any expected future inventory restocks.</td>
<td>51.0</td>
</tr>
<tr>
<td>onHand</td>
<td>Double</td>
<td>The On Hand quantity.</td>
<td>51.0</td>
</tr>
<tr>
<td>reserved</td>
<td>Double</td>
<td>The Reserved quantity.</td>
<td>51.0</td>
</tr>
<tr>
<td>safetyStockCount</td>
<td>Double</td>
<td>The Safety Stock Count.</td>
<td>51.0</td>
</tr>
<tr>
<td>stockKeepingUnit</td>
<td>String</td>
<td>The SKU of the product.</td>
<td>51.0</td>
</tr>
</tbody>
</table>

## ConnectApi.OCILocationAvailabilityOutputRepresentation

A set of inventory availability data for one inventory location.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>inventoryRecords</td>
<td>List&lt;ConnectApi.OCIInventoryRecordOutputRepresentation&gt;</td>
<td>A list of availability data for individual products at this location.</td>
<td>51.0</td>
</tr>
<tr>
<td>locationIdentifier</td>
<td>String</td>
<td>The identifier of the location.</td>
<td>51.0</td>
</tr>
</tbody>
</table>

## ConnectApi.OCILocationGroupAvailabilityOutputRepresentation

A set of inventory availability data for one inventory location group.

---

**SEE ALSO:**
- `getInventoryAvailability(inventoryAvailabilityInputRepresentation)`
- `findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)`
- `ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation`
### ConnectApi.OCIInventoryRecordOutputRepresentation

A list of availability data for individual products. The data combines the quantities for all locations belonging to this location group.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>inventoryRecords</td>
<td>List&lt;ConnectApi.OCIInventoryRecordOutputRepresentation&gt;</td>
<td>A list of availability data for individual products. The data combines the quantities for all locations belonging to this location group.</td>
<td>51.0</td>
</tr>
<tr>
<td>locationGroup</td>
<td>String</td>
<td>The identifier of the location group.</td>
<td>51.0</td>
</tr>
</tbody>
</table>

### ConnectApi.OCIInventoryRecordResponse

Response to a request to publish inventory data.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>inventoryRecords</td>
<td>List&lt;ConnectApi.OCIInventoryRecordOutputRepresentation&gt;</td>
<td>A list of availability data for individual products. The data combines the quantities for all locations belonging to this location group.</td>
<td>51.0</td>
</tr>
</tbody>
</table>

### ConnectApi.OCIInventoryRecordResponseStatus

Detailed status of a publish inventory data job.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>endTimeUTC</td>
<td>String</td>
<td>The UTC time when the job finished. (for example: &quot;2020-07-06T22:54:08.012Z&quot;)</td>
<td>51.0</td>
</tr>
<tr>
<td>recordsProcessedCount</td>
<td>Integer</td>
<td>The number of records processed by the job.</td>
<td>51.0</td>
</tr>
<tr>
<td>recordsReadCount</td>
<td>Integer</td>
<td>The number of records read by the job.</td>
<td>51.0</td>
</tr>
<tr>
<td>recordsSkippedCount</td>
<td>Integer</td>
<td>The number of records skipped by the job.</td>
<td>51.0</td>
</tr>
<tr>
<td>startTimeUTC</td>
<td>String</td>
<td>The UTC time when the job started. (for example: &quot;2020-07-06T22:53:06.788Z&quot;)</td>
<td>51.0</td>
</tr>
<tr>
<td>status</td>
<td>String</td>
<td>The status of the job. (e.g., &quot;PENDING,&quot; &quot;COMPLETED,&quot; etc.).</td>
<td>51.0</td>
</tr>
<tr>
<td>uploadId</td>
<td>String</td>
<td>Identifier of the job.</td>
<td>51.0</td>
</tr>
<tr>
<td>validationErrors</td>
<td>List&lt;String&gt;</td>
<td>List of any validation errors returned by the job.</td>
<td>51.0</td>
</tr>
<tr>
<td>validationStatus</td>
<td>String</td>
<td>The validation status of the job.</td>
<td>51.0</td>
</tr>
</tbody>
</table>

### ConnectApi.OCIInventoryRecordResponseStatus

Response to a request to finalize inventory data.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>endTimeUTC</td>
<td>String</td>
<td>The UTC time when the job finished. (for example: &quot;2020-07-06T22:54:08.012Z&quot;)</td>
<td>51.0</td>
</tr>
<tr>
<td>recordsProcessedCount</td>
<td>Integer</td>
<td>The number of records processed by the job.</td>
<td>51.0</td>
</tr>
<tr>
<td>recordsReadCount</td>
<td>Integer</td>
<td>The number of records read by the job.</td>
<td>51.0</td>
</tr>
<tr>
<td>recordsSkippedCount</td>
<td>Integer</td>
<td>The number of records skipped by the job.</td>
<td>51.0</td>
</tr>
<tr>
<td>startTimeUTC</td>
<td>String</td>
<td>The UTC time when the job started. (for example: &quot;2020-07-06T22:53:06.788Z&quot;)</td>
<td>51.0</td>
</tr>
<tr>
<td>status</td>
<td>String</td>
<td>The status of the job. (e.g., &quot;PENDING,&quot; &quot;COMPLETED,&quot; etc.).</td>
<td>51.0</td>
</tr>
<tr>
<td>uploadId</td>
<td>String</td>
<td>Identifier of the job.</td>
<td>51.0</td>
</tr>
<tr>
<td>validationErrors</td>
<td>List&lt;String&gt;</td>
<td>List of any validation errors returned by the job.</td>
<td>51.0</td>
</tr>
<tr>
<td>validationStatus</td>
<td>String</td>
<td>The validation status of the job.</td>
<td>51.0</td>
</tr>
</tbody>
</table>
### ConnectApi.OCIReleaseReservationOutputRepresentation

Response to a request to release one or more inventory reservations.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>errors</td>
<td>List&lt;ConnectApi.OCIReleaseReservationErrorOutputRepresentation&gt;</td>
<td>Responses for the individual reservations in the release request.</td>
<td>51.0</td>
</tr>
<tr>
<td>success</td>
<td>Boolean</td>
<td>Indicates whether the request was successful.</td>
<td>51.0</td>
</tr>
</tbody>
</table>

### ConnectApi.OCIReleaseReservationSingleOutputRepresentation

Details of a single released reservation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>actionRequestId</td>
<td>String</td>
<td>The UUID that identifies the original release reservation request.</td>
<td>51.0</td>
</tr>
<tr>
<td>externalRefId</td>
<td>String</td>
<td>The external reference ID of the location that released the reservation.</td>
<td>51.0</td>
</tr>
<tr>
<td>locationGroupIdentifier</td>
<td>String</td>
<td>The identifier of the location group that released the reservation.</td>
<td>51.0</td>
</tr>
<tr>
<td>locationIdentifier</td>
<td>String</td>
<td>The identifier of the location that released the reservation.</td>
<td>51.0</td>
</tr>
<tr>
<td>quantity</td>
<td>Double</td>
<td>The released quantity.</td>
<td>51.0</td>
</tr>
<tr>
<td>stockKeepingUnit</td>
<td>String</td>
<td>The SKU of the released product.</td>
<td>51.0</td>
</tr>
</tbody>
</table>

### ConnectApi.OCITransferReservationErrorOutputRepresentation

Response to a request to fulfill one inventory reservation.
### ConnectApi.OCITransferReservationOutputRepresentation

Response to a request to transfer one or more inventory reservations.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>errors</td>
<td>List&lt;ConnectApi.OCITransferReservationErrorOutputRepresentation&gt;</td>
<td>Responses for the individual reservations in the transfer request.</td>
<td>51.0</td>
</tr>
<tr>
<td>success</td>
<td>Boolean</td>
<td>Indicates whether the request was successful.</td>
<td>51.0</td>
</tr>
</tbody>
</table>

### ConnectApi.OCITransferReservationSingleOutputRepresentation

Details of a single transferred reservation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>actionRequestId</td>
<td>String</td>
<td>The UUID that identifies the original transfer reservation request.</td>
<td>51.0</td>
</tr>
<tr>
<td>externalRefId</td>
<td>String</td>
<td>The external reference ID of the location that received the reservation.</td>
<td>51.0</td>
</tr>
<tr>
<td>fromLocationGroupIdentifier</td>
<td>String</td>
<td>The identifier of the location group that sent the reservation.</td>
<td>51.0</td>
</tr>
<tr>
<td>fromLocationIdentifier</td>
<td>String</td>
<td>The identifier of the location that sent the reservation.</td>
<td>51.0</td>
</tr>
<tr>
<td>ignoreAvailabilityCheck</td>
<td>Boolean</td>
<td>Whether this call ignored availability data at the location that received the reservation.</td>
<td>51.0</td>
</tr>
<tr>
<td>quantity</td>
<td>Double</td>
<td>The quantity of transferred inventory.</td>
<td>51.0</td>
</tr>
<tr>
<td>stockKeepingUnit</td>
<td>String</td>
<td>The SKU of the transferred product.</td>
<td>51.0</td>
</tr>
<tr>
<td>toLocationGroupIdentifier</td>
<td>String</td>
<td>The identifier of the location group that received the reservation.</td>

</tr>
<tr>
<td>toLocationIdentifier</td>
<td>String</td>
<td>The identifier of the location that received the reservation.</td>
<td>51.0</td>
</tr>
</tbody>
</table>
### ConnectApi.OCIUploadInventoryAvailabilityOutputRepresentation

Response to an upload inventory availability job.
Subclass of ConnectApi.OCIBaseOutputRepresentation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>uploadId</td>
<td>String</td>
<td>Identifier of the upload job. Use this value to retrieve the status of the job.</td>
<td>5.1.0</td>
</tr>
</tbody>
</table>

### ConnectApi.OCIUploadInventoryAvailabilityStatusOutputRepresentation

Detailed status of an upload inventory availability job.
Subclass of ConnectApi.OCIBaseOutputRepresentation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>endTimeUTC</td>
<td>String</td>
<td>The UTC time when the job finished. (for example: &quot;2020-07-06T22:54:08.012Z&quot;)</td>
<td>5.1.0</td>
</tr>
<tr>
<td>recordsProcessedCount</td>

### ConnectApi-OriginCapability

If a feed element has this capability, it was created by a feed action.

Subclass of ConnectApi.FeedElementCapability.
### ConnectApi.outputClasses

**Actor**

The user who executed the feed action.

**OriginRecord**

A reference to the feed element containing the feed action.

---

**ConnectApi.OutOfOffice**

User's out-of-office message.

**Message**

Out-of-office message for the user.

---

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

**ConnectApi.PardotBusinessUnitContextItem**

Pardot business unit context item.

**Id**

ID of the PardotTenant record.

**IsCurrent**

Specifies whether the business unit is selected as the context user’s current business unit context in the business unit switcher of the Pardot Lightning app (true) or not (false).

**Name**

Name of the Pardot business unit as it is specified in the MasterLabel of the PardotTenant record.

---

**ConnectApi.PardotBusinessUnitContextOutput**

Pardot business unit context.
<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>businessUnits</td>
<td>List&lt;ConnectApi.PardotBusinessUnitContextItem&gt;</td>
<td>List of the Pardot business unit context items that the context user has access to.</td>
<td>55.0</td>

</tr>
</tbody>
</table>

### ConnectApi.PaymentResponse

Payment output.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>accountId</td>
<td><code>String</code></td>
<td>ID of the account related the payment record.</td>
<td>50.0</td>
</tr>
<tr>
<td>amount</td>
<td><code>Double</code></td>
<td>Total amount of the payment transaction performed in the payment request.</td>
<td>50.0</td>
</tr>
<tr>
<td>currencyIsoCode</td>
<td><code>String</code></td>
<td>Three-letter ISO 4217 currency code associated with the payment output.</td>
<td>50.0</td>
</tr>
<tr>
<td>effectiveDate</td>
<td><code>Datetime</code></td>
<td>Date that the payment becomes effective.</td>
<td>50.0</td>
</tr>
<tr>
<td>id</td>
<td><code>String</code></td>
<td>ID of the payment record.</td>
<td>50.0</td>
</tr>
<tr>
<td>paymentNumber</td>
<td><code>String</code></td>
<td>Number of the payment record created as a result of the request processing.</td>
<td>50.0</td>
</tr>
<tr>
<td>requestDate</td>
<td><code>Datetime</code></td>
<td>Date when the payment transaction occurred.</td>
<td>50.0</td>
</tr>
<tr>
<td>status</td>
<td><code>String</code></td>
<td>Status of the new payment record. Can be DRAFT, PROCESSED or CANCELLED.</td>
<td>50.0</td>
</tr>
</tbody>
</table>

### ConnectApi.PercentRecordField

Record field containing a percentage value. Subclass of ConnectApi.LabeledRecordField.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td><code>Double</code></td>
<td>Value of the percentage.</td>
<td>29.0</td>
</tr>
</tbody>
</table>

### ConnectApi.PhoneNumber

Phone number.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td><code>String</code></td>
<td>A localized string indicating the phone type.</td>
<td>30.0</td>
</tr>
<tr>
<td>phoneNumber</td>
<td><code>String</code></td>
<td>Phone number.</td>
<td>28.0</td>
</tr>
</tbody>
</table>
### phoneType

**Type:** String

Phone type. Values are:

- Fax
- Mobile
- Work

These values are not localized.

**Available Version:** 30.0

---

**Note:** This property is not available after version 29.0. Use the `phoneType` property instead.

Values are:
- Fax
- Mobile
- Work

These values are not localized.

**Available Version:** 28.0–29.0

---

### ConnectApi.Photo

Profile photo.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>fullEmailPhotoUrl</td>
<td>String</td>
<td>A temporary URL to the large profile picture. The URL expires after 30 days and is available to unauthenticated users.</td>
<td>28.0</td>
</tr>
<tr>
<td>largePhotoUrl</td>
<td>String</td>
<td>URL to the large profile picture. The default width is 200 pixels, and the height is scaled so the original image proportions are maintained. If a user hasn’t uploaded a photo, this URL points to a default photo. If the user hasn’t uploaded a photo and the request header included <code>X-Connect-Theme: Salesforce1</code>, this URL points to a default photo based on a theme that the admin selected for the org.</td>
<td>28.0</td>
</tr>
<tr>
<td>mediumPhotoUrl</td>
<td>String</td>
<td>URL to the medium profile picture. The default width is 160 pixels, and the height is scaled so the original image proportions are maintained. If a user hasn’t uploaded a photo, this URL points to a default photo.</td>
<td>37.0</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
<td>Available Version</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>photoVersionId</td>
<td>String</td>
<td>18-character ID to that version of the photo</td>
<td>28.0</td>
</tr>
<tr>
<td>smallPhotoUrl</td>
<td>String</td>
<td>URL to the small profile picture. The default size is 64x64 pixels. If a user hasn’t uploaded a photo, this URL points to a default photo. If the user hasn’t uploaded a photo and the request header included X-Connect-Theme: Salesforce1, this URL points to a default photo based on a theme that the admin selected for the org.</td>
<td>28.0</td>
</tr>
<tr>
<td>standardEmailPhotoUrl</td>
<td>String</td>
<td>A temporary URL to the small profile. The URL expires after 30 days and is available to unauthenticated users.</td>
<td>28.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>A resource that returns a Photo object: for example, /services/data/v59.0/chatter/users/005D0000001LL8OIAW/photo</td>
<td>28.0</td>
</tr>
</tbody>
</table>

- ConnectApi.User

**ConnectApi.PicklistRecordField**

Record field containing an enumerated value.
Subclass of ConnectApi.LabeledRecordField.

**ConnectApi.PinCapability**

If a feed element has this capability, users who have permission can pin it to a feed.
Subclass of ConnectApi.FeedElementCapability.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isPinnableByMe</td>
<td>Boolean</td>
<td>Specifies whether the context user can pin or unpin the entity to the feed (true) or not (false).</td>
<td>41.0</td>
</tr>
<tr>
<td>isPinned</td>
<td>Boolean</td>
<td>Specifies whether the entity is pinned (true) or not pinned (false) to the feed.</td>
<td>41.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- ConnectApi.FeedElementCapabilities
ConnectApi.PinnedFeedElements

List of pinned feed elements for a feed.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>elements</td>
<td>List&lt;ConnectApi.FeedElement&gt;</td>
<td>List of pinned feed elements.</td>
<td>41.0</td>
</tr>
</tbody>
</table>

**Note:** In the UI, pinned feed elements don’t show all auxiliary information, such as comments, likes, interaction counts, or read by information. As a result, the ConnectApi.PinnedFeedElements output class doesn’t include all the information for these capabilities.

ConnectApi.PlatformAction

A platform action instance with state information for the context user.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>actionUrl</td>
<td>String</td>
<td>For action links of subtype Ui or Download, direct the user to download or visit the UI from this link. Salesforce issues a Javascript redirect for the link in this format: /action-link-redirect/communityId/actionLinkId?_bearer=bearerToken. For Api action links and for all platform actions, this value is null and Salesforce handles the call.</td>
<td>33.0</td>
</tr>
<tr>
<td>apiName</td>
<td>String</td>
<td>The API name. The value may be null.</td>
<td>33.0</td>
</tr>
<tr>
<td>confirmationMessage</td>
<td>String</td>
<td>If this action requires a confirmation and has a status of NewStatus, this is a default localized message that should be shown to an end user prior to invoking the action. Otherwise, this is null.</td>
<td>33.0</td>
</tr>
<tr>
<td>executingUser</td>
<td>ConnectApi.UserSummary</td>
<td>The user who initiated execution of this platform action.</td>
<td>33.0</td>
</tr>
<tr>
<td>groupDefault</td>
<td>Boolean</td>
<td>true if this platform action is the default or primary platform action in the platform action group; false otherwise. There can be only one default platform action per platform action group.</td>
<td>33.0</td>
</tr>
<tr>
<td>iconUrl</td>
<td>String</td>
<td>The URL of the icon for the platform action. This value may be null.</td>
<td>33.0</td>
</tr>
<tr>
<td>Property Name</td>
<td>Type</td>
<td>Description</td>
<td>Available Version</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>The ID for the platform action. If the type is <code>QuickAction</code> and the subtype is <code>Create</code>, this value is <code>null</code>.</td>
<td>33.0</td>
</tr>
<tr>
<td>label</td>
<td>String</td>
<td>The localized label for this platform action.</td>
<td>33.0</td>
</tr>
<tr>
<td>modifiedDate</td>
<td>Datetime</td>
<td>ISO 8601 format date string, for example, <code>2011-02-25T18:24:31.000Z</code>.</td>
<td>33.0</td>
</tr>
<tr>
<td>platformActionGroup</td>
<td>ConnectApi.Reference</td>
<td>A reference to the platform action group containing this platform action.</td>
<td>33.0</td>
</tr>
<tr>
<td>status</td>
<td>ConnectApi.PlatformActionStatus</td>
<td>The execution status of the platform action. Values are:&lt;br&gt;  • FailedStatus—The action link execution failed.&lt;br&gt;  • NewStatus—The action link is ready to be executed. Available for <code>Download</code> and <code>Ui</code> action links only.&lt;br&gt;  • PendingStatus—The action link is executing. Choosing this value triggers the API call for <code>Api</code> and <code>ApiAsync</code> action links.&lt;br&gt;  • SuccessfulStatus—The action link executed successfully.</td>
<td>33.0</td>
</tr>
<tr>
<td>subtype</td>
<td>String</td>
<td>The subtype of a platform action or <code>null</code>. If the type property is <code>ActionLink</code>, possible values are:&lt;br&gt;  • Api—The action link calls a synchronous API at the action URL. Salesforce sets the status to <code>SuccessfulStatus</code> or <code>FailedStatus</code> based on the HTTP status code returned by your server.&lt;br&gt;  • ApiAsync—The action link calls an asynchronous API at the action URL. The action remains in a <code>PendingStatus</code> state until a third party makes a request to <code>/connect/action-links/actionLinkId</code> to set the status to <code>SuccessfulStatus</code> or <code>FailedStatus</code> when the asynchronous operation is complete.&lt;br&gt;  • Download—The action link downloads a file from the action URL.&lt;br&gt;  • Ui—The action link takes the user to a web page at the action URL.</td>
<td>33.0</td>
</tr>
</tbody>
</table>
Note: Invoking \texttt{ApiAsync} action links from an app requires a call to set the status. However, there isn't currently a way to set the status of an action link using Apex. To set the status, use Connect REST API. See the Action Link resource in the Connect REST API Developer Guide for more information.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
</table>
| \texttt{type} | \texttt{ConnectApi\_PlatformActionType} | The type of platform action. Values are:  
  - \texttt{ActionLink}—An indicator on a feed element that targets an API, a web page, or a file, represented by a button in the Salesforce UI.  
  - \texttt{CustomButton}—When clicked, opens a URL or a Visualforce page in a window or executes JavaScript.  
  - \texttt{ProductivityAction}—Productivity actions are predefined and attached to a limited set of objects. Productivity actions include Send Email, Call, Map, View Website, and Read News. Except for the Call action, you can't edit productivity actions.  
  - \texttt{QuickAction}—A global or object-specific action.  
  - \texttt{StandardButton}—A predefined Salesforce button such as New, Edit, or Delete. | 33.0 |
| \texttt{url} | \texttt{String} | The URL for this platform action.  
If the type is \texttt{QuickAction} and the \texttt{subtype} is Create, this value is null. | 33.0 |

**SEE ALSO:**

\texttt{ConnectApi\_PlatformActionGroup}

**ConnectApi\_PlatformActionGroup**

A platform action group instance with state appropriate for the context user.

Action link groups are one type of platform action group and are therefore represented as \texttt{ConnectApi\_PlatformActionGroup} output classes.
<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
</table>
| category      | ConnectApi.PlatformAction.GroupCategory | Indicates the priority and relative locations of platform actions. Values are:  
  - **Primary**—The action link group is displayed in the body of the feed element.  
  - **Overflow**—The action link group is displayed in the overflow menu of the feed element. | 33.0 |
| id            | String | The 18-character ID or an opaque string ID of the platform action group.  
  * If the ConnectApi.PlatformAction type is QuickAction and the subtype is Create, this value is null. | 33.0 |
| modifiedDate  | Datetime | ISO 8601 date string, for example, 2014-02-25T18:24:31.000Z. | 33.0 |
| platformActions | List<ConnectApi.PlatformAction> | The platform action instances for this group.  
  * Within an action link group, action links are displayed in the order listed in the actionLinks property of the ConnectApi.ActionLinkGroup DefinitionInput class.  
  * Within a feed item, action link groups are displayed in the order specified in the actionLinkGroupIds property of the ConnectApi.AssociatedActions CapabilityInput class. | 33.0 |
| url           | String | The URL for this platform action group.  
  * If the ConnectApi.PlatformAction type is QuickAction and the subtype is Create, this value is null. | 33.0 |

  - ConnectApi.AbstractRecommendation  
  - ConnectApi.AssociatedActionsCapability

**ConnectApi.PollCapability**

If a feed element has this capability, it includes a poll.  
Subclass of ConnectApi.FeedElementCapability.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>choices</td>
<td>List&lt;ConnectApi.FeedPollChoice&gt;</td>
<td>Collection of poll choices that make up the poll.</td>
<td>32.0</td>
</tr>
</tbody>
</table>
**Property Name** | **Type** | **Description** | **Available Version**
--- | --- | --- | ---
myChoiceId | String | 18-character ID of the poll choice that the context user has voted for in this poll. Returns null if the context user has not voted. | 32.0

totalVoteCount | Integer | Total number of votes cast on the feed poll element. | 32.0

### ConnectApi.PostAuthorizationResponse

Gateway response following a post authorization request.

**Property Name** | **Type** | **Description** | **Available Version**
--- | --- | --- | ---
error | ConnectApi.ErrorResponse | Information about errors that occurred in the payment gateway while evaluating the post authorization request. | 54.0

gatewayResponse | ConnectApi.PostAuthGatewayResponse | Payment gateway’s response to the post authorization request. | 54.0

paymentAuthorization | ConnectApi.PaymentAuthorizationResponse | Payment gateway’s response to the original payment authorization request. | 54.0

paymentGatewayLogs | List.CONNECTApi.GatewayLogResponse> | Stores information exchanged between the Salesforce payments platform and external payment gateways. Gateway logs can also record payloads from external payment entities. | 54.0

paymentGroup | ConnectApi.PaymentGroupResponse | Payment group, consisting of one or more payments, sent to the gateway for the post authorization request. | 54.0

paymentMethod | ConnectApi.PaymentMethodResponse | Payment method used in the post authorization request. | 54.0

### ConnectApi.PostAuthGatewayResponse

Gateway response after confirmation that the merchant is ready to capture payment of an existing pre-authorized transaction. Subclass of [ConnectApi.AbstractGatewayResponse](#).
### ConnectApi.PreviewCancelOutputRepresentation

Expected financial values for a proposed cancel action.
Subclass of ConnectApi.BaseOutputRepresentation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>changeBalances</td>
<td>ConnectApi.ChangeItemOutputRepresentation</td>
<td>Expected financial values for the proposed cancel action.</td>
<td>48.0</td>
</tr>
<tr>
<td>orderSummaryId</td>
<td>String</td>
<td>ID of the OrderSummary.</td>
<td>48.0</td>
</tr>
</tbody>
</table>

### ConnectApi.PreviewReturnOutputRepresentation

Expected financial values for a proposed return action.
Subclass of ConnectApi.BaseOutputRepresentation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>

- [ConnectApi.RankAverageDistanceOutputRepresentation](#)

#### ConnectApi.QuestionAndAnswersSuggestions

Question and answers suggestions.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>articles</td>
<td>List&lt;ConnectApi. ArticleItem&gt;</td>
<td>List of articles.</td>
<td>32.0</td>
</tr>
<tr>
<td>questions</td>
<td>List&lt;ConnectApi. FeedElement&gt;</td>
<td>List of questions.</td>
<td>32.0</td>
</tr>
</tbody>
</table>

#### ConnectApi.RankAverageDistanceOutputRepresentation

The results of calculating the average distances from sets of inventory locations to an order recipient.

Subclass of [ConnectApi.BaseOutputRepresentation](#).

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>distanceUnit</td>
<td>String</td>
<td>The specified unit of distance (miles or kilometers).</td>
<td>51.0</td>
</tr>
<tr>
<td>results</td>
<td>List&lt;ConnectApi. AverageDistanceResult OutputRepresentation&gt;</td>
<td>The results of the shipping distance calculations.</td>
<td>51.0</td>
</tr>
</tbody>
</table>

#### ConnectApi.ReadBy

Information about who read the feed element and when.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>lastReadDateByUser</td>
<td>Datetime</td>
<td>When the user last read the feed element in ISO 8601 format.</td>
<td>40.0</td>
</tr>
</tbody>
</table>
**ConnectApi.ReadByCapability**

If a feed element has this capability, the context user can mark it as read.

Subclass of `ConnectApi.FeedElementCapability`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isReadByMe</td>
<td>Boolean</td>
<td>Specifies whether the feed element has been read (true) or not (false) by the context user.</td>
<td>40.0</td>
</tr>
<tr>
<td>lastReadDateByMe</td>
<td>Datetime</td>
<td>Last date when the feed element was marked read for the context user in ISO 8601 format. Otherwise, null.</td>
<td>40.0</td>
</tr>
<tr>
<td>page</td>
<td><code>ConnectApi.ReadByPage</code></td>
<td>First page of information about who read the feed element and when.</td>
<td>40.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- `ConnectApi.FeedElementCapabilities`

**ConnectApi.ReadByPage**

A collection of information about who read the feed element and when.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>currentPageToken</td>
<td>String</td>
<td>Token identifying the current page.</td>
<td>40.0</td>
</tr>
<tr>
<td>currentPageUrl</td>
<td>String</td>
<td>Connect REST API URL identifying the current page. The default is 25 items per page.</td>
<td>40.0</td>
</tr>
<tr>
<td>items</td>
<td><code>List&lt;ConnectApi.ReadBy&gt;</code></td>
<td>Collection of read-by information, including users and when they last read the feed element.</td>
<td>40.0</td>
</tr>
<tr>
<td>nextPageToken</td>
<td>String</td>
<td>Token identifying the next page, or <code>null</code> if there isn't a next page.</td>
<td>40.0</td>
</tr>
<tr>
<td>nextPageUrl</td>
<td>String</td>
<td>Connect REST API URL identifying the next page, or <code>null</code> if there isn't a next page.</td>
<td>40.0</td>
</tr>
<tr>
<td>previousPageToken</td>
<td>String</td>
<td>Reserved for future use.</td>
<td>40.0</td>
</tr>
</tbody>
</table>
### ConnectApi.Recommendation

A Next Best Action recommendation object.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>acceptanceLabel</td>
<td>String</td>
<td>Text indicating user acceptance of the recommendation.</td>
<td>45.0</td>
</tr>
<tr>
<td>actionReference</td>
<td>String</td>
<td>Reference to the action to perform, for example, launching a flow.</td>
<td>45.0</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the recommendation.</td>
<td>45.0</td>
</tr>
<tr>
<td>externalId</td>
<td>String</td>
<td>External ID of the recommendation. This ID doesn’t need to be a Salesforce 18-character ID. For example, it can be a product number from an external system.</td>
<td>46.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the recommendation.</td>
<td>45.0</td>
</tr>
<tr>
<td>image</td>
<td>ConnectApi.FileAsset</td>
<td>Image to display.</td>
<td>45.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the recommendation.</td>
<td>45.0</td>
</tr>
<tr>
<td>rejectionLabel</td>
<td>String</td>
<td>Text indicating user rejection of the recommendation.</td>
<td>45.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>URL to the recommendation.</td>
<td>45.0</td>
</tr>
</tbody>
</table>

### ConnectApi.RecommendationAudience

A custom recommendation audience.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>criteria</td>
<td>ConnectApi.AudienceCriteria</td>
<td>The criteria for the custom recommendation audience type.</td>
<td>36.0</td>
</tr>
</tbody>
</table>

### SEE ALSO:

- ConnectApi.ReadByCapability
### Available Version

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
<td>18-character ID of the custom recommendation audience.</td>
<td>35.0</td>
</tr>
<tr>
<td>memberCount</td>
<td>Integer</td>
<td>Number of members in the custom recommendation audience.</td>
<td>35.0 only</td>
</tr>
<tr>
<td>members</td>
<td></td>
<td>Members of the custom recommendation audience.</td>
<td>35.0 only</td>
</tr>
<tr>
<td>modifiedBy</td>
<td></td>
<td>User who last modified the custom recommendation audience.</td>
<td>36.0</td>
</tr>
<tr>
<td>modifiedDate</td>
<td>Datetime</td>
<td>ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.</td>
<td>36.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the custom recommendation audience.</td>
<td>35.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>URL to the custom recommendation audience.</td>
<td>35.0</td>
</tr>
</tbody>
</table>

### Available Version

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>audienceCount</td>
<td>Integer</td>
<td>The total number of custom recommendation audiences.</td>
<td>35.0</td>
</tr>
<tr>
<td>currentPageUrl</td>
<td>String</td>
<td>URL to the current page.</td>
<td>35.0</td>
</tr>
<tr>
<td>nextPageUrl</td>
<td>String</td>
<td>URL to the next page.</td>
<td>35.0</td>
</tr>
<tr>
<td>previousPageUrl</td>
<td>String</td>
<td>URL to the previous page.</td>
<td>35.0</td>
</tr>
<tr>
<td>recommendation Audiences</td>
<td>List&lt;ConnectApi.Recommendation Audience&gt;</td>
<td>A list of custom recommendation audiences.</td>
<td>35.0</td>
</tr>
</tbody>
</table>
**ConnectApi.RecommendationCollection**

A list of Chatter, custom, and static recommendations.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>recommendations</td>
<td>List&lt;ConnectApi.AbstractRecommendation&gt;</td>
<td>Collection of Chatter, custom, and static recommendations.</td>
<td>33.0</td>
</tr>
</tbody>
</table>

**ConnectApi.RecommendationDefinition**

Represents a custom recommendation definition.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>actionUrl</td>
<td>String</td>
<td>The URL for acting on this custom recommendation.</td>
<td>35.0</td>
</tr>
<tr>
<td>actionUrlName</td>
<td>String</td>
<td>The text label for the action URL in the user interface.</td>
<td>35.0</td>
</tr>
<tr>
<td>explanation</td>
<td>String</td>
<td>Explanation of the custom recommendation definition.</td>
<td>35.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>18-character ID of the custom recommendation definition.</td>
<td>35.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the custom recommendation definition. The name is displayed in Setup.</td>
<td>35.0</td>
</tr>
<tr>
<td>photo</td>
<td>ConnectApi.Photo</td>
<td>Photo of the custom recommendation definition.</td>
<td>35.0</td>
</tr>
<tr>
<td>title</td>
<td>String</td>
<td>Title of the custom recommendation definition.</td>
<td>35.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>URL to the Connect REST API resource for the custom recommendation definition.</td>
<td>35.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- ConnectApi.RecommendationDefinitionPage
- ConnectApi.ScheduledRecommendation

**ConnectApi.RecommendationDefinitionPage**

A list of custom recommendation definitions.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>recommendation Definitions</td>
<td>List&lt;ConnectApi.Recommendation Definition&gt;</td>
<td>A list of custom recommendation definitions.</td>
<td>35.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>URL to the Connect REST API resource for the recommendation definition collection.</td>
<td>35.0</td>
</tr>
</tbody>
</table>
**ConnectApi.RecommendationExplanation**

Explanation for a Chatter recommendation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>detailsUrl</td>
<td>String</td>
<td>URL to explanation details or null if the Chatter recommendation doesn’t have a detailed explanation.</td>
<td>32.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
ConnectApi.AbstractRecommendation

**ConnectApi.RecommendationReaction**

A reaction to a recommendation produced by a recommendation strategy

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>aiModel</td>
<td>String</td>
<td>Reserved for future use.</td>
<td>47.0</td>
</tr>
<tr>
<td>contextRecord</td>
<td>ConnectApi.Reference</td>
<td>Reference to the context record.</td>
<td>45.0</td>
</tr>
<tr>
<td>createdBy</td>
<td>ConnectApi.Reference</td>
<td>Reference to the reaction creator.</td>
<td>45.0</td>
</tr>
<tr>
<td>createdDate</td>
<td>Datetime</td>
<td>Reaction creation date.</td>
<td>45.0</td>
</tr>
<tr>
<td>externalId</td>
<td>String</td>
<td>External target ID of the recommendation reacted on. This ID doesn’t need to be a Salesforce 18-character ID. For example, it can be a product number from an external system.</td>
<td>46.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>Reaction record ID.</td>
<td>45.0</td>
</tr>
<tr>
<td>onBehalfOf</td>
<td>ConnectApi.Reference</td>
<td>Reference to the user or record that is indirectly reacting to the recommendation.</td>
<td>45.0</td>
</tr>
<tr>
<td>reactionType</td>
<td>ConnectApi.RecommendationReactionType</td>
<td>Type of reaction to a recommendation. Values are:</td>
<td>45.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Accepted</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Rejected</td>
<td></td>
</tr>
<tr>
<td>recommendation Mode</td>
<td>String</td>
<td>Reserved for future use.</td>
<td>46.0</td>
</tr>
<tr>
<td>recommendation Score</td>
<td>Double</td>
<td>Reserved for future use.</td>
<td>46.0</td>
</tr>
<tr>
<td>strategy</td>
<td>ConnectApi.RecordSnapshot</td>
<td>Strategy that recommended the target record.</td>
<td>45.0</td>
</tr>
</tbody>
</table>
### ConnectApi.RecommendedObject

A recommended object, such as a custom or static recommendation.

Subclass of ConnectApi.Actor

### ConnectApi.RecommendationReactions

A list of recommendation reactions.

### ConnectApi.RecommendationsCapability

If a feed element has this capability, it has a recommendation.

Subclass of ConnectApi.FeedElementCapability.
### ConnectApi.RecordCapability

If a comment has this capability, it has a record attachment.
Subclass of `ConnectApi.FeedElementCapability`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>recordId</td>
<td>String</td>
<td>ID of the record.</td>
<td>42.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>URL to the record.</td>
<td>42.0</td>
</tr>
</tbody>
</table>

### ConnectApi.RecordField

Generic record field containing a label and text value.
Subclass of `ConnectApi.LabeledRecordField`.
No additional properties.

SEE ALSO:
- `ConnectApi.CompoundRecordField`
- `ConnectApi.OrderItemSummary`
- `ConnectApi.OrderItemSummaryProduct`
- `ConnectApi.OrderDeliveryGroupSummary`
- `ConnectApi.OrderSummaryRepresentation`

### ConnectApi.RecordSnapshot

A record snapshot in a recommendation reaction.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the record.</td>
<td>45.0</td>
</tr>
<tr>
<td>nameAtSnapshot</td>
<td>String</td>
<td>Name of the record when the ID was recorded.</td>
<td>45.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
- `ConnectApi.RecommendationReaction`
**ConnectApi.RecordSnapshotCapability**

If a feed element has this capability, it contains all the snapshotted fields of a record for a single create record event.

Subclass of `ConnectApi.FeedElementCapability`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>recordView</td>
<td><code>ConnectApi.RecordView</code></td>
<td>A record representation that includes metadata and data so you can display the record easily.</td>
<td>32.0</td>
</tr>
</tbody>
</table>

SEE ALSO:  
`ConnectApi.FeedElementCapabilities`

**ConnectApi.RecordSummary**

Record summary.

Subclass of `ConnectApi.AbstractRecordView`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>entityLabel</td>
<td><code>ConnectApi.EntityLabel</code></td>
<td>Label of the record’s entity.</td>
<td>40.0</td>
</tr>
</tbody>
</table>

SEE ALSO:  
`ConnectApi.EmailAddress`  
`ConnectApi.EmailAttachment`  
`ConnectApi.ReferenceRecordField`  
`ConnectApi.ReferenceWithDateRecordField`

**ConnectApi.RecordSummaryList**

Summary information about a list of records in the organization including custom objects.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>records</td>
<td><code>List&lt;ConnectApi.ActorWithId&gt;</code></td>
<td>A list of records.</td>
<td>30.0</td>
</tr>
<tr>
<td>url</td>
<td><code>String</code></td>
<td>The URL to this list of records.</td>
<td>30.0</td>
</tr>
</tbody>
</table>

**ConnectApi.RecordView**

A view of any record in the org, including a custom object record. This object is used if a specialized object, such as User or ChatterGroup, isn’t available for the record type.

Subclass of `ConnectApi.AbstractRecordView`.

1940
### ConnectApi.RecordViewSection

Section of record fields and values on a record detail.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>sections</td>
<td>List&lt;ConnectApi.RecordViewSection&gt;</td>
<td>List of record view sections.</td>
<td>29.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- ConnectApi.RecordSnapshotCapability

### ConnectApi.RecordsetFilterCriteriaCollection

List of the recordset filters and records.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>recordsetFilters</td>
<td>List&lt;ConnectApi.RecordsetFilterCriteria&gt;</td>
<td>Collection of recordset filter criteria IDs and filtered record IDs.</td>
<td>53.0</td>
</tr>
</tbody>
</table>

### ConnectApi.RecordsetFilterCriteria

Recordset filter criteria and the filtered records.
### ConnectApi.RecordsetFilterCriteriaCollection

Reference to a record.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
<td>The ID of the record being referenced, which could be an 18-character ID or some other string identifier.</td>
<td>28.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>The URL to the resource endpoint.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

### ConnectApi.ReferenceRecordField

Record field with a label and text value.
Subclass of ConnectApi.LabeledRecordField.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>ConnectApi.RecordSummary</td>
<td>Object referenced by the record field.</td>
<td>29.0</td>
</tr>
</tbody>
</table>

### ConnectApi.ReferencedRefundResponse

Refund comprehensive output.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>ConnectApi.ErrorResponse</td>
<td>Error response representation for the refund.</td>
<td>50.0</td>
</tr>
<tr>
<td>gatewayResponse</td>
<td>ConnectApi.RefundGatewayResponse</td>
<td>Gateway response received for the processed refund request.</td>
<td>50.0</td>
</tr>
<tr>
<td>paymentGatewayLogs</td>
<td>List&lt;ConnectApi.GatewayLogResponse&gt;</td>
<td>Gateway log collection representation for the refund.</td>
<td>50.0</td>
</tr>
<tr>
<td>paymentGroup</td>
<td>ConnectApi.PaymentGroupResponse</td>
<td>Payment group associated with the refund.</td>
<td>50.0</td>
</tr>
<tr>
<td>refund</td>
<td>ConnectApi.RefundResponse</td>
<td>Refund response representation.</td>
<td>50.0</td>
</tr>
</tbody>
</table>
**ConnectApi.ReferenceWithDateRecordField**

Record field containing a referenced object that acted at a specific time, for example, "Created By...".
Subclass of `ConnectApi.LabeledRecordField`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>dateValue</td>
<td>Datetime</td>
<td>Time at which the referenced object acted.</td>
<td>29.0</td>
</tr>
<tr>
<td>reference</td>
<td><code>ConnectApi.RecordSummary</code></td>
<td>Object referenced by the record field.</td>
<td>29.0</td>
</tr>
</tbody>
</table>

**ConnectApi.RefundGatewayResponse**

Refund gateway response.
No additional properties.

**ConnectApi.RefundResponse**

Refund output.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>accountId</td>
<td>String</td>
<td>ID of the account related to the refund record.</td>
<td>50.0</td>
</tr>
<tr>
<td>amount</td>
<td>Double</td>
<td>Total amount of the refund transaction performed in the payment request.</td>
<td>50.0</td>
</tr>
<tr>
<td>currencyIsoCode</td>
<td>String</td>
<td>Three-letter ISO 4217 currency code associated with the payment group record.</td>
<td>50.0</td>
</tr>
<tr>
<td>effectiveDate</td>
<td>Datetime</td>
<td>Date that the refund becomes effective.</td>
<td>50.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the refund record.</td>
<td>50.0</td>
</tr>
<tr>
<td>refundNumber</td>
<td>String</td>
<td>Number of the refund record that was created as a result of the request processing.</td>
<td>50.0</td>
</tr>
<tr>
<td>requestDate</td>
<td>Datetime</td>
<td>Date when the refund occurred.</td>
<td>50.0</td>
</tr>
<tr>
<td>status</td>
<td>String</td>
<td>Indicates the results of processing the refund transaction in the gateway. Can be DRAFT, PROCESSED or CANCELLED.</td>
<td>50.0</td>
</tr>
</tbody>
</table>

**ConnectApi.RelatedFeedPost**

This class is abstract.
Subclass of `ConnectApi.ActorWithId`.
Superclass of `ConnectApi.RelatedQuestion`.

1943
<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>score</td>
<td>Double</td>
<td>Score of the related feed post that indicates how closely related it is</td>
<td>37.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>to the context feed post.</td>
<td></td>
</tr>
<tr>
<td>title</td>
<td>String</td>
<td>Title of the related feed post.</td>
<td>37.0</td>
</tr>
</tbody>
</table>

SEE ALSO: ConnectApi.RelatedFeedPosts

**ConnectApi.RelatedFeedPosts**

A collection of related feed posts.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>relatedFeedPosts</td>
<td>List&lt;ConnectApi.RelatedFeedPost&gt;</td>
<td>Collection of related feed posts.</td>
<td>37.0</td>
</tr>
</tbody>
</table>

**ConnectApi.RelatedQuestion**

A related question.
Subclass of ConnectApi.RelatedFeedPost.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>hasBestAnswer</td>
<td>Boolean</td>
<td>Indicates whether the question has a best answer.</td>
<td>37.0</td>
</tr>
<tr>
<td>interactions</td>
<td>ConnectApi.InteractionsCapability</td>
<td>The number of individual views, likes, and comments on a question.</td>
<td>38.0</td>
</tr>
</tbody>
</table>

**ConnectApi.ReleaseHeldFOCapacityOutputRepresentation**

Response to a request to confirm held fulfillment order capacity at one or more locations. Can correspond to one action call.
Subclass of ConnectApi.BaseOutputRepresentation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>releaseHeldFOCapacityResponses</td>
<td>List&lt;ConnectApi.ReleaseHeldFOCapacityResponseOutputRepresentation&gt;</td>
<td>List of responses to the requests to confirm held fulfillment order capacity at one or more locations.</td>
<td>55.0</td>
</tr>
</tbody>
</table>

**ConnectApi.ReleaseHeldFOCapacityResponseOutputRepresentation**

Response to a request to release held fulfillment order capacity at one or more locations.
<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>capacityResponses</td>
<td>List&lt;ConnectApi.CapacityResponse&gt;</td>
<td>List of responses to the requests to release held fulfillment order capacity at individual locations.</td>
<td>55.0</td>
</tr>
</tbody>
</table>

**ConnectApi.ReplyIntent**

Reply intent for a social post.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>managedSocialAccount</td>
<td>ConnectApi.ManagedSocialAccount</td>
<td>Managed social account that replies to the social post.</td>
<td>45.0</td>
</tr>
</tbody>
</table>

SEE ALSO:

ConnectApi.ReplyIntents

**ConnectApi.ReplyIntents**

List of reply intents for a social post.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>replies</td>
<td>List&lt;ConnectApi.ReplyIntent&gt;</td>
<td>List of reply intents for the social post.</td>
<td>45.0</td>
</tr>
</tbody>
</table>

SEE ALSO:

ConnectApi.SocialPostIntents

**ConnectApi.RepositoryFileDetail**

A detailed description of a repository file.
Subclass of ConnectApi.AbstractRepositoryFile.
No additional properties.

**ConnectApi.RepositoryFileSummary**

A summary of a repository file.
Subclass of ConnectApi.AbstractRepositoryFile.
No additional properties.

SEE ALSO:

ConnectApi.RepositoryFolderItem
ConnectApi.RepositoryFolderDetail
A detailed description of a repository folder.
Subclass of ConnectApi.AbstractRepositoryFolder.
No additional properties.

ConnectApi.RepositoryFolderItem
A folder item.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>ConnectApi. Repository FileSummary</td>
<td>If the folder item is a file, the file summary. If the folder item is a folder, null.</td>
<td>39.0</td>
</tr>

<td>folder</td>
<td>ConnectApi. Repository FolderSummary</td>
<td>If the folder item is a folder, the folder summary. If the folder item is a file, null.</td>
<td>39.0</td>
</tr>
</tbody>
</table>
| type | ConnectApi. FolderItemType | Type of item in a folder. Values are:  
  • file  
  • folder | 39.0 |

SEE ALSO:
  ConnectApi.RepositoryFolderItemsCollection

ConnectApi.RepositoryFolderItemsCollection
A collection of repository folder items.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>currentPageUrl</td>
<td>String</td>
<td>URL to the current page of items.</td>
<td>39.0</td>
</tr>
<tr>
<td>items</td>
<td>List&lt;ConnectApi. Repository FolderItem&gt;</td>
<td>Collection of items in a repository folder.</td>
<td>39.0</td>
</tr>
<tr>
<td>nextPageUrl</td>
<td>String</td>
<td>URL to the next page of items, or null if there isn’t a next page.</td>
<td>39.0</td>
</tr>
<tr>
<td>previousPageUrl</td>
<td>String</td>
<td>URL to the previous page of items, or null if there isn’t a previous page.</td>
<td>39.0</td>
</tr>
</tbody>
</table>

ConnectApi.RepositoryFolderSummary
A summary of a repository folder.
Subclass of `ConnectApi.AbstractRepositoryFolder`.
No additional properties.

SEE ALSO:
`ConnectApi.RepositoryFolderItem`

**ConnectApi.RepositoryGroupSummary**

A group summary.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
</table>
| groupType     | `ConnectApi.ContentHub.GroupType` | Type of group. Values are:
                    • `Everybody`—Group is public to everybody.
                    • `EverybodyInDomain`—Group is public to everybody in the same domain.
                    • `Unknown`—Group type is unknown. | 39.0               |
| name          | `String`                  | Name of the group.                                                          | 39.0               |

SEE ALSO:
`ConnectApi.ExternalFilePermissionInformation`

**ConnectApi.RepositoryUserSummary**

A user summary.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>firstName</td>
<td><code>String</code></td>
<td>First name of the user.</td>
<td>39.0</td>
</tr>
<tr>
<td>lastName</td>
<td><code>String</code></td>
<td>Last name of the user.</td>
<td>39.0</td>
</tr>
</tbody>
</table>

**ConnectApi.Reputation**

Reputation for a user.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>reputationLevel</td>
<td><code>ConnectApi.ReputationLevel</code></td>
<td>User's reputation level.</td>
<td>32.0</td>
</tr>
<tr>
<td>reputationPoints</td>
<td><code>Double</code></td>
<td>User's reputation points, which can be earned by performing different activities.</td>
<td>32.0</td>
</tr>
</tbody>
</table>

### ConnectApi.ReputationLevel

Reputation level for a user.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>levelImageUrl</td>
<td>String</td>
<td>URL to the reputation level image.</td>
<td>32.0</td>
</tr>
<tr>
<td>levelName</td>
<td>String</td>
<td>Name of the reputation level.</td>
<td>32.0</td>
</tr>
<tr>
<td>levelNumber</td>
<td>Integer</td>
<td>Reputation level number, which is the numerical rank of the level,</td>
<td>32.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>with the lowest level at 1. Administrators define the reputation level</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>point ranges.</td>
<td></td>
</tr>
</tbody>
</table>

**SEE ALSO:**

---

### ConnectApi.RequestHeader

An HTTP request header name and value pair.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the request</td>
<td>33.0</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>header.</td>
<td>33.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**

- [ConnectApi.ActionLinkDefinition](#)

---

### ConnectApi.ResourceLinkSegment

Resource link segment.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>String</td>
<td>URL to a resource not otherwise identified by an ID field, for example,</td>
<td>28.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>a link to a list of users.</td>
<td></td>
</tr>
</tbody>
</table>
**ConnectApi.ReturnItemsOutputRepresentation**

Output of Return Items. Includes the ID of the generated change order for items and delivery charges being returned, as well as the ID of the generated change order for any charged return fees. Also includes information about any ReturnOrderLineItems that were created to represent remaining return quantities.

Subclass of `ConnectApi.BaseOutputRepresentation`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>changeOrderId</td>
<td>String</td>
<td>ID of the change order created by processing the ReturnOrderLineItems...</td>
<td>52.0</td>
</tr>
<tr>
<td>feeChangeOrderId</td>
<td>String</td>
<td>ID of the change order created by processing the ReturnOrderLineItems...</td>
<td>56.0</td>
</tr>
<tr>
<td>returnLineItemSplits</td>
<td>List&lt;String&gt;</td>
<td>List of properties representing any remaining quantities from partial returns processed by this call. It includes order items, delivery charges, and return fees. Each element of the list includes the ID of a split ReturnOrderLineItem and the ID of the partially processed ReturnOrderLineItem whose remaining quantity it holds.</td>
<td>52.0</td>
</tr>
</tbody>
</table>

SEE ALSO:
```
returnItems(returnOrderId, returnItemsInput)
```

**ConnectApi.ReturnOrderLineItemSplitLineOutputRepresentation**

After a change order is created for a ReturnOrderLineItem, that ReturnOrderLineItem is read-only. If the Return Items API is used to return a partial quantity, it creates a new “split” ReturnOrderLineItem to hold the remaining quantity to be returned. In that case, it returns this output property, which contains the IDs of the original and split ReturnOrderLineItems.

Subclass of `ConnectApi.BaseOutputRepresentation`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>newReturnOrderItemId</td>
<td>String</td>
<td>ID of the new ReturnOrderLineItem that holds the remaining return quantity.</td>
<td>52.0</td>
</tr>
<tr>
<td>originalReturnOrderItemId</td>
<td>String</td>
<td>ID of the original ReturnOrderLineItem.</td>
<td>52.0</td>
</tr>
</tbody>
</table>

<tr>
<td>paymentGroup</td>
<td>ConnectApi.PaymentGroupResponse</td>
<td>Payment group used in the sale request.</td>
<td>54.0</td>
</tr>
<tr>
<td>paymentMethod</td>
<td>ConnectApi.PaymentMethodResponse</td>
<td>Payment method used in the sale request.</td>
<td>54.0</td>
</tr>
</tbody>
</table>

ConnectApi.SaleGatewayResponse

Sale gateway response.
No additional properties.

ConnectApi.ScheduledRecommendation

Represents a scheduled custom recommendation.
<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
</table>
| channel       | ConnectApi.Recommendation Channel | A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:  
  • CustomChannel1—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.  
  • CustomChannel2—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.  
  • CustomChannel3—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.  
  • CustomChannel4—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.  
  • CustomChannel5—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.  
  • DefaultChannel—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder. | 36.0              |
<p>| enabled       | Boolean  | Indicates whether scheduling is enabled. If true, the custom recommendation is enabled and appears in Experience Cloud sites. If false, custom recommendations in feeds in Salesforce mobile web aren't removed, but no new custom recommendations appear. In Customer Service and Partner Central sites, disabled custom recommendations no longer appear. | 35.0              |
| id            | String   | 18-character ID of the scheduled custom recommendation.                                                                                                                                                     | 35.0              |</p>
<table>
<thead>
<tr>

</tbody>
</table>

**SEE ALSO:**
*ConnectApi.ProductSearchSuggestionsResults*

**ConnectApi.ServiceAppointmentOutput**

Output of the create service appointment request.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>ConnectApi.ServiceAppointmentResult</td>
<td>Result of the create or update service appointment request.</td>
<td>53.0</td>
</tr>
</tbody>
</table>

**ConnectApi.ServiceAppointmentResult**

Contains result of the service appointment.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>assignedResourceIds</td>
<td>List&lt;String&gt;</td>
<td>The IDs of the assigned resources.</td>
<td>53.0</td>
</tr>
<tr>
<td>parentRecordId</td>
<td>String</td>
<td>The ID of the parent record.</td>
<td>53.0</td>
</tr>
<tr>
<td>serviceAppointmentId</td>
<td>String</td>
<td>The ID of the service appointment record.</td>
<td>53.0</td>
</tr>
</tbody>
</table>

**ConnectApi.ShiftsFromPattern**

Shifts created from a pattern.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>Integer</td>
<td>Total count of created shifts.</td>
<td>51.0</td>
</tr>
</tbody>
</table>
### ConnectApi.ShiftsFromPatternError

Shifts from pattern error response.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>ConnectApi.ShiftsFromPatternError</td>
<td>Error details for shifts from a pattern.</td>
<td>53.0</td>

<tr>
<td>isSuccess</td>
<td>Boolean</td>
<td>Indicates if the request is successful (true) or not (false).</td>
<td>53.0</td>
</tr>
<tr>
<td>recordIds</td>
<td>List&lt;String&gt;</td>
<td>Collection of created shift IDs.</td>
<td>51.0</td>
</tr>
</tbody>
</table>

### ConnectApi.SiteSearchItem

Site search result item.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>contentReference</td>
<td>String</td>
<td>Content reference field, which is the route developer name for a site page or a content key for a content detail page.</td>
<td>54.0</td>
</tr>
<tr>
<td>contentTypeDeveloperName</td>
<td>String</td>
<td>Developer name of the content type of the site search result item.</td>
<td>54.0</td>
</tr>
<tr>
<td>highlightedSnippet</td>
<td>String</td>
<td>Text snippet that contains the query term.</td>
<td>54.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the site search result item.</td>
<td>54.0</td>
</tr>
<tr>
<td>pageType</td>
<td>ConnectApi.SitesPageType</td>
<td>Type of site search result item. Values are:</td>
<td>54.0</td>

<tr>
<td>previousPageUrl</td>
<td>String</td>
<td>URL to the previous page of search results, or null if there isn’t a previous page.</td>
<td>54.0</td>
</tr>
<tr>
<td>totalItems</td>
<td>Integer</td>
<td>Total number of items in the search results across all pages.</td>
<td>54.0</td>
</tr>
</tbody>
</table>

## ConnectApi.SocialAccount

A social account on a social network.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>externalSocialAccountId</td>
<td>String</td>
<td>ID of the external social account, if available.</td>
<td>38.0</td>
</tr>
<tr>
<td>handle</td>
<td>String</td>
<td>Social handle, screen name, or alias that identifies this account.</td>
<td>36.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the account as defined by the account’s owner.</td>
<td>36.0</td>
</tr>
<tr>
<td>profileUrl</td>
<td>String</td>
<td>URL to the account’s profile.</td>
<td>36.0</td>
</tr>
<tr>
<td>socialPersonaId</td>
<td>String</td>
<td>ID of the social persona account, if the external social account ID isn’t available.</td>
<td>39.0</td>
</tr>
</tbody>
</table>

SEE ALSO:

ConnectApi.SocialPostCapability
**ConnectApi.SocialAccountRelationship**

Follow relationship between a managed social account and a social persona.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isFollowed</td>
<td>Boolean</td>
<td>Specifies whether the social account is followed by the social persona.</td>
<td>46.0</td>
</tr>
<tr>

ConnectApi.FeedElementCapabilities

**ConnectApi.SocialPostIntents**

Intents available for a social post.
### ConnectApi.SocialPostMassApprovalOutput

Approval or rejection of a large number of social posts.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isApproved</td>
<td>Boolean</td>
<td>Specifies whether the social posts were approved ( \text{true} ) or rejected ( \text{false} ) for publishing.</td>
<td>46.0</td>
</tr>
</tbody>
</table>

### ConnectApi.SocialPostStatus

The status of a social post.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>Status message.</td>
<td>36.0</td>
</tr>
</tbody>
</table>
### ConnectApi.StatusType

Status type. Values are:
- ApprovalPending
- ApprovalRecalled
- ApprovalRejected
- Deleted
- Failed
- Hidden
- Pending
- Sent
- Unknown

**See also:**
- ConnectApi.SocialPostCapability

### ConnectApi.Stamp

A user stamp.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the stamp.</td>
<td>39.0–43.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the stamp.</td>
<td>39.0–43.0</td>
</tr>
<tr>
<td>imageUrl</td>
<td>String</td>
<td>Image URL of the stamp.</td>
<td>39.0–43.0</td>
</tr>
<tr>
<td>label</td>
<td>String</td>
<td>Label of the stamp.</td>
<td>39.0–43.0</td>
</tr>
</tbody>
</table>

**See also:**

</tr>
<tr>
<td></td>
<td></td>
<td>- Ascending—Sorts in ascending alphanumeric order (A–Z, 0–9).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Default—When no direction is defined, sorts by relevance.</td>
<td></td>
</tr>
</tbody>
</table>
### Property Name: label
- **Type:** String
- **Description:** Label of the sort rule.
- **Available Version:** 52.0

### Property Name: labelSuffix
- **Type:** `ConnectApi.CommerceSearch.SortRuleLabelSuffix`
- **Description:** Label suffix of the sort rule. Values are:
  - Asc—Label suffix for 'Asc'
  - Ascending—Label suffix for 'Ascending'
  - Az—Label suffix for 'A-Z'
  - Desc—Label suffix for 'Desc'
  - Descending—Label suffix for 'Descending'
  - FewMany—Label suffix for 'Few-Many'
  - HeavyLight—Label suffix for 'Heavy-Light'
  - HighLow—Label suffix for 'High-Low'
  - HighestLowest—Label suffix for 'Highest-Lowest'
  - LightHeavy—Label suffix for 'Light-Heavy'
  - LowHigh—Label suffix for 'Low-High'
  - LowestHighest—Label suffix for 'Lowest-Highest'
  - ManyFew—Label suffix for 'Many-Few'
  - NewOld—Label suffix for 'New-Old'
  - Newest—Label suffix for 'Newest'
  - NewestOldest—Label suffix for 'Newest-Oldest'
  - NineZero—Label suffix for '9-0'
  - OldNew—Label suffix for 'Old-New'
  - Oldest—Label suffix for 'Oldest'
  - OldestNewest—Label suffix for 'Oldest-Newest'
  - PriceDecreasing—Label suffix for '$$-$'
  - PriceIncreasing—Label suffix for '$-$'$
  - ThickThin—Label suffix for 'Thick-Thin'
  - ThinThick—Label suffix for 'Thin-Thick'
  - Za—Label suffix for 'Z-A'
  - ZeroNine—Label suffix for '0-9'
- **Available Version:** 54.0

### Property Name: nameOrId
- **Type:** String
- **Description:** Name of the sort rule field or, if the sort rule is based on a custom field, ID.
- **Available Version:** 52.0
<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>sortOrder</td>
<td>Integer</td>
<td>Sort order for the rule. A lower number has higher precedence. The first sort option is called when no other option is selected.</td>
<td>54.0</td>
</tr>
<tr>
<td>sortRuleId</td>
<td>String</td>
<td>ID of the sort rule.</td>
<td>52.0</td>
</tr>
</tbody>
</table>
| type          | ConnectApi.CommerceSearch.SortRuleType | Type of sort rule. Values are:  
- ProductAttributeBased—Sorts by product attribute fields.  
- ProductBased—Sorts by product field data.  
- Relevancy—Sorts by product and catalog term frequency.  
- SortByPricebook—Sorts by product prices defined in the specified pricebook (version 55.0 and later). | 52.0 |

**SEE ALSO:**  
ConnectApi.SortRulesCollection

**ConnectApi.SortRulesCollection**  
Collection of sort rules.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>

</thead>
<tbody>
<tr>
<td>sortRules</td>
<td>List&lt;ConnectApi.SortRule&gt;</td>
<td>Collection of sort rules.</td>
<td>52.0</td>
</tr>
</tbody>
</table>

**ConnectApi.StatusCapability**  
If a feed post or comment has this capability, it has a status that determines its visibility.  
Subclass of ConnectApi.FeedElementCapability.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
</table>
| feedEntityStatus | ConnectApi.FeedEntityStatus | Status of the feed post or comment. Values are:  
- Draft—The feed post isn’t published but is visible to the author and users with Modify All Data or View All Data permission. Comments can’t be drafts.  
- PendingReview—The feed post or comment isn’t approved yet and therefore isn’t published or visible. | 37.0 |
## Published

- **Published** — The feed post or comment is approved and visible.

### isApprovableByMe

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>isApprovableByMe</td>
<td>Boolean</td>
<td>Specifies whether the context user can change the status of the feed post or comment.</td>
<td>37.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- [ConnectApi.CommentCapabilities](#)
- [ConnectApi.FeedElementCapabilities](#)

## ConnectApi.StrategyTrace

Messages and trace nodes for a recommendation strategy execution.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>messages</td>
<td><code>List&lt;String&gt;</code></td>
<td>Messages and errors from the strategy execution.</td>
<td>45.0</td>
</tr>
<tr>
<td>nodes</td>
<td><code>List&lt;ConnectApi.StrategyTraceNode&gt;</code></td>
<td>Nodes of the strategy execution used for debugging.</td>
<td>45.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- [ConnectApi.NBARecommendations](#)

## ConnectApi.StrategyTraceNode

A trace node for a recommendation strategy execution.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputCount</td>
<td>Integer</td>
<td>Number of items put into the node.</td>
<td>45.0</td>
</tr>
<tr>
<td>messages</td>
<td><code>List&lt;String&gt;</code></td>
<td>Messages that occurred during node execution.</td>
<td>45.0</td>
</tr>
<tr>
<td>nodeName</td>
<td>String</td>
<td>Name of the node.</td>
<td>45.0</td>
</tr>
<tr>
<td>nodeTime</td>
<td>Long</td>
<td>Time spent processing inside the node.</td>
<td>45.0</td>
</tr>
<tr>
<td>nodeType</td>
<td>String</td>
<td>Type of node.</td>
<td>45.0</td>
</tr>
<tr>
<td>outputCount</td>
<td>Integer</td>
<td>Number of items returned from the node.</td>
<td>45.0</td>
</tr>
<tr>
<td>outputs</td>
<td><code>List&lt;String&gt;</code></td>
<td>Recommendations that are returned from the node.</td>

### ConnectApi.SubmitCancelOutputRepresentation

ID of the change order created for a cancel action, and a set of its financial values.
Subclass of ConnectApi.BaseOutputRepresentation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>changeBalances</td>
<td>ConnectApi.ChangeItem</td>
<td>Financial values resulting from the cancel.</td>
<td>48.0</td>
</tr>
<tr>
<td>changeOrderId</td>
<td>String</td>
<td>ID of the change order created for the canceled order items and shipping charges. Use this change order to create a credit memo.</td>
<td>48.0</td>
</tr>
<tr>
<td>feeChangeOrderId</td>
<td>String</td>
<td>ID of the change order created by canceling order items with associated cancel fees. Use this change order to create an invoice.</td>
<td>57.0</td>
</tr>
</tbody>
</table>

### ConnectApi.SubmitReturnOutputRepresentation

ID of the change order created for a return action, and a set of its financial values.
Subclass of ConnectApi.BaseOutputRepresentation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>changeBalances</td>
<td>ConnectApi.ChangeItem</td>
<td>Financial values resulting from the return.</td>
<td>48.0</td>
</tr>
<tr>
<td>changeOrderId</td>
<td>String</td>
<td>ID of the change order created for the returned order items and shipping charges. Use this change order to create a credit memo.</td>
<td>48.0</td>
</tr>
<tr>
<td>feeChangeOrderId</td>
<td>String</td>
<td>ID of the change order created by returning order items with associated return fees. Use this change order to create an invoice.</td>
<td>57.0</td>
</tr>
</tbody>
</table>

### ConnectApi.Subscription

Subscription.
### Available Version Description

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>community</td>
<td>ConnectApi.Reference</td>
<td>Information about the Experience Cloud site in which the subscription exists.</td>
<td>28.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>Subscription’s 18–character ID.</td>
<td>28.0</td>
</tr>
<tr>
<td>subject</td>
<td>ConnectApi.Actor</td>
<td>Information about the parent, that is, the thing or person being followed.</td>
<td>28.0</td>
</tr>
<tr>
<td>subscriber</td>
<td>ConnectApi.Actor</td>
<td>Information about the subscriber, that is, the person following this item.</td>
<td>28.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>Connect REST API URL to this specific subscription.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- ConnectApi.FollowerPage
- ConnectApi.FollowingPage

### ConnectApi.SubscriptionTermRule

Subscription term rules.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>increment</td>
<td>Integer</td>
<td>Number of pricing term units that can be used to increase the subscription term.</td>
<td>59.0</td>
</tr>
<tr>
<td>maximum</td>
<td>Integer</td>
<td>Maximum number of pricing term units per subscription term.</td>
<td>59.0</td>
</tr>
<tr>
<td>minimum</td>
<td>Integer</td>
<td>Minimum number of pricing term units per subscription term.</td>
<td>59.0</td>
</tr>
</tbody>
</table>

### ConnectApi.SupportedEmojis

A collection of supported emoji.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>supportedEmojis</td>
<td>ConnectApi.EmojiCollection</td>
<td>A collection of supported emoji.</td>
<td>39.0</td>
</tr>
</tbody>
</table>

### ConnectApi.SurveyInvitationEmailOutput

Survey invitation email.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorCode</td>
<td>Integer</td>
<td>Error code for the failed call.</td>
<td>50.0</td>
</tr>
</tbody>
</table>
### ConnectApi.OutputClasses

**Available Version**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorMessage</td>
<td>String</td>
<td>Details explaining why the call failed.</td>
<td>50.0</td>
</tr>
</tbody>
</table>
| status        | ConnectApi.SurveyEmailStatusEnum | Status of a survey invitation email. Values are:  
  - Failed—The survey invitation email wasn’t sent.  
  - Queued—The survey invitation email is queued for sending. | 50.0 |

### ConnectApi.Target

Personalization target information.

**Available Version**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>audience</td>
<td>ConnectApi.AudienceTarget</td>
<td>Audience assigned to the target.</td>
<td>48.0</td>
</tr>
<tr>
<td>formulaScope</td>
<td>ConnectApi.FormulaScope</td>
<td>Formula scope of the target.</td>
<td>50.0</td>
</tr>
<tr>
<td>groupName</td>
<td>String</td>
<td>Group name of the target. Groups bundle related target and audience pairs.</td>
<td>48.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the target.</td>
<td>48.0</td>
</tr>
<tr>
<td>priority</td>
<td>Integer</td>
<td>Priority of the target. Within a group, priority determines which target is returned if the user matches more than one audience.</td>
<td>48.0</td>
</tr>
</tbody>
</table>
| publishStatus | ConnectApi.PublishStatus | Publish status of the target. Values are:  
  - Draft  
  - Live | 48.0 |
| scope         | List<ConnectApi.Scope> | List of scopes for the target.  
In version 50.0 and later, the formulaScope property returns this information. | 48.0–49.0 |
| targetType    | String | Type of target, indicating the nature of the data being targeted. | 48.0 |
| targetValue   | String | Value of the target. | 48.0 |
| url           | String | URL to the target. | 48.0 |

SEE ALSO:

ConnectApi.TargetCollection
**ConnectApi.TargetCollection**

List of personalization targets.

</tbody>
</table>

**ConnectApi.CalculateTaxResponse**

Shows the results of a tax calculation request.

Subclass of `ConnectApi.TaxTransactionResponse`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>adapterError</td>
<td>ConnectApi.ErrorResponse</td>
<td>Adapter error.</td>
<td>55.0</td>
</tr>
</tbody>
</table>
| status        | ConnectApi.TaxTransactionStatus | Status of a tax transaction. Values are:  
  - Committed—Tax has been committed to the transaction.  
  - Uncommitted—Tax hasn’t been committed to the transaction. | 55.0 |
| taxEngineLogs | List<ConnectApi.TaxEngineLogResponse> | Tax engine logs. | 55.0 |
| taxTransactionType | ConnectApi.TaxTransactionType | Type of tax transaction. Values are:  
  - Credit—Transaction is a credit transaction.  
  - Debit—Transaction is a debit transaction. | 55.0 |
| taxType       | ConnectApi.CalculateTaxType | Type of tax calculation. Values are:  
  - Actual—Calculated tax represents the final taxed amount for the transaction.  
  - Estimated—Calculated tax represents only an estimated value before the transaction is finalized. | 55.0 |

**ConnectApi.TaxAddressResponse**

Location code of an address.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>locationCode</td>
<td>String</td>
<td>Location code of an address.</td>
<td>55.0</td>
</tr>
</tbody>
</table>
ConnectApi.TaxAddressesResponse

The Ship From, Ship To, and Sold To addresses used during tax calculation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>shipFrom</td>
<td>ConnectApi.TaxAddressResponse</td>
<td>The Ship From address used in tax calculation.</td>
<td>55.0</td>
</tr>
<tr>
<td>shipTo</td>
<td>ConnectApi.TaxAddressResponse</td>
<td>The Ship To address used in tax calculation.</td>
<td>55.0</td>
</tr>
<tr>
<td>soldTo</td>
<td>ConnectApi.TaxAddressResponse</td>
<td>The Sold To address used in tax calculation.</td>
<td>55.0</td>
</tr>
</tbody>
</table>

ConnectApi.TaxAmountDetailsResponse

Information about tax amount values on the line item.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>exemptAmount</td>
<td>Double</td>
<td>Amount of the line item exempt from tax application.</td>
<td>55.0</td>
</tr>
<tr>
<td>taxAmount</td>
<td>Double</td>
<td>Tax amount for the line item.</td>
<td>55.0</td>
</tr>
<tr>
<td>totalAmount</td>
<td>Double</td>
<td>Total amount of the line item.</td>
<td>55.0</td>
</tr>
<tr>
<td>totalAmountWithTax</td>
<td>Double</td>
<td>The line item's total amount with tax.</td>
<td>55.0</td>
</tr>
</tbody>
</table>

ConnectApi.TaxDetailsResponse

Tax details for each line item in a tax line item output.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>exemptAmount</td>
<td>Double</td>
<td>Amount of the line item that is exempt from taxation.</td>
<td>55.0</td>
</tr>
<tr>
<td>exemptReason</td>
<td>String</td>
<td>The reason that any tax exemption applied to the line item.</td>
<td>55.0</td>
</tr>
<tr>
<td>imposition</td>
<td>ConnectApi.TaxImpositionResponse</td>
<td>The business justification for applying tax to a line item.</td>
<td>55.0</td>
</tr>
<tr>
<td>jurisdiction</td>
<td>ConnectApi.TaxJurisdictionResponse</td>
<td>Business address used to calculate the tax rate for the line item.</td>
<td>55.0</td>
</tr>
<tr>
<td>rate</td>
<td>Double</td>
<td>Tax rate for the line item.</td>
<td>55.0</td>
</tr>
<tr>
<td>Property Name</td>
<td>Type</td>
<td>Description</td>
<td>Available Version</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
<td>--------------------------------------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>tax</td>
<td>Double</td>
<td>Total amount of tax on the line item.</td>
<td>55.0</td>
</tr>
<tr>
<td>taxId</td>
<td>String</td>
<td>ID for the type of tax applied to the line item.</td>
<td>55.0</td>
</tr>
<tr>
<td>taxableAmount</td>
<td>Double</td>
<td>Amount of line item that can be taxed.</td>
<td>55.0</td>
</tr>
</tbody>
</table>

**ConnectApi.TaxAddressResponse**
Address output representation for tax calculation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>locationCode</td>
<td>String</td>
<td>Location code.</td>
<td>55.0</td>
</tr>
</tbody>
</table>

**ConnectApi.TaxEngineLogResponse**
Shows the results of the tax calculation request to the tax engine.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>createdDate</td>
<td>Datetime</td>
<td>The date that the gateway log was created.</td>
<td>55.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the tax engine log record.</td>
<td>55.0</td>
</tr>
<tr>
<td>resultCode</td>
<td>String</td>
<td>Result code sent from the external tax engine. Review the tax engine provider’s documentation for more information about the code.</td>
<td>55.0</td>
</tr>
</tbody>
</table>

**ConnectApi.TaxImpositionResponse**
Tax imposition output representation.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the tax imposition.</td>
<td>55.0</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Type of the tax imposition.</td>
<td>55.0</td>
</tr>
</tbody>
</table>

**ConnectApi.TaxJurisdictionResponse**
Represents the address or jurisdiction of the primary business used for calculating tax.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>country</td>
<td>String</td>
<td>Country of the tax jurisdiction address.</td>
<td>55.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the tax jurisdiction address.</td>
<td>55.0</td>
</tr>
<tr>
<td>level</td>
<td>String</td>
<td>Level of the tax jurisdiction address.</td>
<td>55.0</td>
</tr>
</tbody>
</table>
ConnectApi.TaxAddressResponse

Available Version
Description
Type
Property Name

55.0
Name of the tax jurisdiction address.
String
name

55.0
Region of the tax jurisdiction address.
String
region

55.0
State-assigned number of the tax jurisdiction address.
String
stateAssignedNo

ConnectApi.LineItemResponse

Response class that stores information about a list of one or more line items on which the tax engine has calculated tax.

Available Version
Description
Type
Property Name

55.0
The Ship From, Ship To, and Sold To addresses used during tax calculation.
ConnectApi.TaxAddressesResponse
addresses

55.0
Information about tax amount values on the line item.
ConnectApi.TaxAmountDetailsResponse
amountDetails

55.0
The date that the tax calculation takes effect.
Datetime
effectiveDate

55.0
System-generated number used to identify the tax line.
String
lineNumber

55.0
Product code for the product related to the taxed line item.
String
productCode

55.0
Quantity of the taxed line item.
Double
quantity

55.0
Tax code for the taxed line item.
String
taxCode

55.0
Tax details for each line item in a tax line item output.
List<ConnectApi.TaxDetailsResponse>
taxes

ConnectApi.TaxTransactionResponse

Tax transaction output representation
This class is abstract.
Superclass of ConnectApi.CalculateTaxResponse.

Available Version
Description
Type
Property Name

55.0
The Ship From, Ship To, and Sold To addresses used during tax calculation.
ConnectApi.TaxAddressesResponse
addresses
<table>

<td>List&lt;ConnectApi.LineItemResponse&gt;</td>
<td>A list of line items on which tax was calculated.</td>
<td>55.0</td>
</tr>
<tr>
<td>referenceDocumentCode</td>
<td>String</td>
<td>The original document code. Used in case of subsequent transactions such as credit tax.</td>
<td>55.0</td>
</tr>
<tr>
<td>referenceEntityId</td>
<td>String</td>
<td>ID of the reference entity used during tax calculation.</td>
<td>55.0</td>
</tr>
<tr>
<td>taxTransactionId</td>
<td>String</td>
<td>ID of the tax transaction.</td>
<td>55.0</td>
</tr>
<tr>
<td>transactionDate</td>
<td>Datetime</td>
<td>The date that the tax transaction occurred.</td>
<td>55.0</td>
</tr>
</tbody>
</table>

**ConnectApi.TextSegment**

Text segment.
Subclass of ConnectApi.MessageSegment.
No additional properties.

**ConnectApi.TimeZone**

User’s time zone as selected in the user’s personal settings in Salesforce. This value doesn’t reflect a device’s current location.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>gmtOffset</td>
<td>Double</td>
<td>Signed offset, in hours, from GMT.</td>
<td>30.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Display name of this time zone.</td>
<td>30.0</td>
</tr>
</tbody>
</table>

### ConnectApi.TopicEndorsement

Represents one user endorsing another user for a single topic.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>endorsee</td>
<td>ConnectApi.User Summary</td>
<td>User being endorsed.</td>
<td>30.0</td>
</tr>
<tr>
<td>endorsementId</td>
<td>String</td>
<td>18-character ID of the endorsement record.</td>
<td>30.0</td>
</tr>
<tr>
<td>endorser</td>
<td>ConnectApi.User Summary</td>
<td>User performing the endorsement.</td>
<td>30.0</td>
</tr>
<tr>
<td>topic</td>
<td>ConnectApi.Topic</td>
<td>Topic the user is being endorsed for.</td>
<td>30.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>URL to the resource for the endorsement record.</td>
<td>30.0</td>
</tr>
</tbody>
</table>
**ConnectApi.TopicEndorsementCollection**

Collection of topic endorsement response bodies.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>currentPageUrl</td>
<td>String</td>
<td>Connect REST API URL identifying the current page.</td>
<td>30.0</td>
</tr>
<tr>
<td>nextPageUrl</td>
<td>String</td>
<td>Connect REST API URL identifying the next page, or null if there isn’t a next page.</td>
<td>30.0</td>
</tr>
<tr>
<td>previousPageUrl</td>
<td>String</td>
<td>Connect REST API URL identifying the previous page, or null if there isn’t a previous page.</td>
<td>30.0</td>
</tr>
<tr>
<td>topicEndorsements</td>
<td>List&lt;ConnectApi.Topic&gt;</td>
<td>List of topic endorsements.</td>
<td>30.0</td>
</tr>
</tbody>
</table>

**ConnectApi.TopicEndorsementSummary**

Topic endorsement summary.

Subclass of ConnectApi.UserActivitySummary.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>endorsementId</td>
<td>ID</td>
<td>ID of the topic endorsement.</td>
<td>42.0</td>
</tr>
</tbody>
</table>

**ConnectApi.TopicImages**

Images associated with a topic.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>coverImageUrl</td>
<td>String</td>
<td>URL to a topic’s cover image, which appears on the topic page. Both topics and managed topics can have cover images.</td>
<td>32.0</td>
</tr>
<tr>
<td>featuredImageUrl</td>
<td>String</td>
<td>URL to a managed topic’s featured image, which appears wherever you feature it, for example, on your Experience Cloud site home page.</td>
<td>32.0</td>
</tr>
</tbody>
</table>

SEE ALSO:

  - ConnectApi.Topic

**ConnectApi.TopicPage**

Page of topics.
### ConnectApi.TopicsCapability

If a feed element has this capability, the context user can add topics to it. Topics help users organize and discover conversations. Subclass of `ConnectApi.FeedElementCapability`.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>canAssignTopics</td>
<td>Boolean</td>
<td><code>true</code> if a topic can be assigned to the feed element, <code>false</code> otherwise.</td>
<td>32.0</td>
</tr>
<tr>
<td>items</td>
<td>List&lt;ConnectApi.Topic&gt;</td>
<td>A collection of topics associated with this feed element.</td>
<td>32.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- `ConnectApi.FeedElementCapabilities`

### ConnectApi.TopicSuggestion

Topic suggestion.

<table>
<thead>

</thead>
<tbody>
<tr>
<td>existingTopic</td>
<td>ConnectApi.Topic</td>
<td>Topic that already exists or null for a new topic</td>
<td>29.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Topic name</td>
<td>29.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- `ConnectApi.TopicSuggestionPage`

### ConnectApi.TopicSuggestionPage

Page of topic suggestions.
## List of topic suggestions.

### TopicSuggestions

Summary of a topic.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the topic.</td>
<td>47.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the topic.</td>
<td>47.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**

ConnectApi.ManagedContentAssociations

## ConnectApi.TrackedChangeBundleCapability

If a feed element has this capability, it has a group of other feed elements aggregated into one feed element called a **bundle**. This type of bundle aggregates feed tracked changes.

Subclass of ConnectApi.BundleCapability.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>changes</td>
<td>List&lt;String&gt;</td>
<td>Collection of feed tracked changes.</td>
<td>31.0</td>
</tr>
</tbody>
</table>

## ConnectApi.TrackedChangeItem

Tracked change item.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>(fieldName)</td>
<td>String</td>
<td>The name of the field that was updated.</td>
<td>28.0</td>
</tr>
<tr>
<td>newValue</td>
<td>String</td>
<td>The new value of the field or <code>null</code> if the field length is long.</td>
<td>28.0</td>
</tr>
<tr>
<td>oldValue</td>
<td>String</td>
<td>The old value of the field or <code>null</code> if the field length is long.</td>
<td>28.0</td>
</tr>
</tbody>
</table>

**SEE ALSO:**

ConnectApi.TrackedChangesCapability

ConnectApi.TrackedChangeBundleCapability
**ConnectApi.TrackedChangesCapability**

If a feed element has this capability, it contains all changes to a record for a single tracked change event.
Subclass of **ConnectApi.FeedElementCapability**.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>changes</td>
<td>List&lt;ConnectApi.TrackedChangeItem&gt;</td>

</tbody>
</table>

SEE ALSO:  
**ConnectApi.FeedElementCapabilities**

**ConnectApi.UnauthenticatedUser**

Unauthenticated user.
Subclass of **ConnectApi.Actor**.
No additional properties.
Instances of this class are used as the actor for feed items and comments posted by Chatter customers.

**ConnectApi.UnreadConversationCount**

Unread count for a conversation.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>hasMore</td>
<td>Boolean</td>
<td>Specifies if there are more than 50 unread messages (true) or not (false).</td>
<td>29.0</td>
</tr>
<tr>
<td>unreadCount</td>
<td>Integer</td>
<td>The total number of unread messages.</td>
<td>29.0</td>
</tr>
</tbody>
</table>

**ConnectApi.UpDownVoteCapability**

If a feed post or comment has this capability, users can upvote or downvote it.
Subclass of **ConnectApi.FeedElementCapability**.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>downVoteCount</td>
<td>Long</td>
<td>Number of downvotes.</td>
<td>41.0</td>
</tr>
<tr>
<td>myVote</td>
<td>ConnectApiUpDownVoteValue</td>
<td>Specifies the context user’s vote. Values are:</td>

### ConnectApi.UserCapabilities

Capabilities associated with a user profile.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>canChat</td>
<td>Boolean</td>
<td>Specifies if the context user can use Chatter Messenger with the subject user (true) or not (false)</td>
<td>29.0</td>
</tr>
</tbody>
</table>
canDirectMessage: Boolean
   Specifies if the context user can direct message the subject user (true) or not (false)
   Available Version: 29.0

canEdit: Boolean
   Specifies if the context user can edit the subject user's account (true) or not (false)
   Available Version: 29.0

canFollow: Boolean
   Specifies if the context user can follow the subject user's feed (true) or not (false)
   Available Version: 29.0

canViewFeed: Boolean
   Specifies if the context user can view the feed of the subject user (true) or not (false)
   Available Version: 29.0

canViewFullProfile: Boolean
   Specifies if the context user can view the full profile of the subject user (true) or only the limited profile (false)
   Available Version: 29.0

isModerator: Boolean
   Specifies if the subject user is a Chatter moderator or admin (true) or not (false)
   Available Version: 29.0

SEE ALSO:
   ConnectApi.UserProfile

ConnectApi.UserChatterSettings
User's global Chatter settings.

defaultGroup
   ConnectApi.GroupEmail EmailFrequency
   The default frequency with which a user receives email from a group when they join it.
   Available Version: 28.0

ConnectApi.UserDetail
Details about a user in an org.
Subclass of ConnectApi.User.
If the context user doesn't have permission to see a property, its value is set to null.

aboutMe: String
   Text from user's profile.
   Available Version: 28.0

address: ConnectApi.Address
   User's address.
   Available Version: 28.0

bannerPhoto: ConnectApi.BannerPhoto
   User's banner photo.
   Available Version: 36.0

chatterActivity: ConnectApi.ChatterActivity
   Chatter activity statistics.
   Available Version: 28.0
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>

</table>

### ConnectApi.Zone

Information about a Chatter Answers zone.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>String</td>
<td>The description of the zone.</td>
<td>29.0</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>The zone ID.</td>
<td>29.0</td>
</tr>
<tr>
<td>isActive</td>
<td>Boolean</td>
<td>Indicates whether or not the zone is active.</td>
<td>29.0</td>
</tr>
<tr>
<td>isChatterAnswers</td>
<td>Boolean</td>
<td>Indicates whether or not the zone is available for Chatter Answers.</td>
<td>29.0</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the zone.</td>
<td>29.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>The URL of the zone.</td>
<td>30.0</td>
</tr>
</tbody>
</table>
## Available Version Description

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>visibility</td>
<td>ConnectApi.ZoneShowIn</td>
<td>Zone visibility type.</td>
<td>29.0</td>

ConnectApi.ZoneSearchPage

Retired ConnectApi Output Classes

These ConnectApi output classes are retired.

IN THIS SECTION:
- ConnectApi.ApprovalAttachment
  Attach an approval to a feed item.
- ConnectApi.BasicTemplateAttachment
  Attachments in feed items with type BasicTemplate.
- ConnectApi.CanvasTemplateAttachment
  Attachments in feed items with type CanvasPost.
- ConnectApi.CaseComment
  Attachments in feed items with type CaseCommentPost.
- ConnectApi.ContentAttachment
  Attachments in feed items with type ContentPost.
- ConnectApi.DashboardComponentAttachment
  Attachments in feed items with type DashboardSnapshot.
- ConnectApi.DatacloudCompany
  Information about a Data.com company.
ConnectApi.DatacloudCompanies
Lists all companies that were purchased in a specific order, page URLs, and the number of companies in the order.

ConnectApi.DatacloudContact
Information about a Data.com contact.

ConnectApi.DatacloudContacts
Lists all contacts that were purchased in the specific order, page URLs, and the number of contacts in the order.

ConnectApi.DatacloudOrder
Represents a Datacloud order.

ConnectApi.DatacloudPurchaseUsage
Information about Data.com point usage for monthly and list pool users.

ConnectApi.EmailMessage
Email message from a case.

ConnectApi.FeedItemAttachment
Feed item attachment.

ConnectApi.FeedItemPage
A paged collection of ConnectApi.FeedItem objects.

ConnectApi.FeedItemTopicPage
Feed item topic page.

ConnectApi.FeedPoll
Attachment of ConnectApi.FeedItem objects where the type property is PollPost.

ConnectApi.LinkAttachment
Link attached to a feed item.

ConnectApi.NonEntityRecommendation
A recommendation for a non-Salesforce entity, such as an application.

ConnectApi.RecordSnapshotAttachment
Fields of a record at the point in time when the record was created.

ConnectApi.TrackedChangeAttachment
Tracked change attachment to a feed item.

ConnectApi.ApprovalAttachment
Attach an approval to a feed item.

⚠️ Important: This class isn’t available in version 32.0 and later. In version 32.0 and later, ConnectApi.ApprovalCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

<table>
<thead>
<tr>

| thumb120By90RenditionStatus| String | Specifies the rendering status of the 120 x 90 preview image of the file. One of these values:  
• Processing—Image is being rendered.  
• Failed—Rendering process failed.  
• Success—Rendering process was successful. | 30.0–31.0         |
Available Version | Description | TypeName
--- | --- | ---
• Na—Rendering is not available for this image.

### thumb240By180 RenditionStatus
- **String**
- Specifies the rendering status of the 240 x 180 preview image of the file. One of these values:
  - Processing—Image is being rendered.
  - Failed—Rendering process failed.
  - Success—Rendering process was successful.
  - Na—Rendering is not available for this image.

### thumb720By480 RenditionStatus
- **String**
- Specifies the rendering status of the 720 x 480 preview image of the file. One of these values:
  - Processing—Image is being rendered.
  - Failed—Rendering process failed.
  - Success—Rendering process was successful.
  - Na—Rendering is not available for this image.

### title
- **String**
- Title of the file.

### versionId
- **String**
- 18-character ID for this version of the content.

---

**ConnectApi.DashboardComponentAttachment**

Attachments in feed items with type DashboardSnapshot.

⚠️ **Important**: This class isn’t available in version 32.0 and later. In version 32.0 and later, ConnectApi.DashboardComponentSnapshotCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

### Name | Type | Description | Available Version
--- | --- | --- | ---
componentId | **String** | Component’s 18–character ID. | 28.0–31.0
componentName | **String** | Name of the component. If no name is saved with the component, returns the localized string, “Untitled Component.”. | 28.0–31.0
dashboardBodyText | **String** | Text displayed next to the actor in the body of a feed item. This is used instead of the default body text. If no text is specified, and there is no default body text, returns null. | 28.0–31.0
dashboardId | **String** | Dashboard’s 18–character ID. | 28.0–31.0
dashboardName | **String** | Name of the dashboard. | 28.0–31.0
fullSizeImageUrl | **String** | URL of the full-sized dashboard image. | 28.0–31.0
lastRefreshDate | **Datetime** | ISO8601 date string, for example, 2011-02-25T18:24:31.000Z, specifying when this dashboard was last refreshed. | 28.0–31.0
### ConnectApi.DatacloudCompany

Information about a Data.com company.

All company information is visible for companies that you purchased and own. If you haven’t purchased a company, some of the fields are hidden. Hidden fields are fully or partially hidden by asterisks “***.”

<td>purchaseDate</td>
<td>Datetime</td>
<td>Purchase date for this order.</td>
<td>32.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>GET request URL for this order.</td>
<td>32.0</td>
</tr>
</tbody>
</table>

### ConnectApi.DatacloudPurchaseUsage

Information about Data.com point usage for monthly and list pool users.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>listpoolCreditsAvailable</td>
<td>Integer</td>
<td>The points or credits that are available in a pool of credits for your organization. This pool of credits can be used by any List Pool User in your organization.</td>
<td>32.0</td>
</tr>
<tr>
<td>listpoolCreditsUsed</td>
<td>Integer</td>
<td>The points or credits that have been used from a pool of credits that are used by List Pool Users to purchase records.</td>
<td>32.0</td>
</tr>
</tbody>
</table>
### ConnectApi.EmailMessage

Email message from a case.

**Important:** This class isn’t available in version 32.0 and later. In version 32.0 and later, `ConnectApi.EmailMessageCapability` is used.

Subclass of `ConnectApi.FeedItemAttachment`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
</table>
| direction          | ConnectApi.EmailMessageDirection Enum | The direction of the email message.  
  - Inbound—An inbound message (sent by a customer).  
  - Outbound—An outbound message (sent to a customer by a support agent). | 29.0–31.0         |
| emailMessageId     | String                | The ID of the email message.                                                | 29.0–31.0         |
| subject            | String                | The subject of the email message.                                           | 29.0–31.0         |
| textBody           | String                | The body of the email message.                                              | 29.0–31.0         |
| toAddresses        | List<ConnectApi.EmailAddress> | A list of email addresses to send the message to.                          | 29.0–31.0         |

### ConnectApi.FeedItemAttachment

Feed item attachment.

**Important:** This class isn’t available in version 32.0 and later. In version 32.0 and later, `ConnectApi.FeedElementCapability` is used.

This class is abstract.

Subclasses:
- `ConnectApi.ApprovalAttachment`
- `ConnectApi.BasicTemplateAttachment`
- `ConnectApi.CanvasTemplateAttachment`
- `ConnectApi.EmailMessage`
- `ConnectApi.CaseComment`
- `ConnectApi.ContentAttachment`
- `ConnectApi.DashboardComponentAttachment`
• ConnectApi.FeedPoll
• ConnectApi.LinkAttachment
• ConnectApi.RecordSnapshotAttachment
• ConnectApi.TrackedChangeAttachment

Message segments in a feed item are typed as ConnectApi.MessageSegment. Feed item capabilities are typed as ConnectApi.FeedItemCapability. Record fields are typed as ConnectApi.AbstractRecordField. These classes are all abstract and have several concrete subclasses. At runtime you can use instanceof to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

⚠️ Important: The composition of a feed can change between releases. Write your code to handle instances of unknown subclasses.

ConnectApi.FeedItemPage
A paged collection of ConnectApi.FeedItem objects.

⚠️ Important: This class isn’t available in version 32.0 and later. In version 32.0 and later, ConnectApi.FeedElementPage is used.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>currentPageToken</td>
<td>String</td>
<td>Token identifying the current page.</td>
<td>28.0–31.0</td>

<td>Boolean</td>
<td>true if a topic can be assigned to the feed item, false otherwise.</td>
<td>28.0–31.0</td>
</tr>
<tr>
<td>topics</td>
<td>List&lt;ConnectApi.Topic&gt;</td>
<td>List of topics.</td>
<td>28.0–31.0</td>
</tr>
</tbody>
</table>

**ConnectApi.FeedPoll**

Attachment of `ConnectApi.FeedItem` objects where the `type` property is `PollPost`.

**Important:** This class isn’t available in version 32.0 and later. In version 32.0 and later, `ConnectApi.PollCapability` is used.

Subclass of `ConnectApi.FeedItemAttachment`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>choices</td>
<td>List&lt;ConnectApi.FeedPollChoice&gt;</td>
<td>List of choices for poll.</td>
<td>28.0–31.0</td>
</tr>
<tr>
<td>myChoiceId</td>
<td>String</td>
<td>ID of the poll choice that the context user has voted for in this poll. Returns <code>null</code> if the context user hasn’t voted.</td>
<td>28.0–31.0</td>
</tr>
<tr>
<td>totalVoteCount</td>
<td>Integer</td>
<td>Total number of votes cast on the feed poll item.</td>
<td>28.0–31.0</td>
</tr>
</tbody>
</table>

**ConnectApi.LinkAttachment**

Link attached to a feed item.

**Important:** This class isn’t available in version 32.0 and later. In version 32.0 and later, `ConnectApi.LinkCapability` is used.

Subclass of `ConnectApi.FeedItemAttachment`.
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>title</td>
<td>String</td>
<td>Title given to the link if available, otherwise, null.</td>
<td>28.0–31.0</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>The link URL.</td>
<td>28.0–31.0</td>
</tr>
</tbody>
</table>

**ConnectApi.NonEntityRecommendation**

A recommendation for a non-Salesforce entity, such as an application.

⚠️ **Important:** ConnectApi.NonEntityRecommendation isn’t used in version 34.0 and later. In version 34.0 and later, ConnectApi.EntityRecommendation is used for all recommendations.

<table>
<thead>
<tr>

<td>ConnectApi.Motif</td>
<td>Motif for the non-entity object.</td>
<td>32.0</td>
</tr>
</tbody>
</table>

**ConnectApi.RecordSnapshotAttachment**

Fields of a record at the point in time when the record was created.

⚠️ **Important:** This class isn’t available in version 32.0 and later. In version 32.0 and later, ConnectApi.RecordSnapshotCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>recordView</td>
<td>ConnectApi.RecordView</td>
<td>The representation of the record.</td>
<td>29.0–31.0</td>
</tr>
</tbody>
</table>

**ConnectApi.TrackedChangeAttachment**

Tracked change attachment to a feed item.

⚠️ **Important:** This class isn’t available in version 32.0 and later. In version 32.0 and later, ConnectApi.TrackedChangesCapability is used.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Available Version</th>

</thead>
<tbody>
<tr>
<td>changes</td>
<td>List&lt;ConnectApi.TrackedChangeItem&gt;</td>
<td>A list of tracked changes.</td>
<td>28.0–31.0</td>
</tr>
</tbody>
</table>
ConnectApi Enums

 Enums specific to the ConnectApi namespace.

ConnectApi enums inherit all properties and methods of Apex enums.

 Enums are not versioned. Enum values are returned in all API versions. Clients should handle values they don’t understand gracefully.

<table>
<thead>
<tr>
<th>Enum</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectApi.ActionLinkExecutionsAllowed</td>
<td>Number of times an action link can be executed.</td>
</tr>
<tr>
<td>• Once</td>
<td>An action link can be executed only one time across all users.</td>
</tr>
<tr>
<td>• OncePerUser</td>
<td>An action link can be executed only one time for each user.</td>
</tr>
<tr>
<td>• Unlimited</td>
<td>An action link can be executed an unlimited number of times by each user. If the action link’s actionType is Api or ApiAsync, you can’t use this value.</td>
</tr>
<tr>
<td>ConnectApi.ActionLinkType</td>
<td>Type of action link.</td>
</tr>
<tr>
<td>• Api</td>
<td>The action link calls a synchronous API at the action URL. Salesforce sets the status to SuccessfulStatus or FailedStatus based on the HTTP status code returned by your server.</td>
</tr>
<tr>
<td>• ApiAsync</td>
<td>The action link calls an asynchronous API at the action URL. The action remains in a PendingStatus state until a third party makes a request to /connect/action-links/actionLinkId to set the status to SuccessfulStatus or FailedStatus when the asynchronous operation is complete.</td>
</tr>
<tr>
<td>• Download</td>
<td>The action link downloads a file from the action URL.</td>
</tr>
<tr>
<td>• Ui</td>
<td>The action link takes the user to a web page at the action URL.</td>
</tr>
<tr>
<td>ConnectApi.ActivitySharingTypeEnum</td>
<td>Type of sharing operation.</td>
</tr>
<tr>
<td>• Everyone</td>
<td>The activity is shared with everyone.</td>
</tr>
<tr>
<td>• MyGroups</td>
<td>The activity is shared only with a selection of the context user’s groups.</td>
</tr>
<tr>
<td>• OnlyMe</td>
<td>The activity is private.</td>
</tr>
<tr>
<td>ConnectApi.AdjustmentAmountScope</td>
<td>Scope of the price adjustment amount.</td>
</tr>
<tr>
<td>• Total</td>
<td>The adjustment scope is the total price.</td>
</tr>
<tr>
<td>• Unit</td>
<td>The adjustment scope is the unit price.</td>
</tr>
<tr>
<td>• UnproratedTotal</td>
<td>The adjustment scope is the unprorated total price.</td>
</tr>
<tr>
<td>ConnectApi.AdjustmentType</td>
<td>How the price adjustment amount is calculated.</td>
</tr>
<tr>
<td>• AdjustmentAmount</td>
<td>The adjustment is a fixed amount.</td>
</tr>
<tr>
<td>• AdjustmentPercentage</td>
<td>The adjustment is a percentage.</td>
</tr>
<tr>
<td>ConnectApi.ArticleTopicJobType</td>
<td>Type of operation to perform on articles and topics.</td>
</tr>
<tr>
<td>• AssignTopicsToArticle</td>
<td>Assign topics to articles in a data category.</td>
</tr>
<tr>
<td>• UnassignTopicsFromArticle</td>
<td>Unassign topics from articles in a data category.</td>
</tr>
<tr>
<td>Enum</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ConnectApi.AsyncOperationStatus</td>
<td>Asynchronous processing status of the cart, if asynchronous processing is enabled for the store.</td>
</tr>
<tr>
<td></td>
<td>• Completed</td>
</tr>
<tr>
<td></td>
<td>•Errored</td>
</tr>
<tr>
<td></td>
<td>• Processing</td>

<td>Level of the promotion target.</td>
</tr>
<tr>
<td>ConnectApi. CartStatus</td>
<td>Status of the cart.</td>
</tr>
<tr>
<td>ConnectApi. CartTaxType</td>
<td>Tax type of the cart.</td>
</tr>
<tr>
<td>ConnectApi. CartType</td>
<td>Type of cart.</td>
</tr>
<tr>
<td>ConnectApi. CaseActorType</td>
<td>Type of user who made the comment.</td>
</tr>
<tr>
<td>ConnectApi. CaseCommentEventType</td>
<td>Event type of a comment in Case Feed.</td>
</tr>
</tbody>
</table>

- **ConnectApi. CartMessageSeverity**
  - Error
  - Info
  - Warning

- **ConnectApi. CartPromotionType**
  - Cart—The target is cart-level.
  - Item—The target is item-level.

- **ConnectApi. CartStatus**
  - Active—Cart is created and available for modifications, like adding or removing products or promotions.
  - Checkout—Cart is in checkout. If the customer modifies the cart, the current checkout session is canceled.
  - Closed—Checkout is complete and an order was created. The cart cannot be modified.
  - PendingClosed—Cart is marked to be closed, but the request isn’t completed yet. The cart can’t be modified. This value is available in API version 57.0 and later.
  - PendingDelete—Cart is marked for delete, but the request isn’t completed yet. The cart can’t be modified.
  - Processing—Cart is processing. For example, taxes are being calculated. The cart can’t be modified.

- **ConnectApi. CartTaxType**
  - Gross—Gross taxation policy.
  - Net—Net taxation policy.

- **ConnectApi. CartType**
  - Cart—Cart created by a customer.
  - ReadOnly—Clone of a Template cart that the customer can check out with.
  - Template—Cart created by an internal user.

- **ConnectApi. CaseActorType**
  - Customer—if a Chatter customer made the comment
  - CustomerService—if a service representative made the comment

- **ConnectApi. CaseCommentEventType**
  - NewInternal—A case comment that has newly been marked Internal Only.
  - NewPublished—A newly published case comment.
  - NewPublishedByCustomer—A case comment by a customer that was newly published.
  - PublishExisting—An existing case comment that was republished.

</table>
### Enum

**ConnectApi.FeedElementCapability Type**

- **Description**

  Capabilities of a feed element in API versions 31.0 and later. If a capability exists on a feed element, the capability is available, even if the value doesn’t exist or is `null`. If the capability doesn’t exist, it isn’t available.

  - **AssociatedActions**—The feed element includes information about actions associated with it.
  - **Approval**—The feed element includes information about an approval.
  - **Banner**—The body of the feed element has an icon and border.
  - **Bookmarks**—The context user can bookmark the feed element. Bookmarked feed elements are visible in the bookmarks feed.
  - **Bundle**—The feed element has a group of other feed elements that display as a bundle in the feed. The **bundle type** determines the additional data associated with the bundle.
  - **CallCollaboration**—The feed element has a recording comment.
  - **Canvas**—The feed element renders a canvas app.
  - **CaseComment**—The feed element has a case comment in the case feed.
  - **ChatterLikes**—The context user can like the feed element.
  - **Close**—The feed element can’t be edited, commented on, or deleted. If the feed element is a poll, it can’t be voted on.
  - **Comments**—The context user can add comments to the feed element.
  - **Content**—The feed element has a file.
  - **DashboardComponentSnapshot**—The feed element has a dashboard component snapshot.
  - **DirectMessage**—The feed element is a direct message.
  - **Edit**—Users who have permission can edit the feed element.
  - **EmailMessage**—The feed element has an email message from a case.
  - **EnhancedLink**—The feed element has a link that can contain supplemental information like an icon, a title, and a description.
  - **Extensions**—The feed element has one or more extension attachments.
  - **FeedEntityShare**—The feed element has a feed entity shared with it.
  - **Files**—The feed element has one or more file attachments.
  - **Interactions**—The feed element has information about user interactions.
  - **Link**—The feed element has a URL.
  - **MediaReferences**—The feed element has one or more media references.
  - **Moderation**—Users in an Experience Cloud site can flag the feed element for moderation.
  - **Mute**—The context user can mute the feed element.
  - **Origin**—A feed action created the feed element.
  - **Pin**—Users who have permission can pin the feed element.
  - **Poll**—The feed element has poll voting.
  - **QuestionAndAnswers**—The feed element has a question, and users can add answers to the feed element instead of comments. Users can also select the best answer.
  - **ReadBy**—The context user can mark the feed element as read.

<thead>
<tr>
<th>Enum</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectApi.FeedElement</td>
<td>Feed elements are the top-level objects that a feed contains. The feed element type describes the characteristics of that feed element.</td>
</tr>
<tr>
<td>• Bundle</td>
<td>A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values.</td>
</tr>
<tr>
<td>• FeedItem</td>
<td>A feed item has a single parent and is scoped to one Experience Cloud site or across all Experience Cloud sites. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values.</td>
</tr>
<tr>
<td>• Recommendation</td>
<td>A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user.</td>
</tr>
<tr>
<td>ConnectApi.FeedEntity</td>
<td>Status of the feed post or comment.</td>
</tr>
<tr>
<td>• Draft</td>
<td>The feed post isn’t published but is visible to the author and users with Modify All Data or View All Data permission. Comments can’t be drafts.</td>
</tr>
<tr>
<td>• PendingReview</td>
<td>The feed post or comment isn’t approved yet and therefore isn’t published or visible.</td>
</tr>
<tr>
<td>• Published</td>
<td>The feed post or comment is approved and visible.</td>
</tr>
<tr>
<td>ConnectApi.FeedFavorite</td>
<td>Origin of the feed favorite.</td>
</tr>
<tr>
<td>• ListView</td>
<td></td>
</tr>
<tr>
<td>• Search</td>
<td></td>

<td>ConnectApi.FeedFilter</td>
<td>Filter value for a feed.</td>
</tr>
<tr>
<td>• AllQuestions</td>
<td>Feed elements that are questions.</td>
</tr>
<tr>
<td>• AuthoredBy</td>
<td>Feed elements authored by the user profile owner. This value is valid only for the UserProfile feed.</td>
</tr>
<tr>
<td>• CommunityScoped</td>
<td>Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record</td>
</tr>
<tr>
<td>Enum</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the UserProfile feed.</td>
</tr>
<tr>
<td></td>
<td>QuestionsWithCandidateAnswers—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.</td>
</tr>
<tr>
<td></td>
<td>QuestionsWithCandidateAnswersReviewedPublished—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.</td>
</tr>
<tr>
<td></td>
<td>Read—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the Record feed of a group.</td>
</tr>
<tr>
<td></td>
<td>SolvedQuestions—Feed elements that are questions and that have a best answer.</td>
</tr>
<tr>
<td></td>
<td>UnansweredQuestions—Feed elements that are questions and that don’t have any answers.</td>
</tr>
<tr>
<td></td>
<td>UnansweredQuestionsWithCandidateAnswers—Feed elements that are questions that don’t have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.</td>
</tr>
<tr>
<td></td>
<td>Unread—Feed elements that are created in the past 30 days and aren’t marked as read for the context user. This value is valid only for the Record feed of a group.</td>
</tr>
<tr>
<td></td>
<td>UnsolvedQuestions—Feed elements that are questions and that don’t have a best answer.</td>
</tr>
<tr>
<td>ConnectApi.FeedItemAttachmentType</td>
<td>Attachment type for feed item output objects.</td>
</tr>
<tr>
<td></td>
<td>Approval—a feed item requiring approval.</td>
</tr>
<tr>
<td></td>
<td>BasicTemplate—a feed item with a generic rendering of an image, link, and title.</td>
</tr>
<tr>
<td></td>
<td>Canvas—a feed item that contains the metadata to render a link to a canvas app.</td>
</tr>
<tr>
<td></td>
<td>CaseComment—a feed item created from a comment to a case record.</td>
</tr>
<tr>
<td></td>
<td>CaseComment—a feed item created from a comment to a case record.</td>
</tr>
<tr>
<td></td>
<td>Content—a feed item with a file attached.</td>
</tr>
<tr>
<td></td>
<td>DashboardComponent—a feed item with a dashboard attached.</td>
</tr>
<tr>
<td></td>
<td>EmailMessage—an email attached to a case record in Case Feed.</td>
</tr>
<tr>
<td></td>
<td>Link—a feed item with a URL attached.</td>
</tr>
<tr>
<td></td>
<td>Poll—a feed item with a poll attached.</td>
</tr>
<tr>
<td></td>
<td>Question—a feed item with a question attached.</td>
</tr>
<tr>
<td></td>
<td>RecordSnapshot—the feed item attachment contains a view of a record at a single ConnectApi.FeedItemType.CreateRecordEvent.</td>
</tr>
<tr>
<td></td>
<td>TrackedChange—all changes to a record for a single ConnectApi.FeedItemType.TrackedChange event.</td>
</tr>
<tr>
<td>ConnectApi.FeedItemType</td>
<td>Type of feed item.</td>
</tr>
<tr>
<td></td>
<td>ActivityEvent—Feed item generated in Case Feed when an event or task associated with a parent record with a feed enabled is created or updated.</td>
</tr>
<tr>
<td>Enum</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>AdvancedTextPost</td>
<td>A feed item with advanced text formatting, such as a group announcement post.</td>
</tr>
<tr>
<td>ApprovalPost</td>
<td>Feed item with an approval capability. Approvers can act on the feed item parent.</td>
</tr>
<tr>
<td>AttachArticleEvent</td>
<td>Feed item generated when an article is attached to a case in Case Feed.</td>
</tr>
<tr>
<td>BasicTemplateFeedItem</td>
<td>Feed item with an enhanced link capability.</td>
</tr>
<tr>
<td>CallLogPost</td>
<td>Feed item generated when a call log is saved to a case in Case Feed.</td>
</tr>
<tr>
<td>CanvasPost</td>
<td>Feed item generated by a canvas app in the publisher or from Connect REST API or Connect in Apex. The post itself is a link to a canvas app.</td>
</tr>
<tr>
<td>CaseCommentPost</td>
<td>Feed item generated when a case comment is saved in Case Feed.</td>
</tr>
<tr>
<td>ChangeStatusPost</td>
<td>Feed item generated when the status of a case is changed in Case Feed.</td>
</tr>
<tr>
<td>ChatTranscriptionPost</td>
<td>Feed item generated in Case Feed when a Live Agent chat transcript is saved to a case.</td>
</tr>
<tr>
<td>CollaborationGroupCreated</td>
<td>Feed item generated when a new public group is created. Contains a link to the new group.</td>
</tr>
<tr>
<td>CollaborationGroupUnarchived</td>
<td>Deprecated. Feed item generated when an archived group is activated.</td>
</tr>
<tr>
<td>ContentPost</td>
<td>Feed item with a content capability.</td>
</tr>
<tr>
<td>CreateRecordEvent</td>
<td>Feed item that describes a record created in the publisher.</td>
</tr>
<tr>
<td>DashboardComponentAlert</td>
<td>Feed item with a dashboard alert.</td>
</tr>
<tr>
<td>DashboardComponentSnapshot</td>
<td>Feed item with a dashboard component snapshot capability.</td>
</tr>
<tr>
<td>EmailMessageEvent</td>
<td>Feed item generated when an email is sent from a case in Case Feed.</td>
</tr>
<tr>
<td>FacebookPost</td>
<td>Deprecated. Feed item generated when a Facebook post is created from a case in Case Feed.</td>
</tr>
<tr>
<td>LinkPost</td>
<td>Feed item with a link capability.</td>
</tr>
<tr>
<td>MilestoneEvent</td>
<td>Feed item generated when a case milestone is either completed or reaches a violation status. Contains a link to the case milestone.</td>
</tr>
<tr>
<td>PollPost</td>
<td>Feed item with a poll capability. Viewers of the feed item are allowed to vote on the options in the poll.</td>
</tr>
<tr>
<td>ProfileSkillPost</td>
<td>Feed item generated when a skill is added to a user’s profile.</td>
</tr>
<tr>
<td>QuestionPost</td>
<td>Feed item generated when a question is asked.</td>
</tr>
<tr>
<td></td>
<td>As of API version 33.0, a feed item of this type can have a content capability and a link capability.</td>
</tr>
<tr>
<td>ReplyPost</td>
<td>Feed item generated by a Chatter Answers reply.</td>
</tr>
<tr>
<td>RypplePost</td>
<td>Feed item generated when a user posts thanks.</td>
</tr>
<tr>
<td>SocialPost</td>
<td>Feed item generated when a social post is created from a case in Case Feed.</td>
</tr>
<tr>
<td>Enum</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>ConnectApi.FeedItemVisibilityType</td>
<td>Type of users who can see a feed item.</td>
</tr>
<tr>
<td>AllUsers</td>
<td>Visibility is not limited to internal users.</td>
</tr>
<tr>
<td>InternalUsers</td>
<td>Visibility is limited to internal users.</td>

</tbody>
</table>

<table>
<thead>
<tr>
<th>ConnectApi.FeedType</th>
<th>Type of feed.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bookmarks</td>
<td>Contains all feed items saved as bookmarks by the context user.</td>
</tr>
<tr>
<td>Company</td>
<td>Contains all feed items except feed items of type TrackedChange. To see the feed item, the user must have sharing access to its parent.</td>
</tr>
<tr>
<td>DirectMessageModeration</td>
<td>Contains all direct messages that are flagged for moderation. The Direct Message Moderation feed is available only to users with Moderate Experiences Chatter Messages permissions.</td>
</tr>
<tr>
<td>DirectMessages</td>
<td>Contains all feed items of the context user’s direct messages.</td>
</tr>
<tr>
<td>Draft</td>
<td>Contains all the feed items that the context user drafted.</td>
</tr>
<tr>
<td>Files</td>
<td>Contains all feed items that contain files posted by people or groups that the context user follows.</td>
</tr>
<tr>
<td>Filter</td>
<td>Contains the news feed filtered to contain feed items whose parent is a specified object type.</td>
</tr>
<tr>
<td>Groups</td>
<td>Contains all feed items from all groups the context user either owns or is a member of.</td>
</tr>
<tr>
<td>Home</td>
<td>Contains all feed items associated with any managed topic in an Experience Cloud site.</td>
</tr>
<tr>
<td>Landing</td>
<td>Contains all feed items that best drive user engagement when the feed is requested. Allows clients to avoid an empty feed when there aren’t many personalized feed items.</td>
</tr>
<tr>
<td>Enum</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>

<tr>
<td>PendingReview</td>
<td>Contains all feed items and comments that are pending review.</td>
</tr>
<tr>
<td>People</td>
<td>Contains all feed items posted by all people the context user follows.</td>
</tr>
<tr>
<td>Record</td>
<td>Contains all feed items whose parent is a specified record, which could be a group, user, object, file, or any other standard or custom object. When the record is a group, the feed also contains feed items that mention the group. When the record is a user, the feed contains only feed items on that user. You can get another user’s record feed.</td>
</tr>
<tr>
<td>Streams</td>
<td>Contains all feed items for any combination of up to 25 feed-enabled entities that the context user subscribes to in a stream. Examples of feed-enabled entities include people, groups, and records.</td>
</tr>
<tr>
<td>To</td>
<td>Contains all feed items with mentions of the context user. Contains feed items the context user commented on and feed items created by the context user that are commented on.</td>
</tr>
<tr>
<td>Topics</td>
<td>Contains all feed items that include the specified topic.</td>
</tr>
<tr>
<td>UserProfile</td>
<td>Contains feed items created when a user changes records that can be tracked in a feed. Contains feed items whose parent is the user and feed items that @mention the user. This feed is different than the news feed, which returns more feed items, including group updates. You can get another user’s user profile feed.</td>
</tr>

<tr>
<td>• Media</td>
<td>• Content—Topics that are associated with native content.</td>
</tr>
<tr>
<td>• MediaSource</td>
<td>• Featured—Topics that are featured, for example, on the Experience Cloud site home page, but don’t provide overall navigation.</td>
</tr>
<tr>
<td>• MultilineText</td>
<td>• Navigational—Topics that display in a navigational menu in the Experience Cloud site.</td>
</tr>
<tr>
<td>• NameField</td>
<td>• RichText</td>
</tr>
<tr>
<td>• Text</td>
<td>• Url</td>
</tr>
<tr>
<td>• Url</td>
<td><strong>ConnectApi.ManagedTopicType</strong> Type of managed topic.</td>
</tr>
<tr>
<td>• ConnectApi.MarkupType</td>
<td>• Bold—Bold tag.</td>
</tr>
<tr>
<td></td>
<td>• Code—Code tag.</td>
</tr>
<tr>
<td></td>
<td>• Hyperlink—Hyperlink anchor tag.</td>
</tr>
<tr>
<td></td>
<td>• Italic—Italic tag.</td>
</tr>
<tr>
<td></td>
<td>• ListItem—List item tag.</td>
</tr>
<tr>
<td></td>
<td>• OrderedList—Ordered list tag.</td>
</tr>
<tr>
<td></td>
<td>• Paragraph—Paragraph tag.</td>
</tr>
<tr>
<td></td>
<td>• Strikethrough—Strikethrough tag.</td>
</tr>
<tr>
<td></td>
<td>• Underline—Underline tag.</td>
</tr>
<tr>
<td></td>
<td>• UnorderedList—Unordered list tag.</td>
</tr>
<tr>
<td></td>
<td><strong>ConnectApi.MentionCompletionType</strong> Type of mention completion.</td>
</tr>
<tr>
<td></td>
<td>• All—All mention completions, regardless of the type of record to which the mention refers.</td>
</tr>
<tr>
<td></td>
<td>• Group—Mention completions for groups.</td>
</tr>
<tr>
<td></td>
<td>• User—Mention completions for users.</td>
</tr>
<tr>
<td></td>
<td><strong>ConnectApi.MentionValidationStatus</strong> Type of validation error for a proposed mention, if any.</td>
</tr>
<tr>
<td></td>
<td>• Disallowed—The proposed mention is invalid and is rejected because the context user is trying to mention something that is not allowed. For example, a user who is not a member of a private group is trying to mention the private group.</td>
</tr>
<tr>
<td></td>
<td>• Inaccessible—The proposed mention is allowed, but the user or record being mentioned isn’t notified. They don’t have access to the parent record that’s being discussed.</td>
</tr>
<tr>
<td></td>
<td>• Ok—There is no validation error for this proposed mention.</td>
</tr>
<tr>
<td>Enum</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>ConnectApi. MessageSegmentType</td>
<td>Type of message segment, such as text, link, field change name, or field change value.</td>
</tr>
<tr>
<td>EntityLink</td>
<td></td>
</tr>
<tr>
<td>FieldChange</td>
<td></td>
</tr>
<tr>
<td>FieldChangeName</td>
<td></td>

| ConnectApi. PlatformActionGroupCategory | Location of an action link group on an associated feed element.  
  - Primary—The action link group is displayed in the body of the feed element.  
  - Overflow—The action link group is displayed in the overflow menu of the feed element. |
  - FailedStatus—The action link execution failed.  
  - NewStatus—The action link is ready to be executed. Available for Download and Ui action links only.  
  - PendingStatus—The action link is executing. Choosing this value triggers the API call for Api and ApiAsync action links.  
  - SuccessfulStatus—The action link executed successfully. |
| ConnectApi. PlatformActionType | Type of platform action.  
  - ActionLink—An indicator on a feed element that targets an API, a web page, or a file, represented by a button in the Salesforce UI.  
  - CustomButton—When clicked, opens a URL or a Visualforce page in a window or executes JavaScript.  
  - ProductivityAction—Productivity actions are predefined and attached to a limited set of objects. Productivity actions include Send Email, Call, Map, View Website, and Read News. Except for the Call action, you can’t edit productivity actions.  
  - QuickAction—A global or object-specific action.  
  - StandardButton—A predefined Salesforce button such as New, Edit, or Delete. |
| ConnectApi. PriceAdjustmentTierType | Type of price adjustment for the tier.  
  - AmountBasedAdjustment—Price is adjusted by a specified amount.  
  - PercentageBasedAdjustment—Price is adjusted by a specified percentage. |
| ConnectApi. PricingTermUnit | Unit of time used to define a pricing term.

### ConnectApi Enums

<table>
<thead>
<tr>
<th>Enum</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ProductMediaUsageType</strong></td>
<td>Usage type of a product media item within a media group.</td>
</tr>
<tr>
<td></td>
<td>• Attachment—Product media group with product documents as attachments.</td>
</tr>
<tr>
<td></td>
<td>• Banner—Product category media group with banner images of the product.</td>
</tr>
<tr>
<td></td>
<td>• Listing—Product media group with listing images of the product.</td>
</tr>
<tr>
<td></td>
<td>• Standard—Product media group with standard images and videos of the product.</td>
</tr>
<tr>
<td></td>
<td>• Tile—Product category media group with tile images of the product.</td>
</tr>
<tr>
<td><strong>PublishSchedule</strong></td>
<td>Publish refresh schedule.</td>
</tr>
<tr>
<td></td>
<td>• One—Refreshes every hour. Used to rapidly publish UI and DBT-based segments.</td>
</tr>
<tr>
<td></td>
<td>• Four—Refreshes every four hours. Used to rapidly publish UI and DBT-based segments.</td>
</tr>
<tr>
<td></td>
<td>• Twelve—Refreshes every twelve hours.</td>
</tr>
<tr>
<td></td>
<td>• TwentyFour—Refreshes every twenty-four hours.</td>
</tr>
<tr>
<td><strong>PublishStatus</strong></td>
<td>Publish status of a personalization audience, target, or navigation menu item.</td>
</tr>
<tr>
<td></td>
<td>• Draft</td>
</tr>
<tr>
<td></td>
<td>• Live</td>
</tr>
<tr>
<td><strong>RecommendationActionType</strong></td>
<td>Action to take on a recommendation.</td>
</tr>
<tr>
<td></td>
<td>• follow—Follow a file, record, topic, or user.</td>
</tr>
<tr>
<td></td>
<td>• join—Join a group.</td>
</tr>
<tr>
<td></td>
<td>• view—View a file, group, article, record, user, custom, or static recommendation.</td>
</tr>
<tr>
<td><strong>RecommendationAudienceCriteriaType</strong></td>
<td>Custom recommendation audience criteria type.</td>
</tr>
<tr>
<td></td>
<td>• CustomList—A custom list of users makes up the audience.</td>
</tr>
<tr>
<td></td>
<td>• MaxDaysInCommunity—New members make up the audience.</td>
</tr>
<tr>
<td><strong>RecommendationAudienceMemberOperationType</strong></td>
<td>Operation to carry out on the custom recommendation audience members.</td>
</tr>
<tr>
<td></td>
<td>• Add—Adds specified members to the audience.</td>
</tr>
<tr>
<td></td>
<td>• Remove—Removes specified members from the audience.</td>
</tr>
<tr>
<td><strong>RecommendationChannel</strong></td>
<td>A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations.</td>
</tr>
<tr>
<td></td>
<td>• CustomChannel1—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.</td>
</tr>
<tr>
<td></td>
<td>• CustomChannel2—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.</td>
</tr>
<tr>
<td></td>
<td>• CustomChannel3—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.</td>
</tr>
<tr>
<td></td>
<td>• CustomChannel4—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.</td>
</tr>
</tbody>
</table>
**Enumerations**

<table>
<thead>
<tr>
<th>Enum</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CustomChannel5</td>
<td>Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.</td>
</tr>
<tr>
<td>DefaultChannel</td>
<td>Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.</td>
</tr>
</tbody>
</table>

**Reason for a Chatter recommendation.**

- ArticleHasRelatedContent—Articles with related content to a context article.
- ArticleViewedTogether—Articles often viewed together with the article that the context user just viewed.
- ArticleViewedTogetherWithViewers—Articles often viewed together with other records that the context user views.
- Custom—Custom recommendations.
- FilePopular—Files with many followers or views.
- FileViewedTogether—Files often viewed at the same time as other files that the context user views.
- FollowedTogetherWithFollowees—Users often followed together with other records that the context user follows.
- GroupMembersFollowed—Groups with members that the context user follows.
- GroupNew—Recently created groups.
- GroupPopular—Groups with many active members.
- ItemViewedTogether—Records often viewed at the same time as other records that the context user views.
- PopularApp—Applications that are popular.
- RecordOwned—Records that the context user owns.
- RecordParentOfFollowed—Parent records of records that the context user follows.
- RecordViewed—Records that the context user recently viewed.
- TopicFollowedTogether—Topics often followed together with the record that the context user just followed.
- TopicFollowedTogetherWithFollowees—Topics often followed together with other records that the context user follows.
- TopicPopularFollowed—Topics with many followers.
- TopicPopularLiked—Topics on posts that have many likes.
- UserDirectReport—Users who report to the context user.
- UserFollowedTogether—Users often followed together with the record that the context user followed.
- UserFollowsSameUsers—Users who follow the same users as the context user.
- UserManager—The context user’s manager.
- UserNew—Recently created users.
- UserPeer—Users who report to the same manager as the context user.

**ConnectApi.ZoneSearchResultType**
Zone search result type.
• Article—Search results contain only articles.
• Question—Search results contain only questions.

**ConnectApi.ZoneShowIn**
Zone search result location.
• Community—Available in an Experience Cloud site.
• Internal—Available internally only.
• Portal—Available in a portal.

---

**ConnectApi Exceptions**

The ConnectApi namespace contains exception classes.
All exceptions classes support built-in methods for returning the error message and exception type. See [Exception Class and Built-In Exceptions](#) on page 3076.

The ConnectApi namespace contains these exceptions:

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectApi.ConnectApiException</td>
<td>Any logic error in the way your application is utilizing ConnectApi code. This is equivalent to receiving a 400 error from Connect REST API.</td>
</tr>
<tr>
<td>ConnectApi.NotFoundException</td>
<td>Any issues with the specified resource being found. This is equivalent to receiving a 404 error from Connect REST API.</td>
</tr>
<tr>
<td>ConnectApi.RateLimitException</td>
<td>When you exceed the rate limit. This is equivalent to receiving a 503 Service Unavailable error from Connect REST API.</td>
</tr>
</tbody>
</table>

**ConnectApi Utilities**

The ConnectApi namespace contains a utility class.

<table>
<thead>
<tr>
<th>Utility</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectApi.ConnectUtilities.unwrapApexWrapper()</td>
<td>Reserved for internal use.</td>
</tr>
</tbody>
</table>

**ConnectApi Release Notes**

Use the Salesforce Release Notes to learn about the most recent updates and changes to the ConnectApi namespace in Apex.
For updates and changes that impact Apex, including ConnectApi, see the Apex Release Notes.

For new and changed ConnectApi classes and enums, see ConnectApi (Connect in Apex): New and Changed Classes and Enums in the Salesforce Release Notes.

Database Namespace

The Database namespace provides classes used with DML operations.

The following are the classes in the Database namespace.

IN THIS SECTION:

Batchable Interface
The class that implements this interface can be executed as a batch Apex job.

BatchableContext Interface
Represents the parameter type of a batch job method and contains the batch job ID. This interface is implemented internally by Apex.

DeletedRecord Class
Contains information about a deleted record.

DeleteResult Class
Represents the result of a delete DML operation returned by the Database.delete method.

DMLOptions Class
Enables you to set options related to DML operations.

DMLOptions.AssignmentRuleHeader Class
Enables setting assignment rule options.

DMLOptions.DuplicateRuleHeader Class
Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.

DMLOptions.EmailHeader Class
Enables setting email options.

DuplicateError Class
Contains information about an error that occurred when an attempt was made to save a duplicate record. Use if your organization has set up duplicate rules, which are part of the Duplicate Management feature.

EmptyRecycleBinResult Class
The result of the emptyRecycleBin DML operation returned by the Database.emptyRecycleBin method.

Error Class
Represents information about an error that occurred during a DML operation when using a Database method.

GetDeletedResult Class
Contains the deleted records retrieved for a specific sObject type and time window.

GetUpdatedResult Class
Contains the result for the Database.getUpdated method call.

LeadConvert Class
Contains information used for lead conversion.
LeadConvertResult Class
The result of a lead conversion.

MergeResult Class
Contains the result of a merge Database method operation.

QueryLocator Class
Represents the record set returned by Database.getQueryLocator and used with Batch Apex.

QueryLocatorIterator Class
Represents an iterator over a query locator record set.

SaveResult Class
The result of an insert or update DML operation returned by a Database method.

UndeleteResult Class
The result of an undelete DML operation returned by the Database.undelete method.

UpsertResult Class
The result of an upsert DML operation returned by the Database.upsert method.

Batchable Interface
The class that implements this interface can be executed as a batch Apex job.

Namespace
Database

SEE ALSO:
Apex Developer Guide: Using Batch

Batchable Methods
The following are methods for Batchable.

IN THIS SECTION:
execute(jobId, recordList)
Gets invoked when the batch job executes and operates on one batch of records. Contains or calls the main execution logic for the batch job.

finish(jobId)
Gets invoked when the batch job finishes. Place any cleanup code in this method.

start(jobId)
Gets invoked when the batch job starts. Returns the record set as an iterable that will be batched for execution.

start(jobId)
Gets invoked when the batch job starts. Returns the record set as a QueryLocator object that will be batched for execution.
execute(jobId, recordList)
Gets invoked when the batch job executes and operates on one batch of records. Contains or calls the main execution logic for the batch job.

Signature
public Void execute(Database.BatchableContext jobId, List<sObject> recordList)

Parameters
jobId
  Type: Database.BatchableContext
  Contains the job ID.
recordList
  Type: List<sObject>
  Contains the batch of records to process.

Return Value
Type: Void

finish(jobId)
Gets invoked when the batch job finishes. Place any clean up code in this method.

Signature
public Void finish(Database.BatchableContext jobId)

Parameters
jobId
  Type: Database.BatchableContext
  Contains the job ID.

Return Value
Type: Void

start(jobId)
Gets invoked when the batch job starts. Returns the record set as an iterable that will be batched for execution.

Signature
public System.Iterable start(Database.BatchableContext jobId)
Parameters

jobId
Type: Database.BatchableContext
Contains the job ID.

Return Value
Type: System.Iterable

start(jobId)
Gets invoked when the batch job starts. Returns the record set as a QueryLocator object that will be batched for execution.

Signature

public Database.QueryLocator start(Database.BatchableContext jobId)

Parameters

jobId
Type: Database.BatchableContext
Contains the job ID.

Return Value
Type: Database.QueryLocator

BatchableContext Interface

Represents the parameter type of a batch job method and contains the batch job ID. This interface is implemented internally by Apex.

Namespace

Database

SEE ALSO:
Batchable Interface

BatchableContext Methods

The following are methods for BatchableContext.

IN THIS SECTION:

getChildJobId()
Returns the ID of the current batch job chunk that is being processed.
getJobId()
Returns the batch job ID.

getChildJobId()
Returns the ID of the current batch job chunk that is being processed.

Signature
public Id getChildJobId()

Return Value
Type: ID

getJobId()
Returns the batch job ID.

Signature
public Id getJobId()

Return Value
Type: ID

DeletedRecord Class
Contains information about a deleted record.

Namespace
Database

Usage
The getDeletedRecords method of the Database.GetDeletedResult class returns a list of Database.DeletedRecord objects. Use the methods in the Database.DeletedRecord class to retrieve details about each deleted record.

DeletedRecord Methods
The following are methods for DeletedRecord. All are instance methods.

IN THIS SECTION:
getDeletedDate()
Returns the deleted date of this record.
getId()  
Returns the ID of a record deleted within the time window specified in the Database.getDeleted method.

getDeletedDate()  
Returns the deleted date of this record.

**Signature**  
`public Date getDeletedDate()`  

**Return Value**  
Type: Date  

getId()  
Returns the ID of a record deleted within the time window specified in the Database.getDeleted method.

**Signature**  
`public Id getId()`  

**Return Value**  
Type: ID  

### DeleteResult Class

Represents the result of a delete DML operation returned by the Database.delete method.

**Namespace**  
Database

**Usage**  
An array of Database.DeleteResult objects is returned with the delete database method. Each element in the DeleteResult array corresponds to the sObject array passed as the sObject[] parameter in the delete Database method; that is, the first element in the DeleteResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the DeleteResult array contains a single element.

**Example**  
The following example shows how to obtain and iterate through the returned Database.DeleteResult objects. It deletes some queried accounts using Database.delete with a false second parameter to allow partial processing of records on failure. Next, it
iterates through the results to determine whether the operation was successful or not for each record. It writes the ID of every record that was processed successfully to the debug log, or error messages and fields of the failed records.

```java
// Query the accounts to delete
Account[] accts = [SELECT Id from Account WHERE Name LIKE 'Acme%'];

// Delete the accounts
Database.DeleteResult[] drList = Database.delete(accts, false);

// Iterate through each returned result
for(Database.DeleteResult dr : drList) {
    if (dr.isSuccess()) {
        // Operation was successful, so get the ID of the record that was processed
        System.debug('Successfully deleted account with ID: ' + dr.getId());
    } else {
        // Operation failed, so get all errors
        for(Database.Error err : dr.getErrors()) {
            System.debug('The following error has occurred: ');
            System.debug(err.getStatusCode() + ': ' + err.getMessage());
            System.debug('Account fields that affected this error: ' + err.getFields());
        }
    }
}
```

### DeleteResult Methods

The following are methods for `DeleteResult`. All are instance methods.

**getErrors()**

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

**getErrId()**

Returns the ID of the sObject you were trying to delete.

**isSuccess()**

A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

**getErrors()**

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

**Signature**

```
public Database.Error[] getErrors()
```

**Return Value**

Type: `Database.Error[]`
getId()
Returns the ID of the sObject you were trying to delete.

Signature
public ID getId()

Return Value
Type: ID

isSuccess()
A Boolean value that is set to true if the DML operation was successful for this object, false otherwise.

Signature
public Boolean isSuccess()

Return Value
Type: Boolean

DMLOptions Class
Enables you to set options related to DML operations.

Namespace
Database

Usage
Database.DMLOptions is only available for Apex saved against API versions 15.0 and higher. DMLOptions settings take effect only for record operations performed using Apex DML and not through the Salesforce user interface. The DMLOptions class has three child options.

DML Child Options
- DmlOptions.AssignmentRuleHeader—Enables setting assignment rule options.
- DmlOptions.DuplicateRuleHeader—Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.
- DmlOptions.EmailHeader—Enables setting email options.

DmlOptions Properties
The following are properties for DmlOptions.
allowFieldTruncation
Specifies the truncation behavior of large strings.

Signature
public Boolean allowFieldTruncation {get; set;}

Property Value
Type: Boolean

Usage
In Apex saved against API versions previous to 15.0, if you specify a value for a string and that value is too large, the value is truncated. For API version 15.0 and later, if a value is specified that is too large, the operation fails and an error message is returned. The allowFieldTruncation property allows you to specify that the previous behavior, truncation, be used instead of the new behavior in Apex saved against API versions 15.0 and later.

assignmentRuleHeader
Specifies the assignment rule to be used when creating a case or lead.

Signature
public Database.DmlOptions.AssignmentRuleHeader assignmentRuleHeader {get; set;}

Property Value
Type: Database.DMLOptions.AssignmentRuleHeader

Usage
Note: The Database.DMLOptions object supports assignment rules for cases and leads, but not for accounts.
**emailHeader**
Specifies additional information regarding the automatic email that gets sent when an event occurs.

**Signature**
```csharp
public Database.DmlOptions.EmailHeader emailHeader {get; set;}
```

**Property Value**
Type: `Database.DmlOptions.EmailHeader`

**Usage**
The Salesforce user interface allows you to specify whether or not to send an email when the following events occur.

- Creation of a new case or task
- Conversion of a case email to a contact
- New user email notification
- Lead queue email notification
- Password reset

In Apex saved against API version 15.0 or later, the `Database.DmlOptions.emailHeader` property enables you to specify additional information regarding the email that gets sent when one of the events occurs because of the code's execution.

**localeOptions**
Specifies the language of any labels that are returned by Apex.

**Signature**
```csharp
public Database.DmlOptions.LocaleOptions localeOptions {get; set;}
```

**Property Value**
Type: `Database.DmlOptions.LocaleOptions`

**Usage**
The value must be a valid user locale (language and country), such as de_DE or en_GB. The value is a String, 2-5 characters long. The first two characters are always an ISO language code, for example `fr` or `en`. If the value is further qualified by a country, then the string also has an underscore (_) and another ISO country code, for example `US` or `UK`. For example, the string for the United States is `en_US`, and the string for French Canadian is `fr_CA`.

**optAllOrNone**
Specifies whether the operation allows for partial success.

**Signature**
```csharp
public Boolean optAllOrNone {get; set;}
```
Property Value

Type: Boolean

Usage

If `optAllOrNone` is set to `true`, all changes are rolled back if any record causes errors. The default for this property is `false` and successfully processed records are committed while records with errors aren't.

This property is available in Apex saved against Salesforce API version 20.0 and later.

DmlOptions.AssignmentRuleHeader Class

Enables setting assignment rule options.

Namespace

Database

Example

The following example uses the `useDefaultRule` option:

```java
Database.DMLOptions dmo = new Database.DMLOptions();
dmo.assignmentRuleHeader.useDefaultRule = true;

Lead l = new Lead(company='ABC', lastname='Smith');
l.setOptions(dmo);
insert l;
```

The following example uses the `assignmentRuleId` option:

```java
Database.DMLOptions dmo = new Database.DMLOptions();
dmo.assignmentRuleHeader.assignmentRuleId = '01QD0000000EqAn';

Lead l = new Lead(company='ABC', lastname='Smith');
l.setOptions(dmo);
insert l;
```

DmlOptions.AssignmentRuleHeader Properties

The following are properties for `DmlOptions.AssignmentRuleHeader`.

IN THIS SECTION:

- `assignmentRuleId`
  - Specifies the ID of a specific assignment rule to run for the case or lead. The assignment rule can be active or inactive.

- `useDefaultRule`
  - If specified as `true` for a case or lead, the system uses the default (active) assignment rule for the case or lead. If specified, do not specify an `assignmentRuleId`. 
**assignmentRuleID**
Specifies the ID of a specific assignment rule to run for the case or lead. The assignment rule can be active or inactive.

**Signature**
```csharp
public Id assignmentRuleID {get; set;}
```

**Property Value**
Type: ID

**Usage**
The ID can be retrieved by querying the AssignmentRule sObject. If specified, do not specify `useDefaultRule`.
If the value is not in the correct ID format (15-character or 18-character Salesforce ID), the call fails and an exception is returned.

**useDefaultRule**
If specified as `true` for a case or lead, the system uses the default (active) assignment rule for the case or lead. If specified, do not specify an `assignmentRuleId`.

**Signature**
```csharp
public Boolean useDefaultRule {get; set;}
```

**Property Value**
Type: Boolean

**Usage**
If there are no assignment rules in the organization, in API version 29.0 and earlier, creating a case or lead with `useDefaultRule` set to `true` results in the case or lead being assigned to the predefined default owner. In API version 30.0 and later, the case or lead is unassigned and doesn’t get assigned to the default owner.

**DMLOptions.DuplicateRuleHeader Class**
Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.

**Namespace**
```csharp
Database
```
Example
The following example shows how to save an account record that’s been identified as a duplicate. To learn how to iterate through duplicate errors, see DuplicateError Class.

```apex
Database.DMLOptions dml = new Database.DMLOptions();
dml.DuplicateRuleHeader.allowSave = true;
dml.DuplicateRuleHeader.runAsCurrentUser = true;
Account duplicateAccount = new Account(Name='dupe');
Database.SaveResult sr = Database.insert(duplicateAccount, dml);
if (sr.isSuccess()) {
    System.debug('Duplicate account has been inserted in Salesforce!');
}
```

IN THIS SECTION:
DMLOptions.DuplicateRuleHeader Properties

DMLOptions.DuplicateRuleHeader Properties
The following are properties for DMLOptions.DuplicateRuleHeader.

IN THIS SECTION:
allowSave
For a duplicate rule, when the Alert option is enabled, bypass alerts and save duplicate records by setting this property to true. Prevent duplicate records from being saved by setting this property to false.

runAsCurrentUser
Make sure that sharing rules for the current user are enforced when duplicate rules run by setting this property to true. Use the sharing rules specified in the class for the request by setting this property to false. If no sharing rules are specified, Apex code runs in system context and sharing rules for the current user are not enforced.

**allowSave**
For a duplicate rule, when the Alert option is enabled, bypass alerts and save duplicate records by setting this property to true. Prevent duplicate records from being saved by setting this property to false.

**Signature**
public Boolean allowSave {get; set;}

**Property Value**
Type: Boolean
Example

This example shows how to save an account record that’s been identified as a duplicate. 

```java
Database.DMLOptions dml = new Database.DMLOptions();
dml.DuplicateRuleHeader.allowSave = true;
dml.DuplicateRuleHeader.runAsCurrentUser = true;
Account duplicateAccount = new Account(Name='dupe');
Database.SaveChanges sr = Database.insert(duplicateAccount, dml);
if (sr.isSuccess()) {
    System.debug('Duplicate account has been inserted in Salesforce!');
}
```

runAsCurrentUser

Make sure that sharing rules for the current user are enforced when duplicate rules run by setting this property to `true`. Use the sharing rules specified in the class for the request by setting this property to `false`. If no sharing rules are specified, Apex code runs in system context and sharing rules for the current user are not enforced.

Signature

`public Boolean runAsCurrentUser {get; set;}`

Property Value

Type: Boolean

Usage

If specified as `true`, duplicate rules run for the current user, which ensures users can’t view duplicate records that aren’t available to them.

Use `runAsCurrentUser = true` to detect duplicates when converting leads to contacts. Typically, lead conversion Apex code runs in a system context and does not enforce sharing rules for the current user.

Example

This example shows how to set options so that duplicate rules run for the current user when saving a new account.

```java
Database.DMLOptions dml = new Database.DMLOptions();
dml.DuplicateRuleHeader.allowSave = true;
dml.DuplicateRuleHeader.runAsCurrentUser = true;
Account duplicateAccount = new Account(Name='dupe');
Database.SaveChanges sr = Database.insert(duplicateAccount, dml);
if (sr.isSuccess()) {
    System.debug('Duplicate account has been inserted in Salesforce!');
}
```
Namespace

Database

Usage

Even though auto-sent emails can be triggered by actions in the Salesforce user interface, the DMLOptions settings for emailHeader take effect only for DML operations carried out in Apex code.

Example

In the following example, the triggerAutoResponseEmail option is specified:

```java
Account a = new Account(name='Acme Plumbing');

    insert a;

    Contact c = new Contact(email='jplumber@salesforce.com',
        firstname='Joe', lastname='Plumber', accountid=a.id);

    insert c;

Database.DMLOptions dlo = new Database.DMLOptions();

dlo.EmailHeader.triggerAutoResponseEmail = true;

Case ca = new Case(subject='Plumbing Problems', contactid=c.id);

database.insert(ca, dlo);
```

Suppose that you use an after-insert or after-update trigger to change ownership of leads, contacts, or opportunities. If you use the API to change record ownership, or if a Lightning Experience user changes a record’s owner, no email notification is sent. To send email notifications to a record’s new owner, set the triggerUserEmail property to true.

DmLOptions.EmailHeader Properties

The following are properties for DmLOptions.EmailHeader.

IN THIS SECTION:

- triggerAutoResponseEmail
  Indicates whether to trigger auto-response rules (true) or not (false), for leads and cases.

- triggerOtherEmail
  Indicates whether to trigger email outside the organization (true) or not (false).

- triggerUserEmail
  Indicates whether to trigger email that is sent to users in the organization (true) or not (false).

**triggerAutoResponseEmail**

Indicates whether to trigger auto-response rules (true) or not (false), for leads and cases.
Signature
public Boolean triggerAutoResponseEmail {get; set;}

Property Value
Type: Boolean

Usage
This email can be automatically triggered by a number of events, for example creating a case or resetting a user password. If this value is set to true, when a case is created, if there is an email address for the contact specified in ContactID, the email is sent to that address. If not, the email is sent to the address specified in SuppliedEmail

triggerOtherEmail
Indicates whether to trigger email outside the organization (true) or not (false).

Signature
public Boolean triggerOtherEmail {get; set;}

Property Value
Type: Boolean

Usage
This email can be automatically triggered by creating, editing, or deleting a contact for a case.

Note: Email sent through Apex because of a group event includes additional behaviors. A group event is an event for which IsGroupEvent is true. The EventAttendee object tracks the users, leads, or contacts that are invited to a group event. Note the following behaviors for group event email sent through Apex:
- Sending a group event invitation to a lead or contact respects the triggerOtherEmail option
- Email sent when updating or deleting a group event also respects the triggerUserEmail and triggerOtherEmail options, as appropriate

triggerUserEmail
Indicates whether to trigger email that is sent to users in the organization (true) or not (false).

Signature
public Boolean triggerUserEmail {get; set;}

Property Value
Type: Boolean
Usage

This email can be automatically triggered by a number of events; resetting a password, creating a new user, or creating or modifying a task.

**Note:** Adding comments to a case in Apex doesn’t trigger email to users in the organization even if triggerUserEmail is set to `true`.

**Note:** Email sent through Apex because of a group event includes additional behaviors. A group event is an event for which `IsGroupEvent` is true. The EventAttendee object tracks the users, leads, or contacts that are invited to a group event. Note the following behaviors for group event email sent through Apex:

- Sending a group event invitation to a user respects the triggerUserEmail option
- Email sent when updating or deleting a group event also respects the triggerUserEmail and triggerOtherEmail options, as appropriate

DuplicateError Class

Contains information about an error that occurred when an attempt was made to save a duplicate record. Use if your organization has set up duplicate rules, which are part of the Duplicate Management feature.

Namespace

Database

Example

When you try to save a record that’s identified as a duplicate record by a duplicate rule, you’ll receive a duplicate error. If the duplicate rule contains the Allow action, an attempt will be made to bypass the error.

```java
// Try to save a duplicate account
Account duplicateAccount = new Account(Name='Acme', BillingCity='San Francisco');
Database.SaveResult sr = Database.insert(duplicateAccount, false);
if (!sr.isSuccess()) {
    // Insertion failed due to duplicate detected
    for(Database.Error duplicateError : sr.getErrors()) {
        Datacloud.DuplicateResult duplicateResult = ((Database.DuplicateError)duplicateError).getDuplicateResult();
        System.debug('Duplicate records have been detected by ' + duplicateResult.getDuplicateRule());
        System.debug(duplicateResult.getErrorMessage());
    }
    // If the duplicate rule is an alert rule, we can try to bypass it
    Database.DMLOptions dml = new Database.DMLOptions();
    dml.DuplicateRuleHeader.AllowSave = true;
    Database.SaveResult sr2 = Database.insert(duplicateAccount, dml);
    if (sr2.isSuccess()) {
        System.debug('Duplicate account has been inserted in Salesforce!');
    }
}
```
DuplicateError Methods

The following are methods for DuplicateError.

getDuplicateResult()
Returns the details of a duplicate rule and duplicate records found by the duplicate rule.

getFields()
Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

getMessage()
Returns the error message text.

getStatusCode()
Returns a code that characterizes the error.

getDuplicateResult()

Returns the details of a duplicate rule and duplicate records found by the duplicate rule.

Signature

public Datacloud.DuplicateResult getDuplicateResult()

Return Value

Type: Datacloud.DuplicateResult

Example

This example shows the code used to get the possible duplicates and related match information after saving a new contact. This code is part of a custom application that implements duplicate management when users add a contact. See DuplicateResult Class on page 2092 to check out the entire sample application.

Datacloud.DuplicateResult duplicateResult =
   duplicateError.getDuplicateResult();

getFields()

Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.
**Signature**

```java
public List<String> getFields()
```

**Return Value**

Type: `List<String>`

---

**getMesage()**

Returns the error message text.

**Signature**

```java
public String getMessage()
```

**Return Value**

Type: `String`

---

**getStatusCode()**

Returns a code that characterizes the error.

**Signature**

```java
public StatusCode getStatusCode()
```

**Return Value**

Type: `StatusCode`

---

**EmptyRecycleBinResult Class**

The result of the emptyRecycleBin DML operation returned by the `Database.emptyRecycleBin` method.

**Namespace**

`Database`

**Usage**

A list of `Database.EmptyRecycleBinResult` objects is returned by the `Database.emptyRecycleBin` method. Each object in the list corresponds to either a record ID or an sObject passed as the parameter in the `Database.emptyRecycleBin` method. The first index in the `EmptyRecycleBinResult` list matches the first record or sObject specified in the list, the second with the second, and so on.

**EmptyRecycleBinResult Methods**

The following are methods for `EmptyRecycleBinResult`. All are instance methods.
IN THIS SECTION:

getErrors()
If an error occurred during the delete for this record or sObject, returns a list of one or more Database.Error objects. If no errors occurred, the returned list is empty.

getId()
Returns the ID of the record or sObject you attempted to delete.

isSuccess()
Returns true if the record or sObject was successfully removed from the Recycle Bin; otherwise false.

getErrors()
If an error occurred during the delete for this record or sObject, returns a list of one or more Database.Error objects. If no errors occurred, the returned list is empty.

Signature
public Database.Errors[] getErrors()

Return Value
Type: Database.Errors []

getId()
Returns the ID of the record or sObject you attempted to delete.

Signature
public ID getId()

Return Value
Type: ID

isSuccess()
Returns true if the record or sObject was successfully removed from the Recycle Bin; otherwise false.

Signature
public Boolean isSuccess()

Return Value
Type: Boolean

Error Class
Represents information about an error that occurred during a DML operation when using a Database method.
Namespace

Database

Usage

Error class is part of SaveResult, which is generated when a user attempts to save a Salesforce record.

SEE ALSO:

SaveResult Class
DuplicateError Class

Error Methods

The following are methods for Error. All are instance methods.

IN THIS SECTION:

getFields()
Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

getMessage()
Returns the error message text.

getStatusCode()
Returns a code that characterizes the error.

getFields()

Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

Signature

public String[] getFields()

Return Value

Type: String[]

getMessage()

Returns the error message text.

Signature

public String getMessage()

Return Value

Type: String
getStatusCode()
Returns a code that characterizes the error.

Signature
public StatusCode getStatusCode()

Return Value
Type: StatusCode

Usage
The full list of status codes is available in the WSDL file for your organization (see Downloading Salesforce WSDLs and Client Authentication Certificates in the Salesforce online help.)

GetDeletedResult Class
Contains the deleted records retrieved for a specific sObject type and time window.

Namespace
Database

Usage
The Database.getDeleted method returns the deleted record information as a Database.GetDeletedResult object.

GetDeletedResult Methods
The following are methods for GetDeletedResult. All are instance methods.

IN THIS SECTION:
  getDeletedRecords()
  Returns a list of deleted records for the time window specified in the Database.getDeleted method call.
  getEarliestDateAvailable()
  Returns the date in Coordinated Universal Time (UTC) of the earliest physically deleted object for the sObject type specified in Database.getDeleted.
  getLatestDateCovered()
  Returns the date in Coordinated Universal Time (UTC) of the last date covered in the Database.getDeleted call.

getDeletedRecords()
Returns a list of deleted records for the time window specified in the Database.getDeleted method call.
Signature
public List<Database.DeletedRecord> getDeletedRecords()

Return Value
Type: List<Database.DeletedRecord>

getEarliestDateAvailable()
Returns the date in Coordinated Universal Time (UTC) of the earliest physically deleted object for the sObject type specified in Database.getDeleted.

Signature
public Date getEarliestDateAvailable()

Return Value
Type: Date

getLatestDateCovered()
Returns the date in Coordinated Universal Time (UTC) of the last date covered in the Database.getDeleted call.

Signature
public Date getLatestDateCovered()

Return Value
Type: Date

Usage
If there is a value, it is less than or equal to the endDate argument of Database.getDeleted. A value here indicates that, for safety, you should use this value for the startDate of your next call to capture the changes that started after this date but didn’t complete before endDate and were, therefore, not returned in the previous call.

GetUpdatedResult Class
Contains the result for the Database.getUpdated method call.

Namespace
Database
Usage

Use the methods in this class to obtain detailed information about the updated records returned by Database.getUpdated for a specific time window.

GetUpdatedResult Methods

The following are methods for GetUpdatedResult. All are instance methods.

IN THIS SECTION:
- getIds()<br>
  Returns the IDs of records updated within the time window specified in the Database.getUpdated method.<br>
- getLatestDateCovered()<br>
  Returns the date in Coordinated Universal Time (UTC) of the last date covered in the Database.getUpdated call.

getIds()

Returns the IDs of records updated within the time window specified in the Database.getUpdated method.

Signature

public List<Id> getIds()

Return Value

Type: List<ID>

getLatestDateCovered()

Returns the date in Coordinated Universal Time (UTC) of the last date covered in the Database.getUpdated call.

Signature

public Date getLatestDateCovered()

Return Value

Type: Date

LeadConvert Class

Contains information used for lead conversion.

Namespace

Database
Usage

The `convertLead` Database method converts a lead into an account and contact or an account and person account, as well as (optionally) an opportunity. The `convertLead` takes an instance of the `Database.LeadConvert` class as a parameter. Create an instance of this class and set the information required for conversion, such as setting the lead, and destination account and contact.

Note: The `Database.convertLead()` method can take one `LeadConvert` object or a list of `LeadConvert` objects.

Example

This example shows how to use the `Database.convertLead` method to convert a lead. It inserts a new lead, creates a `LeadConvert` object, sets its status to converted, then passes it to the `Database.convertLead` method. Finally, it verifies that the conversion was successful.

```java
Lead myLead = new Lead(LastName = 'Fry', Company='Fry And Sons');
insert myLead;

Database.LeadConvert lc = new Database.LeadConvert();
lc.setLeadId(myLead.id);

LeadStatus convertStatus = [SELECT Id, MasterLabel FROM LeadStatus WHERE IsConverted=true LIMIT 1];
lc.setConvertedStatus(convertStatus.MasterLabel);

Database.LeadConvertResult lcr = Database.convertLead(lc);
System.assert(lcr.isSuccess());
```

LeadConvert Constructors

The following are constructors for `LeadConvert`.

LeadConvert()

Creates a new instance of the `Database.LeadConvert` class.

Signature

`public LeadConvert()`
LeadConvert Methods

The following are methods for LeadConvert. All are instance methods.

IN THIS SECTION:

- `getAccountId()`
  Gets the ID of the account into which the lead will be merged.

- `getContactId()`
  Gets the ID of the contact into which the lead will be merged.

- `getConvertedStatus()`
  Gets the lead status value for a converted lead.

- `getLeadID()`
  Gets the ID of the lead to convert.

- `getOpportunityId()`
  Gets the ID of the existing opportunity that will be related to the resulting contact.

- `getOpportunityName()`
  Gets the name of the opportunity to create.

- `getOwnerID()`
  Gets the ID of the person to own any newly created account, contact, and opportunity.

- `getRelatedPersonAccountId()`
  Gets the ID of the existing person account into which the lead will be converted.

- `getRelatedPersonAccountRecord()`
  Gets the entity record of the new person account into which the lead will be converted.

- `isDoNotCreateOpportunity()`
  Indicates whether an Opportunity is created during lead conversion (false, the default) or not (true).

- `isOverWriteLeadSource()`
  Indicates whether the LeadSource field on the target Contact object is overwritten with the contents of the LeadSource field in the source Lead object (true), or not (false, the default).

- `isSendNotificationEmail()`
  Indicates whether a notification email is sent to the owner specified by setOwnerId (true) or not (false, the default).

- `setAccountId(accountId)`
  Sets the ID of the account into which the lead is merged. This value is required only when updating an existing account, including person accounts.

- `setContactId(contactId)`
  Sets the ID of the contact into which the lead will be merged (this contact must be associated with the account specified with setAccountId, and setAccountId must be specified). This value is required only when updating an existing contact.

- `setConvertedStatus(status)`
  Sets the lead status value for a converted lead. This field is required.

- `setDoNotCreateOpportunity(createOpportunity)`
  Specifies whether to create an opportunity during lead conversion. The default value is false: opportunities are created by default. Set this flag to true only if you do not want to create an opportunity from the lead.
setLeadId(leadId)
Sets the ID of the lead to convert. This field is required.

setOpportunityId(opportunityId)
Sets the ID of the opportunity into which the lead is merged. This value is required only when updating an existing opportunity.

setOpportunityName(opportunityName)
Sets the name of the opportunity to create. If no name is specified, this value defaults to the company name of the lead.

setOverwriteLeadSource(overwriteLeadSource)
Specifies whether to overwrite the LeadSource field on the target contact object with the contents of the LeadSource field in the source lead object. The default value is false, to not overwrite the field. If you specify this as true, you must also specify setContactId for the target contact.

setOwnerId(ownerId)
Specifies the ID of the person to own any newly created account, contact, and opportunity. If the application does not specify this value, the owner of the new object will be the owner of the lead.

setRelatedPersonAccountId(relatedPersonAccountId)
Sets the ID of the existing person account into which to convert the lead. This value is required only when updating an existing person account.

setRelatedPersonAccountRecord(Entity relatedPersonAccountRecord)
Sets the entity record of the new person account into which to convert the lead.

setSendNotificationEmail(sendEmail)
Specifies whether to send a notification email to the owner specified by setOwnerId. The default value is false, that is, to not send email.

getAccountId()
Gets the ID of the account into which the lead will be merged.

Signature
public ID getAccountId()

Return Value
Type: ID

getContactId()
Gets the ID of the contact into which the lead will be merged.

Signature
public ID getContactId()

Return Value
Type: ID
**getConvertedStatus()**
Gets the lead status value for a converted lead.

**Signature**
public String getConvertedStatus()

**Return Value**
Type: String

**getLeadID()**
Gets the ID of the lead to convert.

**Signature**
public ID getLeadID()

**Return Value**
Type: ID

**getOpportunityId()**
Gets the ID of the existing opportunity that will be related to the resulting contact.

**Signature**
public ID getOpportunityId()

**Return Value**
Type: ID

**getOpportunityName()**
Gets the name of the opportunity to create.

**Signature**
public String getOpportunityName()

**Return Value**
Type: String

**getOwnerID()**
Gets the ID of the person to own any newly created account, contact, and opportunity.
**Signature**

```java
public ID getOwnerID()
```

**Return Value**

Type: ID

---

**getRelatedPersonAccountID()**

Gets the ID of the existing person account into which the lead will be converted.

**Signature**

```java
public ID getRelatedPersonAccountID()
```

**Return Value**

Type: ID

---

**getRelatedPersonAccountRecord()**

Gets the entity record of the new person account into which the lead will be converted.

**Signature**

```java
public ID getRelatedPersonAccountRecord()
```

**Return Value**

Type: ID

---

**isDoNotCreateOpportunity()**

Indicates whether an Opportunity is created during lead conversion (`false`, the default) or not (`true`).

**Signature**

```java
public Boolean isDoNotCreateOpportunity()
```

**Return Value**

Type: `Boolean`

---

**isOverWriteLeadSource()**

Indicates whether the `LeadSource` field on the target Contact object is overwritten with the contents of the `LeadSource` field in the source Lead object (`true`), or not (`false`, the default).
**Signature**

`public Boolean isOverWriteLeadSource()`

**Return Value**

Type: Boolean

**isSendNotificationEmail()**

Indicates whether a notification email is sent to the owner specified by `setOwnerId` (true) or not (false, the default).

**Signature**

`public Boolean isSendNotificationEmail()`

**Return Value**

Type: Boolean

**setAccountId(accountId)**

Sets the ID of the account into which the lead is merged. This value is required only when updating an existing account, including person accounts.

**Signature**

`public Void setAccountId(ID accountId)`

**Parameters**

`accountId`

Type: ID

**Return Value**

Type: Void

**setContactId(contactId)**

Sets the ID of the contact into which the lead will be merged (this contact must be associated with the account specified with `setAccountId`, and `setAccountId` must be specified). This value is required only when updating an existing contact.

**Signature**

`public Void setContactId(ID contactId)`

**Parameters**

`contactId`

Type: ID
Return Value
Type: Void

Usage
If setContactId is specified, then the application creates a new contact that is implicitly associated with the account. The contact name and other existing data are not overwritten (unless setOverwriteLeadSource is set to true, in which case only the LeadSource field is overwritten).

**Important:** If you are converting a lead into a person account, do not specify setContactId or an error will result. Specify only setAccountId of the person account.

**setConvertedStatus(status)**
Sets the lead status value for a converted lead. This field is required.

Signature
```java
public Void setConvertedStatus(String status)
```

Parameters
- **status**
  Type: String

Return Value
Type: Void

**setDoNotCreateOpportunity(createOpportunity)**
Specifies whether to create an opportunity during lead conversion. The default value is false: opportunities are created by default. Set this flag to true only if you do not want to create an opportunity from the lead.

Signature
```java
public Void setDoNotCreateOpportunity(Boolean createOpportunity)
```

Parameters
- **createOpportunity**
  Type: Boolean

Return Value
Type: Void

**setLeadId(leadId)**
Sets the ID of the lead to convert. This field is required.
Signature
public Void setLeadId(ID leadId)

Parameters
leadId
Type: ID

Return Value
Type: Void

setOpportunityId(opportunityId)
Sets the ID of the opportunity into which the lead is merged. This value is required only when updating an existing opportunity.

Signature
public Void setOpportunityId(ID opportunityId)

Parameters
opportunityId
Type: ID

Return Value
Type: Void

setOpportunityName(opportunityName)
Sets the name of the opportunity to create. If no name is specified, this value defaults to the company name of the lead.

Signature
public Void setOpportunityName(String opportunityName)

Parameters
opportunityName
Type: String

Return Value
Type: Void

Usage
The maximum length of this field is 80 characters.
If `setDoNotCreateOpportunity` is true, no Opportunity is created and this field must be left blank; otherwise, an error is returned.

**setOverwriteLeadSource (overwriteLeadSource)**

Specifies whether to overwrite the `LeadSource` field on the target contact object with the contents of the `LeadSource` field in the source lead object. The default value is `false`, to not overwrite the field. If you specify this as `true`, you must also specify `setContactId` for the target contact.

**Signature**

```java
public Void setOverwriteLeadSource(Boolean overwriteLeadSource)
```

**Parameters**

- `overwriteLeadSource`  
  Type: `Boolean`

**Return Value**

Type: `Void`

**setOwnerId (ownerId)**

Specifies the ID of the person to own any newly created account, contact, and opportunity. If the application does not specify this value, the owner of the new object will be the owner of the lead.

**Signature**

```java
public Void setOwnerId(ID ownerId)
```

**Parameters**

- `ownerId`  
  Type: `ID`

**Return Value**

Type: `Void`

**Usage**

This method is not applicable when merging with existing objects—if `setOwnerId` is specified, the `ownerId` field is not overwritten in an existing account or contact.

**setRelatedPersonAccountId (relatedPersonAccountId)**

Sets the ID of the existing person account into which to convert the lead. This value is required only when updating an existing person account.
Signature

```
public Void setRelatedPersonAccountId(ID relatedPersonAccountId)
```

Parameters

```
relatedPersonAccountId
  Type: ID
```

Return Value

Type: Void

```
setRelatedPersonAccountRecord(Entity relatedPersonAccountRecord)
```

Sets the entity record of the new person account into which to convert the lead.

Signature

```
public Void setRelatedPersonAccountRecord(Entity relatedPersonAccountRecord)
```

Parameters

```
relatedPersonAccountRecord
  Type: ID
```

Return Value

Type: Void

```
setSendNotificationEmail(Boolean sendEmail)
```

Specifies whether to send a notification email to the owner specified by `setOwnerId`. The default value is `false`, that is, to not send email.

Signature

```
public Void setSendNotificationEmail(Boolean sendEmail)
```

Parameters

```
sendEmail
  Type: Boolean
```

Return Value

Type: Void

```
LeadConvertResult Class
```

The result of a lead conversion.
Namespace

Database

Usage

An array of LeadConvertResult objects is returned with the `convertLead` Database method. Each element in the LeadConvertResult array corresponds to the sObject array passed as the `SObject[]` parameter in the `convertLead` Database method, that is, the first element in the LeadConvertResult array matches the first element passed in the SObject array, the second element corresponds to the second element, and so on. If only one sObject is passed in, the LeadConvertResult array contains a single element.

LeadConvertResult Methods

The following are methods for `LeadConvertResult`. All are instance methods.

IN THIS SECTION:
  - `getAccountId()`
  - `getContactId()`
  - `getErrors()`
  - `getLeadId()`
  - `getOpportunityId()`
  - `getRelatedPersonAccountId()`
  - `isSuccess()`

`getAccountId()`

The ID of the new account (if a new account was specified) or the ID of the account specified when `convertLead` was invoked.

Signature

public ID getAccountId()

Return Value

Type: ID

`getContactId()`

The ID of the new contact (if a new contact was specified) or the ID of the contact specified when `convertLead` was invoked.

`getErrors()`

If an error occurred, an array of one or more database error objects providing the error code and description.

`getLeadId()`

The ID of the converted lead.

`getOpportunityId()`

The ID of the new opportunity, if one was created when `convertLead` was invoked.

`getRelatedPersonAccountId()`

The ID of the new or existing person account specified when `convertLead` was invoked.

`isSuccess()`

A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

2078
Signature
public ID getContactId()

Return Value
Type: ID

getErrors()
If an error occurred, an array of one or more database error objects providing the error code and description.

Signature
public Database.Error[] getErrors()

Return Value
Type: Database.Error[]

getLeadId()
The ID of the converted lead.

Signature
public ID getLeadId()

Return Value
Type: ID

getOpportunityId()
The ID of the new opportunity, if one was created when convertLead was invoked.

Signature
public ID getOpportunityId()

Return Value
Type: ID

getRelatedPersonAccountId()
The ID of the new or existing person account specified when convertLead was invoked.

Signature
public ID getRelatedPersonAccountId()
Return Value
Type: ID

**isSuccess()**
A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```java
public Boolean isSuccess()
```

Return Value
Type: Boolean

**MergeResult Class**
Contains the result of a merge Database method operation.

**Namespace**
`Database`

**Usage**
The `Database.merge` method returns a `Database.MergeResult` object for each merged record.

**MergeResult Methods**
The following are methods for `MergeResult`. All are instance methods.

**IN THIS SECTION:**
- `getErrors()`
  Returns a list of `Database.Error` objects representing the errors encountered, if any, during a merge operation using the `Database.merge` method. If no error occurred, returns null.
- `getId()`
  Returns the ID of the master record into which other records were merged.
- `getMergedRecordIds()`
  Returns the IDs of the records merged into the master record.
- `getUpdatedRelatedIds()`
  Returns the IDs of all related records that were reparented as a result of the merge that are viewable by the user sending the merge call.
- `isSuccess()`
  Indicates whether the merge was successful (`true`) or not (`false`).
getErrors()
Returns a list of Database.Error objects representing the errors encountered, if any, during a merge operation using the Database.merge method. If no error occurred, returns null.

Signature
public List<Database.Error> getErrors()

Return Value
Type: List<Database.Error>

get_id()
Returns the ID of the master record into which other records were merged.

Signature
public Id getId()

Return Value
Type: ID

getMergedRecordIds()
Returns the IDs of the records merged into the master record.

Signature
public List<String> getMergedRecordIds()

Return Value
Type: List<String>

getUpdatedRelatedIds()
Returns the IDs of all related records that were reparented as a result of the merge that are viewable by the user sending the merge call.

Signature
public List<String> getUpdatedRelatedIds()

Return Value
Type: List<String>
**isSuccess()**
Indicates whether the merge was successful (`true`) or not (`false`).

**Signature**
```
public Boolean isSuccess()
```

**Return Value**
Type: `Boolean`

---

**QueryLocator Class**
Represents the record set returned by `Database.getQueryLocator` and used with Batch Apex.

**Namespace**
`Database`

**QueryLocator Methods**
The following are methods for `QueryLocator`. All are instance methods.

**IN THIS SECTION:**
- `getQuery()`
  Returns the query used to instantiate the `Database.QueryLocator` object. This is useful when testing the `start` method.
- `iterator()`
  Returns a new instance of a query locator iterator.

**getQuery()**
Returns the query used to instantiate the `Database.QueryLocator` object. This is useful when testing the `start` method.

**Signature**
```
public String getQuery()
```

**Return Value**
Type: `String`

**Usage**
You can’t use the `FOR UPDATE` keywords with a `getQueryLocator` query to lock a set of records. The set of records in the batch is determined when the `start` method is run.
iterator()

Returns a new instance of a query locator iterator.

Signature

public Database.QueryLocatorIterator iterator()

Return Value

Type: Database.QueryLocatorIterator

Usage

⚠️ Warning: To iterate over a query locator, save the iterator instance that this method returns in a variable and then use this variable to iterate over the collection. Calling iterator every time you want to perform an iteration can result in incorrect behavior because each call returns a new iterator instance.

For an example, see QueryLocatorIterator Class.

QueryLocatorIterator Class

Represents an iterator over a query locator record set.

Namespace

Database

Example

This sample shows how to obtain an iterator for a query locator, which contains five accounts. This sample calls hasNext and next to get each record in the collection.

```java
// Get a query locator
Database.QueryLocator q = Database.getQueryLocator(
    [SELECT Name FROM Account LIMIT 5]);
// Get an iterator
Database.QueryLocatorIterator it = q.iterator();

// Iterate over the records
while (it.hasNext())
{
    Account a = (Account)it.next();
}
```
QueryLocatorIterator Methods

The following are methods for QueryLocatorIterator. All are instance methods.

**IN THIS SECTION:**

**hasNext()**
Returns `true` if there are one or more records remaining in the collection; otherwise, returns `false`.

**next()**
Advances the iterator to the next sObject record and returns the sObject.

**hasNext()**
Returns `true` if there are one or more records remaining in the collection; otherwise, returns `false`.

**Signature**
```java
public Boolean hasNext()
```

**Return Value**
Type: Boolean

**next()**
Advances the iterator to the next sObject record and returns the sObject.

**Signature**
```java
public sObject next()
```

**Return Value**
Type: sObject

**Usage**
Because the return value is the generic sObject type, you must cast it if using a more specific type. For example:

```java
Account a = (Account)myIterator.next();
```

**Example**
```java
Account a = (Account)myIterator.next();
```
SaveResult Class

The result of an insert or update DML operation returned by a Database method.

Namespace

Database

Usage

An array of SaveResult objects is returned with the insert and update database methods. Each element in the SaveResult array corresponds to the sObject array passed as the sObject[] parameter in the Database method, that is, the first element in the SaveResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the SaveResult array contains a single element.

A SaveResult object is generated when a new or existing Salesforce record is saved.

Example

The following example shows how to obtain and iterate through the returned Database.SaveResult objects. It inserts two accounts using Database.insert with a false second parameter to allow partial processing of records on failure. One of the accounts is missing the Name required field, which causes a failure. Next, it iterates through the results to determine whether the operation was successful or not for each record. It writes the ID of every record that was processed successfully to the debug log, or error messages and fields of the failed records. This example generates one successful operation and one failure.

```java
// Create two accounts, one of which is missing a required field
Account[] accts = new List<Account>{
    new Account(Name='Account1'),
    new Account();
};
Database.SaveResult[] srList = Database.insert(accts, false);

// Iterate through each returned result
for (Database.SaveResult sr : srList) {
    if (sr.isSuccess()) {
        // Operation was successful, so get the ID of the record that was processed
        System.debug('Successfully inserted account. Account ID: ' + sr.getId());
    } else {
        // Operation failed, so get all errors
        for(Database.Error err : sr.getErrors()) {
            System.debug('The following error has occurred: ');
            System.debug(err.getStatusCode() + ': ' + err.getMessage());
            System.debug('Account fields that affected this error: ' + err.getFields());
        }
    }
}
```

SEE ALSO:

Error Class

DuplicateError Class
SaveResult Methods

The following are methods for SaveResult. All are instance methods.

IN THIS SECTION:
  getErrors()  
  If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.
  getId()  
  Returns the ID of the sObject you were trying to insert or update.
  isSuccess()  
  Returns a Boolean that is set to true if the DML operation was successful for this object, false otherwise.

getErrors()

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

Signature

public Database.Error[] getErrors()

Return Value

Type: Database.Error[]

getId()

Returns the ID of the sObject you were trying to insert or update.

Signature

public ID getId()

Return Value

Type: ID

Versioned Behavior Changes

Prior to API version 53.0, the method returned a null value if the record wasn’t updated successfully. In API version 53.0 and later, the method returns the sObject ID, regardless of whether the update operation is successful or not.

isSuccess()

Returns a Boolean that is set to true if the DML operation was successful for this object, false otherwise.
Signature

public Boolean isSuccess()

Return Value

Type: Boolean

Example

This example shows the code used to process duplicate records, which are detected when there is an unsuccessful save due to an error. This code is part of a custom application that implements duplicate management when users add a contact. See DuplicateResult Class on page 2092 to check out the entire sample application.

```java
if (!saveResult.isSuccess()) { ... }
```

UndeleteResult Class

The result of an undelete DML operation returned by the Database.undelete method.

Namespace

Database

Usage

An array of Database.UndeleteResult objects is returned with the undelete database method. Each element in the UndeleteResult array corresponds to the sObject array passed as the sObject[] parameter in the undelete Database method; that is, the first element in the UndeleteResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the UndeleteResults array contains a single element.

UndeleteResult Methods

The following are methods for UndeleteResult. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns null.

getId()
Returns the ID of the sObject you were trying to undelete.

isSuccess()
Returns a Boolean value that is set to true if the DML operation was successful for this object, false otherwise.

getErrors()
If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns null.
public Database.Error[] getErrors()

Return Value
Type: Database.Error[]

getId()
Returns the ID of the sObject you were trying to undelete.

public ID getId()

Return Value
Type: ID

Usage
If this field contains a value, the object was successfully undeleted. If this field is empty, the operation was not successful for that object.

isSuccess()
Returns a Boolean value that is set to true if the DML operation was successful for this object, false otherwise.

public Boolean isSuccess()

Return Value
Type: Boolean

UpsertResult Class
The result of an upsert DML operation returned by the Database.upsert method.

Namespace
Database

Usage
An array of Database.UpsertResult objects is returned with the upsert database method. Each element in the UpsertResult array corresponds to the sObject array passed as the sObject[] parameter in the upsert Database method; that is, the first element in the UpsertResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the UpsertResults array contains a single element.
**UpsertResult Methods**

The following are methods for `UpsertResult`. All are instance methods.

**IN THIS SECTION:**

- `getErrors()`: If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.
- `getId()`: Returns the ID of the sObject you were trying to update or insert.
- `isCreated()`: A Boolean value that is set to `true` if the record was created, `false` if the record was updated.
- `isSuccess()`: Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

### getErrors()

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

**Signature**

```java
public Database.Error[] getErrors()
```

**Return Value**

Type: `Database.Error[]`

### getId()

Returns the ID of the sObject you were trying to update or insert.

**Signature**

```java
public ID getId()
```

**Return Value**

Type: `ID`

**Versioned Behavior Changes**

Prior to API version 53.0, the method returned a null value if the record wasn’t upserted successfully. In API version 53.0 and later, the method returns the sObject ID regardless of whether the update operation is successful.

### isCreated()

A Boolean value that is set to `true` if the record was created, `false` if the record was updated.
Datacloud Namespace

The Datacloud namespace provides classes and methods for retrieving information about duplicate rules. Duplicate rules let you control whether and when users can save duplicate records within Salesforce.

The Datacloud namespace is related to the Duplicate Management feature. For more information, see Manage Duplicate Records in Salesforce Help and Duplicate Management in Trailhead. The Datacloud namespace isn’t related to the Salesforce Data Cloud product. See Data Cloud.

The following are the classes in the Datacloud namespace.

IN THIS SECTION:

  AdditionalInformationMap Class
  Represents other information, if any, about matched records.

  DuplicateResult Class
  Represents the details of a duplicate rule that detected duplicate records and information about those duplicate records.

  FieldDiff Class
  Represents the name of a matching rule field and how the values of the field compare for the duplicate and its matching record.

  FindDuplicates Class
  Performs rule-based searches for duplicate records. The input is an array of sObjects. Each sObject represents a record you want to find duplicates of. The output identifies the detected duplicates for each input sObject based on active duplicate rules for the given object.

  FindDuplicatesByIds Class
  Performs rule-based searches for duplicate records. The input is an array of IDs. Each ID specifies records to search for duplicates among. The duplicates are detected based on the active duplicate rules applicable to the object type corresponding to the input IDs.

Signature

public Boolean isCreated()

Return Value

Type: Boolean

isSuccess()

Returns a Boolean value that is set to true if the DML operation was successful for this object, false otherwise.

Signature

public Boolean isSuccess()

Return Value

Type: Boolean
FindDuplicatesResult Class
Output for rule-based searches for duplicate records. FindDuplicatesResult contains results of detecting duplicates using instances of FindDuplicates or FindDuplicatesByIds classes.

MatchRecord Class
Represents a duplicate record detected by a matching rule.

MatchResult Class
Represents the duplicate results for a matching rule.

AdditionalInformationMap Class
Represents other information, if any, about matched records.

Namespace
Datacloud

IN THIS SECTION:
AdditionalInformationMap Methods

AdditionalInformationMap Methods
The following are methods for AdditionalInformationMap.

IN THIS SECTION:
getName()
Returns the element name.

getValue()
Returns the value of the element.

**getName()**
Returns the element name.

**Signature**
public String getName()

**Return Value**
Type: String

**getValue()**
Returns the value of the element.
Signature

```java
public String getValue()
```

Return Value

Type: String

**DuplicateResult Class**

Represents the details of a duplicate rule that detected duplicate records and information about those duplicate records.

**Namespace**

Datacloud

**Usage**

The `DuplicateResult` class and its methods are available to organizations that use duplicate rules. `DuplicateResult` is contained within `DuplicateError`, which is part of `SaveResult`. `SaveResult` is generated when a user attempts to save a record in Salesforce.

**Example**

This example shows a custom application that lets users add a contact. When a contact is saved, an alert displays if there are duplicate records.

The sample application consists of a Visualforce page and an Apex controller. The Visualforce page is listed first so that you can see how the page makes use of the Apex controller. Save the Apex class first before saving the Visualforce page.

```
<apex:page controller="ContactDedupeController">
    <apex:form>
        <apex:pageBlock title="Duplicate Records" rendered="{!hasDuplicateResult}"
            <apex:pageMessages />
        <apex:pageBlockTable value="{!duplicateRecords}" var="item">
            <apex:column>
                <apex:facet name="header">Name</apex:facet>
                <apex:outputLink value="/ {!item['Id']}">{!item['Name']}</apex:outputLink>
            </apex:column>
            <apex:column>
                <apex:facet name="header">Owner</apex:facet>
                <apex:outputField value="{!item['OwnerId']}"/>
            </apex:column>
            <apex:column>
                <apex:facet name="header">Last Modified Date</apex:facet>
                <apex:outputField value="{!item['LastModifiedDate']}"/>
            </apex:column>
        </apex:pageBlockTable>
    </apex:pageBlock>
    <apex:pageBlock title="Contact" mode="edit">
```

2092
This sample is the Apex controller for the page. This controller contains the action method for the Save button. The `save` method inserts the new contact. If errors are returned, this method iterates through each error, checks if it's a duplicate error, adds the error message to the page, and returns information about the duplicate records to be displayed on the page.

```apex
public class ContactDedupeController {

    // Initialize a variable to hold the contact record you're processing
    private final Contact contact;

    // Initialize a list to hold any duplicate records
    private List<sObject> duplicateRecords;

    // Define variable that’s true if there are duplicate records
    public boolean hasDuplicateResult{get;set;}

    // Define the constructor
    public ContactDedupeController() {

        // Define the values for the contact you're processing based on its ID
        Id id = ApexPages.currentPage().getParameters().get('id');
        this.contact = (id == null) ? new Contact() :
            [SELECT Id, FirstName, LastName, Email, Phone, AccountId
             FROM Contact WHERE Id = :id];

        // Initialize empty list of potential duplicate records
        this.duplicateRecords = new List<sObject>();
        this.hasDuplicateResult = false;
    }

    // Return contact and its values to the Visualforce page for display
    public Contact getContact() {
        return this.contact;
    }

    // Return duplicate records to the Visualforce page for display
    public List<sObject> getDuplicateRecords() {
        return this.duplicateRecords;
    }

    // Process the saved record and handle any duplicates
```
public PageReference save() {

    // Optionally, set DML options here, use “DML” instead of “false”
    // in the insert()
    Database.DMLOptions dml = new Database.DMLOptions();
    dml.DuplicateRuleHeader.allowSave = true;
    dml.DuplicateRuleHeader.runAsCurrentUser = true;
    Database.SaveResult saveResult = Database.insert(contact, false);

    if (!saveResult.isSuccess()) {
        for (Database.Error error : saveResult.getErrors()) {
            // If there are duplicates, an error occurs
            // Process only duplicates and not other errors
            // (e.g., validation errors)
            if (error instanceof Database.DuplicateError) {
                // Handle the duplicate error by first casting it as a
                // DuplicateError class
                // This lets you use methods of that class
                // (e.g., getDuplicateResult())
                Database.DuplicateError duplicateError =
                    (Database.DuplicateError)error;
                Datacloud.DuplicateResult duplicateResult =
                    duplicateError.getDuplicateResult();

                // Display duplicate error message as defined in the duplicate rule
                ApexPages.Message errorMessage = new ApexPages.Message{
                    ApexPages.Severity.ERROR, 'Duplicate Error: ' +
                    duplicateResult.getErrorMessage()};
                ApexPages.addMessage(errorMessage);

                // Get duplicate records
                this.duplicateRecords = new List<sObject>();

                // Return only match results of matching rules that
                // find duplicate records
                Datacloud.MatchResult[] matchResults =
                    duplicateResult.getMatchResults();

                // Just grab first match result (which contains the
                // duplicate record found and other match info)
                Datacloud.MatchResult matchResult = matchResults[0];

                Datacloud.MatchRecord[] matchRecords = matchResult.getMatchRecords();

                // Add matched record to the duplicate records variable
                for (Datacloud.MatchRecord matchRecord : matchRecords) {
                    System.debug('MatchRecord: ' + matchRecord.getRecord());
                    this.duplicateRecords.add(matchRecord.getRecord());
                }

                this.hasDuplicateResult = !this.duplicateRecords.isEmpty();
            }
        }
    }
}
// If there's a duplicate record, stay on the page
return null;

// After save, navigate to the view page:
return (new ApexPages.StandardController(contact)).view();

IN THIS SECTION:
DuplicateResult Methods

SEE ALSO:
SaveResult Class
DuplicateError Class

DuplicateResult Methods
The following are methods for DuplicateResult.

IN THIS SECTION:
getDuplicateRule()  
Returns the developer name of the executed duplicate rule that returned duplicate records.
getErrorMessage()  
Returns the error message configured by the administrator to warn users they may be creating duplicate records. This message is associated with a duplicate rule.
getMatchResults()  
Returns the duplicate records and match information.
isAllowSave()  
Indicates whether the duplicate rule will allow a record that's identified as a duplicate to be saved. Set to true if duplicate rule should allow save; otherwise, false.

getDuplicateRule()  
Returns the developer name of the executed duplicate rule that returned duplicate records.

Signature

public String getDuplicateRule()

Return Value

Type: String
**getErrorMessage()**

Returns the error message configured by the administrator to warn users they may be creating duplicate records. This message is associated with a duplicate rule.

**Signature**

```java
public String getErrorMessage()
```

**Return Value**

Type: String

**Example**

This example shows the code used to display the error message when duplicates are found while saving a new contact. This code is part of a custom application that lets users add a contact. When a contact is saved, an alert displays if there are duplicate records. Review the DuplicateResult Class on page 2092 to check out the entire sample application.

```java
ApexPages.Message errorMessage = new ApexPages.Message(
    ApexPages.Severity.ERROR, 'Duplicate Error: ' +
    duplicateResult.getErrorMessage());
ApexPages.addMessage(errorMessage);
```

**getMatchResults()**

Returns the duplicate records and match information.

**Signature**

```java
public List<Datacloud.MatchResult> getMatchResults()
```

**Return Value**

Type: List<Datacloud.MatchResult>

**Example**

This example shows the code used to return duplicate record and match information and assign it to the `matchResults` variable. This code is part of a custom application that implements duplicate management when users add a contact. See the DuplicateResult Class on page 2092 to check out the entire sample application.

```java
Datacloud.MatchResult[] matchResults =
    duplicateResult.getMatchResults();
```

**isAllowSave()**

Indicates whether the duplicate rule will allow a record that’s identified as a duplicate to be saved. Set to `true` if duplicate rule should allow save; otherwise, `false`.

---

2096
**Signature**

```java
public Boolean isAllowSave()
```

**Return Value**

Type: Boolean

**FieldDiff Class**

Represents the name of a matching rule field and how the values of the field compare for the duplicate and its matching record.

**Namespace**

Datacloud

**IN THIS SECTION:**

FieldDiff Methods

**FieldDiff Methods**

The following are methods for FieldDiff.

**IN THIS SECTION:**

- `getDifference()`
  Returns how the field values compare for the duplicate and its matching record.

- `getName()`
  Returns the name of a field on a matching rule that detected duplicates.

**getDifference()**

Returns how the field values compare for the duplicate and its matching record.

**Signature**

```java
public String getDifference()
```

**Return Value**

Type: String

Possible values include:

- **SAME**: Indicates the field values match exactly.
- **DIFFERENT**: Indicates that the field values do not match.
- **NULL**: Indicates that the field values are a match because both values are blank.
getName()

Returns the name of a field on a matching rule that detected duplicates.

Signature

```java
public String getName()
```

Return Value

Type: String

FindDuplicates Class

Performs rule-based searches for duplicate records. The input is an array of sObjects. Each sObject represents a record you want to find duplicates of. The output identifies the detected duplicates for each input sObject based on active duplicate rules for the given object.

Namespace

Datacloud

IN THIS SECTION:

FindDuplicates Methods

FindDuplicates Methods

The following are methods for FindDuplicates.

IN THIS SECTION:

findDuplicates(sObjects)

Identifies duplicates for sObjects provided and returns a list of FindDuplicatesResult objects.

findDuplicates(sObjects)

Identifies duplicates for sObjects provided and returns a list of FindDuplicatesResult objects.

Usage

Use FindDuplicates to apply active duplicate rules associated with an object to records represented by input sObjects. FindDuplicates uses the duplicate rules for the object that has the same type as the input sObjects.

Input

- All sObjects in the input array must be of the same object type, and that type must correspond to an object type that supports duplicate rules.
- The input array is limited to 50 elements. If you exceed this limit, an exception is thrown with the following message: Configuration error: The number of records to check is greater than the permitted batch size.
Output

- The output of FindDuplicates is an array of objects with the same number of elements as the input array, and in the same order. The output objects encapsulate record IDs for duplicate records. The output objects also contain values from the duplicate records.
- Each element contains an array of DuplicateResult objects. If FindDuplicates doesn’t find any duplicates, the duplicateRule field in DuplicateResult contains the name of the duplicate rule that FindDuplicates applied, but the matchResults array is empty.

Example

```java
Account acct = new Account();
acct.Name = 'Acme';
acct.BillingStreet = '123 Fake St';
acct.BillingCity = 'Springfield';
acct.BillingState = 'VT';
acct.BillingCountry = 'US';

List<Account> acctList = new List<Account>();
acctList.add(acct);

if (Datacloud.FindDuplicates.findDuplicates(acctList).size() == 0) {
    // If the new account doesn't have duplicates, insert it.
    insert(acct);
}
```

Signature

```java
public static List<Datacloud.FindDuplicatesResult> findDuplicates(List<SObject> sObjects)
```

Parameters

- `sObjects` Type: List<SObject>
  
An array of sObjects for which you want to find duplicates.

Return Value

Type: List<FindDuplicatesResult>

FindDuplicatesByIds Class

Performs rule-based searches for duplicate records. The input is an array of IDs. Each ID specifies records to search for duplicates among. The duplicates are detected based on the active duplicate rules applicable to the object type corresponding to the input IDs.

Namespace

Datacloud
IN THIS SECTION:

**FindDuplicatesByIds Methods**

**FindDuplicatesByIds Methods**
The following are methods for `FindDuplicatesByIds`.

**IN THIS SECTION:**

- `findDuplicatesByIds(ids)`
  - Identifies duplicates of sObjects provided and returns a list of `FindDuplicatesResult` objects.

## findDuplicatesByIds(ids)

Identifies duplicates of sObjects provided and returns a list of `FindDuplicatesResult` objects.

### Usage

Use `FindDuplicatesByIds` to apply active duplicate rules associated with an object to records represented by the record IDs. `FindDuplicatesByIds` uses the duplicate rules for the object that has the same type as the input record IDs. For example, if the record ID represents an Account, `FindDuplicatesByIds` uses the duplicate rules associated with the Account object.

### Input

- All record IDs in the input array must be of the same object type, and that type must correspond to an object type that supports duplicate rules.
- The input array is limited to 50 elements. If you exceed this limit, an exception is thrown with the following message: **Configuration error: The number of records to check is greater than the permitted batch size.**

### Output

- The output of `FindDuplicatesByIds` is an array of objects with the same number of elements as the input array, and in the same order. The output objects encapsulate record IDs for duplicate records. The output objects also contain values from the duplicate records.
- Each element contains an array of `DuplicateResult` objects. If `FindDuplicatesByIds` doesn’t find any duplicates, the `duplicateRule` field in `DuplicateResult` contains the name of the duplicate rule that `FindDuplicatesByIds` applied, but the `matchResults` array is empty.

### Example

```apex
Account acct = new Account(name='Salesforce');
insert acct;

List<Id> idList = new List<Id>{};
idList.add(acct.id);

if (Datacloud.FindDuplicatesByIds.findDuplicatesByIds(idList).size() > 0) {
    System.debug('Found duplicates');
}
```
public static List<Datacloud.FindDuplicatesResult> findDuplicatesByIds(List<Id> ids)

Parameters
ids
Type: List<Id>
A list of IDs for which you want to find duplicates.

Return Value
Type: List<Datacloud.FindDuplicatesResult>

FindDuplicatesResult Class
Output for rule-based searches for duplicate records. FindDuplicatesResult contains results of detecting duplicates using instances of FindDuplicates or FindDuplicatesByIds classes.

Namespace
Datacloud

IN THIS SECTION:
FindDuplicatesResult Properties
FindDuplicatesResult Methods

FindDuplicatesResult Properties
The following are properties for FindDuplicatesResult.

IN THIS SECTION:
duplicateresults
A list of DuplicateResult objects representing the results of calling FindDuplicates.findDuplicates(sObjects) or FindDuplicatesByIds.findDuplicatesByIds(ids). Elements in the list correspond to sObjects or IDs in the input list.
errors
A list of Database.Error objects holding errors resulting from calling FindDuplicates.findDuplicates(sObjects) or FindDuplicatesByIds.findDuplicatesByIds(ids).
success
Boolean signifying whether the call to FindDuplicates.findDuplicates(sObjects) or FindDuplicatesByIds.findDuplicatesByIds(ids) was successful.
**duplicateresults**
A list of DuplicateResult objects representing the results of calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`. Elements in the list correspond to sObjects or IDs in the input list.

**Signature**
```
public List<Datacloud.DuplicateResult> duplicateresults
```

**Property Value**
Type: `List<DuplicateResult>`

**errors**
A list of Database.Error objects holding errors resulting from calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`.

**Signature**
```
public List<Database.Error> errors {get; set;}
```

**Property Value**
Type: `List<Database.Error>`

**success**
Boolean signifying whether the call to `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)` was successful.

**Signature**
```
public Boolean success {get; set;}
```

**Property Value**
Type: `Boolean`

**FindDuplicatesResult Methods**
The following are methods for `FindDuplicatesResult`.

**IN THIS SECTION:**
- `getDuplicateResults()`
  Returns a list of DuplicateResult objects representing the results of calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`. Elements in the list correspond to sObjects or IDs in the input list.
getErrors()
Returns a list of DatabaseError objects containing errors resulting from calling
FindDuplicates.findDuplicates(sObjects) or FindDuplicatesByIds.findDuplicatesByIds(ids),
if errors were encountered.

isSuccess()
Returns a Boolean signifying whether the call to FindDuplicates.findDuplicates(sObjects) or
FindDuplicatesByIds.findDuplicatesByIds(ids) was successful.

getDuplicateResults()
Returns a list of DuplicateResult objects representing the results of calling
FindDuplicates.findDuplicates(sObjects) or FindDuplicatesByIds.findDuplicatesByIds(ids).
Elements in the list correspond to sObjects or IDs in the input list.

Example

```java
Account acct = new Account(name='Salesforce');
List<Account> acctList = new List<Account>();
acctList.add(acct);

Datacloud.FindDuplicatesResult[] results = Datacloud.FindDuplicates.findDuplicates(acctList);
for (Datacloud.FindDuplicatesResult findDupeResult : results) {
    for (Datacloud.DuplicateResult dupeResult : findDupeResult.getDuplicateResults()) {
        for (Datacloud.MatchResult matchResult : dupeResult.getMatchResults()) {
            for (Datacloud.MatchRecord matchRecord : matchResult.getMatchRecords()) {
                System.debug('Duplicate Record: ' + matchRecord.getRecord());
            }
        }
    }
}
```

Signature

```java
public List<Datacloud.DuplicateResult> getDuplicateResults()
```

Return Value

Type: List<DuplicateResult>

getErrors()

Returns a list of DatabaseError objects containing errors resulting from calling
FindDuplicates.findDuplicates(sObjects) or FindDuplicatesByIds.findDuplicatesByIds(ids),
if errors were encountered.

Signature

```java
public List<Database.Error> getErrors()
```
Return Value
Type: List<Database.Error>

**isSuccess()**

Returns a Boolean signifying whether the call to `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)` was successful.

**Signature**

```
public Boolean isSuccess()
```

Return Value
Type: Boolean

**MatchRecord Class**

Represents a duplicate record detected by a matching rule.

**Namespace**

Datacloud

**IN THIS SECTION:**

MatchRecord Methods

**MatchRecord Methods**

The following are methods for MatchRecord.

**IN THIS SECTION:**

- `getAdditionalInformation()`
  Returns other information about a matched record. For example, a `matchGrade` represents the quality of the data for the D&B fields in the matched record.

- `getFieldDiffs()`
  Returns all matching rule fields and how each field value compares for the duplicate and its matching record.

- `getMatchConfidence()`
  Returns the ranking of how similar a matched record’s data is to the data in your request. Must be equal to or greater than the value of the `minMatchConfidence` specified in your request. Returns -1 if unused.

- `getRecord()`
  Returns the fields and field values for the duplicate.
getAdditionalInformation()
Returns other information about a matched record. For example, a matchGrade represents the quality of the data for the D&B fields in the matched record.

Signature
public List<Datacloud.AdditionalInformationMap> getAdditionalInformation()

Return Value
Type: List<Datacloud.AdditionalInformationMap>

getFieldDiffs()
Returns all matching rule fields and how each field value compares for the duplicate and its matching record.

Signature
public List<Datacloud.FieldDiff> getFieldDiffs()

Return Value
Type: List<Datacloud.FieldDiff>

getMatchConfidence()
Returns the ranking of how similar a matched record’s data is to the data in your request. Must be equal to or greater than the value of the minMatchConfidence specified in your request. Returns -1 if unused.

Signature
public Double getMatchConfidence()

Return Value
Type: Double

getRecord()
Returns the fields and field values for the duplicate.

Signature
public SObject getRecord()

Return Value
Type: SObject
**MatchResult Class**

Represents the duplicate results for a matching rule.

**Namespace**

Datacloud

**IN THIS SECTION:**

MatchResult Methods

**MatchResult Methods**

The following are methods for MatchResult.

**IN THIS SECTION:**

- `getEntityType()`: Returns the entity type of the matching rule.
- `getErrors()`: Returns errors that occurred during matching for the matching rule.
- `getMatchEngine()`: Returns the match engine for the matching rule.
- `getMatchRecords()`: Returns information about the duplicates for the matching rule.
- `getRule()`: Returns the developer name of the matching rule.
- `getSize()`: Returns the number of duplicates detected by the matching rule.
- `isSuccess()`: Returns `false` if there’s an error with the matching rule, and `true` if the matching rule successfully ran.

**getEntityType()**

Returns the entity type of the matching rule.

**Signature**

```java
public String getEntityType()
```

**Return Value**

Type: `String`
getErrors()
Returns errors that occurred during matching for the matching rule.

Signature
public List<Database.Error> getErrors()

Return Value
Type: List<Database.Error>

getMatchEngine()
Returns the match engine for the matching rule.

Signature
public String getMatchEngine()

Return Value
Type: String

getMatchRecords()
Returns information about the duplicates for the matching rule.

Signature
public List<Datacloud.MatchRecord> getMatchRecords()

Return Value
Type: List<Datacloud.MatchRecord>

getRule()
Returns the developer name of the matching rule.

Signature
public String getRule()

Return Value
Type: String

getSize()
Returns the number of duplicates detected by the matching rule.
Signature

```java
public Integer getSize()
```

Return Value

Type: Integer

**isSuccess()**

Returns `false` if there's an error with the matching rule, and `true` if the matching rule successfully ran.

Signature

```java
public Boolean isSuccess()
```

Return Value

Type: Boolean

## DataSource Namespace

The **DataSource** namespace provides the classes for the Apex Connector Framework. Use the Apex Connector Framework to develop a custom adapter for Salesforce Connect. Then connect your Salesforce organization to any data anywhere via the Salesforce Connect custom adapter.

The following are the classes in the **DataSource** namespace.

**IN THIS SECTION:**

- **AsyncDeleteCallback Class**
  A callback class that the `Database.deleteAsync` method references. Salesforce calls this class after the remote `deleteAsync` operation is completed. This class provides the compensating transaction in the completion context of the delete operation. Extend this class to define the actions to execute after the remote delete operation finishes execution.

- **AsyncSaveCallback Class**
  A callback class that the `Database.insertAsync` or `Database.updateAsync` method references. Salesforce calls this class after the remote operation is completed. This class provides the compensating transaction in the completion context of the insert or update operation. Extend this class to define the actions to execute after the remote insert or update operation finishes execution.

- **AuthenticationCapability Enum**
  Specifies the types of authentication that can be used to access the external system.

- **AuthenticationProtocol Enum**
  Determines what type of credentials are used to authenticate to the external system.

- **Capability Enum**
  Declares which functional operations the external system supports. Also specifies required endpoint settings for the external data source definition.

- **Column Class**
  Describes a column on a `DataSource.Table`. This class extends the `DataSourceUtil` class and inherits its methods.
ColumnSelection Class
Identifies the list of columns to return during a query or search.

Connection Class
Extend this class to enable your Salesforce org to sync the external system’s schema and to handle queries, searches, and write operations (upsert and delete) of the external data. This class extends the DataSourceUtil class and inherits its methods.

ConnectionParams Class
Contains the credentials for authenticating to the external system.

DataSourceUtil Class
Parent class for the DataSource.Provider, DataSource.Connection, DataSource.Table, and DataSource.Column classes.

DataType Enum
Specifies the data types that are supported by the Apex Connector Framework.

DeleteContext Class
An instance of DeleteContext is passed to the deleteRows() method on your Database.Connection class. The class provides context information about the delete request to the implementor of deleteRows().

DeleteResult Class
Represents the result of a delete operation on an sObject record. The result is returned by the DataSource.deleteRows method of the DataSource.Connection class.

Filter Class
Represents a WHERE clause in a SOSL or SOQL query.

FilterType Enum
Referenced by the type property on a DataSource.Filter.

IdentityType Enum
Determines which set of credentials is used to authenticate to the external system.

Order Class
Contains details about how to sort the rows in the result set. Equivalent to an ORDER BY statement in a SOQL query.

OrderDirection Enum
Specifies the direction for sorting rows based on column values.

Provider Class
Extend this base class to create a custom adapter for Salesforce Connect. The class informs Salesforce of the functional and authentication capabilities that are supported by or required to connect to the external system. This class extends the DataSourceUtil class and inherits its methods.

QueryAggregation Enum
Specifies how to aggregate a column in a query.

QueryContext Class
An instance of QueryContext is provided to the query method on your DataSource.Connection class. The instance corresponds to a SOQL request.

QueryUtils Class
Contains helper methods to locally filter, sort, and apply limit and offset clauses to data rows. This helper class is provided for your convenience during early development and tests, but it isn’t supported for use in production environments.

ReadContext Class
Abstract base class for the QueryContext and SearchContext classes.
SearchContext Class
An instance of SearchContext is provided to the search method on your DataSource.Connection class. The instance corresponds to a search or SOSL request.

SearchUtils Class
Helper class for implementing search on a custom adapter for Salesforce Connect.

Table Class
Describes a table on an external system that the Salesforce Connect custom adapter connects to. This class extends the DataSourceUtil class and inherits its methods.

TableResult Class
Contains the results of a search or query.

TableSelection Class
Contains a breakdown of the SOQL or SOSL query. Its properties represent the FROM, ORDER BY, SELECT, and WHERE clauses in the query.

UpsertContext Class
An instance of UpsertContext is passed to the upsertRows() method on your Datasource.Connection class. This class provides context information about the upsert request to the implementor of upsertRows().

UpsertResult Class
Represents the result of an upsert operation on an external object record. The result is returned by the upsertRows method of the DataSource.Connection class.

DataSource Exceptions
The DataSource namespace contains exception classes.

AsyncDeleteCallback Class
A callback class that the Database.deleteAsync method references. Salesforce calls this class after the remote deleteAsync operation is completed. This class provides the compensating transaction in the completion context of the delete operation. Extend this class to define the actions to execute after the remote delete operation finishes execution.

Namespace
DataSource

IN THIS SECTION:
AsyncDeleteCallback Methods

AsyncDeleteCallback Methods
The following are methods for AsyncDeleteCallback.

IN THIS SECTION:
processDelete(deleteResult)
Override this method to define actions that Salesforce executes after a remote Database.deleteAsync operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org.
processDelete(deleteResult)

Override this method to define actions that Salesforce executes after a remote Database.deleteAsync operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org.

Signature

public void processDelete(Database.DeleteResult deleteResult)

Parameters

deleteResult
   Type: Database.DeleteResult
   The result of the asynchronous delete operation.

Return Value

Type: void

AsyncSaveCallback Class

A callback class that the Database.insertAsync or Database.updateAsync method references. Salesforce calls this class after the remote operation is completed. This class provides the compensating transaction in the completion context of the insert or update operation. Extend this class to define the actions to execute after the remote insert or update operation finishes execution.

Namespace

DataSource

IN THIS SECTION:

AsyncSaveCallback Methods

AsyncSaveCallback Methods

The following are methods for AsyncSaveCallback.

IN THIS SECTION:

processSave(saveResult)

Override this method to define actions that Salesforce executes after the remote Database.insertAsync or Database.updateAsync operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org.

processSave (saveResult)

Override this method to define actions that Salesforce executes after the remote Database.insertAsync or Database.updateAsync operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org.
Signature

```java
public void processSave(Database.SaveResult saveResult)
```

Parameters

`saveResult`  
Type: `Database.SaveResult`  
The result of the asynchronous insert or update operation.

Return Value

Type: `void`

**AuthenticationCapability Enum**

Specifies the types of authentication that can be used to access the external system.

**Usage**

The `DataSource.Provider` class returns `DataSource.AuthenticationCapability` enum values. The returned values determine which authentication settings are available on the external data source definition in Salesforce.

If you set up callouts in your `DataSource.Connection` class, you can specify the callout endpoints as named credentials instead of URLs. If you do so for all callouts, return `ANONYMOUS` as the sole entry in the list of data source authentication capabilities. That way, the external data source definition doesn’t require authentication settings. Salesforce manages all authentication for Apex callouts that specify a named credential as the callout endpoint so that your code doesn’t have to.

**Enum Values**

The following are the values of the `DataSource.AuthenticationCapability` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANONYMOUS</td>
<td>No credentials are required to authenticate to the external system.</td>
</tr>
<tr>
<td>BASIC</td>
<td>A username and password can be used to authenticate to the external system.</td>
</tr>
<tr>
<td>CERTIFICATE</td>
<td>A security certificate can be supplied when establishing each connection to the external system.</td>
</tr>
<tr>
<td>OAUTH</td>
<td>OAuth can be used to authenticate to the external system.</td>
</tr>
</tbody>
</table>

**AuthenticationProtocol Enum**

Determines what type of credentials are used to authenticate to the external system.

**Enum Values**

The following are the values of the `DataSource.AuthenticationProtocol` enum.
Capability Enum

Declares which functional operations the external system supports. Also specifies required endpoint settings for the external data source definition.

Usage

The `DataSource.Provider` class returns `DataSource.Capability` enum values, which:

- Specify the functional capabilities of the external system.
- Determine which endpoint settings are available on the external data source definition in Salesforce.

Enum Values

The following are the values of the `DataSource.Capability` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY_PAGINATION_SERVER_DRIVEN</td>
<td>With server-driven paging, the external system determines the page sizes and batch boundaries. The external system’s paging settings can optimize the external system’s performance and improve the load times for external objects in your org. Also, the external data set can change while your users or the Lightning Platform are paging through the result set. Typically, server-driven paging adjusts batch boundaries to accommodate changing data sets more effectively than client-driven paging. If you enable server-driven paging on an external data source, Salesforce ignores the requested page sizes, including the default <code>queryMore()</code> batch size of 500 rows. The pages returned by the external system determine the batches, but each page can’t exceed 2,000 rows. Also, the Apex code must generate a query token and use it to determine and fetch the next batch of results.</td>
</tr>
<tr>
<td>QUERY_TOTAL_SIZE</td>
<td>The external system can provide the total number of rows that meet the query criteria, even when requested to return a smaller batch size. This capability enables you to simplify how you paginate results by using <code>queryMore()</code></td>
</tr>
<tr>
<td>REQUIRE_ENDPOINT</td>
<td>Requires the administrator to specify the endpoint in the URL field in the external data source definition.</td>
</tr>
<tr>
<td>REQUIRE_HTTPS</td>
<td>Requires the endpoint URL to use secure HTTP. If <code>REQUIRE_ENDPOINT</code> isn’t declared, <code>REQUIRE_HTTPS</code> is ignored.</td>
</tr>
<tr>
<td>ROW_CREATE</td>
<td>Allows creating of external data.</td>
</tr>
<tr>
<td>ROW_DELETE</td>
<td>Allows deleting external data.</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ROW_QUERY</td>
<td>Allows API and SOQL queries of the external data. Also allows reports on the external objects.</td>
</tr>
<tr>
<td>ROW_UPDATE</td>
<td>Allows updating external data.</td>
</tr>
<tr>
<td>SEARCH</td>
<td>Allows SOSL and Salesforce searches of the external data.</td>
</tr>
<tr>
<td></td>
<td>When the custom adapter declares the SEARCH capability, you can control which external objects are searchable by selecting or deselecting Allow Search on each external object. However, syncing always overwrites the external object’s search status to match the search status of the external data source. Only text, text area, and long text area fields on external objects can be searched. If an external object has no searchable fields, searches on that object return no records.</td>
</tr>
</tbody>
</table>

Salesforce Help: Validate and Sync an External Data Source

Column Class

Describes a column on a DataSource.Table. This class extends the DataSourceUtil class and inherits its methods.

Namespace

DataSource

Usage

A list of column metadata is provided by the DataSource.Connection class when the sync() method is invoked. Each column can become a field on an external object.

The metadata is stored in Salesforce. Updating the Apex code to return new or updated values for the column metadata doesn’t automatically update the stored metadata in Salesforce.

IN THIS SECTION:
Column Properties
Column Methods

Column Properties

The following are properties for Column.

IN THIS SECTION:
decimalPlaces
If the data type is numeric, the number of decimal places to the right of the decimal point.
description
Description of what the column represents.

filterable
Whether a result set can be filtered based on the values of the column.

label
User-friendly name for the column that appears in the Salesforce user interface.

length
If the column is a string data type, the number of characters in the column. If the column is a numeric data type, the total number of digits on both sides of the decimal point, but excluding the decimal point.

name
Name of the column in the external system.

referenceTargetField
API name of the custom field on the parent object whose values are compared against this column’s values. Matching values identify related records in an indirect lookup relationship. Applies only when the column’s data type is INDIRECT_LOOKUP_TYPE. For other data types, this value is ignored.

referenceTo
API name of the parent object in the relationship that’s represented by this column. Applies only when the column’s data type is LOOKUP_TYPE, EXTERNAL_LOOKUP_TYPE, or INDIRECT_LOOKUP_TYPE. For other data types, this value is ignored.

sortable
Whether a result set can be sorted based on the values of the column via an ORDER BY clause.

type
Data type of the column.

decimalPlaces
If the data type is numeric, the number of decimal places to the right of the decimal point.

Signature
public Integer decimalPlaces {get; set;}

Property Value
Type: Integer

description
Description of what the column represents.

Signature
public String description {get; set;}

Property Value
Type: String
**filterable**
Whether a result set can be filtered based on the values of the column.

**Signature**
```
public Boolean filterable {get; set;}
```

**Property Value**
Type: Boolean

**label**
User-friendly name for the column that appears in the Salesforce user interface.

**Signature**
```
public String label {get; set;}
```

**Property Value**
Type: String

**length**
If the column is a string data type, the number of characters in the column. If the column is a numeric data type, the total number of digits on both sides of the decimal point, but excluding the decimal point.

**Signature**
```
public Integer length {get; set;}
```

**Property Value**
Type: Integer

**name**
Name of the column in the external system.

**Signature**
```
public String name {get; set;}
```

**Property Value**
Type: String
**referenceTargetField**

API name of the custom field on the parent object whose values are compared against this column’s values. Matching values identify related records in an indirect lookup relationship. Applies only when the column’s data type is `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

**Signature**

```java
public String referenceTargetField {get; set;}
```

**Property Value**

Type: `String`

**referenceTo**

API name of the parent object in the relationship that’s represented by this column. Applies only when the column’s data type is `LOOKUP_TYPE`, `EXTERNAL_LOOKUP_TYPE`, or `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

**Signature**

```java
public String referenceTo {get; set;}
```

**Property Value**

Type: `String`

**sortable**

Whether a result set can be sorted based on the values of the column via an `ORDER BY` clause.

**Signature**

```java
public Boolean sortable {get; set;}
```

**Property Value**

Type: `Boolean`

**type**

Data type of the column.

**Signature**

```java
public DataSource.DataType type {get; set;}
```

**Property Value**

Type: `DataSource.DataType`
Column Methods

The following are methods for Column.

IN THIS SECTION:

boolean(name)
Returns a new column of data type BOOLEAN_TYPE.

externalLookup(name, domain)
Returns a new column of data type EXTERNAL_LOOKUP_TYPE.

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces, referenceTo, referenceTargetField)
Returns a new column with the ten specified Column property values.

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces)
Returns a new column with the eight specified Column property values.

get(name, label, description, isSortable, isFilterable, type, length)
Returns a new column with the seven specified Column property values.

indirectLookup(name, domain, targetField)
Returns a new column of data type INDIRECT_LOOKUP_TYPE.

integer(name, length)
Returns a new numeric column with no decimal places using the specified name and length.

lookup(name, domain)
Returns a new column of data type LOOKUP_TYPE.

number(name, length, decimalPlaces)
Returns a new column of data type NUMBER_TYPE.

text(name, label, length)
Returns a new column of data type STRING_SHORT_TYPE or STRING_LONG_TYPE, with the specified name, label, and length.

text(name, length)
Returns a new column of data type STRING_SHORT_TYPE or STRING_LONG_TYPE, with the specified name and length.

text(name)
Returns a new column of data type STRING_SHORT_TYPE with the specified name and the length of 255 characters.

textarea(name)
Returns a new column of data type STRING_LONG_TYPE with the specified name and the length of 32,000 characters.

url(name, length)
Returns a new column of data type URL_TYPE with the specified name and length.

url(name)
Returns a new column of data type URL_TYPE with the specified name and the length of 1,000 characters.

boolean(name)
Returns a new column of data type BOOLEAN_TYPE.
Signature

public static DataSource.Column boolean(String name)

Parameters

name
  Type: String
  Name of the column.

Return Value

Type: DataSource.Column

externalLookup(name, domain)

Returns a new column of data type EXTERNAL_LOOKUP_TYPE.

Signature

public static DataSource.Column externalLookup(String name, String domain)

Parameters

name
  Type: String
  Name of the column.

domain
  Type: String
  API name of the parent object in the external lookup relationship.

Return Value

Type: DataSource.Column

The returned column has these property values.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>name</td>
</tr>
<tr>
<td>label</td>
<td>name</td>
</tr>
<tr>
<td>description</td>
<td>name</td>
</tr>
<tr>
<td>isSortable</td>
<td>true</td>
</tr>
<tr>
<td>isFilterable</td>
<td>true</td>
</tr>
<tr>
<td>type</td>
<td>DataSource.DataType.EXTERNAL_LOOKUP_TYPE</td>
</tr>
<tr>
<td>length</td>
<td>255</td>
</tr>
</tbody>
</table>
get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces, referenceTo, referenceTargetField)

Returns a new column with the ten specified Column property values.

Signature

public static DataSource.Column get(String name, String label, String description, Boolean isSortable, Boolean isFilterable, DataSource.DataType type, Integer length, Integer decimalPlaces, String referenceTo, String referenceTargetField)

Parameters

See Column Properties on page 2114 for information about each parameter.

name
  Type: String

label
  Type: String

description
  Type: String

isSortable
  Type: Boolean

isFilterable
  Type: Boolean

type
  Type: DataSource.DataType

length
  Type: Integer

decimalPlaces
  Type: Integer

referenceTo
  Type: String

referenceTargetField
  Type: String

Return Value

Type: DataSource.Column
get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces)

Returns a new column with the eight specified Column property values.

Signature

public static DataSource.Column get(String name, String label, String description, Boolean isSortable, Boolean isFilterable, DataSource.DataType type, Integer length, Integer decimalPlaces)

Parameters

See Column Properties on page 2114 for information about each parameter.

- name
  Type: String
- label
  Type: String
- description
  Type: String
- isSortable
  Type: Boolean
- isFilterable
  Type: Boolean
- type
  Type: DataSource.DataType
- length
  Type: Integer
- decimalPlaces
  Type: Integer

Return Value

Type: DataSource.Column

get(name, label, description, isSortable, isFilterable, type, length)

Returns a new column with the seven specified Column property values.

Signature

public static DataSource.Column get(String name, String label, String description, Boolean isSortable, Boolean isFilterable, DataSource.DataType type, Integer length)

Parameters

See Column Properties on page 2114 for information about each parameter.
name
  Type: String

label
  Type: String

description
  Type: String

isSortable
  Type: Boolean

isFilterable
  Type: Boolean

type
  Type: DataSource.DataType

length
  Type: Integer

Return Value
  Type: DataSource.Column

indirectLookup(name, domain, targetField)

Returns a new column of data type INDIRECT_LOOKUP_TYPE.

Signature

public static DataSource.Column indirectLookup(String name, String domain, String targetField)

Parameters

name
  Type: String

  Name of the column.

domain
  Type: String

  API name of the parent object in the indirect lookup relationship.

targetField
  Type: String

  API name of the custom field on the parent object whose values are compared against this column’s values. Matching values identify related records in an indirect lookup relationship.

Return Value
  Type: DataSource.Column

The returned column has these property values.
**integer(name, length)**

Returns a new numeric column with no decimal places using the specified name and length.

**Signature**

```java
public static DataSource.Column integer(String name, Integer length)
```

**Parameters**

- **name**
  - Type: `String`
  - The column name.

- **length**
  - Type: `Integer`
  - The column length.

**Return Value**

Type: `DataSource.Column`

**lookup(name, domain)**

Returns a new column of data type `LOOKUP_TYPE`.

**Signature**

```java
public static DataSource.Column lookup(String name, String domain)
```
Parameters

name
Type: String
Name of the column.

domain
Type: String
API name of the parent object in the lookup relationship.

Return Value
Type: DataSource.Column
The returned column has these property values.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>name</td>
</tr>
<tr>
<td>label</td>
<td>name</td>
</tr>
<tr>
<td>description</td>
<td>name</td>
</tr>
<tr>
<td>isSortable</td>
<td>true</td>
</tr>
<tr>
<td>isFilterable</td>
<td>true</td>
</tr>
<tr>
<td>type</td>
<td>DataSource.DataType.LOOKUP_TYPE</td>
</tr>
<tr>
<td>length</td>
<td>255</td>
</tr>
<tr>
<td>decimalPlaces</td>
<td>0</td>
</tr>
<tr>
<td>referenceTo</td>
<td>domain</td>
</tr>
<tr>
<td>referenceTargetField</td>
<td>null</td>
</tr>
</tbody>
</table>

number(name, length, decimalPlaces)
Returns a new column of data type NUMBER_TYPE.

Signature
public static DataSource.Column number(String name, Integer length, Integer decimalPlaces)

Parameters
See Column Properties on page 2114 for information about each parameter.

name
Type: String

length
Type: Integer
decimalPlaces
  Type: Integer

Return Value
Type: DataSource.Column
The returned column has these property values.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>name</td>
</tr>
<tr>
<td>label</td>
<td>name</td>
</tr>
<tr>
<td>description</td>
<td>name</td>
</tr>
<tr>
<td>isSortable</td>
<td>true</td>
</tr>
<tr>
<td>isFilterable</td>
<td>true</td>
</tr>
<tr>
<td>type</td>
<td>DataSource.DataType.NUMBER_TYPE</td>
</tr>
<tr>
<td>length</td>
<td>length</td>
</tr>
<tr>
<td>decimalPlaces</td>
<td>decimalPlaces</td>
</tr>
</tbody>
</table>

text(name, label, length)
Returns a new column of data type STRING_SHORT_TYPE or STRING_LONG_TYPE, with the specified name, label, and length.

Signature
public static DataSource.Column text(String name, String label, Integer length)

Parameters
name
  Type: String
  Name of the column.

label
  Type: String
  User-friendly name for the column that appears in the Salesforce user interface.

length
  Type: Integer
  Number of characters allowed in the column.

Return Value
Type: DataSource.Column
The returned column has these property values.
**text(name, length)**

Returns a new column of data type `STRING_SHORT_TYPE` or `STRING_LONG_TYPE`, with the specified name and length.

**Signature**

```java
public static DataSource.Column text(String name, Integer length)
```

**Parameters**

- **name**
  - Type: `String`
  - Name of the column.

- **length**
  - Type: `Integer`
  - Number of characters allowed in the column.

**Return Value**

Type: `DataSource.Column`

The returned column has these property values.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td><code>name</code></td>
</tr>
<tr>
<td>label</td>
<td><code>label</code></td>
</tr>
<tr>
<td>description</td>
<td><code>label</code></td>
</tr>
<tr>
<td>isSortable</td>
<td>true</td>
</tr>
<tr>
<td>isFilterable</td>
<td>true</td>
</tr>
<tr>
<td>type</td>
<td><code>length</code></td>
</tr>
<tr>
<td>decimalPlaces</td>
<td>0</td>
</tr>
</tbody>
</table>

 DataSource.DataType.STRING_SHORT_TYPE if `length` is 255 or less
 DataSource.DataType.STRING_LONG_TYPE if `length` is greater than 255
**Property** | **Value**
---|---
type | DataSource.DataType.STRING_SHORT_TYPE if length is 255 or less
| DataSource.DataType.STRING_LONG_TYPE if length is greater than 255
length | length
decimalPlaces | 0

**text(name)**

Returns a new column of data type STRING_SHORT_TYPE with the specified name and the length of 255 characters.

**Signature**

```java
public static DataSource.Column text(String name)
```

**Parameters**

- **name**
  - Type: String
  - Name of the column.

**Return Value**

Type: DataSource.Column

The returned column has these property values.

**Property** | **Value**
---|---
name | name
label | name
description | name
isSortable | true
isFilterable | true
type | DataSource.DataType.STRING_SHORT_TYPE
length | 255
decimalPlaces | 0

**textarea(name)**

Returns a new column of data type STRING_LONG_TYPE with the specified name and the length of 32,000 characters.
Signature

public static DataSource.Column textarea(String name)

Parameters

name
Type: String
Name of the column.

Return Value
Type: DataSource.Column
The returned column has these property values.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>name</td>
</tr>
<tr>
<td>label</td>
<td>name</td>
</tr>
<tr>
<td>description</td>
<td>name</td>
</tr>
<tr>
<td>isSortable</td>
<td>true</td>
</tr>
<tr>
<td>isFilterable</td>
<td>true</td>
</tr>
<tr>
<td>type</td>
<td>DataSource.DataType.STRING_LONG_TYPE</td>
</tr>
<tr>
<td>length</td>
<td>32000</td>
</tr>
<tr>
<td>decimalPlaces</td>
<td>0</td>
</tr>
</tbody>
</table>

url(name, length)
Returns a new column of data type URL_TYPE with the specified name and length.

Signature

public static DataSource.Column url(String name, Integer length)

Parameters

name
Type: String
Name of the column.

length
Type: Integer
Number of characters allowed in the column.
Return Value
Type: DataSource.Column
The returned column has these property values.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>name</td>
</tr>
<tr>
<td>label</td>
<td>name</td>
</tr>
<tr>
<td>description</td>
<td>name</td>
</tr>
<tr>
<td>isSortable</td>
<td>true</td>
</tr>
<tr>
<td>isFilterable</td>
<td>true</td>
</tr>
<tr>
<td>type</td>
<td>DataSource.DataType.URL_TYPE</td>
</tr>
<tr>
<td>length</td>
<td>length</td>
</tr>
<tr>
<td>decimalPlaces</td>
<td>0</td>
</tr>
</tbody>
</table>

`url(name)`
Returns a new column of data type `URL_TYPE` with the specified name and the length of 1,000 characters.

Signature

```java
public static DataSource.Column url(String name)
```

Parameters

name
Type: String
Name of the column.

Return Value
Type: DataSource.Column
The returned column has these property values.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>name</td>
</tr>
<tr>
<td>label</td>
<td>name</td>
</tr>
<tr>
<td>description</td>
<td>name</td>
</tr>
<tr>
<td>isSortable</td>
<td>true</td>
</tr>
<tr>
<td>isFilterable</td>
<td>true</td>
</tr>
<tr>
<td>type</td>
<td>DataSource.DataType.URL_TYPE</td>
</tr>
</tbody>
</table>
### ColumnSelection Class

Identifies the list of columns to return during a query or search.

### Namespace

**DataSource Namespace**

### Usage

This class is associated with the `SELECT` clause for a SOQL query, or the `RETURNING` clause for a SOSL query.

### ColumnSelection Properties

The following are properties for `ColumnSelection`.

#### aggregation

How to aggregate the column’s data.

#### columnName

Name of the selected column.

#### tableName

Name of the column’s table.

#### aggregation

How to aggregate the column’s data.

**Signature**

```
public DataSource.QueryAggregation aggregation {get; set;}
```

**Property Value**

Type: `DataSource.QueryAggregation`
**columnName**
Name of the selected column.

**Signature**
```java
public String columnName {get; set;}
```

**Property Value**
Type: String

**tableName**
Name of the column's table.

**Signature**
```java
public String tableName {get; set;}
```

**Property Value**
Type: String

**Connection Class**
Extend this class to enable your Salesforce org to sync the external system's schema and to handle queries, searches, and write operations (upsert and delete) of the external data. This class extends the `DataSourceUtil` class and inherits its methods.

**Namespace**
`DataSource`

**Usage**
Your `DataSource.Connection` and `DataSource.Provider` classes compose a custom adapter for Salesforce Connect. Changing the `sync` method on the `DataSource.Connection` class doesn’t automatically resync any external objects.

**Example**
```java
global class SampleDataSourceConnection extends DataSource.Connection {

global SampleDataSourceConnection(DataSource.ConnectionParams connectionParams) {
}

override global List<DataSource.Table> sync() {
    List<DataSource.Table> tables = new List<DataSource.Table>();
    List<DataSource.Column> columns;
    columns = new List<DataSource.Column>();
    columns.add(DataSource.Column.text('Name', 255));
    columns.add(DataSource.Column.text('ExternalId', 255));
    ```
columns.add(DataSource.Column.url('DisplayUrl'));
tables.add(DataSource.Table.get('Sample', 'Title', columns));
return tables;
}

override global DataSource.TableResult query(DataSource.QueryContext c) {
return DataSource.TableResult.get(c, DataSource.QueryUtils.process(c, getRows()));
}

override global List<DataSource.TableResult> search(DataSource.SearchContext c) {
List<DataSource.TableResult> results = new List<DataSource.TableResult>();
for (DataSource.TableSelection tableSelection : c.tableSelections) {
    results.add(DataSource.TableResult.get(tableSelection, getRows()));
}
return results;

// Helper method to get record values from the external system for the Sample table.
private List<Map<String, Object>> getRows () {
    // Get row field values for the Sample table from the external system via a callout.
    HttpResponse response = makeGetCallout();
    // Parse the JSON response and populate the rows.
    Map<String, Object> m = (Map<String, Object>)JSON.deserializeUntyped(response.getBody());
    Map<String, Object> error = (Map<String, Object>)m.get('error');
    if (error != null) {
        throwException(string.valueOf(error.get('message')));
    }
    List<Map<String, Object>> rows = new List<Map<String, Object>>();
    List<Object> jsonRows = (List<Object>)m.get('value');
    if (jsonRows == null) {
        rows.add(foundRow(m));
    } else {
        for (Object jsonRow : jsonRows) {
            Map<String, Object> row = (Map<String, Object>)jsonRow;
            rows.add(foundRow(row));
        }
    }
    return rows;
}

global override List<DataSource.UpsertResult> upsertRows(DataSource.UpsertContext context) {
if (context.tableSelected == 'Sample') {
    List<DataSource.UpsertResult> results = new List<DataSource.UpsertResult>();
    List<Map<String, Object>> rows = context.rows;
    for (Map<String, Object> row : rows) {
        // Make a callout to insert or update records in the external system.
        HttpResponse response;
        // Determine whether to insert or update a record.
if (row.get('ExternalId') == null) {
    // Send a POST HTTP request to insert new external record.
    // Make an Apex callout and get HttpResponse.
    response = makePostCallout(
        '{"name":"' + row.get('Name') + '","ExternalId":"' + row.get('ExternalId') + '"
    };
}
else {
    // Send a PUT HTTP request to update an existing external record.
    // Make an Apex callout and get HttpResponse.
    response = makePutCallout(
        '{"name":"' + row.get('Name') + '","ExternalId":"' + row.get('ExternalId') + '",
            String.valueOf(row.get('ExternalId')));
    }
    // Check the returned response.
    // First, deserialize it.
    Map<String, Object> m = (Map<String, Object>)JSON.deserializeUntyped(response.getBody());
    if (response.getStatusCode() == 200) {
        results.add(DataSource.UpsertResult.success(String.valueOf(m.get('id'))));
    }
    else {
        results.add(DataSource.UpsertResult.failure( String.valueOf(m.get('id')),
        'The callout resulted in an error: ' + response.getStatusCode()));
    }
}
return results;
return null;
}

global override List<DataSource.DeleteResult> deleteRows(DataSource.DeleteContext context) {
    if (context.tableSelected == 'Sample') {
        List<DataSource.DeleteResult> results = new List<DataSource.DeleteResult>();
        for (String externalId : context.externalIds) {
            HttpResponse response = makeDeleteCallout(externalId);
            if (response.getStatusCode() == 200) {
                results.add(DataSource.DeleteResult.success(externalId));
            }
            else {
                results.add(DataSource.DeleteResult.failure(externalId,
                    'Callout delete error:' + response.getBody()));
            }
        }
        return results;
    }
    return null;
}
Helper methods

// Make a GET callout
private static HttpResponse makeGetCallout() {
    HttpResponse response;
    // Make callout
    // ...
    return response;
}

// Populate a row based on values from the external system.
private Map<String,Object> foundRow(Map<String,Object> foundRow) {
    Map<String,Object> row = new Map<String,Object>();
    row.put('ExternalId', string.valueOf(foundRow.get('Id')));
    row.put('DisplayUrl', string.valueOf(foundRow.get('DisplayUrl')));
    row.put('Name', string.valueOf(foundRow.get('Name')));
    return row;
}

// Make a POST callout
private static HttpResponse makePostCallout(String jsonBody) {
    HttpResponse response;
    // Make callout
    // ...
    return response;
}

// Make a PUT callout
private static HttpResponse makePutCallout(String jsonBody, String externalID) {
    HttpResponse response;
    // Make callout
    // ...
    return response;
}

private static HttpResponse makeDeleteCallout(String externalID) {
    HttpResponse response;
    // Make callout
    // ...
    return response;
}

IN THIS SECTION:

Connection Methods

Connection Methods
The following are methods for Connection.
IN THIS SECTION:

**deleteRows(deleteContext)**
Invoked when external object records are deleted via the Salesforce user interface, APIs, or Apex.

**query(queryContext)**
Invoked by a SOQL query of an external object. A SOQL query is generated and executed when a user visits an external object’s list view or record detail page in Salesforce. Returns the results of the query.

**search(searchContext)**
Invoked by a SOSL query of an external object or when a user performs a Salesforce global search that also searches external objects. Returns the results of the query.

**sync()**
Invoked when an administrator clicks Validate and Sync on the external data source detail page. Returns a list of tables that describe the external system’s schema.

**upsertRows(upsertContext)**
Invoked when external object records are created or updated via the Salesforce user interface, APIs, or Apex.

---

**deleteRows (deleteContext)**
Invoked when external object records are deleted via the Salesforce user interface, APIs, or Apex.

**Signature**

```java
public List<DataSource.DeleteResult> deleteRows(DataSource.DeleteContext deleteContext)
```

**Parameters**

`deleteContext`
Type: `DataSource.DeleteContext`
Contains context information about the delete request.

**Return Value**
Type: `List<DataSource.DeleteResult>`
The results of the delete operation.

---

**query (queryContext)**
Invoked by a SOQL query of an external object. A SOQL query is generated and executed when a user visits an external object’s list view or record detail page in Salesforce. Returns the results of the query.

**Signature**

```java
public DataSource.TableResult query(DataSource.QueryContext queryContext)
```

**Parameters**

`queryContext`
Type: `DataSource.QueryContext`
Represents the query to run against a data table.

**Return Value**

Type: `DataSource.TableResult`

**search(searchContext)**

Invoked by a SOSL query of an external object or when a user performs a Salesforce global search that also searches external objects. Returns the results of the query.

**Signature**

```java
public List<DataSource.TableResult> search(DataSource.SearchContext searchContext)
```

**Parameters**

`searchContext`

Type: `DataSource.SearchContext`

Represents the query to run against an external data table.

**Return Value**

Type: `List<DataSource.TableResult>`

**sync()**

Invoked when an administrator clicks **Validate and Sync** on the external data source detail page. Returns a list of tables that describe the external system’s schema.

**Signature**

```java
public List<DataSource.Table> sync()
```

**Return Value**

Type: `List<DataSource.Table>`

Each returned table can be used to create an external object in Salesforce. On the Validate External Data Source page, the administrator views the list of returned tables and selects which tables to sync. When the administrator clicks **Sync**, an external object is created for each selected table. Each column within the selected tables also becomes a field in the external object.

**upsertRows(upsertContext)**

Invoked when external object records are created or updated via the Salesforce user interface, APIs, or Apex.

**Signature**

```java
public List<DataSource.UpsertResult> upsertRows(DataSource.UpsertContext upsertContext)
```
Parameters

_upsertContext_
Type: `DataSource.UpsertContext`
Contains context information about the upsert request.

Return Value

Type: `List<DataSource.UpsertResult>`
The results of the upsert operation.

ConnectionParams Class
Contains the credentials for authenticating to the external system.

Namespace
`DataSource`

Usage

If your extension of the `DataSource.Provider` class returns `DataSource.AuthenticationCapability` values that indicate support for authentication, the `DataSource.Connection` class is instantiated with a `DataSource.ConnectionParams` instance in the constructor.

The authentication credentials in the `DataSource.ConnectionParams` instance depend on the `Identity Type` field of the external data source definition in Salesforce.

- If `Identity Type` is set to `Named Principal`, the credentials come from the external data source definition.
- If `Identity Type` is set to `Per User`:
  - For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user’s authentication settings for the external system.
  - For administrative connections, such as syncing the external system’s schema, the credentials come from the external data source definition.

The values in this class can appear in debug logs and can be accessed by users who have the “Author Apex” permission. If you require better security, we recommend that you specify named credentials instead of URLs as your Apex callout endpoints. Salesforce manages all authentication for Apex callouts that specify a named credential as the callout endpoint so that your code doesn’t have to.

IN THIS SECTION:

ConnectionParams Properties

ConnectionParams Properties
The following are properties for `ConnectionParams`. 
In this section:

- **certificateName**
  The name of the certificate for establishing each connection to the external system.

- **endpoint**
  The URL of the external system.

- **oauthToken**
  The OAuth token that’s issued by the external system.

- **password**
  The password for authenticating to the external system.

- **principalType**
  An instance of `DataSource.IdentityType`, which determines which set of credentials to use to access the external system.

- **protocol**
  The type of protocol that’s used to authenticate to the external system.

- **repository**
  Reserved for future use.

- **username**
  The username for authenticating to the external system.

**certificateName**
The name of the certificate for establishing each connection to the external system.

**Signature**

```java
public String certificateName {get; set;}
```

**Property Value**

Type: `String`

The value comes from the external data source definition in Salesforce.

**endpoint**
The URL of the external system.

**Signature**

```java
public String endpoint {get; set;}
```

**Property Value**

Type: `String`

The value comes from the external data source definition in Salesforce.
oauthToken
The OAuth token that's issued by the external system.

Signature
public String oauthToken {get; set;}

Property Value
Type: String

password
The password for authenticating to the external system.

Signature
public String password {get; set;}

Property Value
Type: String
The value depends on the Identity Type field of the external data source definition in Salesforce.

• If Identity Type is set to Named Principal, the credentials come from the external data source definition.

• If Identity Type is set to Per User:
  – For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user’s authentication settings for the external system.
  – For administrative connections, such as syncing the external system’s schema, the credentials come from the external data source definition.

principalType
An instance of DataSource.IdentityType, which determines which set of credentials to use to access the external system.

Signature
public DataSource.IdentityType principalType {get; set;}

Property Value
Type: DataSource.IdentityType

protocol
The type of protocol that's used to authenticate to the external system.
**Signature**
```
public DataSource.AuthenticationProtocol protocol {get; set;}
```

**Property Value**
Type: `DataSource.AuthenticationProtocol`

**repository**
Reserved for future use.

**Signature**
```
public String repository {get; set;}
```

**Property Value**
Type: `String`
Reserved for future use.

**username**
The username for authenticating to the external system.

**Signature**
```
public String username {get; set;}
```

**Property Value**
Type: `String`
The value depends on the `Identity Type` field of the external data source definition in Salesforce.

- If `Identity Type` is set to `Named Principal`, the credentials come from the external data source definition.
- If `Identity Type` is set to `Per User`:
  - For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user’s authentication settings for the external system.
  - For administrative connections, such as syncing the external system’s schema, the credentials come from the external data source definition.

**DataSourceUtil Class**
Parent class for the `DataSource.Provider`, `DataSource.Connection`, `DataSource.Table`, and `DataSource.Column` classes.

**Namespace**
`DataSource`
DataSourceUtil Methods

The following are methods for.DataSourceUtil.

logWarning(message)
Logs the error message in the debug log.

Signature
public void logWarning(String message)

Parameters
message
Type: String
The error message.

Return Value
Type: void

throwException(message)
Throws a DataSourceException and displays the provided message to the user.

Signature
public void throwException(String message)

Parameters
message
Type: String
Error message to display to the user.

Return Value
Type: void
DataType Enum

Specifies the data types that are supported by the Apex Connector Framework.

Usage

The `DataSource.DataType` enum is referenced by the `type` property on the `DataSource.Column` class.

Enum Values

The following are the values of the `DataSource.DataType` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOLEAN_TYPE</td>
<td>Boolean</td>
</tr>
<tr>
<td>DATETIME_TYPE</td>
<td>Date/time</td>
</tr>
<tr>
<td>EXTERNAL_LOOKUP_TYPE</td>
<td>External lookup relationship</td>
</tr>
<tr>
<td>INDIRECT_LOOKUP_TYPE</td>
<td>Indirect lookup relationship</td>
</tr>
<tr>
<td>LOOKUP_TYPE</td>
<td>Lookup relationship</td>
</tr>
<tr>
<td>NUMBER_TYPE</td>
<td>Number</td>
</tr>
<tr>
<td>STRING_LONG_TYPE</td>
<td>Long text area</td>
</tr>
<tr>
<td>STRING_SHORT_TYPE</td>
<td>Text area</td>
</tr>
<tr>
<td>URL_TYPE</td>
<td>URL</td>
</tr>
</tbody>
</table>

DeleteContext Class

An instance of `DeleteContext` is passed to the `deleteRows()` method on your `Database.Connection` class. The class provides context information about the delete request to the implementor of `deleteRows()`.

Namespace

`DataSource`

Usage

The Apex Connector Framework creates context for operations. Context is comprised of parameters about the operations, which other methods can use. An instance of the `DeleteContext` class packages these parameters into an object that can be used when a `deleteRows()` operation is initiated.

IN THIS SECTION:

DeleteContext Properties
DeleteContext Properties

The following are properties for DeleteContext.

IN THIS SECTION:

externalIds
The external IDs of the rows representing external object records to delete.

tableSelected
The name of the table to delete rows from.

**externalIds**
The external IDs of the rows representing external object records to delete.

**Signature**

```java
public List<String> externalIds {get; set;}
```

**Property Value**

Type: List<String>

**tableSelected**
The name of the table to delete rows from.

**Signature**

```java
public String tableSelected {get; set;}
```

**Property Value**

Type: String

DeleteResult Class

Represents the result of a delete operation on an sObject record. The result is returned by the `DataSource.deleteRows` method of the `DataSource.Connection` class.

**Namespace**

`DataSource`

**Usage**

A delete operation on external object records generates an array of objects of type `DataSource.DeleteResult`. Its methods create result records that indicate whether the delete operation succeeded or failed.
DeleteResult Properties

The following are properties for DeleteResult.

errorMessage
The error message that’s generated by a failed delete operation. Recorded with a result of type DataSource.DeleteResult.

externalId
The unique identifier of a row that represents an external object record to delete.

success
Indicates whether a delete operation succeeded or failed.

Signature
public String errorMessage {get; set;}

Property Value
Type: String

externalId
The unique identifier of a row that represents an external object record to delete.

Signature
public String externalId {get; set;}

Property Value
Type: String

success
Indicates whether a delete operation succeeded or failed.

Signature
public Boolean success {get; set;}
DeleteResult Methods

The following are methods for `DeleteResult`.

**IN THIS SECTION:**

- `equals(obj)`
  Maintains the integrity of lists of type `DeleteResult` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals` method in Java.

- `failure(externalId, errorMessage)`
  Creates a delete result indicating the failure of a delete request for a given external ID.

- `hashCode()`
  Maintains the integrity of lists of type `DeleteResult` by determining the uniqueness of the external object records in a list.

- `success(externalId)`
  Creates a delete result indicating the successful completion of a delete request for a given external ID.

### equals(obj)

Maintains the integrity of lists of type `DeleteResult` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals` method in Java.

**Signature**

```java
public Boolean equals(Object obj)
```

**Parameters**

- `obj`
  Type: `Object`
  External object whose key is to be validated.

For information about the `equals` method, see Using Custom Types in Map Keys and Sets.

**Return Value**

Type: `Boolean`

### failure(externalId, errorMessage)

Creates a delete result indicating the failure of a delete request for a given external ID.

**Signature**

```java
public static DataSource.DeleteResult failure(String externalId, String errorMessage)
```
Parameters

- **externalId**
  - Type: `String`
  - The unique identifier of the sObject record to delete.

- **errorMessage**
  - Type: `String`
  - The reason the delete operation failed.

Return Value

- Type: `DataSource.DeleteResult`
  - Status result of the delete operation.

**hashCode()**

Maintains the integrity of lists of type `DeleteResult` by determining the uniqueness of the external object records in a list.

**Signature**

```java
public Integer hashCode()
```

**Return Value**

- Type: `Integer`

**success(externalId)**

Creates a delete result indicating the successful completion of a delete request for a given external ID.

**Signature**

```java
public static DataSource.DeleteResult success(String externalId)
```

**Parameters**

- **externalId**
  - Type: `String`
  - The unique identifier of the sObject record to delete.

**Return Value**

- Type: `DataSource.DeleteResult`
  - Status result of the delete operation for the sObject with the given external ID.

**Filter Class**

Represents a `WHERE` clause in a SOSL or SOQL query.
Namespace
DataSource

Usage
Compound types require child filters. Specifically, the subfilters property can’t be null if the type property is NOT_, AND_, or OR_.

IN THIS SECTION:
Filter Properties

Filter Properties
The following are properties for Filter.

IN THIS SECTION:
columnName
Name of the column that’s being evaluated in a simple comparative type of filter.
columnValue
Value that the filter compares records against in a simple comparative type of filter.
subfilters
List of subfilters for compound filter types, such as NOT_, AND_, and OR_.
tableName
Name of the table whose column is being evaluated in a simple comparative type of filter.
type
Type of filter operation that limits the returned data.

columnName
Name of the column that’s being evaluated in a simple comparative type of filter.

Signature
public String columnName {get; set;}

Property Value
Type: String

columnValue
Value that the filter compares records against in a simple comparative type of filter.
Signature
public Object columnValue {get; set;}

Property Value
Type: Object

subfilters
List of subfilters for compound filter types, such as NOT_, AND_, and OR_.

Signature
public List<DataSource.Filter> subfilters {get; set;}

Property Value
Type: List<DataSource.Filter>

tableName
Name of the table whose column is being evaluated in a simple comparative type of filter.

Signature
public String tableName {get; set;}

Property Value
Type: String

type
Type of filter operation that limits the returned data.

Signature
public DataSource.FilterType type {get; set;}

Property Value
Type: DataSource.FilterType

FilterType Enum
Referenced by the type property on a DataSource.Filter.

Usage
Determines how to limit the returned data.
Enum Values

The following are the values of the `DataSource.FilterType` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AND</td>
<td>This compound filter type returns all rows that match all the subfilters.</td>
</tr>
<tr>
<td>CONTAINS</td>
<td>Simple comparative filter type.</td>
</tr>
<tr>
<td>ENDS_WITH</td>
<td>Simple comparative filter type.</td>
</tr>
<tr>
<td>EQUALS</td>
<td>Simple comparative filter type.</td>
</tr>
<tr>
<td>GREATER_THAN</td>
<td>Simple comparative filter type.</td>
</tr>
<tr>
<td>GREATER_THAN_OR_EQUAL_TO</td>
<td>Simple comparative filter type.</td>
</tr>
<tr>
<td>LESS_THAN</td>
<td>Simple comparative filter type.</td>
</tr>
<tr>
<td>LESS_THAN_OR_EQUAL_TO</td>
<td>Simple comparative filter type.</td>
</tr>
<tr>
<td>LIKE</td>
<td>Simple comparative filter type.</td>
</tr>
<tr>
<td>NOT</td>
<td>This compound filter type returns the rows that don’t match the subfilter.</td>
</tr>
<tr>
<td>NOT_EQUALS</td>
<td>Simple comparative filter type.</td>
</tr>
<tr>
<td>OR</td>
<td>This compound filter type returns all rows that match any of the subfilters.</td>
</tr>
<tr>
<td>STARTS_WITH</td>
<td>Simple comparative filter type.</td>
</tr>
</tbody>
</table>

IdentityType Enum

Determines which set of credentials is used to authenticate to the external system.

Usage

The relevant credentials are passed to your `DataSource.Connection` class.

Enum Values

The following are the values of the `DataSource.IdentityType` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANONYMOUS</td>
<td>No credentials are used to authenticate to the external system.</td>
</tr>
<tr>
<td>NAMED_USER</td>
<td>The credentials in the external data source definition are used to authenticate to the external system, regardless of which user is accessing the external data from your organization.</td>
</tr>
</tbody>
</table>
For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user’s authentication settings for the external system.

For administrative connections, such as syncing the external system’s schema, the credentials come from the external data source definition.

### Order Class

Contains details about how to sort the rows in the result set. Equivalent to an ORDER BY statement in a SOQL query.

### Namespace

**DataSource**

### Usage

Used in the `order` property on the `DataSource.TableSelection` class.

### Order Properties

The following are properties for `Order`.

#### columnName

Name of the column whose values are used to sort the rows in the result set.

#### direction

Direction for sorting rows based on column values.

#### tableName

Name of the table whose column values are used to sort the rows in the result set.

#### columnName

Name of the column whose values are used to sort the rows in the result set.

### Signature

```java
public String columnName {get; set;}
```
Property Value
type: String

direction
Direction for sorting rows based on column values.

Signature
public DataSource.OrderDirection direction {get; set;}

Property Value
type: DataSource.OrderDirection

tableName
Name of the table whose column values are used to sort the rows in the result set.

Signature
public String tableName {get; set;}

Property Value
type: String

Order Methods
The following are methods for Order.

IN THIS SECTION:
get(tableName, columnName, direction)
Creates an instance of the DataSource.Order class.

get(tableName, columnName, direction)
Creates an instance of the DataSource.Order class.

Signature
public static DataSource.Order get(String tableName, String columnName, DataSource.OrderDirection direction)

Parameters
tableName
type: String
Name of the table whose column values are used to sort the rows in the result set.
**columnName**
Type: String
Name of the column whose values are used to sort the rows in the result set.

**direction**
Type: DataSource.OrderDirection
Direction for sorting rows based on column values.

**Return Value**
Type: DataSource.Order

**OrderDirection Enum**
Specifies the direction for sorting rows based on column values.

**Usage**
Used by the direction property on the DataSource.Order class.

**Enum Values**
The following are the values of the DataSource.OrderDirection enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASCENDING</td>
<td>Sort rows in ascending order (A–Z).</td>
</tr>
<tr>
<td>DESCENDING</td>
<td>Sort rows in descending order (Z–A).</td>
</tr>
</tbody>
</table>

**Provider Class**
Extend this base class to create a custom adapter for Salesforce Connect. The class informs Salesforce of the functional and authentication capabilities that are supported by or required to connect to the external system. This class extends the DataSourceUtil class and inherits its methods.

**Namespace**
DataSource

**Usage**
Create an Apex class that extends DataSource.Provider to specify the following.

- The types of authentication that can be used to access the external system
- The features that are supported for the connection to the external system
- The Apex class that extends DataSource.Connection to sync the external system’s schema and to handle the queries and searches of the external data
The values that are returned by the `DataSource.Provider` class determine which settings are available in the external data source definition in Salesforce. To access the external data source definition from Setup, enter `External Data Sources` in the Quick Find box, then select `External Data Sources`.

**IN THIS SECTION:**

**Provider Methods**

The following are methods for `Provider`.

**IN THIS SECTION:**

- `getAuthenticationCapabilities()`
  Returns the types of authentication that can be used to access the external system.

- `getCapabilities()`
  Returns the functional operations that the external system supports and the required endpoint settings for the external data source definition in Salesforce.

- `getConnection(connectionParams)`
  Returns a connection that points to an instance of the external data source.

---

**getAuthenticationCapabilities()**

Returns the types of authentication that can be used to access the external system.

**Signature**

```java
public List<DataSource.AuthenticationCapability> getAuthenticationCapabilities()
```

**Return Value**

Type: `List<DataSource.AuthenticationCapability>`

---

**getCapabilities()**

Returns the functional operations that the external system supports and the required endpoint settings for the external data source definition in Salesforce.

**Signature**

```java
public List<DataSource.Capability> getCapabilities()
```

**Return Value**

Type: `List<DataSource.Capability>`
getConnection(connectionParams)

Returns a connection that points to an instance of the external data source.

**Signature**

```
public DataSource.Connection getConnection(DataSource.ConnectionParams connectionParams)
```

**Parameters**

- `connectionParams`  
  
  **Type:** DataSource.ConnectionParams  
  
  Credentials for authenticating to the external system.

**Return Value**

- **Type:** DataSource.Connection

**QueryAggregation Enum**

Specifies how to aggregate a column in a query.

**Usage**

Used by the `aggregation` property on the DataSource.ColumnSelection class.

**Enum Values**

The following are the values of the `DataSource.QueryAggregation` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVG</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>COUNT</td>
<td>Returns the number of rows that meet the query criteria.</td>
</tr>
<tr>
<td>MAX</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>MIN</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>NONE</td>
<td>No aggregation.</td>
</tr>
<tr>
<td>SUM</td>
<td>Reserved for future use.</td>
</tr>
</tbody>
</table>

**QueryContext Class**

An instance of `QueryContext` is provided to the `query` method on your `DataSource.Connection` class. The instance corresponds to a SOQL request.
Namespace

DataSource

IN THIS SECTION:
QueryContext Properties
QueryContext Methods

QueryContext Properties
The following are properties for QueryContext.

IN THIS SECTION:
queryMoreToken
Query token that’s used for server-driven paging to determine and fetch the subsequent batch of results.
tableSelection
Query details that represent the FROM, ORDER BY, SELECT, and WHERE clauses in a SOQL or SOSL query.

queryMoreToken
Query token that’s used for server-driven paging to determine and fetch the subsequent batch of results.

Signature
public String queryMoreToken {get; set;}

Property Value
Type: String

tableSelection
Query details that represent the FROM, ORDER BY, SELECT, and WHERE clauses in a SOQL or SOSL query.

Signature
public DataSource.TableSelection tableSelection {get; set;}

Property Value
Type: DataSource.TableSelection

QueryContext Methods
The following are methods for QueryContext.
IN THIS SECTION:

get(metadata, offset, maxResults, tableSelection)
Creates an instance of the QueryContext class.

get(metadata, offset, maxResults, tableSelection)
Creates an instance of the QueryContext class.

Signature

public static DataSource.QueryContext get(List<DataSource.Table> metadata, Integer offset, Integer maxResults, DataSource.TableSelection tableSelection)

Parameters

metadata
Type: List<DataSource.Table>
List of table metadata that describes the external system’s tables to query.

dataoffset
Type: Integer
Used for client-driven paging. Specifies the starting row offset into the query’s result set.

maxResults
Type: Integer
Used for client-driven paging. Specifies the maximum number of rows to return in each batch.

tableSelection
Type: DataSource.TableSelection
Query details that represent the FROM, ORDER BY, SELECT, and WHERE clauses in a SOQL or SOSL query.

Return Value

Type: DataSource.QueryContext

QueryUtils Class

Contains helper methods to locally filter, sort, and apply limit and offset clauses to data rows. This helper class is provided for your convenience during early development and tests, but it isn’t supported for use in production environments.

Namespace

DataSource

Usage

The DataSource.QueryUtils class and its helper methods can process query results locally within your Salesforce org. This class is provided for your convenience to simplify the development of your Salesforce Connect custom adapter for initial tests. However, the DataSource.QueryUtils class and its methods aren’t supported for use in production environments that use callouts to retrieve...
data from external systems. Complete the filtering and sorting on the external system before sending the query results to Salesforce. When possible, use server-driven paging or another technique to have the external system determine the appropriate data subsets according to the limit and offset clauses in the query.

IN THIS SECTION:

QueryUtils Methods

QueryUtils Methods

The following are methods for QueryUtils.

IN THIS SECTION:

applyLimitAndOffset(queryContext, rows)

Returns a subset of data rows after locally applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn’t supported for use in production environments.

filter(queryContext, rows)

Returns a subset of data rows after locally ordering and applying filters from the query. This helper method is provided for your convenience during early development and tests, but it isn’t supported for use in production environments.

process(queryContext, rows)

Returns data rows after locally filtering, sorting, ordering, and applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn’t supported for use in production environments.

sort(queryContext, rows)

Returns data rows after locally sorting and applying the order from the query. This helper method is provided for your convenience during early development and tests, but it isn’t supported for use in production environments.

applyLimitAndOffset(queryContext, rows)

Returns a subset of data rows after locally applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn’t supported for use in production environments.

Signature

public static List<Map<String, Object>> applyLimitAndOffset(DataSource.QueryContext queryContext, List<Map<String, Object>> rows)

Parameters

queryContext

  Type: DataSource.QueryContext

  Represents the query to run against a data table.

rows

  Type: List<Map<String, Object>>

  Rows of data.
Return Value
Type: List<Map<String, Object>>

**filter** (queryContext, rows)
Returns a subset of data rows after locally ordering and applying filters from the query. This helper method is provided for your convenience during early development and tests, but it isn’t supported for use in production environments.

**Signature**

```java
public static List<Map<String, Object>> filter(DataSource.QueryContext queryContext, List<Map<String, Object>> rows)
```

**Parameters**

- **queryContext**
  Type: DataSource.QueryContext
- **rows**
  Type: List<Map<String, Object>>

  Rows of data.

Return Value
Type: List<Map<String, Object>>

**process** (queryContext, rows)
Returns data rows after locally filtering, sorting, ordering, and applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn’t supported for use in production environments.

**Signature**

```java
public static List<Map<String, Object>> process(DataSource.QueryContext queryContext, List<Map<String, Object>> rows)
```

**Parameters**

- **queryContext**
  Type: DataSource.QueryContext
  Represents the query to run against a data table.
- **rows**
  Type: List<Map<String, Object>>

  Rows of data.

Return Value
Type: List<Map<String, Object>>
sort(queryContext, rows)
Returns data rows after locally sorting and applying the order from the query. This helper method is provided for your convenience during early development and tests, but it isn’t supported for use in production environments.

Signature
public static List<Map<String, Object>> sort(DataSource.QueryContext queryContext, List<Map<String, Object>> rows)

Parameters
queryContext
Type: DataSource.QueryContext
Represents the query to run against a data table.

rows
Type: List<Map<String, Object>>
Rows of data.

Return Value
Type: List<Map<String, Object>>

ReadContext Class
Abstract base class for the QueryContext and SearchContext classes.

Namespace
DataSource

IN THIS SECTION:
ReadContext Properties

ReadContext Properties
The following are properties for ReadContext.

IN THIS SECTION:
maxResults
Maximum number of rows that the query can return.
metadata
Describes the external system’s tables to query.
offset
The starting row offset into the query’s result set. Used for client-driven paging.
**maxResults**
Maximum number of rows that the query can return.

**Signature**
```java
public Integer maxResults {get; set;}
```

**Property Value**
Type: Integer

**metadata**
Describes the external system’s tables to query.

**Signature**
```java
public List<DataSource.Table> metadata {get; set;}
```

**Property Value**
Type: List<DataSource.Table>

**offset**
The starting row offset into the query’s result set. Used for client-driven paging.

**Signature**
```java
public Integer offset {get; set;}
```

**Property Value**
Type: Integer

**SearchContext Class**

An instance of SearchContext is provided to the search method on your DataSource.Connection class. The instance corresponds to a search or SOSL request.

**Namespace**
```
DataSource
```

IN THIS SECTION:
- SearchContext Constructors
- SearchContext Properties
SearchContext Constructors

The following are constructors for SearchContext.

IN THIS SECTION:

SearchContext(metadata, offset, maxResults, tableSelections, searchPhrase)
Creates an instance of the SearchContext class with the specified parameter values.

SearchContext()
Creates an instance of the SearchContext class.

SearchContext (metadata, offset, maxResults, tableSelections, searchPhrase)
Creates an instance of the SearchContext class with the specified parameter values.

Signature

public SearchContext(List<DataSource.Table> metadata, Integer offset, Integer maxResults, List<DataSource.TableSelection> tableSelections, String searchPhrase)

Parameters

metadata
Type: List<DataSource.Table>
List of table metadata that describes the external system’s tables to query.

offset
Type: Integer
Specifies the starting row offset into the query’s result set.

maxResults
Type: Integer
Specifies the maximum number of rows to return in each batch.

tableSelections
Type: List<DataSource.TableSelection>
List of queries and their details. The details represent the FROM, ORDER BY, SELECT, and WHERE clauses in each SOQL or SOSL query.

searchPhrase
Type: String
The user-entered search string as a case-sensitive single phrase, with all non-alphanumeric characters removed.

SearchContext ()
Creates an instance of the SearchContext class.

Signature

public SearchContext ()
SearchContext Properties

The following are properties for SearchContext.

**IN THIS SECTION:**

**searchPhrase**

The user-entered search string as a case-sensitive single phrase, with all non-alphanumeric characters removed.

**tableSelections**

List of queries and their details. The details represent the FROM, ORDER BY, SELECT, and WHERE clauses in each SOQL or SOSL query.

**SearchPhrase**

The user-entered search string as a case-sensitive single phrase, with all non-alphanumeric characters removed.

**Signature**

```java
public String searchPhrase {get; set;}
```

**Property Value**

Type: String

**tableSelections**

List of queries and their details. The details represent the FROM, ORDER BY, SELECT, and WHERE clauses in each SOQL or SOSL query.

**Signature**

```java
public List<DataSource.TableSelection> tableSelections {get; set;}
```

**Property Value**

Type: List<DataSource.TableSelection>

**SearchUtils Class**

Helper class for implementing search on a custom adapter for Salesforce Connect.

**Namespace**

DataSource

**Usage**

We recommend that you develop your own search implementation that can search columns in addition to the designated name field.

**IN THIS SECTION:**

**SearchUtils Methods**
SearchUtils Methods

The following are methods for SearchUtils.

IN THIS SECTION:

searchByName(searchDetails, connection)

Queries all the tables and returns each row whose designated name field contains the search phrase.

searchByName(searchDetails, connection)

Queries all the tables and returns each row whose designated name field contains the search phrase.

**Signature**

`public static List<DataSource.TableResult> searchByName(DataSource.SearchContext searchDetails, DataSource.Connection connection)`

**Parameters**

- `searchDetails`
  Type: `DataSource.SearchContext`
  The `SearchContext` class that specifies which data to search and what to search for.

- `connection`
  Type: `DataSource.Connection`
  The `DataSource.Connection` class that connects to the external system.

**Return Value**

Type: `List<DataSource.TableResult>`

**Table Class**

Describes a table on an external system that the Salesforce Connect custom adapter connects to. This class extends the `DataSourceUtil` class and inherits its methods.

**Namespace**

`DataSource`

**Usage**

A list of table metadata is provided by the `DataSource.Connection` class when the `sync()` method is invoked. Each table can become an external object in Salesforce.

The metadata is stored in Salesforce. Updating the Apex code to return new or updated values for the table metadata doesn’t automatically update the stored metadata in Salesforce.
Table Properties

The following are properties for Table.

IN THIS SECTION:

columns
List of table columns.

description
Description of what the table represents.

description
Plural form of the user-friendly name for the table. The labelPlural becomes the object's plural label in the Salesforce user interface.

description
Singular form of the user-friendly name for the table. The labelSingular becomes the object label in the Salesforce user interface. We recommend that you make object labels unique across all standard, custom, and external objects in the org.

name
Name of the table on the external system.

nameColumn
Name of the table column that becomes the name field of the external object when the administrator syncs the table.

columns
List of table columns.

Signature

public List<DataSource.Column> columns {get; set;}

Property Value

Type: List<DataSource.Column>

description
Description of what the table represents.

Signature

public String description {get; set;
Property Value
Type: String

**labelPlural**
Plural form of the user-friendly name for the table. The `labelPlural` becomes the object's plural label in the Salesforce user interface.

**Signature**

```java
public String labelPlural {get; set;}
```

Property Value
Type: String

**labelSingular**
Singular form of the user-friendly name for the table. The `labelSingular` becomes the object label in the Salesforce user interface. We recommend that you make object labels unique across all standard, custom, and external objects in the org.

**Signature**

```java
public String labelSingular {get; set;}
```

Property Value
Type: String

**name**
Name of the table on the external system.

**Signature**

```java
public String name {get; set;}
```

Property Value
Type: String

**nameColumn**
Name of the table column that becomes the name field of the external object when the administrator syncs the table.

**Signature**

```java
public String nameColumn {get; set;}
```
Property Value
Type: String

Table Methods
The following are methods for Table.

IN THIS SECTION:

get(name, labelSingular, labelPlural, description, nameColumn, columns)
Returns the table metadata with the specified parameter values.

get(name, nameColumn, columns)
Returns the table metadata with the specified parameter values, using the name for the labels and description.

get(name, labelSingular, labelPlural, description, nameColumn, columns)
Returns the table metadata with the specified parameter values.

Signature
public static DataSource.Table get(String name, String labelSingular, String labelPlural, String description, String nameColumn, List<DataSource.Column> columns)

Parameters

name
Type: String
Name of the external table.

labelSingular
Type: String
Singular form of the user-friendly name for the table. The labelSingular becomes the object label in the Salesforce user interface.

labelPlural
Type: String
Plural form of the user-friendly name for the table. The labelPlural becomes the object’s plural label in the Salesforce user interface.

description
Type: String
Description of the external table.

nameColumn
Type: String
Name of the table column that becomes the name field of the external object when the administrator syncs the table.

columns
Type: List<DataSource.Column>
List of table columns.
Return Value
Type: DataSource.Table

get(name, nameColumn, columns)
Returns the table metadata with the specified parameter values, using the name for the labels and description.

Signature
public static DataSource.Table get(String name, String nameColumn, List<DataSource.Column> columns)

Parameters
name
Type: String
Name of the external table.

nameColumn
Type: String
Name of the table column that becomes the name field of the external object when the administrator syncs the table.

columns
Type: List<DataSource.Column>
List of table columns.

Return Value
Type: DataSource.Table
The returned table metadata has these property values.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>name</td>
</tr>
<tr>
<td>labelSingular</td>
<td>name</td>
</tr>
<tr>
<td>labelPlural</td>
<td>name</td>
</tr>
<tr>
<td>description</td>
<td>name</td>
</tr>
<tr>
<td>nameColumn</td>
<td>nameColumn</td>
</tr>
<tr>
<td>columns</td>
<td>columns</td>
</tr>
</tbody>
</table>

TableResult Class
Contains the results of a search or query.
Namespace

**DataSource**

IN THIS SECTION:

- **TableResult Properties**
- **TableResult Methods**

**TableResult Properties**

The following are properties for TableResult.

IN THIS SECTION:

- **errorMessage**
- **errorMessage**
- **queryMoreToken**
  
  Query token that's used for server-driven paging to determine and fetch the subsequent batch of results. This token is passed back to the Apex data source on subsequent queries in the `queryMoreToken` property on the `QueryContext`.

- **rows**
  
  Rows of data.

- **success**
  
  Whether the search or query was successful.

- **tableName**
  
  Name of the table that was queried.

- **totalSize**
  
  The total number of rows that meet the query criteria, even when the external system is requested to return a smaller batch size.

**errorMessage**

errorMessage

**Signature**

```java
public String errorMessage {get; set;}
```

**Property Value**

Type: **String**

**queryMoreToken**

Query token that's used for server-driven paging to determine and fetch the subsequent batch of results. This token is passed back to the Apex data source on subsequent queries in the `queryMoreToken` property on the `QueryContext`. 
Signature
public String queryMoreToken {get; set;}

Property Value
Type: String

rows
Rows of data.

Signature
public List<Map<String, Object>> rows {get; set;}

Property Value
Type: List<Map<String, Object>>

success
Whether the search or query was successful.

Signature
public Boolean success {get; set;}

Property Value
Type: Boolean

tableName
Name of the table that was queried.

Signature
public String tableName {get; set;}

Property Value
Type: String

totalSize
The total number of rows that meet the query criteria, even when the external system is requested to return a smaller batch size.

Signature
public Integer totalSize {get; set;}
**Property Value**

Type: Integer

**TableResult Methods**

The following are methods for `TableResult`.

**IN THIS SECTION:**

- `error(errorMessage)`
  Returns failed search or query results with the provided error message.
- `get(success, errorMessage, tableName, rows, totalSize)`
  Returns a subset of data rows in a `TableResult` with the provided property values and the number of rows in the table.
- `get(success, errorMessage, tableName, rows)`
  Returns a subset of data rows in a `TableResult` with the provided property values.
- `get(queryContext, rows)`
  Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.
- `get(tableSelection, rows)`
  Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.

**error(errorMessage)**

Returns failed search or query results with the provided error message.

**Signature**

```java
public static DataSource.TableResult error(String errorMessage)
```

**Parameters**

- `errorMessage`
  Type: String
  errorMessage

**Return Value**

Type: `DataSource.TableResult`

The returned `TableResult` has these property values.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>false</td>
</tr>
<tr>
<td>errorMessage</td>
<td><code>errorMessage</code></td>
</tr>
<tr>
<td>tableName</td>
<td>null</td>
</tr>
<tr>
<td>rows</td>
<td>null</td>
</tr>
</tbody>
</table>
get(success, errorMessage, tableName, rows, totalSize)

Returns a subset of data rows in a TableResult with the provided property values and the number of rows in the table.

Signature

```java
public static DataSource.TableResult get(Boolean success, String errorMessage, String tableName, List<Map<String, Object>> rows, Integer totalSize)
```

Parameters

- **success**
  - Type: Boolean
  - Whether the search or query was successful.
- **errorMessage**
  - Type: String
  - errorMessage
- **tableName**
  - Type: String
  - Name of the table that was queried.
- **rows**
  - Type: List<Map<String, Object>>
  - Rows of data.
- **totalSize**
  - Type: Integer
  - The total number of rows that meet the query criteria, even when the external system is requested to return a smaller batch size.

Return Value

Type: DataSource.TableResult

get(success, errorMessage, tableName, rows)

Returns a subset of data rows in a TableResult with the provided property values.

Signature

```java
public static DataSource.TableResult get(Boolean success, String errorMessage, String tableName, List<Map<String, Object>> rows)
```
Parameters

success
  Type: Boolean
  Whether the search or query was successful.

errorMessage
  Type: String

tableName
  Type: String
  Name of the table that was queried.

rows
  Type: List<Map<String, Object>>
  Rows of data.

Return Value
Type: DataSource.TableResult

get(queryContext, rows)
Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a TableResult.

Signature
public static DataSource.TableResult get(DataSource.QueryContext queryContext, List<Map<String, Object>> rows)

Parameters

queryContext
  Type: DataSource.QueryContext
  Represents the query to run against a data table.

rows
  Type: List<Map<String, Object>>
  Rows of data.

Return Value
Type: DataSource.TableResult

get(tableName, rows)
Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a TableResult.
Signature

public static DataSource.TableResult get(DataSource.TableSelection tableSelection, List<Map<String, Object>> rows)

Parameters

   tableSelection
     Type: DataSource.TableSelection
     Query details that represent the FROM, ORDER BY, SELECT, and WHERE clauses in a SOQL or SOSL query.

   rows
     Type: List<Map<String, Object>>
     Rows of data.

Return Value

Type: DataSource.TableResult

TableSelection Class

Contains a breakdown of the SOQL or SOSL query. Its properties represent the FROM, ORDER BY, SELECT, and WHERE clauses in the query.

Namespace

DataSource

IN THIS SECTION:
   TableSelection Properties

TableSelection Properties

The following are properties for TableSelection.

IN THIS SECTION:
   columnsSelected
     List of columns to query. Corresponds to the SELECT clause in a SOQL or SOSL query.

   filter
     Identifies the query filter, which can be a compound filter that has a list of subfilters. The filter corresponds to the WHERE clause in a SOQL or SOSL query.

   order
     Identifies the order for sorting the query results. Corresponds to the ORDER BY clause in a SOQL or SOSL query.

   tableSelected
     Name of the table to query. Corresponds to the FROM clause in a SOQL or SOSL query.
**columnsSelected**
List of columns to query. Corresponds to the **SELECT** clause in a SOQL or SOSL query.

**Signature**
```csharp
public List<DataSource.ColumnSelection> columnsSelected {get; set;}
```

**Property Value**
Type: List<DataSource.ColumnSelection>

**filter**
Identifies the query filter, which can be a compound filter that has a list of subfilters. The filter corresponds to the **WHERE** clause in a SOQL or SOSL query.

**Signature**
```csharp
public DataSource.Filter filter {get; set;}
```

**Property Value**
Type: DataSource.Filter

**order**
Identifies the order for sorting the query results. Corresponds to the **ORDER BY** clause in a SOQL or SOSL query.

**Signature**
```csharp
public List<DataSource.Order> order {get; set;}
```

**Property Value**
Type: List<DataSource.Order>

**tableSelected**
Name of the table to query. Corresponds to the **FROM** clause in a SOQL or SOSL query.

**Signature**
```csharp
public String tableSelected {get; set;}
```

**Property Value**
Type: String
UpsertContext Class

An instance of ` UpsertContext` is passed to the `upsertRows()` method on your `Datasource.Connection` class. This class provides context information about the upsert request to the implementor of `upsertRows()`.

Namespace

`DataSource`

Usage

The Apex Connector Framework creates the context for operations. Context is comprised of parameters about the operations, which other methods can use. An instance of the `UpsertContext` class packages these parameters into an object that can be used when an `upsertRows()` operation is initiated.

IN THIS SECTION:

- `UpsertContext Properties`

UpsertContext Properties

The following are properties for `UpsertContext`.

IN THIS SECTION:

- `rows`
- `tableSelected`

(rows)

List of rows corresponding to the external object records to upsert.

(tableSelected)

The name of the table to upsert rows in.

(rows)

List of rows corresponding to the external object records to upsert.

Signature

```java
public List<Map<String,ANY>> rows {get; set;}
```

Property Value

Type: `List<Map<String,object>>`

(tableSelected)

The name of the table to upsert rows in.

Signature

```java
public String tableSelected {get; set;}
```
UpsertResult Class

Represents the result of an upsert operation on an external object record. The result is returned by the upsertRows method of the DataSource.Connection class.

Namespace

DataSource

Usage

An upsert operation on external object records generates an array of objects of type DataSource.UpsertResult. Its methods create result records that indicate whether the upsert operation succeeded or failed.

IN THIS SECTION:

UpsertResult Properties

UpsertResult Methods

UpsertResult Properties

The following are properties for UpsertResult.

IN THIS SECTION:

errorMessage

The error message that's generated by a failed upsert operation.

externalId

The unique identifier of a row that represents an external object record to upsert.

success

Indicates whether a delete operation succeeded or failed.

errorMessage

The error message that's generated by a failed upsert operation.

Signature

public String errorMessage {get; set;}

Property Value

Type: String
**externalId**
The unique identifier of a row that represents an external object record to upsert.

**Signature**
```java
public String externalId {get; set;}
```

**Property Value**
Type: String

**success**
Indicates whether a delete operation succeeded or failed.

**Signature**
```java
public Boolean success {get; set;}
```

**Property Value**
Type: Boolean

**UpsertResult Methods**
The following are methods for UpsertResult.

**IN THIS SECTION:**
- `equals(obj)`
  Maintains the integrity of lists of type UpsertResult by determining the equality of external object records in a list. This method is dynamic and is based on the `equals` method in Java.
- `failure(externalId, errorMessage)`
  Creates an upsert result that indicates the failure of a delete request for a given external ID.
- `hashCode()`
  Maintains the integrity of lists of type UpsertResult by determining the uniqueness of the external object records in a list.
- `success(externalId)`
  Creates a delete result that indicates the successful completion of an upsert request for a given external ID.

**equals(obj)**
Maintains the integrity of lists of type UpsertResult by determining the equality of external object records in a list. This method is dynamic and is based on the `equals` method in Java.

**Signature**
```java
public Boolean equals(Object obj)
```
Parameters

**obj**
Type: Object
External object whose key is to be validated.

Return Value
Type: Boolean

**failure(externalId, errorMessage)**
Creates an upsert result that indicates the failure of a delete request for a given external ID.

Signature

```
public static DataSource.UpsertResult failure(String externalId, String errorMessage)
```

Parameters

- **externalId**
  Type: String
  The unique identifier of the external object record to upsert.

- **errorMessage**
  Type: String
  The reason the upsert operation failed.

Return Value
Type: DataSource.UpsertResult
Status result for the upsert operation.

**hashCode()**

Maintains the integrity of lists of type UpsertResult by determining the uniqueness of the external object records in a list.

Signature

```
public Integer hashCode()
```

Return Value
Type: Integer

**success(externalId)**
Creates a delete result that indicates the successful completion of an upsert request for a given external ID.
**Signature**

```java
public static DataSource.UpsertResult success(String externalId)
```

**Parameters**

- `externalId`
  - Type: `String`
  - The unique identifier of the external object record to upsert.

**Return Value**

- Type: `DataSource.UpsertResult`
  - Status result of the upsert operation for the external object record with the given external ID.

**DataSource Exceptions**

The `DataSource` namespace contains exception classes. All exception classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions.

The `DataSource` namespace contains these exceptions.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
<th>Methods</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>DataSource.DataSourceException</code></td>
<td>Throw this exception to indicate that an error occurred while communicating with an external data source.</td>
<td>To get the error message and write it to debug log, use the <code>String getMessage()</code> method.</td>
</tr>
<tr>
<td><code>DataSource.OAuthTokenExpiredException</code></td>
<td>Throw this exception to indicate that an OAuth token has expired. The system then attempts to refresh the token automatically and restart the query, search, or sync operation.</td>
<td>To get the error message and write it to debug log, use the <code>String getMessage()</code> method.</td>
</tr>
</tbody>
</table>

**DataWeave Namespace**

The `DataWeave` namespace provides classes and methods to support the invocation of `DataWeave` scripts from Apex.

`DataWeave` is the MuleSoft expression language for accessing, parsing, and transforming data that travels through a Mule application.

For detailed information, see DataWeave Language.

These are the classes in the `DataWeave` namespace.

**IN THIS SECTION:**

- **Result Class**
  - Contains methods to retrieve data that was transformed using `Script` class methods.
Script Class
Contains the `createScript()` method to load DataWeave scripts and the `execute()` method to obtain script output in a `DataWeave.Result` object.

SEE ALSO:
DataWeave in Apex

Result Class
Contains methods to retrieve data that was transformed using Script class methods.

Namespace
DataWeave

Example
See Script Class for an example to run a DataWeave script from Apex and retrieve the resulting script output.

IN THIS SECTION:
Result Methods

Result Methods
The following are methods for Result.

IN THIS SECTION:
getValue()
Returns the result of a DataWeave script execution as an object.

getValueAsString()
Returns the result of a DataWeave script execution as a string value.

```
getValue()
```
Returns the result of a DataWeave script execution as an object.

**Signature**

```
public Object getValue()
```

**Return Value**
Type: Object
getValueAsString()

Returns the result of a DataWeave script execution as a string value.

**Signature**

```java
public String getValueAsString()
```

**Return Value**

Type: String

**Script Class**

Contains the `createScript()` method to load DataWeave scripts and the `execute()` method to obtain script output in a `DataWeave.Result` object.

**Namespace**

DataWeave

This example runs a DataWeave script from Apex and retrieves the resulting script output. First deploy the script to the org as `ContactsToJson.dwl`.

```java
%dw 2.0
input records application/java
output application/json
---
{
  users: records map(record) -> {
    firstName: record.FirstName,
    lastName: record.LastName
  }
}
```

Then, execute the script from Apex.

```java
List<Contact> data = [SELECT FirstName, LastName FROM Contact WHERE LastName LIMIT 5];
Map<String, Object> args = new Map<String, Object>{ 'records' => data };
DataWeave.Script script = DataWeave.Script.createScript('ContactsToJson');

DataWeave.Result result = script.execute(args);
string jsonOutput = result.getValueAsString();
```

**IN THIS SECTION:**

Script Methods

The following are methods for `Script`. 

**Script Methods**

The following are methods for `Script`. 

---

2181
IN THIS SECTION:

createScript(scriptName)
Loads a DataWeave 2.0 script from the .dwl metadata file that is deployed in an org. The script can then be run using the Script.execute method.

createScript(namespace, scriptName)
Loads a DataWeave 2.0 script from a specified namespace. The script can then be run using the Script.execute method.

execute(parameters)
Executes the DataWeave script that is loaded using the createScript() method and returns the script output.

toString()
Returns the name of the script.

createScript(scriptName)
Loads a DataWeave 2.0 script from the .dwl metadata file that is deployed in an org. The script can then be run using the Script.execute method.

Signature

class public static createScript(String scriptName)

Parameters

scriptName
Type: String
The name of the deployed metadata .dwl script (not including the file extension).

Return Value

Type: DataWeave.Script
DataWeave script that is used as a parameter in the Script.execute() method.

createScript(namespace, scriptName)
Loads a DataWeave 2.0 script from a specified namespace. The script can then be run using the Script.execute method.

Signature

class public static dataweave.Script createScript(String namespace, String scriptName)

Parameters

namespace
Type: String
The namespace name for the deployed script. If the namespace name is null, the caller namespace is used. If the namespace name is empty, the org namespace is used.

scriptName
Type: String
The name of the deployed metadata .dw1 script (not including the file extension).

**Return Value**
Type: DataWeave.Script
DataWeave script that is used as a parameter in the Script.execute() method.

**execute (parameters)**
Executes the DataWeave script that is loaded using the createScript() method and returns the script output.

**Signature**
```java
public execute(Map<String, Object> parameters)
```

**Parameters**
- `parameters`
  - Type: Map<String, Object>
  - Input to the DataWeave script. The keys correspond to the input directive names defined in the DataWeave header. See Input Directive and DataWeave Header.

**Return Value**
Type: DataWeave.Result
The DataWeave.Result object contains the script output.

**toString()**
Returns the name of the script.

**Signature**
```java
public String toString()
```

**Return Value**
Type: String

---

**Dom Namespace**
The Dom namespace provides classes and methods for parsing and creating XML content. The following are the classes in the Dom namespace.

**IN THIS SECTION:**
- Document Class
  - Use the Document class to process XML content. You can parse nested XML content that’s up to 50 nodes deep.
XmlNode Class
Use the XmlNode class to work with a node in an XML document.

Document Class
Use the Document class to process XML content. You can parse nested XML content that's up to 50 nodes deep.

Namespace
Dom

Usage
One common application is to use it to create the body of a request for HttpRequest or to parse a response accessed by HttpResponse.

IN THIS SECTION:
  Document Constructors
  Document Methods

SEE ALSO:
  Reading and Writing XML Using the DOM

Document Constructors
The following are constructors for Document.

IN THIS SECTION:
  Document()
  Document()

Signature

public Document()
getRootElement()
Returns the top-level root element node in the document. If this method returns \texttt{null}, the root element has not been created yet.

load(xml)
Parse the XML representation of the document specified in the \texttt{xml} argument and load it into a document.

toXmlString()
Returns the XML representation of the document as a String.

createRootElement(name, namespace, prefix)
Creates the top-level root element for a document.

\textbf{Signature}

\texttt{public Dom.XmlNode createRootElement(String name, String namespace, String prefix)}

\textbf{Parameters}

\textit{name}
Type: String

\textit{namespace}
Type: String

\textit{prefix}
Type: String

\textbf{Return Value}
Type: Dom.XmlNode

\textbf{Usage}
For more information about namespaces, see \textit{Reading and Writing XML Using the DOM}.
Calling this method more than once on a document generates an error as a document can have only one root element.

gRootElement()
Returns the top-level root element node in the document. If this method returns \texttt{null}, the root element has not been created yet.

\textbf{Signature}

\texttt{public Dom.XmlNode getRootElement()}

\textbf{Return Value}
Type: Dom.XmlNode

load(xml)
Parse the XML representation of the document specified in the \texttt{xml} argument and load it into a document.
Signature
public Void load(String xml)

Parameters
xml
Type: String

Return Value
Type: Void

Example
doc.load(xml);

toXmlString()
Returns the XML representation of the document as a String.

Signature
public String toXmlString()

Return Value
Type: String

XmlNode Class
Use the XmlNode class to work with a node in an XML document.

Namespace
Dom

XmlNode Methods
The following are methods for XmlNode. All are instance methods.

IN THIS SECTION:
   addChildElement(name, namespace, prefix)
   Creates a child element node for this node.
   addCommentNode(text)
   Creates a child comment node for this node.
addTextNode(text)
 creates a child text node for this node.

getAttribute(key, keyNamespace)
 returns namespace:prefix:attributeValue for the given key and key namespace.

getAttributeCount()
 returns the number of attributes for this node.

getAttributeKeyAt(index)
 returns the attribute key for the given index. Index values start at 0.

getAttributeKeyNsAt(index)
 returns the attribute key namespace for the given index.

getAttributeValue(key, keyNamespace)
 returns the attribute value for the given key and key namespace.

getAttributeValueNs(key, keyNamespace)
 returns the attribute value namespace for the given key and key namespace.

getChildElement(name, namespace)
 returns the child element node for the node with the given name and namespace.

getChildElements()
 returns the child element nodes for this node. This doesn’t include child text or comment nodes.

getChildren()
 returns the child nodes for this node. This includes all node types.

getName()
 returns the element name.

getNamespace()
 returns the namespace of the element.

getNamespaceFor(prefix)
 returns the namespace of the element for the given prefix.

getNodeType()
 returns the node type.

getParent()
 returns the parent of this element.

getPrefixFor(namespace)
 returns the prefix of the given namespace.

getText()
 returns the text for this node.

insertBefore(newChild, refChild)
 inserts a new child node before the specified node.

removeAttribute(key, keyNamespace)
 removes the attribute with the given key and key namespace. Returns true if successful, false otherwise.

removeChild(childNode)
 removes the given child node.
setAttribute(key, value)
Sets the key attribute value.
setAttributeNs(key, value, keyNamespace, valueNamespace)
Sets the key attribute value.
setNamespace(prefix, namespace)
Sets the namespace for the given prefix.

addChildElement(name, namespace, prefix)
Creates a child element node for this node.

Signature
public Dom.XmlNode addChildElement(String name, String namespace, String prefix)

Parameters
name
Type: String
The name argument can’t have a null value.
namespace
Type: String
prefix
Type: String

Return Value
Type: Dom.XmlNode

Usage
• If the namespace argument has a non-null value and the prefix argument is null, the namespace is set as the default namespace.
• If the prefix argument is null, Salesforce automatically assigns a prefix for the element. The format of the automatic prefix is ns$i, where i is a number. If the prefix argument is '', the namespace is set as the default namespace.

addCommentNode(text)
Creates a child comment node for this node.

Signature
public Dom.XmlNode addCommentNode(String text)

Parameters
text
Type: String
The `text` argument can't have a `null` value.

Return Value
Type: `Dom.XmlNode`

`addTextNode(text)`
Creates a child text node for this node.

Signature
```
public Dom.XmlNode addTextNode(String text)
```

Parameters
`text`
Type: `String`
The `text` argument can't have a `null` value.

Return Value
Type: `Dom.XmlNode`

`getAttribute(key, keyNamespace)`
Returns `namespacePrefix:attributeValue` for the given key and key namespace.

Signature
```
public String getAttribute(String key, String keyNamespace)
```

Parameters
`key`
Type: `String`
`keyNamespace`
Type: `String`

Return Value
Type: `String`

Example
For example, for the `<xyz a:b="c:d" />` element:

- `getAttribute` returns `c:d`
- `getAttributeValue` returns `d`
getAttributeCount()
Returns the number of attributes for this node.

Signature
public Integer getAttributeCount()

Return Value
Type: Integer

ggetAttributeKeyAt(index)
Returns the attribute key for the given index. Index values start at 0.

Signature
public String getAttributeKeyAt(Integer index)

Parameters
index
Type: Integer

Return Value
Type: String

ggetAttributeKeyNsAt(index)
Returns the attribute key namespace for the given index.

Signature
public String getAttributeKeyNsAt(Integer index)

Parameters
index
Type: Integer

Return Value
Type: String

ggetAttributeValue(key, keyNamespace)
Returns the attribute value for the given key and key namespace.
**getAttributeValue(key, keyNamespace)**

```java
public String getAttributeValue(String key, String keyNamespace)
```

**Parameters**

- `key`
  - Type: `String`
- `keyNamespace`
  - Type: `String`

**Return Value**

Type: `String`

**Example**

For example, for the `<xyz a:b="c:d" />` element:

- `getAttribute` returns `c:d`
- `getAttributeValue` returns `d`

**getAttributeValueNs(key, keyNamespace)**

Returns the attribute value namespace for the given key and key namespace.

**Signature**

```java
public String getAttributeValueNs(String key, String keyNamespace)
```

**Parameters**

- `key`
  - Type: `String`
- `keyNamespace`
  - Type: `String`

**Return Value**

Type: `String`

**getChildElement(name, namespace)**

Returns the child element node for the node with the given name and namespace.

**Signature**

```java
public Dom.XmlNode getChildElement(String name, String namespace)
```
Parameters

name
Type: String
namespace
Type: String

Return Value
Type: Dom.XmlNode

**getChildElements()**
Returns the child element nodes for this node. This doesn't include child text or comment nodes.

Signature

```java
public Dom.XmlNode[] getChildElements()
```

Return Value
Type: Dom.XmlNode[]

**getChildren()**
Returns the child nodes for this node. This includes all node types.

Signature

```java
public Dom.XmlNode[] getChildren()
```

Return Value
Type: Dom.XmlNode[]

**getName()**
Returns the element name.

Signature

```java
public String getName()
```

Return Value
Type: String

**getNamespace()**
Returns the namespace of the element.
Signature

public String getNamespace()

Return Value
Type: String

getNamespaceFor(prefix)
Returns the namespace of the element for the given prefix.

Signature

public String getNamespaceFor(String prefix)

Parameters
prefix
Type: String

Return Value
Type: String

getNodeType()
Returns the node type.

Signature

public Dom.XmlNodeType getNodeType()

Return Value
Type: Dom.XmlNodeType

getParent()
Returns the parent of this element.

Signature

public Dom.XmlNode getParent()

Return Value
Type: Dom.XmlNode
**getPrefixFor(namespace)**
Returns the prefix of the given namespace.

**Signature**
```java
public String getPrefixFor(String namespace)
```

**Parameters**
- `namespace`
  - Type: `String`
  - The `namespace` argument can't have a `null` value.

**Return Value**
- Type: `String`

**getText()**
Returns the text for this node.

**Signature**
```java
public String getText()
```

**Return Value**
- Type: `String`

**insertBefore(newChild, refChild)**
Inserts a new child node before the specified node.

**Signature**
```java
public Dom.XmlNode insertBefore(Dom.XmlNode newChild, Dom.XmlNode refChild)
```

**Parameters**
- `newChild`
  - Type: `Dom.XmlNode`
  - The node to insert.
- `refChild`
  - Type: `Dom.XmlNode`
  - The node before the new node.

**Return Value**
- Type: `Dom.XmlNode`
Usage

- If `refChild` is `null`, `newChild` is inserted at the end of the list.
- If `refChild` doesn’t exist, an exception is thrown.

**removeAttribute(key, keyNamespace)**
Removes the attribute with the given key and key namespace. Returns `true` if successful, `false` otherwise.

**Signature**

```java
public Boolean removeAttribute(String key, String keyNamespace)
```

**Parameters**

- `key` Type: `String`
- `keyNamespace` Type: `String`

**Return Value**
Type: `Boolean`

**removeChild(childNode)**
Removes the given child node.

**Signature**

```java
public Boolean removeChild(Dom.XmlNode childNode)
```

**Parameters**

- `childNode` Type: `Dom.XmlNode`

**Return Value**
Type: `Boolean`

**setAttribute(key, value)**
Sets the key attribute value.

**Signature**

```java
public Void setAttribute(String key, String value)
```
Parameters

key
  Type: String
value
  Type: String

Return Value
Type: Void

setAttributeNs(key, value, keyNamespace, valueNamespace)

Sets the key attribute value.

Signature

public Void setAttributeNs(String key, String value, String keyNamespace, String valueNamespace)

Parameters

key
  Type: String
value
  Type: String
keyNamespace
  Type: String
valueNamespace
  Type: String

Return Value
Type: Void

setNamespace(prefix, namespace)

Sets the namespace for the given prefix.

Signature

public Void setNamespace(String prefix, String namespace)

Parameters

prefix
  Type: String
namespace
  Type: String
Return Value
Type: Void

EventBus Namespace

The EventBus namespace provides classes and methods for platform events and Change Data Capture events. The following are the classes in the EventBus namespace.

IN THIS SECTION:

- ChangeEventHeader Class
  Contains header fields of Change Data Capture events.

- EventPublishFailureCallback Interface
  Implement this interface to track platform event messages that failed to publish. The onFailure() method in this interface is called when the final result of the asynchronous publish operation becomes available.

- EventPublishSuccessCallback Interface
  Implement this interface to track platform event messages that were published successfully. The onSuccess() method in this interface is called when the final result of the asynchronous publish operation becomes available.

- FailureResult Interface
  Contains the result of an Apex publish callback when the event publishing failed. This interface is used as a parameter in the onFailure method of the EventPublishFailureCallback interface.

- SuccessResult Interface
  Contains the result of an Apex publish callback when the event publishing succeeded. This interface is used as a parameter in the onSuccess method of the EventPublishSuccessCallback interface.

- TestBroker Class
  Contains methods that simulate the successful delivery or failed publishing of platform event or change event messages in an Apex test.

- TriggerContext Class
  Provides information about the platform event or change event trigger that’s currently executing, such as how many times the trigger was retried due to the EventBus.RetryableException. Also, provides a method to resume trigger executions.

SEE ALSO:
Platform Events Developer Guide

ChangeEventHeader Class
Contains header fields of Change Data Capture events.

Namespace
EventBus
IN THIS SECTION:

ChangeEventHeader Properties

SEE ALSO:

Change Data Capture Developer Guide

ChangeEventHeader Properties

The following are properties for ChangeEventHeader.

IN THIS SECTION:

changedfields
A list of the fields that were changed in an update operation, including the LastModifiedDate system field. This field is empty for other operations, including record creation. This property is available in Apex saved using API version 47.0 or later.

changeorigin
Only populated for changes done by API apps or from Lightning Experience; empty otherwise. The Salesforce API and the API client ID that initiated the change, if set by the client. Use this field to detect whether your app initiated the change to not process the change again and potentially avoid a deep cycle of changes.

changetype
The operation that caused the change.

commitnumber
The system change number (SCN) of a committed transaction, which increases sequentially. This field is provided for diagnostic purposes. The field value is not guaranteed to be unique in Salesforce—it is unique only in a single database instance. If your Salesforce org migrates to another database instance, the commit number might not be unique or sequential.

committimestamp
The date and time when the change occurred, represented as the number of milliseconds since January 1, 1970 00:00:00 GMT.

commituser
The ID of the user that ran the change operation.

difffields
Contains the names of fields whose values are sent as a unified diff because they contain large text values.

difffields
The API name of the standard or custom object that the change pertains to. For example, Account or MyObject__c.

difffields
Contains the names of fields whose values were changed to null in an update operation. Use this field in Apex change event messages to determine if a field was changed to null in an update and isn’t an unchanged field.

recordids
One or more record IDs for the changed records. Typically, this field contains one record ID. If in one transaction the same change occurred in multiple records of the same object type during one second, Salesforce merges the change notifications. In this case, Salesforce sends one change event for all affected records and the recordIds field contains the IDs for all records that have the same change.

sequencenumber
The sequence of the change within a transaction. The sequence number starts from 1.
transactionkey
A string that uniquely identifies each Salesforce transaction. You can use this key to identify and group all changes that were made in the same transaction.

changedfields
A list of the fields that were changed in an update operation, including the LastModifiedDate system field. This field is empty for other operations, including record creation. This property is available in Apex saved using API version 47.0 or later.

Signature
public List<String> changedfields {get; set;}

Property Value
Type: List<String>

changeorigin
Only populated for changes done by API apps or from Lightning Experience; empty otherwise. The Salesforce API and the API client ID that initiated the change, if set by the client. Use this field to detect whether your app initiated the change to not process the change again and potentially avoid a deep cycle of changes.

Signature
public String changeorigin {get; set;}

Property Value
Type: String
The format of the changeOrigin field value is:
com/salesforce/api/<API_Name>/<API_Version>;client=<Client_ID>

- <API_Name> is the name of the Salesforce API used to make the data change. It can take one of these values: soap, rest, bulkapi, xmlrpc, oldsoap, toolingsoap, toolingrest, apex, apexdebuggerrest.
- <API_Version> is the version of the API call that made the change and is in the format XX.X.
- <Client_ID> is a string that contains the client ID of the app that initiated the change. If the client ID is not set in the API call, client=<Client_ID> is not appended to the changeOrigin field.

Example:
com/salesforce/api/soap/49.0;client=Astro
The client ID is set in the Call Options header of an API call. For an example on how to set the Call Options header, see:
- REST API: Sforce-Call-Options Header. (Bulk API also uses the Sforce-Call-Options header.)
- SOAP API: CallOptions Header. (Apex API also uses the CallOptions element.)

changetype
The operation that caused the change.
**Signature**

```java
public String changeType {get; set;}
```

**Property Value**

Type: `String`

Can be one of the following values:

- `CREATE`
- `UPDATE`
- `DELETE`
- `UNDELETE`

For gap events, the change type starts with the `GAP_` prefix.

- `GAP_CREATE`
- `GAP_UPDATE`
- `GAP_DELETE`
- `GAP_UNDELETE`

For overflow events, the change type is `GAP_OVERFLOW`.

---

**commitnumber**

The system change number (SCN) of a committed transaction, which increases sequentially. This field is provided for diagnostic purposes. The field value is not guaranteed to be unique in Salesforce—it is unique only in a single database instance. If your Salesforce org migrates to another database instance, the commit number might not be unique or sequential.

**Signature**

```java
public Long commitNumber {get; set;}
```

**Property Value**

Type: `Long`

---

**committimestamp**

The date and time when the change occurred, represented as the number of milliseconds since January 1, 1970 00:00:00 GMT.

**Signature**

```java
public Long committimestamp {get; set;}
```

**Property Value**

Type: `Long`

---

**commituser**

The ID of the user that ran the change operation.
**Signature**

public String commituser {get; set;}

**Property Value**

Type: String

**difffields**

Contains the names of fields whose values are sent as a unified diff because they contain large text values.

**Signature**

public List<String> difffields {get; set;}

**Property Value**

Type: List<String>

SEE ALSO:

*Change Data Capture Developer Guide: Sending Data Differences for Fields of Updated Records*

**entityname**

The API name of the standard or custom object that the change pertains to. For example, Account or MyObject__c.

**Signature**

public String entityname {get; set;}

**Property Value**

Type: String

**nulledfields**

Contains the names of fields whose values were changed to null in an update operation. Use this field in Apex change event messages to determine if a field was changed to null in an update and isn't an unchanged field.

**Signature**

public List<String> nulledfields {get; set;}

**Property Value**

Type: List<String>
**recordids**

One or more record IDs for the changed records. Typically, this field contains one record ID. If in one transaction the same change occurred in multiple records of the same object type during one second, Salesforce merges the change notifications. In this case, Salesforce sends one change event for all affected records and the `recordIds` field contains the IDs for all records that have the same change.

**Signature**

```java
public List<String> recordids {get; set;}
```

**Property Value**

Type: `List<String>`

Examples of operations with same changes are:

- Update of `fieldA` to `valueA` in `Account` records.
- Deletion of `Account` records.
- Renaming or replacing a picklist value that results in updating the field value in all affected records.

The `recordIds` field can contain a wildcard value when a change event message is generated for custom field type conversions that cause data loss. In this case, the `recordIds` value is the three-character prefix of the object, followed by the wildcard character `*`. For example, for accounts, the value is `001*`.

**sequencenumber**

The sequence of the change within a transaction. The sequence number starts from 1.

**Signature**

```java
public Integer sequencenumber {get; set;}
```

**Property Value**

Type: `Integer`

A lead conversion is an example of a transaction that can have multiple changes. A lead conversion results in the following sequence of changes, all within the same transaction.

1. Create an account
2. Create a contact
3. Create an opportunity
4. Update a lead

**transactionkey**

A string that uniquely identifies each Salesforce transaction. You can use this key to identify and group all changes that were made in the same transaction.

**Signature**

```java
public String transactionkey {get; set;}
```
Property Value
Type: String

EventPublishFailureCallback Interface
Implement this interface to track platform event messages that failed to publish. The `onFailure()` method in this interface is called when the final result of the asynchronous publish operation becomes available.

Namespace
EventBus

Usage
For more information, see <link>Get the Result of Asynchronous Platform Event Publishing with Apex Publish Callbacks</link> in the Platform Events Developer Guide.

IN THIS SECTION:
- EventPublishFailureCallback Methods
- EventPublishFailureCallback Example Implementation

EventPublishFailureCallback Methods
The following are methods for EventPublishFailureCallback.

IN THIS SECTION:
- onFailure(result)
  The system invokes this method when the final result of `EventBus.publish` is available and the publishing of the platform event message failed.

**onFailure(result)**
The system invokes this method when the final result of `EventBus.publish` is available and the publishing of the platform event message failed.

**Signature**
`public void onFailure(eventbus.FailureResult result)`

**Parameters**
- `result`
  Type: `EventBus.FailureResult`
  The final result of `EventBus.publish`.
Return Value
Type: void

EventPublishFailureCallback Example Implementation
For an example implementation and a test class, see <link>Get the Result of Asynchronous Platform Event Publishing with Apex Publish Callbacks</link> in the Platform Events Developer Guide.

EventPublishSuccessCallback Interface
Implement this interface to track platform event messages that were published successfully. The `onSuccess()` method in this interface is called when the final result of the asynchronous publish operation becomes available.

Namespace
EventBus

Usage
For more information, see <link>Get the Result of Asynchronous Platform Event Publishing with Apex Publish Callbacks</link> in the Platform Events Developer Guide.

IN THIS SECTION:
- EventPublishSuccessCallback Methods
- EventPublishSuccessCallback Example Implementation

EventPublishSuccessCallback Methods
The following are methods for EventPublishSuccessCallback.

IN THIS SECTION:
- `onSuccess(result)`
  
  The system invokes this method when the final result of `EventBus.publish` is available and the publishing of the platform event message succeeded.

`onSuccess(result)`

The system invokes this method when the final result of `EventBus.publish` is available and the publishing of the platform event message succeeded.

Signature

```java
public void onSuccess(eventbus.SuccessResult result)
```
Parameters

result
Type: EventBus.SuccessResult
The final result of EventBus.publish.

Return Value
Type: void

EventPublishSuccessCallback Example Implementation
For an example implementation and a test class, see <link>Get the Result of Asynchronous Platform Event Publishing with Apex Publish Callbacks</link> in the Platform Events Developer Guide.

FailureResult Interface
Contains the result of an Apex publish callback when the event publishing failed. This interface is used as a parameter in the onFailure method of the EventPublishFailureCallback interface.

Namespace
EventBus

IN THIS SECTION:
FailureResult Methods

FailureResult Methods
The following are methods for FailureResult.

IN THIS SECTION:
getEventUuids() Returns a list of EventUuid field values of each platform event that is included in EventBus.EventPublishFailureCallback.

getEventUuids() Returns a list of EventUuid field values of each platform event that is included in EventBus.EventPublishFailureCallback.

Signature
public List<String> getEventUuids()
Return Value
Type: List<String>

SuccessResult Interface
Contains the result of an Apex publish callback when the event publishing succeeded. This interface is used as a parameter in the onSuccess method of the EventBus.EventPublishSuccessCallback interface.

Namespace
EventBus

IN THIS SECTION:
SuccessResult Methods

SuccessResult Methods
The following are methods for SuccessResult.

IN THIS SECTION:
getEventUuids()

Returns a list of EventUuid field values of each platform event that is included in the EventBus.EventPublishSuccessCallback.

getEventUuids()
Returns a list of EventUuid field values of each platform event that is included in the EventBus.EventPublishSuccessCallback.

Signature
public List<String> getEventUuids()

Return Value
Type: List<String>

TestBroker Class
Contains methods that simulate the successful delivery or failed publishing of platform event or change event messages in an Apex test.

Namespace
EventBus
TestBroker Methods

The following are methods for TestBroker.

deliver()
Delivers platform event messages to the test event bus. Use this method to deliver test event messages multiple times and verify that event subscribers have processed the test events each step of the way.

fail()
Causes the publishing of platform event messages to fail in the test event bus. Use this method to test Apex publish callbacks.

**deliver()**

Delivers platform event messages to the test event bus. Use this method to deliver test event messages multiple times and verify that event subscribers have processed the test events each step of the way.

**Signature**

```
public void deliver()
```

**Return Value**

Type: void

**Usage**

Enclose `Test.getEventBus().deliver()` within the `Test.startTest()` and `Test.stopTest()` statement block.

```java
Test.startTest();
// Create test events
// ...
// Publish test events with EventBus.publish()
// ...
// Deliver test events
Test.getEventBus().deliver();
// Perform validation
// ...
Test.stopTest();
```

**SEE ALSO:**

*Platform Events Developer Guide*

**fail()**

Causes the publishing of platform event messages to fail in the test event bus. Use this method to test Apex publish callbacks.
Signature

public void fail()

Return Value

Type: void

Usage

// Create test events
// ...
// Publish test events with EventBus.publish()
// ...
// Fail publishing of test events
Test.getEventBus().fail();
// Perform validation
// ...

For more information, see <link>Get the Result of Asynchronous Platform Event Publishing with Apex Publish Callbacks</link> in the Platform Events Developer Guide.

TriggerContext Class

Provides information about the platform event or change event trigger that’s currently executing, such as how many times the trigger was retried due to the EventBus.RetryableException. Also, provides a method to resume trigger executions.

Namespace

EventBus

IN THIS SECTION:

  TriggerContext Properties
  TriggerContext Methods

TriggerContext Properties

The following are properties for TriggerContext.

IN THIS SECTION:

  lastError
Read-only. The error message that the last thrown EventBus.RetryableException contains.

  retries
Read-only. The number of times the trigger was retried due to throwing the EventBus.RetryableException.
**lastError**

Read-only. The error message that the last thrown `EventBus.RetryableException` contains.

**Signature**

```
public String lastError {get;}
```

**Property Value**

Type: `String`

**Usage**

The error message that this property returns is the message that was passed in when creating the `EventBus.RetryableException` exception, as follows.

```java
throw new EventBus.RetryableException(
    'Condition is not met, so retrying the trigger again.');
```

**retries**

Read-only. The number of times the trigger was retried due to throwing the `EventBus.RetryableException`.

**Signature**

```
public Integer retries {get;}
```

**Property Value**

Type: `Integer`

**TriggerContext Methods**

The following are methods for `TriggerContext`.

**IN THIS SECTION:**

- `currentContext()`
  Returns an instance of the `EventBus.TriggerContext` class containing information about the currently executing trigger.

- `getResumeCheckpoint()`
  Returns the replay ID that was set by `setResumeCheckpoint()`. The returned value is the replay ID of the event message after which trigger processing resumes in a new trigger invocation.

- `setResumeCheckpoint(resumeReplayId)`
  Sets a checkpoint in the event stream where the platform event trigger resumes execution in a new invocation. Use this method to recover from limit and uncaught exceptions, or to control the number of events processed in one trigger execution. When calling this method, pass in the replay ID of the last successfully processed event message. When the trigger stops execution before all events in `Trigger.New` are processed, either because of an uncaught exception or intentionally, the trigger is invoked again. The new execution starts with the event message in the stream after the one with the checkpointed Replay ID.
currentContext()
Returns an instance of the EventBus.TriggerContext class containing information about the currently executing trigger.

Signature
public static eventbus.TriggerContext currentContext()

Return Value
Type: EventBus.TriggerContext
Information about the currently executing trigger.

getResumeCheckpoint()
Returns the replay ID that was set by setResumeCheckpoint(). The returned value is the replay ID of the event message after which trigger processing resumes in a new trigger invocation.

Signature
public String getResumeCheckpoint()

Return Value
Type: String

setResumeCheckpoint(resumeReplayId)
Sets a checkpoint in the event stream where the platform event trigger resumes execution in a new invocation. Use this method to recover from limit and uncaught exceptions, or to control the number of events processed in one trigger execution. When calling this method, pass in the replay ID of the last successfully processed event message. When the trigger stops execution before all events in Trigger.New are processed, either because of an uncaught exception or intentionally, the trigger is invoked again. The new execution starts with the event message in the stream after the one with the checkpointed Replay ID.

Signature
public void setResumeCheckpoint(String resumeReplayId)

Parameters
resumeReplayId
Type: String
The replay ID of the last successfully processed platform event message, after which to resume processing in a new trigger execution context.

Return Value
Type: void
Usage

The method throws an EventBus.InvalidReplayIdException if the supplied Replay ID is not valid—the replay ID is not in the current trigger batch of events, in the Trigger.new list.

Example

This snippet shows how to call the method and pass in the replayId property of an event instance.

```java
EventBus.TriggerContext.currentContext().setResumeCheckpoint(event.replayId);
```

ExternalService Namespace

The ExternalService namespace provides dynamically generated Apex service interfaces and Apex classes for complex object data types.

The ExternalService namespace doesn’t define a fixed set of classes. The namespace reflects OpenAPI-compatible external service registrations with active operations for type-safe outbound calls. The object schema, in the API specification that is associated with the registered external service, maps to Apex types.

SEE ALSO:

* Salesforce Help: Invoke External Service Callouts Using Apex*

Flow Namespace

The Flow namespace provides a class for advanced Visualforce controller access to flows.

The following is the class in the Flow namespace.

IN THIS SECTION:

**Interview Class**

The Flow.Interview class provides advanced controller access to flows and the ability to start a flow.

Interview Class

The Flow.Interview class provides advanced controller access to flows and the ability to start a flow.

Namespace

Flow

Usage

SOQL and DML limits apply during flow execution. See Per-Transaction Flow Limits in the Salesforce Help.

To create an Interview object, you have two options.

- Create the object directly in your class by using:
- No namespace: Flow.Interview.flowName
- Namespace: Flow.Interview.namespace.flowName

Create the object dynamically by using createInterview()

Note: We recommend only using createInterview() if you need to reuse your method or class. Using createInterview() has these drawbacks.

- If you package a class that uses createInterview(), you have to add the associated flow manually.
- If you delete a flow, Salesforce doesn’t check if it’s referenced with createInterview().

Examples: Starting Flow Interviews

The following examples are all sample controllers that start an interview for the flow from the Build a Discount Calculator project on Trailhead. Each shows a different permutation, based on:

- Whether the interview is created statically, with Flow.Interview.myFlow, or dynamically, with createInterview().
- Whether the flow is managed or local.

### Interview Created Statically for a Local Flow

```java
{  
  Map<String, Object> inputs = new Map<String, Object>();  
  inputs.put('AccountID', myAccount);  
  inputs.put('OpportunityID', myOppty);  

  Flow.Interview.Calculate_discounts myFlow =  
  new Flow.Interview.Calculate_discounts(inputs);  
  myFlow.start();
}
```

### Interview Created Dynamically for a Local Flow

```java
public void callFlow(String flowName, Map<String, Object> inputs) {
  Flow.Interview myFlow = Flow.Interview.createInterview(flowName, inputs);
  myFlow.start();
}
```

### Interview Created Statically for a Managed Flow

```java
{  
  Map<String, Object> inputs = new Map<String, Object>();  
  inputs.put('AccountID', myAccount);  
  inputs.put('OpportunityID', myOppty);  

  Flow.Interview.myNamespace.Calculate_discounts myFlow =  
  new Flow.Interview.myNamespace.Calculate_discounts(inputs);  
  myFlow.start();
}
```

### Interview Created Dynamically for a Managed Flow

```java
public void callFlow(String namespace, String flowName, Map<String, Object> inputs) {
  Flow.Interview myFlow = Flow.Interview.createInterview(namespace, flowName, inputs);
  myFlow.start();
}
```
Example: Getting Variable Values

This sample uses the `getVariableValue` method to obtain breadcrumb (navigation) information from a flow. If that flow contains subflow elements, and each of the referenced flows also contains a `vaBreadCrumb` variable, you can provide users with breadcrumbs regardless of which flow the interview is running.

```java
public class SampleController {

    // Instance of the flow
    public Flow.Interview.Flow_Template_Gallery myFlow {get; set;}

    public String getBreadCrumb() {
        String aBreadCrumb;
        if (myFlow==null) { return 'Home';}
        else aBreadCrumb = (String) myFlow.getVariableValue('vaBreadCrumb');

        return(aBreadCrumb==null ? 'Home': aBreadCrumb);
    }
}
```

Interview Methods

The following are instance methods for `Interview`.

`createInterview(namespace, flowName, inputVariables)`

Creates an interview for a namespaced flow.

**Signature**

```java
public static Flow.Interview createInterview(String namespace, String flowName, Map<String,ANY> inputVariables)
```

**Parameters**

`namespace`

Type: `String`

The flow's namespace.

`flowName`

Type: `String`

The flow's API name.

`inputVariables`

Type: `Map<String, Object>`

Initial values for the flow's input variables.

**Return Value**

Type: `Flow.Interview`
Usage

Use this method to dynamically create a Flow.Interview object for the `start()` method.

How you get output variable values from an interview depends on the type of the Apex variable where you’re storing the interview.

- If the variable is cast to a specific flow, you can use `myFlow.myVar` to access a variable, where `myVar` is the name of the variable.
  ```java
  system.debug('My Output Variable: ' + myFlow.varName);
  ```

- If the variable is of type Flow.Interview but not cast to a specific flow, you must use `getVariableValue()` to access the flow's variables.
  ```java
  system.debug('My Output Variable: ' + myFlow.getVariableValue('varName'));
  ```

If the flow doesn’t exist in the current org, a `TypeException` is thrown.

`createInterview(flowName, inputVariables)`

Creates an interview for a flow.

**Signature**

```java
public static Flow.Interview createInterview(String flowName, Map<String,Object> inputVariables)
```

**Parameters**

- `flowName`
  
  **Type:** `String`
  
  The flow’s API name.

- `inputVariables`
  
  **Type:** `Map<String,Object>`
  
  Initial values for the flow’s input variables.

**Return Value**

**Type:** `Flow.Interview`

**Usage**

Use this method to dynamically create a Flow.Interview object for the `start()` method.

How you get output variable values from an interview depends on the type of the Apex variable where you’re storing the interview.

- If the variable is cast to a specific flow, you can use `myFlow.myVar` to access a variable, where `myVar` is the name of the variable.
  ```java
  system.debug('My Output Variable: ' + myFlow.varName);
  ```

- If the variable is of type Flow.Interview but not cast to a specific flow, you must use `getVariableValue()` to access the flow's variables.
  ```java
  system.debug('My Output Variable: ' + myFlow.getVariableValue('varName'));
  ```

If the flow doesn’t exist in the current org, a `TypeException` is thrown.
getVariableValue (variableName)
Returns the value of the specified flow variable. The flow variable can be in the flow embedded in the Visualforce page, or in a separate flow that is called by a subflow element.

Signature
public Object getVariableValue(String variableName)

Parameters
variableName
Type: String
Specifies the unique name of the flow variable.

Return Value
Type: Object

Usage
The returned variable value comes from whichever flow the interview is running. If the specified variable can’t be found in that flow, the method returns null.

This method checks for the existence of the variable at run time only, not at compile time.

start()
Starts an instance (interview) for an autolaunched or user provisioning flow.

Signature
public Void start()

Return Value
Type: Void

Usage
This method can be used only with flows that have one of these types.

• Autolaunched Flow
• User Provisioning Flow

For details, see “Flow Types” in Salesforce Help.

When a flow user invokes an autolaunched flow, the active flow version runs. If there's no active version, the latest version runs. When a flow admin invokes a flow, the latest version always runs.
Functions Namespace

The Functions namespace provides classes and methods used to invoke and manage Salesforce Functions. Salesforce Functions is your code, run on demand, in the Salesforce Functions trusted elastic compute cloud. Upload your complex business logic code, written using your preferred languages and frameworks, and Salesforce Functions takes care of everything else necessary to invoke your code in a secure, multi-tenant aware, and self-scaling environment. For more details on Salesforce Functions, see Salesforce Functions.

The following are the classes in the functions namespace.

IN THIS SECTION:

- **Function Class**
  Use the Function class to access deployed Salesforce Functions, and invoke them synchronously or asynchronously.

- **FunctionCallback Interface**
  Represents the callback Salesforce calls when an asynchronous, queued Function invocation has completed.

- **FunctionErrorType Enum**
  Represents the error type of FunctionInvocationError.

- **FunctionInvocation Interface**
  Use FunctionInvocation to get the status and results of a synchronous or asynchronous Function invocation.

- **FunctionInvocationError Interface**
  Use FunctionInvocationError to get detailed error information about a failed Function invocation.

- **FunctionInvocationStatus Enum**
  Represents the status of a Function invocation.

- **FunctionInvokeMock Interface**
  Use the FunctionInvokeMock interface to mock Salesforce Functions responses during testing.

- **MockFunctionInvocationFactory Class**
  Use the MockFunctionInvocationFactory methods to generate appropriate mock responses for testing Salesforce Functions.

Function Class

Use the Function class to access deployed Salesforce Functions, and invoke them synchronously or asynchronously.

Namespace

functions

Usage

The Function class represents an instance of a deployed Function you can invoke from your org. You can invoke Functions synchronously, or asynchronously using asynchronous Apex.

If your Function takes longer than 2 minutes to return, the request will time out. To avoid timing out, consider using asynchronous invocation. Invoking a Function asynchronously doesn’t count against asynchronous Apex limits, such as Apex Queueable limits.
Before synchronously invoking a Function, commit any pending data operations in Apex, otherwise you will get a CalloutException. For asynchronous invocations, the queued invocation won’t happen if the Apex transaction is not committed. Any data operations that happen in the Function itself are not considered part of the Apex transaction.

Functions cannot be invoked in an Apex test. A “Function invocations from Apex tests are not supported” CalloutException is thrown if Apex determines that a Function is being invoked during a test. If you must run tests against code that invokes Functions you’ll need to mock your Function invocations during the tests. See FunctionInvocation Example Implementation for an example of a mocked FunctionInvocation that you can use in testing.

**Example**

The following example synchronously invokes a deployed “accountfunction” Function:

```java
functions.Function accountFunction = functions.Function.get('MyProject.accountfunction');
functions.FunctionInvocation invocation = accountFunction.invoke('{ "accountName" : "Acct",  
  "contactName" : "MyContact", "opportunityName" : "Oppty" }');
String jsonResponse = invocation.getResponse();
```

The following example asynchronously invokes a deployed “AccountFunction” Function, using the provided callback:

```java
functions.Function accountFunction = functions.Function.get('MyProject.accountfunction');
accountFunction.invoke('{ "accountName" : "Acct", "contactName" : "MyContact",  
  "opportunityName" : "Oppty" }', new MyCallback());

public class MyCallback  
  implements functions.FunctionCallback { 
    public void handleResponse(functions.FunctionInvocation result) {
    // Handle result of function invocation
    // ...
    }
  }
```

**IN THIS SECTION:**

  Function Methods

**Function Methods**

The following are methods for `Function`.

**IN THIS SECTION:**

  `get(functionName)`
  Returns the Function instance for the named Function and Project. The Function must be properly deployed and have appropriate permissions to work with the org running your Apex code.

  `get(namespace, functionName)`
  Returns the Function instance for the named Function, Project, and Namespace. The Function must be properly deployed and have appropriate permissions to work with the org running your Apex code.

  `invoke(payload, callback)`
  Invokes the Function asynchronously.
invoke(payload)
Invokes the Function synchronously.

get(functionName)
Returns the Function instance for the named Function and Project. The Function must be properly deployed and have appropriate permissions to work with the org running your Apex code.

**Signature**

```java
public static functions.Function get(String functionName)
```

**Parameters**

- **functionName**
  - Type: String
  - The name of the Salesforce Function and the Functions Project that the Function is part of. The format of the parameter string is "project name.function name". For example, to retrieve the `generatepdf` Function in the `Onboarding` Function Project, use `Onboarding.generatepdf`. The Function and Project must be deployed to a compute environment connected to the org.

**Return Value**

- Type: functions.Function
  - Returns a Function instance that you can invoke.

**Usage**

The `Function.get()` method can throw the following exceptions:

- **InvalidParameterValueException** — The `functionName` parameter doesn’t have the correct `project name.function name` format.
- **NoDataFoundException** — The project or Function name provided in the `functionName` parameter couldn’t be found. Make sure the project and Function name are spelled correctly and that the project and Function have been properly deployed.

get(namespace, functionName)
Returns the Function instance for the named Function, Project, and Namespace. The Function must be properly deployed and have appropriate permissions to work with the org running your Apex code.

**Signature**

```java
public static functions.Function get(String namespace, String functionName)
```

**Parameters**

- **namespace**
  - Type: String
  - The name of the Namespace that both the Salesforce Function and the Functions Project are part of. The org the Function is in must be global to access across namespaces. Default value is the same org where the method is being called.
**Function Name**

Type: String

The name of the Salesforce Function and the Functions Project that the Function is part of. The format of the parameter string is "**project name.function name**". For example, to retrieve the `generatepdf` Function in the `Onboarding` Function Project, use `Onboarding.generatepdf`. The Function and Project must be deployed to a compute environment connected to the org.

**Return Value**

Type: functions.Function

Returns a Function instance that you can invoke.

**Usage**

The `Function.get()` method can throw the following exceptions:

- **InvalidParameterValueException** — The `functionName` parameter doesn’t have the correct **project name.function name** format.
- **NoDataFoundException** — The project or Function name provided in the `functionName` parameter couldn’t be found. Make sure the project and Function name are spelled correctly and that the project and Function have been properly deployed.
- **RuntimeException** — The function is **public** yet references a function across namespaces. Make sure to retrieve references across namespaces only in a global org.

**invoke(payload, callback)**

Invokes the Function asynchronously.

**Signature**

```java
public functions.FunctionInvocation invoke(String payload, functions.FunctionCallback callback)
```

**Parameters**

- **payload**
  
  Type: String
  
  The payload data that gets passed to the Function. Specify your payload data in a JSON-format string.

- **callback**
  
  Type: functions.FunctionCallback
  
  A FunctionCallback implementation that gets called when your Function is invoked asynchronously.

**Return Value**

Type: functions.FunctionInvocation

Returns a FunctionInvocation that contains information about the results of the invocation, such as the Function response, or error results.
Usage

The `Function.invoke(payload, callback)` method can throw the following exceptions:

- **CalloutException** — One of the following conditions causes this exception to be thrown:
  - Salesforce Functions isn’t enabled on the current org. For more details on enabling Functions, see [Configure Orgs for Functions](#) in the Functions Developer Guide.
  - The Function is being invoked in an Apex test. Functions can’t be invoked in tests.
  - The “Functions” permission set is missing or has incorrect permissions for `FunctionInvocationRequest`. For more details on the correct permissions for `FunctionInvocationRequest` see [Function Permissions](#) in the Functions Developer Guide.
  - The provided payload isn’t valid JSON.
  - The Function hasn’t completed deployment to a compute environment or invocation request returns a 404 HTTP error.

- **InvalidParameterValueException** — The `callback` parameter is null or references a class that doesn’t implement `functions.FunctionCallback`.

- **NoDataFoundException** — A reference for the Function couldn’t be found in the current org. Make sure the project and Function have been properly deployed.

### `invoke(payload)`

Invokes the Function synchronously.

### Signature

```java
public functions.FunctionInvocation invoke(String payload)
```

### Parameters

- **payload**
  - Type: `String`
  - The payload data that gets passed to the Function. Specify your payload data in a JSON-format string.

### Return Value

Type: `functions.FunctionInvocation`  
Returns a `FunctionInvocation` that contains information about the results of the invocation, such as the Function response, or error results.

Usage

The `Function.invoke(payload)` method can throw the following exceptions:

- **CalloutException** — One of the following conditions causes this exception to be thrown:
  - Salesforce Functions isn’t enabled on the current org. For more details on enabling Functions, see [Configure Orgs for Functions](#) in the Functions Developer Guide.
  - The Function is being invoked in an Apex test. Functions can’t be invoked in tests.
  - The provided payload isn’t valid JSON.
  - There are pending DML operations.
The Function is being synchronously invoked from an Apex trigger.
The Function hasn’t completed deployment to a compute environment or invocation request returns a 404 HTTP error.
The Function request returns a 5xx HTTP error.
The Function invocation has exceeded the time limit for synchronous invocations. For details on the time limit and work-arounds, see Limits in the Functions Developer Guide.

- NoDataFoundException — A reference for the Function couldn’t be found in the current org. Make sure the project and Function have been properly deployed.

FunctionCallback Interface

Represents the callback Salesforce calls when an asynchronous, queued Function invocation has completed.

Namespace

functions

Usage

When invoking Functions asynchronously via `Function.invoke(payload, callback)`, you provide your own class that implements FunctionCallback.

IN THIS SECTION:
- FunctionCallback Methods
- FunctionCallback Example Implementation

FunctionCallback Methods

The following are methods for FunctionCallback.

IN THIS SECTION:
- `handleResponse(var1)`
  Called when an asynchronous Function invocation has completed.

**handleResponse (var1)**

Called when an asynchronous Function invocation has completed.

**Signature**

```java
public void handleResponse(functions.FunctionInvocation var1)
```

**Parameters**

- `var1`
  Type: `functions.FunctionInvocation`
The result parameter contains JSON response information and error information.

**Return Value**
Type: void

**FunctionCallback Example Implementation**
This is an example implementation of the functions.FunctionCallback interface.

```java
public class MyCallback
   implements functions.FunctionCallback {
   public void handleResponse(functions.FunctionInvocation result) {
      // Handle result of function invocation
      String jsonResponse = result.getResponse();
      System.debug('Got response ' + jsonResponse);
      JSONParser parser = JSON.createParser(jsonResponse);
      // Process JSON using your own data class...
   }
}
```

The following example uses this implementation when invoking a Function asynchronously:

```java
myFunction.invoke('{ "accountName" : "Acct", "contactName" : "MyContact", "opportunityName" : "Oppty" }', new MyCallback());
```

**FunctionErrorType Enum**
Represents the error type of FunctionInvocationError.

**Enum Values**
These are the values of the functions.FunctionErrorType enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUNCTION_EXCEPTION</td>
<td>A known exception resulting from the Function logic itself. Examples include an exception thrown from the Function code, or an exception thrown from a library or framework the Function uses.</td>
</tr>
<tr>
<td>RUNTIME_EXCEPTION</td>
<td>A known exception resulting from the Salesforce Functions runtime. For example, a malformed payload passed to the Function when invoked results in this error type.</td>
</tr>
<tr>
<td>UNEXPECTED_FUNCTION_EXCEPTION</td>
<td>An unknown exception. For example, a network or system-level issue within the Salesforce Functions infrastructure results in this error type.</td>
</tr>
</tbody>
</table>

**FunctionInvocation Interface**
Use FunctionInvocation to get the status and results of a synchronous or asynchronous Function invocation.
Namespace
functions

Usage
The results of a Function invocation are passed back via FunctionInvocation. Use this instance to determine if the invocation was successful, and any results from the Function invocation.

You can also implement your own FunctionInvocation interface if you run Apex tests with your Function invocation code. Your test code can create and use your own FunctionInvocation instance in place of using the results from a call to Function.invoke().

IN THIS SECTION:
  FunctionInvocation Methods
  FunctionInvocation Example Implementation

FunctionInvocation Methods
The following are methods for FunctionInvocation.

IN THIS SECTION:
  getError()
  getInvocationId()
  getResponse()
  getStatus()

getError()
Returns error information for a Function invocation.

Signature
public functions.FunctionInvocationError getError()

Return Value
Type: functions.FunctionInvocationError
Contains a FunctionInvocationError instance that you can use to get information about any invocation errors. If the Function was invoked successfully, the returned instance is null.

getInvocationId()
Returns the invocation ID of the Function invocation.
**Signature**

```java
public String getInvocationId()
```

**Return Value**

Type: `String`

This ID is available after a call to either the synchronous or asynchronous `Function.invoke()` methods. For asynchronous invocations, this ID can be used to check the status of the queued invocation.

**getResponse()**

Returns the response string of the Function invocation.

**Signature**

```java
public String getResponse()
```

**Return Value**

Type: `String`

The response string is the raw request JSON response, which can be parsed using the `JSONParser` Class.

**getStatus()**

Returns the status of the Function invocation.

**Signature**

```java
public functions.FunctionInvocationStatus getStatus()
```

**Return Value**

Type: `functions.FunctionInvocationStatus`

The result of the invocation, such as `FunctionInvocationStatus.SUCCESS` or `FunctionInvocationStatus.ERROR`.

**FunctionInvocation Example Implementation**

This is an example implementation of the `functions.FunctionInvocation` interface.

```java
public class MyFunctionInvocationError implements functions.FunctionInvocationError {
    public String getMessage() {
        return 'Mock error message for testing';
    }
    public functions.FunctionErrorType getType() {
        return functions.FunctionErrorType.FUNCTION_EXCEPTION;
    }
}

public class MyFunctionInvocation
```
```java
implements functions.FunctionInvocation {
    public functions.FunctionInvocationStatus getStatus() {
        return functions.FunctionInvocationStatus.ERROR;
    }
    public String getResponse() {
        return 'Mock response for testing';
    }
    public String getInvocationId() {
        return 'MOCKTESTID';
    }
    public functions.FunctionInvocationError getError() {
        functions.FunctionInvocationError testError = new MyFunctionInvocationError();
        return testError;
    }
}
```

The following example tests the implementation:

```java
functions.FunctionInvocation testInvocation = new MyFunctionInvocation();
if (testInvocation.getStatus() == functions.FunctionInvocationStatus.ERROR) {
    System.debug('Error: ' + (testInvocation.getError() != null ? testInvocation.getError().getMessage() : 'UNKNOWN'));
    return;
}
```

**FunctionInvocationError Interface**

Use FunctionInvocationError to get detailed error information about a failed Function invocation.

**Namespace**

`functions`

**Usage**

FunctionInvocationError contains various error information such as the error message at the time of the error.

**IN THIS SECTION:**

- FunctionInvocationError Methods
- FunctionInvocationError Example Implementation

**FunctionInvocationError Methods**

The following are methods for `FunctionInvocationError`.

**IN THIS SECTION:**

- `getMessage()`
  Returns the error message from a Function invocation error.
**getMessage()**
Returns the error message from a Function invocation error.

**Signature**
```java
public String getMessage()
```

**Return Value**
Type: String

**getType()**
Returns the error type for FunctionInvocationError.

**Signature**
```java
public functions.FunctionErrorType getType()
```

**Return Value**
Type: functions.FunctionErrorType

### FunctionInvocationError Example Implementation
This is an example implementation of the `functions.FunctionInvocationError` interface.

```java
public class MyFunctionInvocationError implements functions.FunctionInvocationError {
    public String getMessage() {
        return 'Mock error message for testing';
    }
    public functions.FunctionErrorType getType() {
        return functions.FunctionErrorType.FUNCTION_EXCEPTION;
    }
}
```

This example tests the implementation.

```java
functions.FunctionInvocationError testError = new MyFunctionInvocationError();
System.debug('Error: ' + testError.getMessage() + ' Type: ' + testError.getType());
```

### FunctionInvocationStatus Enum
Represents the status of a Function invocation.
Enum Values

The following are the values of the `functions.FunctionInvocationStatus` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERROR</td>
<td>The invocation failed. Check the <code>FunctionInvocation</code> and <code>FunctionInvocationError</code> returned by the invoke call to debug the issue.</td>
</tr>
<tr>
<td>PENDING</td>
<td>The invocation is pending. If the Function is being invoked asynchronously, the invocation is still in the asynch queue.</td>
</tr>
<tr>
<td>SUCCESS</td>
<td>The invocation succeeded. Use <code>FunctionInvocation.getResponse()</code> with the <code>FunctionInvocation</code> instance returned by the invoke call to get any response returned by the Function.</td>
</tr>
</tbody>
</table>

FunctionInvokeMock Interface

Use the `FunctionInvokeMock` interface to mock Salesforce Functions responses during testing.

Namespace

`functions`

Usage

To mock Salesforce Functions testing, implement an appropriate mock response in the `respond(functionName, payload)` method of the `FunctionInvokeMock` interface. During mock testing of a Salesforce Functions, Apex runtime sends the response specified in the `respond()` method, rather than invoking the function itself. Appropriate success and error messages can be configured with the `createSuccessResponse(invocationId, message)` and `createErrorResponse(invocationId, functionsErrorType, errorMsg)` methods in `Functions.MockFunctionInvocationFactory`.

IN THIS SECTION:
- FunctionInvokeMock Methods
- FunctionInvokeMock Example Implementation

FunctionInvokeMock Methods

The following are methods for `FunctionInvokeMock`.

IN THIS SECTION:
- `respond(functionName, payload)`
  The mock response implemented in the `functions.FunctionInvokeMock` interface. The response is sent by Apex runtime when the `Test.setMock()` method is called.
respond(functionName, payload)

The mock response implemented in the Functions.FunctionInvokeMock interface. The response is sent by Apex runtime when the Test.setMock() method is called.

**Signature**

```
public functions.FunctionInvocation respond(String functionName, String payload)
```

**Parameters**

- **functionName**
  - Type: String
  - The name of the Salesforce Function and the Functions Project that the Function is part of. The format of the parameter string is "project name.function name".

- **payload**
  - Type: String
  - The JSON-format payload data that is passed to the Function.

**Return Value**

Type: FunctionInvocation Interface

The result of the mock call to Salesforce Functions. Appropriate responses can be generated by using the createSuccessResponse() and createErrorResponse() methods in the Functions.MockFunctionInvocationFactory class.

**FunctionInvokeMock Example Implementation**

This is sample implementation of the functions.FunctionInvokeMock interface.

```java
@isTest
public class FunctionsInvokeMockImpl implements functions.FunctionInvokeMock {
    public functions.FunctionInvocation respond(String functionName, String payload) {
        // return mock success response
        String invocationId = '00000000000000000000000000000000';
        String response = 'mockResponse';
        return functions.MockFunctionInvocationFactory.createSuccessResponse(invocationId, response);
    }
}
```

This example shows the minimal setup required for testing synchronous and asynchronous functions and is simplified to include both function invocations and the FunctionCallback class.

```java
@isTest
public class FunctionTest {
    @isTest
    static void testSyncFunctionCall() {
        // Set mock class to respond to function invocations
        Test.setMock( functions.FunctionInvokeMock.class, new FunctionsInvokeMockInner() );
    }
}
```
functions.Function mockedFunction = functions.Function.get('example.function');

Test.startTest();
// Synchronous function call
functions.FunctionInvocation invokeResult = mockedFunction.invoke('{}');
Test.stopTest();

// Verify that the received response contains expected mock values
System.assertEquals(functions.FunctionInvocationStatus.SUCCESS,
                      invokeResult.getStatus());
System.assertEquals('mockResponse', invokeResult.getResponse());
System.assertEquals('000000000000000', invokeResult.getInvocationId());

@Test
static void testAsyncFunctionCall() {
// Set mock class to respond to function invocations
Test.setMock( functions.FunctionInvokeMock.class, new
FunctionsInvokeMockInner());

functions.Function mockedFunction = functions.Function.get('example.function2');

Test.startTest();
// Asynchronous function invocation with callback
mockedFunction.invoke('{}', new DemoCallback());
Test.stopTest();
// Include assertions here about the expected callback processing
}

public class DemoCallback implements functions.FunctionCallback {
public void handleResponse(functions.FunctionInvocation invokeResult) {
  // Handle result of function invocation
  // The callback is included in the example here for convenience
  // It would normally be defined in the classes being tested

  // Verify that the received response contains expected mock values
  System.assertEquals(invokeResult.getStatus(),
                      functions.FunctionInvocationStatus.ERROR);
  functions.FunctionInvocationError resultError = invokeResult.getError();
  System.assertEquals('bang', invokeResult.getError().getMessage());
  System.assertEquals('000000000000000', invokeResult.getInvocationId());
}
}

public class FunctionsInvokeMockInner implements functions.FunctionInvokeMock {
public functions.FunctionInvocation respond(String functionName, String payload) {
  // return mock success response
String invocationId = '000000000000000';

if(functionName == 'example.function2') {
    return functions.MockFunctionInvocationFactory.createErrorResponse(
        invocationId,
        functions.FunctionErrorType.FUNCTION_EXCEPTION,
        'bang');
}

String response = 'mockResponse';
return functions.MockFunctionInvocationFactory.createSuccessResponse(invocationId, response);

MockFunctionInvocationFactory Class

Use the MockFunctionInvocationFactory methods to generate appropriate mock responses for testing Salesforce Functions.

Namespace

functions

Usage

To mock Salesforce Functions testing, implement an appropriate mock response in the respond(functionName,payload) method of the FunctionInvokeMock interface. During mock testing of a Salesforce Functions, the Apex runtime sends the response specified in the respond() method, rather than invoking the function itself. Appropriate success and error messages can be configured with the createSuccessResponse(invocationId,message) and createErrorResponse(invocationId,functionsErrorType,errorMsg) methods.

See FunctionInvokeMock Example Implementation.

MockFunctionInvocationFactory Methods

The following are methods for MockFunctionInvocationFactory.

createErrorResponse(invocationId, functionsErrorType, errorMsg)
Generate a response for an error condition during mock testing of Salesforce Functions.
createSuccessResponse(invocationId, response)
Generate a response for a successful mock test of Salesforce Functions.

createErrorResponse(invocationId, functionsErrorType, errMsg)
Generate a response for an error condition during mock testing of Salesforce Functions.

Signature
public static functions.FunctionInvocation createErrorResponse(String invocationId, functions.FunctionErrorType functionsErrorType, String errMsg)

Parameters
invocationId
Type: String
The ID associated with a call to either the synchronous or asynchronous Function.invoke() method.

functionsErrorType
Type: FunctionErrorType Enum
The error type of FunctionInvocationError.

eerrMsg
Type: String
The error message.

Return Value
Type: FunctionInvocation Interface

createSuccessResponse(invocationId, response)
Generate a response for a successful mock test of Salesforce Functions.

Signature
public static functions.FunctionInvocation createSuccessResponse(String invocationId, String response)

Parameters
invocationId
Type: String
The ID associated with a call to either the synchronous or asynchronous Function.invoke() method.

response
Type: String
The message indicating success.
Return Value
Type: FunctionInvocation Interface

Invocable Namespace

The Invocable namespace provides classes for calling invocable actions from Apex. These classes are in the Invocable namespace.

IN THIS SECTION:
  Action Class
  Contains methods to create, update, and retrieve information about invocable actions.
  Action.Error Class
  Contains methods to retrieve errors returned by invocable actions.
  Action.Result Class
  Contains methods to retrieve results from invocable actions called from Apex code.

Action Class
Contains methods to create, update, and retrieve information about invocable actions.

Namespace
Invocable

IN THIS SECTION:
  Action Methods

SEE ALSO:
  Apex Developer Guide: InvocableMethod Annotation

Action Methods
These methods are for Action.

IN THIS SECTION:
  addInvocation()
  Creates an empty invocation in preparation for calling an invocable action. After you create the invocation, you can add parameters to the invocation.
  clearInvocations()
  Clears the existing invocations from the action.
  clone()
  Creates a copy of the Invocable.Action.
createCustomAction(type, namespace, name)
Creates a wrapper for a custom invocable action in a specified namespace.

createCustomAction(type, name)
Creates a wrapper for a custom invocable action.

createStandardAction(type)
Creates a wrapper for a standard invocable action.

getName()
Gets the name of an invocable action.

getNamespace()
Gets the namespace of a custom invocable action.

getType()
Gets the type of an invocable action.

invoke()
Invokes an invocable action from Apex code.

isStandard()
Determines whether an invocable action is a standard invocable action.

setInvocationParameter(parameterName, parameterValue)
Sets a value for an invocable action parameter.

setInvocations(invocations)
Initializes the invocations for an action from a pre-existing list of invocations.

addInvocation()
Creates an empty invocation in preparation for calling an invocable action. After you create the invocation, you can add parameters to the invocation.

Signature
public Invocable.Action addInvocation()

Return Value
Type: Invocable.Action on page 2232

clearInvocations()
Clears the existing invocations from the action.

Signature
public Invocable.Action clearInvocations()

Return Value
Type: Invocable.Action on page 2232
**clone()**

Creates a copy of the Invocable.Action.

**Signature**

```java
public Object clone()
```

**Return Value**

Type: Object

---

**createCustomAction(type, namespace, name)**

Creates a wrapper for a custom invocable action in a specified namespace.

**Signature**

```java
public static Invocable.Action createCustomAction(String type, String namespace, String name)
```

**Parameters**

- **type**
  - Type: String
  - Type of invocable action.
- **namespace**
  - Type: String
  - Namespace where the invocable action is located.
- **name**
  - Type: String
  - Name for the custom invocable action.

**Return Value**

Type: Invocable.Action

---

**createCustomAction(type, name)**

Creates a wrapper for a custom invocable action.

**Signature**

```java
public static Invocable.Action createCustomAction(String type, String name)
```

**Parameters**

- **type**
  - Type: String
Type of invocable action.

name
  Type: String
  Name for the custom invocable action.

Return Value
Type: Invocable.Action

createStandardAction(type)
Creates a wrapper for a standard invocable action.

Signature
public static Invocable.Action createStandardAction(String type)

Parameters
type
  Type: String
  Type of invocable action.

Return Value
Type: Invocable.Action

getName()
Gets the name of an invocable action.

Signature
public String getName()

Return Value
Type: String
Name of the invocable action.

getNamespace()
Gets the namespace of a custom invocable action.

Signature
public String getNamespace()
Return Value
Type: String
Namespace of the custom invocable action.

**getType()**
Gets the type of an invocable action.

**Signature**
```
public String getType()
```

Return Value
Type: String
Type of invocable action.

**invoke()**
Invokes an invocable action from Apex code.

**Signature**
```
public List<Invocable.Action.Result> invoke()
```

Return Value
Type: List<Invocable.Action.Result>

**isStandard()**
Determines whether an invocable action is a standard invocable action.

**Signature**
```
public Boolean isStandard()
```

Return Value
Type: Boolean
This method returns `true` if the invocable action is a standard invocable action.

**setInvocationParameter(parameterName, parameterValue)**
Sets a value for an invocable action parameter.
**Signature**

```java
public Invocable.Action setInvocationParameter(String parameterName, Object parameterValue)
```

**Parameters**

- `parameterName`
  - Type: `String`
  - Name of the invocable action parameter to set.

- `parameterValue`
  - Type: `Object`
  - Value to set the invocable action parameter to.

**Return Value**

Type: `Invocable.Action` on page 2232

**setInvocations(invocations)**

Initializes the invocations for an action from a pre-existing list of invocations.

**Signature**

```java
public Invocable.Action setInvocations(List<Map<String,ANY>> invocations)
```

**Parameters**

- `invocations`
  - Type: `List` on page 3177 `<Map` on page 3198 `<String` on page 3402,ANY`>`
  - List of invocations for the invocable action.

**Return Value**

Type: `Invocable.Action` on page 2232

**Action.Error Class**

Contains methods to retrieve errors returned by invocable actions.

**Namespace**

`Invocable`

IN THIS SECTION:

- Action.Error Methods
Action.Error Methods

These methods are for Action.Error.

IN THIS SECTION:

- **getCode()**: Gets the error code returned by an invocable action.
- **getMessage()**: Gets the error message returned by an invocable action.

**clone()**

**Signature**

```java
public Object clone()
```

**Return Value**

Type: Object

**getCode()**

Gets the error code returned by an invocable action.

**Signature**

```java
public String getCode()
```

**Return Value**

Type: String

**getMessage()**

Gets the error message returned by an invocable action.

**Signature**

```java
public String getMessage()
```

**Return Value**

Type: String
**Action.Result Class**

Contains methods to retrieve results from invocable actions called from Apex code.

**Namespace**

Invocable

**IN THIS SECTION:**

*Action.Result Methods*

**Action.Result Methods**

The methods are for `Action.Result`.

**IN THIS SECTION:**

- `clone()`
- `getAction()`
  Gets the invocable action that was invoked and caused a result to be returned.
- `getErrors()`
  Gets a list of errors that were returned by an invocable action.
- `getInvocationParameters()`
  Gets a list of the parameter values set for an invocable action. This method returns a list that contains the input parameter values for each invocation of an action. Each map in the list contains a key for the name of each input parameter.
- `getOutputParameters()`
  Gets a list of the parameter values returned by an invocable action. This method returns a list that contains the result for each invocation of an action. Each map in the list contains a key for the name of each output parameter.
- `isSuccess()`
  Determines if an invocable action ran without errors.

**clone()**

**Signature**

```java
public Object clone()
```

**Return Value**

Type: Object
**getAction()**
Gets the invocable action that was invoked and caused a result to be returned.

**Signature**

```java
public Invocable.Action getAction()
```

**Return Value**
Type: `Invocable.Action` on page 2232

**getErrors()**
Gets a list of errors that were returned by an invocable action.

**Signature**

```java
public List<Invocable.Action.Error> getErrors()
```

**Return Value**
Type: `List<Invocable.Action.Error>` on page 2237

**getInvocationParameters()**
Gets a list of the parameter values set for an invocable action. This method returns a list that contains the input parameter values for each invocation of an action. Each map in the list contains a key for the name of each input parameter.

**Signature**

```java
public Map<String, Object> getInvocationParameters()
```

**Return Value**
Type: `Map<String, Object>` on page 3198

**getOutputParameters()**
Gets a list of the parameter values returned by an invocable action. This method returns a list that contains the result for each invocation of an action. Each map in the list contains a key for the name of each output parameter.

**Signature**

```java
public Map<String, Object> getOutputParameters()
```

**Return Value**
Type: `Map<String, Object>` on page 3198
**isSuccess()**
Determines if an invocable action ran without errors.

**Signature**

```java
public Boolean isSuccess()
```

**Return Value**

Type: Boolean

This method returns `true` if the invocable action ran successfully.

---

**KbManagement Namespace**

The `KbManagement` namespace provides a class for managing knowledge articles.

The following is the class in the `KbManagement` namespace.

---

**IN THIS SECTION:**

- PublishingService Class
  - Use the methods in the `KbManagement.PublishingService` class to manage the lifecycle of an article and its translations.

**PublishingService Class**

Use the methods in the `KbManagement.PublishingService` class to manage the lifecycle of an article and its translations.

**Namespace**

`KbManagement`

**Usage**

Use the methods in the `KbManagement.PublishingService` class to manage the following parts of the lifecycle of an article and its translations:

- Publishing
- Updating
- Retrieving
- Deleting
- Submitting for translation
- Setting a translation to complete or incomplete status
- Archiving
- Assigning review tasks for draft articles or translations

**Note:** Date values are based on GMT.
To use the methods in this class, you must enable Salesforce Knowledge. See Salesforce Knowledge Implementation Guide for more information on setting up Salesforce Knowledge.

**PublishingService Methods**

The following are methods for `PublishingService`. All methods are static.

**IN THIS SECTION:**

- `archiveOnlineArticle(articleId, scheduledDate)`: Archives an online version of an article. If the specified scheduledDate is null, the article is archived immediately. Otherwise, it archives the article on the scheduled date.
- `assignDraftArticleTask(articleId, assigneeId, instructions, dueDate, sendEmailNotification)`: Assigns a review task related to a draft article.
- `assignDraftTranslationTask(articleVersionId, assigneeId, instructions, dueDate, sendEmailNotification)`: Assigns a review task related to a draft translation.
- `cancelScheduledArchivingOfArticle(articleId)`: Cancels the scheduled archiving of an online article.
- `cancelScheduledPublicationOfArticle(articleId)`: Cancels the scheduled publication of a draft article.
- `completeTranslation(articleVersionId)`: Puts a translation in a completed state that is ready to publish.
- `deleteArchivedArticle(articleId)`: Deletes an archived article.
- `deleteArchivedArticleVersion(articleId, versionNumber)`: Deletes a specific archived version of a published article.
- `deleteDraftArticle(articleId)`: Deletes a draft article.
- `deleteDraftTranslation(articleVersionId)`: Deletes a draft translation.
- `editArchivedArticle(articleId)`: Creates a draft article from the archived primary version and returns the new draft primary version ID of the article.
- `editOnlineArticle(articleId, unpublish)`: Creates a draft article from the online version and returns the new draft primary version ID of the article. Also, unpublishes the online article, if `unpublish` is set to `true`.
- `editPublishedTranslation(articleId, language, unpublish)`: Creates a draft version of the online translation for a specific language and returns the new draft primary version ID of the article. Also, unpublishes the article, if set to `true`.
- `publishArticle(articleId, flagAsNew)`: Publishes an article. If `flagAsNew` is set to `true`, the article is published as a major version.
- `restoreOldVersion(articleId, versionNumber)`: Creates a draft article from an existing online article based on the specified archived version of the article and returns the article version ID.
scheduleForPublication(articleId, scheduledDate)
Schedules the article for publication as a major version. If the specified date is null, the article is published immediately.

setTranslationToIncomplete(articleVersionId)
Sets a draft translation that is ready for publication back to “in progress” status.

submitForTranslation(articleId, language, assigneeId, dueDate)
Submits an article for translation to the specified language. Also assigns the specified user and due date to the submittal and returns new ID of the draft translation.

archiveOnlineArticle(articleId, scheduledDate)
Archives an online version of an article. If the specified scheduledDate is null, the article is archived immediately. Otherwise, it archives the article on the scheduled date.

Signature
public static Void archiveOnlineArticle(String articleId, Datetime scheduledDate)

Parameters

articleId
Type: String

scheduledDate
Type: Datetime

Return Value
Type: Void

Example
String articleId = 'Insert article ID';
Datetime scheduledDate = Datetime.newInstanceGmt(2012, 12, 13, 13, 30, 0);
KbManagement.PublishingService.archiveOnlineArticle(articleId, scheduledDate);

assignDraftArticleTask(articleId, assigneeId, instructions, dueDate, sendEmailNotification)
Assigns a review task related to a draft article.

Signature
public static Void assignDraftArticleTask(String articleId, String assigneeId, String instructions, Datetime dueDate, Boolean sendEmailNotification)

Parameters

articleId
Type: String
assigneeId
Type: String

instructions
Type: String

dueDate
Type: Datetime

sendEmailNotification
Type: Boolean

Return Value
Type: Void

Example

String articleId = 'Insert article ID';
String assigneeId = '';
String instructions = 'Please review this draft.';
Datetime dueDate = Datetime.newInstanceGmt(2012, 12, 1);
KbManagement.PublishingService.assignDraftArticleTask(articleId, assigneeId, instructions, dueDate, true);

assignDraftTranslationTask(articleVersionId, assigneeId, instructions, dueDate, sendEmailNotification)

Assigns a review task related to a draft translation.

Signature

public static Void assignDraftTranslationTask(String articleVersionId, String assigneeId, String instructions, Datetime dueDate, Boolean sendEmailNotification)

Parameters

articleVersionId
Type: String

assigneeId
Type: String

instructions
Type: String

dueDate
Type: Datetime

sendEmailNotification
Type: Boolean
Return Value
Type: Void

Example
String articleId = 'Insert article ID';
String assigneeId = 'Insert assignee ID';
String instructions = 'Please review this draft.';
Datetime dueDate = Datetime.newInstanceGmt(2012, 12, 1);
KbManagement.PublishingService.assignDraftTranslationTask(articleId, assigneeId, instructions, dueDate, true);

cancelScheduledArchivingOfArticle(articleId)
Cancels the scheduled archiving of an online article.

Signature
public static Void cancelScheduledArchivingOfArticle(String articleId)

Parameters
articleId
Type: String

Return Value
Type: Void

Example
String articleId = 'Insert article ID';
KbManagement.PublishingService.cancelScheduledArchivingOfArticle(articleId);

cancelScheduledPublicationOfArticle(articleId)
Cancels the scheduled publication of a draft article.

Signature
public static Void cancelScheduledPublicationOfArticle(String articleId)

Parameters
articleId
Type: String

Return Value
Type: Void
Example

```java
String articleId = 'Insert article ID';
KbManagement.PublishingService.cancelScheduledPublicationOfArticle (articleId);
```

cancelScheduledPublicationOfArticle(articleId)

Puts a translation in a completed state that is ready to publish.

Signature

```java
public static Void cancelScheduledPublicationOfArticle(String articleId)
```

Parameters

- **articleId**
  - Type: String

Return Value

Type: Void

Example

```java
String articleId = 'Insert article ID';
KbManagement.PublishingService.cancelScheduledPublicationOfArticle (articleId);
```

completeTranslation(articleVersionId)

Puts a translation in a completed state that is ready to publish.

Signature

```java
public static Void completeTranslation(String articleVersionId)
```

Parameters

- **articleVersionId**
  - Type: String

Return Value

Type: Void

Example

```java
String articleVersionId = 'Insert article ID';
KbManagement.PublishingService.completeTranslation(articleVersionId);
```

deleteArchivedArticle(articleId)

Deletes an archived article.

Signature

```java
public static Void deleteArchivedArticle(String articleId)
```

Parameters

- **articleId**
  - Type: String

Return Value

Type: Void

Example

```java
String articleId = 'Insert article ID';
KbManagement.PublishingService.deleteArchivedArticle(articleId);
```
**deleteArchivedArticleVersion(articleId, versionNumber)**

Deletes a specific archived version of a published article.

**Signature**

```java
public static Void deleteArchivedArticleVersion(String articleId, Integer versionNumber)
```

**Parameters**

- **articleId**
  Type: String
- **versionNumber**
  Type: Integer

**Return Value**

Type: Void

**Example**

```java
String articleId = 'Insert article ID';
Integer versionNumber = 1;
KbManagement.PublishingService.deleteArchivedArticleVersion(articleId, versionNumber);
```

**deleteDraftArticle(articleId)**

Deletes a draft article.

**Signature**

```java
public static Void deleteDraftArticle(String articleId)
```

**Parameters**

- **articleId**
  Type: String

**Return Value**

Type: Void

**Example**

```java
String articleId = 'Insert article ID';
KbManagement.PublishingService.deleteDraftArticle(articleId);
```

**deleteDraftTranslation(articleVersionId)**

Deletes a draft translation.

**Example**

```java
String articleId = 'Insert article ID';
KbManagement.PublishingService.deleteDraftTranslation(articleVersionId);
```
Signature

public static Void deleteDraftTranslation(String articleVersionId)

Parameters

articleVersionId
    Type: String

Return Value

Type: Void

Example

String articleVersionId = 'Insert article ID';
KbManagement.PublishingService.deleteDraftTranslation (articleVersionId);

editArchivedArticle(articleId)

Creates a draft article from the archived primary version and returns the new draft primary version ID of the article.

Signature

public static String editArchivedArticle(String articleId)

Parameters

articleId
    Type: String

Return Value

Type: String

Example

String articleId = 'Insert article ID';
String id = KbManagement.PublishingService.editArchivedArticle(articleId);

editOnlineArticle(articleId, unpublish)

Creates a draft article from the online version and returns the new draft primary version ID of the article. Also, unpublishes the online article, if unpublish is set to true.

Signature

public static String editOnlineArticle(String articleId, Boolean unpublish)
Parameters

- **articleId**
  - Type: String
- **unpublish**
  - Type: Boolean

Return Value

- Type: String

Example

```java
String articleId = 'Insert article ID';
String id = KbManagement.PublishingService.editOnlineArticle(articleId, true);
```

editPublishedTranslation(articleId, language, unpublish)

Creates a draft version of the online translation for a specific language and returns the new draft primary version ID of the article. Also, unpublishes the article, if set to `true`.

Signature

```java
public static String editPublishedTranslation(String articleId, String language, Boolean unpublish)
```

Parameters

- **articleId**
  - Type: String
- **language**
  - Type: String
- **unpublish**
  - Type: Boolean

Return Value

- Type: String

Example

```java
String articleId = 'Insert article ID';
String language = 'fr';
String id = KbManagement.PublishingService.editPublishedTranslation(articleId, language, true);
```

publishArticle(articleId, flagAsNew)

Publishes an article. If `flagAsNew` is set to `true`, the article is published as a major version.
Signature

`public static Void publishArticle(String articleId, Boolean flagAsNew)`

Parameters

- `articleId`
  - Type: `String`
- `flagAsNew`
  - Type: `Boolean`

Return Value

Type: `Void`

Example

```java
String articleId = 'Insert article ID';
KbManagement.PublishingService.publishArticle(articleId, true);
```

`restoreOldVersion(articleId, versionNumber)`

Creates a draft article from an existing online article based on the specified archived version of the article and returns the article version ID.

Signature

`public static String restoreOldVersion(String articleId, Integer versionNumber)`

Parameters

- `articleId`
  - Type: `String`
- `versionNumber`
  - Type: `Integer`

Return Value

Type: `String`

Example

```java
String articleId = 'Insert article ID';
String id = KbManagement.PublishingService.restoreOldVersion (articleId, 1);
```

`scheduleForPublication(articleId, scheduledDate)`

Schedules the article for publication as a major version. If the specified date is null, the article is published immediately.
**Signature**

public static Void scheduleForPublication(String articleId, Datetime scheduledDate)

**Parameters**

articleId  
Type: String  
scheduledDate  
Type: Datetime

**Return Value**

Type: Void

**Example**

```java
String articleId = 'Insert article ID';
Datetime scheduledDate = Datetime.newInstanceGmt(2012, 12, 1, 13, 30, 0);
KbManagement.PublishingService.scheduleForPublication(articleId, scheduledDate);
```

setTranslationToIncomplete(articleVersionId)

Sets a draft translation that is ready for publication back to "in progress" status.

**Signature**

public static Void setTranslationToIncomplete(String articleVersionId)

**Parameters**

articleVersionId  
Type: String

**Return Value**

Type: Void

**Example**

```java
String articleVersionId = 'Insert article ID';
KbManagement.PublishingService.setTranslationToIncomplete(articleVersionId);
```

submitForTranslation(articleId, language, assigneeId, dueDate)

Submits an article for translation to the specified language. Also assigns the specified user and due date to the submittal and returns new ID of the draft translation.
Signature

public static String submitForTranslation(String articleId, String language, String assigneeId, Datetime dueDate)

Parameters

articleId
Type: String

language
Type: String

assigneeId
Type: String

dueDate
Type: Datetime

Return Value

Type: String

Example

String articleId = 'Insert article ID';
String language = 'fr';
String assigneeId = 'Insert assignee ID';
Datetime dueDate = Datetime.newInstanceGmt(2012, 12,1);
String id = KbManagement.PublishingService.submitForTranslation(articleId, language, assigneeId, dueDate);

LxScheduler Namespace

The LxScheduler namespace provides an interface and classes for integrating Salesforce Scheduler with external calendars. The following are the classes and the interface in the LxScheduler namespace.

IN THIS SECTION:

GetAppointmentCandidatesInput Class
Contains information about the available service resources (appointment candidates) based on work type group and service territories.

GetAppointmentCandidatesInputBuilder Class
Contains methods to build an instance of the lxscheduler.GetAppointmentCandidatesInput class.

GetAppointmentSlotsInput Class
Contains information about the available appointment time slots for a resource based on given work type group and territories.

GetAppointmentSlotsInputBuilder Class
Contains methods to build an instance of the lxscheduler.GetAppointmentSlotsInput class.

SchedulerResources Class
Contains methods that holds the business logic to get resources availability.
SkillRequirement Class
Contains information about the set of skills that are required to complete a particular task for a work type.

SkillRequirementBuilder Class
Contains methods to build an instance of the `lxscheduler.SkillRequirement` class.

WorkType Class
Contains information about the type of work to be performed.

WorkTypeBuilder Class
Contains methods to build an instance of the `lxscheduler.WorkType` class.

ServiceResourceScheduleHandler Interface
Allows an implementing class to check external calendar events to find already booked time slots for the requested service resources. This interface is part of Salesforce Scheduler.

ServiceAppointmentRequestInfo Class
Represents the list of parameters that are passed to the `ServiceResourceScheduleHandler` interface. This class is implemented internally by Apex.

ServiceResourceInfo Class
Contains information about a service resource.

ServiceResourceSchedule Class
Use this class to pass results from your implemented Apex class to the `ServiceResourceScheduleHandler` interface methods.

UnavailableTimeslot Class
Use this class to pass the unavailable time slots to the `lxscheduler.ServiceResourceSchedule` class.

SEE ALSO:

Apex Interface Implementation Limitations and Error Codes

---

GetAppointmentCandidatesInput Class

Contains information about the available service resources (appointment candidates) based on work type group and service territories. Set up Salesforce Scheduler before making requests. This setup includes creating or configuring Service Resources, Service Territory Members, Work Type Groups, Work Types, Work Type Group Members, and Service Territory Work Types. See Set Up Salesforce Scheduler for more information.

The appointment time slots are determined based on multiple factors, such as field values, scheduled appointments, absences, Scheduler Settings, and Scheduling Policies to determine available time slots. See How Salesforce Scheduler Determines Available Time Slots for more information.

The following factors are considered for returning start time and end time of resources.

**Resource Availability**
Determined using service territory member, service territory, work type, and account operating hours fields.

**Resource Unavailability**
Determined by resource absences, existing appointments that the resource is assigned to. The resource must be marked as a required resource for the appointment with a status that isn’t in closed, canceled, or completed.

**Appointment Start Time Interval in the Scheduling Policy**
Appointment start time interval field in the Scheduling Policy is used to determine when the appointment can start. This interval can be 5, 10, 15, 20, 30, or 60. By default, it’s set to 15.
Work Type Duration

The end time is calculated as start time + duration of the work type.

Note: If asset scheduling is enabled, the response also includes asset-based candidates.

Namespace

LxScheduler

Usage

The constructor for this class can’t be called directly. Create an instance of this class using the GetAppointmentCandidatesInputBuilder.build() method.

This example shows how to get a list of available appointment candidates based on workTypeGroupId:

```java
//Build input for GetAppointmentCandidates API
lxscheduler.GetAppointmentCandidatesInput input = new lxscheduler.GetAppointmentCandidatesInputBuilder()
    .setWorkTypeGroupId('0VSRM0000000ABc4AM')
    .setTerritoryIds(new List<String>{'0HhRM0000000FXd0AM'})
    .setStartTime(System.now().format('yyyy-MM-ddERSIONal: T\'HH:mm:ssZ','America/New_York'))
    .setEndTime(System.now().addDays(5).format('yyyy-MM-dd\'T\'HH:mm:ssZ','America/New_York'))
    .setAccountId('001RM0000053iQgYAI')
    .setSchedulingPolicyId('0VrRM00000000Bx')
    .setApiVersion(Double.valueOf('50.0'))
    .build();

String response = lxscheduler.SchedulerResources.getAppointmentCandidates(input);
```

This example shows how to get a list of available appointment candidates based on workType:

```java
//Build WorkType
lxscheduler.WorkType workType = new lxscheduler.WorkTypeBuilder()
    .setId('08qRM0000000G9RYAU')
    .build();

lxscheduler.GetAppointmentCandidatesInput input = new lxscheduler.GetAppointmentCandidatesInputBuilder()
    .setWorkType(workType)
    .setTerritoryIds(new List<String>{'0HhRM0000000FXd0AM'})
    .setStartTime(System.now().format('yyyy-MM-dd\'T\'HH:mm:ssZ','America/New_York'))
    .setEndTime(System.now().addDays(5).format('yyyy-MM-dd\'T\'HH:mm:ssZ','America/New_York'))
    .setAccountId('001RM0000053iQgYAI')
    .setSchedulingPolicyId('0VrRM00000000Bx')
    .setApiVersion(Double.valueOf('50.0'))
    .build();

String response = lxscheduler.SchedulerResources.getAppointmentCandidates(input);
```
This example shows how to get a list of available candidate appointments based on `durationInMinutes` and without the `workTypeGroupId` or `workType` fields:

```java
//Build SkillRequirement
lxscheduler.SkillRequirement skillReq = new lxscheduler.SkillRequirementBuilder()
    .setSkillId('0C5RM0000004EZS0A2')
    .setSkillLevel(90)
    .build();

//Build WorkType
lxscheduler.WorkType workType = new lxscheduler.WorkTypeBuilder()
    .setDurationInMinutes(15)
    .setBlockTimeBeforeAppointmentInMinutes(5)
    .setBlockTimeAfterAppointmentInMinutes(5)
    .setTimeFrameStartInMinutes(10080)
    .setTimeFrameEndInMinutes(40320)
    .setOperatingHoursId('0OHRM0000000FmG4AU')
    .setSkillRequirements(new List<lxscheduler.SkillRequirement>{skillReq})
    .build();

lxscheduler.GetAppointmentCandidatesInput input = new
lxscheduler.GetAppointmentCandidatesInputBuilder()
    .setWorkType(workType)
    .setTerritoryIds(new List<String>{'0HhRM0000000FXd0AM'})
    .setSchedulingPolicyId('0VrRM00000000Bx')
    .setApiVersion(Double.valueOf('50.0'))
    .build();

String response = lxscheduler.SchedulerResources.getAppointmentCandidates(input);
```

This example shows a sample response of a list of available candidates:

```json
[
  {
    "startTime": "2021-02-16T16:15:00.000+0000",
    "endTime": "2021-02-16T16:16:00.000+0000",
    "resources": ["0Hnxx00000004C9BCAU"],
    "territoryId": "0Hhxx00000004C92CAE"
  },
  {
    "startTime": "2021-02-16T16:30:00.000+0000",
    "endTime": "2021-02-16T16:31:00.000+0000",
    "resources": ["0Hnxx00000004C9BCAU"],
    "territoryId": "0Hhxx00000004C92CAE"
  }
]
```
GetAppointmentCandidatesInputBuilder Class

Contains methods to build an instance of the lxscheduler.GetAppointmentCandidatesInput class.

A Builder object is obtained by invoking one of the GetAppointmentCandidatesInputBuilder methods defined by the GetAppointmentCandidatesInput class.

Namespace

LxScheduler

IN THIS SECTION:

GetAppointmentCandidatesInputBuilder Methods

GetAppointmentCandidatesInputBuilder Methods

The following are methods for GetAppointmentCandidatesInputBuilder.

IN THIS SECTION:

- `setAccountId(accountId)`: Sets the ID of the associated account for which you want to create the appointments.
- `setAllowConcurrent(allowConcurrent)`: Allows the scheduling of concurrent appointments.
- `setApiVersion(apiVersion)`: Sets the API version of the business logic for the getAppointmentCandidates method.
- `setCorrelationId(correlationId)`: Sets the correlation ID.
- `setEndTime(endTime)`: Sets the scheduling end time.
- `setEngagementChannelTypeIds(engagementChannelTypeIds)`: Sets an engagement channel type.
- `setFilterByResources(filterByResources)`: Enables filtering resources using a comma-separated list of service resource IDs.
- `setResourceLimitApptDistribution(resourceLimitApptDistribution)`: Sets the number of service resources to show during appointment scheduling.
- `setSchedulingPolicyId(schedulingPolicyId)`: Sets the ID of the AppointmentSchedulingPolicy object.
- `setStartTime(startTime)`: Sets the scheduling start time to the specified time.
- `setTerritoryIds(territoryIds)`: Sets the service territory IDs.
setWorkType(workType)
Sets the type of work to be performed.

setWorkTypeGroupId(workTypeGroupId)
Sets the ID of the work type group.

**build()**
Returns an instance of the `lxscheduler.GetAppointmentCandidatesInput` object.

**Signature**
```java
public lxscheduler.GetAppointmentCandidatesInput build()
```

**Return Value**
Type: `lxscheduler.GetAppointmentCandidatesInput`

**setAccountId(accountId)**
Sets the ID of the associated account for which you want to create the appointments.

**Signature**
```java
public lxscheduler.GetAppointmentCandidatesInputBuilder setAccountId(String accountId)
```

**Parameters**
- `accountId`
  Type: `String`

**Return Value**
Type: `LxScheduler.GetAppointmentCandidatesInputBuilder`

**setAllowConcurrent(allowConcurrent)**
Allows the scheduling of concurrent appointments.

**Signature**
```java
public lxscheduler.GetAppointmentCandidatesInputBuilder setAllowConcurrent(Boolean allowConcurrent)
```

**Parameters**
- `allowConcurrent`
  Type: `Boolean`
  If true, allows scheduling of concurrent appointments in a time slot. The default is false.
  Available in API version 47.0 and later.
Return Value
Type: LxScheduler.GetAppointmentCandidatesInputBuilder

**setApiVersion(apiVersion)**
Sets the API version of the business logic for the `getAppointmentCandidates` method.

**Signature**
`public lxscheduler.GetAppointmentCandidatesInputBuilder setApiVersion(Double apiVersion)`

**Parameters**
- `apiVersion`
  Type: `Double`

**Usage**
The specified parameter must use the correct API version. For example, if API version is set to 45.0 and `filterByResources` is set (which is available in API version 51.0 and later), then this field is ignored. If no API version or incorrect API version is passed in the request body, by default the latest version is used.

⚠️ **Note:** The API is available since version 45.0.

Return Value
Type: LxScheduler.GetAppointmentCandidatesInputBuilder

**setCorrelationId(correlationId)**
Sets the correlation ID.

**Signature**
`public lxscheduler.GetAppointmentCandidatesInputBuilder setCorrelationId(String correlationId)`

**Parameters**
- `correlationId`
  Type: `String`
  ID to pass custom information to the `ServiceResourceScheduleHandler` Apex interface. For example, you can use the correlation ID to identify the app, website, or any other external system that calls this Apex interface implementation. If you don’t pass a custom value, a randomly generated identifier is passed. Available in API version 53.0 and later.

Return Value
Type: LxScheduler.GetAppointmentCandidatesInputBuilder
**setEndTime(endTime)**
Sets the scheduling end time.

**Signature**

```java
public lxscheduler.GetAppointmentCandidatesInputBuilder setEndTime(String endTime)
```

**Parameters**

`endTime`
Type: `String`
The latest time that a time slot can end (inclusive).

⚠️ **Note:** If end time is not specified, it defaults to 31 days.

**Usage**
The specified string should use the standard date format 
"yyyy-MM-dd'T'HH:mm:ssZ" in the local time zone. Defaults to the user’s time zone.

**Return Value**
Type: `LxScheduler.GetAppointmentCandidatesInputBuilder`

**setEngagementChannelTypeIds(engagementChannelTypeIds)**
Sets an engagement channel type.

**Signature**

```java
public lxscheduler.GetAppointmentCandidatesInputBuilder setEngagementChannelTypeIds(List<String> engagementChannelTypeIds)
```

**Parameters**

`engagementChannelTypeIds`
Type: `List<String>`
The ID of the engagement channel type record. The availability of service resources is filtered based on the engagement channel type selected. This field is available in API version 56.0 and later.

⚠️ **Note:** This field supports only one engagement channel type ID.

**Return Value**
Type: `LxScheduler.GetAppointmentCandidatesInputBuilder`

**Usage**
You can use engagement channel types only in these cases:
The **Schedule Appointments Using Engagement Channels** setting is enabled in Salesforce Scheduler Settings in your Salesforce org.

Shifts are defined in the scheduling policy. For more information on setting up shifts in scheduling policy, see Define Shift Rules in Scheduling Policy.

**Note:** Engagement channel types are not supported with operating-hours rules in the scheduling policy.

### setFilterByResources(filterByResources)

Enables filtering resources using a comma-separated list of service resource IDs.

**Signature**

```java
public LxScheduler.GetAppointmentCandidatesInputBuilder setFilterByResources(List<String> filterByResources)
```

**Parameters**

- **filterByResources**
  - Type: `List<String>`
  - Gets only eligible resources that are both in the list and in the selected service territory sorted by the order in which the resource IDs are passed. This field is available in API version 51.0 and later.

**Return Value**

Type: `LxScheduler.GetAppointmentCandidatesInputBuilder`

### setResourceLimitApptDistribution(resourceLimitApptDistribution)

Sets the number of service resources to show during appointment scheduling.

**Signature**

```java
```

**Parameters**

- **resourceLimitApptDistribution**
  - Type: `Integer`
  - Specify the maximum number of service resources that you want to show during appointment scheduling when appointment distribution is enabled. Available in API version 53.0 and later.

**Return Value**

Type: `LxScheduler.GetAppointmentCandidatesInputBuilder`
**setSchedulingPolicyId(schedulingPolicyId)**
Sets the ID of the AppointmentSchedulingPolicy object.

**Signature**

```java
public lxscheduler.GetAppointmentCandidatesInputBuilder setSchedulingPolicyId(String schedulingPolicyId)
```

**Parameters**

- **schedulingPolicyId**
  - **Type:** String
  - The ID of the AppointmentSchedulingPolicy object. If no scheduling policy is passed in the request body, the default configurations are used.

**Return Value**

- **Type:** LxScheduler.GetAppointmentCandidatesInputBuilder

**setStartTime(startTime)**
Sets the scheduling start time to the specified time.

**Signature**

```java
public lxscheduler.GetAppointmentCandidatesInputBuilder setStartTime(String startTime)
```

**Parameters**

- **startTime**
  - **Type:** String
  - The earliest time that a time slot can begin (inclusive). You can also use a time from the past.

**Usage**

The specified string should use the standard date format "'yyyy-MM-dd'T'HH:mm:ssZ'" in the local time zone. Defaults to the user’s time zone.

**Return Value**

- **Type:** LxScheduler.GetAppointmentCandidatesInputBuilder

**setTerritoryIds(territoryIds)**
Sets the service territory IDs.
Signature

```java
public lxscheduler.GetAppointmentCandidatesInputBuilder setTerritoryIds(List<String> territoryIds)
```

Parameters

territoryIds
Type: List<String>
List of service territory IDs, where the work that is being requested is performed. This is a required field.

Return Value
Type: LxScheduler.GetAppointmentCandidatesInputBuilder

**setWorkType(workType)**
Sets the type of work to be performed.

Signature

```java
public lxscheduler.GetAppointmentCandidatesInputBuilder setWorkType(lxscheduler.WorkType workType)
```

Parameters

workType
Type: lxscheduler.WorkType
This method takes input as an instance of the lxscheduler.WorkType class. Build the instance of the input class using the lxscheduler.WorkTypeBuilder class.

Required if `workTypeGroupId` is not given. If id of the `workType` is given, the rest of `workType` fields are optional.

Usage

Return Value
Type: LxScheduler.GetAppointmentCandidatesInputBuilder

**setWorkTypeGroupId(workTypeGroupId)**
Sets the ID of the work type group.

Signature

```java
public lxscheduler.GetAppointmentCandidatesInputBuilder setWorkTypeGroupId(String workTypeGroupId)
```
Parameters

workTypeGroupId
Type: String
The ID of the work type group containing the work types that are being performed. Required if workType is not given. If workType is given, then you must provide either id or durationInMinutes, but not both.

Return Value
Type: LxScheduler.GetAppointmentCandidatesInputBuilder

GetAppointmentSlotsInput Class
Contains information about the available appointment time slots for a resource based on given work type group and territories.

The appointment time slots are determined based on your Salesforce Scheduler data model configurations. Here are some prerequisites that you can consider while setting up data.

• Set up Salesforce Scheduler before making your requests. The setup includes creating or configuring Service Resources, Service Territory Members, Work Type Groups, Work Types, Work Type Group Members, and Service Territory Work Types. See Manage Business Information in Salesforce Scheduler for more information.

• Configure a work type mapped for each territory in the request body via Service Territory Work Type. Map the same work type to the work type group, via work type group member.

The following factors affect how time slots are calculated and returned.

• Timezones that differ across operating hours are handled and results are always returned in UTC.
• The resource must be marked as a required resource on the assigned resource object.
• The resource is considered unavailable if the status categories of the resource assigned to service appointments are other than Canceled, Cannot Complete, and Completed.
• Resource Absences of all types are considered unavailable from start to end.
• The following fields of Work Type records, if configured, are used to fine-tune time slot requirements. For more information, see Create Work Types in Salesforce Scheduler.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeframe Start</td>
<td>Time slots sooner than current time + Timeframe Start aren't returned.</td>
</tr>
<tr>
<td>Timeframe End</td>
<td>Time slots later than current time + Timeframe End aren't returned.</td>
</tr>
<tr>
<td>Block Time Before Appointment</td>
<td>The time period before the appointment is considered as unavailable.</td>
</tr>
<tr>
<td>Block Time After Appointment</td>
<td>The time period after the appointment is considered as unavailable.</td>
</tr>
<tr>
<td>Operating Hours</td>
<td>The overlap of all operating hours from the account, work type, service territory, and service territory member are considered while determining time slots. For more information, see Set Up Operating Hours in Salesforce Scheduler.</td>
</tr>
</tbody>
</table>

• Only the time slots within the period of 31 days from the start date are returned.
Salesforce Scheduler uses multiple factors, such as field values, scheduled appointments, absences, Scheduler Settings, and Scheduling Policies to determine available time slots, including the earliest and latest appointment slots. See How Does Salesforce Scheduler Determine Available Time Slots.

**Note:** If asset scheduling is enabled, you can provide an asset-based service resource in `requiredResourceIds` to retrieve available timeslots for the asset resource.

### Namespace

`LxScheduler`

### Usage

The constructor for this class can’t be called directly. Create an instance of this class using the `GetAppointmentSlotsInputBuilder.build()` method.

This example shows how to get a list of available time slots based on `workTypeGroupId`:

```java
//Build input for GetAppointmentSlots API
lxscheduler.GetAppointmentSlotsInput input = new lxscheduler.GetAppointmentSlotsInputBuilder()
    .setWorkTypeGroupId('0VSxx0000004C92GAE')
    .setTerritoryIds(new List<String>{'0Hhx0000004C92CAE'})
    .setStartTime(System.now().format('yyyy-MM-dd\"T\"HH:mm:ssZ'))
    .setEndTime(System.now().addDays(1).format('yyyy-MM-dd\"T\"HH:mm:ssZ'))
    .setAccountId('001xx000003GYK0AAO')
    .setRequiredResourceIds(new List<String>{'0Hnx0000004C92CAE'})
    .setSchedulingPolicyId('0Vrxx0000004C92CAE')
    .setApiVersion(Double.valueOf('48.0'))
    .build();

String response = lxscheduler.SchedulerResources.getAppointmentSlots(input);
```

This example shows how to get a list of available time slots based on `workType`:

```java
//Build WorkType
lxscheduler.WorkType workType = new lxscheduler.WorkTypeBuilder()
    .setId('08qxx0000004C92AAE')
    .build();

lxscheduler.GetAppointmentSlotsInput input = new lxscheduler.GetAppointmentSlotsInputBuilder()
    .setWorkType(workType)
    .setTerritoryIds(new List<String>{'0Hhx0000004C92CAE'})
    .setStartTime(System.now().format('yyyy-MM-dd\"T\"HH:mm:ssZ'))
    .setEndTime(System.now().addDays(1).format('yyyy-MM-dd\"T\"HH:mm:ssZ'))
    .setAccountId('001xx000003GYK0AAO')
    .setRequiredResourceIds(new List<String>{'0Hnx0000004C92CAE'})
    .setSchedulingPolicyId('0Vrxx0000004C92CAE')
    .setApiVersion(Double.valueOf('48.0'))
    .build();

String response = lxscheduler.SchedulerResources.getAppointmentSlots(input);
```
This example shows how to get a list of available time slots based on `durationInMinutes` and without `workTypeGroupId` or `workType` fields:

```java
//Build WorkType
lxscheduler.WorkType workType = new lxscheduler.WorkTypeBuilder()
    .setDurationInMinutes(60)
    .build();

lxscheduler.GetAppointmentSlotsInput input = new
lxscheduler.GetAppointmentSlotsInputBuilder()
    .setWorkType(workType)
    .setTerritoryIds(new List<String>{'0Hhxx0000004C92CAE'})
    .setRequiredResourceIds(new List<String>{'0Hnxx0000004C92CAE'})
    .setApiVersion(Double.valueOf('48.0'))
    .build();

String response = lxscheduler.SchedulerResources.getAppointmentSlots(input);
```

This example shows a sample response of a list of available time slots:

```json
[{
    "territoryId": "0Hhxx0000004C92CAE",
    "startTime": "2021-02-10T16:00:00.000+0000",
    "endTime": "2021-02-10T16:15:00.000+0000",
    "remainingAppointments": 1
}, {
    "territoryId": "0Hhxx0000004C92CAE",
    "startTime": "2021-02-10T16:15:00.000+0000",
    "endTime": "2021-02-10T16:30:00.000+0000",
    "remainingAppointments": 1
},
]```

## GetAppointmentSlotsInputBuilder Class

Contains methods to build an instance of the `lxscheduler.GetAppointmentSlotsInput` class. A Builder object is obtained by invoking one of the `GetAppointmentSlotsInputBuilder` methods defined by the `GetAppointmentSlotsInput` class.

### Namespace

LxScheduler

### IN THIS SECTION:

GetAppointmentSlotsInputBuilder Methods

### GetAppointmentSlotsInputBuilder Methods

The following are methods for `GetAppointmentSlotsInputBuilder`.
IN THIS SECTION:

build()
Returns an instance of the lxscheduler.GetAppointmentSlotsInput object.

setAccountId(accountId)
Sets the ID of the associated account for which you want to create appointments.

setAllowConcurrentScheduling(allowConcurrentScheduling)
Allows the scheduling of concurrent appointments.

setApiVersion(apiVersion)
Sets the API version of the business logic for the getAppointmentSlots method.

setCorrelationId(correlationId)
Sets the correlation ID.

setEndTime(endTime)
Sets the scheduling end time.

setEngagementChannelTypeIds(engagementChannelTypeIds)
Sets an engagement channel type.

setPrimaryResourceId(primaryResourceId)
Sets the ID of the primary resource.

setRequiredResourceIds(requiredResourceIds)
Sets the resource IDs.

setSchedulingPolicyId(schedulingPolicyId)
Sets the ID of the AppointmentSchedulingPolicy object.

setStartTime(startTime)
Sets the scheduling start time.

setTerritoryIds(territoryIds)
Sets the IDs of service territories.

setWorkType(workType)
Sets the type of work to be performed.

setWorkTypeGroupId(workTypeGroupId)
Sets the ID of the work type group.

**build()**

Returns an instance of the lxscheduler.GetAppointmentSlotsInput object.

**Signature**

```java
public lxscheduler.GetAppointmentSlotsInput build()
```

**Return Value**

Type: lxscheduler.GetAppointmentSlotsInput
**setAccountId(accountId)**
Sets the ID of the associated account for which you want to create appointments.

**Signature**

```java
public lxscheduler.GetAppointmentSlotsInputBuilder setAccountId(String accountId)
```

**Parameters**

- **accountId**
  - **Type:** String
  - The ID of the associated account.

**Return Value**

- **Type:** lxscheduler.GetAppointmentSlotsInputBuilder

**setAllowConcurrentScheduling(allowConcurrentScheduling)**
Allows the scheduling of concurrent appointments.

**Signature**

```java
public lxscheduler.GetAppointmentSlotsInputBuilder setAllowConcurrentScheduling(Boolean allowConcurrentScheduling)
```

**Parameters**

- **allowConcurrentScheduling**
  - **Type:** Boolean
  - If true, allows scheduling of concurrent appointments in a time slot. If false, concurrent appointments are not allowed. The default is false. Available in API version 47.0 and later.

**Return Value**

- **Type:** lxscheduler.GetAppointmentSlotsInputBuilder

**setApiVersion(apiVersion)**
Sets the API version of the business logic for the getAppointmentSlots method.

**Signature**

```java
public lxscheduler.GetAppointmentSlotsInputBuilder setApiVersion(Double apiVersion)
```

**Parameters**

- **apiVersion**
  - **Type:** Double
Usage
The specified parameter must use the correct API version. For example, if API version is set to 45.0 and `primaryResourceId` is set (which is available in API version 48.0 and later), then this field is ignored. If no API version or incorrect API version is passed in the request body, by default the latest version is used.

Note: The API is available since version 45.0.

Return Value
Type: lxscheduler.GetAppointmentSlotsInputBuilder

`setCorrelationId(correlationId)`
Sets the correlation ID.

Signature
`public lxscheduler.GetAppointmentSlotsInputBuilder setCorrelationId(String correlationId)`

Parameters
`correlationId`
Type: String
ID to pass custom information to the `ServiceResourceScheduleHandler` Apex interface. For example, you can use the correlation ID to identify the app, website, or any other external system that calls this Apex interface implementation. If you don’t pass a custom value, a randomly generated identifier is passed. Available in API version 53.0 and later.

Return Value
Type: lxscheduler.GetAppointmentSlotsInputBuilder

`setEndTime(endTime)`
Sets the scheduling end time.

Signature
`public lxscheduler.GetAppointmentSlotsInputBuilder setEndTime(String endTime)`

Parameters
`endTime`
Type: String
The latest time that a time slot can end (inclusive). If end time is not specified, it defaults to 31 days.

Usage
The specified string should use the standard date format `"[yyyy-MM-dd'T'HH:mm:ssZ]"` in the local time zone. Defaults to the user’s time zone.
Return Value
Type: lxscheduler.GetAppointmentSlotsInputBuilder

**setEngagementChannelTypeIds** (engagementChannelTypeIds)
Sets an engagement channel type.

Signature
```
public lxscheduler.GetAppointmentSlotsInputBuilder
setEngagementChannelTypeIds(List<String> engagementChannelTypeIds)
```

Parameters
```
engagementChannelTypeIds
    Type: List<String>
```
The ID of the engagement channel type record. The availability of time slots is filtered based on the engagement channel type selected. This field is available in API version 56.0 and later.

Note: This field supports only one engagement channel type ID.

Return Value
Type: lxscheduler.GetAppointmentSlotsInputBuilder

Usage
You can use engagement channel types only in these cases:
- The Schedule Appointments Using Engagement Channels setting is enabled in Salesforce Scheduler Settings in your Salesforce org.
- Shifts are defined in the scheduling policy. For more information on setting up shifts in scheduling policy, see Define Shift Rules in Scheduling Policy.

Note: Engagement channel types are not supported with operating-hours rules in the scheduling policy.

**setPrimaryResourceId** (primaryResourceId)
Sets the ID of the primary resource.

Signature
```
public lxscheduler.GetAppointmentSlotsInputBuilder
setPrimaryResourceId(String primaryResourceId)
```

Parameters
```
primaryResourceId
    Type: String
```
The ID of the primary resource in multi-resource scheduling. Required only when multi-resource scheduling is enabled. Available in API version 48.0 and later.

**Return Value**
Type: lxscheduler.GetAppointmentSlotsInputBuilder

**setRequiredResourceIds(requiredResourceIds)**
Sets the resource IDs.

**Signature**
```java
public lxscheduler.GetAppointmentSlotsInputBuilder setRequiredResourceIds(List<String> requiredResourceIds)
```

**Parameters**

- `requiredResourceIds`
  Type: List<String>
  List of resource IDs that must be available during the time slot. This is a required field.

**Return Value**
Type: lxscheduler.GetAppointmentSlotsInputBuilder

**setSchedulingPolicyId(schedulingPolicyId)**
Sets the ID of the AppointmentSchedulingPolicy object.

**Signature**
```java
public lxscheduler.GetAppointmentSlotsInputBuilder setSchedulingPolicyId(String schedulingPolicyId)
```

**Parameters**

- `schedulingPolicyId`
  Type: String
  If no scheduling policy is passed in the request body, the default configurations are used.

**Return Value**
Type: lxscheduler.GetAppointmentSlotsInputBuilder

**setStartTime(startTime)**
Sets the scheduling start time.
Signature

```java
public lxscheduler.GetAppointmentSlotsInputBuilder setStartTime(String startTime)
```

Parameters

```java
startTime
Type: String
```

The earliest time that a time slot can begin (inclusive). Defaults to the current time of the request, if empty.

Usage

The specified string should use the standard date format "T\[yyyy-MM-dd'T'HH:mm:ssZ\]" in the local time zone. Defaults to the user's time zone.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

```java
setTerritoryIds(territoryIds)
```

Sets the IDs of service territories.

Signature

```java
public lxscheduler.GetAppointmentSlotsInputBuilder setTerritoryIds(List<String> territoryIds)
```

Parameters

```java
territoryIds
Type: List<String>
```

List of IDs of service territories, where the work that is being requested is performed. This is a required field.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

```java
setWorkType(workType)
```

Sets the type of work to be performed.

Signature

```java
public lxscheduler.GetAppointmentSlotsInputBuilder setWorkType(lxscheduler.WorkType workType)
```

Parameters

```java
workType
Type: lxscheduler.WorkType
```
This method takes input as an instance of the `lxscheduler.WorkType` class. Build the instance of the input class using the `lxscheduler.WorkTypeBuilder` class.

Required if `workTypeGroupId` is not given.

**Return Value**

Type: `lxscheduler.GetAppointmentSlotsInputBuilder`

**setWorkTypeGroupId(workTypeGroupId)**

Sets the ID of the work type group.

**Signature**

```java
public lxscheduler.GetAppointmentSlotsInputBuilder setWorkTypeGroupId(String workTypeGroupId)
```

**Parameters**

- `workTypeGroupId`
  
  Type: `String`
  
  The ID of the work type group containing the work types that are being performed.

**Return Value**

Type: `lxscheduler.GetAppointmentSlotsInputBuilder`

---

**SchedulerResources Class**

Contains methods that holds the business logic to get resources availability.

**Namespace**

LxScheduler

**Implementation Considerations**

Apex implementation of the methods in the `SchedulerResources` class should adhere to Apex Governor Limits. It includes synchronous heap size limit, synchronous CPU time limit, and synchronous concurrent transactions for long running transactions. To avoid governor limits, you must tune the input by reducing the time frame, limiting number of service resources, or limiting number or territories at a time. This will reduce the overall transaction time and response size of the implementation. For more information on standard Apex Governor Limits, see Salesforce Developer Limits and Allocations Quick Reference.

**Example**

To get list of available service resources (appointment candidates):

```java
String response = lxscheduler.SchedulerResources.getAppointmentCandidates(input);
```
To get a list of available appointment time slots for a resource:

```java
String response = lxscheduler.SchedulerResources.getAppointmentSlots(input);
```

IN THIS SECTION:
- **SchedulerResources Methods**

**SchedulerResources Methods**

The following are methods for SchedulerResources.

IN THIS SECTION:
- `getAppointmentCandidates(getAppointmentCandidatesInput)`
  Returns a list of service resources based on work type group or work type and service territories.
- `getAppointmentSlots(getAppointmentSlotsInput)`
  Returns a list of available appointment time slots for a resource based on given work type group or work type and service territories.
- `setAppointmentCandidatesMock(expectedResponse)`
  Sets a mock object when running tests for the `getAppointmentCandidates` method.
- `setAppointmentSlotsMock(expectedResponse)`
  Sets a mock object when running tests for the `getAppointmentSlots` method.

**getAppointmentCandidates (getAppointmentCandidatesInput)**

Returns a list of service resources based on work type group or work type and service territories.

Set up Salesforce Scheduler before making requests. This setup includes creating or configuring Service Resources, Service Territory Members, Work Type Groups, Work Types, Work Type Group Members, and Service Territory Work Types. See Set Up Salesforce Scheduler for more information.

The appointment time slots are determined based on multiple factors, such as field values, scheduled appointments, absences, Scheduler Settings, and Scheduling Policies to determine available time slots. See How Salesforce Scheduler Determines Available Time Slots for more information.

The following factors are considered for returning start time and end time of resources.

**Resource Availability**
- Determined using service territory member, service territory, work type, and account operating hours fields.

**Resource Unavailability**
- Determined by resource absences, existing appointments that the resource is assigned to. The resource must be marked as a required resource for the appointment with a status that isn’t in closed, canceled, or completed.

**Appointment Start Time Interval in the Scheduling Policy**
- Appointment start time interval field in the Scheduling Policy is used to determine when the appointment can start. This interval can be 5, 10, 15, 20, 30, or 60. By default, it’s set to 15.

**Work Type Duration**
- The end time is calculated as start time + duration of the work type.

**Note:** If asset scheduling is enabled, the response also includes asset-based candidates.
Signature

```java
public static String getAppointmentCandidates(lxscheduler.GetAppointmentCandidatesInput getAppointmentCandidatesInput)
```

Parameters

`getAppointmentCandidatesInput`
Type: `lxscheduler.GetAppointmentCandidatesInput`

This method takes input as an instance of the `lxscheduler.GetAppointmentCandidatesInput` class. Build the instance of the input class using the `lxscheduler.GetAppointmentCandidatesInputBuilder` class.

Return Value
Type: `String`

`getAppointmentSlots(getAppointmentSlotsInput)`

Returns a list of available appointment time slots for a resource based on given work type group or work type and service territories. The appointment time slots are determined based on your Salesforce Scheduler data model configurations. Here are some prerequisites that you can consider while setting up data.

- Set up Salesforce Scheduler before making your requests. The setup includes creating or configuring Service Resources, Service Territory Members, Work Type Groups, Work Types, Work Type Group Members, and Service Territory Work Types. See Manage Business Information in Salesforce Scheduler for more information.
- Configure a work type mapped for each territory in the request body via Service Territory Work Type. Map the same work type to the work type group, via work type group member.

The following factors affect how time slots are calculated and returned.

- Timezones that differ across operating hours are handled and results are always returned in UTC.
- The resource must be marked as a required resource on the assigned resource object.
- The resource is considered unavailable if the status categories of the resource assigned to service appointments are other than Canceled, Cannot Complete, and Completed.
- Resource Absences of all types are considered unavailable from start to end.
- The following fields of Work Type records, if configured, are used to fine-tune time slot requirements. For more information, see Create Work Types in Salesforce Scheduler.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeframe Start</td>
<td>Time slots sooner than current time + <strong>Timeframe Start</strong> aren’t returned.</td>
</tr>
<tr>
<td>Timeframe End</td>
<td>Time slots later than current time + <strong>Timeframe End</strong> aren’t returned.</td>
</tr>
<tr>
<td>Block Time Before Appointment</td>
<td>The time period before the appointment is considered as unavailable.</td>
</tr>
<tr>
<td>Block Time After Appointment</td>
<td>The time period after the appointment is considered as unavailable.</td>
</tr>
<tr>
<td>Operating Hours</td>
<td>The overlap of all operating hours from the account, work type, service territory, and service territory member are considered while determining time slots. For more information, see <strong>Set Up Operating Hours in Salesforce Scheduler.</strong></td>
</tr>
</tbody>
</table>
Only the time slots within the period of 31 days from the start date are returned.

Salesforce Scheduler uses multiple factors, such as field values, scheduled appointments, absences, Scheduler Settings, and Scheduling Policies to determine available time slots, including the earliest and latest appointment slots. See How Does Salesforce Scheduler Determine Available Time Slots.

Note: If asset scheduling is enabled, you can provide an asset-based service resource in requiredResourceIds to retrieve available timeslots for the asset resource.

Signature

```
public static String getAppointmentSlots(lxscheduler.GetAppointmentSlotsInput getAppointmentSlotsInput)
```

Parameters

```
getAppointmentSlotsInput
Type: lxscheduler.GetAppointmentSlotsInput
```

This method takes input as an instance of the lxscheduler.GetAppointmentSlotsInput class. Build the instance of the input class using the lxscheduler.GetAppointmentSlotsInputBuilder class.

Return Value

Type: String

```
setAppointmentCandidatesMock(expectedResponse)
```

Sets a mock object when running tests for the getAppointmentCandidates method.

This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
public static void setAppointmentCandidatesMock(String expectedResponse)
```

Parameters

```
expectedResponse
Type: String
```

Return Value

Type: void

This example shows a sample implementation of the GetAppointmentCandidates class:

```
public class AppointmentCandidateService {
    //Instance members for parsing
    public String startTime;
    public String endTime;
    public List<String> resources;
    public String territoryId;
```
public static List<AppointmentCandidateService> getAppointmentCandidates() {
    // Build input for GetAppointmentCandidates API
    lxscheduler.GetAppointmentCandidatesInput input = new lxscheduler.GetAppointmentCandidatesInputBuilder()
        .setWorkTypeGroupId('0VSRM0000000AGT4A2')
        .setTerritoryIds(new List<String>{'0HhRM0000000G8W0AU'})
        .setStartTime(System.now().format('yyyy-MM-dd\"T\"HH:mm:ssZ','America/Los_Angeles'))
        .setEndTime(System.now().addDays(2).format('yyyy-MM-dd\"T\"HH:mm:ssZ','America/Los_Angeles'))
        .setSchedulingPolicyId('0VrRM00000000D0')
        .setApiVersion(Double.valueOf('50.0'))
        .build();
    List<AppointmentCandidateService> vList = parse(lxscheduler.SchedulerResources.getAppointmentCandidates(input));
    return vList;
}

private static List<AppointmentCandidateService> parse(String json) {
    return (List<AppointmentCandidateService>) System.JSON.deserialize(json, List<AppointmentCandidateService>.class);
}

This example shows how to set a sample mock using the setAppointmentCandidatesMock method:

@isTest
private class GetAppointmentCandidatesTest {
    static testMethod void getAppCandidatesTest() {
        String expectedResponse = ' [
            { "startTime": "2021-03-18T16:00:00.000+0000", ' +
            "endTime": "2021-03-18T17:00:00.000+0000", ' +
            "resources": [ ' +
                "0HnRM0000000Fxv0AE"' +
            ], ' +
            "territoryId": "0HhRM0000000G8W0AU"' +
            ' }, ' +
            { "startTime": "2021-03-18T19:00:00.000+0000", ' +
            "endTime": "2021-03-18T20:00:00.000+0000", ' +
            "resources": [ ' +
                "0HnRM0000000Fxv0AE"' +
            ], ' +
            "territoryId": "0HhRM0000000G8W0AU"' +
            ' }];
        lxscheduler.SchedulerResources.setAppointmentCandidatesMock(expectedResponse);
        Test.startTest();
    }
}
List<AppointmentCandidateService> candidateList = AppointmentCandidateService.getAppointmentCandidates();
    System.assertEquals(2, candidateList.size(), 'Should return only 2 records!');
    Test.stopTest();
}

**setAppointmentSlotsMock(expectedResponse)**

Sets a mock object when running tests for the `getAppointmentSlots` method.
This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

**Signature**

```java
public static void setAppointmentSlotsMock(String expectedResponse)
```

**Parameters**

- **expectedResponse**
  - Type: `String`

**Return Value**

- Type: `void`

**SkillRequirement Class**

Contains information about the set of skills that are required to complete a particular task for a work type.

**Namespace**

`LxScheduler`

**Usage**

The constructor for this class can't be called directly. Create an instance of this class using the `SkillRequirementBuilder.build()` method.

**SkillRequirementBuilder Class**

Contains methods to build an instance of the `lxscheduler.SkillRequirement` class.
A `Builder` object is obtained by invoking one of the `SkillRequirementBuilder` methods defined by the `SkillRequirement` class.

**Namespace**

`LxScheduler`
IN THIS SECTION:
  SkillRequirementBuilder Methods

**SkillRequirementBuilder Methods**

The following are methods for `SkillRequirementBuilder`.

**IN THIS SECTION:**
  build()
  Returns an instance of the `lxscheduler.SkillRequirement` object.

  setSkillId(skillId)
  Sets the skill that is required to complete a particular task for a work type. This is a required field.

  setSkillLevel(skillLevel)
  Sets the level of the skill that is required to complete a particular task for a work type

### build()

Returns an instance of the `lxscheduler.SkillRequirement` object.

**Signature**

```
public lxscheduler.SkillRequirement build()
```

**Return Value**

Type: `lxscheduler.SkillRequirement`

### setSkillId(skillId)

Sets the skill that is required to complete a particular task for a work type. This is a required field.

**Signature**

```
public lxscheduler.SkillRequirementBuilder setSkillId(String skillId)
```

**Parameters**

- `skillId`
  Type: `String`

**Return Value**

Type: `lxscheduler.SkillRequirementBuilder`

### setSkillLevel(skillLevel)

Sets the level of the skill that is required to complete a particular task for a work type.
Signature

```java
public lxscheduler.SkillRequirementBuilder setSkillLevel(Double skillLevel)
```

Parameters

`skillLevel`

Type: `Double`

The skill levels can range from zero to 99.99. Depending on your business needs, you might want the skill level to reflect years of experience, certification levels, or license classes.

Return Value

Type: `lxscheduler.SkillRequirementBuilder`

---

**WorkType Class**

Contains information about the type of work to be performed.

**Namespace**

`LxScheduler`

**Usage**

The constructor for this class can't be called directly. Create an instance of this class using the `WorkTypeBuilder.build()` method.

---

**WorkTypeBuilder Class**

Contains methods to build an instance of the `lxscheduler.WorkType` class.

A Builder object is obtained by invoking one of the `WorkTypeBuilder` methods defined by the `WorkType` class.

**Namespace**

`LxScheduler`

---

**WorkTypeBuilder Methods**

The following are methods for `WorkTypeBuilder`.

**IN THIS SECTION:**

- `build()`

  Returns an instance of the `lxscheduler.WorkType` object.
**setBlockTimeAfterAppointmentInMinutes(blockTimeAfterAppointmentInMinutes)**
Sets the time period, in minutes.

**setBlockTimeBeforeAppointmentInMinutes(blockTimeBeforeAppointmentInMinutes)**
Sets the time period, in minutes.

**setDurationInMinutes(durationInMinutes)**
Sets the event length.

**setId(id)**
Sets the ID of the work type to the specified ID.

**setOperatingHoursId(operatingHoursId)**
Sets the overlap of operating hours.

**setSkillRequirements(skillRequirements)**
Sets the skills that are required to complete a particular task for a work type.

**setTimeFrameEndInMinutes(timeFrameEndInMinutes)**
Sets the end of the timeframe.

**setTimeFrameStartInMinutes(timeFrameStartInMinutes)**
Sets the beginning of the timeframe.

**build()**
Returns an instance of the lxscheduler.WorkType object.

**Signature**

```java
public lxscheduler.WorkType build()
```

**Return Value**

Type: lxscheduler.WorkType

**setBlockTimeAfterAppointmentInMinutes(blockTimeAfterAppointmentInMinutes)**
Sets the time period, in minutes.

**Signature**

```java
public lxscheduler.WorkTypeBuilder setBlockTimeAfterAppointmentInMinutes(Integer blockTimeAfterAppointmentInMinutes)
```

**Parameters**

- **blockTimeAfterAppointmentInMinutes**
  - Type: `Integer`
  - The time period after the appointment is considered unavailable.
Return Value
Type: lxscheduler.WorkTypeBuilder

**setBlockTimeBeforeAppointmentInMinutes** *(blockTimeBeforeAppointmentInMinutes)*
Sets the time period, in minutes.

**Signature**
```
public lxscheduler.WorkTypeBuilder setBlockTimeBeforeAppointmentInMinutes(Integer blockTimeBeforeAppointmentInMinutes)
```

**Parameters**
- **blockTimeBeforeAppointmentInMinutes**
  Type: Integer
  The time period before the appointment is considered as unavailable.

Return Value
Type: lxscheduler.WorkTypeBuilder

**setDurationInMinutes** *(durationInMinutes)*
Sets the event length.

**Signature**
```
public lxscheduler.WorkTypeBuilder setDurationInMinutes(Integer durationInMinutes)
```

**Parameters**
- **durationInMinutes**
  Type: Integer
  Contains the event length, in minutes. Required if **id** is not given.

Return Value
Type: lxscheduler.WorkTypeBuilder

**setId** *(id)*
Sets the ID of the work type to the specified ID.

**Signature**
```
public lxscheduler.WorkTypeBuilder setId(String id)
```
Parameters

id
   Type: String
   The ID of the work type. Required if durationInMinutes is not given.

Return Value

Type: lx scheduler.WorkTypeBuilder

setOperatingHoursId(operatingHoursId)

Sets the overlap of operating hours.

Signature

public lx scheduler.WorkTypeBuilder setOperatingHoursId(String operatingHoursId)

Parameters

operatingHoursId
   Type: String
   The overlap of all operating hours from the account, work type, service territory, and service territory member are considered while determining time slots.

Return Value

Type: lx scheduler.WorkTypeBuilder

setSkillRequirements(skillRequirements)

Sets the skills that are required to complete a particular task for a work type.

Signature

public lx scheduler.WorkTypeBuilder
setSkillRequirements(List<lx scheduler.SkillRequirement> skillRequirements)

Parameters

skillRequirements
   Type: List<lx scheduler.SkillRequirement>
   This method takes input as an instance of the lx scheduler.SkillRequirement class. Build the instance of the input class using the lx scheduler.SkillRequirementBuilder class.

Return Value

Type: lx scheduler.WorkTypeBuilder
**setTimeFrameEndInMinutes (timeFrameEndInMinutes)**

Sets the end of the timeframe.

**Signature**

```java
public lxscheduler.WorkTypeBuilder setTimeFrameEndInMinutes(Integer timeFrameEndInMinutes)
```

**Parameters**

- `timeFrameEndInMinutes`  
  Type: `Integer`

**Return Value**

Type: `lxscheduler.WorkTypeBuilder`

**setTimeFrameStartInMinutes (timeFrameStartInMinutes)**

Sets the beginning of the timeframe.

**Signature**

```java
public lxscheduler.WorkTypeBuilder setTimeFrameStartInMinutes(Integer timeFrameStartInMinutes)
```

**Parameters**

- `timeFrameStartInMinutes`  
  Type: `Integer`

**Return Value**

Type: `lxscheduler.WorkTypeBuilder`

**ServiceResourceScheduleHandler Interface**

Allows an implementing class to check external calendar events to find already booked time slots for the requested service resources. This interface is part of Salesforce Scheduler.

**Namespace**

`LxScheduler`

**Usage**

The `lxscheduler.ServiceResourceScheduleHandler` interface is called by Salesforce Scheduler APIs.
To implement this interface, you must first declare a class with the `implements` keyword as follows:

```java
public class ServiceResourceScheduleHandlerImpl implements LxScheduler.ServiceResourceScheduleHandler{
}
```

Next, your class must provide an implementation for the following method:

```java
public static List<LxScheduler.ServiceResourceSchedule> getUnavailableTimeslots(LxScheduler.ServiceAppointmentRequestInfo requestInfo){
    //Your code here
}
```

The implemented method must be declared as `global` or `public`.

IN THIS SECTION:
- **ServiceResourceScheduleHandler Methods**
- **ServiceResourceScheduleHandler Example Implementation**

**ServiceResourceScheduleHandler Methods**

The following are methods for `ServiceResourceScheduleHandler`.

IN THIS SECTION:
- `getUnavailableTimeslots(var1)`

`getUnavailableTimeslots(var1)`

Passes the required information to get unavailable time slots from an external system. The implementation of this method returns the `lxscheduler.ServiceResourceSchedule` class.

**Signature**

```java
public List<lxscheduler.ServiceResourceSchedule> getUnavailableTimeslots(LxScheduler.ServiceAppointmentRequestInfo var1)
```

**Parameters**

`var1`

Type: `lxscheduler.ServiceAppointmentRequestInfo`

Represents the list of parameters that are passed to the `ServiceResourceScheduleHandler` interface.

**Return Value**

Type: `List<lxscheduler.ServiceResourceSchedule>`
ServiceResourceScheduleHandler Example Implementation

This is an example implementation of the `lxscheduler.ServiceResourceScheduleHandler` interface.

```java
/**
 * Implement interface `lxscheduler.ServiceResourceScheduleHandler`
 * This class is called when fetching service resources and time slots through Salesforce Scheduler API.*/

public class ServiceResourceScheduleHandlerImpl implements lxscheduler.ServiceResourceScheduleHandler {
    // The main interface method.
    public static List<lxscheduler.ServiceResourceSchedule> getUnavailableTimeslots(lxscheduler.ServiceAppointmentRequestInfo requestInfo) {
        // Request info values.
        List<lxscheduler.ServiceResourceInfo> serviceResources = requestInfo.getServiceResources();
        DateTime startDate = requestInfo.getStartDate();
        DateTime endDate = requestInfo.getEndDate();

        Set<lxscheduler.UnavailableTimeslot> unavailabilityIntervals = new Set<lxscheduler.UnavailableTimeslot>();

        // This is a dummy response. Implement your own business logic to connect to your internal or external systems.
        for (Integer i = 0; i < 5; i++) {
            // Set the unavailability intervals of a service resource.
            unavailabilityIntervals.add(new lxscheduler.UnavailableTimeslot(startDate.addMinutes(15*i), startDate.addMinutes(15*(i+1))));
        }

        for (lxscheduler.ServiceResourceInfo ServiceResource : serviceResources) {
            // Set the unavailability of Service resource.
            resourceUnavailability.add(new lxscheduler.ServiceResourceSchedule(ServiceResource.getServiceResourceId(), unavailabilityIntervals));
        }

        return resourceUnavailability;
    }
}
```

This example shows how to set a sample test mock using the `lxscheduler.ServiceResourceScheduleHandler` interface.

```java
@isTest
private class ServiceResourceScheduleHandlerImplTest {
    static testMethod void getUnavailableTimeslotsTest() {
        // Initializing the test execution with mock values. Change it according to the
```
implementation.
// In case of non-test execution, the lxscheduler.ServiceAppointmentRequestInfo instance will automatically initialize.

// Mock values for lxscheduler.ServiceResourceInfo
String userId = '05D2000000I1N6IAK';
String userName = 'someuser@example.com';
String email = 'someuser@example.com';
String serviceResourceId = '0HnD20000004C9bKAE';
List<String> territoryIds = new List<String>();
String resourceType = 'T';
lxscheduler.ServiceResourceInfo serviceResInfo = new lxscheduler.ServiceResourceInfo(userId, userName, email, serviceResourceId, territoryIds, resourceType);

// Mock values for lxscheduler.ServiceAppointmentRequestInfo
DateTime startDate = System.now();
DateTime endDate = System.now();
List<lxscheduler.ServiceResourceInfo> serviceResources = new List<lxscheduler.ServiceResourceInfo>();
serviceResources.add(serviceResInfo);
String schedulingPolicyId = '0VrD20000004C9S';
String workTypeGroupId = '0VSD20000004C93OA';
String accountId = '001D2000002pkXwIAI';
String primaryResourceId = '0HnD20000004C9bKAE';
String workTypeId = '08qD20000004C9XIUA';
String correlationId = 'SOME_ID';
lxscheduler.ServiceAppointmentRequestInfo mockRequestInfo = new lxscheduler.ServiceAppointmentRequestInfo(startDate, endDate, serviceResources, schedulingPolicyId, workTypeGroupId, accountId, primaryResourceId, workTypeId, correlationId);

ServiceResourceScheduleHandlerImpl.getUnavailableTimeslots(mockRequestInfo);
}

---

**ServiceAppointmentRequestInfo Class**

Represents the list of parameters that are passed to the ServiceResourceScheduleHandler interface. This class is implemented internally by Apex.

**Namespace**

LxScheduler

IN THIS SECTION:

- ServiceAppointmentRequestInfo Constructors
ServiceAppointmentRequestInfo Methods

ServiceAppointmentRequestInfo Constructors

The following are constructors for ServiceAppointmentRequestInfo.

IN THIS SECTION:

ServiceAppointmentRequestInfo(startDate, endDate, ServiceResources, SchedulingPolicyId, workTypeGroupId, accountId, primaryResourceId, workTypeId, correlationId)

Creates a new instance of the lxscheduler.ServiceAppointmentRequestInfo class using the specified start date, end date, service resources, scheduling policy, work type group, account ID, primary resource, work type, and correlation.

ServiceAppointmentRequestInfo(startDate, endDate, ServiceResources, SchedulingPolicyId, workTypeGroupId, accountId, primaryResourceId, workTypeId, correlationId)

Creates a new instance of the lxscheduler.ServiceAppointmentRequestInfo class using the specified start date, end date, service resources, scheduling policy, work type group, account ID, primary resource, work type, and correlation.

Signature

public ServiceAppointmentRequestInfo(Datetime startDate, Datetime endDate, List<lxscheduler.ServiceResourceInfo> ServiceResources, String SchedulingPolicyId, String workTypeGroupId, String accountId, String primaryResourceId, String workTypeId, String correlationId)

Parameters

startDate
Type: Datetime
The start date and time for which unavailable time slots are requested.

date
Type: Datetime
The end date and time for which unavailable time slots are requested.

ServiceResources
Type: List<lxscheduler.ServiceResourceInfo>
The list of requested service resources for the unavailable time slots.

SchedulingPolicyId
Type: String
The ID of the scheduling policy.

workTypeGroupId
Type: String
The work type group ID.

accountId
Type: String
The account ID of an existing user.

`primaryResourceId`
Type: String
The ID of the primary service resource.

`workTypeId`
Type: String
The work type ID.

`correlationId`
Type: String
A unique identifier for a service appointment request.

### ServiceAppointmentRequestInfo Methods

The following are methods for `ServiceAppointmentRequestInfo`.

**IN THIS SECTION:**
- `getAccountId()`: Returns the account ID of the customer if the API request contains one.
- `getCorrelationId()`: Returns a unique identifier for a request.
- `getEndDate()`: Returns the end date and time for which unavailable time slots are requested.
- `getPrimaryResourceId()`: Returns the ID of the primary service resource.
- `getSchedulingPolicyId()`: Returns the ID of the scheduling policy that the API request contains.
- `getServiceResources()`: Returns the list of requested service resources for the unavailable time slots.
- `getStartDate()`: Returns the start date and time for which unavailable time slots are requested.
- `getWorkTypeGroupId()`: Returns the work type group ID if the API request contains one.
- `getWorkTypeId()`: Returns the work type ID if the API request contains one.

**getAccountId()**

Returns the account ID of the customer if the API request contains one.

**Signature**

```java
public String getAccountId()
```
Return Value
Type: String

getCorrelationId()
Returns a unique identifier for a request.

Signature
public String getCorrelationId()

Return Value
Type: String

gEndDate()
Returns the end date and time for which unavailable time slots are requested.

Signature
public Datetime getEndDate()

Return Value
Type: Datetime

getPrimaryResourceId()
Returns the ID of the primary service resource.

Signature
public String getPrimaryResourceId()

Return Value
Type: String

getSchedulingPolicyId()
Returns the ID of the scheduling policy that the API request contains.

Signature
public String getSchedulingPolicyId()

Return Value
Type: String
**getServiceResources()**
Returns the list of requested service resources for the unavailable time slots.

**Signature**
```java
public List<lxscheduler.ServiceResourceInfo> getServiceResources()
```

**Return Value**
Type: List<lxscheduler.ServiceResourceInfo>

**getStartDate()**
Returns the start date and time for which unavailable time slots are requested.

**Signature**
```java
public Datetime getStartDate()
```

**Return Value**
Type: Datetime

**getWorkTypeGroupId()**
Returns the work type group ID if the API request contains one.

**Signature**
```java
public String getWorkTypeGroupId()
```

**Return Value**
Type: String

**getWorkTypeId()**
Returns the work type ID if the API request contains one.

**Signature**
```java
public String getWorkTypeId()
```

**Return Value**
Type: String

**ServiceResourceInfo Class**
Contains information about a service resource.
Namespace
LxScheduler

IN THIS SECTION:
ServiceResourceInfo Constructors
ServiceResourceInfo Methods

ServiceResourceInfo Constructors
The following are constructors for ServiceResourceInfo.

IN THIS SECTION:
ServiceResourceInfo(userId, userName, email, serviceResourceId, territoryIds, resourceType)
Creates a new instance of the lxscheduler.ServiceResourceInfo class using the specified service resource details.

ServiceResourceInfo(userId, userName, email, serviceResourceId, territoryIds, resourceType)
Creates a new instance of the lxscheduler.ServiceResourceInfo class using the specified service resource details.

Signature
public ServiceResourceInfo(String userId, String userName, String email, String serviceResourceId, List<String> territoryIds, String resourceType)

Parameters
userId
Type: String
The user ID of the service resource.

userName
Type: String
The user name of the service resource.

email
Type: String
The email ID of the service resource.

serviceResourceId
Type: String
The ID of the service resource.

territoryIds
Type: List<String>
A list of requested service territories for the service resource.
resourceType
Type: String
The type of the service resource such as Technician or Asset.

ServiceResourceInfo Methods
The following are methods for ServiceResourceInfo.

IN THIS SECTION:

getEmail()
Returns the email ID of the service resource.
getResourceType()
Returns the type of the service resource such as Technician or Asset.
getServiceResourceId()
Returns the ID of the service resource.
getTerritoryIds()
Returns a list of requested service territories for the service resource.
getUserId()
Returns the user ID of the service resource.
getUserName()
Returns the user name of the service resource.

getEmail()
Returns the email ID of the service resource.

Signature
public String getEmail()

Return Value
Type: String

ggetResourceType()
Returns the type of the service resource such as Technician or Asset.

Signature
public String getResourceType()

Return Value
Type: String
getServiceResourceId()  
Returns the ID of the service resource.

Signature  
public String getServiceResourceId()

Return Value  
Type: String

getTerritoryIds()  
Returns a list of requested service territories for the service resource.

Signature  
public List<String> getTerritoryIds()

Return Value  
Type: List<String>

getUserId()  
Returns the user ID of the service resource.

Signature  
public String getUserId()

Return Value  
Type: String

getUserName()  
Returns the user name of the service resource.

Signature  
public String getUserName()

Return Value  
Type: String

ServiceResourceSchedule Class  
Use this class to pass results from your implemented Apex class to the ServiceResourceScheduleHandler interface methods.
Namespace
LxScheduler

IN THIS SECTION:
ServiceResourceSchedule Constructors
ServiceResourceSchedule Properties

ServiceResourceSchedule Constructors
The following are constructors for ServiceResourceSchedule.

IN THIS SECTION:
ServiceResourceSchedule(serviceResourceId, unavailableTimeslots)
Creates a new instance of lxscheduler.ServiceResourceSchedule class.

ServiceResourceSchedule(serviceResourceId, unavailableTimeslots)

Signature
public ServiceResourceSchedule(String serviceResourceId,
Set<lxscheduler.UnavailableTimeslot> unavailableTimeslots)

Parameters
serviceResourceId
Type: String
Record ID of the service resource.

unavailableTimeslots
Type: Set<lxscheduler.UnavailableTimeslot>
An instance of lxscheduler.UnavailableTimeslot class.

ServiceResourceSchedule Properties
The following are properties for ServiceResourceSchedule.

IN THIS SECTION:
serviceResourceId
Record ID of the service resource.

unavailableTimeslots
An instance of lxscheduler.UnavailableTimeslot class.
**serviceResourceId**
Record ID of the service resource.

**Signature**
```
public String serviceResourceId {get; set;}
```

**Property Value**
Type: String

**unavailableTimeslots**
An instance of lxscheduler.UnavailableTimeslot class.

**Signature**
```
public Set<lxscheduler.UnavailableTimeslot> unavailableTimeslots {get; set;}
```

**Property Value**
Type: Set<lxscheduler.UnavailableTimeslot>

### UnavailableTimeslot Class
Use this class to pass the unavailable time slots to the lxscheduler.ServiceResourceSchedule class.

### Namespace
LxScheduler

**IN THIS SECTION:**

- UnavailableTimeslot Constructors
- UnavailableTimeslot Properties

### UnavailableTimeslot Constructors
The following are constructors for UnavailableTimeslot.

**IN THIS SECTION:**

- UnavailableTimeslot(timeMin, timeMax)
  Creates an instance of lxscheduler.UnavailableTimeslot class.

**UnavailableTimeslot(timeMin, timeMax)**
Creates an instance of lxscheduler.UnavailableTimeslot class.
Signature

```java
public UnavailableTimeslot(Datetime timeMin, Datetime timeMax)
```

Parameters

- `timeMin`
  Type: `Datetime`
  Start time of an unavailable time slot.

- `timeMax`
  Type: `Datetime`
  End time of an unavailable time slot.

UnavailableTimeslot Properties

The following are properties for `UnavailableTimeslot`.

**IN THIS SECTION:**

- `timeMax`
  End time of an unavailable time slot.

- `timeMin`
  Start time of an unavailable time slot.

**timeMax**

End time of an unavailable time slot.

Signature

```java
public Datetime timeMax {get; set;}
```

Property Value

Type: `Datetime`

**timeMin**

Start time of an unavailable time slot.

Signature

```java
public Datetime timeMin {get; set;}
```

Property Value

Type: `Datetime`
Messaging Namespace

The **Messaging** namespace provides classes and methods for Salesforce outbound and inbound email functionality. The following are the classes in the **Messaging** namespace.

**IN THIS SECTION:**

- **AttachmentRetrievalOption Enum**
  Provides options for including attachment metadata only, attachment metadata and content, or excluding attachments.

- **Email Class (Base Email Methods)**
  Contains base email methods common to both single and mass email.

- **EmailFileAttachment Class**
  EmailFileAttachment is used in SingleEmailMessage to specify attachments passed in as part of the request, as opposed to existing documents in Salesforce.

- **InboundEmail Class**
  Represents an inbound email object.

- **InboundEmail.AuthenticationResult Class**
  Contains the authentication type and response for inbound emails.

- **InboundEmail.AuthenticationResultField Class**
  Contains field data from the authentication result response for inbound emails.

- **InboundEmail.BinaryAttachment Class**
  An InboundEmail object stores binary attachments in an InboundEmail.BinaryAttachment object.

- **InboundEmail.TextAttachment Class**
  An InboundEmail object stores text attachments in an InboundEmail.TextAttachment object.

- **InboundEmailResult Class**
  The InboundEmailResult object is used to return the result of the email service. If this object is null, the result is assumed to be successful.

- **InboundEnvelope Class**
  The InboundEnvelope object stores the envelope information associated with the inbound email, and has the following fields.

- **MassEmailMessage Class**
  Contains methods for sending mass email.

- **InboundEmail.Header Class**
  An InboundEmail object stores RFC 2822 email header information in an InboundEmail.Header object with the following properties.

- **PushNotification Class**
  PushNotification is used to configure push notifications and send them from an Apex trigger.

- **PushNotificationPayload Class**
  Contains methods to create the notification message payload for an Apple device.

- **CustomNotification Class**
  CustomNotification is used to create, configure, and send custom notifications from Apex code.

- **RenderEmailTemplateBodyResult Class**
  Contains the results for rendering email templates.
RenderEmailTemplateError Class
Represents an error that the RenderEmailTemplateBodyResult object can contain.

SendEmailError Class
Represents an error that the SendEmailResult object may contain.

SendEmailResult Class
Contains the result of sending an email message.

SingleEmailMessage Methods
Contains methods for sending single email messages.

AttachmentRetrievalOption Enum
Provides options for including attachment metadata only, attachment metadata and content, or excluding attachments.

Namespace
Messaging

Usage
Use these enum values with the renderStoredEmailTemplate(templateId, whold, whatld, attachmentRetrievalOption) method.

Enum Values
The following are the values of the Messaging.AttachmentRetrievalOption enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>METADATA_ONLY</td>
<td>Includes only the file name, content type, and the object ID in the fileAttachments property of Messaging.SingleEmailMessage.</td>
</tr>
<tr>
<td></td>
<td>Note: When the template is rendered from a Visualforce template (and not from a static file attached to the template), the object ID is not available.</td>
</tr>
<tr>
<td>METADATA_WITH_BODY</td>
<td>Includes the attachment content, in addition to the file name, content type, and the object ID in the fileAttachments property of Messaging.SingleEmailMessage.</td>
</tr>
<tr>
<td>NONE</td>
<td>Doesn’t include any attachments in Messaging.SingleEmailMessage.</td>
</tr>
</tbody>
</table>

Email Class (Base Email Methods)
Contains base email methods common to both single and mass email.

Namespace
Messaging
Usage

Note: If templates are not being used, all email content must be in plain text, HTML, or both. Visualforce email templates cannot be used for mass email.

Email Methods

The following are methods for Email. All are instance methods.

IN THIS SECTION:

- `setBccSender(bcc)`
- `setReplyTo(replyAddress)`
- `setTemplateID(templateId)`
- `setSaveAsActivity(saveAsActivity)`
- `setSenderDisplayName(displayName)`
- `setUseSignature(useSignature)`

`setBccSender(bcc)`

Indicates whether the email sender receives a copy of the email that is sent. For a mass mail, the sender is only copied on the first email sent.

Signature

```java
public Void setBccSender(Boolean bcc)
```

Parameters

- `bcc`
  
  Type: Boolean

Return Value

Type: Void
Usage

Note: If the BCC compliance option is set at the organization level, the user cannot add BCC addresses on standard messages. The following error code is returned: BCC_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED. Contact your Salesforce representative for information on BCC compliance.

setReplyTo(replyAddress)
Optional. The email address that receives the message when a recipient replies.

Signature
public Void setReplyTo(String replyAddress)

Parameters
replyAddress
Type: String

Return Value
Type: Void

setTemplateID(templateId)
The ID of the template to be merged to create this email. Specify a value for setTemplateId, setHtmlBody, or setPlainTextBody. Or, you can define both setHtmlBody and setPlainTextBody.

Signature
public Void setTemplateID(ID templateId)

Parameters
templateId
Type: ID

Return Value
Type: Void

Usage

Note: setHtmlBody and setPlainTextBody apply only to single email methods, not to mass email methods.

setSaveAsActivity(saveAsActivity)
Optional. The default value is true, meaning the email is saved as an activity. This argument only applies if the recipient list is based on targetObjectId or targetObjectIds. If HTML email tracking is enabled for the organization, you will be able to track open rates.
Signature

public Void setSaveAsActivity(Boolean saveAsActivity)

Parameters

saveAsActivity
Type: Boolean

Return Value
Type: Void

setSenderDisplayName(displayName)
Optional. The name that appears on the From line of the email. This cannot be set if the object associated with a setOrgWideEmailAddressId for a SingleEmailMessage has defined its DisplayName field.

Signature

public Void setSenderDisplayName(String displayName)

Parameters

displayName
Type: String

Return Value
Type: Void

setUseSignature(useSignature)
Indicates whether the email includes an email signature if the user has one configured. The default is true, meaning if the user has a signature it is included in the email unless you specify false.

Signature

public Void setUseSignature(Boolean useSignature)

Parameters

useSignature
Type: Boolean

Return Value
Type: Void
EmailFileAttachment Class

EmailFileAttachment is used in SingleEmailMessage to specify attachments passed in as part of the request, as opposed to existing documents in Salesforce.

Namespace

Messaging

IN THIS SECTION:

EmailFileAttachment Constructors

EmailFileAttachment Properties

EmailFileAttachment Constructors

The following are constructors for EmailFileAttachment.

IN THIS SECTION:

EmailFileAttachment()

EmailFileAttachment()

Signature

public EmailFileAttachment()

EmailFileAttachment Properties

The following are properties for EmailFileAttachment.

IN THIS SECTION:

body

contenttype

filename

id

inline

Specifies a Content-Disposition of inline (true) or attachment (false).
**body**
Gets or sets the attachment itself.

**Signature**
```java
public Blob body {get; set;}
```

**Property Value**
Type: Blob

**contenttype**
Gets or sets the attachment’s Content-Type.

**Signature**
```java
public String contenttype {get; set;}
```

**Property Value**
Type: String

**filename**
Gets or sets the name of the file to attach.

**Signature**
```java
public String filename {get; set;}
```

**Property Value**
Type: String

**id**
Read-Only. Gets the attachment ID.

**Signature**
```java
public Id id {get;}
```

**Property Value**
Type: Id

**inline**
Specifies a Content-Disposition of inline (`true`) or attachment (`false`).
Signature

public Boolean inline {get; set;}

Property Value

Type: Boolean

InboundEmail Class

Represents an inbound email object.

Namespace

Messaging

IN THIS SECTION:
   InboundEmail Constructors
   InboundEmail Properties

InboundEmail Constructors

The following are constructors for InboundEmail.

IN THIS SECTION:
   InboundEmail()

InboundEmail()

Creates a new instance of the Messaging.InboundEmail class.

Signature

public InboundEmail()

InboundEmail Properties

The following are properties for InboundEmail.

IN THIS SECTION:
   authenticationResults
   A list of authentication results received with the email, if any.
   binaryAttachments
   A list of binary attachments received with the email, if any.
ccAddresses
A list of carbon copy (CC) addresses, if any.

cFrom
The email address that appears in the From field.

cFromName
The name that appears in the From field, if any.

cHeaders
A list of the RFC 2822 headers in the email.

cHtmlBody
The HTML version of the email, if specified by the sender.

cHtmlBodyIsTruncated
Indicates whether the HTML body text is truncated (true) or not (false).

cInReplyTo
The In-Reply-To field of the incoming email. Identifies the email or emails to which this one is a reply (parent emails). Contains the parent email or emails' message-IDs.

cMessageId
The Message-ID—the incoming email's unique identifier.

cPlainTextBody
The plain text version of the email, if specified by the sender.

cPlainTextBodyIsTruncated
Indicates whether the plain body text is truncated (true) or not (false).

cReferences
The References field of the incoming email. Identifies an email thread. Contains a list of the parent emails' References and message IDs, and possibly the In-Reply-To fields.

cReplyTo
The email address that appears in the reply-to header.

cSubject
The subject line of the email, if any.

cTextAttachments
A list of text attachments received with the email, if any.

cToAddresses
The email address that appears in the To field.

authenticationResults
A list of authentication results received with the email, if any.

Signature

public InboundEmail.AuthenticationResult[] authenticationResults {get; set;}

2305
Property Value
Type: InboundEmail.AuthenticationResult[]

Usage
Examples of authentication results include dkim, dmarc, and spf.

binaryAttachments
A list of binary attachments received with the email, if any.

Signature
public InboundEmail.BinaryAttachment[] binaryAttachments {get; set;}

Property Value
Type: InboundEmail.BinaryAttachment[]

Usage
Examples of binary attachments include image, audio, application, and video files.

ccAddresses
A list of carbon copy (CC) addresses, if any.

Signature
public String[] ccAddresses {get; set;}

Property Value
Type: String[]

fromAddress
The email address that appears in the From field.

Signature
public String fromAddress {get; set;}

Property Value
Type: String

fromName
The name that appears in the From field, if any.
Signature
```
public String fromName {get; set;}
```

Property Value
Type: String

headers
A list of the RFC 2822 headers in the email.

Signature
```
public InboundEmail.Header[] headers {get; set;}
```

Property Value
Type: InboundEmail.Header[]

Usage
The list of the RFC 2822 headers includes:
- Received from
- Custom headers
- Message-ID
- Date

htmlBody
The HTML version of the email, if specified by the sender.

Signature
```
public String htmlBody {get; set;}
```

Property Value
Type: String

htmlBodyIsTruncated
Indicates whether the HTML body text is truncated (true) or not (false)

Signature
```
public Boolean htmlBodyIsTruncated {get; set;}
```
**Property Value**

Type: `Boolean`

**inReplyTo**

The In-Reply-To field of the incoming email. Identifies the email or emails to which this one is a reply (parent emails). Contains the parent email or emails’ message-IDs.

**Signature**

```java
public String inReplyTo {get; set;}
```

**Property Value**

Type: `String`

**messageId**

The Message-ID—the incoming email’s unique identifier.

**Signature**

```java
public String messageId {get; set;}
```

**Property Value**

Type: `String`

**plainTextBody**

The plain text version of the email, if specified by the sender.

**Signature**

```java
public String plainTextBody {get; set;}
```

**Property Value**

Type: `String`

**plainTextBodyIsTruncated**

Indicates whether the plain body text is truncated (`true`) or not (`false`).

**Signature**

```java
public Boolean plainTextBodyIsTruncated {get; set;}
```
Property Value
Type: Boolean

**references**
The References field of the incoming email. Identifies an email thread. Contains a list of the parent emails' References and message IDs, and possibly the In-Reply-To fields.

Signature
```
public String[] references {get; set;}
```

Property Value
Type: String[]

**replyTo**
The email address that appears in the reply-to header.

Signature
```
public String replyTo {get; set;}
```

Property Value
Type: String

Usage
If there is no reply-to header, this field is identical to the `fromAddress` field.

**subject**
The subject line of the email, if any.

Signature
```
public String subject {get; set;}
```

Property Value
Type: String

**textAttachments**
A list of text attachments received with the email, if any.
InboundEmail.TextAttachment[] textAttachments {get; set;}

Property Value
Type: InboundEmail.TextAttachment[]

Usage
The text attachments can be any of the following:
- Attachments with a Multipurpose Internet Mail Extension (MIME) type of text
- Attachments with a MIME type of application/octet-stream and a file name that ends with either a .vcf or .vcs extension. These are saved as text/x-vcard and text/calendar MIME types, respectively.

toAddresses
The email address that appears in the To field.

InboundEmail.AuthenticationResult Class
Contains the authentication type and response for inbound emails.

Namespace
Messaging

InboundEmail.AuthenticationResult Constructors
The following are constructors for InboundEmail.AuthenticationResult.

InboundEmail.AuthenticationResult Class
Apex Reference Guide  InboundEmail.AuthenticationResult Class

InboundEmail.AuthenticationResult() Creates a new instance of the Messaging.InboundEmail.AuthenticationResult class.
InboundEmail.AuthenticationResult()

Creates a new instance of the Messaging.InboundEmail.AuthenticationResult class.

Signature

public InboundEmail.AuthenticationResult()

InboundEmail.AuthenticationResult Properties

The following are properties for InboundEmail.AuthenticationResult.

IN THIS SECTION:

  authenticationResultFields
  Additional information in authentication result headers. Examples include: name: smtp.mailfrom and value: example.com.

  method
  The authentication method used for the security check. Possible values include dkim, dmarc, or spf.

  result
  The result of the authentication check. When the email service is configured to verify the legitimacy of the sending server before processing a message, possible values include pass or fail. Otherwise, the value returned is none.

authenticationResultFields

Additional information in authentication result headers. Examples include: name: smtp.mailfrom and value: example.com.

Signature

public InboundEmail.AuthenticationResultField[] authenticationResultFields {get; set;}

Property Value

Type: InboundEmail.AuthenticationResultField[]

method

The authentication method used for the security check. Possible values include dkim, dmarc, or spf.

Signature

public String method {get; set;}

Property Value

Type: String
The result of the authentication check. When the email service is configured to verify the legitimacy of the sending server before processing a message, possible values include pass or fail. Otherwise, the value returned is none.

public String result {get; set;}

Type: String

InboundEmail.AuthenticationResultField Class

Contains field data from the authentication result response for inbound emails.

Namespace

Messaging

InboundEmail.AuthenticationResultField Constructors

The following are constructors for InboundEmail.AuthenticationResultField.

InboundEmail.AuthenticationResultField()

Creates a new instance of the Messaging.InboundEmail.AuthenticationResultField class.

InboundEmail.AuthenticationResultField()
IN THIS SECTION:

**name**
The authentication result field name. For example: `smtp.mailfrom`.

**value**
The authentication result field value. For example: `example.com`.

**Signature**

```java
public String name {get; set;}
```

**Property Value**

Type: `String`

**value**
The authentication result field value. For example: `example.com`.

**Signature**

```java
public String value {get; set;}
```

**Property Value**

Type: `String`

**InboundEmail.BinaryAttachment Class**

An `InboundEmail` object stores binary attachments in an `InboundEmail.BinaryAttachment` object.

**Namespace**

`Messaging`

**Usage**

Examples of binary attachments include image, audio, application, and video files.
InboundEmail.BinaryAttachment Constructors

The following are constructors for InboundEmail.BinaryAttachment.

IN THIS SECTION:

- InboundEmail.BinaryAttachment()
  Creates a new instance of the Messaging.InboundEmail.BinaryAttachment class.

InboundEmail.BinaryAttachment()

Creates a new instance of the Messaging.InboundEmail.BinaryAttachment class.

Signature

```java
public InboundEmail.BinaryAttachment()
```

InboundEmail.BinaryAttachment Properties

The following are properties for InboundEmail.BinaryAttachment.

IN THIS SECTION:

- body
  The body of the attachment.
- fileName
  The name of the attached file.
- headers
  Any header values associated with the attachment. Examples of header names include Content-Type, Content-Transfer-Encoding, and Content-ID.
- mimeTypeSubType
  The primary and sub MIME-type.

body

The body of the attachment.

Signature

```java
public Blob body {get; set;}
```

Property Value

Type: Blob

fileName

The name of the attached file.
**Signature**

```java
public String fileName {get; set;}
```

**Property Value**

Type: `String`

**headers**

Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

**Signature**

```java
public List<Messaging.InboundEmail.Header> headers {get; set;}
```

**Property Value**

Type: `List<Messaging.InboundEmail.Header>`

**mimeTypeSubType**

The primary and sub MIME-type.

**Signature**

```java
public String mimeTypeSubType {get; set;}
```

**Property Value**

Type: `String`

---

**InboundEmail.TextAttachment Class**

An InboundEmail object stores text attachments in an InboundEmail.TextAttachment object.

**Namespace**

`Messaging`

**Usage**

The text attachments can be any of the following:

- Attachments with a Multipurpose Internet Mail Extension (MIME) type of `text`
- Attachments with a MIME type of `application/octet-stream` and a file name that ends with either a `.vcf` or `.vcs` extension. These are saved as `text/x-vcard` and `text/calendar` MIME types, respectively.
IN THIS SECTION:
  InboundEmail.TextAttachment Constructors
  InboundEmail.TextAttachment Properties

InboundEmail.TextAttachment Constructors

The following are constructors for InboundEmail.TextAttachment.

IN THIS SECTION:
  InboundEmail.TextAttachment()
  Creates a new instance of the Messaging.InboundEmail.TextAttachment class.

InboundEmail.TextAttachment()

Creates a new instance of the Messaging.InboundEmail.TextAttachment class.

Signature

public InboundEmail.TextAttachment()

InboundEmail.TextAttachment Properties

The following are properties for InboundEmail.TextAttachment.

IN THIS SECTION:
  body
  The body of the attachment.
  bodyIsTruncated
  Indicates whether the attachment body text is truncated (true) or not (false).
  charset
  The original character set of the body field. The body is re-encoded as UTF-8 as input to the Apex method.
  fileName
  The name of the attached file.
  headers
  Any header values associated with the attachment. Examples of header names include Content-Type, Content-Transfer-Encoding, and Content-ID.
  mimeTypeSubType
  The primary and sub MIME-type.

body

The body of the attachment.
Signature

public String body {get; set;}

Property Value
Type: String

**bodyIsTruncated**
Indicates whether the attachment body text is truncated (**true**) or not (**false**).

Signature

public Boolean bodyIsTruncated {get; set;}

Property Value
Type: Boolean

**charset**
The original character set of the body field. The body is re-encoded as UTF-8 as input to the Apex method.

Signature

public String charset {get; set;}

Property Value
Type: String

**fileName**
The name of the attached file.

Signature

public String fileName {get; set;}

Property Value
Type: String

**headers**
Any header values associated with the attachment. Examples of header names include **Content-Type**, **Content-Transfer-Encoding**, and **Content-ID**.
Signature
public List<Messaging.InboundEmail.Header> headers {get; set;}

Property Value
Type: List<Messaging.InboundEmail.Header>

mimeTypeSubType
The primary and sub MIME-type.

Signature
public String mimeTypeSubType {get; set;}

Property Value
Type: String

InboundEmailResult Class
The InboundEmailResult object is used to return the result of the email service. If this object is null, the result is assumed to be successful.

Namespace
Messaging

InboundEmailResult Properties
The following are properties for InboundEmailResult.

IN THIS SECTION:
message
A message that Salesforce returns in the body of a reply email. This field can be populated with text irrespective of the value returned by the Success field.

success
A value that indicates whether the email was successfully processed.

message
A message that Salesforce returns in the body of a reply email. This field can be populated with text irrespective of the value returned by the Success field.

Signature
public String message {get; set;}

2318
Property Value
Type: String

**success**
A value that indicates whether the email was successfully processed.

Signature
```csharp
public Boolean success {get; set;}
```

Property Value
Type: Boolean

Usage
If false, Salesforce rejects the inbound email and sends a reply email to the original sender containing the message specified in the Message field.

**InboundEnvelope Class**
The InboundEnvelope object stores the envelope information associated with the inbound email, and has the following fields.

**Namespace**
Messaging

**InboundEnvelope Properties**
The following are properties for InboundEnvelope.

IN THIS SECTION:
- **fromAddress**
The name that appears in the From field of the envelope, if any.
- **toAddress**
The name that appears in the To field of the envelope, if any.

**fromAddress**
The name that appears in the From field of the envelope, if any.

Signature
```csharp
public String fromAddress {get; set;}
```
Property Value
Type: String

toAddress
The name that appears in the To field of the envelope, if any.

Signature
public String toAddress {get; set;}

Property Value
Type: String

MassEmailMessage Class
Contains methods for sending mass email.

Namespace
Messaging

Usage
MassEmailMessage extends Email and inherits all of its methods. All base email (Email class) methods are also available to the MassEmailMessage objects.

IN THIS SECTION:
MassEmailMessage Constructors
MassEmailMessage Methods

SEE ALSO:
Email Class (Base Email Methods)

MassEmailMessage Constructors
The following are constructors for MassEmailMessage.

IN THIS SECTION:
MassEmailMessage()
MassEmailMessage()

MassEmailMessage()
Creates a new instance of the Messaging.MassEmailMessage class.
Signature
public MassEmailMessage()

MassEmailMessage Methods
The following are methods for MassEmailMessage. All are instance methods. All base email (Email class) methods are also available to the MassEmailMessage objects. These methods are described in Email Class (Base Email Methods).

IN THIS SECTION:

setDescription(String)
The description of the email.

setTargetObjectIds(ID[])
A list of IDs of the contacts, leads, or users to which the email will be sent. The IDs you specify set the context and ensure that merge fields in the template contain the correct data. The objects must be of the same type (all contacts, all leads, or all users).

setWhatIds(ID[])
Optional. If you specify a list of contacts for the targetObjectIds field, you can specify a list of whatIds as well. This helps to further ensure that merge fields in the template contain the correct data.

setDescription(String)
The description of the email.

Signature
public Void setDescription(String description)

Parameters
description
Type: String

Return Value
Type: Void

setTargetObjectIds(ID[])
A list of IDs of the contacts, leads, or users to which the email will be sent. The IDs you specify set the context and ensure that merge fields in the template contain the correct data. The objects must be of the same type (all contacts, all leads, or all users).

Signature
public Void setTargetObjectIds(ID[] targetObjectIds)

Parameters
targetObjectIds
Type: ID[]
Return Value
Type: Void

Usage
You can list multiple IDs per email. If you specify a value for the targetObjectIds field, optionally specify a whatId as well to set the email context to a user, contact, or lead. This ensures that merge fields in the template contain the correct data. Each ID counts against the sending organization’s daily mass email limit.
Do not specify the IDs of records that have the Email Opt Out option selected.
All emails must have a recipient value in at least one of the following fields:
- toAddresses
- ccAddresses
- bccAddresses
- targetObjectId

setWhatIds (whatIds)
Optional. If you specify a list of contacts for the targetObjectIds field, you can specify a list of whatIds as well. This helps to further ensure that merge fields in the template contain the correct data.

Signature
public Void setWhatIds(ID[] whatIds)

Parameters
whatIds
Type: ID[]

Return Value
Type: Void

Usage
The values must be one of the following types:
- Contract
- Case
- Opportunity
- Product

Note: If you specify whatIds, specify one for each targetObjectId; otherwise, you will receive an INVALID_ID_FIELD error.

InboundEmail.Header Class
An InboundEmail object stores RFC 2822 email header information in an InboundEmail.Header object with the following properties.
Namespace
Messaging

InboundEmail.Header Properties
The following are properties for InboundEmail.Header.

IN THIS SECTION:

name
The name of the header parameter, such as Date or Message-ID.

type
The type of the header.

value
The value of the header.

signature
public String name {get; set;}

property value
Type: String

value
The value of the header.

signature
public String value {get; set;}

property value
Type: String

PushNotification Class

PushNotification is used to configure push notifications and send them from an Apex trigger.

Namespace
Messaging
Example

This sample Apex trigger sends push notifications to the connected app named Test_App, which corresponds to a mobile app on iOS mobile clients. The trigger fires after cases have been updated and sends the push notification to two users: the case owner and the user who last modified the case.

trigger caseAlert on Case (after update) {
    for(Case cs : Trigger.New) {
        // Instantiating a notification

        // Assembling the necessary payload parameters for Apple.
        // Apple params are:
        // ({alert text},{alert sound},{badge count},
        // {free-form data})
        // This example doesn't use badge count or free-form data.
        // The number of notifications that haven't been acted
        // upon by the intended recipient is best calculated
        // at the time of the push. This timing helps
        // ensure accuracy across multiple target devices.
        Map<String, Object> payload = Messaging.PushNotificationPayload.apple('Case ' + cs.CaseNumber + ' status changed to: ' + cs.Status, '', null, null);

        // Adding the assembled payload to the notification
        msg.setPayload(payload);

        // Getting recipient users
        String userId1 = cs.OwnerId;
        String userId2 = cs.LastModifiedById;

        // Adding recipient users to list
        Set<String> users = new Set<String>();
        users.add(userId1);
        users.add(userId2);

        // Sending the notification to the specified app and users.
        // Here we specify the API name of the connected app.
        msg.send('Test_App', users);
    }
}
PushNotification Constructors

The following are the constructors for PushNotification.

IN THIS SECTION:

PushNotification()
Creates a new instance of the Messaging.PushNotification class.

PushNotification(payload)
Creates a new instance of the Messaging.PushNotification class using the specified payload parameters as key-value pairs. When you use this constructor, you don’t need to call setPayload to set the payload.

PushNotification()

Creates a new instance of the Messaging.PushNotification class.

Signature

public PushNotification()

PushNotification (payload)

Creates a new instance of the Messaging.PushNotification class using the specified payload parameters as key-value pairs. When you use this constructor, you don’t need to call setPayload to set the payload.

Signature

public PushNotification (Map<String, Object> payload)

Parameters

payload
Type: Map<String, Object>
The payload, expressed as a map of key-value pairs.

PushNotification Methods

The following are the methods for PushNotification. All are global methods.

IN THIS SECTION:

send(application, users)
Sends a push notification message to the specified users.

setPayload(payload)
Sets the payload of the push notification message.

setTtl(ttl)
Reserved for future use.
**send(application, users)**
Sends a push notification message to the specified users.

**Signature**
```
public void send(String application, Set<String> users)
```

**Parameters**
- **application**
  - Type: String
  - The connected app API name. This corresponds to the mobile client app the notification should be sent to.
- **users**
  - Type: Set
  - A set of user IDs that correspond to the users the notification should be sent to.

**Example**
See the Push Notification Example.

**setPayload(payload)**
Sets the payload of the push notification message.

**Signature**
```
public void setPayload(Map<String, Object> payload)
```

**Parameters**
- **payload**
  - Type: Map<String, Object>
  - The payload, expressed as a map of key-value pairs.
  - Payload parameters can be different for each mobile OS vendor. For more information on Apple's payload parameters, search for "Apple Push Notification Service" at https://developer.apple.com/library/mac/documentation/. To create the payload for an Apple device, see the PushNotificationPayload Class.

**Example**
See the Push Notification Example.

**setTtl(ttl)**
Reserved for future use.

**Signature**
```
public void setTtl(Integer ttl)
```
Parameters

ttl
Type: Integer
Reserved for future use.

**PushNotificationPayload Class**
Contains methods to create the notification message payload for an Apple device.

**Namespace**
Messaging

**Usage**
Apple has specific requirements for the notification payload, and this class has helper methods to create the payload. For more information on Apple’s payload parameters, search for “Apple Push Notification Service” at [https://developer.apple.com/library/mac/documentation/](https://developer.apple.com/library/mac/documentation/).

**Example**
See the Push Notification Example.

IN THIS SECTION:
PushNotificationPayload Methods

**PushNotificationPayload Methods**
The following are the methods for PushNotificationPayload. All are global static methods.

IN THIS SECTION:

apple(alert, sound, badgeCount, userData)
Helper method that creates a valid Apple payload from the specified arguments.

apple(alertBody, actionLocKey, locKey, locArgs, launchImage, sound, badgeCount, userData)
Helper method that creates a valid Apple payload from the specified arguments.

**apple(alert, sound, badgeCount, userData)**
Helper method that creates a valid Apple payload from the specified arguments.

**Signature**

```java
public static Map<String,Object> apple(String alert, String sound, Integer badgeCount, Map<String,Object> userData)
```
Parameters

alert
  Type: String
  Notification message to be sent to the mobile client.

sound
  Type: String
  Name of a sound file to be played as an alert. This sound file should be in the mobile application bundle.

badgeCount
  Type: Integer
  Number to display as the badge of the application icon.

userData
  Type: Map<String, Object>
  Map of key-value pairs that contains any additional data used to provide context for the notification. For example, it can contain IDs of the records that caused the notification to be sent. The mobile client app can use these IDs to display these records.

Return Value

Type: Map<String, Object>

Returns a formatted payload that includes all of the specified arguments.

Usage

To generate a valid payload, you must provide a value for at least one of the following parameters: alert, sound, badgeCount.

Example

See the Push Notification Example.

apple(alertBody, actionLocKey, locKey, locArgs, launchImage, sound, badgeCount, userData)

Helper method that creates a valid Apple payload from the specified arguments.

Signature

public static Map<String, Object> apple(String alertBody, String actionLocKey, String locKey, String[] locArgs, String launchImage, String sound, Integer badgeCount, Map<String, Object> userData)

Parameters

alertBody
  Type: String
  Text of the alert message.

actionLocKey
  Type: String
If a value is specified for the `actionLocKey` argument, an alert with two buttons is displayed. The value is a key to get a localized string in a `Localizable.strings` file to use for the right button’s title.

`locKey`
- **Type**: `String`
- Key to an alert-message string in a `Localizable.strings` file for the current localization.

`locArgs`
- **Type**: `List<String>`
- Variable string values to appear in place of the format specifiers in `locKey`.

`launchImage`
- **Type**: `String`
- File name of an image file in the application bundle.

`sound`
- **Type**: `String`
- Name of a sound file to be played as an alert. This sound file should be in the mobile application bundle.

`badgeCount`
- **Type**: `Integer`
- Number to display as the badge of the application icon.

`userData`
- **Type**: `Map<String, Object>`
- Map of key-value pairs that contains any additional data used to provide context for the notification. For example, it can contain IDs of the records that caused the notification to be sent. The mobile client app can use these IDs to display these records.

**Return Value**
- **Type**: `Map<String, Object>`
- Returns a formatted payload that includes all of the specified arguments.

**Usage**
To generate a valid payload, you must provide a value for at least one of the following parameters: `alert`, `sound`, `badgeCount`.

**CustomNotification Class**

*CustomNotification* is used to create, configure, and send custom notifications from Apex code.

**Namespace**

*.Messaging*

**Usage**

*CustomNotification* allows two approaches to creating and configuring a custom notification.

- Create an instance with the default constructor, and then set notification attributes using the various setter methods.
- Create an instance and configure notification parameters at the same time using the parameterized constructor.
Once the custom notification is configured, call send() to send the notification.

**Notification Target**

The notification target is used by the receiving client application to navigate to an appropriate record or page when a user responds to a notification. For example, when a user is notified that a record was updated, responding to the notification can open the relevant record.

You must specify a target for a notification. The target can be specified using either the targetID or the targetPageRef attribute. Neither attribute is required, but if both are omitted, send() throws an exception. If there's no natural target for a notification, set the targetID to a dummy value, such as 000000000000000AAA. A dummy value prevents the exception, and also prevents automatic navigation when responding to the notification in the client app.

You can set both targetID and targetPageRef in the same notification. The client app that receives the notification determines which target, if any, to use when responding to the notification.

**Important:** Before Winter '21 you could set only a target record (targetID) for a notification. Most client applications expect to find a targetID in the notification payload. If you can't update a client app to handle notifications that include only a targetPageRef, set the targetID to a dummy value.

**Execution Context and Notification Permissions**

By default Apex code executes in system mode, and doesn't require user permissions to send notifications with CustomNotification. However, if your Apex code runs in a user context—for example, by executing anonymous Apex in the Developer Console—the Send Custom Notifications user permission is checked, and send() fails if you don't have the required permission.

**Example**

This example Apex class provides a static method for sending a custom notification to a recipient list. Call this method from a trigger, flow, or wherever you want to send a custom notification from Apex.

```apex
public without sharing class CustomNotificationFromApex {
    public static void notifyUsers(Set<String> recipientsIds, String targetId) {
        // Get the Id for our custom notification type
        CustomNotificationType notificationType =
            [SELECT Id, DeveloperName
             FROM CustomNotificationType
             WHERE DeveloperName='Custom_Notification'];

        // Create a new custom notification
        Messaging.CustomNotification notification = new Messaging.CustomNotification();

        // Set the contents for the notification
        notification.setTitle('Apex Custom Notification');
        notification.setBody('The notifications are coming from INSIDE the Apex!');

        // Set the notification type and target
        notification.setNotificationTypeId(notificationType.Id);
        notification.setTargetId(targetId);

        // Actually send the notification
        try {
            notification.send(recipientsIds);
        }
    }
}
```
```java
    catch (Exception e) {
        System.debug('Problem sending notification: ' + e.getMessage());
    }
}

Note: This example uses a hard-coded string, Custom_Notification, as the DeveloperName (also known as the API Name) of a Custom Notification Type. Use your custom notification types in your own code.

    CustomNotification.send() can throw an exception, which is handled minimally in this example. Add more substantial error handling to code you plan to use in production.

CustomNotification Constructors

The following are constructors for CustomNotification.

IN THIS SECTION:

    CustomNotification()
    Creates a new instance of the Messaging.CustomNotification class.

    CustomNotification(typeId, sender, title, body, targetId, targetPageRef)
    Creates an instance of the Messaging.CustomNotification class using the specified parameters. When you use this constructor, you don’t need to call the various setter methods to define the custom notification attributes.

CustomNotification()

Creates a new instance of the Messaging.CustomNotification class.

Signature

public CustomNotification()

CustomNotification(typeId, sender, title, body, targetId, targetPageRef)

Creates an instance of the Messaging.CustomNotification class using the specified parameters. When you use this constructor, you don’t need to call the various setter methods to define the custom notification attributes.
Signature

```java
public CustomNotification(String typeId, String sender, String title, String body,
String targetId, String targetPageRef)
```

Parameters

typeId
Type: String
The ID of the Custom Notification Type being used for the notification.

sender
Type: String
The User ID of the sender of the notification.

title
Type: String
The title of the notification. Maximum characters: 250.

body
Type: String
The body of the notification. Maximum characters: 750.

targetId
Type: String
The Record ID for the target record of the notification.

You must specify either a `targetID` or a `targetPageRef`. See Custom Notification Usage.

targetPageRef
Type: String
The `PageReference` for the navigation target of the notification. To see how to specify the target using JSON, see pageReference Types.

You must specify either a `targetID` or a `targetPageRef`. See Custom Notification Usage.

Usage

A client may see a truncated notification title or body depending on the delivery channel or app, and how the Connect API notification parameters are configured. For more information on the `trimMessages` query parameter, see Notification.

CustomNotification Methods

The following are methods for CustomNotification.

IN THIS SECTION:

- send(users)
  Sends a custom notification to the specified users.
- setNotificationTypeId(id)
  Sets the type of the custom notification.
setTitle(title)
Sets the title of the custom notification.

setBody(body)
Sets the body of the custom notification.

setSenderId(id)
Sets the sender of the custom notification.

setTargetId(targetId)
Sets the target record of the custom notification.

setTargetPageRef(pageRef)
Sets the target page of the custom notification.

send(users)
Sends a custom notification to the specified users.

Signature
public void send(Set<String> users)

Parameters
users
Type: Set<String>
Required. A set of recipient IDs. Each recipient ID corresponds to a recipient or recipient type that the notification should be sent to. Valid recipient or recipient type values are:

- **UserId** — The notification is sent to this user, if this user is active.
- **AccountId** — The notification is sent to all active users who are members of this account’s Account Team.

⚠️ **Note:** This recipient type is valid if account teams are enabled for your org.

- **OpportunityId** — The notification is sent to all active users who are members of this opportunity’s Opportunity Team.

⚠️ **Note:** This recipient type is valid if team selling is enabled for your org.

- **GroupId** — The notification is sent to all active users who are members of this group.
- **QueueId** — The notification is sent to all active users who are members of this queue.

Values can be combined in a set, up to the maximum of 500 values.

Return Value
Type: void

Example
See the Custom Notification Example.
**setNotificationTypeId(id)**
Sets the type of the custom notification.

**Signature**
```java
public void setNotificationTypeId(String id)
```

**Parameters**
- **id**
  - Type: String
  - The ID of the Custom Notification Type being used for the notification.
  - A notification type is required to send a custom notification. See Custom Notification Usage.

**Return Value**
Type: void

**Example**
See the Custom Notification Example.

**setTitle(title)**
Sets the title of the custom notification.

**Signature**
```java
public void setTitle(String title)
```

**Parameters**
- **title**
  - Type: String
  - The title of the notification, as it will be seen by recipients. Maximum characters: 250.
  - A title is required to send a custom notification. See Custom Notification Usage.

**Return Value**
Type: void

**Example**
See the Custom Notification Example.

**setBody (body)**
Sets the body of the custom notification.
Signature
public void setBody(String body)

Parameters
body
   Type: String
   The body of the notification, as it will be seen by recipients. Maximum characters: 750.
   A body is required to send a custom notification. See Custom Notification Usage.

Return Value
Type: void

Example
See the Custom Notification Example.

setSenderId(id)
Sets the sender of the custom notification.

Signature
public void setSenderId(String id)

Parameters
id
   Type: String
   The User ID of the sender of the notification.
   Setting a sender is optional. See Custom Notification Usage.

Return Value
Type: void

Example
See the Custom Notification Example.

setTargetId(targetId)
Sets the target record of the custom notification.

Signature
public void setTargetId(String targetId)
Parameters

`targetId`
Type: `String`
The Record ID for the target record of the notification.
Either a `targetID` or a `targetPageRef` is required to send a custom notification. See Custom Notification Usage.

Return Value
Type: `void`

Example
See the Custom Notification Example.

```java
setTargetPageRef(pageRef)
```
Sets the target page of the custom notification.

Signature
```java
public void setTargetPageRef(String pageRef)
```

Parameters

`pageRef`
Type: `String`
The PageReference for the navigation target of the notification.
Either a `targetID` or a `targetPageRef` is required to send a custom notification. See Custom Notification Usage.

Return Value
Type: `void`

Example
See the Custom Notification Example.

`RenderEmailTemplateBodyResult Class`
Contains the results for rendering email templates.

Namespace
`Messaging`

IN THIS SECTION:
- `RenderEmailTemplateBodyResult Methods`
RenderEmailTemplateBodyResult Methods

The following are methods for RenderEmailTemplateBodyResult.

IN THIS SECTION:

getErrors()
If an error occurred during the renderEmailTemplate method, a RenderEmailTemplateError object is returned.

getMergedBody()
Returns the rendered body text with merge field references replaced with the corresponding record data.

getSuccess()
Indicates whether the operation was successful.

getErrors()
If an error occurred during the renderEmailTemplate method, a RenderEmailTemplateError object is returned.

Signature

public List<Messaging.RenderEmailTemplateError> getErrors()

Return Value

Type: List<Messaging.RenderEmailTemplateError>

getMergedBody()
Returns the rendered body text with merge field references replaced with the corresponding record data.

Signature

public String getMergedBody()

Return Value

Type: String

getSuccess()
Indicates whether the operation was successful.

Signature

public Boolean getSuccess()

Return Value

Type: Boolean
RenderEmailTemplateError Class

Represents an error that the RenderEmailTemplateBodyResult object can contain.

Namespace

Messaging

IN THIS SECTION:

RenderEmailTemplateError Methods

RenderEmailTemplateError Methods

The following are methods for RenderEmailTemplateError.

IN THIS SECTION:

getFieldName()
Returns the name of the merge field in the error.

getMessage()
Returns a message describing the error.

getOffset()
Returns the offset within the supplied body text where the error was discovered. If the offset cannot be determined, -1 is returned.

getStatusCode()
Returns a Salesforce API status code.

getFieldName()

Returns the name of the merge field in the error.

Signature

public String getFieldName()

Return Value

Type: String

getMessage()

Returns a message describing the error.

Signature

public String getMessage()
Return Value
Type: String

getOffset()
Returns the offset within the supplied body text where the error was discovered. If the offset cannot be determined, -1 is returned.

Signature
public Integer getOffset()

Return Value
Type: Integer

getStatusCode()
Returns a Salesforce API status code.

Signature
public System.StatusCode getStatusCode()

Return Value
Type: System.StatusCode

SendEmailError Class
Represents an error that the SendEmailResult object may contain.

Namespace
Messaging

SendEmailError Methods
The following are methods for SendEmailError. All are instance methods.

IN THIS SECTION:
getFields()
A list of one or more field names. Identifies which fields in the object, if any, affected the error condition.

getMessage()
The text of the error message.

getStatusCode()
Returns a code that characterizes the error.
getTargetObjectId()
The ID of the target record for which the error occurred.

getFields()
A list of one or more field names. Identifies which fields in the object, if any, affected the error condition.

**Signature**
public String[] getFields()

**Return Value**
Type: String[]

getMessage()
The text of the error message.

**Signature**
public String getMessage()

**Return Value**
Type: String

getStatusCode()
Returns a code that characterizes the error.

**Signature**
public System.StatusCode getStatusCode()

**Return Value**
Type: System.StatusCode

**Usage**
The full list of status codes is available in the WSDL file for your organization. For more information about accessing the WSDL file for your organization, see Downloading Salesforce WSDLs and Client Authentication Certificates in the Salesforce online help.

getTargetObjectId()
The ID of the target record for which the error occurred.

**Signature**
public String getTargetObjectId()
SendEmailResult Class

Contains the result of sending an email message.

Namespace

Messaging

SendEmailResult Methods

The following are methods for SendEmailResult. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred during the sendEmail method, a SendEmailError object is returned.

isSuccess()
Indicates whether the email was successfully submitted for delivery (true) or not (false). Even if isSuccess is true, it does not mean the intended recipients received the email, as there could have been a problem with the email address or it could have bounced or been blocked by a spam blocker.

getErrors()
If an error occurred during the sendEmail method, a SendEmailError object is returned.

Signature

public SendEmailError[] getErrors()

Return Value

Type: Messaging.SendEmailError[]

isSuccess()
Indicates whether the email was successfully submitted for delivery (true) or not (false). Even if isSuccess is true, it does not mean the intended recipients received the email, as there could have been a problem with the email address or it could have bounced or been blocked by a spam blocker.

Signature

public Boolean isSuccess()

Return Value

Type: Boolean
**SingleEmailMessage Methods**

Contains methods for sending single email messages.

**Namespace**

**Messaging**

**Usage**

SingleEmailMessage extends Email and inherits all of its methods. All base email (Email class) methods are also available to the SingleEmailMessage objects. Emails sent via SingleEmailMessage count against the sending organization's daily single email limit.

Email properties are readable and writable. Each property has corresponding setter and getter methods. For example, the `toAddresses()` property is equivalent to the `setToAddresses()` and `getToAddresses()` methods. Only the setter methods are documented. However, the `getTemplateName()` method doesn't have an equivalent setter method; use `setTemplateId()` to specify a template name.

**IN THIS SECTION:**

SingleEmailMessage Constructors

SingleEmailMessage Methods

**SEE ALSO:**

Email Class (Base Email Methods)

**SingleEmailMessage Constructors**

The following are constructors for `SingleEmailMessage`.

**IN THIS SECTION:**

`SingleEmailMessage()`

Creates a new instance of the `Messaging.SingleEmailMessage` class.

**SingleEmailMessage()**

Creates a new instance of the `Messaging.SingleEmailMessage` class.

**Signature**

```java
public SingleEmailMessage()
```

**SingleEmailMessage Methods**

The following are methods for `SingleEmailMessage`. All are instance methods. All base email (Email class) methods are also available to the `SingleEmailMessage` objects. These methods are described in Email Class (Base Email Methods).
IN THIS SECTION:

getTemplateName()
The name of the template used to create the email.

setBccAddresses(bccAddresses)
Optional. A list of blind carbon copy (BCC) addresses or object IDs of the contacts, leads, and users you’re sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of toAddresses, ccAddresses, and bccAddresses per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

setCcAddresses(ccAddresses)
Optional. A list of carbon copy (CC) addresses or object IDs of the contacts, leads, and users you’re sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of toAddresses, ccAddresses, and bccAddresses per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

setCharset(characterSet)
Optional. The character set for the email. If this value is null, the user’s default value is used.

setDocumentAttachments(documentIds)
(Deprecated. Use setEntityAttachments() instead.) Optional. A list containing the ID of each document object you want to attach to the email.

setEntityAttachments(ids)
Optional. Array of IDs of Document, ContentVersion, or Attachment items to attach to the email.

setFileAttachments(fileNames)
Optional. A list containing the file names of the binary and text files you want to attach to the email.

setHtmlBody(htmlBody)
Optional. The HTML version of the email, specified by the sender. The value is encoded according to the specification associated with the organization. Specify a value for setTemplateId, setHtmlBody, or setPlainTextBody. Or, you can define both setHtmlBody and setPlainTextBody.

setInReplyTo(parentMessageIds)
Sets the optional In-Reply-To field of the outgoing email. This field identifies the email or emails to which this email is a reply (parent emails).

setOptOutPolicy(emailOptOutPolicy)
Optional. If you added recipients by ID instead of email address and the Email Opt-Out option is set, this method determines the behavior of the sendEmail() call. If you add recipients by their email addresses, the opt-out settings for those recipients aren’t checked and those recipients always receive the email.

setPlainTextBody(plainTextBody)
Optional. The text version of the email, specified by the sender. Specify a value for setTemplateId, setHtmlBody, or setPlainTextBody. Or, you can define both setHtmlBody and setPlainTextBody.

setOrgWideEmailAddressId(emailAddressId)
Optional. The ID of the organization-wide email address associated with the outgoing email. If you’re using Apex to send emails from the guest user, set the sender to the verified org-wide email address or the emails are blocked. The object’s DisplayName field cannot be set if the setSenderDisplayName field is already set.

setReferences(references)
Optional. The References field of the outgoing email. Identifies an email thread. Contains the parent emails’ References and message IDs, and possibly the In-Reply-To fields.

setSubject(subject)
Optional. The email subject line. If you are using an email template, the subject line of the template overrides this value.
**setTargetObjectId(targetObjectId)**
Required if using a template, optional otherwise. The ID of the contact, lead, or user to which the email will be sent. The ID you specify sets the context and ensures that merge fields in the template contain the correct data.

**setTemplateId(templateId)**
Required if using a template, optional otherwise. The ID of the template used to create the email.

**setToAddresses(toAddresses)**
Optional. A list of email addresses or object IDs of the contacts, leads, and users you’re sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of toAddresses, ccAddresses, and bccAddresses per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

**setTreatBodiesAsTemplate(treatAsTemplate)**
Optional. If set to true, the subject, plain text, and HTML text bodies of the email are treated as template data. The merge fields are resolved using the renderEmailTemplate method. Default is false.

**setTreatObjectIdAsRecipient(treatAsRecipient)**
Optional. If set to true, the targetObjectId (a contact, lead, or user) is the recipient of the email. If set to false, the targetObjectId is supplied as the WhoId field for template rendering but isn’t a recipient of the email. The default is true.

**setWhatId(whatId)**
If you specify a contact for the targetObjectId field, you can specify an optional whatId as well. This helps to further ensure that merge fields in the template contain the correct data.

**getTemplateName()**
The name of the template used to create the email.

**Signature**
```java
public STRING getTemplateName()
```

**Return Value**
Type: String

**Usage**
There is no equivalent setter method for getTemplateName(). If the email didn’t use a template, getTemplateName() returns nothing. If you use setTemplateId(), and then call getTemplateName(), the template name associated to the template ID is returned.

**setBccAddresses(bccAddresses)**
Optional. A list of blind carbon copy (BCC) addresses or object IDs of the contacts, leads, and users you’re sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of toAddresses, ccAddresses, and bccAddresses per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

**Signature**
```java
public Void setBccAddresses(String[] bccAddresses)
```
Parameters

`bccAddresses`
Type: `String[]`

Return Value
Type: Void

Usage
All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

If the BCC compliance option is set at the organization level, the user cannot add BCC addresses on standard messages. The following error code is returned: `BCC_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED`. Contact your Salesforce representative for information on BCC compliance.

`setCcAddresses(ccAddresses)`
Optional. A list of carbon copy (CC) addresses or object IDs of the contacts, leads, and users you’re sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of `toAddresses`, `ccAddresses`, and `bccAddresses` per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

Signature

```
public Void setCcAddresses(String[] ccAddresses)
```

Parameters

`ccAddresses`
Type: `String[]`

Return Value
Type: Void

Usage
All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`
**setCharset(characterSet)**
Optional. The character set for the email. If this value is null, the user's default value is used.

**Signature**
```
public Void setCharset(String characterSet)
```

**Parameters**
`characterSet`
Type: `String`

**Return Value**
Type: `Void`

**setDocumentAttachments(documentIds)**
(Optional. Use `setEntityAttachments()` instead.) Optional. A list containing the ID of each document object you want to attach to the email.

**Signature**
```
public Void setDocumentAttachments(ID[] documentIds)
```

**Parameters**
`documentIds`
Type: `ID[]`

**Return Value**
Type: `Void`

**Usage**
You can attach multiple documents as long as the total size of all attachments does not exceed 10 MB.

**setEntityAttachments(ids)**
Optional. Array of IDs of `Document`, `ContentVersion`, or `Attachment` items to attach to the email.

**Signature**
```
public void setEntityAttachments(List<String> ids)
```

**Parameters**
`ids`
Type: `List<String>`
Return Value
Type: void

**setFileAttachments***(fileNames)*
Optional. A list containing the file names of the binary and text files you want to attach to the email.

**Signature**
```
public Void setFileAttachments(EmailFileAttachment[] fileNames)
```

**Parameters**
```
fileNames
  Type: Messaging.EmailFileAttachment[]
```

**Return Value**
Type: Void

**Usage**
You can attach multiple files as long as the total size of all attachments does not exceed 10 MB.

**setHtmlBody***(htmlBody)*
Optional. The HTML version of the email, specified by the sender. The value is encoded according to the specification associated with the organization. Specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

**Signature**
```
public Void setHtmlBody(String htmlBody)
```

**Parameters**
```
htmlBody
  Type: String
```

**Return Value**
Type: Void

**setInReplyTo***(parentMessageIds)*
Sets the optional In-Reply-To field of the outgoing email. This field identifies the email or emails to which this email is a reply (parent emails).
**Signature**

```java
public Void setInReplyTo(String parentMessageIds)
```

**Parameters**

`parentMessageIds`

Type: `String`  
Contains one or more parent email message IDs.

**Return Value**

Type: `Void`

**setOptOutPolicy(emailOptOutPolicy)**

Optional. If you added recipients by ID instead of email address and the Email Opt Out option is set, this method determines the behavior of the `sendEmail()` call. If you add recipients by their email addresses, the opt-out settings for those recipients aren’t checked and those recipients always receive the email.

**Signature**

```java
public void setOptOutPolicy(String emailOptOutPolicy)
```

**Parameters**

`emailOptOutPolicy`

Type: `String`  
Possible values of the `emailOptOutPolicy` parameter are:

- **SEND** (default)—The email is sent to all recipients. The recipients’ Email Opt Out setting is ignored. The setting Enforce email privacy settings is ignored.
- **FILTER**—No email is sent to recipients that have the Email Opt Out option set. Emails are sent to the other recipients. The setting Enforce email privacy settings is ignored.
- **REJECT**—If any of the recipients have the Email Opt Out option set, `sendEmail()` throws an error and no email is sent. The setting Enforce email privacy settings is respected, as are the selections in the data privacy record based on the Individual object. If any of the recipients have Don’t Market, Don’t Process, or Forget This Individual selected, `sendEmail()` throws an error and no email is sent.

**Return Value**

Type: `void`

**Example**

This example shows how to send an email with the opt-out setting enforced. Recipients are specified by their IDs. The FILTER option causes the email to be sent only to recipients that haven’t opted out from email. This example uses dot notation of the email properties, which is equivalent to using the set methods.

```java
Messaging.SingleEmailMessage message = new Messaging.SingleEmailMessage();  
// Set recipients to two contact IDs.
```
// Replace IDs with valid record IDs in your org.
message.toAddresses = new String[] { '003D000000QDexS', '003D000000QDfW5' };
message.optOutPolicy = 'FILTER';
message.subject = 'Opt Out Test Message';
message_plainTextBody = 'This is the message body.';
Messaging.SingleEmailMessage[] messages =
    new List<Messaging.SingleEmailMessage> {message};
Messaging.SendEmailResult[] results = Messaging.sendEmail(messages);
if (results[0].success) {
    System.debug('The email was sent successfully.');
} else {
    System.debug('The email failed to send: '
        + results[0].errors[0].message);
}

setPlainTextBody(plainTextBody)
Optional. The text version of the email, specified by the sender. Specify a value for setTemplateId, setHtmlBody, or setPlainTextBody. Or, you can define both setHtmlBody and setPlainTextBody.

Signature
public Void setPlainTextBody(String plainTextBody)

Parameters
plainTextBody
    Type: String

Return Value
Type: Void

setOrgWideEmailAddressId(emailAddressId)
Optional. The ID of the organization-wide email address associated with the outgoing email. If you're using Apex to send emails from the guest user, set the sender to the verified org-wide email address or the emails are blocked. The object's DisplayName field cannot be set if the setSenderDisplayName field is already set.

Signature
public Void setOrgWideEmailAddressId(ID emailAddressId)

Parameters
emailAddressId
    Type: ID
Usage
After you create an org-wide email address, you're sent a confirmation email to verify it. Copy the Id from the URL and use the `setOrgWideEmailAddressId(Id)` method on your instance of `Messaging.SingleEmailMessage`.

To avoid hard-coding an ID, after creating your org-wide email address, you can query them.

```java
OrgWideEmailAddress[] owa = [select Id from OrgWideEmailAddress where Address = 'doNotReply@somedomain.com'];
Messaging.SingleEmailMessage mail = new Messaging.SingleEmailMessage();
if ( owa.size() > 0 ) {
    mail.setOrgWideEmailAddressId(owa.get(0).Id);
}
```

Return Value
Type: Void

`setReferences(references)`
Optional. The References field of the outgoing email. Identifies an email thread. Contains the parent emails’ References and message IDs, and possibly the In-Reply-To fields.

**Signature**

```java
public Void setReferences(String references)
```

**Parameters**

`references`
Type: `String`

Return Value
Type: Void

`setSubject(subject)`
Optional. The email subject line. If you are using an email template, the subject line of the template overrides this value.

**Signature**

```java
public Void setSubject(String subject)
```

**Parameters**

`subject`
Type: `String`

Return Value
Type: Void
**setTargetObjectId(targetObjectId)**

Required if using a template, optional otherwise. The ID of the contact, lead, or user to which the email will be sent. The ID you specify sets the context and ensures that merge fields in the template contain the correct data.

**Signature**

```java
public Void setTargetObjectId(ID targetObjectId)
```

**Parameters**

- **targetObjectId**
  - Type: ID

**Return Value**

Type: Void

**Usage**

Do not specify the IDs of records that have the Email Opt Out option selected.

All emails must have a recipient value in at least one of the following fields:

- toAddresses
- ccAddresses
- bccAddresses
- targetObjectId

**setTemplateId(templateId)**

Required if using a template, optional otherwise. The ID of the template used to create the email.

**Signature**

```java
public Void setTemplateId(ID templateId)
```

**Parameters**

- **templateId**
  - Type: ID

**Return Value**

Type: Void

**setToAddresses(toAddresses)**

Optional. A list of email addresses or object IDs of the contacts, leads, and users you’re sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of toAddresses, ccAddresses, and bccAddresses per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.
**Signature**

```java
public Void setToAddresses(String[] toAddresses)
```

**Parameters**

toAddresses  
Type: `String[]`

**Return Value**

Type: Void

**Usage**

All emails must have a recipient value in at least one of the following fields:

- toAddresses
- ccAddresses
- bccAddresses
- targetObjectId

**setTreatBodiesAsTemplate(treatAsTemplate)**

Optional. If set to `true`, the subject, plain text, and HTML text bodies of the email are treated as template data. The merge fields are resolved using the `renderEmailTemplate` method. Default is `false`.

**Signature**

```java
public void setTreatBodiesAsTemplate(Boolean treatAsTemplate)
```

**Parameters**

treatAsTemplate  
Type: `Boolean`

**Return Value**

Type: void

**setTreatTargetObjectAsRecipient(treatAsRecipient)**

Optional. If set to `true`, the `targetObjectId` (a contact, lead, or user) is the recipient of the email. If set to `false`, the `targetObjectId` is supplied as the `WhoId` field for template rendering but isn't a recipient of the email. The default is `true`.

**Signature**

```java
public void setTreatTargetObjectAsRecipient(Boolean treatAsRecipient)
```
Parameters

treatAsRecipient

Type: Boolean

Return Value

Type: void

Usage

Note: You can set TO, CC, and BCC addresses using the email messaging methods regardless of whether a template is used for the email or the target object is a recipient.

setWhatId(whatId)

If you specify a contact for the targetObjectId field, you can specify an optional whatId as well. This helps to further ensure that merge fields in the template contain the correct data.

Signature

public Void setWhatId(ID whatId)

Parameters

whatId

Type: ID

Return Value

Type: Void

Usage

The value must be one of the following types:

- Account
- Asset
- Campaign
- Case
- Contract
- Opportunity
- Order
- Product
- Solution
- Custom
The `Metadata` namespace provides classes and methods for working with custom metadata in Salesforce. Salesforce uses metadata types and components to represent org configuration and customization. Metadata is used for org settings that admins control or configuration information applied by installed apps and packages. Use the classes in the `Metadata` namespace to access metadata from within Apex code.

Metadata access in Apex is available for Apex classes using API version 40.0 and later.

For more information, see `Metadata`.

The following are the classes in the `Metadata` namespace.

IN THIS SECTION:

- `AnalyticsCloudComponentLayoutItem Class`
  Represents the settings for a Wave Analytics dashboard on a standard or custom page.

- `ConsoleComponent Class`
  Represents a custom console component on a section of a page layout.

- `Container Class`
  Represents a location and style in which to display more than one custom console component in the sidebars of the console.

- `CustomConsoleComponents Class`
  Represents custom console components (Visualforce pages, lookup fields, or related lists) on a page layout.

- `CustomMetadata Class`
  Represents records of custom metadata types.

- `CustomMetadataValue Class`
  Represents custom metadata values for a custom metadata component.

- `DeployCallback Interface`
  An interface for metadata deployment callback classes.

- `DeployCallbackContext Class`
  Represents context information for a deployment job.

- `DeployContainer Class`
  Represents a container for custom metadata components to be deployed.

- `DeployDetails Class`
  Contains detailed information on deployed components.

- `DeployMessage Class`
  Represents result information for the deployment of a metadata component.

- `DeployProblemTypeEnum`
  Describes the problem type for an unsuccessful component deploy.

- `DeployResult Class`
  Represents the results of a metadata deployment.

- `DeployStatus Enum`
  The result status of a deployment.
FeedItemTypeEnum Enum
The type of feed item in a feed-based page layout.

FeedLayout Class
Represents the values that define the feed view of a feed-based page layout. Feed-based layouts are available on Account, Case, Contact, Lead, Opportunity, custom, and external objects. They include a feed view and a detail view.

FeedLayoutComponent Class
Represents a component in the feed view of a feed-based page layout.

FeedLayoutComponentTypeEnum Enum
Indicates the type of feed layout component.

FeedLayoutFilter Class
Represents a feed filter option in the feed view of a feed-based page layout. A filter can have only standardFilter or feedItemType set.

FeedLayoutFilterPosition Enum
Describes where the feed filters list is included in the layout.

FeedLayoutFilterType Enum
The type of feed layout filter.

Layout Class
Represents the metadata associated with a page layout.

LayoutColumn Class
Represents the items in a column within a layout section.

LayoutHeader Enum
Represents tagging types used for Metadata.Layout.headers

LayoutItem Class
Represents the valid values that define a layout item.

LayoutSection Class
Represents a section of a page layout, such as the Custom Links section.

LayoutSectionStyle Enum
Describes the possible styles for a layout section.

Metadata Class
An abstract base class that represents a custom metadata component.

MetadataTypeEnum Enum
Represents the custom metadata components available in Apex.

MetadataValue Class
An abstract base class that represents a custom metadata component field.

MiniLayout Class
Represents a mini view of a record in the Console tab, hover details, and event overlays.

Operations Class
Represents a class to execute metadata operations, such as retrieving or deploying custom metadata.

PlatformActionList Class
Represents the list of actions, and their order, that display in the Salesforce mobile action bar for the layout.
PlatformActionListContextEnum Enum
Describes the different contexts of action lists.

PlatformActionListItem Class
Represents an action in the platform action list for a layout.

PlatformActionTypeEnum Enum
The type of action for a PlatformActionListItem.

PrimaryTabComponents Class
Represents custom console components on primary tabs in the Salesforce console.

QuickActionList Class
Represents the list of actions associated with the page layout.

QuickActionListItem Class
Represents an action in the QuickActionList.

RelatedContent Class
Represents the Mobile Cards section of the page layout.

RelatedContentItem Class
Represents an individual item in the RelatedContent list.

RelatedList Class
Represents related list custom components on the sidebars of the Salesforce console.

RelatedListItem Class
Represents an item in the related list in a page layout.

ReportChartComponentLayoutItem Class
Represents the settings for a report chart on a standard or custom page.

ReportChartComponentSize Enum
Describes the size of the displayed report chart component.

SidebarComponent Class
Represents a specific custom console component to display in a container that hosts multiple components in one of the sidebars of the Salesforce console.

SortOrder Enum
Describes the sort order of a related list.

StatusCode Enum
Describes the status code for an unsuccessful component deploy.

SubtabComponents Class
Represents custom console components on subtabs in the Salesforce console.

SummaryLayoutStyleEnum Enum
Describes the highlights panel style for a SummaryLayout.

SummaryLayout Class
Controls the appearance of the highlights panel, which summarizes key fields in a grid at the top of a page layout, when Case Feed is enabled.

SummaryLayoutItem Class
Controls the appearance of an individual field and its column and row position within the highlights panel grid, when Case Feed is enabled. You can have two fields per each grid in a highlights panel.
UiBehavior Enum
Describes the behavior for a layout item on a layout page.

AnalyticsCloudComponentLayoutItem Class
Represents the settings for a Wave Analytics dashboard on a standard or custom page.

Namespace
Metadata

Usage
Use this class when accessing Metadata.Layout metadata components. For more information, see “AnalyticsCloudComponentLayoutItem” in the Metadata API Developer Guide.

IN THIS SECTION:
AnalyticsCloudComponentLayoutItem Properties
AnalyticsCloudComponentLayoutItem Methods

AnalyticsCloudComponentLayoutItem Properties
The following are properties for AnalyticsCloudComponentLayoutItem.

IN THIS SECTION:
assetType
Specifies the type of Wave Analytics asset.
devName
Unique development name of the dashboard to add.
error
An error string that is populated only when an error occurred in the underlying dashboard.
filter
Dashboard filters for mapping data fields in the dashboard to the object’s fields.
height
Specifies the height of the dashboard, in pixels.
hideOnError
Controls whether users see a dashboard that has an error.
showHeader
If true, includes the dashboard’s header bar. If false, the dashboard appears without a header bar.
showSharing
If set to true, and the dashboard is shareable the dashboard shows the Share icon. If set to false, the dashboard doesn’t show the Share icon.
showTitle
If true, includes the dashboard’s title above the dashboard. If false, the dashboard appears without a title.

width
Specifies the width of the dashboard, in pixels or percentage.

**assetType**
Specifies the type of Wave Analytics asset.

**Signature**
```
public String assetType {get; set;}
```

**Property Value**
Type: `String`

**devName**
Unique development name of the dashboard to add.

**Signature**
```
public String devName {get; set;}
```

**Property Value**
Type: `String`

**error**
An error string that is populated only when an error occurred in the underlying dashboard.

**Signature**
```
public String error {get; set;}
```

**Property Value**
Type: `String`

**filter**
Dashboard filters for mapping data fields in the dashboard to the object’s fields.

**Signature**
```
public String filter {get; set;}
```
Property Value
Type: String

**height**
Specifies the height of the dashboard, in pixels.

Signature
```java
public Integer height {get; set;}
```

Property Value
Type: Integer

**hideOnError**
Controls whether users see a dashboard that has an error.

Signature
```java
public Boolean hideOnError {get; set;}
```

Property Value
Type: Boolean

**showHeader**
If true, includes the dashboard's header bar. If false, the dashboard appears without a header bar.

Signature
```java
public Boolean showHeader {get; set;}
```

Property Value
Type: Boolean

**showSharing**
If set to true, and the dashboard is shareable the dashboard shows the Share icon. If set to false, the dashboard doesn’t show the Share icon.

Signature
```java
public Boolean showSharing {get; set;}
```
Property Value
Type: Boolean

**showTitle**
If true, includes the dashboard’s title above the dashboard. If false, the dashboard appears without a title.

**Signature**
```java
public Boolean showTitle {get; set;}
```

Property Value
Type: Boolean

**width**
Specifies the width of the dashboard, in pixels or percentage.

**Signature**
```java
public String width {get; set;}
```

Property Value
Type: String

**AnalyticsCloudComponentLayoutItem Methods**
The following are methods for AnalyticsCloudComponentLayoutItem.

**IN THIS SECTION:**
- **clone()**
  Makes a duplicate copy of the Metadata.AnalyticsCloudComponentLayoutItem.

**clone()**
Makes a duplicate copy of the Metadata.AnalyticsCloudComponentLayoutItem.

**Signature**
```java
public Object clone()
```

**Return Value**
Type: Object
ConsoleComponent Class

Represents a custom console component on a section of a page layout.

Namespace

Metadata

Usage

Use this class when accessing Metadata.Layout metadata components. For more information, see “ConsoleComponent” in the Metadata API Developer Guide.

IN THIS SECTION:

ConsoleComponent Properties

ConsoleComponent Methods

ConsoleComponent Properties

The following are properties for ConsoleComponent.

IN THIS SECTION:

height
The height of the custom console component in pixels.

location
The location of the custom console component on the page layout. Valid values are right, left, top, and bottom.

visualforcePage
The unique name of the custom console component.

width
The width of the custom console component in pixels.

height

The height of the custom console component in pixels.

Signature

public Integer height {get; set;}

Property Value

Type: Integer

location

The location of the custom console component on the page layout. Valid values are right, left, top, and bottom.
Signature
public String location {get; set;}

Property Value
Type: String

visualforcePage
The unique name of the custom console component.

Signature
public String visualforcePage {get; set;}

Property Value
Type: String

width
The width of the custom console component in pixels.

Signature
public Integer width {get; set;}

Property Value
Type: Integer

ConsoleComponent Methods
The following are methods for ConsoleComponent.

IN THIS SECTION:
  clone()
    Makes a duplicate copy of the Metadata.ConsoleComponent.

clone()
Makes a duplicate copy of the Metadata.ConsoleComponent.

Signature
public Object clone()
Return Value
Type: Object

Container Class
Represents a location and style in which to display more than one custom console component in the sidebars of the console.

Namespace
Metadata

Usage
Use this class when accessing `Metadata.Layout` metadata components. For more information, see “Container” in the `Metadata API Developer Guide`.

IN THIS SECTION:
- Container Properties
- Container Methods

Container Properties
The following are properties for `Container`.

IN THIS SECTION:
- `height`
- `isContainerAutoSizeEnabled`
- `region`
- `sidebarComponents`
- `style`
- `unit`
- `width`

**height**
The height of the component’s container. The `unit` property determines the unit of measurement, in pixels or percent.

**isContainerAutoSizeEnabled**
If set to true, stacked console components in the sidebars autosize vertically.

**region**
The location of the component’s container (right, left, bottom, top).

**sidebarComponents**
Represents a specific custom console component to display in the components’ container.

**style**
The style of the container in which to display multiple components (stack, tab, accordion).

**unit**
The unit of measurement, in pixels or percent, for the height or width of the components’ container.

**width**
The width of the component’s container. The `unit` property determines the unit of measurement, in pixels or percent.
**Signature**

```java
public Integer height {get; set;}
```

**Property Value**

Type: `Integer`

---

**isContainerAutoSizeEnabled**

If set to true, stacked console components in the sidebars autosize vertically.

**Signature**

```java
public Boolean isContainerAutoSizeEnabled {get; set;}
```

**Property Value**

Type: `Boolean`

---

**region**

The location of the component's container (right, left, bottom, top).

**Signature**

```java
public String region {get; set;}
```

**Property Value**

Type: `String`

---

**sidebarComponents**

Represents a specific custom console component to display in the components' container.

**Signature**

```java
public List<Metadata.SidebarComponent> sidebarComponents {get; set;}
```

**Property Value**

Type: `List<Metadata.SidebarComponent>`

---

**style**

The style of the container in which to display multiple components (stack, tab, accordion).

**Signature**

```java
public String style {get; set;}
```
Property Value
Type: `String`

**unit**
The unit of measurement, in pixels or percent, for the height or width of the components’ container.

**Signature**
`public String unit {get; set;}`

Property Value
Type: `String`

**width**
The width of the component’s container. The `unit` property determines the unit of measurement, in pixels or percent.

**Signature**
`public Integer width {get; set;}`

Property Value
Type: `Integer`

**Container Methods**
The following are methods for `Container`.

**IN THIS SECTION:**
`clone()`  
Makes a duplicate copy of the `Metadata.Container`.

`clone()`  
Makes a duplicate copy of the `Metadata.Container`.

**Signature**
`public Object clone()`  

**Return Value**
Type: `Object`
CustomConsoleComponents Class

Represents custom console components (Visualforce pages, lookup fields, or related lists) on a page layout.

Namespace

Metadata

Usage

Use this class when accessing Metadata.Layout metadata components. For more information, see “CustomConsoleComponents” in the Metadata API Developer Guide.

In this section:

- CustomConsoleComponents Properties
- CustomConsoleComponents Methods

CustomConsoleComponents Properties

The following are properties for CustomConsoleComponents.

In this section:

- primaryTabComponents
- subtabComponents

primaryTabComponents

Represents custom console components on primary tabs in the Salesforce console.

Signature

```java
public Metadata.PrimaryTabComponents primaryTabComponents {get; set;}
```

Property Value

Type: Metadata.PrimaryTabComponents

subtabComponents

Represents custom console components on subtabs in the Salesforce console.

Signature

```java
public Metadata.SubtabComponents subtabComponents {get; set;}
```
CustomConsoleComponents Methods

The following are methods for CustomConsoleComponents.

**IN THIS SECTION:**

**clone()**

Makes a duplicate copy of the Metadata.CustomConsoleComponents.

**Signature**

```java
public Object clone()
```

**Return Value**

Type: Object

CustomMetadata Class

Represents records of custom metadata types.

**Warning:** Protected custom metadata types behave like public custom metadata types when they are outside of a managed package. Public custom metadata types are readable for all profiles, including the guest user. Do not store secrets, personally identifying information, or any private data in these records. Use protected custom metadata types only in managed packages. Outside of a managed package, use named credentials or encrypted custom fields to store secrets like OAuth tokens, passwords, and other confidential material.

**Namespace**

Metadata

**Usage**

Use Metadata.CustomMetadata to represent records of custom metadata types in Apex. For more information, see Custom Metadata Types in the Metadata API Developer Guide.

**Example**

```java
// Set up custom metadata to be created in the subscriber org.
Metadata.CustomMetadata customMetadata = new Metadata.CustomMetadata();
customMetadata.fullName = 'ISVNamespace__MetadataTypeName.MetadataRecordName';
```
customField = new Metadata.CustomMetadataValue();
customField.field = 'customField__c';
customField.value = 'New value';
customMetadata.values.add(customField);

Note: When you assign namespaces to records, provide full, qualified record names to the app. If both the type and the record are in Namespace, use something like: customMetadata.fullName = 'Namespace__MetadataTypeName.Namespace__MetadataRecordName'

IN THIS SECTION:

CustomMetadata Properties

CustomMetadata Methods

CustomMetadata Properties

The following are properties for CustomMetadata.

IN THIS SECTION:

description
The description of the custom metadata.

label
The label of the custom metadata record.

protected_x
Property that describes whether the custom metadata record is a protected component.

values
A list of custom metadata values, such as custom fields, for the custom metadata record.

description

The description of the custom metadata.

Signature

public String description {get; set;}

Property Value

Type: String

label

The label of the custom metadata record.

Signature

public String label {get; set;}
Property Value
Type: String

**protected_x**
Property that describes whether the custom metadata record is a protected component.

Signature
```csharp
public Boolean protected_x {get; set;}
```

Property Value
Type: Boolean

**values**
A list of custom metadata values, such as custom fields, for the custom metadata record.

Signature
```csharp
public List<Metadata.CustomMetadataValue> values {get; set;}
```

Property Value
Type: List<Metadata.CustomMetadataValue>

**CustomMetadata Methods**
The following are methods for CustomMetadata.

IN THIS SECTION:

**clone()**
Makes a duplicate copy of the Metadata.CustomMetadata.

**clone()**
Makes a duplicate copy of the Metadata.CustomMetadata.

Signature
```csharp
public Object clone()
```

Return Value
Type: Object
CustomMetadataValue Class

Represents custom metadata values for a custom metadata component.

Namespace

Metadata

Usage

Use Metadata CustomMetadataValue to access values for custom fields of custom metadata records.

Supported Apex primitive types are:

- Boolean
- Date
- DateTime
- Decimal
- Double
- Integer
- Long
- String

Example

```java
// Set a custom field value for a custom metadata record
Metadata.CustomMetadataValue customField = new Metadata.CustomMetadataValue();
customField.field = 'CustomField1__c';
customField.value = 'New Value';
customMetadata.values.add(customField);
```

IN THIS SECTION:

- CustomMetadataValue Properties
- CustomMetadataValue Methods

CustomMetadataValue Properties

The following are properties for CustomMetadataValue.

IN THIS SECTION:

- field
  - The field name for the custom metadata value.
- value
  - The field value for the custom metadata value.
**field**
The field name for the custom metadata value.

**Signature**
`public String field {get; set;}

**Property Value**
Type: String

**value**
The field value for the custom metadata value.

**Signature**
`public Object value {get; set;}

**Property Value**
Type: Object
Supported Apex primitive types are:
- Boolean
- Date
- DateTime
- Decimal
- Double
- Integer
- Long
- String

When setting the value for relationship fields, use the qualified API name of the related metadata, not the ID. For more information, see Primitive Data Types.

**CustomMetadataValue Methods**
The following are methods for CustomMetadataValue.

IN THIS SECTION:
- `clone()`
  - Makes a duplicate copy of the Metadata.CustomMetadataValue.

- `clone()`
  - Makes a duplicate copy of the Metadata.CustomMetadataValue.
DeployCallback Interface

An interface for metadata deployment callback classes.

Namespace

Metadata

Usage

You must provide a callback class for the asynchronous deployment of custom metadata through Apex. This class must implement the `Metadata.DeployCallback` interface.

Salesforce calls your `DeployCallback.handleResult(var1, var2)` method asynchronously once the queued deployment completes. Because the callback is called as asynchronous Apex after deployment, there may be a brief period where the deploy has completed, but your callback has not been called yet.

IN THIS SECTION:

- DeployCallback Methods
- DeployCallback Example Implementation

DeployCallback Methods

The following are methods for `DeployCallback`.

IN THIS SECTION:

- `handleResult(var1, var2)`
  
  Method that is called when the asynchronous deployment of custom metadata completes.

`handleResult(var1, var2)`

Method that is called when the asynchronous deployment of custom metadata completes.

Signature

```
public void handleResult(Metadata.DeployResult var1, Metadata.DeployCallbackContext var2)
```
Parameters

var1
Type: Metadata.DeployResult
The results of the asynchronous deployment.

var2
Type: Metadata.DeployCallbackContext
The context for the queued asynchronous deployment job.

Return Value
Type: void

DeployCallback Example Implementation

This is an example implementation of the Metadata.DeployCallback interface.

```java
public class MyCallback implements Metadata.DeployCallback {
    public void handleResult(Metadata.DeployResult result,
                              Metadata.DeployCallbackContext context) {
        if (result.status == Metadata.DeployStatus.Succeeded) {
            // Deployment was successful
        } else {
            // Deployment was not successful
        }
    }
}
```

The following example uses this implementation for a deployment.

```java
// Setup callback and deploy
MyCallback callback = new MyCallback();
Metadata.Operations.enqueueDeployment(mdContainer, callback);
```

DeployCallbackContext Class

Represents context information for a deployment job.

Namespace

Metadata

Usage

After an asynchronous metadata deployment finishes, Salesforce provides an instance of Metadata.DeployCallbackContext in an asynchronous call to your implementation of handleResult() in your Metadata.DeployCallback class.
Example

```java
public void handleResult(Metadata.DeployResult result,
    Metadata.DeployCallbackContext context) {
    // Check the callback job ID for the deployment
    Id jobId = context.getCallbackJobId();
    // ...process the results...
}
```

IN THIS SECTION:
DeployCallbackContext Methods

DeployCallbackContext Methods
The following are methods for DeployCallbackContext.

IN THIS SECTION:
clone()  
Makes a duplicate copy of the Metadata.DeployCallbackContext.

callbackJobId()  
Gets the asynchronous Apex job ID for the callback job.

clone()

Makes a duplicate copy of the Metadata.DeployCallbackContext.

**Signature**

```java
public Object clone()
```

**Return Value**

Type: Object

getCallbackJobId()

Gets the asynchronous Apex job ID for the callback job.

**Signature**

```java
public Id getCallbackJobId()
```

**Return Value**

Type: Id
DeployContainer Class

Represents a container for custom metadata components to be deployed.

Namespace

Metadata

Usage

Use Metadata.DeployContainer to manage custom metadata components for deployment. A container must have one or more components before being deployed.

Example

```java
// Use DeployContainer for deployment
Metadata.DeployContainer mdContainer = new Metadata.DeployContainer();
mdContainer.addMetadata(customMetadata);
...

// Enqueue deploy
Metadata.Operations.enqueueDeployment(mdContainer, callback);
```

IN THIS SECTION:

DeployContainer Methods

DeployContainer Methods

The following are methods for DeployContainer.

IN THIS SECTION:

addMetadata(md)

Add a custom metadata component to the container.

clonel)

Makes a duplicate copy of the Metadata.DeployContainer.

getMetadata()

Retrieves a list of custom metadata components from the container.

removeMetadata(md)

Removes a metadata component from the container.

removeMetadataByFullName(fullName)

Removes a metadata component from the container using the component’s full name.

addMetadata (md)

Add a custom metadata component to the container.
Signature
public void addMetadata(Metadata.Metadata md)

Parameters
md
Type: Metadata.Metadata
A custom metadata component class that derives from Metadata.Metadata. Avoid adding components to a Metadata.DeployContainer that have the same Metadata.Metadata.fullName because it causes deployment errors.

Return Value
Type: void

clone()
Makes a duplicate copy of the Metadata.DeployContainer.

Signature
public Object clone()

Return Value
Type: Object

getMetadata()
Retrieves a list of custom metadata components from the container.

Signature
public List<Metadata.Metadata> getMetadata()

Return Value
Type: List<Metadata.Metadata>

removeMetadata(md)
Removes a metadata component from the container.

Signature
public Boolean removeMetadata(Metadata.Metadata md)
DeployDetails Class

Contains detailed information on deployed components.

Namespace

Metadata

Usage

Use this class to obtain a list of the successfully and unsuccessfully deployed components after a completed deployment by Salesforce in your Metadata.DeployCallback results.

IN THIS SECTION:

DeployDetails Properties
DeployDetails Methods
DeployDetails Properties

The following are properties for DeployDetails.

IN THIS SECTION:

- **componentFailures**
  Contains a list of information about components that failed to deploy.

- **componentSuccesses**
  Contains a list of information about components that deployed successfully.

**componentFailures**

Contains a list of information about components that failed to deploy.

**Signature**

```csharp
public List<Metadata.DeployMessage> componentFailures {get; set;}
```

**Property Value**

Type: `List<Metadata.DeployMessage>`

**componentSuccesses**

Contains a list of information about components that deployed successfully.

**Signature**

```csharp
public List<Metadata.DeployMessage> componentSuccesses {get; set;}
```

**Property Value**

Type: `List<Metadata.DeployMessage>`

DeployDetails Methods

The following are methods for DeployDetails.

IN THIS SECTION:

- **clone()**
  Makes a duplicate copy of the `Metadata.DeployDetails`.

**clone()**

Makes a duplicate copy of the `Metadata.DeployDetails`.
Signature

```java
public Object clone()
```

Return Value

Type: Object

DeployMessage Class

Represents result information for the deployment of a metadata component.

Namespace

`Metadata`

Usage

Use `DeployMessage` to access detailed information about component deployments. Salesforce provides a list of `DeployMessages` for a completed deployment via the `DeployDetails` and `DeployResults` instances sent in the `DeployCallback.handleResult()` callback.

IN THIS SECTION:

- DeployMessage Properties
- DeployMessage Methods

DeployMessage Properties

The following are properties for `DeployMessage`.

IN THIS SECTION:

- `changed`
  Determines whether the component was changed after deployment. If true, the component was changed as a result of the deployment. If false, the deployed component was the same as the corresponding component already in the org.
- `columnNameNumber`
  Each component is represented by a text file. If an error occurs during deployment, this property represents the column of the text file where the error occurred.
- `componentType`
  The metadata type of the component in the deployment.
- `created`
  If true, the component was created as a result of the deployment. If false, the component was modified as a result of the deployment.
- `createdDate`
  The date and time when the component was created as a result of the deployment.
deleted
If true, the component was deleted as a result of the deployment. If false, the component was either new or modified as result of the deployment.

fileName
The name of the file in the metadata archive used to deploy the component.

fullName
Full name for the custom metadata component.

id
ID of the component that was deployed.

lineNumber
Each component is represented by a text file. If an error occurs during deployment, this field represents the line number of the text file where the error occurred.

problem
If an error or warning occurred, this field contains a description of the problem that caused the deployment to fail.

problemType
Indicates the problem type, for example, an error or warning.

success
Indicates whether the component was successfully deployed (true) or not (false).

changed
Determines whether the component was changed after deployment. If true, the component was changed as a result of the deployment. If false, the deployed component was the same as the corresponding component already in the org.

Signature

```java
public Boolean changed {get; set;}
```

Property Value
Type: Boolean

columnNumber
Each component is represented by a text file. If an error occurs during deployment, this property represents the column of the text file where the error occurred.

Signature

```java
public Integer columnNumber {get; set;}
```

Property Value
Type: Integer
componentType
The metadata type of the component in the deployment.

Signature
public String componentType {get; set;}

Property Value
Type: String

created
If true, the component was created as a result of the deployment. If false, the component was modified as a result of the deployment.

Signature
public Boolean created {get; set;}

Property Value
Type: Boolean

createdDate
The date and time when the component was created as a result of the deployment.

Signature
public Datetime createdDate {get; set;}

Property Value
Type: Datetime

deleted
If true, the component was deleted as a result of the deployment. If false, the component was either new or modified as result of the deployment.

Signature
public Boolean deleted {get; set;}

Property Value
Type: Boolean
**fileName**
The name of the file in the metadata archive used to deploy the component.

**Signature**
```java
public String fileName {get; set;}
```

**Property Value**
Type: String

**fullName**
Full name for the custom metadata component.

**Signature**
```java
public String fullName {get; set;}
```

**Property Value**
Type: String

**id**
ID of the component that was deployed.

**Signature**
```java
public Id id {get; set;}
```

**Property Value**
Type: Id

**lineNumber**
Each component is represented by a text file. If an error occurs during deployment, this field represents the line number of the text file where the error occurred.

**Signature**
```java
public Integer lineNumber {get; set;}
```

**Property Value**
Type: Integer
**problem**
If an error or warning occurred, this field contains a description of the problem that caused the deployment to fail.

**Signature**
```csharp
public String problem {get; set;}
```

**Property Value**
Type: `String`

**problemType**
Indicates the problem type, for example, an error or warning.

**Signature**
```csharp
public Metadata.DeployProblemType problemType {get; set;}
```

**Property Value**
Type: `Metadata.DeployProblemType`

**success**
Indicates whether the component was successfully deployed (true) or not (false).

**Signature**
```csharp
public Boolean success {get; set;}
```

**Property Value**
Type: `Boolean`

**DeployMessage Methods**
The following are methods for `DeployMessage`.

**IN THIS SECTION:**

2383
DeployProblemType Enum

Describes the problem type for an unsuccessful component deploy.

Enum Values

The following are the values of the Metadata_DeployProblemType enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>The deploy problem is an error.</td>
</tr>
<tr>
<td>Info</td>
<td>The deploy problem is of type &quot;Info&quot;.</td>
</tr>
<tr>
<td>Warning</td>
<td>The deploy problem is a warning.</td>
</tr>
</tbody>
</table>

SEE ALSO:

StatusCode Enum

DeployResult Class

Represents the results of a metadata deployment.

Namespace

Metadata

Usage

After an asynchronous metadata deployment finishes, Salesforce provides an instance of Metadata_DeployResult in a call to your implementation of handleResult() in your Metadata_DeployCallback class.

Example

```plaintext
public void handleResult(Metadata.DeployResult result,
            Metadata.DeployCallbackContext context) {
    if (result.status == Metadata.DeployStatus.Succeeded) {
        // Deployment was successful
    } else {
        // Deployment was not successful
    }
```
The following are properties for `DeployResult`.

- **canceledBy**: ID of the user who canceled the queued deployment.
- **canceledByName**: Full name of the user who canceled the queued deployment.
- **checkOnly**: Indicates whether the deployment checked only the validity of the deployed files without making changes in the org. A check-only deployment does not deploy components or change the org in any way.
- **completedDate**: Date and time for when the deployment process ended.
- **createdBy**: ID of the user who created the deployment job.
- **createdByName**: Full name of the user who created the deployment job.
- **createdDate**: Date and time the deployment job was first queued.
- **details**: Provides the details for components in a completed deployment.
- **done**: Indicates whether Salesforce finished processing the deployment.
- **errorMessage**: Message corresponding to the values in the `errorStatusCode` property, if any.
- **errorStatusCode**: If an error occurs during deployment, a status code is returned. The message corresponding to the status code is returned in the `errorMessage` property.
- **id**: ID of the deployment job.
- **ignoreWarnings**: Specifies whether a deployment continues, even if the deployment generates warnings.
lastModifiedDate
Date and time of the last update for the deployment process.
messages
A list of all the detail messages for a deployment.
numberComponentErrors
The number of components that generated errors during the deployment.
numberComponentsDeployed
The number of components deployed in the deployment process. Use this value with the numberComponentsTotal property to get an estimate of the deployment’s progress.
numberComponentsTotal
The total number of components in the deployment. Use this value with the numberComponentsDeployed property to get an estimate of the deployment’s progress.
rollbackOnError
Indicates whether any failure causes a complete rollback (true) or not (false) of the deployment.
startDate
Date and time the deployment process began.
stateDetail
Indicates which component is being deployed.
status
Indicates the current state of the deployment.
success
Indicates whether the deployment was successful (true) or not (false).

canceledBy
ID of the user who canceled the queued deployment.

Signature
public String canceledBy {get; set;}

Property Value
Type: String

canceledByName
Full name of the user who canceled the queued deployment.

Signature
public String canceledByName {get; set;}

Property Value
Type: String
checkOnly
Indicates whether the deployment checked only the validity of the deployed files without making changes in the org. A check-only deployment does not deploy components or change the org in any way.

Signature
public Boolean checkOnly {get; set;}

Property Value
Type: Boolean

completedDate
Date and time for when the deployment process ended.

Signature
public Datetime completedDate {get; set;}

Property Value
Type: Datetime

createdBy
ID of the user who created the deployment job.

Signature
public String createdBy {get; set;}

Property Value
Type: String

createdByName
Full name of the user who created the deployment job.

Signature
public String createdByName {get; set;}

Property Value
Type: String
**createdDate**
Date and time the deployment job was first queued.

**Signature**
```
public Datetime createdDate {get; set;}
```

**Property Value**
Type: Datetime

**details**
Provides the details for components in a completed deployment.

**Signature**
```
public Metadata.DeployDetails details {get; set;}
```

**Property Value**
Type: Metadata.DeployDetails

**done**
Indicates whether Salesforce finished processing the deployment.

**Signature**
```
public Boolean done {get; set;}
```

**Property Value**
Type: Boolean

**errorMessage**
Message corresponding to the values in the errorStatusCode property, if any.

**Signature**
```
public String errorMessage {get; set;}
```

**Property Value**
Type: String
**errorStatusCode**

If an error occurs during deployment, a status code is returned. The message corresponding to the status code is returned in the `errorMessage` property.

**Signature**

```java
public String errorStatusCode {get; set;}
```

**Property Value**

Type: `String`

For a description of each status code value, see Core Data Types Used in API Calls in the SOAP API Developer Guide.

**id**

ID of the deployment job.

**Signature**

```java
public Id id {get; set;}
```

**Property Value**

Type: `Id`

**ignoreWarnings**

Specifies whether a deployment continues, even if the deployment generates warnings.

**Signature**

```java
public Boolean ignoreWarnings {get; set;}
```

**Property Value**

Type: `Boolean`

**lastModifiedDate**

Date and time of the last update for the deployment process.

**Signature**

```java
public Datetime lastModifiedDate {get; set;}
```

**Property Value**

Type: `Datetime`
**messages**
A list of all the detail messages for a deployment.

**Signature**
```csharp
public List<Metadata.DeployMessage> messages {get; set;}
```

**Property Value**
Type: `List<Metadata.DeployMessage>`

---

**numberComponentErrors**
The number of components that generated errors during the deployment.

**Signature**
```csharp
public Integer numberComponentErrors {get; set;}
```

**Property Value**
Type: `Integer`

---

**numberComponentsDeployed**
The number of components deployed in the deployment process. Use this value with the `numberComponentsTotal` property to get an estimate of the deployment’s progress.

**Signature**
```csharp
public Integer numberComponentsDeployed {get; set;}
```

**Property Value**
Type: `Integer`

---

**numberComponentsTotal**
The total number of components in the deployment. Use this value with the `numberComponentsDeployed` property to get an estimate of the deployment’s progress.

**Signature**
```csharp
public Integer numberComponentsTotal {get; set;}
```

**Property Value**
Type: `Integer`
**rollbackOnError**
Indicates whether any failure causes a complete rollback (true) or not (false) of the deployment.

**Signature**
```
public Boolean rollbackOnError {get; set;}
```

**Property Value**
Type: Boolean

---

**startDate**
Date and time the deployment process began.

**Signature**
```
public Datetime startDate {get; set;}
```

**Property Value**
Type: Datetime

---

**stateDetail**
Indicates which component is being deployed.

**Signature**
```
public String stateDetail {get; set;}
```

**Property Value**
Type: String

---

**status**
Indicates the current state of the deployment.

**Signature**
```
public Metadata.DeployStatus status {get; set;}
```

**Property Value**
Type: Metadata.DeployStatus

---

**success**
Indicates whether the deployment was successful (true) or not (false).
Signature

```java
public Boolean success {get; set;}
```

Property Value

Type: Boolean

DeployResult Methods

The following are methods for DeployResult.

IN THIS SECTION:

- **clone()**

  Makes a duplicate copy of the Metadata.DeployResult.

**clone()**

Makes a duplicate copy of the Metadata.DeployResult.

Signature

```java
public Object clone()
```

Return Value

Type: Object

DeployStatus Enum

The result status of a deployment.

Usage

`Metadata.DeployResult.status` uses this enum to describe the results of the deployment.

Enum Values

The following are the values of the `Metadata.DeployStatus` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Canceled</td>
<td>The queued deployment was canceled.</td>
</tr>
<tr>
<td>Canceling</td>
<td>The queued deployment is being canceled.</td>
</tr>
<tr>
<td>Failed</td>
<td>The deployment failed.</td>
</tr>
<tr>
<td>InProgress</td>
<td>The deployment has been started and is in progress.</td>
</tr>
<tr>
<td>Pending</td>
<td>The deployment has been queued but not started.</td>
</tr>
</tbody>
</table>
The deployment succeeded.

The deployment succeeded, but some components might not have been successfully deployed. Check Metadata.DeployResult for more details.

---

**FeedItemTypeEnum Enum**

The type of feed item in a feed-based page layout.

**Enum Values**

The following are the values of the Metadata.FeedItemTypeEnum enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActivityEvent</td>
<td>Activity on tasks and events associated with a case. Available only on Case layouts.</td>
</tr>
<tr>
<td>AdvancedTextPost</td>
<td>Group announcements posted on a feed.</td>
</tr>
<tr>
<td>AnnouncementPost</td>
<td>Not used.</td>
</tr>
<tr>
<td>ApprovalPost</td>
<td>Approvals submitted on a feed.</td>
</tr>
<tr>
<td>AttachArticleEvent</td>
<td>Activity related to attaching articles to cases.</td>
</tr>
<tr>
<td>BasicTemplateFeedItem</td>
<td>Activity from the Log a Call action. Available only on layouts for objects that support Activities (tasks and events).</td>
</tr>
<tr>
<td>CallLogPost</td>
<td>Activity from the Log a Call action. Available only on layouts for objects that support Activities (tasks and events).</td>
</tr>
<tr>
<td>CanvasPost</td>
<td>Posts a canvas app makes on a feed.</td>
</tr>
<tr>
<td>CaseCommentPost</td>
<td>Activity from the Case Note action. Available only on Case layouts.</td>
</tr>
<tr>
<td>ChangeStatusPost</td>
<td>Activity from the Change Status action. Available only on Case layouts.</td>
</tr>
<tr>
<td>ChatTranscriptPost</td>
<td>Activity related to attaching Chat transcripts to cases. Available only on Case layouts.</td>
</tr>
<tr>
<td>CollaborationGroupCreated</td>
<td>Creating a public group.</td>
</tr>
<tr>
<td>CollaborationGroupUnarchived</td>
<td>Not used.</td>
</tr>
<tr>
<td>ContentPost</td>
<td>Attaching a file to a post.</td>
</tr>
<tr>
<td>CreateRecordEvent</td>
<td>Creating a record from the publisher.</td>
</tr>
<tr>
<td>DashboardComponentAlert</td>
<td>Not used.</td>
</tr>
<tr>
<td>DashboardComponentSnapshot</td>
<td>Posting a dashboard snapshot on a feed.</td>
</tr>
<tr>
<td>EmailMessageEvent</td>
<td>Activity from the Email action. Available only on Case layouts.</td>
</tr>
<tr>
<td>FacebookPost</td>
<td>Not used.</td>
</tr>
</tbody>
</table>
### FeedLayout Class

Represents the values that define the feed view of a feed-based page layout. Feed-based layouts are available on Account, Case, Contact, Lead, Opportunity, custom, and external objects. They include a feed view and a detail view.

### Namespace

*Metadata*

### Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see “FeedLayout” in the Metadata API Developer Guide.

IN THIS SECTION:

- FeedLayout Properties
- FeedLayout Methods

### FeedLayout Properties

The following are properties for `FeedLayout`.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LinkPost</td>
<td>Attaching a URL to a post.</td>
</tr>
<tr>
<td>MilestoneEvent</td>
<td>Changing the milestone status on a case. Available only on Case layouts.</td>
</tr>
<tr>
<td>PollPost</td>
<td>Posting a poll on a feed.</td>
</tr>
<tr>
<td>ProfileSkillPost</td>
<td>Adding skills to a user's Chatter profile.</td>
</tr>
<tr>
<td>QuestionPost</td>
<td>Posting a question on a feed.</td>
</tr>
<tr>
<td>ReplyPost</td>
<td>Activity from the Portal action. Available only on Case layouts.</td>
</tr>
<tr>
<td>RypplePost</td>
<td>Creating a Thanks badge in WDC.</td>
</tr>
<tr>
<td>SocialPost</td>
<td>Activity on Twitter from the Social Post action.</td>
</tr>
<tr>
<td>TestItem</td>
<td>Creating a text post from the publisher.</td>
</tr>
<tr>
<td>TextPost</td>
<td>Making a change or group of changes to a tracked field.</td>
</tr>
<tr>
<td>TrackedChange</td>
<td>Not used.</td>
</tr>
<tr>
<td>Undefined</td>
<td>Undefined feed item.</td>
</tr>
<tr>
<td>UserStatus</td>
<td>Not used.</td>
</tr>
</tbody>
</table>
IN THIS SECTION:

- **autocollapsePublisher**
  Specifies whether the publisher is collapsed when the page loads (true) or not (false).

- **compactFeed**
  Specifies whether the feed-based page layout uses a compact feed (true) or not (false). If set to true, feed items on the page are collapsed by default, and the feed view has an updated design.

- **feedFilterPosition**
  Indicates where the feed filters list is included in the layout.

- **feedFilters**
  The individual filters displayed in the feed filters list.

- **fullWidthFeed**
  Specifies whether the feed expands horizontally to take up all available space on the page (true) or not (false).

- **hideSidebar**
  Specifies whether the sidebar is hidden (true) or not (false).

- **highlightExternalFeedItems**
  Controls whether to highlight external feed items (true) or not (false).

- **leftComponents**
  The individual components displayed in the left column of the feed view.

- **rightComponents**
  Lists the individual components displayed in the right column of the feed view.

- **useInlineFiltersInConsole**
  Indicates whether to use inline filters in the Salesforce console.

---

**autocollapsePublisher**

Specifies whether the publisher is collapsed when the page loads (true) or not (false).

**Signature**

```java
public Boolean autocollapsePublisher {get; set;}
```

**Property Value**

Type: Boolean

**compactFeed**

Specifies whether the feed-based page layout uses a compact feed (true) or not (false). If set to true, feed items on the page are collapsed by default, and the feed view has an updated design.

**Signature**

```java
public Boolean compactFeed {get; set;}
```
**Property Value**

*Type: Boolean*

**feedFilterPosition**

Indicates where the feed filters list is included in the layout.

**Signature**

```csharp
public Metadata.FeedLayoutFilterPosition feedFilterPosition {get; set;}
```

**Property Value**

*Type: FeedLayoutFilterPosition Enum*

**feedFilters**

The individual filters displayed in the feed filters list.

**Signature**

```csharp
public List<Metadata.FeedLayoutFilter> feedFilters {get; set;}
```

**Property Value**

*Type: List<FeedLayoutFilter Class>.*

**fullWidthFeed**

Specifies whether the feed expands horizontally to take up all available space on the page (`true`) or not (`false`).

**Signature**

```csharp
public Boolean fullWidthFeed {get; set;}
```

**Property Value**

*Type: Boolean*

**hideSidebar**

Specifies whether the sidebar is hidden (`true`) or not (`false`).

**Signature**

```csharp
public Boolean hideSidebar {get; set;}
```

**Property Value**

*Type: Boolean*
**highlightExternalFeedItems**
Controls whether to highlight external feed items (true) or not (false).

**Signature**
```
public Boolean highlightExternalFeedItems {get; set;}
```

**Property Value**
Type: Boolean

**leftComponents**
The individual components displayed in the left column of the feed view.

**Signature**
```
public List<Metadata.FeedLayoutComponent> leftComponents {get; set;}
```

**Property Value**
Type: List<FeedLayoutComponent Class>

**rightComponents**
Lists the individual components displayed in the right column of the feed view.

**Signature**
```
public List<Metadata.FeedLayoutComponent> rightComponents {get; set;}
```

**Property Value**
Type: List<FeedLayoutComponent Class>

**useInlineFiltersInConsole**
Indicates whether to use inline filters in the Salesforce console.

**Signature**
```
public Boolean useInlineFiltersInConsole {get; set;}
```

**Property Value**
Type: Boolean

**FeedLayout Methods**
The following are methods for FeedLayout.
clone()  
Makes a duplicate copy of the Metadata.FeedLayout.

Signature  
public Object clone()

Return Value  
Type: Object

FeedLayoutComponent Class

Represents a component in the feed view of a feed-based page layout.

Namespace

Metadata

Usage

Use this class when accessing Metadata.Layout metadata components. For more information, see “FeedLayoutComponent” in the Metadata API Developer Guide.

FeedLayoutComponent Properties

The following are properties for FeedLayoutComponent.

See FeedLayoutComponent in the Metadata API Developer Guide.

IN THIS SECTION:

componentType  
Represents a component in the feed view of a feed-based page layout. The type of component is required.

height  
The height, in pixels, of the component. Doesn’t apply to standardComponents.

page_x  
The name of the Visualforce page used as a custom component.
**componentType**
Represented as a component in the feed view of a feed-based page layout. The type of component is required.

**Signature**
```csharp
public Metadata.FeedLayoutComponentType componentType {get; set;}
```

**Property Value**
Type: Metadata.FeedLayoutComponentType on page 2400

**height**
The height, in pixels, of the component. Doesn’t apply to standardComponents

**Signature**
```csharp
public Integer height {get; set;}
```

**Property Value**
Type: Integer

**page_x**
The name of the Visualforce page used as a custom component.

**Signature**
```csharp
public String page_x {get; set;}
```

**Property Value**
Type: String

**FeedLayoutComponent Methods**
The following are methods for FeedLayoutComponent.

**IN THIS SECTION:**
```csharp
clone()
```
Makes a duplicate copy of the Metadata.FeedLayoutComponent.

```csharp
clone()
```
Makes a duplicate copy of the Metadata.FeedLayoutComponent.
Signature

public Object clone()

Return Value

Type: Object

FeedLayoutComponentType Enum

Indicates the type of feed layout component.

Enum Values

The following are the values of the Metadata.FeedLayoutComponentType enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CaseExperts</td>
<td>List of case experts.</td>
</tr>
<tr>
<td>CaseUnifiedFiles</td>
<td>List of all files attached to the case.</td>
</tr>
<tr>
<td>CustomButtons</td>
<td>Custom button.</td>
</tr>
<tr>
<td>CustomLinks</td>
<td>Custom link.</td>
</tr>
<tr>
<td>Followers</td>
<td>List of followers.</td>
</tr>
<tr>
<td>Following</td>
<td>Icon that toggles between a Follow button (if the user viewing a record doesn’t already follow it) and a Following indicator (if the user viewing a record does follow it).</td>
</tr>
<tr>
<td>HelpAndToolLinks</td>
<td>Icons that link to the help topic for the page, the page layout, and, the printable view of the page. Available only on Case layouts.</td>
</tr>
<tr>
<td>Milestones</td>
<td>Milestone tracker, which lets users see the status of a milestone on a case. Available only on Case layouts.</td>
</tr>
<tr>
<td>SimilarCases</td>
<td>List of similar cases.</td>
</tr>
<tr>
<td>Topics</td>
<td>List of topics related to the record.</td>
</tr>
<tr>
<td>Visualforce</td>
<td>Custom Visualforce component.</td>
</tr>
</tbody>
</table>

FeedLayoutFilter Class

Represents a feed filter option in the feed view of a feed-based page layout. A filter can have only standardFilter or feedItemType set.

Namespace

Metadata
Usage
Use this class when accessing `Metadata.Layout` metadata components. For more information, see “FeedLayoutFilter” in the `Metadata API Developer Guide`.

IN THIS SECTION:
  FeedLayoutFilter Properties
  FeedLayoutFilter Methods

FeedLayoutFilter Properties
The following are properties for FeedLayoutFilter.

IN THIS SECTION:
  feedFilterName
  The name of a CustomFeedFilter component. Names are prefixed with the name of the parent object. For example, `Case.MyCustomFeedFilter`.

  feedFilterType
  The type of filter.

  feedItemType
  The type of feed item to display.

**feedFilterName**
The name of a CustomFeedFilter component. Names are prefixed with the name of the parent object. For example, `Case.MyCustomFeedFilter`.

**Signature**
```
public String feedFilterName {get; set;}
```

**Property Value**
Type: `String`

**feedFilterType**
The type of filter.

**Signature**
```
public Metadata.FeedLayoutFilterType feedFilterType {get; set;}
```

**Property Value**
Type: `FeedLayoutFilterType Enum`
**feedItemType**
The type of feed item to display.

**Signature**
```
public Metadata.FeedItemTypeEnum feedItemType {get; set;}
```

**Property Value**
Type: `FeedItemTypeEnum` Enum

**FeedLayoutFilter Methods**
The following are methods for `FeedLayoutFilter`.

**IN THIS SECTION:**
```
clone()
```

Makes a duplicate copy of the `Metadata.FeedLayoutFilter`.

**clone()**
Makes a duplicate copy of the `Metadata.FeedLayoutFilter`.

**Signature**
```
public Object clone()
```

**Return Value**
Type: Object

**FeedLayoutFilterPosition Enum**
Describes where the feed filters list is included in the layout.

**Enum Values**
The following are the values of the `Metadata.FeedLayoutFilterPosition` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CenterDropDown</td>
<td>As a drop-down list in the center column.</td>
</tr>
<tr>
<td>LeftFixed</td>
<td>As a fixed list in the left column.</td>
</tr>
<tr>
<td>LeftFloat</td>
<td>As a floating list in the left column.</td>
</tr>
</tbody>
</table>
FeedLayoutFilterType Enum

The type of feed layout filter.

Enum Values

The following are the values of the Metadata.FeedLayoutFilterType enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AllUpdates</td>
<td>Shows all feed items on a record.</td>
</tr>
<tr>
<td>Custom</td>
<td>Shows custom feed items.</td>
</tr>
<tr>
<td>FeedItemType</td>
<td>Shows feed items only for a particular type of activity on the record.</td>
</tr>
</tbody>
</table>

Layout Class

Represents the metadata associated with a page layout.

Namespace

Metadata

Usage

Use this class to access layout metadata components. For more information, see Layout in the Metadata API Developer Guide.

IN THIS SECTION:

- Layout Properties
- Layout Methods

Layout Properties

The following are properties for Layout.

IN THIS SECTION:

- customButtons
  - The custom buttons for this layout.
- customConsoleComponents
  - Represents custom console components (Visualforce pages, lookup fields, or related lists) on a page layout.
- emailDefault
  - Default value for the email checkbox. Only relevant if the showEmailCheckbox property is set.
- excludeButtons
  - List of standard buttons to exclude from this layout.
feedLayout
Represents the values that define the feed view of a feed-based page layout.

headers
Represents the layout headers used for tagging.

layoutSections
The main sections of the layout containing fields, s-controls, and custom links. The order here determines the layout order.

miniLayout
Represents a minilayout, which is used in the mini view of a record in the Console tab, hover details, and event overlays.

multilineLayoutFields
Fields for special multiline layout fields which appear in OpportunityProduct layouts.

platformActionList
The list of actions, and their order, that display in the Salesforce mobile action bar for the layout.

quickActionList
The list of quick actions that display in the full Salesforce site for the page layout.

relatedContent
The Related Content section of the page layout.

relatedLists
The related lists for the layout, listed in the order they appear in the user interface.

relatedObjects
The list of related objects that appears in the mini view of the console.

runAssignmentRulesDefault
Default value for the "run assignment rules" checkbox. Only relevant if the showRunAssignmentRulesCheckbox property is set.

showEmailCheckbox
Controls whether to show the email checkbox. Only allowed on Case, CaseClose, and Task layouts. The default state of checkbox is controlled by the emailDefault property.

showHighlightsPanel
If set, the highlights panel displays on pages in the Salesforce console.

showInteractionLogPanel
If set, the interaction log displays on pages in the Salesforce console.

showKnowledgeComponent
Only allowed on Case layouts. If set, the Knowledge sidebar displays on cases in the Salesforce console.

showRunAssignmentRulesCheckbox
Controls whether to show the Run Assignment Rules checkbox. Only allowed on Lead and Case layouts. The default state of checkbox is controlled by the runAssignmentRulesDefault property.

showSolutionSection
Only allowed on CaseClose layout. If set, the built-in solution information section shows up on the page.

showSubmitAndAttachButton
For Cast layouts only. If set, the Submit & Add Attachment button displays on case edit pages to portal users in the Customer Portal.

summaryLayout
The summary layout for this layout.
**customButtons**
The custom buttons for this layout.

**Signature**
public List<String> customButtons {get; set;}

**Property Value**
Type: List<String>

**customConsoleComponents**
Represents custom console components (Visualforce pages, lookup fields, or related lists) on a page layout.

**Signature**
public Metadata.CustomConsoleComponents customConsoleComponents {get; set;}

**Property Value**
Type: CustomConsoleComponents Class

**emailDefault**
Default value for the email checkbox. Only relevant if the showEmailCheckbox property is set.

**Signature**
public Boolean emailDefault {get; set;}

**Property Value**
Type: Boolean

**excludeButtons**
List of standard buttons to exclude from this layout.

**Signature**
public List<String> excludeButtons {get; set;}

**Property Value**
Type: List<String>

**feedLayout**
Represents the values that define the feed view of a feed-based page layout.
**Signature**

```java
public Metadata.FeedLayout feedLayout {get; set;}
```

**Property Value**

Type: `Metadata.FeedLayout`

**headers**

Represents the layout headers used for tagging.

**Signature**

```java
public List<Metadata.LayoutHeader> headers {get; set;}
```

**Property Value**

Type: `List<Metadata.LayoutHeader>`

**layoutSections**

The main sections of the layout containing fields, s-controls, and custom links. The order here determines the layout order.

**Signature**

```java
public List<Metadata.LayoutSection> layoutSections {get; set;}
```

**Property Value**

Type: `List<Metadata.LayoutSection>`

**miniLayout**

Represents a minilayout, which is used in the mini view of a record in the Console tab, hover details, and event overlays.

**Signature**

```java
public Metadata.MiniLayout miniLayout {get; set;}
```

**Property Value**

Type: `Metadata.MiniLayout`

**multilineLayoutFields**

Fields for special multiline layout fields which appear in OpportunityProduct layouts.

**Signature**

```java
public List<String> multilineLayoutFields {get; set;}
```
Property Value
Type: List<String>

platformActionList
The list of actions, and their order, that display in the Salesforce mobile action bar for the layout.

Signature
public Metadata.PlatformActionList platformActionList {get; set;}

Property Value
Type: Metadata.PlatformActionList

quickActionList
The list of quick actions that display in the full Salesforce site for the page layout.

Signature
public Metadata.QuickActionList quickActionList {get; set;}

Property Value
Type: Metadata.QuickActionList

relatedContent
The Related Content section of the page layout.

Signature
public Metadata.RelatedContent relatedContent {get; set;}

Property Value
Type: Metadata.RelatedContent

relatedLists
The related lists for the layout, listed in the order they appear in the user interface.

Signature
public List<Metadata.RelatedListItem> relatedLists {get; set;}

Property Value
Type: List<Metadata.RelatedListItem>
relatedObjects
The list of related objects that appears in the mini view of the console.

Signature
public List<String> relatedObjects {get; set;}

Property Value
Type: List<String>

runAssignmentRulesDefault
Default value for the “run assignment rules” checkbox. Only relevant if the showRunAssignmentRulesCheckbox property is set.

Signature
public Boolean runAssignmentRulesDefault {get; set;}

Property Value
Type: Boolean

showEmailCheckbox
Controls whether to show the email checkbox. Only allowed on Case, CaseClose, and Task layouts. The default state of checkbox is controlled by the emailDefault property.

Signature
public Boolean showEmailCheckbox {get; set;}

Property Value
Type: Boolean

showHighlightsPanel
If set, the highlights panel displays on pages in the Salesforce console.

Signature
public Boolean showHighlightsPanel {get; set;}

Property Value
Type: Boolean
showInteractionLogPanel
If set, the interaction log displays on pages in the Salesforce console.

Signature
public Boolean showInteractionLogPanel {get; set;}

Property Value
Type: Boolean

showKnowledgeComponent
Only allowed on Case layouts. If set, the Knowledge sidebar displays on cases in the Salesforce console.

Signature
public Boolean showKnowledgeComponent {get; set;}

Property Value
Type: Boolean

showRunAssignmentRulesCheckbox
Controls whether to show the Run Assignment Rules checkbox. Only allowed on Lead and Case layouts. The default state of checkbox is controlled by the runAssignmentRulesDefault property.

Signature
public Boolean showRunAssignmentRulesCheckbox {get; set;}

Property Value
Type: Boolean

showSolutionSection
Only allowed on CaseClose layout. If set, the built-in solution information section shows up on the page.

Signature
public Boolean showSolutionSection {get; set;}

Property Value
Type: Boolean
**showSubmitAndAttachButton**
For Cast layouts only. If set, the Submit & Add Attachment button displays on case edit pages to portal users in the Customer Portal.

**Signature**

```java
public Boolean showSubmitAndAttachButton {get; set;}
```

**Property Value**

Type: Boolean

**summaryLayout**
The summary layout for this layout.

**Signature**

```java
public Metadata.SummaryLayout summaryLayout {get; set;}
```

**Property Value**

Type: Metadata.SummaryLayout

### Layout Methods
The following are methods for `Layout`.

**IN THIS SECTION:**

- **clone()**
  Makes a duplicate copy of the `Metadata.Layout`.

- **clone()**
  Makes a duplicate copy of the `Metadata.Layout`.

  **Signature**

  ```java
  public Object clone()
  ```

  **Return Value**

  Type: Object

### LayoutColumn Class

Represents the items in a column within a layout section.
Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "LayoutColumn" in the `Metadata API Developer Guide`.

IN THIS SECTION:

- LayoutColumn Properties
- LayoutColumn Methods

LayoutColumn Properties

The following are properties for `LayoutColumn`.

IN THIS SECTION:

- layoutItems
- reserved

**layoutItems**

The individual items within a column (ordered from top to bottom).

**Signature**

```java
public List<Metadata.LayoutItem> layoutItems {get; set;}
```

**Property Value**

Type: `List<Metadata.LayoutItem>`

**reserved**

This field is reserved for Salesforce.

**Signature**

```java
public String reserved {get; set;}
```

**Property Value**

Type: `String`
**LayoutColumn Methods**

The following are methods for LayoutColumn.

**IN THIS SECTION:**

- `clone()`
  Makes a duplicate copy of the Metadata.LayoutColumn.

**clone()**

Makes a duplicate copy of the Metadata.LayoutColumn.

**Signature**

```java
public Object clone()
```

**Return Value**

Type: Object

**LayoutHeader Enum**

Represents tagging types used for Metadata.Layout.headers

**Enum Values**

The following are the values of the Metadata.LayoutHeader enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PersonalTagging</td>
<td>Tag is set to private user.</td>
</tr>
<tr>
<td>PublicTagging</td>
<td>Tag is viewable to any user who can access the record.</td>
</tr>
</tbody>
</table>

**LayoutItem Class**

Represents the valid values that define a layout item.

**Namespace**

Metadata

**Usage**

Use this class when accessing Metadata.Layout metadata components. For more information, see "LayoutItem" in the Metadata API Developer Guide.
IN THIS SECTION:

LayoutItem Properties
LayoutItem Methods

LayoutItem Properties

The following are properties for LayoutItem.

IN THIS SECTION:

analyticsCloudComponent
A Wave Analytics dashboard component on a page.

behavior
Determines the field behavior.

canvas
References a canvas app.

component
References a component.

customLink
The custom link reference.

emptySpace
Controls if this layout item is a blank space.

field
The field name reference, relative to the layout, for example “Description” or “MyField__c”.

height
For s-controls and pages only, the height in pixels.

page_x
Reference to a Visualforce page.

reportChartComponent
Refers to a report chart that you can add to a standard or custom object page.

scontrol
Reference to an s-control.

showLabel
For s-control and pages only, whether to show the label.

showScrollbars
For s-control and pages only, whether to show scrollbars.

width
For s-control and pages only, the width in pixels or percent. Pixel values are simply the number of pixels, for example, 500. Percentage values must include the percent sign, for example, 20%.

analyticsCloudComponent
A Wave Analytics dashboard component on a page.
**Signature**

```csharp
public Metadata.AnalyticsCloudComponentLayoutItem analyticsCloudComponent {get; set;}
```

**Property Value**

Type: `Metadata.AnalyticsCloudComponentLayoutItem`

---

**behavior**

Determines the field behavior.

**Signature**

```csharp
public Metadata.UiBehavior behavior {get; set;}
```

**Property Value**

Type: `Metadata.UiBehavior`

---

**canvas**

References a canvas app.

**Signature**

```csharp
public String canvas {get; set;}
```

**Property Value**

Type: `String`

---

**component**

References a component.

**Signature**

```csharp
public String component {get; set;}
```

**Property Value**

Type: `String`

---

**customLink**

The custom link reference.

**Signature**

```csharp
public String customLink {get; set;}
```
Property Value
Type: String

**emptySpace**
Controls if this layout item is a blank space.

Signature
```
public Boolean emptySpace {get; set;}
```

Property Value
Type: Boolean

**field**
The field name reference, relative to the layout, for example "Description" or "MyField__c".

Signature
```
public String field {get; set;}
```

Property Value
Type: String

**height**
For s-controls and pages only, the height in pixels.

Signature
```
public Integer height {get; set;}
```

Property Value
Type: Integer

**page_x**
Reference to a Visualforce page.

Signature
```
public String page_x {get; set;}
```

Property Value
Type: String
**reportChartComponent**
Refers to a report chart that you can add to a standard or custom object page.

**Signature**
```csharp
public Metadata.ReportChartComponentLayoutItem reportChartComponent {get; set;}
```

**Property Value**
Type: `Metadata.ReportChartComponentLayoutItem`

**scontrol**
Reference to an s-control.

**Signature**
```csharp
public String scontrol {get; set;}
```

**Property Value**
Type: `String`

**showLabel**
For s-control and pages only, whether to show the label.

**Signature**
```csharp
public Boolean showLabel {get; set;}
```

**Property Value**
Type: `Boolean`

**showScrollbars**
For s-control and pages only, whether to show scrollbars.

**Signature**
```csharp
public Boolean showScrollbars {get; set;}
```

**Property Value**
Type: `Boolean`
**width**
For s-control and pages only, the width in pixels or percent. Pixel values are simply the number of pixels, for example, 500. Percentage values must include the percent sign, for example, 20%.

**Signature**
```java
public String width {get; set;}
```

**Property Value**
Type: String

**LayoutItem Methods**
The following are methods for LayoutItem.

**In This Section:**
- `clone()`  
  Makes a duplicate copy of the Metadata.LayoutItem.

**clone()**
Makes a duplicate copy of the Metadata.LayoutItem.

**Signature**
```java
public Object clone()
```

**Return Value**
Type: Object

**LayoutSection Class**
Represents a section of a page layout, such as the Custom Links section.

**Namespace**
Metadata

**Usage**
Use this class when accessing Metadata.Layout metadata components. For more information, see “LayoutSection” in the Metadata API Developer Guide.

**In This Section:**
- LayoutSection Properties
## LayoutSection Properties

The following are properties for `LayoutSection`.

### IN THIS SECTION:

- **customLabel**
  Indicates if this section’s label is custom or standard (built-in).

- **detailHeading**
  Controls if this section appears in the detail page.

- **editHeading**
  Controls if this section appears in the edit page.

- **label**
  The label; either standard or custom, based on the `customLabel` property.

- **layoutColumns**
  Lists the layout columns. You can have one, two, or three columns, ordered left to right, are possible.

- **style**
  The style of the layout for this section.

---

### customLabel

Indicates if this section's label is custom or standard (built-in).

**Signature**

```java
public Boolean customLabel {get; set;}
```

**Property Value**

Type: `Boolean`

---

### detailHeading

Controls if this section appears in the detail page.

**Signature**

```java
public Boolean detailHeading {get; set;}
```

**Property Value**

Type: `Boolean`

---

### editHeading

Controls if this section appears in the edit page.

**Signature**

```java
public Boolean editHeading {get; set;}
```

**Property Value**

Type: `Boolean`
Signature
public Boolean editHeading {get; set;}

Property Value
Type: Boolean

label
The label; either standard or custom, based on the customLabel property.

Signature
public String label {get; set;}

Property Value
Type: String

layoutColumns
Lists the layout columns. You can have one, two, or three columns, ordered left to right, are possible.

Signature
public List<Metadata.LayoutColumn> layoutColumns {get; set;}

Property Value
Type: List<Metadata.LayoutColumn>

style
The style of the layout for this section.

Signature
public Metadata.LayoutSectionStyle style {get; set;}

Property Value
Type: Metadata.LayoutSectionStyle

LayoutSection Methods
The following are methods for LayoutSection.
IN THIS SECTION:

**clone()**

Makes a duplicate copy of the `Metadata.LayoutSection`.

**Signature**

```java
public Object clone()
```

**Return Value**

Type: Object

---

**LayoutSectionStyle Enum**

Describes the possible styles for a layout section.

**Enum Values**

The following are the values of the `Metadata.LayoutSectionStyle` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CustomLinks</td>
<td>Contains custom links only</td>
</tr>
<tr>
<td>OneColumn</td>
<td>One column</td>
</tr>
<tr>
<td>TwoColumnsLeftToRight</td>
<td>Two columns, tab goes left to right</td>
</tr>
<tr>
<td>TwoColumnsTopToBottom</td>
<td>Two columns, tab goes top to bottom</td>
</tr>
</tbody>
</table>

---

**Metadata Class**

An abstract base class that represents a custom metadata component.

**Namespace**

`Metadata`

**Usage**

You can't create instances of this abstract class. Instead, create an instance of a specific custom metadata component class that derives from `Metadata`, such as `Metadata.CustomMetadata`. For more information, see `Metadata` in the `Metadata API Developer Guide`.
IN THIS SECTION:
  Metadata Properties
  Metadata Methods

Metadata Properties
The following are properties for Metadata.

IN THIS SECTION:
  fullName
  The full name of the custom metadata, which can include the namespace, type, and component name.

**fullName**
The full name of the custom metadata, which can include the namespace, type, and component name.

**Signature**
```java
public String fullName {get; set;}
```

**Property Value**
*Type: String*
The format of the full name can include the namespace, metadata type, and metadata component name. If you’re updating components in a namespace, you also need to qualify the namespace for the component in the full name. For example, the full name for a custom metadata "MDType1__mdt" component named "Component1" that is contained in the "myPackage" namespace is "myPackage__MDType1__mdt.myPackage__Component1". For more information on full name formats for different metadata types, see reference documentation on the metadata types in the Metadata API Developer Guide.

Metadata Methods
The following are methods for Metadata.

IN THIS SECTION:
  clone()
  Makes a duplicate copy of the Metadata.Metadata.

**clone()**
Makes a duplicate copy of the Metadata.Metadata.

**Signature**
```java
public Object clone()
```
**Return Value**

Type: Object

---

**MetadataType Enum**

Represents the custom metadata components available in Apex.

**Enum Values**

The following are the values of the `Metadata.MetadataType` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CustomMetadata</td>
<td>Records of custom metadata types</td>
</tr>
<tr>
<td>Layout</td>
<td>Layouts</td>
</tr>
</tbody>
</table>

**MetadataValue Class**

An abstract base class that represents a custom metadata component field.

**Namespace**

`Metadata`

**Usage**

You can't create instances of this abstract class. Instead, create an instance of a specific custom metadata component value class that derives from `Metadata.MetadataValue`, such as `Metadata.CustomMetadataValue`.

IN THIS SECTION:

`MetadataValue Methods`

**MetadataValue Methods**

The following are methods for `MetadataValue`.

IN THIS SECTION:

`clone()`

Makes a duplicate copy of the `Metadata.MetadataValue`.

`clone()`

Makes a duplicate copy of the `Metadata.MetadataValue`. 
MiniLayout Class

Represents a mini view of a record in the Console tab, hover details, and event overlays.

Namespace

Metadata

Usage

Use this class when accessing Metadata.Layout metadata components. For more information, see “MiniLayout” in the Metadata API Developer Guide.

IN THIS SECTION:

MiniLayout Properties
MiniLayout Methods

MiniLayout Properties

The following are properties for MiniLayout.

IN THIS SECTION:

fields
The fields for the mini-layout, listed in the order they appear in the UI. Fields that appear in the mini-layout must appear in the main layout.

relatedLists
The mini related lists, listed in the order they appear in the UI. You cannot set sorting on mini related lists. Fields that appear in the mini related lists must appear in the main layout.

fields
The fields for the mini-layout, listed in the order they appear in the UI. Fields that appear in the mini-layout must appear in the main layout.

Signature

public List<String> fields {get; set;}

Return Value

Type: Object
**relatedLists**

The mini related lists, listed in the order they appear in the UI. You cannot set sorting on mini related lists. Fields that appear in the mini related lists must appear in the main layout.

**Signature**

```java
public List<Metadata.RelatedListItem> relatedLists {get; set;}
```

**MiniLayout Methods**

The following are methods for `MiniLayout`.

**IN THIS SECTION:**

`clone()`

Makes a duplicate copy of the `Metadata.MiniLayout`.

**clone()**

Makes a duplicate copy of the `Metadata.MiniLayout`.

**Signature**

```java
public Object clone()
```

**Return Value**

Type: Object

**Operations Class**

Represents a class to execute metadata operations, such as retrieving or deploying custom metadata.

**Namespace**

`Metadata`

**Usage**

Use the `Metadata.Operations` class to execute metadata operations. For more information on use cases and restrictions of metadata operations in Apex, see `Metadata`. 
Example: Retrieve Metadata

The following example retrieves the "MyTestCustomMDType" custom metadata record from the subscriber org, and inspects the custom fields.

```java
public class ReadMetadata {
    public void retrieveMetadata () {
        // List fullnames of components we want to retrieve
        List<String> componentNameList = new List<String>{'ISVNamespace__TestCustomMDType.MyTestCustomMDType'};

        // Retrieve components that are records of custom metadata types
        // based on name
        List<Metadata.Metadata> components = Metadata.Operations.retrieve(Metadata.MetadataType.CustomMetadata, componentNameList);
        Metadata.CustomMetadata customMetadataRecord = (Metadata.CustomMetadata) components.get(0);

        // Check fields of retrieved component
        List<Metadata.CustomMetadataValue> values = customMetadataRecord.values;
        for (integer i = 0; i < values.size(); i++) {
            if (values.get(i).field == 'testField__c' && values.get(i).value == 'desired value') {
                // ...process accordingly...
            }
        }
    }
}
```

Example: Deploy Metadata

The following example uses the Metadata API in Apex to update the customField custom field value of the MetadataRecordName custom metadata record and deploy this change into the subscriber org. Because the deployment is asynchronous, you must provide a callback class that implements the Metadata.DeployCallback interface, which is then used when the queued deployment completes.

```java
public class CreateMetadata {
    public void updateAndDeployMetadata() {
        // Setup custom metadata to be created in the subscriber org.
        Metadata.CustomMetadata customMetadata = new Metadata.CustomMetadata();
        customMetadata.fullName = 'ISVNamespace__MetadataTypeName.MetadataRecordName';

        Metadata.CustomMetadataValue customField = new Metadata.CustomMetadataValue();
        customField.field = 'customField__c';
        customField.value = 'New value';

        customMetadata.values.add(customField);

        Metadata.DeployContainer mdContainer = new Metadata.DeployContainer();
        mdContainer.addMetadata(customMetadata);

        // Setup deploy callback, MyDeployCallback implements
        // the Metadata.DeployCallback interface (code for
        // this class not shown in this example)
        MyDeployCallback callback = new MyDeployCallback();
    }
}
```
// Enqueue custom metadata deployment
Id jobId = Metadata.Operations.enqueueDeployment(mdContainer, callback);
}

Example: Create Two Metadata Records Synchronously
Create a metadata record along with another one that references it in the same transaction. If the parent record was installed with a namespace, prefix the developer name with `recordNs__`.

Note: No custom metadata relationship can relate records of the same type to each other.

```apex
public class CreateMetadata {
    public Id doCreate(
        String parentRecDevName,
        String parentRecLabel,
        String childRecDevName,
        String childRecLabel) {

        Metadata.DeployContainer mdContainer = new Metadata.DeployContainer();

        Metadata.CustomMetadata parentRecord = new Metadata.CustomMetadata();
        parentRecord.fullName = 'ParentType.' + parentRecDevName;
        parentRecord.label = parentRecLabel;
        mdContainer.addMetadata(parentRecord);

        Metadata.CustomMetadata childRecord = new Metadata.CustomMetadata();
        childRecord.fullName = 'ChildType.' + childRecDevName;
        childRecord.label = childRecLabel;
        Metadata.CustomMetadataValue relValue = new Metadata.CustomMetadataValue();
        relValue.field = 'Parent__c';
        relValue.value = parentRecDevName;
        childRecord.values.add(relValue);
        mdContainer.addMetadata(childRecord);

        Id jobId = Metadata.Operations.enqueueDeployment(mdContainer, null);
        return jobId;
    }
}
```

IN THIS SECTION:
- Operations Methods

Operations Methods
The following are methods for Operations.
IN THIS SECTION:

- **clone()**

- **enqueueDeployment(container, callback)**
  Deploys custom metadata components asynchronously.

- **retrieve(type, fullNames)**
  Retrieves a list of custom metadata components.

---

**clone()**

**Signature**

```java
public Object clone()
```

**Return Value**

Type: Object

---

**enqueueDeployment(container, callback)**

Deploys custom metadata components asynchronously.

**Signature**

```java
public static Id enqueueDeployment(Metadata.DeployContainer container,
                                   Metadata.DeployCallback callback)
```

**Parameters**

- **container**
  Type: Metadata.DeployContainer
  Container that contains the set of metadata components to deploy.

- **callback**
  Type: Metadata.DeployCallback
  A class that implements the Metadata.DeployCallback interface. Used by Salesforce to return information about the deployment results.

**Return Value**

Type: Id

ID of deployment request.

---

**retrieve(type, fullNames)**

Retrieves a list of custom metadata components.
Signature

```java
public static List<Metadata.Metadata> retrieve(Metadata.MetadataType type, List<String> fullNames)
```

Parameters

type
Type: Metadata.MetadataType
The metadata component type.

fullNames
Type: List<String>
A list of component names to retrieve. For information on component name formats, see Metadata.fullName().

Return Value
Type: List<Metadata.Metadata>

PlatformActionList Class

Represents the list of actions, and their order, that display in the Salesforce mobile action bar for the layout.

Namespace
Metadata

Usage
Use this class when accessing Metadata.Layout metadata components. For more information, see “PlatformActionList” in the Metadata API Developer Guide.

IN THIS SECTION:
  PlatformActionList Properties
  PlatformActionList Methods

PlatformActionList Properties

The following are properties for PlatformActionList.

IN THIS SECTION:
  actionListContext
  The context of the action list.
  platformActionListItems
  The actions in the platform action list.
relatedSourceEntity
When the actionListContext property is "RelatedList" or "RelatedListRecord", this field represents the API name of the related list to which the action belongs.

actionListContext
The context of the action list.

Signature
public Metadata.PlatformActionListContextEnum actionListContext {get; set;}

Property Value
Type: Metadata.PlatformActionListContextEnum

platformActionListItems
The actions in the platform action list.

Signature
public List<Metadata.PlatformActionListItem> platformActionListItems {get; set;}

Property Value
Type: List<Metadata.PlatformActionListItem>

relatedSourceEntity
When the actionListContext property is "RelatedList" or "RelatedListRecord", this field represents the API name of the related list to which the action belongs.

Signature
public String relatedSourceEntity {get; set;}

Property Value
Type: String

PlatformActionList Methods
The following are methods for PlatformActionList.

IN THIS SECTION:
    clone()
    Makes a duplicate copy of the Metadata.PlatformActionList.
clone()

Makes a duplicate copy of the Metadata.PlatformActionList.

Signature

public Object clone()

Return Value

Type: Object

PlatformActionListContextEnum Enum

Describes the different contexts of action lists.

Enum Values

The following are the values of the Metadata.PlatformActionListContextEnum enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActionDefinition</td>
<td>Action definition context.</td>
</tr>
<tr>
<td>Assistant</td>
<td>Assistant context.</td>
</tr>
<tr>
<td>BannerPhoto</td>
<td>Banner photo context.</td>
</tr>
<tr>
<td>Chatter</td>
<td>Chatter context.</td>
</tr>
<tr>
<td>Dockable</td>
<td>Dockable context.</td>
</tr>
<tr>
<td>FeedElement</td>
<td>Feed element context.</td>
</tr>
<tr>
<td>Flexipage</td>
<td>Flexipage context.</td>
</tr>
<tr>
<td>Global_x</td>
<td>Global context.</td>
</tr>
<tr>
<td>ListView</td>
<td>Listview context.</td>
</tr>
<tr>
<td>ListViewDefinition</td>
<td>Listview definition context.</td>
</tr>
<tr>
<td>ListViewRecord</td>
<td>Listview record context.</td>
</tr>
<tr>
<td>Lookup</td>
<td>Lookup context.</td>
</tr>
<tr>
<td>MruList</td>
<td>MRU list context.</td>
</tr>
<tr>
<td>MruRow</td>
<td>MRU row context.</td>
</tr>
<tr>
<td>ObjectHomeChart</td>
<td>Object home chart context.</td>
</tr>
<tr>
<td>Photo</td>
<td>Photo context.</td>
</tr>
<tr>
<td>Record</td>
<td>Record context.</td>
</tr>
<tr>
<td>RecordEdit</td>
<td>Record edit context</td>
</tr>
</tbody>
</table>
Related list context.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RelatedList</td>
<td>Related list context.</td>
</tr>
<tr>
<td>RelatedListRecord</td>
<td>Related list record context.</td>
</tr>
</tbody>
</table>

### PlatformActionListItem Class

Represents an action in the platform action list for a layout.

#### Namespace

**Metadata**

#### Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see “PlatformActionListItem” in the Metadata API Developer Guide.

#### PlatformActionListItem Properties

The following are properties for `PlatformActionListItem`.

#### actionName

The API name for the action in the list.

#### actionType

The type of action.

#### sortOrder

The placement of the action in the list.

#### subtype

The subtype of the action.

### actionName

The API name for the action in the list.

### Signature

```java
public String actionName {get; set;}
```
Property Value
Type: String

**actionType**
The type of action.

Signature
`public Metadata.PlatformActionTypeEnum actionType {get; set;}`

Property Value
Type: `Metadata.PlatformActionTypeEnum`

**sortOrder**
The placement of the action in the list.

Signature
`public Integer sortOrder {get; set;}`

Property Value
Type: `Integer`

**subtype**
The subtype of the action.

Signature
`public String subtype {get; set;}`

Property Value
Type: `String`

**PlatformActionListItem Methods**
The following are methods for `PlatformActionListItem`.

IN THIS SECTION:
- `clone()`
  Makes a duplicate copy of the `Metadata.PlatformActionListItem`. 
clone()

Makes a duplicate copy of the Metadata.PlatformActionListItem.

Signature

public Object clone()

Return Value

Type: Object

PlatformActionTypeEnum Enum

The type of action for a PlatformActionListItem.

Enum Values

The following are the values of the Metadata.PlatformActionTypeEnum enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActionLink</td>
<td>An indicator on a feed element that targets an API, a web page, or a file, represented by a button in the Salesforce Chatter feed UI.</td>
</tr>
<tr>
<td>CustomButton</td>
<td>When clicked, opens a URL or a Visualforce page in a window or executes JavaScript.</td>
</tr>
<tr>
<td>InvocableAction</td>
<td>An invocable action such as posting to Chatter.</td>
</tr>
<tr>
<td>ProductivityAction</td>
<td>Productivity actions are predefined by Salesforce and are attached to a limited set of objects. You can’t edit or delete productivity actions.</td>
</tr>
<tr>
<td>QuickAction</td>
<td>A global or object-specific action.</td>
</tr>
<tr>
<td>StandardButton</td>
<td>A predefined Salesforce button such as New, Edit, and Delete.</td>
</tr>
</tbody>
</table>

PrimaryTabComponents Class

Represents custom console components on primary tabs in the Salesforce console.

Namespace

Metadata

Usage

Use this class when accessing Metadata.Layout metadata components. For more information, see “PrimaryTabComponents” in the Metadata API Developer Guide.
**PrimaryTabComponents Properties**

The following are properties for `PrimaryTabComponents`.

**component**

Represents a custom console component (Visualforce page, lookup field, or related lists) on a section of a page layout.

**containers**

Represents a location and style in which to display more than one custom console component on the sidebars of the Salesforce console.

**Signature**

```java
public List<Metadata.ConsoleComponent> component {get; set;}
```

**Property Value**

Type: `List<Metadata.ConsoleComponent>`

**containers**

Represents a location and style in which to display more than one custom console component on the sidebars of the Salesforce console.

**Signature**

```java
public List<Metadata.Container> containers {get; set;}
```

**Property Value**

Type: `List<Metadata.Container>`

**PrimaryTabComponents Methods**

The following are methods for `PrimaryTabComponents`.

**clone()**

Makes a duplicate copy of the `Metadata.PrimaryTabComponents`.
clone()

Makes a duplicate copy of the Metadata.PrimaryTabComponents.

Signature

public Object clone()

Return Value

Type: Object

QuickActionList Class

Represents the list of actions associated with the page layout.

Namespace

Metadata

Usage

Use this class when accessing Metadata.Layout metadata components. For more information, see “QuickActionList” in the Metadata API Developer Guide.

IN THIS SECTION:

QuickActionList Properties
QuickActionList Methods

QuickActionList Properties

The following are properties for QuickActionList.

IN THIS SECTION:

quickActionListItems

List of QuickActionList objects.

quickActionListItems

List of QuickActionList objects.

Signature

public List<Metadata.QuickActionListItem> quickActionListItems {get; set;}

Property Value

Type: List<Metadata.QuickActionListItem>
QuickActionList Methods

The following are methods for QuickActionList.

IN THIS SECTION:

  clone()
  Makes a duplicate copy of the Metadata.QuickActionList.

clone()

Makes a duplicate copy of the Metadata.QuickActionList.

Signature

public Object clone()

Return Value

Type: Object

QuickActionListItem Class

Represents an action in the QuickActionList.

Namespace

Metadata

Usage

Use this class when accessing Metadata.Layout metadata components. For more information, see “QuickActionListItem” in the Metadata API Developer Guide.

QuickActionListItem Properties

The following are properties for QuickActionListItem.

IN THIS SECTION:

quickActionName
The API name of the action.
**quickActionName**
The API name of the action.

**Signature**
```java
public String quickActionName {get; set;}
```

**Property Value**
Type: String

**QuickActionListItem Methods**
The following are methods for `QuickActionListItem`.

IN THIS SECTION:
- `clone()`

  Makes a duplicate copy of the `Metadata.QuickActionListItem`.

**clone()**
Makes a duplicate copy of the `Metadata.QuickActionListItem`.

**Signature**
```java
public Object clone()
```

**Return Value**
Type: Object

**RelatedContent Class**
Represents the Mobile Cards section of the page layout.

**Namespace**
`Metadata`

**Usage**
Use this class when accessing `Metadata.Layout` metadata components. For more information, see “RelatedContent” in the `Metadata API Developer Guide`.

IN THIS SECTION:
- RelatedContent Properties
- RelatedContent Methods
RelatedContent Properties
The following are properties for RelatedContent.

IN THIS SECTION:

**relatedContentItems**
A list of layout items in the Mobile Cards section of the page layout.

**Signature**
```
public List<Metadata.RelatedContentItem> relatedContentItems {get; set;}
```

**Property Value**
Type: `List<Metadata.RelatedContentItem>`

RelatedContent Methods
The following are methods for RelatedContent.

IN THIS SECTION:

**clone()**
Makes a duplicate copy of the `Metadata.RelatedContent`.

**Signature**
```
public Object clone()
```

**Return Value**
Type: `Object`

RelatedContentItem Class
Represents an individual item in the RelatedContent list.

**Namespace**
`Metadata`
Usage
Use this class when accessing `Metadata.Layout` metadata components. For more information, see “RelatedContentItem” in the `Metadata API Developer Guide`.

IN THIS SECTION:
- RelatedContentItem Properties
- RelatedContentItem Methods

RelatedContentItem Properties
The following are properties for `RelatedContentItem`.

IN THIS SECTION:
- layoutItem
  An individual layout item in the Mobile Cards section.

**layoutItem**
An individual layout item in the Mobile Cards section.

**Signature**
```csharp
public Metadata.LayoutItem layoutItem {get; set;}
```

**Property Value**
Type: `Metadata.LayoutItem`

RelatedContentItem Methods
The following are methods for `RelatedContentItem`.

IN THIS SECTION:
- clone()
  Makes a duplicate copy of the `Metadata.RelatedContentItem`.

**clone()**
Makes a duplicate copy of the `Metadata.RelatedContentItem`.

**Signature**
```csharp
public Object clone()
```
RelatedList Class

Represents related list custom components on the sidebars of the Salesforce console.

Namespace

Metadata

Usage

Use this class when accessing Metadata.Layout metadata components. For more information, see “RelatedList” in the Metadata API Developer Guide.

IN THIS SECTION:

RelatedList Properties
RelatedList Methods

RelatedList Properties

The following are properties for RelatedList.

IN THIS SECTION:

hideOnDetail
When set to true, the related list is hidden from detail pages where it appears as a component to prevent duplicate information from showing.

name
The name of the component as it appears to console users.

hideOnDetail

When set to true, the related list is hidden from detail pages where it appears as a component to prevent duplicate information from showing.

Signature

public Boolean hideOnDetail {get; set;}

Property Value

Type: Boolean
name

The name of the component as it appears to console users.

Signature

```java
public String name {get; set;}
```

Property Value

Type: String

RelatedList Methods

The following are methods for RelatedList.

IN THIS SECTION:

- clone()

  Makes a duplicate copy of the Metadata.RelatedList.

clone()

Makes a duplicate copy of the Metadata.RelatedList.

Signature

```java
public Object clone()
```

Return Value

Type: Object

RelatedListItem Class

Represents an item in the related list in a page layout.

Namespace

Metadata

Usage

Use this class when accessing Metadata.Layout metadata components. For more information, see “RelatedListItem” in the Metadata API Developer Guide.

IN THIS SECTION:

- RelatedListItem Properties
- RelatedListItem Methods
RelatedListItem Properties

The following are properties for RelatedListItem.

IN THIS SECTION:
  customButtons
  A list of custom buttons used in the related list.
  excludeButtons
  A list of excluded related-list buttons.
  fields
  A list of fields displayed in the related list. Uses aliases instead of field or API names.
  relatedList
  The name of the related list.
  sortField
  The name of the field used for sorting.
  sortOrder
  When sortField is set, the sortOrder property determines the sort order.

customButtons

A list of custom buttons used in the related list.

Signature

public List<String> customButtons {get; set;}

Property Value

Type: List<String>

For more information, see “Define Custom Buttons and Links” in the Salesforce online help.

excludeButtons

A list of excluded related-list buttons.

Signature

public List<String> excludeButtons {get; set;}

Property Value

Type: List<String>

fields

A list of fields displayed in the related list. Uses aliases instead of field or API names.
Signatures

**fields**

*public List<String> fields {get; set;}*

**relatedList**

The name of the related list.

*Signature*

*public String relatedList {get; set;)*

**sortField**

The name of the field used for sorting.

*Signature*

*public String sortField {get; set;)*

**sortOrder**

When `sortField` is set, the `sortOrder` property determines the sort order.

*Signature*

*public Metadata.SortOrder sortOrder {get; set;)*

**RelatedListItem Methods**

The following are methods for `RelatedListItem`.
IN THIS SECTION:

**clone()**

Makes a duplicate copy of the Metadata.RelatedListItem.

**Signature**

```java
public Object clone()
```

**Return Value**

Type: Object

---

**ReportChartComponentLayoutItem Class**

Represents the settings for a report chart on a standard or custom page.

**Namespace**

Metadata

**Usage**

Use this class when accessing Metadata.Layout metadata components. For more information, see “ReportChartComponentLayoutItem” in the Metadata API Developer Guide.

---

**ReportChartComponentLayoutItem Properties**

The following are properties for ReportChartComponentLayoutItem.

**IN THIS SECTION:**

- ReportChartComponentLayoutItem Properties
- ReportChartComponentLayoutItem Methods

**cacheData**

Indicates whether to use cached data when displaying the chart. When the attribute is set to true, data is cached for 24 hours. When the attribute is set to false, the report is run every time the page is refreshed.

**contextFilterableField**

Unique development name of the field by which a report chart is filtered to return data relevant to the page. If set, the ID field for the parent object of the page or report type is the chart data filter. The parent object for the report type and the page must match for a chart to return relevant data.
error
Error string that is populated only when an error occurs in the underlying report.

hideOnError
Controls whether users see a chart that has an error. When an error occurs and this attribute is not set, the chart doesn’t show any data except the error. Set the attribute to true to hide the chart from a page on error.

includeContext
If true, filters the report chart to return data that’s relevant to the page.

reportName
Unique development name of a report that includes a chart.

showTitle
If true, applies the title from the report to the chart.

size
Size of the displayed chart. The default is medium.

cacheData
Indicates whether to use cached data when displaying the chart. When the attribute is set to true, data is cached for 24 hours. When the attribute is set to false, the report is run every time the page is refreshed.

Signature
public Boolean cacheData {get; set;}

Property Value
Type: Boolean

contextFilterableField
Unique development name of the field by which a report chart is filtered to return data relevant to the page. If set, the ID field for the parent object of the page or report type is the chart data filter. The parent object for the report type and the page must match for a chart to return relevant data.

Signature
public String contextFilterableField {get; set;}

Property Value
Type: String

error
Error string that is populated only when an error occurs in the underlying report.

Signature
public String error {get; set;}

2445
Property Value
Type: String

hideOnError
Controls whether users see a chart that has an error. When an error occurs and this attribute is not set, the chart doesn’t show any data except the error. Set the attribute to true to hide the chart from a page on error.

Signature
public Boolean hideOnError {get; set;}

Property Value
Type: Boolean

includeContext
If true, filters the report chart to return data that’s relevant to the page.

Signature
public Boolean includeContext {get; set;}

Property Value
Type: Boolean

reportName
Unique development name of a report that includes a chart.

Signature
public String reportName {get; set;}

Property Value
Type: String

showTitle
If true, applies the title from the report to the chart.

Signature
public Boolean showTitle {get; set;}
Property Value
Type: Boolean

size
Size of the displayed chart. The default is medium.

Signature
public Metadata.ReportChartComponentSize size {get; set;}

Property Value
Type: Metadata.ReportChartComponentSize

ReportChartComponentLayoutItem Methods
The following are methods for ReportChartComponentLayoutItem.

IN THIS SECTION:
clone()  

clone ()

Signature
public Object clone()

Return Value
Type: Object

ReportChartComponentSize Enum
Describes the size of the displayed report chart component.

Enum Values
The following are the values of the Metadata.ReportChartComponentSize enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LARGE</td>
<td>Large chart size.</td>
</tr>
<tr>
<td>MEDIUM</td>
<td>Medium chart size.</td>
</tr>
</tbody>
</table>
SidebarComponent Class

Represents a specific custom console component to display in a container that hosts multiple components in one of the sidebars of the Salesforce console.

XML

NAMESPACE

Usage

Use this class when accessing Metadata.Layout metadata components. For more information, see “SidebarComponent” in the Metadata API Developer Guide.

IN THIS SECTION:

SidebarComponent Properties

SidebarComponent Methods

SidebarComponent Properties

The following are properties for SidebarComponent.

IN THIS SECTION:

componentType

Specifies the component type. Valid values are “KnowledgeOne”, “Lookup”, “Milestones”, “RelatedList”, “Topics”, “Files”, and “CaseExperts”.

createAction

If the component is a lookup field, the name of the quick action used to create a record.

enableLinking

If the component is a lookup field, lets users associate a record with this field.

height

The height of the component in the container. The unit property determines the unit of measurement, in pixels or percent.

knowledgeOneEnable

Indicates if the component is enabled for Knowledge One.

label

The name of the component as it displays to console users. Available for components in a container with the style of tabs or accordion.

lookup

If the component is a lookup field, the name of the field.
page_x
If the component is a Visualforce page, the name of the Visualforce page.

relatedLists
If the component is a related list component, the list of related list names.

unit
The unit of measurement (pixels or percent) for the height and width of the component in the container.

updateAction
If the component is a lookup field, the name of the quick action used to update a record.

width
The width of the component in the container. The unit property determines the unit of measurement, in pixels or percent.

**componentType**
Specifies the component type. Valid values are “KnowledgeOne”, “Lookup”, “Milestones”, “RelatedList”, “Topics”, “Files”, and “CaseExperts”.

**Signature**

```java
public String componentType {get; set;}
```

**Property Value**
Type: String

**createAction**
If the component is a lookup field, the name of the quick action used to create a record.

**Signature**

```java
public String createAction {get; set;}
```

**Property Value**
Type: String

**enableLinking**
If the component is a lookup field, lets users associate a record with this field.

**Signature**

```java
public Boolean enableLinking {get; set;}
```

**Property Value**
Type: Boolean
**height**
The height of the component in the container. The `unit` property determines the unit of measurement, in pixels or percent.

**Signature**
```java
public Integer height {get; set;}
```

**Property Value**
Type: Integer

**knowledgeOneEnable**
Indicates if the component is enabled for Knowledge One.

**Signature**
```java
public Boolean knowledgeOneEnable {get; set;}
```

**Property Value**
Type: Boolean

**label**
The name of the component as it displays to console users. Available for components in a container with the style of tabs or accordion.

**Signature**
```java
public String label {get; set;}
```

**Property Value**
Type: String

**lookup**
If the component is a lookup field, the name of the field.

**Signature**
```java
public String lookup {get; set;}
```

**Property Value**
Type: String

**page_x**
If the component is a Visualforce page, the name of the Visualforce page.
Signature

public String page_x {get; set;}

Property Value
Type: String

relatedLists
If the component is a related list component, the list of related list names.

Signature

public List<Metadata.RelatedList> relatedLists {get; set;}

Property Value
Type: List<Metadata.RelatedList>

unit
The unit of measurement (pixels or percent) for the height and width of the component in the container.

Signature

public String unit {get; set;}

Property Value
Type: String

updateAction
If the component is a lookup field, the name of the quick action used to update a record.

Signature

public String updateAction {get; set;}

Property Value
Type: String

width
The width of the component in the container. The unit property determines the unit of measurement, in pixels or percent.

Signature

public Integer width {get; set;}
Property Value
Type: Integer

SidebarComponent Methods
The following are methods forSidebarComponent.

IN THIS SECTION:

**clone()**
Makes a duplicate copy of the Metadata.SidebarComponent.

**Signature**
```
public Object clone()
```

**Return Value**
Type: Object

SortOrder Enum
Describes the sort order of a related list.

**Enum Values**
The following are the values of the Metadata.SortOrder enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asc_x</td>
<td>Sort in ascending order.</td>
</tr>
<tr>
<td>Desc_x</td>
<td>Sort in descending order.</td>
</tr>
</tbody>
</table>

StatusCode Enum
Describes the status code for an unsuccessful component deploy.

**Enum Values**
The following are the values of the Metadata.StatusCode enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_SCS_INBOUND_USER</td>
<td>Log in as the RunAs user configured in your SCS setup.</td>
</tr>
</tbody>
</table>
### SCS Connected App

**Value**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REQUIRE_CONNECTED_APP_SCS</td>
<td>SCS Connected App is not installed.</td>
</tr>
<tr>
<td>REQUIRE_CONNECTED_APP_SESSION_SCS</td>
<td>To use the SCS connected app, the user must be authenticated.</td>
</tr>
<tr>
<td>REQUIRE_RUNAS_USER</td>
<td>A RunAs user must be configured in your org.</td>
</tr>
</tbody>
</table>

**SEE ALSO:**

- DeployProblemType Enum

### SubtabComponents Class

Represents custom console components on subtabs in the Salesforce console.

**Namespace**

`Metadata`

**Usage**

Use this class when accessing `Metadata.Layout` metadata components. For more information, see “SubtabComponents” in the Metadata API Developer Guide.

**IN THIS SECTION:**

- SubtabComponents Properties
- SubtabComponents Methods

### SubtabComponents Properties

The following are properties for `SubtabComponents`.

**IN THIS SECTION:**

- `component`
  - Represents a custom console component (Visualforce page, lookup field, or related lists) on a section of a page layout.

- `containers`
  - Represents a location and style in which to display more than one custom console component on the sidebars of the Salesforce console.

**component**

Represents a custom console component (Visualforce page, lookup field, or related lists) on a section of a page layout.

**Signature**

```java
public List<Metadata.ConsoleComponent> component {get; set;}
```
Property Value
Type: List<Metadata.ConsoleComponent>

containers
Represents a location and style in which to display more than one custom console component on the sidebars of the Salesforce console.

Signature
public List<Metadata.Container> containers {get; set;}

Property Value
Type: List<Metadata.Container>

SubtabComponents Methods
The following are methods for SubtabComponents.

IN THIS SECTION:
    clone()
    Makes a duplicate copy of the Metadata.SubtabComponents.

    clone()
    Makes a duplicate copy of the Metadata.SubtabComponents.

Signature
public Object clone()

Return Value
Type: Object

SummaryLayoutStyleEnum Enum
Describes the highlights panel style for a SummaryLayout.

Enum Values
The following are the values of the Metadata.SummaryLayoutStyleEnum enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CaseInteraction</td>
<td>Case interaction style.</td>
</tr>
<tr>
<td>ChildServiceReportTemplateStyle</td>
<td>Child service report template style.</td>
</tr>
</tbody>
</table>
### SummaryLayout Class

Controls the appearance of the highlights panel, which summarizes key fields in a grid at the top of a page layout, when Case Feed is enabled.

#### Namespace

*Metadata*

#### Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "SummaryLayout" in the *Metadata API Developer Guide*.

#### SummaryLayout Properties

The following are properties for `SummaryLayout`.

#### SummaryLayout Methods
sizeZ
If provided, the setting is not visible to users.

summaryLayoutItems
Controls the appearance of an individual field and its column and row position within the highlights panel grid, when Case Feed is enabled. At least one is required.

summaryLayoutStyle
Specifies the panel style.

masterLabel
The name of the layout label.

⚠️ Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Signature

class SummaryLayout
{
    public String masterLabel {get; set;}
}

Property Value
Type: String

sizeX
Number of columns in the highlights pane, between 1 and 4 (inclusive).

Signature

class SummaryLayout
{
    public Integer sizeX {get; set;}
}

Property Value
Type: Integer

sizeY
Number of rows in each column, either 1 or 2.

Signature

class SummaryLayout
{
    public Integer sizeY {get; set;}
}

Property Value
Type: Integer

sizeZ
If provided, the setting is not visible to users.
Signature

```java
public Integer sizeZ {get; set;}
```

Property Value

**Type:** Integer

**summaryLayoutItems**

Controls the appearance of an individual field and its column and row position within the highlights panel grid, when Case Feed is enabled. At least one is required.

Signature

```java
public List<Metadata.SummaryLayoutItem> summaryLayoutItems {get; set;}
```

Property Value

**Type:** List<Metadata.SummaryLayoutItem>

**summaryLayoutStyle**

Specifies the panel style.

Signature

```java
public Metadata.SummaryLayoutStyleEnum summaryLayoutStyle {get; set;}
```

Property Value

**Type:** Metadata.SummaryLayoutStyleEnum

**SummaryLayout Methods**

The following are methods for SummaryLayout.

**IN THIS SECTION:**

- **clone()**
  Makes a duplicate copy of the `Metadata.SummaryLayout`.

- **clone()**
  Makes a duplicate copy of the `Metadata.SummaryLayout`.

**Signature**

```java
public Object clone()
```
SummaryLayoutItem Class

Controls the appearance of an individual field and its column and row position within the highlights panel grid, when Case Feed is enabled. You can have two fields per each grid in a highlights panel.

Namespace

Metadata

Usage

Use this class when accessing Metadata.Layout metadata components. For more information, see “SummaryLayoutItem” in the Metadata API Developer Guide.

IN THIS SECTION:

SummaryLayoutItem Properties
SummaryLayoutItem Methods

SummaryLayoutItem Properties

The following are properties for SummaryLayoutItem.

IN THIS SECTION:

customLink
The custom link reference.
field
The field name reference, relative to the page layout. Must be a standard or custom field that also exists on the detail page.
posX
The item’s column position in the highlights panel grid. Must be within the range of sizeX.
posY
The item’s row position in the highlights panel grid. Must be within the range of sizeY.
posZ
Reserved for future use. If provided, the setting is not visible to users.

customLink
The custom link reference.

Signature

public String customLink {get; set;}

2458
Property Value
Type: String

field
The field name reference, relative to the page layout. Must be a standard or custom field that also exists on the detail page.

Signature
public String field {get; set;}

Property Value
Type: String

posX
The item's column position in the highlights panel grid. Must be within the range of sizeX.

Signature
public Integer posX {get; set;}

Property Value
Type: Integer

posY
The item's row position in the highlights panel grid. Must be within the range of sizeY.

Signature
public Integer posY {get; set;}

Property Value
Type: Integer

posZ
Reserved for future use. If provided, the setting is not visible to users.

Signature
public Integer posZ {get; set;}

Property Value
Type: Integer
SummaryLayoutItem Methods

The following are methods for SummaryLayoutItem.

IN THIS SECTION:

clone()

Makes a duplicate copy of the Metadata.SummaryLayoutItem.

clone()

Makes a duplicate copy of the Metadata.SummaryLayoutItem.

Signature

public Object clone()

Return Value

Type: Object

UiBehavior Enum

Describes the behavior for a layout item on a layout page.

Enum Values

The following are the values of the Metadata.UiBehavior enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit</td>
<td>The layout field can be edited but is not required.</td>
</tr>
<tr>
<td>Readonly</td>
<td>The layout field is read-only.</td>
</tr>
<tr>
<td>Required</td>
<td>The layout field can be edited and is required.</td>
</tr>
</tbody>
</table>

Pref_center Namespace

The Pref_center namespace provides an interface, classes, and methods to create and retrieve data in forms in Preference Manager. Preference Manager, previously called Preference Center, is a feature within the Privacy Center app.

The following are the classes in the Pref_center namespace.

IN THIS SECTION:

LoadFormData Class

Retrieve records related to the tokenized record id, and populate the values of a preference form.
LoadParameters Class
Contains methods to retrieve record Id information for parameters passed into the load-form handler.

PreferenceCenterApexHandler Interface
Pass data between your organization and a form in Preference Manager.

SubmitFormData Class
Contains methods to retrieve information on buttons and options selected in a preference form.

SubmitParameters Class
Retrieve record ID information to use with your submit-form handler.

TokenType Enum
Defines the types of values supported by the TokenUtility methods.

TokenUtility Class
Generate authentication tokens to access preference forms.

ValidationResult Class
This class is reserved for future use with Preference Manager.

LoadFormData Class
Retrieve records related to the tokenized record id, and populate the values of a preference form.

Namespace
Pref_center

Example
Use methods in the LoadFormData class to set available and selected values in different form components:

```java
List<System.SelectOption> picklistOptions = new List<System.SelectOption>();
picklistOptions.add(new System.SelectOption('optIn', 'Opt In'));
picklistOptions.add(new System.SelectOption('optOut', 'Opt Out'));

// Set the available options for the picklist
loadFormData.setOptions('myPicklist', picklistOptions);
// Add an option to the existing options for the picklist
loadFormDataдобавимOption('myPicklist', 'optOutAll', 'Opt Out All');
// Select the 'optIn' option in the picklist
loadFormData.setSelectedOption('myPicklist', 'optIn');
```

```java
List<System.SelectOption> checkboxOptions = new List<System.SelectOption>();
checkboxOptions.add(new System.SelectOption('yes', 'Yes'));
checkboxOptions.add(new System.SelectOption('no', 'No'));

// Set available options for the checkbox group
loadFormData.setOptions('myCheckbox', checkboxOptions);
// Select the 'yes' option in the checkbox group
loadFormData.addSelectedOption('myCheckbox', 'yes');
```
// Also select the 'no' option in the checkbox group
loadFormData.addSelectedOption('myCheckbox', 'no');
// Another way to select both the 'yes' and 'no' options in the checkbox group
loadFormData.setSelectedOptions('myCheckbox', new List<String>{'yes', 'no'});

// Fill the value in the text input
loadFormData.setTextValue('myTextInput', 'admin@salesforce.com');
// Set the hint text for the text input
loadFormData.setTextHint('myTextInput', 'Email Address');

// Set the label for the button
loadFormData.setButtonLabel('myButton', 'Save Preferences');

IN THIS SECTION:

LoadFormData Constructors
LoadFormData Methods

LoadFormData Constructors

The following are constructors for LoadFormData.

IN THIS SECTION:

LoadFormData(data)

Creates an instance of the LoadFormData class for running tests on any custom Apex classes you create for Preference Manager.

**LoadFormData (data)**

Creates an instance of the LoadFormData class for running tests on any custom Apex classes you create for Preference Manager.

**Signature**

```java
public LoadFormData(Map<String, pref_center.FieldProperties> data)
```

**Parameters**

`data`

Type: `Map<String, pref_center.FieldProperties>\nMaps preference form data from the field ID to the field properties.

**Usage**

This constructor is available in API version 56.0 and later.

LoadFormData Methods

The following are methods for LoadFormData.
IN THIS SECTION:

- **addOption(fieldId, value, label)**
  Add an option for a checkbox, picklist, or radio button field in a preference form using the label and value.

- **addOption(fieldId, option)**
  Add a defined, selectable option for a checkbox, picklist, or radio button field in a preference form.

- **addSelectedOption(fieldId, option)**
  Add a selected option for a checkbox field in a preference form. This requires the field on the form to have a defined option with a set value.

- **setButtonLabel(fieldId, label)**
  Set the label of a button added to the preference form.

- **setOptions(fieldId, options)**
  Add a list of selectable options for a field on a preference form.

- **setSelectedOption(fieldId, optionValue)**
  For a picklist or radio button field on a preference form that has defined values, set the value entered in the optionValue field as the selected option.

- **setSelectedOptions(fieldId, options)**
  For an existing checkbox field on a preference form that has defined values, set the values entered in the options field as the selected options. This requires the field on the form to have defined options with a set value.

- **setTextHint(fieldId, hintText)**
  Set the hint text inside a text input field. The hint text tells the user what type of information to enter, like an email address.

- **setTextValue(fieldId, value)**
  Set the value of a text field in a preference form.

---

**addOption(fieldId, value, label)**

Add an option for a checkbox, picklist, or radio button field in a preference form using the label and value.

**Signature**

```java
public void addOption(String fieldId, String value, String label)
```

**Parameters**

- **fieldId**
  - Type: `String`
  - Identifies a field in the preference form.

- **value**
  - Type: `String`
  - Represents the selection or text entered in a preference form field.

- **label**
  - Type: `String`
  - The label for the value of a field in a preference form.
Return Value
Type: void

**addOption(fieldId, option)**
Add a defined, selectable option for a checkbox, picklist, or radio button field in a preference form.

**Signature**
```java
public void addOption(String fieldId, System.SelectOption option)
```

**Parameters**
- **fieldId**
  Type: *String*
  Identifies a field in the preference form.
- **option**
  Type: *System.SelectOption*
  The option selected on a field in the preference form.

Return Value
Type: void

**addSelectedOption(fieldId, option)**
Add a selected option for a checkbox field in a preference form. This requires the field on the form to have a defined option with a set value.

**Signature**
```java
public void addSelectedOption(String fieldId, String option)
```

**Parameters**
- **fieldId**
  Type: *String*
  Identifies a field in the preference form.
- **option**
  Type: *String*
  The selectable option being added.

Return Value
Type: void
**setButtonLabel(fieldId, label)**
Set the label of a button added to the preference form.

**Signature**
```
public void setButtonLabel(String fieldId, String label)
```

**Parameters**
- **fieldId**
  - Type: String
  - Identifies a field in the preference form.
- **label**
  - Type: String
  - The label for a button added to the preference form.

**Return Value**
Type: void

**setOptions(fieldId, options)**
Add a list of selectable options for a field on a preference form.

**Signature**
```
public void setOptions(String fieldId, List<SelectOption> options)
```

**Parameters**
- **fieldId**
  - Type: String
  - Identifies a field in the preference form.
- **options**
  - Type: List<SelectOption>
  - The selectable options for a field in the preference form.

**Return Value**
Type: void

**setSelectedOption(fieldId, optionValue)**
For a picklist or radio button field on a preference form that has defined values, set the value entered in the optionValue field as the selected option.
Signature

public void setSelectedOption(String fieldId, String optionValue)

Parameters

fieldId
Type: String
Identifies a field in the preference form.

optionValue
Type: String
The value for the selected option.

Return Value
Type: void

setSelectedOptions(fieldId, options)

For an existing checkbox field on a preference form that has defined values, set the values entered in the options field as the selected options. This requires the field on the form to have defined options with a set value.

Signature

public void setSelectedOptions(String fieldId, List<String> options)

Parameters

fieldId
Type: String
Identifies the checkbox field in the preference form.

options
Type: List<String>
The selected options for a field in the preference form.

Return Value
Type: void

setTextHint(fieldId, hintText)

Set the hint text inside a text input field. The hint text tells the user what type of information to enter, like an email address.

Signature

public void setTextHint(String fieldId, String hintText)
Parameters

**fieldId**
- Type: **String**
  - The ID of the text input field in the preference form.

**hintText**
- Type: **String**
  - The hint text in the text input field.

Return Value

Type: void

**setTextValue(fieldId, value)**
Set the value of a text field in a preference form.

Signature

```java
public void setTextValue(String fieldId, String value)
```

Parameters

**fieldId**
- Type: **String**
  - Identifies a field in the preference form.

**value**
- Type: **String**
  - Represents the value entered for the text field in a preference form.

Return Value

Type: void

LoadParameters Class

Contains methods to retrieve record Id information for parameters passed into the load-form handler.

Namespace

**Pref_center**

Example

```java
String userId = loadParams.getRecordId();

User user = [select id, AboutMe from User where id=:userId];
```
LoadParameters Methods
The following are methods for LoadParameters.

getRecordId()
Returns the untokenized version of the record Id.

Signature
public String getRecordId()

Return Value
Type: String

PreferenceCenterApexHandler Interface
Pass data between your organization and a form in Preference Manager.

Namespace
Pref_center

PreferenceCenterApexHandler Methods
The following are methods for PreferenceCenterApexHandler.

load(loadParams, formData, validationResult)
Retrieve the record IDs and initial values from a preference form before it is edited and submitted.

submit(loadParams, formData, validationResult)
Updates the changed values of fields when the preference form is submitted.
load(loadParams, formData, validationResult)
Retrieves the record IDs and initial values from a preference form before it is edited and submitted.

Signature
public pref_center.LoadFormData load(pref_center.LoadParameters loadParams,
pref_center.LoadFormData formData, pref_center.ValidationResult validationResult)

Parameters
loadParams
  Type: pref_center.LoadParameters
  Retrieve the tokenized record ID.
formData
  Type: pref_center.LoadFormData
  Set the initial values of fields in a form before they are edited.
validationResult
  Type: pref_center.ValidationResult
  Reserved for future use.

Return Value
Type: pref_center.LoadFormData

submit(loadParams, formData, validationResult)
Updates the changed values of fields when the preference form is submitted.

Signature
public void submit(pref_center.SubmitParameters submitParams,
pref_center.SubmitFormData formData, pref_center.ValidationResult validationResult)

Parameters
submitParams
  Type: pref_center.SubmitParameters
  Retrieve the tokenized record ID.
formData
  Type: pref_center.SubmitFormData
  Retrieve the values of fields in a submitted form.
validationResult
  Type: pref_center.ValidationResult
  Reserved for future use.
Return Value
Type: void

SubmitFormData Class
Contains methods to retrieve information on buttons and options selected in a preference form.

Namespace
Pref_center

Example
Use methods in the SubmitFormData class to retrieve the selected values in different form components:

```java
String buttonClickedId = formData.getButtonClicked();
if (buttonClickedId == 'submitButton') {
    // Handle form submit
} else if (buttonClickedId == 'cancelButton') {
    // Handle form cancel
}

String picklistValueOld = formData.getOldSelectedValue('myPicklist');
String picklistValueNew = formData.getSelectedValue('myPicklist');
if (picklistValueOld != picklistValueNew) {
    // Do something
}

List<String> checkboxValuesOld = formData.getOldSelectedValues('myCheckbox');
List<String> checkboxValuesNew = formData.getSelectedValues('myCheckbox');
if (checkboxValuesOld != null && checkboxValuesNew != null && (checkboxValuesOld.size() != checkboxValuesNew.size())) {
    // Do something
}

String textinputValueOld = formData.getOldStringValue('myTextinput');
String textinputValueNew = formData.getStringValue('myTextinput');
if (textinputValueOld != textinputValueNew) {
    // Do something
}
```

IN THIS SECTION:
SubmitFormData Methods

SubmitFormData Methods
The following are methods for SubmitFormData.
IN THIS SECTION:

getButtonClicked()
Returns the field ID of the button that was clicked in the preference form. For example, use this method to determine if the clicked button was Submit or Cancel.

getOldSelectedValue(fieldId)
Returns the value that was set for the specified field when the preference form was previously edited by the user. This method is used for field types such as picklist or radio buttons.

getOldSelectedValues(fieldId)
Returns a list of the string values that were set on a checkbox field when the preference form was previously edited by the user.

getOldStringValue(fieldId)
Returns the string value that was set on a field when the preference form was loaded. This method is used for field types such as text, and throws a TypeException if used with a field that can return more than one value, like a checkbox field.

getSelectedValue(fieldId)
Returns the string value that is currently selected for a picklist or radio button field in the preference form.

getSelectedValues(fieldId)
Returns a list of string values that are currently selected on a checkbox field in the preference form.

getStringValue(fieldId)
Returns the string value that was set on a field when the preference form was loaded. This method is used for field types such as text.

---

**getButtonClicked()**

Returns the field ID of the button that was clicked in the preference form. For example, use this method to determine if the clicked button was Submit or Cancel.

**Signature**

```java
public String getButtonClicked()
```

**Return Value**

Type: String

**getOldSelectedValue(fieldId)**

Returns the value that was set for the specified field when the preference form was previously edited by the user. This method is used for field types such as picklist or radio buttons.

**Signature**

```java
public String getOldSelectedValue(String fieldId)
```

**Parameters**

- **fieldId**
  Type: String

---

2471
Identifies a field in the preference form.

Return Value
Type: String

`getOldSelectedValues(fieldId)`
Returns a list of the string values that were set on a checkbox field when the preference form was previously edited by the user.

Signature
```java
public List<String> getOldSelectedValues(String fieldId)
```

Parameters
`fieldId`
Type: String
Identifies a field in the preference form.

Return Value
Type: List<String>

`getOldStringValue(fieldId)`
Returns the string value that was set on a field when the preference form was loaded. This method is used for field types such as text, and throws a TypeException if used with a field that can return more than one value, like a checkbox field.

Signature
```java
public String getOldStringValue(String fieldId)
```

Parameters
`fieldId`
Type: String
Identifies a field in the preference form.

Return Value
Type: String

`getSelectedValue(fieldId)`
Returns the string value that is currently selected for a picklist or radio button field in the preference form.

Signature
```java
public String getSelectedValue(String fieldId)
```
Parameters

fieldId
Type: String
Identifies a field in the preference form.

Return Value
Type: String

getSelectedValues(fieldId)
Returns a list of string values that are currently selected on a checkbox field in the preference form.

Signature
public List<String> getSelectedValues(String fieldId)

Parameters

fieldId
Type: String
Identifies a field in the preference form.

Return Value
Type: List<String>

getStringValue(fieldId)
Returns the string value that was set on a field when the preference form was loaded. This method is used for field types such as text.

Signature
public String getStringValue(String fieldId)

Parameters

fieldId
Type: String
Identifies a field in the preference form.

Return Value
Type: String

SubmitParameters Class
Retrieve record ID information to use with your submit-form handler.
### Namespace

Pref_center

### Example

```java
String userId = submitParams.getRecordId();
User user = [select id, AboutMe from User where id=:userId];
```

IN THIS SECTION:

SubmitParameters Methods

### SubmitParameters Methods

The following are methods for SubmitParameters.

IN THIS SECTION:

getRecordId()

Returns the untokenized version of the record ID.

---

#### getRecordId()

Returns the untokenized version of the record ID.

---

### Signature

`public String getRecordId()`

---

### Return Value

Type: `String`

---

### TokenType Enum

Defines the types of values supported by the TokenUtility methods.

---

### Enum Values

The following are the values of the `pref_center.TokenType` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMAIL</td>
<td>Identifies the token as an email address.</td>
</tr>
<tr>
<td>STANDARD</td>
<td>Identifies the token as a Salesforce record ID. This is the default token type.</td>
</tr>
</tbody>
</table>
TokenUtility Class

Generate authentication tokens to access preference forms.

Namespace

Pref_center

Example

Call the `generateToken()` method to generate a single token for a specified Salesforce record ID:

``` apex
Individual individual = [SELECT Id FROM Individual LIMIT 1];
String token = pref_center.TokenUtility.generateToken(individual.Id);
// Do something with the token
System.debug(token)
```

Call the `generateTokens()` method to generate tokens in bulk when given a list of Salesforce record IDs:

``` apex
List<Id> individualIds = new List<Id>();
// Get Ids of Individuals who have not opted out of tracking
for (Individual individual : [SELECT Id FROM Individual WHERE HasOptedOutTracking = false])
    individualIds.add(individual.Id);
// Generate tokens for the list of Individual record Ids
Map<String, String> tokens = pref_center.TokenUtility.generateTokens(individualIds);
String firstIndividualId = individualIds[0];
// The returned Map has the input record Id as key and the corresponding token as value
String tokenForFirstIndividual = tokens.get(firstIndividualId);
// Do something with the token
System.debug(tokenForFirstIndividual);
```

IN THIS SECTION:

TokenUtility Methods

TokenUtility Methods

The following are methods for `TokenUtility`.

IN THIS SECTION:

- `generateToken(tokenValue, tokenType)`
  Returns the authentication token for the specified token value using the given token type.
- `generateToken(tokenValue)`
  Returns the authentication token for the specified token value using the default `standard` token type.
- `generateTokens(tokenValues, tokenType)`
  Returns the authentication tokens in the form of a map, where the map key is the input value to be tokenized and the map value is the corresponding token. The given token type is used to generate the tokens.
generateTokens(tokenValues)
Returns the generated tokens in the form of a map. This method uses the default standard token type to generate the tokens.

generateToken(tokenValue, tokenType)
Returns the authentication token for the specified token value using the given token type.

Signature
public static String generateToken(String tokenValue, pref_center.TokenType tokenType)

Parameters
tokenValue
Type: String
The value passed to LoadParameters.getRecordId() and SubmitParameters.getRecordId(). Identifies the entity that the preference form is acting on.
tokenType
Type: pref_center.TokenType
Specifies the type of the value to be encrypted with authentication tokens.

Return Value
Type: String

generateToken(tokenValue)
Returns the authentication token for the specified token value using the default standard token type.

Signature
public static String generateToken(String tokenValue)

Parameters
tokenValue
Type: String
Identifies the entity that the preference form is acting on. The value passed to LoadParameters.getRecordId() and SubmitParameters.getRecordId().

Return Value
Type: String

generateTokens(tokenValues, tokenType)
Returns the authentication tokens in the form of a map, where the map key is the input value to be tokenized and the map value is the corresponding token. The given token type is used to generate the tokens.
**Signature**

```java
public static Map<String,String> generateTokens(List<String> tokenValues,
pref_center.TokenType tokenType)
```

**Parameters**

- **tokenValues**
  - Type: `List<String>`
  - The values passed to `LoadParameters.getRecordId()` and `SubmitParameters.getRecordId()`. Identifies the entity that the preference form is acting on. Contains multiple values to be encrypted with authentication tokens.

- **tokenType**
  - Type: `pref_center.TokenType`
  - Specifies the type of the value to be encrypted with authentication tokens.

**Return Value**

- Type: `Map<String,String>`, where the map key is the input value to be tokenized and the map value is the corresponding token.

**ValidationResult Class**

This class is reserved for future use with Preference Manager.

**Namespace**

`Pref_center`
Process Namespace

The Process namespace provides an interface and classes for passing data between your organization and a flow. The following are the interfaces and classes in the Process namespace.

IN THIS SECTION:

- Plugin Interface
- PluginDescribeResult Class
- PluginDescribeResult.InputParameter Class
- PluginDescribeResult.OutputParameter Class
- PluginRequest Class
- PluginResult Class

Plugin Interface

Allows you to pass data between your organization and a specified flow.

Namespace

Process

Tip: We recommend using the @InvocableMethod annotation instead of the Process.Plugin interface.

- The interface doesn’t support Blob, Collection, sObject, and Time data types, and it doesn’t support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

IN THIS SECTION:

- Plugin Methods
- Plugin Example Implementation

Plugin Methods

The following are instance methods for Plugin.
IN THIS SECTION:

`describe()`

Returns a `Process.PluginDescribeResult` object that describes this method call.

`invoke(request)`

Primary method that the system invokes when the class that implements the interface is instantiated.

**describe()**

Returns a `Process.PluginDescribeResult` object that describes this method call.

**Signature**

```
public Process.PluginDescribeResult describe()
```

**Return Value**

Type: `Process.PluginDescribeResult`

**invoke(request)**

Primary method that the system invokes when the class that implements the interface is instantiated.

**Signature**

```
```

**Parameters**

`request`

Type: `Process.PluginRequest`

**Return Value**

Type: `Process.PluginResult`

**Plugin Example Implementation**

```java
global class flowChat implements Process.Plugin {

    // The main method to be implemented. The Flow calls this at run time.
    global Process.PluginResult invoke(Process.PluginRequest request) {
        // Get the subject of the Chatter post from the flow
        String subject = (String) request.inputParameters.get('subject');

        // Use the Chatter APIs to post it to the current user's feed
        FeedItem fItem = new FeedItem();
        fItem.ParentId = UserInfo.getUserId();
        fItem.Body = 'Flow Update: ' + subject;
        insert fItem;
    }
}
```
// return to Flow
Map<String, Object> result = new Map<String, Object>();
return new Process.PluginResult(result);
}

// Returns the describe information for the interface
global Process.PluginDescribeResult describe() {
    Process.PluginDescribeResult result = new Process.PluginDescribeResult();
    result.Name = 'flowchatplugin';
    result.Tag = 'chat';
    result.inputParameters = new List<Process.PluginDescribeResult.InputParameter>{
        new Process.PluginDescribeResult.InputParameter('subject',
            Process.PluginDescribeResult.ParameterType.STRING, true)
    };
    result.outputParameters = new List<Process.PluginDescribeResult.OutputParameter>{}
    return result;
}

Test Class
The following is a test class for the above class.

@isTest
private class flowChatTest {

    static testmethod void flowChatTests() {
        flowChat plugin = new flowChat();
        Map<String, Object> inputParams = new Map<String, Object>();

        string feedSubject = 'Flow is alive';
        InputParams.put('subject', feedSubject);

        Process.PluginRequest request = new Process.PluginRequest(inputParams);

        plugin.invoke(request);
    }
}

PluginDescribeResult Class
Describes the input and output parameters for Process.PluginResult.

Namespace
Process
Tip: We recommend using the @InvocableMethod annotation instead of the Process.Plugin interface.

- The interface doesn’t support Blob, Collection, sObject, and Time data types, and it doesn’t support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

IN THIS SECTION:
- PluginDescribeResult Constructors
- PluginDescribeResult Properties

PluginDescribeResult Constructors

The following are constructors for PluginDescribeResult.

IN THIS SECTION:
- PluginDescribeResult()

PluginDescribeResult()

Creates a new instance of the Process.PluginDescribeResult class.

Signature

public PluginDescribeResult()

PluginDescribeResult Properties

The following are properties for PluginDescribeResult.

IN THIS SECTION:
- description
- inputParameters
- name
- outputParameters

description

This optional field describes the purpose of the plug-in.

inputParameters

The input parameters passed by the Process.PluginRequest class from a flow to the class that implements the Process.Plugin interface.

name

Unique name of the plug-in.

outputParameters

The output parameters passed by the Process.PluginResult class from the class that implements the Process.Plugin interface to the flow.
**description**
This optional field describes the purpose of the plug-in.

**Signature**

```java
public String description {get; set;}
```

**Property Value**
Type: String

**Usage**
Size limit: 255 characters.

**inputParameters**
The input parameters passed by the `Process.PluginRequest` class from a flow to the class that implements the `Process.Plugin` interface.

**Signature**

```java
public List<Process.PluginDescribeResult.InputParameter> inputParameters {get; set;}
```

**Property Value**
Type: `List<Process.PluginDescribeResult.InputParameter>`

**name**
Unique name of the plug-in.

**Signature**

```java
public String name {get; set;}
```

**Property Value**
Type: String

**Usage**
Size limit: 40 characters.

**outputParameters**
The output parameters passed by the `Process.PluginResult` class from the class that implements the `Process.Plugin` interface to the flow.
Signature
public List<Process.PluginDescribeResult.OutputParameter> outputParameters {get; set;}

Property Value
Type: List<Process.PluginDescribeResult.OutputParameter>

PluginDescribeResult.InputParameter Class
Describes the input parameter for Process.PluginResult.

Namespace
Process

Tip: We recommend using the @InvocableMethod annotation instead of the Process.Plugin interface.
- The interface doesn’t support Blob, Collection, sObject, and Time data types, and it doesn’t support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

IN THIS SECTION:
- PluginDescribeResult.InputParameter Constructors
- PluginDescribeResult.InputParameter Properties

PluginDescribeResult.InputParameter Constructors
The following are constructors for PluginDescribeResult.InputParameter.

IN THIS SECTION:
- PluginDescribeResult.InputParameter(name, description, parameterType, required)
  Creates a new instance of the Process.PluginDescribeResult.InputParameter class using the specified name, description, parameter type, and required option.
- PluginDescribeResult.InputParameter(name, parameterType, required)
  Creates a new instance of the Process.PluginDescribeResult.InputParameter class using the specified name, parameter type, and required option.

PluginDescribeResult.InputParameter(name, description, parameterType, required)
Creates a new instance of the Process.PluginDescribeResult.InputParameter class using the specified name, description, parameter type, and required option.
**Signature**

```java
public PluginDescribeResult.InputParameter(String name, String description,
Process.PluginDescribeResult.ParameterType parameterType, Boolean required)
```

**Parameters**

- **name**
  - Type: `String`
  - Unique name of the plug-in.

- **description**
  - Type: `String`
  - Describes the purpose of the plug-in.

- **parameterType**
  - Type: `Process.PluginDescribeResult.ParameterType`
  - The data type of the input parameter.

- **required**
  - Type: `Boolean`
  - Set to `true` for required and `false` otherwise.

**PluginDescribeResult.InputParameter(name, parameterType, required)**

Creates a new instance of the `Process.PluginDescribeResult.InputParameter` class using the specified name, parameter type, and required option.

**PluginDescribeResult.InputParameter Properties**

The following are properties for `PluginDescribeResult.InputParameter`. No specific properties are listed in the provided text.
IN THIS SECTION:

- **Description**
  This optional field describes the purpose of the plug-in.

- **Name**
  Unique name of the plug-in.

- **ParameterType**
  The data type of the input parameter.

- **Required**
  Set to `true` for required and `false` otherwise.

**Description**
This optional field describes the purpose of the plug-in.

**Signature**

```csharp
public String Description {get; set;}
```

**Property Value**
Type: `String`

**Usage**
Size limit: 255 characters.

**Name**
Unique name of the plug-in.

**Signature**

```csharp
public String Name {get; set;}
```

**Property Value**
Type: `String`

**Usage**
Size limit: 40 characters.

**ParameterType**
The data type of the input parameter.

**Signature**

```csharp
public Process.PluginDescribeResult.ParameterType ParameterType {get; set;}
```
Property Value
Type: Process.PluginDescribeResult.ParameterType

Required
Set to true for required and false otherwise.

Signature
public Boolean Required {get; set;}

Property Value
Type: Boolean

PluginDescribeResult.OutputParameter Class
Describes the output parameter for Process.PluginResult.

Namespace
Process

Tip: We recommend using the @InvocableMethod annotation instead of the Process.Plugin interface.

- The interface doesn’t support Blob, Collection, sObject, and Time data types, and it doesn’t support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

IN THIS SECTION:
- PluginDescribeResult.OutputParameter Constructors
- PluginDescribeResult.OutputParameter Properties

PluginDescribeResult.OutputParameter Constructors
The following are constructors for PluginDescribeResult.OutputParameter.

IN THIS SECTION:
- PluginDescribeResult.OutputParameter(name, description, parameterType)
  Creates a new instance of the Process.PluginDescribeResult.OutputParameter class using the specified name, description, and parameter type.
- PluginDescribeResult.OutputParameter(name, parameterType)
  Creates a new instance of the Process.PluginDescribeResult.OutputParameter class using the specified name, description, and parameter type.
PluginDescribeResult.OutputParameter(name, description, parameterType)

Creates a new instance of the Process.PluginDescribeResult.OutputParameter class using the specified name, description, and parameter type.

**Signature**

```java
public PluginDescribeResult.OutputParameter(String name, String description,
Process.PluginDescribeResult.ParameterType parameterType)
```

**Parameters**

- **name**
  - Type: String
  - Unique name of the plug-in.

- **description**
  - Type: String
  - Describes the purpose of the plug-in.

- **parameterType**
  - Type: Process.PluginDescribeResult.ParameterType
  - The data type of the input parameter.

PluginDescribeResult.OutputParameter(name, parameterType)

Creates a new instance of the Process.PluginDescribeResult.OutputParameter class using the specified name, description, and parameter type.

**Signature**

```java
public PluginDescribeResult.OutputParameter(String name,
Process.PluginDescribeResult.ParameterType parameterType)
```

**Parameters**

- **name**
  - Type: String
  - Unique name of the plug-in.

- **parameterType**
  - Type: Process.PluginDescribeResult.ParameterType
  - The data type of the input parameter.

**PluginDescribeResult.OutputParameter Properties**

The following are properties for PluginDescribeResult.OutputParameter.
IN THIS SECTION:

**Description**
This optional field describes the purpose of the plug-in.

**Name**
Unique name of the plug-in.

**ParameterType**
The data type of the input parameter.

**Description**
This optional field describes the purpose of the plug-in.

**Signature**

```csharp
public String Description {get; set;}
```

**Property Value**
Type: String

**Usage**
Size limit: 255 characters.

**Name**
Unique name of the plug-in.

**Signature**

```csharp
public String Name {get; set;}
```

**Property Value**
Type: String

**Usage**
Size limit: 40 characters.

**ParameterType**
The data type of the input parameter.

**Signature**

```csharp
public Process.PluginDescribeResult.ParameterType ParameterType {get; set;}
```
Property Value
Type: Process.PluginDescribeResult.ParameterType

PluginRequest Class
Passes input parameters from the class that implements the Process.Plugin interface to the flow.

Namespace
Process

Tip: We recommend using the @InvocableMethod annotation instead of the Process.Plugin interface.
  - The interface doesn’t support Blob, Collection, sObject, and Time data types, and it doesn’t support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
  - The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

PluginRequest Properties
The following are properties for PluginRequest.

IN THIS SECTION:
inputParameters
Input parameters that are passed from the class that implements the Process.Plugin interface to the flow.

inputParameters
Input parameters that are passed from the class that implements the Process.Plugin interface to the flow.

Signature
public MAP<String,ANY> inputParameters {get; set;}

Property Value
Type: Map<String, Object>

PluginResult Class
Returns output parameters from the class that implements the Process.Plugin interface to the flow.

Tip: We recommend using the @InvocableMethod annotation instead of the Process.Plugin interface.
  - The interface doesn’t support Blob, Collection, sObject, and Time data types, and it doesn’t support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
  - The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.
Namespace

Process

PluginResult Properties

The following are properties for PluginResult.

IN THIS SECTION:

outputParameters
Output parameters returned from the class that implements the interface to the flow.

outputParameters
Output parameters returned from the class that implements the interface to the flow.

Signature

public MAP<String, ANY> outputParameters {get; set;}

Property Value

Type: Map<String, Object>

QuickAction Namespace

The QuickAction namespace provides classes and methods for quick actions.

The following are the classes in the QuickAction namespace.

IN THIS SECTION:

DescribeAvailableQuickActionResult Class
Contains describe metadata information for a quick action that is available for a specified parent.

DescribeLayoutComponent Class
Represents the smallest unit in a layout—a field or a separator.

DescribeLayoutItem Class
Represents an individual item in a QuickAction.DescribeLayoutRow.

DescribeLayoutRow Class
Represents a row in a QuickAction.DescribeLayoutSection.

DescribeLayoutSection Class
Represents a section of a layout and consists of one or more columns and one or more rows (an array of QuickAction.DescribeLayoutRow).

DescribeQuickActionDefaultValue Class
Returns a default value for a quick action.
DescribeQuickActionResult Class
Contains describe metadata information for a quick action.

QuickActionDefaults Class
Represents an abstract Apex class that provides the context for running the standard Email Action on Case Feed and the container of the Email Message fields for the action payload. You can override the target fields before the standard Email Action is rendered.

QuickActionDefaultsHandler Interface
The QuickAction.QuickActionDefaultsHandler interface lets you specify the default values for the standard Email and Send Email actions in the case feed. You can use this interface to specify the From address, CC address, BCC address, subject, and email body for the Email action in the case feed. You can use the interface to pre-populate these fields based on the context where the action is displayed, such as the case origin (for example, country) and subject.

QuickActionRequest Class
Use the QuickAction.QuickActionRequest class for providing action information for quick actions to be performed by QuickAction class methods. Action information includes the action name, context record ID, and record.

QuickActionResult Class
After you initiate a quick action with the QuickAction class, use the QuickActionResult class for processing action results.

SendEmailQuickActionDefaults Class
Represents an Apex class that provides: the From address list; the original email’s email message ID, provided that the reply action was invoked on the email message feed item; and methods to specify related settings on templates. You can override these fields before the standard Email Action is rendered.

DescribeAvailableQuickActionResult Class
Contains describe metadata information for a quick action that is available for a specified parent.

Namespace
QuickAction

Usage
The QuickAction describeAvailableQuickActions method returns an array of available quick action describe result objects (QuickAction.DescribeAvailableQuickActionResult).

DescribeAvailableQuickActionResult Methods
The following are methods for DescribeAvailableQuickActionResult. All are instance methods.

IN THIS SECTION:

getActionEnumOrId()
Returns the unique ID for the action. If the action doesn’t have an ID, its API name is used.

getLabel()
The quick action label.
getName()  
The quick action name.

getType()  
The quick action type.

getActionEnumOrId()  
Returns the unique ID for the action. If the action doesn’t have an ID, its API name is used.

Signature

public String getActionEnumOrId()

Return Value

Type: String

getLabel()  
The quick action label.

Signature

public String getLabel()

Return Value

Type: String

getName()  
The quick action name.

Signature

public String getName()

Return Value

Type: String

getType()  
The quick action type.

Signature

public String getType()
Return Value
Type: String

DescribeLayoutComponent Class
Represents the smallest unit in a layout—a field or a separator.

Namespace
QuickAction

DescribeLayoutComponent Methods
The following are methods for DescribeLayoutComponent. All are instance methods.

IN THIS SECTION:
- getDisplayLines()
  Returns the vertical lines displayed for a field. Applies to textarea and multi-select picklist fields.
- getTabOrder()
  Returns the tab order for the item in the row.
- getType()
  Returns the name of the QuickAction.DescribeLayoutComponent type for this component.
- getValue()
  Returns the name of the field if the type for QuickAction.DescribeLayoutComponent is textarea.

getDisplayLines()
Returns the vertical lines displayed for a field. Applies to textarea and multi-select picklist fields.

Signature
public Integer getDisplayLines()

Return Value
Type: Integer

getTabOrder()
Returns the tab order for the item in the row.

Signature
public Integer getTabOrder()
Return Value
Type: Integer

getType()  
Returns the name of the QuickAction.DescribeLayoutComponent type for this component.

Signature
public String getType()

Return Value
Type: String

getValue()  
Returns the name of the field if the type for QuickAction.DescribeLayoutComponent is textarea.

Signature
public String getValue()

Return Value
Type: String

DescribeLayoutItem Class
Represents an individual item in a QuickAction.DescribeLayoutRow.

Namespace
QuickAction

Usage
For most fields on a layout, there is only one component per layout item. However, in a display-only view, the QuickAction.DescribeLayoutItem might be a composite of the individual fields (for example, an address can consist of street, city, state, country, and postal code data). On the corresponding edit view, each component of the address field would be split up into separate QuickAction.DescribeLayoutItems.

DescribeLayoutItem Methods
The following are methods for DescribeLayoutItem. All are instance methods.
IN THIS SECTION:

**getLabel()**
Returns the label text for this item.

**getLayoutComponents()**
Returns a list of `QuickAction.DescribeLayoutComponents` for this item.

**isEditableForNew()**
Indicates whether this item can be edited for new (`true`) or not (`false`).

**isEditableForUpdate()**
Indicates whether this item can be edited for update (`true`) or not (`false`).

**isPlaceholder()**
Indicates whether this item is a placeholder (`true`) or not (`false`). If `true`, then this item is blank.

**isRequired()**
Indicates whether this item is required (`true`) or not (`false`).

---

**getLabel()**
Returns the label text for this item.

**Signature**

```java
public String getLabel()
```

**Return Value**

Type: `String`

---

**getLayoutComponents()**
Returns a list of `QuickAction.DescribeLayoutComponents` for this item.

**Signature**

```java
public List<QuickAction.DescribeLayoutComponent> getLayoutComponents()
```

**Return Value**

Type: `List<QuickAction.DescribeLayoutComponent>`

---

**isEditableForNew()**
Indicates whether this item can be edited for new (`true`) or not (`false`).

**Signature**

```java
public Boolean isEditableForNew()
```
Return Value
Type: Boolean

**isEditableForUpdate()**
Indicates whether this item can be edited for update (true) or not (false).

**Signature**
```
public Boolean isEditableForUpdate()
```

Return Value
Type: Boolean

**isPlaceholder()**
Indicates whether this item is a placeholder (true) or not (false). If true, then this item is blank.

**Signature**
```
public Boolean isPlaceholder()
```

Return Value
Type: Boolean

**isRequired()**
Indicates whether this item is required (true) or not (false).

**Signature**
```
public Boolean isRequired()
```

Return Value
Type: Boolean

**Usage**
This is useful if, for example, you want to render required fields in a contrasting color.

**DescribeLayoutRow Class**
Represents a row in a `QuickAction.DescribeLayoutSection`.

**Namespace**
`QuickAction`
Usage

A QuickAction.DescribeLayoutRow consists of one or more QuickAction.DescribeLayoutItem objects. For each QuickAction.DescribeLayoutRow, a QuickAction.DescribeLayoutItem refers either to a specific field or to an "empty" QuickAction.DescribeLayoutItem (one that contains no QuickAction.DescribeLayoutComponent objects). An empty QuickAction.DescribeLayoutItem can be returned when a given QuickAction.DescribeLayoutRow is sparse (for example, containing more fields on the right column than on the left column).

DescribeLayoutRow Methods

The following are methods for DescribeLayoutRow. All are instance methods.

IN THIS SECTION:

getLayoutItems()
Returns either a specific field or an empty QuickAction.DescribeLayoutItem (one that contains no QuickAction.DescribeLayoutComponent objects).

getNumItems()
Returns the number of QuickAction.DescribeLayoutItem.

getLayoutItems()

Returns either a specific field or an empty QuickAction.DescribeLayoutItem (one that contains no QuickAction.DescribeLayoutComponent objects).

Signature

public List<QuickAction.DescribeLayoutItem> getLayoutItems()

Return Value
Type: List<QuickAction.DescribeLayoutItem>

getNumItems()

Returns the number of QuickAction.DescribeLayoutItem.

Signature

public Integer getNumItems()

Return Value
Type: Integer

DescribeLayoutSection Class

Represents a section of a layout and consists of one or more columns and one or more rows (an array of QuickAction.DescribeLayoutRow).
Namespace

QuickAction

DescribeLayoutSection Properties

The following are properties for DescribeLayoutSection.

collapsed

The current view of the record details section: collapsed (true) or expanded (false).

Signature

public Boolean collapsed {get; set;}

Property Value

Type: Boolean

layoutsectionid

The unique ID of the record details section in the layout.

Signature

public Id layoutsectionid {get; set;}

Property Value

Type: Id

DescribeLayoutSection Methods

The following are methods for DescribeLayoutSection.

IN THIS SECTION:

getColumns()  
Returns the number of columns in the QuickAction.DescribeLayoutSection.

getHeading()  
The heading text (label) for the QuickAction.DescribeLayoutSection.

getLayoutRows()  
Returns an array of one or more QuickAction.DescribeLayoutRow objects.

getLayoutSectionId()  
Returns the ID of the record details section in the layout.

getParentLayoutId()  
Returns the ID of the layout upon which this DescribeLayoutSection resides.
getRows()
Returns the number of rows in the QuickAction.DescribeLayoutSection.

isCollapsed()
Indicates whether the record details section is collapsed (true) or expanded (false). If you build your own app, you can use this method to see whether the current user collapsed a section, and respect that preference in your own UI.

isUseCollapsibleSection()
Indicates whether the QuickAction.DescribeLayoutSection is a collapsible section (true) or not (false).

isUseHeading()
Indicates whether to use the heading (true) or not (false).

getColumns()
Returns the number of columns in the QuickAction.DescribeLayoutSection.

Signature
public Integer getColumns()

Return Value
Type: Integer

getHeading()
The heading text (label) for the QuickAction.DescribeLayoutSection.

Signature
public String getHeading()

Return Value
Type: String

getLayoutRows()
Returns an array of one or more QuickAction.DescribeLayoutRow objects.

Signature
public List<QuickAction.DescribeLayoutRow> getLayoutRows()

Return Value
Type: List<QuickAction.DescribeLayoutRow>

getLayoutSectionId()
Returns the ID of the record details section in the layout.
Signature

```java
public Id getLayoutSectionId()
```

Return Value

Type: Id

```java
public Id getParentLayoutId()
```

Returns the ID of the layout upon which this DescribeLayoutSection resides.

Return Value

Type: Id

```java
public Integer getRows()
```

Returns the number of rows in the QuickAction.DescribeLayoutSection.

Return Value

Type: Integer

```java
public Boolean isCollapsed()
```

Indicates whether the record details section is collapsed (true) or expanded (false). If you build your own app, you can use this method to see whether the current user collapsed a section, and respect that preference in your own UI.

Return Value

Type: Boolean

```java
public Boolean isUseCollapsibleSection()
```

Indicates whether the QuickAction.DescribeLayoutSection is a collapsible section (true) or not (false).
Signature

public Boolean isUseCollapsibleSection()

Return Value

Type: Boolean

isUseHeading()

Indicates whether to use the heading (true) or not (false).

Signature

public Boolean isUseHeading()

Return Value

Type: Boolean

DescribeQuickActionDefaultValue Class

Returns a default value for a quick action.

Namespace

QuickAction

Usage

Represents the default values of fields to use in default layouts.

DescribeQuickActionDefaultValue Methods

The following are methods for DescribeQuickActionDefaultValue. All are instance methods.

IN THIS SECTION:

getDefaultValue()

Returns the default value of the quick action.

getField()

Returns the field name of the action.

give the default value of the quick action.
Signature

public String getDefaultValue()

Return Value
Type: String

gField()

Returns the field name of the action.

Signature

public String getField()

Return Value
Type: String

DescribeQuickActionResult Class

Contains describe metadata information for a quick action.

Namespace

QuickAction

Usage

The QuickAction describeQuickActions method returns an array of quick action describe result objects (QuickAction.DescribeQuickActionResult).

IN THIS SECTION:
- DescribeQuickActionResult Properties
- DescribeQuickActionResult Methods

DescribeQuickActionResult Properties

The following are properties for DescribeQuickActionResult.

IN THIS SECTION:
- canvasapplicationname
  The name of the Canvas application invoked by the custom action.
- colors
  Array of color information. Each color is associated with a theme.
contextobjecttype
The object used for the action. Was getsourceSobjectType() in API version 29.0 and earlier.

defaultvalues
The action’s default values.

flowdevname
If the custom action invokes a flow, the fully qualified name of the flow.

flowrecordidvar
If the custom action invokes a flow, the input variable that the custom action passes the record’s ID to.

height
The height in pixels of the action pane.

iconname
The name of the icon used for the action. If a custom icon is not used, this value isn’t set.

icons
Array of icons. Each icon is associated with a theme.

iconurl
The URL of the icon used for the action. This icon URL corresponds to the 32x32 icon used for the current Salesforce theme, introduced in Spring ’10, or the custom icon, if there is one.

layout
The section of the layout where the action resides.

lightningcomponentbundleid
If the custom action invokes a Lightning component, the ID of the Lightning component bundle to which the component belongs.

lightningcomponentbundlename
If the custom action invokes a Lightning component, the name of the Lightning component bundle to which the component belongs.

lightningcomponentqualifiedname
The fully qualified name of the Lightning component invoked by the custom action.

miniiconurl
The icon’s URL. This icon URL corresponds to the 16x16 icon used for the current Salesforce theme, introduced in Spring ’10, or the custom icon, if there is one.

showquickactionlcheader
Indicates whether the Lightning component quick action header and footer are shown. If false, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren’t displayed.

showquickactionvfheader
Indicates whether the Visualforce quick action header and footer should be shown. If false, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren’t displayed.

targetparentfield
The parent object type of the action. Links the target object to the parent object. For example, the value is Account if the target object is Contact and the parent object is Account.

targetrecordtypeid
The record type of the target record.
targetsobjecttype
The action's target object type.

visualforcepagename
The name of the Visualforce page associated with the custom action.

visualforcepageurl
The URL of the Visualforce page associated with the action.

width
The width in pixels of the action pane, for custom actions that call Visualforce pages, Canvas apps, or Lightning components.

canvasapplicationname
The name of the Canvas application invoked by the custom action.

Signature
public String canvasapplicationname {get; set;}

Property Value
Type: String

colors
Array of color information. Each color is associated with a theme.

Signature
public List<Schema.DescribeColorResult> colors {get; set;}

Property Value
Type: List<Schema.DescribeColorResult> on page 2707

contextsobjecttype
The object used for the action. Was getsourceSobjectType() in API version 29.0 and earlier.

Signature
public String contextsobjecttype {get; set;}

Property Value
Type: String

defaultvalues
The action's default values.
Signature
public List<QuickAction.DescribeQuickActionDefaultValue> defaultvalues {get; set;}

Property Value
Type: List<QuickAction.DescribeQuickActionDefaultValue>

flowdevname
If the custom action invokes a flow, the fully qualified name of the flow.

Signature
public String flowdevname {get; set;}

Property Value
Type: String

flowrecordidvar
If the custom action invokes a flow, the input variable that the custom action passes the record’s ID to.

Signature
public String flowrecordidvar {get; set;}

Property Value
Type: String
Valid values are null or recordId.

height
The height in pixels of the action pane.

Signature
public Integer height {get; set;}

Property Value
Type: Integer

iconname
The name of the icon used for the action. If a custom icon is not used, this value isn’t set.
Signature
public String iconname {get; set;}

Property Value
Type: String

icons
Array of icons. Each icon is associated with a theme.

Signature
public List<Schema.DescribeIconResult> icons {get; set;}

Property Value
Type: List<Schema.DescribeIconResult> on page 2730
If no custom icon was associated with the quick action and the quick action creates a specific object, the icons will correspond to the icons used for the created object. For example, if the quick action creates an Account, the icon array will contain the icons used for Account.
If a custom icon was associated with the quick action, the array will contain that custom icon.

iconurl
The URL of the icon used for the action. This icon URL corresponds to the 32x32 icon used for the current Salesforce theme, introduced in Spring '10, or the custom icon, if there is one.

Signature
public String iconurl {get; set;}

Property Value
Type: String

layout
The section of the layout where the action resides.

Signature
public QuickAction.DescribeLayoutSection layout {get; set;}

Property Value
Type: QuickAction.DescribeLayoutSection on page 2497
**lightningcomponentbundleid**
If the custom action invokes a Lightning component, the ID of the Lightning component bundle to which the component belongs.

**Signature**

```java
public String lightningcomponentbundleid {get; set;}
```

**Property Value**
Type: String

**lightningcomponentbundlename**
If the custom action invokes a Lightning component, the name of the Lightning component bundle to which the component belongs.

**Signature**

```java
public String lightningcomponentbundlename {get; set;}
```

**Property Value**
Type: String

**lightningcomponentqualifiedname**
The fully qualified name of the Lightning component invoked by the custom action.

**Signature**

```java
public String lightningcomponentqualifiedname {get; set;}
```

**Property Value**
Type: String

**miniiconurl**
The icon's URL. This icon URL corresponds to the 16x16 icon used for the current Salesforce theme, introduced in Spring '10, or the custom icon, if there is one.

**Signature**

```java
public String miniiconurl {get; set;}
```

**Property Value**
Type: String
**showquickactionlcheader**
Indicates whether the Lightning component quick action header and footer are shown. If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren’t displayed.

**Signature**
```
public Boolean showquickactionlcheader {get; set;}
```

**Property Value**
Type: Boolean

**showquickactionvfheader**
Indicates whether the Visualforce quick action header and footer should be shown. If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren’t displayed.

**Signature**
```
public Boolean showquickactionvfheader {get; set;}
```

**Property Value**
Type: Boolean

**targetparentfield**
The parent object type of the action. Links the target object to the parent object. For example, the value is Account if the target object is Contact and the parent object is Account.

**Signature**
```
public String targetparentfield {get; set;}
```

**Property Value**
Type: String

**targetrecordtypeid**
The record type of the target record.

**Signature**
```
public String targetrecordtypeid {get; set;}
```

**Property Value**
Type: String
**targetsobjecttype**
The action's target object type.

**Signature**
```
public String targetsobjecttype {get; set;}
```

**Property Value**
Type: String

**visualforcepagename**
The name of the Visualforce page associated with the custom action.

**Signature**
```
public String visualforcepagename {get; set;}
```

**Property Value**
Type: String

**visualforcepageurl**
The URL of the Visualforce page associated with the action.

**Signature**
```
public String visualforcepageurl {get; set;}
```

**Property Value**
Type: String

**width**
The width in pixels of the action pane, for custom actions that call Visualforce pages, Canvas apps, or Lightning components.

**Signature**
```
public Integer width {get; set;}
```

**Property Value**
Type: Integer

**DescribeQuickActionResult Methods**
The following are methods for DescribeQuickActionResult. All are instance methods.
IN THIS SECTION:

- **getActionEnumOrId()**
  Returns the unique ID for the action. If the action doesn't have an ID, its API name is used.

- **getCanvasApplicationName()**
  Returns the name of the Canvas application, if used.

- **getColors()**
  Returns an array of color information. Each color is associated with a theme.

- **getContextSobjectType()**
  Returns the object used for the action. Replaces `getsourceSobjectType()` in API version 30.0 and later.

- **getDefaultValues()**
  Returns the default values for a action.

- **getFlowDevName()**
  If the custom action invokes a flow, returns the fully qualified name of the flow invoked by the custom action.

- **getFlowRecordIdVar()**
  If the custom action invokes a flow, returns the input variable that the custom action passes the record’s ID to.

- **getHeight()**
  Returns the height in pixels of the action pane.

- **getIconName()**
  Returns the action’s icon name.

- **getIconUrl()**
  Returns the URL of the 32x32 icon used for the action.

- **getIcons()**
  Returns a list of `Schema.DescribeIconResult` objects that describe colors used in a tab.

- **getLabel()**
  Returns the action label.

- **getLayout()**
  Returns the layout sections that comprise an action.

- **getLightningComponentBundleId()**
  If the custom action invokes a Lightning component, returns the ID of the Lightning component bundle to which the component belongs.

- **getLightningComponentBundleName()**
  If the custom action invokes a Lightning component, returns the name of the Lightning component bundle to which the component belongs.

- **getLightningComponentQualifiedName()**
  If the custom action invokes a Lightning component, returns the fully qualified name of the Lightning component invoked by the custom action.

- **getMiniIconUrl()**
  Returns the 16x16 icon URL.

- **getName()**
  Returns the action name.
getShowQuickActionLcHeader()
Returns an indication of whether the Lightning component quick action header and footer are shown.

getShowQuickActionVfHeader()
Returns an indication of whether the Visualforce quick action header and footer should be shown.

ggetSourceSobjectType()
Returns the object type used for the action.

gGetTargetParentField()
Returns the parent object’s type for the action.

gGetTargetRecordTypeId()
Returns the record type of the targeted record.

gGetTargetSobjectType()
Returns the action’s target object type.

gGetType()
Returns a create or custom Visualforce action.

gGetVisualforcePageName()
If Visualforce is used, returns the name of the associated page for the action.

gGetVisualforcePageUrl()
Returns the URL of the Visualforce page associated with the action.

gGetWidth()
If a custom action is created, returns the width in pixels of the action pane.

gGetActionEnumOrId()
Returns the unique ID for the action. If the action doesn’t have an ID, its API name is used.

**Signature**

```java
public String getActionEnumOrId()
```

**Return Value**

Type: `String`

**getCanvasApplicationName()**

Returns the name of the Canvas application, if used.

**Syntax**

```java
public String getCanvasApplicationName()
```

**Return Value**

Type: `String`
getColors()
Returns an array of color information. Each color is associated with a theme.

Signature
public List<Schema.DescribeColorResult> getColors()

Return Value
Type: List<Schema.DescribeColorResult>

getContextSobjectType()
Returns the object used for the action. Replaces getSourceSobjectType() in API version 30.0 and later.

Signature
public String getContextSobjectType()

Return Value
Type: String

getDefaultValues()
Returns the default values for a action.

Signature
public List<QuickAction.DescribeQuickActionDefaultValue> getDefaultValues()

Return Value
Type: List<QuickAction.DescribeQuickActionDefaultValue>

getFlowDevName()
If the custom action invokes a flow, returns the fully qualified name of the flow invoked by the custom action.

Signature
public String getFlowDevName()

Return Value
Type: String

getFlowRecordIdVar()
If the custom action invokes a flow, returns the input variable that the custom action passes the record’s ID to.
Signature
public String getFlowRecordIdVar()

Return Value
Type: String

getHeight()
Returns the height in pixels of the action pane.

Signature
public Integer getHeight()

Return Value
Type: Integer

getIconName()
Returns the actions' icon name.

Signature
public String getIconName()

Return Value
Type: String

getIconUrl()
Returns the URL of the 32x32 icon used for the action.

Signature
public String getIconUrl()

Return Value
Type: String

getIcons()
Returns a list of Schema.DescribeIconResult objects that describe colors used in a tab.

Signature
public List<Schema.DescribeIconResult> getIcons()
Return Value
Type: List<Schema.DescribeIconResult>

getLabel()
Returns the action label.

Signature
public String getLabel()

Return Value
Type: String

getLayout()
Returns the layout sections that comprise an action.

Signature
public QuickAction.DescribeLayoutSection getLayout()

Return Value
Type: QuickAction.DescribeLayoutSection

g LightningComponentBundleId()
If the custom action invokes a Lightning component, returns the ID of the Lightning component bundle to which the component belongs.

Signature
public String getLightningComponentBundleId()

Return Value
Type: String

g LightningComponentBundleName()
If the custom action invokes a Lightning component, returns the name of the Lightning component bundle to which the component belongs.

Signature
public String getLightningComponentBundleName()
Return Value
Type: String

**getLightningComponentQualifiedName()**
If the custom action invokes a Lightning component, returns the fully qualified name of the Lightning component invoked by the custom action.

**Signature**
```java
public String getLightningComponentQualifiedName()
```

**Return Value**
Type: String

**getMiniIconUrl()**
Returns the 16x16 icon URL.

**Signature**
```java
public String getMiniIconUrl()
```

**Return Value**
Type: String

**getName()**
Returns the action name.

**Signature**
```java
public String getName()
```

**Return Value**
Type: String

**getShowQuickActionLcHeader()**
Returns an indication of whether the Lightning component quick action header and footer are shown.

**Signature**
```java
public Boolean getShowQuickActionLcHeader()
```
Return Value
Type: Boolean
If false, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren’t displayed.

getShowQuickActionVfHeader()
Returns an indication of whether the Visualforce quick action header and footer should be shown.

Signature
public Boolean getShowQuickActionVfHeader()

Return Value
Type: Boolean
If false, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren’t displayed.

getSourceSobjectType()
Returns the object type used for the action.

Signature
public String getSourceSobjectType()

Return Value
Type: String

getTargetParentField()
Returns the parent object’s type for the action.

Signature
public String getTargetParentField()

Return Value
Type: String

getTargetRecordTypeId()
Returns the record type of the targeted record.

Signature
public String getTargetRecordTypeId()
Return Value
Type: String

getTargetSobjectType() Returns the action’s target object type.

Signature
public String getTargetSobjectType()

Return Value
Type: String

getType() Returns a create or custom Visualforce action.

Signature
public String getType()

Return Value
Type: String

getVisualforcePageName() If Visualforce is used, returns the name of the associated page for the action.

Signature
public String getVisualforcePageName()

Return Value
Type: String

getVisualforcePageUrl() Returns the URL of the Visualforce page associated with the action.

Signature
public String getVisualforcePageUrl()

Return Value
Type: String
**getWidth()**
If a custom action is created, returns the width in pixels of the action pane.

**Signature**
```java
public Integer getWidth()
```

**Return Value**
Type: Integer

### QuickActionDefaults Class
Represents an abstract Apex class that provides the context for running the standard Email Action on Case Feed and the container of the Email Message fields for the action payload. You can override the target fields before the standard Email Action is rendered.

**Namespace**
QuickAction

**Usage**

> **Note:** You cannot extend this abstract class. You can use the getter methods when using it in the context of QuickAction.QuickActionDefaultsHandler. Salesforce provides a class that extends this class (See QuickAction.SendEmailQuickActionDefaults.)

IN THIS SECTION:
QuickActionDefaults Methods

### QuickActionDefaults Methods
The following are methods for QuickActionDefaults.

IN THIS SECTION:
- `getActionName()`
- `getActionType()`
- `getContextId()`
- `getTargetSObject()`
getActionName()
Returns the name of the standard Email Action on Case Feed (Case.Email).

Signature
public String getActionName()

Return Value
Type: String

getActionType()
Returns the type of the standard Email Action on Case Feed (Email).

Signature
public String getActionType()

Return Value
Type: String

getContextId()
The ID of the context related to the standard Email Action on Case Feed (Case ID).

Signature
public Id getContextId()

Return Value
Type: Id

getTargetSObject()
The target object of the standard Email Action on Case Feed (EmailMessage).

Signature
public SObject getTargetSObject()

Return Value
Type: SObject
QuickActionDefaultsHandler Interface

The QuickAction.QuickActionDefaultsHandler interface lets you specify the default values for the standard Email and Send Email actions in the case feed. You can use this interface to specify the From address, CC address, BCC address, subject, and email body for the Email action in the case feed. You can use the interface to pre-populate these fields based on the context where the action is displayed, such as the case origin (for example, country) and subject.

Namespace

QuickAction

Usage

To specify default values for the standard Email action in the case feed, create a class that implements QuickAction.QuickActionDefaultsHandler.

The QuickAction.QuickActionDefaultsHandler interface works in Salesforce Classic and Lightning Experience.

When working in Lightning Experience, keep the following things in mind:

• The interface overrides email values set up with predefined IDs.
• The interface works with the out-of-the-box Email action provided on cases. You can also use the interface with custom Email actions for the case object.
• The interface in Lightning Experience doesn’t support:
  – Email attachments
  – Custom email fields
  – Visualforce email templates, which are a type of email template available in Salesforce Classic
• The From field determines the from address picklist. While you can’t customize this picklist in Send Email action types via the QuickActionDefaultsHandler interface, you can customize the From Address field. To customize this field, remove the From field from the SendEmail quick action layout and add the From Address field instead. Then provide a valid and verified from address in the QuickActionDefaultsHandler code. This address must be the current user’s address, an organization-wide email address that the current user has access to, or an Email-to-Case routing address.
• If your Apex interface adds content to the email body, merge fields display as unresolved. During preview and send, the merge fields resolve.

When you implement this interface, provide an empty parameterless constructor.

IN THIS SECTION:

QuickActionDefaultsHandler Methods
QuickActionDefaultsHandler Example Implementations

QuickActionDefaultsHandler Methods

The following are methods for QuickActionDefaultsHandler.
IN THIS SECTION:

**onInitDefaults(actionDefaults)**
Implement this method to provide default values for the standard Email action in the case feed.

**Signature**

```java
public void onInitDefaults(QuickAction.QuickActionDefaults[] actionDefaults)
```

**Parameters**

- `actionDefaults`
  Type: `QuickAction.QuickActionDefaults[]`
  This array contains only one item of type `QuickAction.SendEmailQuickActionDefaults`.

**Return Value**

Type: void

**QuickActionDefaultsHandler Example Implementations**

These examples are implementations of the `QuickAction.QuickActionDefaultsHandler` interface.

In this example, the `onInitDefaults` method checks whether the element passed in the array is for the standard Email action in the case feed. Then, it performs a query to retrieve the case that corresponds to the context ID. Next, it sets the value of the BCC address of the corresponding email message to a default value. The default value is based on the case reason. Finally, it sets the default values of the email template properties. The `onInitDefaults` method determines the default values based on two criteria: first, whether a reply action on an email message initiated the call to the method, and second, whether any previous emails attached to the case are associated with the call.

```java
global class EmailPublisherLoader implements QuickAction.QuickActionDefaultsHandler {
    // Empty constructor
    global EmailPublisherLoader() {
    }

    // The main interface method
    global void onInitDefaults(QuickAction.QuickActionDefaults[] defaults) {
        QuickAction.SendEmailQuickActionDefaults sendEmailDefaults = null;

        // Check if the quick action is the standard case feed Send Email action
        for (Integer j = 0; j < defaults.size(); j++) {
            if (defaults.get(j) instanceof QuickAction.SendEmailQuickActionDefaults &&
                defaults.get(j).getTargetSObject().getSObjectType() == EmailMessage.sObjectType &&
                defaults.get(j).getActionName().equals('Case.Email') &&
                defaults.get(j).getActionType().equals('Email')) {
                sendEmailDefaults =
            }
        }
    }
}
```
if (sendEmailDefaults != null) {
    Case c = [SELECT Status, Reason FROM Case
                WHERE Id=:sendEmailDefaults.getContextId()];
    EmailMessage emailMessage = (EmailMessage)sendEmailDefaults.getTargetSObject();
    // Set BCC address to make sure each email goes for audit
    emailMessage.BccAddress = getBccAddress(c.Reason);
    /*
    Set Template related fields
    when the In Reply To Id field is null we know the interface
    is called on page load. Here we check if
    there are any previous emails attached to the case and load
    the 'New_Case_Created' or 'Automatic_Response' template.
    When the In Reply To Id field is not null we know that
    the interface is called on click of reply/reply all
    of an email and we load the 'Default_reply_template' template */
    if (sendEmailDefaults.getInReplyToId() == null) {
        Integer emailCount = [SELECT count() FROM EmailMessage
                               WHERE ParentId=:sendEmailDefaults.getContextId()];
        if (emailCount != null && emailCount > 0) {
            sendEmailDefaults.setTemplateId(
                getTemplateIdHelper('Automatic_Response'));
        } else {
            sendEmailDefaults.setTemplateId(
                getTemplateIdHelper('New_Case_Created'));
        }
        sendEmailDefaults.setInsertTemplateBody(false);
        sendEmailDefaults.setIgnoreTemplateSubject(false);
    } else {
        sendEmailDefaults.setTemplateId(
            getTemplateIdHelper('Default_reply_template'));
        sendEmailDefaults.setInsertTemplateBody(false);
        sendEmailDefaults.setIgnoreTemplateSubject(true);
    }
}

private Id getTemplateIdHelper(String templateApiName) {
    Id templateId = null;
    try {
        templateId = [select id, name from EmailTemplate
                      where developername = :templateApiName].id;
    } catch (Exception e) {
        system.debug('Unable to locate EmailTemplate using name: ' +
                     templateApiName + ' refer to Setup | Communications Templates '
                     + templateApiName);
    }
}
private String getBccAddress(String reason) {
    if (reason != null && reason.equals('Technical')) {
        return 'support_technical@mycompany.com';
    } else if (reason != null && reason.equals('Billing')) {
        return 'support_billing@mycompany.com';
    } else {
        return 'support@mycompany.com';
    }
}

In this example, the `onInitDefaults` method checks whether the element passed in the array is for the standard Email action in the case feed. Then it performs a query to determine if the case Priority is set to `High`. If the Priority is set to `High`, the email address `managers@acme.com` is appended to the BCC field.

```java
global class EmailPublisherForHighPriorityCases implements QuickAction.QuickActionDefaultsHandler {
    // Empty constructor
    global EmailPublisherForHighPriorityCases() {
    }

    // The main interface method
    global void onInitDefaults(QuickAction.QuickActionDefaults[] defaults) {
        QuickAction.SendEmailQuickActionDefaults sendEmailDefaults = (QuickAction.SendEmailQuickActionDefaults)defaults.get(0);
        EmailMessage emailMessage = (EmailMessage)sendEmailDefaults.getTargetSObject();

        Case c = [SELECT CaseNumber, Priority FROM Case WHERE Id=:sendEmailDefaults.getContextId()];

        // If case severity is "High," append "managers@acme.com" to the existing (and possibly blank) BCC field
        if (c.Priority != null && c.Priority.equals('High')) {
            emailMessage.BccAddress = 'managers@acme.com';
        }
    }
}
```

In this example, the `onInitDefaults` method checks whether the element passed in the array is for the standard Email action in the case feed. Then it performs a query to determine if the case Type is set to `Problem`. If the type is set to `Problem`, the `First Response` email template is inserted into the body of the email.

```java
global class EmailPublisherForCaseType implements QuickAction.QuickActionDefaultsHandler {
    // Empty constructor
    global EmailPublisherForCaseType() {
    }

    // The main interface method
    global void onInitDefaults(QuickAction.QuickActionDefaults[] defaults) {
        QuickAction.SendEmailQuickActionDefaults sendEmailDefaults = (QuickAction.SendEmailQuickActionDefaults)defaults.get(0);
```

2523
In this example, the `onInitDefaults` method checks whether the element passed in the array is for the standard Email action in the case feed. Then it performs a query to determine if the email is a Reply or Reply All email. If email is a Reply or Reply All email, the corresponding email templates for these emails are inserted into the body of the email.

```apex
global class EmailPublisherForReplyAndReplyAll implements QuickAction.QuickActionDefaultsHandler {
    // Empty constructor
    global EmailPublisherForReplyAndReplyAll() {
    }

    // The main interface method
    global void onInitDefaults(QuickAction.QuickActionDefaults[] defaults) {
        QuickAction.SendEmailQuickActionDefaults sendEmailDefaults =
            (QuickAction.SendEmailQuickActionDefaults)defaults.get(0);
        EmailMessage emailMessage = (EmailMessage)sendEmailDefaults.getTargetSObject();

        // If the email is a “Reply” email, insert the “Reply Email Template” to the email body
        if (sendEmailDefaults.getActionName().equals('EmailMessage._Reply')) {
            sendEmailDefaults.setTemplateId('Insert Reply Email Template ID Here');
            sendEmailDefaults.setInsertTemplateBody(true);
            sendEmailDefaults.setIgnoreTemplateSubject(false);
        }

        // If the email is a “Reply All” email, insert the “Reply All Email Template” to the email body
        else if (sendEmailDefaults.getActionName().equals('EmailMessage._ReplyAll')) {
            sendEmailDefaults.setTemplateId('Insert Reply All Email Template ID Here');
            sendEmailDefaults.setInsertTemplateBody(true);
            sendEmailDefaults.setIgnoreTemplateSubject(false);
        }
    }
}
```
QuickActionRequest Class

Use the `QuickAction.QuickActionRequest` class for providing action information for quick actions to be performed by `QuickAction` class methods. Action information includes the action name, context record ID, and record.

Namespace

`QuickAction`

Usage

For Apex saved using Salesforce API version 28.0, a parent ID is associated with the `QuickActionRequest` instead of the context ID. The constructor of this class takes no arguments:

```java
QuickAction.QuickActionRequest qar = new QuickAction.QuickActionRequest();
```

Example

In this sample, a new quick action is created to create a contact and assign a record to it.

```java
QuickAction.QuickActionRequest req = new QuickAction.QuickActionRequest();
// Some quick action name
req.quickActionName = Schema.Account.QuickAction.AccountCreateContact;

// Define a record for the quick action to create
Contact c = new Contact();
c.lastname = 'last name';
req.record = c;

// Provide the context ID (or parent ID). In this case, it is an Account record.
req.contextid = '001xx000003DGcO';

QuickAction.QuickActionResult res = QuickAction.performQuickAction(req);
```

SEE ALSO:

- `QuickAction Class`

QuickActionRequest Constructors

The following are constructors for `QuickActionRequest`. 
QuickActionRequest()  
Creates a new instance of the `QuickAction.QuickActionRequest` class.

**Signature**  
```
public QuickActionRequest()
```

**QuickActionRequest Methods**  
The following are methods for `QuickActionRequest`. All are instance methods.

**getContextId()**  
Returns this QuickAction’s context record ID.

**getQuickActionName()**  
Returns this QuickAction’s name.

**getRecord()**  
Returns the QuickAction’s associated record.

**setContextId(contextId)**  
Sets this QuickAction’s context ID. Returned by `getContextId`.

**setQuickActionName(name)**  
Sets this QuickAction’s name. Returned by `getQuickActionName`.

**setRecord(record)**  
Sets a record for this QuickAction. Returned by `getRecord`.

**getContextId()**  
Returns this QuickAction’s context record ID.

**Signature**  
```
public Id getContextId()
```

**Return Value**  
Type: ID

**getQuickActionName()**  
Returns this QuickAction’s name.
Signature

```java
public String getQuickActionName()
```

Return Value
Type: `String`

```java
getRecord()
```

Returns the QuickAction’s associated record.

Signature

```java
public SObject getRecord()
```

Return Value
Type: `SObject`

```java
setContextId(contextId)
```

Sets this QuickAction’s context ID. Returned by `getContextId`.

Signature

```java
public Void setContextId(Id contextId)
```

Parameters
```
contextId
Type: `Id`
```

Return Value
Type: `Void`

Usage
For Apex saved using Salesforce API version 28.0, sets this QuickAction’s parent ID and is returned by `getParentId`.

```java
setQuickActionName(name)
```

Sets this QuickAction’s name. Returned by `getQuickActionName`.

Signature

```java
public Void setQuickActionName(String name)
```
Parameters
name
  Type: String

Return Value
Type: Void

setRecord(record)
Sets a record for this QuickAction. Returned by getRecord.

Signature
public Void setRecord(SObject record)

Parameters
record
  Type: SObject

Return Value
Type: Void

QuickActionResult Class
After you initiate a quick action with the QuickAction class, use the QuickActionResult class for processing action results.

Namespace
QuickAction

SEE ALSO:
  QuickAction Class

QuickActionResult Methods
The following are methods for QuickActionResult. All are instance methods.

IN THIS SECTION:
  getErrors()
  If an error occurs, an array of one or more database error objects, along with error codes and descriptions, is returned.
  getIds()
  The IDs of the QuickActions being processed.
  getSuccessMessage()
  Returns the success message associated with the quick action.
isCreated()
Returns `true` if the action is created; otherwise, `false`.

isSuccess()
Returns `true` if the action completes successfully; otherwise, `false`.

getErrors()
If an error occurs, an array of one or more database error objects, along with error codes and descriptions, is returned.

Signature
```
public List<Database.Error> getErrors()
```

Return Value
Type: `List<Database.Error>`

getIds()
The IDs of the QuickActions being processed.

Signature
```
public List<Id> getIds()
```

Return Value
Type: `List<Id>`

getSuccessMessage()
Returns the success message associated with the quick action.

Signature
```
public String getSuccessMessage()
```

Return Value
Type: `String`

isCreated()
Returns `true` if the action is created; otherwise, `false`.

Signature
```
public Boolean isCreated()
```
Return Value
Type: Boolean

**isSuccess()**
Returns `true` if the action completes successfully; otherwise, `false`.

Signature
```
public Boolean isSuccess()
```

Return Value
Type: Boolean

**SendEmailQuickActionDefaults Class**

Represents an Apex class that provides: the From address list; the original email's email message ID, provided that the reply action was invoked on the email message feed item; and methods to specify related settings on templates. You can override these fields before the standard Email Action is rendered.

Namespace
QuickAction

Usage

**Note:** You cannot instantiate this class. One can use the getters/setters when using it in the context of `QuickAction.QuickActionDefaultsHandler`.

IN THIS SECTION:

SendEmailQuickActionDefaults Methods

**SendEmailQuickActionDefaults Methods**
The following are methods for `SendEmailQuickActionDefaults`.

IN THIS SECTION:

getFromAddressList()
Returns a list of email addresses that are available in the From: address drop-down menu for the standard Email Action.

getInReplyTold()
Returns the email message ID of the email to which the reply/reply all action has been invoked.

setIgnoreTemplateSubject(useOriginalSubject)
Specifies whether the template subject should be ignored (true), thus using the original subject, or whether the template subject should replace the original subject (false).
setInsertTemplateBody(keepOriginalBodyContent)
Specifies whether the template body should be inserted above the original body content (true) or whether it should replace the entire content with the template body (false).

setTemplateId(templatedId)
Sets the email template ID to load into the email body.

getFromAddressList()
Returns a list of email addresses that are available in the From: address drop-down menu for the standard Email Action.

Signature
public List<String> getFromAddressList()

Return Value
Type: List<String>

getInReplyToId()
Returns the email message ID of the email to which the reply/reply all action has been invoked.

Signature
public Id getInReplyToId()

Return Value
Type: Id

setIgnoreTemplateSubject(useOriginalSubject)
Specifies whether the template subject should be ignored (true), thus using the original subject, or whether the template subject should replace the original subject (false).

Signature
public void setIgnoreTemplateSubject(Boolean useOriginalSubject)

Parameters
useOriginalSubject
Type: Boolean

Return Value
Type: void
**setInsertTemplateBody(keepOriginalBodyContent)**

Specifies whether the template body should be inserted above the original body content (true) or whether it should replace the entire content with the template body (false).

**Signature**

`public void setInsertTemplateBody(Boolean keepOriginalBodyContent)`

**Parameters**

`keepOriginalBodyContent`

Type: Boolean

**Return Value**

Type: void

**setTemplateId(templateId)**

Sets the email template ID to load into the email body.

**Signature**

`public void setTemplateId(Id templateId)`

**Parameters**

`templateId`

Type: Id

The template ID.

**Return Value**

Type: void

**Reports Namespace**

The Reports namespace provides classes for accessing the same data as is available in the Salesforce Reports and Dashboards REST API.

The following are the classes in the Reports namespace.

**IN THIS SECTION:**

- **AggregateColumn Class**
  
  Contains methods for describing summary fields such as Record Count, Sum, Average, Max, Min, and custom summary formulas. Includes name, label, data type, and grouping context.
BucketField Class
Contains methods and constructors to work with information about a bucket field, including bucket type, name, and bucketed values.

BucketFieldValue Class
Contains information about the report values included in a bucket field.

BucketType Enum
The types of values included in a bucket.

ColumnDataType Enum
The Reports.ColumnDataType enum describes the type of data in a column. It is returned by the getDataType method.

ColumnSortOrder Enum
The Reports.ColumnSortOrder enum describes the order that the grouping column uses to sort data.

CrossFilter Class
Contains methods and constructors used to work with information about a cross filter.

CsfGroupType Enum
The group level at which the custom summary format aggregate is displayed in a report.

DateGranularity Enum
The Reports.DateGranularity enum describes the date interval that is used for grouping.

DetailColumn Class
 Contains methods for describing fields that contain detailed data. Detailed data fields are also listed in the report metadata.

Dimension Class
Contains information for each row or column grouping.

EvaluatedCondition Class
Contains the individual components of an evaluated condition for a report notification, such as the aggregate name and label, the operator, and the value that the aggregate is compared to.

EvaluatedConditionOperator Enum
The Reports.EvaluatedConditionOperator enum describes the type of operator used to compare an aggregate to a value. It is returned by the getOperator method.

FilterOperator Class
Contains information about a filter operator, such as display name and API name.

FilterValue Class
Contains information about a filter value, such as the display name and API name.

FormulaType Enum
The format of the numbers in a custom summary formula.

GroupingColumn Class
Contains methods for describing fields that are used for column grouping.

GroupingInfo Class
Contains methods for describing fields that are used for grouping.

GroupingValue Class
Contains grouping values for a row or column, including the key, label, and value.

NotificationAction Interface
Implement this interface to trigger a custom Apex class when the conditions for a report notification are met.
NotificationActionContext Class
Contains information about the report instance and condition threshold for a report notification.

ReportCsf Class
Contains methods and constructors for working with information about a custom summary formula (CSF).

ReportCurrency Class
Contains information about a currency value, including the amount and currency code.

ReportDataCell Class
Contains the data for a cell in the report, including the display label and value.

ReportDescribeResult Class
Contains report, report type, and extended metadata for a tabular, summary, or matrix report.

ReportDetailRow Class
Contains data cells for a detail row of a report.

ReportDivisionInfo Class
Contains information about the divisions that can be used to filter a report.

ReportExtendedMetadata Class
Contains report extended metadata for a tabular, summary, or matrix report.

ReportFact Class
Contains the fact map for the report, which represents the report’s data values.

ReportFactWithDetails Class
Contains the detailed fact map for the report, which represents the report’s data values.

ReportFactWithSummaries Class
Contains the fact map for the report, which represents the report’s data values, and includes summarized fields.

ReportFilter Class
Contains information about a report filter, including column, operator, and value.

ReportFormat Enum
Contains the possible report format types.

ReportFilterType Enum
The types of values included in a report filter type.

ReportInstance Class
Returns an instance of a report that was run asynchronously. Retrieves the results for that instance.

ReportManager Class
Runs a report synchronously or asynchronously and with or without details.

ReportMetadata Class
Contains report metadata for a tabular, summary, or matrix report.

ReportResults Class
Contains the results of running a report.

ReportScopeInfo Class
Contains information about possible scope values that you can choose. Scope values depend on the report type. For example, you can set the scope for opportunity reports to All opportunities, My team’s opportunities, or My opportunities.
ReportScopeValue Class
Contains information about a possible scope value. Scope values depend on the report type. For example, you can set the scope for opportunity reports to All opportunities, My team’s opportunities, or My opportunities.

ReportType Class
Contains the unique API name and display name for the report type.

ReportTypeColumn Class
Contains detailed report type metadata about a field, including data type, display name, and filter values.

ReportTypeColumnCategory Class
Information about categories of fields in a report type.

ReportTypeMetadata Class
Contains report type metadata, which gives you information about the fields that are available in each section of the report type, plus filter information for those fields.

SortColumn Class
Contains information about the sort column used in the report.

StandardDateFilter Class
Contains information about standard date filter available in the report—for example, the API name, start date, and end date of the standard date filter duration as well as the API name of the date field on which the filter is placed.

StandardDateFilterDuration Class
Contains information about each standard date filter—also referred to as a relative date filter. It contains the API name and display label of the standard date filter duration as well as the start and end dates.

StandardDateFilterDurationGroup Class
Contains information about the standard date filter groupings, such as the grouping display label and all standard date filters that fall under the grouping. Groupings include Calendar Year, Calendar Quarter, Calendar Month, Calendar Week, Fiscal Year, Fiscal Quarter, Day, and custom values based on user-defined date ranges.

StandardFilter Class
Contains information about the standard filter defined in the report, such as the filter field API name and filter value.

StandardFilterInfo Class
Is an abstract base class for an object that provides standard filter information.

StandardFilterInfoPicklist Class
Contains information about the standard filter picklist, such as the display name and type of the filter field, the default picklist value, and a list of all possible picklist values.

StandardFilterType Enum
The StandardFilterType enum describes the type of standard filters in a report. The getType() method returns a Reports.StandardFilterType enum value.

SummaryValue Class
Contains summary data for a cell of the report.

ThresholdInformation Class
Contains a list of evaluated conditions for a report notification.

TopRows Class
Contains methods and constructors for working with information about a row limit filter.

Reports Exceptions
The Reports namespace contains exception classes.
AggregateColumn Class

Contains methods for describing summary fields such as Record Count, Sum, Average, Max, Min, and custom summary formulas. Includes name, label, data type, and grouping context.

Namespace

Reports

AggregateColumn Methods

The following are methods for AggregateColumn. All are instance methods.

IN THIS SECTION:

getName()
Returns the unique API name of the summary field.

getLabel()
Returns the localized display name for the summarized or custom summary formula field.

dataType()
Returns the data type of the summarized or custom summary formula field.

getAcrossGroupingContext()
Returns the column grouping in the report where the summary field is displayed.

downGroupingContext()
Returns the row grouping in the report where the summary field is displayed.

tName()
Returns the unique API name of the summary field.

Syntax

public String getName()

Return Value

Type: String

tLabel()
Returns the localized display name for the summarized or custom summary formula field.

Syntax

public String getLabel()
**Return Value**
Type: String

**getDataType()**
Returns the data type of the summarized or custom summary formula field.

**Syntax**
```java
public String getDataType()
```

**getAcrossGroupingContext()**
Returns the column grouping in the report where the summary field is displayed.

**Syntax**
```java
public String getAcrossGroupingContext()
```

**getDownGroupingContext()**
Returns the row grouping in the report where the summary field is displayed.

**Syntax**
```java
public String getDownGroupingContext()
```

**BucketField Class**
Contains methods and constructors to work with information about a bucket field, including bucket type, name, and bucketed values.

**Namespace**
Reports

IN THIS SECTION:
BucketField Constructors
BucketField Methods

BucketField Constructors
The following are constructors for BucketField.

IN THIS SECTION:

BucketField(bucketType, devloperName, label, nullTreatedAsZero, otherBucketLabel, sourceColumnName, values)
Creates an instance of the Reports.BucketField class using the specified parameters.

BucketField()
Creates an instance of the Reports.BucketField class. You can then set values by using the class’s set methods.

**BucketField(bucketType, devloperName, label, nullTreatedAsZero, otherBucketLabel, sourceColumnName, values)**
Creates an instance of the Reports.BucketField class using the specified parameters.

**Signature**

```
public BucketField(Reports.BucketType bucketType, String devloperName, String label,
                   Boolean nullTreatedAsZero, String otherBucketLabel, String sourceColumnName,
                   List<Reports.BucketFieldValue> values)
```

**Parameters**

- **bucketType**
  Type: `Reports.BucketType`
  The type of bucket.

- **devloperName**
  Type: `String`
  API name of the bucket.

- **label**
  Type: `String`
  User-facing name of the bucket.

- **nullTreatedAsZero**
  Type: `Boolean`
  Specifies whether null values are converted to zero (`true`) or not (`false`).

- **otherBucketLabel**
  Type: `String`
  Name of the fields grouped as Other (in buckets of BucketType PICKLIST).

- **sourceColumnName**
  Type: `String`
  Name of the bucketed field.
values
Type: List<Reports.BucketType>
Types of the values included in the bucket.

BucketField()
Creates an instance of the Reports.BucketField class. You can then set values by using the class’s set methods.

Signature
public BucketField()

BucketField Methods
The following are methods for BucketField.

IN THIS SECTION:
getBucketType()
Returns the bucket type.
getDevloperName()
Returns the bucket’s API name.
setLabel()
Returns the user-facing name of the bucket.
getNullTreatedAsZero()
Returns true if null values are converted to the number zero, otherwise returns false.
getOtherBucketLabel()
Returns the name of fields grouped as Other in buckets of type PICKLIST.
getSourceColumnName()
Returns the API name of the bucketed field.
getValues()
Returns the report values grouped by the bucket field.
setBucketType(value)
Sets the BucketType of the bucket.
setBucketType(bucketType)
Sets the BucketType of the bucket.
setDevloperName(devloperName)
Sets the API name of the bucket.
setLabel(label)
Sets the user-facing name of the bucket.
setNullTreatedAsZero(nullTreatedAsZero)
Specifies whether null values in the bucket are converted to zero (true) or not (false).
setOtherBucketLabel(otherBucketLabel)
Sets the name of the fields grouped as Other (in buckets of BucketType PICKLIST).

setSourceColumnName(sourceColumnName)
Specifies the name of the bucketed field.

setValues(values)
Specifies which type of values are included in the bucket.

toString()
Returns a string.

getBucketType()
Returns the bucket type.

Signature
public Reports.BucketType getBucketType()

Return Value
Type: Reports.BucketType

getDevloperName()
Returns the bucket’s API name.

Signature
public String getDevloperName()

Return Value
Type: String

getLabel()
Returns the user-facing name of the bucket.

Signature
public String getLabel()

Return Value
Type: String

getNullTreatedAsZero()
Returns true if null values are converted to the number zero, otherwise returns false.
getNullTreatedAsZero()  
Returns whether null values are treated as zero.

Signature  
```java
public Boolean getNullTreatedAsZero()
```

getOtherBucketLabel()  
Returns the name of fields grouped as `Other` in buckets of type `PICKLIST`.

Signature  
```java
public String getOtherBucketLabel()
```

getSourceColumnName()  
Returns the API name of the bucketed field.

Signature  
```java
public String getSourceColumnName()
```

getValues()  
Returns the report values grouped by the bucket field.

Signature  
```java
public List<Reports.BucketFieldValue> getValues()
```

setBucketType(value)  
Sets the `BucketType` of the bucket.

Signature  
```java
public void setBucketType(String value)
```
Parameters

value
  Type: String
  See the Reports.BucketType enum for valid values.

Return Value

Type: void

setBucketType (bucketType)
Sets the BucketType of the bucket.

Signature

public void setBucketType(Reports.BucketType bucketType)

Parameters

bucketType
  Type: Reports.BucketType

Return Value

Type: void

setDevloperName (devloperName)
Sets the API name of the bucket.

Signature

public void setDevloperName(String devloperName)

Parameters

devloperName
  Type: String
  The API name to assign to the bucket.

Return Value

Type: void

setLabel (label)
Sets the user-facing name of the bucket.
Signature
public void setLabel(String label)

Parameters
label
Type: String

Return Value
Type: void

`setNullTreatedAsZero(nullTreatedAsZero)`
Specifies whether null values in the bucket are converted to zero (true) or not (false).

Signature
public void setNullTreatedAsZero(Boolean nullTreatedAsZero)

Parameters
nullTreatedAsZero
Type: Boolean

Return Value
Type: void

`setOtherBucketLabel(otherBucketLabel)`
Sets the name of the fields grouped as Other (in buckets of BucketType PICKLIST).

Signature
public void setOtherBucketLabel(String otherBucketLabel)

Parameters
otherBucketLabel
Type: String

Return Value
Type: void

`setSourceColumnName(sourceColumnName)`
Specifies the name of the bucketed field.
Signature

```java
public void setSourceColumnName(String sourceColumnName)
```

Parameters

`sourceColumnName`
Type: String

Return Value

Type: void

### setValues(values)

Specifies which type of values are included in the bucket.

Signature

```java
public void setValues(List<Reports.BucketFieldValue> values)
```

Parameters

`values`
Type: List on page 3177<Reports.BucketFieldValue>

Return Value

Type: void

### toString()

Returns a string.

Signature

```java
public String toString()
```

Return Value

Type: String

**BucketFieldValue Class**

Contains information about the report values included in a bucket.

**Namespace**

Reports
IN THIS SECTION:

BucketFieldValue Constructors

BucketFieldValue Methods

BucketFieldValue Constructors

The following are constructors for BucketFieldValue.

IN THIS SECTION:

BucketFieldValue(label, sourceDimensionValues, rangeUpperBound)
Creates an instance of the Reports.BucketFieldValue class using the specified parameters.

BucketFieldValue()
Creates an instance of the Reports.BucketFieldValue class. You can then set values by using the class’s set methods.

**BucketFieldValue(label, sourceDimensionValues, rangeUpperBound)**

Creates an instance of the Reports.BucketFieldValue class using the specified parameters.

**Signature**

```java
public BucketFieldValue(String label, List<String> sourceDimensionValues, Double rangeUpperBound)
```

**Parameters**

**label**
Type: **String**
The user-facing name of the bucket.

**sourceDimensionValues**
Type: **List on page 3177<String>**
A list of the values from the source field included in this bucket category (in buckets of type PICKLIST and buckets of type TEXT).

**rangeUpperBound**
Type: **Double**
The greatest range limit under which values are included in this bucket category (in buckets of type NUMBER).

**BucketFieldValue()**

Creates an instance of the Reports.BucketFieldValue class. You can then set values by using the class’s set methods.

**Signature**

```java
public BucketFieldValue()
```

**BucketFieldValue Methods**

The following are methods for BucketFieldValue.
IN THIS SECTION:

getLabel()
Returns the user-facing name of the bucket category.

getRangeUpperBound()
Returns the greatest range limit under which values are included in this bucket category (in buckets of type NUMBER).

getSourceDimensionValues()
Returns a list of the values from the source field included in this bucket category (in buckets of type PICKLIST and buckets of type TEXT).

setLabel(label)
Set the user-facing name of the bucket category.

setRangeUpperBound(rangeUpperBound)
Sets the greatest limit of a range under which values are included in this bucket category (in buckets of type NUMBER).

setSourceDimensionValues(sourceDimensionValues)
Specifies the values from the source field included in this bucket category (in buckets of type PICKLIST and buckets of type TEXT).

toString()
Returns a string.

getLabel()
Returns the user-facing name of the bucket category.

Signature

public String getLabel()

Return Value

Type: String

getRangeUpperBound()
Returns the greatest range limit under which values are included in this bucket category (in buckets of type NUMBER).

Signature

public Double getRangeUpperBound()

Return Value

Type: Double

getSourceDimensionValues()
Returns a list of the values from the source field included in this bucket category (in buckets of type PICKLIST and buckets of type TEXT).
**Signature**

```java
public List<String> getSourceDimensionValues()
```

**Return Value**

Type: `List<String>`

**setLabel(label)**

Set the user-facing name of the bucket category.

**Signature**

```java
public void setLabel(String label)
```

**Parameters**

- `label`
  Type: `String`

**Return Value**

Type: `void`

**setRangeUpperBound(rangeUpperBound)**

Sets the greatest limit of a range under which values are included in this bucket category (in buckets of type `NUMBER`).

**Signature**

```java
public void setRangeUpperBound(Double rangeUpperBound)
```

**Parameters**

- `rangeUpperBound`
  Type: `Double`

**Return Value**

Type: `void`

**setSourceDimensionValues(sourceDimensionValues)**

Specifies the values from the source field included in this bucket category (in buckets of type `PICKLIST` and buckets of type `TEXT`).

**Signature**

```java
public void setSourceDimensionValues(List<String> sourceDimensionValues)
```
Parameters

sourceDimensionValues
Type: List<String>

Return Value
Type: void

toString()
Returns a string.

Signature
public String toString()

Return Value
Type: String

BucketType Enum
The types of values included in a bucket.

Enum Values
The following are the values of the Reports.BucketType enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER</td>
<td>Numeric values</td>
</tr>
<tr>
<td>PICKLIST</td>
<td>Picklist values</td>
</tr>
<tr>
<td>TEXT</td>
<td>String values</td>
</tr>
</tbody>
</table>

ColumnDataType Enum
The Reports.ColumnDataType enum describes the type of data in a column. It is returned by the getDataType method.

Namespace
Reports

Enum Values
The following are the values of the Reports.ColumnDataType enum.
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOLEAN_DATA</td>
<td>Boolean (true or false) values</td>
</tr>
<tr>
<td>COMBOBOX_DATA</td>
<td>Comboboxes, which provide a set of enumerated values and enable the user to specify a value that is not in the list</td>
</tr>
<tr>
<td>CURRENCY_DATA</td>
<td>Currency values</td>
</tr>
<tr>
<td>DATETIME_DATA</td>
<td>DateTime values</td>
</tr>
<tr>
<td>DATE_DATA</td>
<td>Date values</td>
</tr>
<tr>
<td>DOUBLE_DATA</td>
<td>Double values</td>
</tr>
<tr>
<td>EMAIL_DATA</td>
<td>Email addresses</td>
</tr>
<tr>
<td>ID_DATA</td>
<td>An object’s Salesforce ID</td>
</tr>
<tr>
<td>INT_DATA</td>
<td>Integer values</td>
</tr>
<tr>
<td>MULTIPICKLIST_DATA</td>
<td>Multi-select picklists, which provide a set of enumerated values from which multiple values can be selected</td>
</tr>
<tr>
<td>PERCENT_DATA</td>
<td>Percent values</td>
</tr>
<tr>
<td>PHONE_DATA</td>
<td>Phone numbers. Values can include alphabetic characters. Client applications are responsible for phone number formatting.</td>
</tr>
<tr>
<td>PICKLIST_DATA</td>
<td>Single-select picklists, which provide a set of enumerated values from which only one value can be selected</td>
</tr>
<tr>
<td>REFERENCE_DATA</td>
<td>Cross-references to another object, analogous to a foreign key field</td>
</tr>
<tr>
<td>STRING_DATA</td>
<td>String values</td>
</tr>
<tr>
<td>TEXTAREA_DATA</td>
<td>String values that are displayed as multiline text fields</td>
</tr>
<tr>
<td>TIME_DATA</td>
<td>Time values</td>
</tr>
<tr>
<td>URL_DATA</td>
<td>URL values that are displayed as hyperlinks</td>
</tr>
</tbody>
</table>

**ColumnSortOrder Enum**

The `Reports.ColumnSortOrder` enum describes the order that the grouping column uses to sort data.

**Namespace**

`Reports`

**Usage**

The `GroupingInfo.getColumnSortOrder()` method returns a `Reports.ColumnSortOrder` enum value. The `GroupingInfo.setColumnSortOrder()` method takes the enum value as an argument.
Enum Values

The following are the values of the `Reports.ColumnSortOrder` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASCENDING</td>
<td>Sort data in ascending order (A–Z)</td>
</tr>
<tr>
<td>DESCENDING</td>
<td>Sort data in descending order (Z–A)</td>
</tr>
</tbody>
</table>

CrossFilter Class

Contains methods and constructors used to work with information about a cross filter.

Namespace

`Reports`

IN THIS SECTION:
- CrossFilter Constructors
- CrossFilter Methods

CrossFilter Constructors

The following are constructors for `CrossFilter`.

IN THIS SECTION:
- `CrossFilter(criteria, includesObject, primaryEntityField, relatedEntity, relatedEntityJoinField)`
  Creates an instance of the `Reports.CrossFilter` class using the specified parameters.
- `CrossFilter()`
  Creates an instance of the `Reports.CrossFilter` class. You can then set values by using the class's set methods.

**CrossFilter(criteria, includesObject, primaryEntityField, relatedEntity, relatedEntityJoinField)**

Creates an instance of the `Reports.CrossFilter` class using the specified parameters.

**Signature**

```java
public CrossFilter(List<Reports.ReportFilter> criteria, Boolean includesObject, String primaryEntityField, String relatedEntity, String relatedEntityJoinField)
```

**Parameters**

- `criteria`
  Type: `List<Reports.ReportFilter>`
Information about how to filter the `relatedEntity`. Relates the primary entity with a subset of the `relatedEntity`.

`includesObject`
Type: `Boolean`
Specifies whether objects returned have a relationship with the `relatedEntity` (`true`) or not (`false`).

`primaryEntityField`
Type: `String`
The name of the object on which the cross filter is evaluated.

`relatedEntity`
Type: `String`
The name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

`relatedEntityJoinField`
Type: `String`
The name of the field used to join the `primaryEntityField` and `relatedEntity`.

**CrossFilter()**
Creates an instance of the `Reports.CrossFilter` class. You can then set values by using the class’s set methods.

**Signature**
```java
public CrossFilter()
```

**CrossFilter Methods**
The following are methods for `CrossFilter`.

**IN THIS SECTION:**
- `getCriteria()`
  Returns information about how to filter the `relatedEntity`. Describes the subset of the `relatedEntity` which the primary entity is evaluated against.
- `getIncludesObject()`
  Returns `true` if primary object has a relationship with the `relatedEntity`, otherwise returns `false`.
- `getPrimaryEntityField()`
  Returns the name of the object on which the cross filter is evaluated.
- `getRelatedEntity()`
  Returns name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.
- `getRelatedEntityJoinField()`
  Returns the name of the field used to join the `primaryEntityField` and `relatedEntity`.
- `setCriteria(criteria)`
  Specifies how to filter the `relatedEntity`. Relates the primary entity with a subset of the `relatedEntity`.
- `setIncludesObject(includesObject)`
  Specifies whether objects returned have a relationship with the `relatedEntity` (`true`) or not (`false`).
setPrimaryEntityField(primaryEntityField)
Specifies the name of the object on which the cross filter is evaluated.

setRelatedEntity(relatedEntity)
Specifies the name of the object that the primaryEntityField is evaluated against—the right-hand side of the cross filter.

setRelatedEntityJoinField(relatedEntityJoinField)
Specifies the name of the field used to join the primaryEntityField and relatedEntity.

toString()
Returns a string.

getCriteria() 
Returns information about how to filter the relatedEntity. Describes the subset of the relatedEntity which the primary entity is evaluated against.

Signature
public List<Reports.ReportFilter> getCriteria()

Return Value
Type: List<Reports.ReportFilter>

getIncludesObject() 
Returns true if primary object has a relationship with the relatedEntity, otherwise returns false.

Signature
public Boolean getIncludesObject()

Return Value
Type: Boolean

getPrimaryEntityField() 
Returns the name of the object on which the cross filter is evaluated.

Signature
public String getPrimaryEntityField()

Return Value
Type: String

getRelatedEntity() 
Returns name of the object that the primaryEntityField is evaluated against—the right-hand side of the cross filter.
Signature

public String getRelatedEntity()

Return Value

Type: String

getRelatedEntityJoinField()

Returns the name of the field used to join the primaryEntityField and relatedEntity.

Signature

public String getRelatedEntityJoinField()

Return Value

Type: String

setCriteria(criteria)

Specifies how to filter the relatedEntity. Relates the primary entity with a subset of the relatedEntity.

Signature

public void setCriteria(List<Reports.ReportFilter> criteria)

Parameters

criteria
Type: List<Reports.ReportFilter>

Return Value

Type: void

setIncludesObject(includesObject)

Specifies whether objects returned have a relationship with the relatedEntity (true) or not (false).

Signature

public void setIncludesObject(Boolean includesObject)

Parameters

includesObject
Type: Boolean
Return Value
Type: void

`setPrimaryEntityField(String primaryEntityField)`
Specifies the name of the object on which the cross filter is evaluated.

Signature
`public void setPrimaryEntityField(String primaryEntityField)`

Parameters
`primaryEntityField`
Type: `String`

Return Value
Type: void

`setRelatedEntity(String relatedEntity)`
Specifies the name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

Signature
`public void setRelatedEntity(String relatedEntity)`

Parameters
`relatedEntity`
Type: `String`

Return Value
Type: void

`setRelatedEntityJoinField(String relatedEntityJoinField)`
Specifies the name of the field used to join the `primaryEntityField` and `relatedEntity`.

Signature
`public void setRelatedEntityJoinField(String relatedEntityJoinField)`

Parameters
`relatedEntityJoinField`
Type: `String`
Return Value
Type: void

**toString()**
Returns a string.

**Signature**
public String toString()

Return Value
Type: String

**CsfGroupType Enum**
The group level at which the custom summary format aggregate is displayed in a report.

**Enum Values**
The following are the values of the Reports.CsfGroupType enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL</td>
<td>The aggregate is displayed at the end of every summary row.</td>
</tr>
<tr>
<td>CUSTOM</td>
<td>The aggregate is displayed at specified grouping levels.</td>
</tr>
<tr>
<td>GRAND_TOTAL</td>
<td>The aggregate is displayed only at the grand total level.</td>
</tr>
</tbody>
</table>

**DateGranularity Enum**
The Reports.DateGranularity enum describes the date interval that is used for grouping.

**Namespace**
Reports

**Usage**
The GroupingInfo.getDateGranularity method returns a Reports.DateGranularity enum value. The GroupingInfo.setDateGranularity method takes the enum value as an argument.

**Enum Values**
The following are the values of the Reports.DateGranularity enum.
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DAY</td>
<td>The day of the week (Monday–Sunday)</td>
</tr>
<tr>
<td>DAY_IN_MONTH</td>
<td>The day of the month (1–31)</td>
</tr>
<tr>
<td>FISCAL_PERIOD</td>
<td>The fiscal period</td>
</tr>
<tr>
<td>FISCAL_QUARTER</td>
<td>The fiscal quarter</td>
</tr>
<tr>
<td>FISCAL_WEEK</td>
<td>The fiscal week</td>
</tr>
<tr>
<td>FISCAL_YEAR</td>
<td>The fiscal year</td>
</tr>
<tr>
<td>MONTH</td>
<td>The month (January–December)</td>
</tr>
<tr>
<td>MONTH_IN_YEAR</td>
<td>The month number (1–12)</td>
</tr>
<tr>
<td>NONE</td>
<td>No date grouping</td>
</tr>
<tr>
<td>QUARTER</td>
<td>The quarter number (1–4)</td>
</tr>
<tr>
<td>WEEK</td>
<td>The week number (1–52)</td>
</tr>
<tr>
<td>YEAR</td>
<td>The year number (###)</td>
</tr>
</tbody>
</table>

**DetailColumn Class**

Contains methods for describing fields that contain detailed data. Detailed data fields are also listed in the report metadata.

**Namespace**

*Reports*

**DetailColumn Instance Methods**

The following are instance methods for `DetailColumn`. All are instance methods.

**IN THIS SECTION:**

- `getName()`
  - Returns the unique API name of the detail column field.

- `getLabel()`
  - Returns the localized display name of a standard field, the ID of a custom field, or the API name of a bucket field that has detailed data.

- `getDataType()`
  - Returns the data type of a detail column field.

**getName()**

Returns the unique API name of the detail column field.
**Dimension Class**
Contains information for each row or column grouping.

**Namespace**
Reports

**Dimension Methods**
The following are methods for Dimension. All are instance methods.

IN THIS SECTION:
  - `getGroupings()`
    Returns information for each row or column grouping as a list.
getGroupings()
Returns information for each row or column grouping as a list.

Syntax
public List<Reports.GroupingValue> getGroupings()

Return Value
Type: List<Reports.GroupingValue>

EvaluatedCondition Class
Contains the individual components of an evaluated condition for a report notification, such as the aggregate name and label, the operator, and the value that the aggregate is compared to.

Namespace
Reports

IN THIS SECTION:
EvaluatedCondition Constructors
EvaluatedCondition Methods

EvaluatedCondition Constructors
The following are constructors for EvaluatedCondition.

IN THIS SECTION:
EvaluatedCondition(aggregateName, aggregateLabel, compareToValue, aggregateValue, displayCompareTo, displayValue, operator)
Creates a new instance of the Reports.EvaluatedConditions class using the specified parameters.

EvaluatedCondition(aggregateName, aggregateLabel, compareToValue, aggregateValue, displayCompareTo, displayValue, operator)
Creates a new instance of the Reports.EvaluatedConditions class using the specified parameters.

Signature
public EvaluatedCondition(String aggregateName, String aggregateLabel, Double compareToValue, Double aggregateValue, String displayCompareTo, String displayValue, Reports.EvaluatedConditionOperator operator)
Parameters

aggregateName
Type: String
The unique API name of the aggregate.

aggregateLabel
Type: String
The localized display name of the aggregate.

compareToValue
Type: Double
The value that the aggregate is compared to in the condition.

aggregateValue
Type: Double
The actual value of the aggregate when the report is run.

displayCompareTo
Type: String
The value that the aggregate is compared to in the condition, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

displayValue
Type: String
The value of the aggregate when the report is run, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

operator
Type: Reports.EvaluatedConditionOperator
The operator used in the condition.

EvaluatedCondition Methods

The following are methods for EvaluatedCondition.

IN THIS SECTION:

getAggregateLabel() Returns the localized display name of the aggregate.

getAggregateName() Returns the unique API name of the aggregate.

getCompareTo() Returns the value that the aggregate is compared to in the condition.

getDisplayCompareTo() Returns the value that the aggregate is compared to in the condition, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

getAddressValue() Returns the value of the aggregate when the report is run, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.
getOperator()
Returns the operator used in the condition.

getValue()
Returns the actual value of the aggregate when the report is run.

getagregateLabel()  
Returns the localized display name of the aggregate.

Signature
public String getAggregateLabel()

Return Value
Type: String

getagregateName()  
Returns the unique API name of the aggregate.

Signature
public String getAggregateName()

Return Value
Type: String

getCompareTo()  
Returns the value that the aggregate is compared to in the condition.

Signature
public Double getCompareTo()

Return Value
Type: Double

getDisplayCompareTo()  
Returns the value that the aggregate is compared to in the condition, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

Signature
public String getDisplayCompareTo()
Return Value
Type: String

gDisplayValue()
Returns the value of the aggregate when the report is run, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

Signature
public String getDisplayValue()

Return Value
Type: String

gOperator()
Returns the operator used in the condition.

Signature
public Reports.EvaluatedConditionOperator getOperator()

Return Value
Type: Reports.EvaluatedConditionOperator

gValue()
Returns the actual value of the aggregate when the report is run.

Signature
public Double getValue()

Return Value
Type: Double

EvaluatedConditionOperator Enum
The Reports.EvaluatedConditionOperator enum describes the type of operator used to compare an aggregate to a value. It is returned by the getOperator method.

Namespace
Reports
**Enum Values**

The following are the values of the `Reports.EvaluatedConditionOperator` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EQUAL</td>
<td>Equality operator.</td>
</tr>
<tr>
<td>GREATER_THAN</td>
<td>Greater than operator.</td>
</tr>
<tr>
<td>GREATER_THAN_EQUAL</td>
<td>Greater than or equal to operator.</td>
</tr>
<tr>
<td>LESS_THAN</td>
<td>Less than operator.</td>
</tr>
<tr>
<td>LESS_THAN_EQUAL</td>
<td>Less than or equal to operator.</td>
</tr>
<tr>
<td>NOT_EQUAL</td>
<td>Inequality operator.</td>
</tr>
</tbody>
</table>

**FilterOperator Class**

Contains information about a filter operator, such as display name and API name.

**Namespace**

`Reports`

**FilterOperator Methods**

The following are methods for `FilterOperator`. All are instance methods.

**IN THIS SECTION:**

- `getLabel()`
  Returns the localized display name of the filter operator. Possible values for this name are restricted based on the data type of the column being filtered.

- `getName()`
  Returns the unique API name of the filter operator. Possible values for this name are restricted based on the data type of the column being filtered. For example `multipicklist` fields can use the following filter operators: “equals,” “not equal to,” “includes,” and “excludes.” Bucket fields are considered to be of the `String` type.

**getLabel()**

Returns the localized display name of the filter operator. Possible values for this name are restricted based on the data type of the column being filtered.

**Syntax**

```java
public String getLabel()
```
Return Value
Type: String

getName()
Returns the unique API name of the filter operator. Possible values for this name are restricted based on the data type of the column being filtered. For example multipicklist fields can use the following filter operators: "equals," "not equal to," "includes," and "excludes." Bucket fields are considered to be of the String type.

Syntax
public String getName()
Return Value
Type: String

**getName()**
Returns the unique API name of the filter value. Possible values for this name are restricted based on the data type of the column being filtered.

**Syntax**

```java
public String getName()
```

Return Value
Type: String

**FormulaType Enum**
The format of the numbers in a custom summary formula.

**Enum Values**
The following are the values of the `Reports.FormulaType` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CURRENCY</td>
<td>Formatted as currency. For example, $100.00.</td>
</tr>
<tr>
<td>NUMBER</td>
<td>Formatted as numbers. For example, 100.</td>
</tr>
<tr>
<td>PERCENT</td>
<td>Formatted as percentages. For example, 100%.</td>
</tr>
</tbody>
</table>

**GroupingColumn Class**
Contains methods for describing fields that are used for column grouping.

**Namespace**
`Reports`

The `GroupingColumn` class provides basic information about column grouping fields. The `GroupingInfo` class includes additional methods for describing and updating grouping fields.

**GroupingColumn Methods**
The following are methods for `GroupingColumn`. All are instance methods.
IN THIS SECTION:

- **getName()**
  Returns the unique API name of the field or bucket field that is used for column grouping.

- **getLabel()**
  Returns the localized display name of the field that is used for column grouping.

- **getDataType()**
  Returns the data type of the field that is used for column grouping.

- **getGroupingLevel()**
  Returns the level of grouping for the column.

**getName()**

Returns the unique API name of the field or bucket field that is used for column grouping.

**Syntax**

```java
public String getName()
```

**Return Value**

Type: String

**getLabel()**

Returns the localized display name of the field that is used for column grouping.

**Syntax**

```java
public String getLabel()
```

**Return Value**

Type: String

**getDataType()**

Returns the data type of the field that is used for column grouping.

**Syntax**

```java
public Reports.ColumnDataType getDataType()
```

**Return Value**

Type: Reports.ColumnDataType

**getGroupingLevel()**

Returns the level of grouping for the column.
Syntax

public Integer getGroupingLevel()

Return Value

Type: Integer

Usage

• In a summary report, 0, 1, or 2 indicates grouping at the first, second, or third row level.
• In a matrix report, 0 or 1 indicates grouping at the first or second row or column level.

GroupingInfo Class

Contains methods for describing fields that are used for grouping.

Namespace

Reports

GroupingInfo Methods

The following are methods for GroupingInfo. All are instance methods.

IN THIS SECTION:

getName()
Returns the unique API name of the field or bucket field that is used for row or column grouping.

getSortOrder()
Returns the order that is used to sort data in a row or column grouping (ASCENDING or DESCENDING).

dateGranularity()
Returns the date interval that is used for row or column grouping.

getSortAggregate()
Returns the summary field that is used to sort data within a grouping in a summary report. The value is null when data within a grouping is not sorted by a summary field.

getName()()
Returns the unique API name of the field or bucket field that is used for row or column grouping.

Syntax

public String getName()
**getSortOrder()**
Returns the order that is used to sort data in a row or column grouping (ASCENDING or DESCENDING).

**Syntax**
```java
public Reports.ColumnSortOrder getSortOrder()
```

**Return Value**
Type: Reports.ColumnSortOrder

**getDateGranularity()**
Returns the date interval that is used for row or column grouping.

**Syntax**
```java
public Reports.DateGranularity getDateGranularity()
```

**Return Value**
Type: Reports.DateGranularity

**getSortAggregate()**
Returns the summary field that is used to sort data within a grouping in a summary report. The value is null when data within a grouping is not sorted by a summary field.

**Syntax**
```java
public String getSortAggregate()
```

**Return Value**
Type: String

**GroupingValue Class**
Contains grouping values for a row or column, including the key, label, and value.

**Namespace**
Reports

**GroupingValue Methods**
The following are methods for GroupingValue. All are instance methods.
IN THIS SECTION:

**getGroupings()**
Returns a list of second- or third-level row or column groupings. If there are none, the value is an empty array.

**getKey()**
Returns the unique identifier for a row or column grouping. The identifier is used by the fact map to specify data values within each grouping.

**getLabel()**
Returns the localized display name of a row or column grouping. For date and time fields, the label is the localized date or time.

**getValue()**
Returns the value of the field that is used as a row or column grouping.

---

**getGroupings()**
Returns a list of second- or third-level row or column groupings. If there are none, the value is an empty array.

**Syntax**

```java
public LIST<Reports.GroupingValue> getGroupings()
```

**Return Value**

Type: `List<Reports.GroupingValue>`

---

**getKey()**
Returns the unique identifier for a row or column grouping. The identifier is used by the fact map to specify data values within each grouping.

**Syntax**

```java
public String getKey()
```

**Return Value**

Type: `String`

---

**getLabel()**
Returns the localized display name of a row or column grouping. For date and time fields, the label is the localized date or time.

**Syntax**

```java
public String getLabel()
```

**Return Value**

Type: `String`
**getValue()**

Returns the value of the field that is used as a row or column grouping.

**Syntax**

```java
public Object getValue()
```

**Return Value**

Type: Object

**Usage**

The value depends on the field’s data type.

- **Currency fields:**
  - `amount`: Of type currency. A data cell’s value.
  - `currency`: Of type picklist. The ISO 4217 currency code, if available; for example, USD for US dollars or CNY for Chinese yuan. (If the grouping is on the converted currency, this value is the currency code for the report and not for the record.)

- **Picklist fields:** API name. For example, a custom picklist field—Type of Business with values 1, 2, and 3 for Consulting, Services, and Add-On Business respectively—has 1, 2, or 3 as the grouping value.

- **ID fields:** API name.

- **Record type fields:** API name.

- **Date and time fields:** Date or time in ISO-8601 format.

- **Lookup fields:** Unique API name. For example, for the Opportunity Owner lookup field, the ID of each opportunity owner’s Chatter profile page can be a grouping value.

---

**NotificationAction Interface**

Implement this interface to trigger a custom Apex class when the conditions for a report notification are met.

**Namespace**

Reports

**Usage**

Report notifications for reports that users have subscribed to can trigger a custom Apex class, which must implement the Reports.NotificationAction interface. The execute method in this interface receives a NotificationActionContext object as a parameter, which contains information about the report instance and the conditions that must be met for a notification to be triggered.

IN THIS SECTION:

- NotificationAction Methods
- NotificationAction Example Implementation
NotificationAction Methods

The following are methods for NotificationAction.

IN THIS SECTION:

execute(context)

Executes the custom Apex action specified in the context parameter of the context object, NotificationActionContext. The object contains information about the report instance and the conditions that must be met for a notification to be triggered. The method executes whenever the specified conditions are met.

**execute (context)**

Executes the custom Apex action specified in the context parameter of the context object, NotificationActionContext. The object contains information about the report instance and the conditions that must be met for a notification to be triggered. The method executes whenever the specified conditions are met.

**Signature**

```java
public void execute(Reports.NotificationActionContext context)
```

**Parameters**

`context`

Type: Reports.NotificationActionContext

**Return Value**

Type: Void

NotificationAction Example Implementation

This is an example implementation of the Reports.NotificationAction interface.

```java
public class AlertOwners implements Reports.NotificationAction {

    public void execute(Reports.NotificationActionContext context) {
        Reports.ReportResults results = context.getReportInstance().getReportResults();
        for (Reports.GroupingValue g: results.getGroupingsDown().getGroupings()) {
            FeedItem t = new FeedItem();
            t.ParentId = (Id)g.getValue();
            t.Body = 'This record needs attention. Please view the report.';
            t.Title = 'Needs Attention: ' + results.getReportMetadata().getName();
            t.LinkUrl = '/' + results.getReportMetadata().getId();
            insert t;
        }
    }
}
```
NotificationActionContext Class

Contains information about the report instance and condition threshold for a report notification.

Namespace

Reports

IN THIS SECTION:
- NotificationActionContext Constructors
- NotificationActionContext Methods

NotificationActionContext Constructors

The following are constructors for NotificationActionContext.

IN THIS SECTION:
- NotificationActionContext(reportInstance, thresholdInformation)
  Creates a new instance of the Reports.NotificationActionContext class using the specified parameters.

**NotificationActionContext**(*reportInstance*, *thresholdInformation*)

Creates a new instance of the Reports.NotificationActionContext class using the specified parameters.

Signature

```java
public NotificationActionContext(Reports.ReportInstance reportInstance,
                                 Reports.ThresholdInformation thresholdInformation)
```

Parameters

- **reportInstance**
  - Type: Reports.ReportInstance
  - An instance of a report.
- **thresholdInformation**
  - Type: Reports.ThresholdInformation
  - The evaluated conditions for the notification.

NotificationActionContext Methods

The following are methods for NotificationActionContext.

IN THIS SECTION:
- **getReportInstance()**
  - Returns the report instance associated with the notification.
getThresholdInformation()
Returns the threshold information associated with the notification.

getReportInstance()
Returns the report instance associated with the notification.

Signature

public Reports.ReportInstance getReportInstance()

Return Value
Type: Reports.ReportInstance

getThresholdInformation()
Returns the threshold information associated with the notification.

Signature

public Reports.ThresholdInformation getThresholdInformation()

Return Value
Type: Reports.ThresholdInformation

ReportCsf Class
Contains methods and constructors for working with information about a custom summary formula (CSF).

Namespace
Reports

IN THIS SECTION:
ReportCsf Constructors
ReportCsf Methods

ReportCsf Constructors
The following are constructors for ReportCsf.

IN THIS SECTION:
ReportCsf(label, description, formulaType, decimalPlaces, downGroup, downGroupType, acrossGroup, acrossGroupType, formula)
Creates an instance of the Reports.ReportCsf class using the specified parameters.
ReportCsf()
Creates an instance of the Reports.ReportCsf class. You can then set values by using the class's set methods.

ReportCsf(label, description, formulaType, decimalPlaces, downGroup, downGroupType, acrossGroup, acrossGroupType, formula)
Creates an instance of the Reports.ReportCsf class using the specified parameters.

Signature
public ReportCsf(String label, String description, Reports.FormulaType formulaType, Integer decimalPlaces, String downGroup, Reports.CsfGroupType downGroupType, String acrossGroup, Reports.CsfGroupType acrossGroupType, String formula)

Parameters

label
Type: String
The user-facing name of the custom summary formula.

description
Type: String
The user-facing description of the custom summary formula.

formulaType
Type: Reports.FormulaType
The format of the numbers in the custom summary formula.

decimalPlaces
Type: Integer
The number of decimal places to include in numbers.

downGroup
Type: String
The name of a row grouping when the downGroupType is CUSTOM; null otherwise.

downGroupType
Type: Reports.CsfGroupType
Where to display the aggregate of the custom summary formula.

acrossGroup
Type: String
The name of a column grouping when the accrossGroupType is CUSTOM; null otherwise.

acrossGroupType
Type: Reports.CsfGroupType
Where to display the aggregate of the custom summary formula.

formula
Type: String
The operations performed on values in the custom summary formula.
**ReportCsf()**

Creates an instance of the `Reports.ReportCsf` class. You can then set values by using the class’s `set` methods.

**Signature**

```java
public ReportCsf()
```

**ReportCsf Methods**

The following are methods for `ReportCsf`.

**IN THIS SECTION:**

- `getAcrossGroup()`: Returns the name of a column grouping when the `acrossGroupType` is `CUSTOM`. Otherwise, returns `null`.  
- `getAcrossGroupType()`: Returns where to display the aggregate.  
- `getDecimalPlaces()`: Returns the number of decimal places that numbers in the custom summary formula have.  
- `getDescription()`: Returns the user-facing description of a custom summary formula.  
- `getDownGroup()`: Returns the name of a row grouping when the `downGroupType` is `CUSTOM`. Otherwise, returns `null`.  
- `getDownGroupType()`: Returns where to display the aggregate of the custom summary formula.  
- `getFormula()`: Returns the operations performed on values in the custom summary formula.  
- `getFormulaType()`: Returns the formula type.  
- `getLabel()`: Returns the user-facing name of the custom summary formula.  
- `setAcrossGroup(acrossGroup)`: Specifies the column for the across grouping.  
- `setAcrossGroupType(value)`: Sets where to display the aggregate.  
- `setAcrossGroupType(acrossGroupType)`: Sets where to display the aggregate.  
- `setDecimalPlaces(decimalPlaces)`: Sets the number of decimal places in numbers.  
- `setDescription(description)`: Sets the user-facing description of the custom summary formula.  
- `setDownGroup(downGroup)`: Sets the name of a row grouping when the `downGroupType` is `CUSTOM`.  

2574
setDownGroupType(value)
Sets where to display the aggregate.

setDownGroupType(downGroupType)
Sets where to display the aggregate.

setFormula(formula)
Sets the operations to perform on values in the custom summary formula.

setFormulaType(value)
Sets the format of the numbers in the custom summary formula.

setFormulaType(formulaType)
Sets the format of numbers used in the custom summary formula.

setLabel(label)
Sets the user-facing name of the custom summary formula.

toString()
Returns a string.

getAcrossGroup()
Returns the name of a column grouping when the acrossGroupType is CUSTOM. Otherwise, returns null.

Signature
public String getAcrossGroup()

Return Value
Type: String

getAcrossGroupType()
Returns where to display the aggregate.

Signature
public Reports.CsfGroupType getAcrossGroupType()

Return Value
Type: Reports.CsfGroupType

getDecimalPlaces()
Returns the number of decimal places that numbers in the custom summary formula have.

Signature
public Integer getDecimalPlaces()
Return Value
Type: Integer

description()
Returns the user-facing description of a custom summary formula.

Signature
public String getDescription()

Return Value
Type: String

downGroup()
Returns the name of a row grouping when the downGroupType is CUSTOM. Otherwise, returns null.

Signature
public String getDownGroup()

Return Value
Type: String

downGroupType()
Returns where to display the aggregate of the custom summary formula.

Signature
public Reports.CsfGroupType getDownGroupType()

Return Value
Type: Reports.CsfGroupType

formula()
Returns the operations performed on values in the custom summary formula.

Signature
public String getFormula()

Return Value
Type: String
getFormulaType ()
Returns the formula type.

Signature
public Reports.FormulaType getFormulaType()  

Return Value
Type: Reports.FormulaType

g.getLabel ()
Returns the user-facing name of the custom summary formula.

Signature
public String getLabel()  

Return Value
Type: String

setAcrossGroup (acrossGroup)
Specifies the column for the across grouping.

Signature
public void setAcrossGroup(String acrossGroup)  

Parameters
acrossGroup
Type: String

Return Value
Type: void

setAcrossGroupType (value)
Sets where to display the aggregate.

Signature
public void setAcrossGroupType(String value)
Parameters

\texttt{value}

Type: String

For possible values, see \texttt{Reports.CsfGroupType}.

Return Value

Type: void

\texttt{setAcrossGroupType(\texttt{acrossGroupType})}

Sets where to display the aggregate.

Signature

\texttt{public void setAcrossGroupType(Reports.CsfGroupType \texttt{acrossGroupType})}

Parameters

\texttt{acrossGroupType}

Type: \texttt{Reports.CsfGroupType}

Return Value

Type: void

\texttt{setDecimalPlaces(\texttt{decimalPlaces})}

Sets the number of decimal places in numbers.

Signature

\texttt{public void setDecimalPlaces(Integer \texttt{decimalPlaces})}

Parameters

\texttt{decimalPlaces}

Type: \texttt{Integer}

Return Value

Type: void

\texttt{setDescription(\texttt{description})}

Sets the user-facing description of the custom summary formula.

Signature

\texttt{public void setDescription(String \texttt{description})}
Parameters
description
Type: String

Return Value
Type: void

setDownGroup (downGroup)
Sets the name of a row grouping when the downGroupType is CUSTOM.

Signature
public void setDownGroup(String downGroup)

Parameters
downGroup
Type: String

Return Value
Type: void

setDownGroupType (value)
Sets where to display the aggregate.

Signature
public void setDownGroupType(String value)

Parameters
value
Type: String
For valid values, see Reports.CsfGroupType.

Return Value
Type: void

setDownGroupType (downGroupType)
Sets where to display the aggregate.

Signature
public void setDownGroupType(Reports.CsfGroupType downGroupType)
Parameters

downGroupType
   Type: Reports.CsfGroupType

Return Value
Type: void

setFormula(formula)
Sets the operations to perform on values in the custom summary formula.

Signature
public void setFormula(String formula)

Parameters

formula
   Type: String

Return Value
Type: void

setFormulaType(value)
Sets the format of the numbers in the custom summary formula.

Signature
public void setFormulaType(String value)

Parameters

value
   Type: String
   For valid values, see Reports.FormulaType.

Return Value
Type: void

setFormulaType(formulaType)
Sets the format of numbers used in the custom summary formula.

Signature
public void setFormulaType(Reports.FormulaType formulaType)
Parameters

\textit{formulaType}

Type: \texttt{Reports.FormulaType}

Return Value

Type: void

\texttt{setLabel(label)}

Sets the user-facing name of the custom summary formula.

Signature

\texttt{public void setLabel(String label)}

Parameters

\textit{label}

Type: \texttt{String}

Return Value

Type: void

\texttt{toString()}

Returns a string.

Signature

\texttt{public String toString()}

Return Value

Type: \texttt{String}

\textbf{ReportCurrency Class}

Contains information about a currency value, including the amount and currency code.

\textbf{Namespace}

\texttt{Reports}

\textbf{ReportCurrency Methods}

The following are methods for \texttt{ReportCurrency}. All are instance methods.
getAmount()  
Returns the amount of the currency value.

getCurrencyCode()  
Returns the report currency code, such as USD, EUR, or GBP, for an organization that has multicurrency enabled. The value is null if the organization does not have multicurrency enabled.

getAmount()  
Returns the amount of the currency value.

Syntax  
public Decimal getAmount()  

Return Value  
Type: Decimal  

getCurrencyCode()  
Returns the report currency code, such as USD, EUR, or GBP, for an organization that has multicurrency enabled. The value is null if the organization does not have multicurrency enabled.

Syntax  
public String getCurrencyCode()  

Return Value  
Type: String  

ReportDataCell Class  
Contains the data for a cell in the report, including the display label and value.

Namespace  
Reports  

ReportDataCell Methods  
The following are methods for ReportDataCell. All are instance methods.

IN THIS SECTION:  
getLabel()  
Returns the localized display name of the value of a specified cell in the report.
getValue()
Returns the value of a specified cell of a detail row of a report.

getLabel()
Returns the localized display name of the value of a specified cell in the report.

Syntax
public String getLabel()

Return Value
Type: String

g getValue ()
Returns the value of a specified cell of a detail row of a report.

Syntax
public Object getValue ()

Return Value
Type: Object

ReportDescribeResult Class
Contains report, report type, and extended metadata for a tabular, summary, or matrix report.

Namespace
Reports

ReportDescribeResult Methods
The following are methods for ReportDescribeResult. All are instance methods.

IN THIS SECTION:
  getReportExtendedMetadata()
  Returns additional information about grouping and summaries.
  getReportMetadata()
  Returns unique identifiers for groupings and summaries.
  getReportTypeMetadata()
  Returns the fields in each section of a report type, plus filtering information for those fields.
getReportExtendedMetadata()
Returns additional information about grouping and summaries.

Syntax
public Reports.ReportExtendedMetadata getReportExtendedMetadata()

Return Value
Type: Reports.ReportExtendedMetadata

getReportMetadata()
Returns unique identifiers for groupings and summaries.

Syntax
public Reports.ReportMetadata getReportMetadata()

Return Value
Type: Reports.ReportMetadata

getReportTypeMetadata()
Returns the fields in each section of a report type, plus filtering information for those fields.

Syntax
public Reports.ReportTypeMetadata getReportTypeMetadata()

Return Value
Type: Reports.ReportTypeMetadata

ReportDetailRow Class
Contains data cells for a detail row of a report.

Namespace
Reports

ReportDetailRow Methods
The following are methods for ReportDetailRow. All are instance methods.
IN THIS SECTION:

**getDataCells()**
Returns a list of data cells for a detail row.

**getDataCells()**
Returns a list of data cells for a detail row.

Syntax

```java
public LIST<Reports.ReportDataCell> getDataCells()
```

Return Value

Type: List<Reports.ReportDataCell>

**ReportDivisionInfo Class**

Contains information about the divisions that can be used to filter a report.

Available only if your organization uses divisions to segment data and you have the “Affected by Divisions” permission. If you do not have the “Affected by Divisions” permission, your reports include records in all divisions.

**Namespace**

Reports

**Usage**

Use to filter records in the report based on a division, like West Coast and East Coast.

**ReportDivisionInfo Methods**

The following are methods for ReportDivisionInfo.

**getDefaultValue()**
Returns the default division for the report.

**Signature**

```java
public String getDefaultValue()
```

**Return Value**

Type: String

**getValues()**
Returns a list of all possible divisions for the report.
**Signature**

```java
public List<Reports.FilterValue> getValues()
```

**Return Value**

Type: `List<Reports.FilterValue>`

---

### ReportExtendedMetadata Class

Contains report extended metadata for a tabular, summary, or matrix report.

---

### Namespace

**Reports**

Report extended metadata provides additional, detailed metadata about summary and grouping fields, including data type and label information.

---

### ReportExtendedMetadata Methods

The following are methods for `ReportExtendedMetadata`. All are instance methods.

**IN THIS SECTION:**

- `getAggregateColumnInfo()`
  - Returns all report summaries such as `Record Count`, `Sum`, `Average`, `Max`, `Min`, and custom summary formulas. Contains values for each summary that is listed in the report metadata.

- `getDetailColumnInfo()`
  - Returns a map of two properties for each field that has detailed data identified by its unique API name. The detailed data fields are also listed in the report metadata.

- `getGroupingColumnInfo()`
  - Returns a map of each row or column grouping to its metadata. Contains values for each grouping that is identified in the `groupingsDown` and `groupingsAcross` lists.

**getAggregateColumnInfo()**

Returns all report summaries such as `Record Count`, `Sum`, `Average`, `Max`, `Min`, and custom summary formulas. Contains values for each summary that is listed in the report metadata.

**Syntax**

```java
public MAP<String,Reports.AggregateColumn> getAggregateColumnInfo()
```

**Return Value**

Type: `Map<String,Reports.AggregateColumn>`

---

2586
getDetailColumnInfo()

Returns a map of two properties for each field that has detailed data identified by its unique API name. The detailed data fields are also listed in the report metadata.

Syntax

public MAP<String,Reports.DetailColumn> getDetailColumnInfo()

Return Value

Type: Map<String,Reports.DetailColumn>

getGroupingColumnInfo()

Returns a map of each row or column grouping to its metadata. Contains values for each grouping that is identified in the groupingsDown and groupingsAcross lists.

Syntax

public MAP<String,Reports.GroupingColumn> getGroupingColumnInfo()

Return Value

Type: Map<String,Reports.GroupingColumn>

ReportFact Class

Contains the fact map for the report, which represents the report's data values.

Namespace

Reports

Usage

ReportFact is the parent class of ReportFactWithDetails and ReportFactWithSummaries. If includeDetails is true when the report is run, the fact map is a ReportFactWithDetails object. If includeDetails is false when the report is run, the fact map is a ReportFactWithSummaries object.

ReportFact Methods

The following are methods for ReportFact. All are instance methods.

IN THIS SECTION:

getaGgregates()

Returns summary-level data for a report, including the record count.
getKey()
Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

def getKey()
Returns summary-level data for a report, including the record count.

def getAggregates()

Syntax
public LIST<Reports.SummaryValue> getAggregates()

Return Value
Type: List<Reports.SummaryValue>

getKey()
Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

Syntax
public String getKey()

Return Value
Type: String

ReportFactWithDetails Class
Contains the detailed fact map for the report, which represents the report’s data values.

Namespace
Reports

Usage
The ReportFactWithDetails class extends the ReportFact class. A ReportFactWithDetails object is returned if includeDetails is set to true when the report is run. To access the detail values, you’ll need to cast the return value of the ReportResults.getFactMap method to a ReportFactWithDetails object.

ReportFactWithDetails Methods
The following are methods for ReportFactWithDetails. All are instance methods.
IN THIS SECTION:

getAggregates()
Returns summary-level data for a report, including the record count.

getKey()
Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

getRows()
Returns a list of detailed report data in the order of the detail columns that are provided by the report metadata.

getAggregates()
Returns summary-level data for a report, including the record count.

Syntax
public LIST<Reports.SummaryValue> getAggregates()

Return Value
Type: List<Reports.SummaryValue>

getKey()
Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

Syntax
public String getKey()

Return Value
Type: String

getRows()
Returns a list of detailed report data in the order of the detail columns that are provided by the report metadata.

Syntax
public LIST<Reports.ReportDetailRow> getRows()

Return Value
Type: List<Reports.ReportDetailRow>

ReportFactWithSummaries Class
Contains the fact map for the report, which represents the report’s data values, and includes summarized fields.
Namespace
Reports

Usage
The ReportFactWithSummaries class extends the ReportFact class. A ReportFactWithSummaries object is returned if includeDetails is set to false when the report is run.

ReportFactWithSummaries Methods
The following are methods for ReportFactWithSummaries. All are instance methods.

IN THIS SECTION:
getAggregates()
Returns summary-level data for a report, including the record count.
getKey()
Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.
toString()
Returns a string.

getAggregates()
Returns summary-level data for a report, including the record count.

Syntax
public LIST<Reports.SummaryValue> getAggregates()

Return Value
Type: List<Reports.SummaryValue>

getKey()

Syntax
public String getKey()

Return Value
Type: String
toString()
Returns a string.

Signature
public String toString()

Return Value
Type: String

ReportFilter Class
Contains information about a report filter, including column, operator, and value.

Namespace
Reports

IN THIS SECTION:
ReportFilter Constructors
ReportFilter Methods

ReportFilter Constructors
The following are constructors for ReportFilter.

IN THIS SECTION:
ReportFilter()
Creates a new instance of the Reports.ReportFilter class. You can then set values by using the “set” methods.
ReportFilter(column, operator, value)
Creates a new instance of the Reports.ReportFilter class by using the specified parameters.
ReportFilter(column, operator, value, filterType)
Creates a new instance of the Reports.ReportFilter class by using the specified parameters.

ReportFilter()
Creates a new instance of the Reports.ReportFilter class. You can then set values by using the “set” methods.

Signature
public ReportFilter()

ReportFilter(column, operator, value)
Creates a new instance of the Reports.ReportFilter class by using the specified parameters.
Signature

public ReportFilter(String column, String operator, String value)

Parameters

column
  Type: String
operator
  Type: String
value
  Type: String

ReportFilter(column, operator, value, filterType)

Creates a new instance of the Reports.ReportFilter class by using the specified parameters.

Syntax

public ReportFilterType(String column, String operator, String value, Reports.ReportFilterType filterType)

Parameters

column
  Type: String
operator
  Type: String
value
  Type: String
filterType
  Type: ReportFilterType Enum on page 2596

ReportFilter Methods

The following are methods for ReportFilter. All are instance methods.

IN THIS SECTION:

getColumn()
  Returns the unique API name for the field that’s being filtered.
getFilterType()
  Returns the type of report filter.
getOperator()
  Returns the unique API name for the condition that is used to filter a field, such as “greater than” or “not equal to.” Filter conditions depend on the data type of the field.
getValue()
Returns the value that the field is being filtered by. For example, the field `Age` can be filtered by a numeric value.

setColumn(column)
Sets the unique API name for the field that's being filtered.

setFilterType()
Sets the type of report filter.

setOperator(operator)
Sets the unique API name for the condition that is used to filter a field, such as "greater than" or "not equal to." Filter conditions depend on the data type of the field.

setValue(value)
Sets the value by which a field can be filtered. For example, the field `Age` can be filtered by a numeric value.

toString(column)
Returns a string representation of the filter.

getColumn()
Returns the unique API name for the field that's being filtered.

**Syntax**
```
public String getColumn()
```

**Return Value**
Type: `String`

getFilterType()
Returns the type of report filter.

**Syntax**
```
public String getFilterType()
```

**Return Value**
Type: `ReportFilterType Enum` on page 2596

getOperator()
Returns the unique API name for the condition that is used to filter a field, such as "greater than" or "not equal to." Filter conditions depend on the data type of the field.

**Syntax**
```
public String getOperator()
```
Return Value
Type: String

**getValue()**
Returns the value that the field is being filtered by. For example, the field *Age* can be filtered by a numeric value.

Syntax
```java
public String getValue()
```

---

**setColumn(column)**
Sets the unique API name for the field that’s being filtered.

Syntax
```java
public Void setColumn(String column)
```

Parameters
- **column**
  Type: String

Return Value
Type: Void

---

**setFilterType()**
Sets the type of report filter.

Syntax
```java
public Void setFilterType(String column)
```

Parameters
- **column**
  Type: String

Return Value
Type: Void
**setOperator**(operator)
Sets the unique API name for the condition that is used to filter a field, such as "greater than" or "not equal to." Filter conditions depend on the data type of the field.

**Syntax**
```
public Void setOperator(String operator)
```

**Parameters**
- **operator**
  Type: String

**Return Value**
Type: Void

**setValue**(value)
Sets the value by which a field can be filtered. For example, the field **Age** can be filtered by a numeric value.

**Syntax**
```
public Void setValue(String value)
```

**Parameters**
- **value**
  Type: String

**Return Value**
Type: Void

**toString**(column)
Returns a string representation of the filter.

**Signature**
```
public String toString()
```

**Return Value**
Type: String

**ReportFormat Enum**
Contains the possible report format types.
Namespace
Reports

Enum Values
The following are the values of the Reports.ReportFormat enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MATRIX</td>
<td>Matrix report format</td>
</tr>
<tr>
<td>SUMMARY</td>
<td>Summary report format</td>
</tr>
<tr>
<td>TABULAR</td>
<td>Tabular report format</td>
</tr>
</tbody>
</table>

ReportFilterType Enum
The types of values included in a report filter type.

Enum Values
The following are the values of the Reports.ReportFilterType enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldToField</td>
<td>Field-to-field filter</td>
</tr>
<tr>
<td>fieldValue</td>
<td>Field-to-value filter</td>
</tr>
</tbody>
</table>

ReportInstance Class
Returns an instance of a report that was run asynchronously. Retrieves the results for that instance.

Namespace
Reports

ReportInstance Methods
The following are methods for ReportInstance. All are instance methods.

IN THIS SECTION:
- `getCompletionDate()`
  Returns the date and time when the instance of the report finished running. The completion date is available only if the report instance ran successfully or couldn’t be run because of an error. Date and time information is in ISO-8601 format.
- `getId()`
  Returns the unique ID for an instance of a report that was run asynchronously.
getOwnerId()  
Returns the ID of the user who created the report instance.

getReportId()  
Returns the unique ID of the report this instance is based on.

getReportResults()  
Retrieves results for an instance of an asynchronous report. When you request your report, you can specify whether to summarize data or include details.

getRequestDate()  
Returns the date and time when an instance of the report was run. Date and time information is in ISO-8601 format.

getStatus()  
Returns the status of a report.

getCompletionDate()  
Returns the date and time when the instance of the report finished running. The completion date is available only if the report instance ran successfully or couldn’t be run because of an error. Date and time information is in ISO-8601 format.

Syntax

```java
public Datetime getCompletionDate()
```

Return Value

Type: Datetime

ggetId()  
Returns the unique ID for an instance of a report that was run asynchronously.

Syntax

```java
public Id getId()
```

Return Value

Type: Id

ggetOwnerId()  
Returns the ID of the user who created the report instance.

Syntax

```java
public Id getOwnerId()
```

Return Value

Type: Id
**getReportId()**
Returns the unique ID of the report this instance is based on.

**Syntax**
```
public Id getReportId()
```

**Return Value**
Type: Id

**getReportResults()**
Retrieves results for an instance of an asynchronous report. When you request your report, you can specify whether to summarize data or include details.

**Syntax**
```
public Reports.ReportResults getReportResults()
```

**Return Value**
Type: Reports.ReportResults

**getRequestDate()**
Returns the date and time when an instance of the report was run. Date and time information is in ISO-8601 format.

**Syntax**
```
public Datetime getRequestDate()
```

**Return Value**
Type: Datetime

**getStatus()**
Returns the status of a report.

**Syntax**
```
public String getStatus()
```

**Return Value**
Type: String
Usage

- **New** if the report run was recently triggered through a request.
- **Success** if the report ran.
- **Running** if the report is being run.
- **Error** if the report run failed. The instance of a report run can return an error if, for example, your permission to access the report was removed after you requested the run.

ReportManager Class

Runs a report synchronously or asynchronously and with or without details.

Namespace

Reports

Usage

Gets instances of reports and describes the metadata of Reports.

ReportManager Methods

The following are methods for ReportManager. All methods are static.

IN THIS SECTION:

- `describeReport(reportId)`
  
  Retrieves report, report type, and extended metadata for a tabular, summary, or matrix report.

- `getDatatypeFilterOperatorMap()`
  
  Lists the field data types that you can use to filter the report.

- `getReportInstance(instanceld)`
  
  Retrieves results for an instance of a report that has been run asynchronously. The settings you use when you run your asynchronous report determine whether you can retrieve summary data or detailed data.

- `getReportInstances(reportId)`
  
  Returns a list of instances for a report that was run asynchronously. Each item in the list represents a separate instance of the report, with metadata for the time at which the report was run.

- `runAsyncReport(reportId, reportMetadata, includeDetails)`
  
  Runs a report asynchronously with the report ID. Includes details if `includeDetails` is set to `true`. Filters the report based on the report metadata in `reportMetadata`.

- `runAsyncReport(reportId, includeDetails)`
  
  Runs a report asynchronously with the report ID. Includes details if `includeDetails` is set to `true`.

- `runAsyncReport(reportId, reportMetadata)`
  
  Runs a report asynchronously with the report ID. Filters the results based on the report metadata in `reportMetadata`.

- `runAsyncReport(reportId)`
  
  Runs a report asynchronously with the report ID.
Run a report immediately with the report ID. Includes details if `includeDetails` is set to `true`. Filters the results based on the report metadata in `reportMetadata`.

```
runReport(reportId, reportMetadata, includeDetails)
```

Runs a report immediately with the report ID. Includes details if `includeDetails` is set to `true`.

```
runReport(reportId, includeDetails)
```

Runs a report immediately with the report ID. Filters the results based on the report metadata in `reportMetadata`.

```
runReport(reportId, reportMetadata)
```

Runs a report immediately with the report ID.

```
runReport(reportId)
```

`describeReport(reportId)`

Retrieves report, report type, and extended metadata for a tabular, summary, or matrix report.

**Syntax**

```
public static Reports.ReportDescribeResult describeReport(Id reportId)
```

**Parameters**

- `reportId`
  - Type: `Id`

**Return Value**

- Type: `Reports.ReportDescribeResult`

`getDatatypeFilterOperatorMap()`

Lists the field data types that you can use to filter the report.

**Syntax**

```
public static MAP<String, LIST<Reports.FilterOperator>> getDatatypeFilterOperatorMap()
```

**Return Value**

- Type: `Map<String, List<Reports.FilterOperator>>`

`getReportInstance(instanceId)`

Retrieves results for an instance of a report that has been run asynchronously. The settings you use when you run your asynchronous report determine whether you can retrieve summary data or detailed data.

**Syntax**

```
public static Reports.ReportInstance getReportInstance(Id instanceId)
```
Parameters

instanceId
Type: Id

Return Value
Type: Reports.ReportInstance

getReportInstances (reportId)
Returns a list of instances for a report that was run asynchronously. Each item in the list represents a separate instance of the report, with metadata for the time at which the report was run.

Syntax
public static LIST<Reports.ReportInstance> getReportInstances(Id reportId)

Parameters
reportId
Type: Id

Return Value
Type: List<Reports.ReportInstance>

runAsyncReport (reportId, reportMetadata, includeDetails)
Runs a report asynchronously with the report ID. Includes details if includeDetails is set to true. Filters the report based on the report metadata in reportMetadata.

Syntax
public static Reports.ReportInstance runAsyncReport(Id reportId, Reports.ReportMetadata reportMetadata, Boolean includeDetails)

Parameters
reportId
Type: Id
reportMetadata
Type: Reports.ReportMetadata
includeDetails
Type: Boolean

Return Value
Type: Reports.ReportInstance
runAsyncReport(reportId, includeDetails)
Runs a report asynchronously with the report ID. Includes details if includeDetails is set to true.

Syntax
public static Reports.ReportInstance runAsyncReport(Id reportId, Boolean includeDetails)

Parameters
reportId
Type: Id
includeDetails
Type: Boolean

Return Value
Type: Reports.ReportInstance

runAsyncReport(reportId, reportMetadata)
Runs a report asynchronously with the report ID. Filters the results based on the report metadata in reportMetadata.

Syntax
public static Reports.ReportInstance runAsyncReport(Id reportId, Reports.ReportMetadata reportMetadata)

Parameters
reportId
Type: Id
reportMetadata
Type: Reports.ReportMetadata

Return Value
Type: Reports.ReportInstance

runAsyncReport(reportId)
Runs a report asynchronously with the report ID.

Syntax
public static Reports.ReportInstance runAsyncReport(Id reportId)
Parameters

reportId
Type: Id

Return Value

Type: Reports.ReportInstance

runReport(reportId, reportMetadata, includeDetails)
Runs a report immediately with the report ID. Includes details if includeDetails is set to true. Filters the results based on the report metadata in reportMetadata.

Syntax

public static Reports.ReportResults runReport(Id reportId, Reports.ReportMetadata reportMetadata, Boolean includeDetails)

Parameters

reportId
Type: Id
reportMetadata
Type: Reports.ReportMetadata
includeDetails
Type: Boolean

Return Value

Type: Reports.ReportResults

runReport(reportId, includeDetails)
Runs a report immediately with the report ID. Includes details if includeDetails is set to true.

Syntax

public static Reports.ReportResults runReport(Id reportId, Boolean includeDetails)
runReport(reportId, reportMetadata)

Runs a report immediately with the report ID. Filters the results based on the report metadata in `rmData`.

**Syntax**

```java
public static Reports.ReportResults runReport(Id reportId, Reports.ReportMetadata reportMetadata)
```

**Parameters**

`reportId`
Type: `Id`

`reportMetadata`
Type: `Reports.ReportMetadata`

**Return Value**
Type: `Reports.ReportResults`

runReport(reportId)

Runs a report immediately with the report ID.

**Syntax**

```java
public static Reports.ReportResults runReport(Id reportId)
```

**Parameters**

`reportId`
Type: `Id`

**Return Value**
Type: `Reports.ReportResults`

**ReportMetadata Class**

Contains report metadata for a tabular, summary, or matrix report.

**Namespace**

`Reports`

**Usage**

Report metadata gives information about the report as a whole, such as the report type, format, summary fields, row or column groupings, and filters that are saved to the report. You can use the `ReportMetadata` class to retrieve report metadata and to set metadata that can be used to filter a report.
ReportMetadata Methods

The following are methods for ReportMetadata. All are instance methods.

IN THIS SECTION:

- getAggregates()
  Returns unique identifiers for summary or custom summary formula fields in the report.

- getBuckets()
  Returns a list of bucket fields in the report.

- getCrossFilters()
  Returns information about cross filters applied to a report.

- getCurrencyCode()
  Returns report currency, such as USD, EUR, or GBP, for an organization that has multicurrency enabled. The value is null if the organization does not have multicurrency enabled.

- getCustomSummaryFormula()
  Returns information about custom summary formulas in a report.

- getDescription()
  Returns the description of the report.

- getDetailColumns()
  Returns unique API names (column names) for the fields that contain detailed data. For example, the method might return the following values: "OPPORTUNITY_NAME, TYPE, LEAD_SOURCE, AMOUNT."

- getDeveloperName()
  Returns the report API name. For example, the method might return the following value: "Closed_Sales_This_Quarter."

- getDivision()
  Returns the division specified in the report.

- getGroupingsAcross()
  Returns column groupings in a report.

- getGroupingsDown()
  Returns row groupings for a report.

- getHasDetailRows()
  Indicates whether the report has detail rows.

- getHasRecordCount()
  Indicates whether the report shows the total number of records.

- getHistoricalSnapshotDates()
  Returns a list of historical snapshot dates.

- getId()
  Returns the unique report ID.

- getName()
  Returns the report name.

- getReportBooleanFilter()
  Returns logic to parse custom field filters. The value is null when filter logic is not specified.
getReportFilters()
Returns a list of each custom filter in the report along with the field name, filter operator, and filter value.

getReportFormat()
Returns the format of the report.

getReportType()
Returns the unique API name and display name for the report type.

getScope()
Returns the API name for the scope defined for the report. Scope values depend on the report type.

getShowGrandTotal()
Indicates whether the report shows the grand total.

getShowSubtotals()
Indicates whether the report shows subtotals, such as column or row totals.

getSortBy()
Returns the list of columns on which the report is sorted. Currently, you can sort on only one column.

getStandardDateFilter()
Returns information about the standard date filter for the report, such as the start date, end date, date range, and date field API name.

getStandardFilters()
Returns a list of standard filters for the report.

getTopRows()
Returns information about a row limit filter, including the number of rows returned and the sort order.

setAggregates(aggregates)
Sets unique identifiers for standard or custom summary formula fields in the report.

setBuckets(buckets)
Creates bucket fields in a report.

setCrossFilters(crossFilters)
Applies cross filters to a report.

setCurrencyCode(currencyCode)
Sets the currency, such as USD, EUR, or GBP, for report summary fields in an organization that has multicurrency enabled.

setCustomSummaryFormula(customSummaryFormula)
Adds a custom summary formula to a report.

setDescription(description)
Sets the description of the report.

setDetailColumns(detailColumns)
Sets the unique API names for the fields that contain detailed data—for example, OPPORTUNITY_NAME, TYPE, LEAD_SOURCE, or AMOUNT.

setDeveloperName(developerName)
Sets the report API name—for example, Closed_Sales_This_Quarter.

setDivision(division)
Sets the division of the report.
setGroupingsAcross(groupingInfo)
Sets column groupings in a report.

setGroupingsDown(groupingInfo)
Sets row groupings for a report.

setHasDetailRows(hasDetailRows)
Specifies whether the report has detail rows.

setHasRecordCount(hasRecordCount)
Specifies whether the report is configured to show the total number of records.

setHistoricalSnapshotDates(historicalSnapshot)
Sets a list of historical snapshot dates.

setId(id)
Sets the unique report ID.

setName(name)
Sets the report name.

setReportBooleanFilter(reportBooleanFilter)
Sets logic to parse custom field filters.

setReportFilters(reportFilters)
Sets a list of each custom filter in the report along with the field name, filter operator, and filter value.

setReportFormat(format)
Sets the format of the report.

setReportType(reportType)
Sets the unique API name and display name for the report type.

setScope(scopeName)
Sets the API name for the scope defined for the report. Scope values depend on the report type.

setShowGrandTotal(showGrandTotal)
Specifies whether the report shows the grand total.

setShowSubtotals(showSubtotals)
Specifies whether the report shows subtotals, such as column or row totals.

setSortBy(column)
Sets the list of columns on which the report is sorted. Currently, you can only sort on one column.

setStandardDateFilter(dateFilter)
Sets the standard date filter—which includes the start date, end date, date range, and date field API name—for the report.

setStandardFilters(filters)
Sets one or more standard filters on the report.

setTopRows(topRows)
Applies a row limit filter to a report.

getAggregates()
Returns unique identifiers for summary or custom summary formula fields in the report.
Syntax
public LIST<String> getAggregates()

Return Value
Type: List<String>

Usage
For example:
- a!Amount represents the average for the Amount column.
- s!Amount represents the sum of the Amount column.
- m!Amount represents the minimum value of the Amount column.
- x!Amount represents the maximum value of the Amount column.
- s! <customfieldID> represents the sum of a custom field column. For custom fields and custom report types, the identifier is a combination of the summary type and the field ID.

getBuckets()
Returns a list of bucket fields in the report.

Signature
public List<Reports.BucketField> getBuckets()

Return Value
Type: List<Reports.BucketField>

getcrossfilters()
Returns information about cross filters applied to a report.

Signature
public Reports.CrossFilter getCrossFilters()

Return Value
Type: List<Reports.CrossFilter>

getchannel()

getCurrencyCode()
Returns report currency, such as USD, EUR, or GBP, for an organization that has multicurrency enabled. The value is null if the organization does not have multicurrency enabled.

Syntax
public String getCurrencyCode()
getCustomSummaryFormula()
Returns information about custom summary formulas in a report.

Signature
public Map<String, Reports.ReportCsf> getCustomSummaryFormula()

Return Value
Type: Map<String, Reports.ReportCsf>

description()
Returns the description of the report.

Signature
public String getDescription()

Return Value
Type: String

detailColumns()
Returns unique API names (column names) for the fields that contain detailed data. For example, the method might return the following values: "OPPORTUNITY_NAME, TYPE, LEAD_SOURCE, AMOUNT."

Syntax
public List<String> getDetailColumns()

Return Value
Type: List<String>

developerName()
Returns the report API name. For example, the method might return the following value: "Closed_Sales_This_Quarter."

Syntax
public String getDeveloperName()
Return Value
Type: String

getDivision()
Returns the division specified in the report.

Note: Reports that use standard filters (such as My Cases or My Team’s Accounts) show records in all divisions. These reports can’t be further limited to a specific division.

Signature
public String getDivision()

Return Value
Type: String

getGroupingsAcross()
Returns column groupings in a report.

Syntax
public LIST<Reports.GroupingInfo> getGroupingsAcross()

Return Value
Type: List<Reports.GroupingInfo>

Usage
The identifier is:
• An empty array for reports in summary format, because summary reports don’t include column groupings
• BucketField_(ID) for bucket fields
• The ID of a custom field when the custom field is used for a column grouping

getGroupingsDown()
Returns row groupings for a report.

Syntax
public LIST<Reports.GroupingInfo> getGroupingsDown()

Return Value
Type: List<Reports.GroupingInfo>
Usage
The identifier is:

- BucketField_\(\text{ID}\) for bucket fields
- The ID of a custom field when the custom field is used for grouping

**getHasDetailRows()**
Indicates whether the report has detail rows.

**Signature**
```
public Boolean getHasDetailRows()
```

**Return Value**
Type: Boolean

**getHasRecordCount()**
Indicates whether the report shows the total number of records.

**Signature**
```
public Boolean getHasRecordCount()
```

**Return Value**
Type: Boolean

**getHistoricalSnapshotDates()**
Returns a list of historical snapshot dates.

**Syntax**
```
public LIST<String> getHistoricalSnapshotDates()
```

**Return Value**
Type: List<String>

**getId()**
Returns the unique report ID.

**Syntax**
```
public Id getId()
```
Return Value
Type: Id

getName()
Returns the report name.

Syntax
public String getName()

Return Value
Type: String

getReportBooleanFilter()
Returns logic to parse custom field filters. The value is null when filter logic is not specified.

Syntax
public String getReportBooleanFilter()

Return Value
Type: String

getReportFilters()
Returns a list of each custom filter in the report along with the field name, filter operator, and filter value.

Syntax
public LIST<Reports.ReportFilter> getReportFilters()

Return Value
Type: List<Reports.ReportFilter>

getReportFormat()
Returns the format of the report.

Syntax
public Reports.ReportFormat getReportFormat()

Return Value
Type: Reports.ReportFormat
Usage
This value can be:
- TABULAR
- SUMMARY
- MATRIX

getReportType()
Returns the unique API name and display name for the report type.

Syntax
```java
public Reports.ReportType getReportType()
```

Return Value
Type: Reports.ReportType

getScope()
Returns the API name for the scope defined for the report. Scope values depend on the report type.

Signature
```java
public String getScope()
```

Return Value
Type: String

getShowGrandTotal()
Indicates whether the report shows the grand total.

Signature
```java
public Boolean getShowGrandTotal()
```

Return Value
Type: Boolean

getShowSubtotals()
Indicates whether the report shows subtotals, such as column or row totals.

Signature
```java
public Boolean getShowSubtotals()
```
Return Value
Type: Boolean

getSortBy()
Returns the list of columns on which the report is sorted. Currently, you can sort on only one column.

Signature
public List<Reports.SortColumn> getSortBy()

Return Value
Type: List<Reports.SortColumn>

getStandardDateFilter()
Returns information about the standard date filter for the report, such as the start date, end date, date range, and date field API name.

Signature
public Reports.StandardDateFilter getStandardDateFilter()

Return Value
Type: Reports.StandardDateFilter

getStandardFilters()
Returns a list of standard filters for the report.

Signature
public List<Reports.StandardFilter> getStandardFilters()

Return Value
Type: List<Reports.StandardFilter>

getTopRows()
Returns information about a row limit filter, including the number of rows returned and the sort order.

Signature
public Reports.TopRows getTopRows()

Return Value
Type: Reports.TopRows
**setAggregates (aggregates)**
Sets unique identifiers for standard or custom summary formula fields in the report.

**Signature**

```java
public void setAggregates(List<String> aggregates)
```

**Parameters**

- `aggregates`
  - Type: List<String>

**Return Value**

Type: void

---

**setBuckets (buckets)**
Creates bucket fields in a report.

**Signature**

```java
public void setBuckets(List<Reports.BucketField> buckets)
```

**Parameters**

- `buckets`
  - Type: List<Reports.BucketField>

**Return Value**

Type: void

---

**setCrossFilters (crossFilters)**
Applies cross filters to a report.

**Signature**

```java
public void setCrossFilters(List<Reports.CrossFilter> crossFilters)
```

**Parameters**

- `crossFilter`
  - Type: List<Reports.CrossFilter>

**Return Value**

Type: void
**setCurrencyCode(currencyCode)**
Sets the currency, such as USD, EUR, or GBP, for report summary fields in an organization that has multicurrency enabled.

**Signature**

```java
public void setCurrencyCode(String currencyCode)
```

**Parameters**

- `currencyCode`
  Type: `String`

**Return Value**
Type: `void`

**setCustomSummaryFormula(customSummaryFormula)**
Adds a custom summary formula to a report.

**Signature**

```java
public void setCustomSummaryFormula(Map<String, Reports.ReportCsf> customSummaryFormula)
```

**Parameters**

- `customSummaryFormula`
  Type: `Map<String, Reports.ReportCsf>`

**Return Value**
Type: `void`

**setDescription(description)**
Sets the description of the report.

**Signature**

```java
public void setDescription(String description)
```

**Parameters**

- `description`
  Type: `String`

**Return Value**
Type: `void`
**setDetailColumns**
Sets the unique API names for the fields that contain detailed data—for example, OPPORTUNITY_NAME, TYPE, LEAD_SOURCE, or AMOUNT.

**Signature**
```java
public void setDetailColumns(List<String> detailColumns)
```

**Parameters**
- `detailColumns`
  - Type: List<String>

**Return Value**
Type: void

**setDeveloperName**
Sets the report API name—such as Closed_Sales_This_Quarter.

**Signature**
```java
public void setDeveloperName(String developerName)
```

**Parameters**
- `developerName`
  - Type: String

**setDivision**
Sets the division of the report.

---

**Note:** Reports that use standard filters (such as My Cases or My Team’s Accounts) show records in all divisions. These reports can’t be further limited to a specific division.

**Signature**
```java
public void setDivision(String division)
```

**Parameters**
- `division`
  - Type: String
Return Value
Type: void

setGroupingsAcross(groupingInfo)
Sets column groupings in a report.

Signature
public void setGroupingsAcross(List<Reports.GroupingInfo> groupingInfo)

Parameters

Parameters

groupingInfo
Type: List<Reports.GroupingInfo>

Return Value
Type: void

setGroupingsDown(groupingInfo)
Sets row groupings for a report.

Signature
public void setGroupingsDown(List<Reports.GroupingInfo> groupingInfo)

Parameters

groupingInfo
Type: List<Reports.GroupingInfo>

Return Value
Type: void

setHasDetailRows(hasDetailRows)
Specifies whether the report has detail rows.

Signature
public void setHasDetailRows(Boolean hasDetailRows)

Parameters

Parameters

hasDetailRows
Type: Boolean
Return Value
Type: void

**setHasRecordCount** (hasRecordCount)
Specifies whether the report is configured to show the total number of records.

**Signature**
public void setHasRecordCount(Boolean hasRecordCount)

**Parameters**
- hasRecordCount
  Type: Boolean

Return Value
Type: void

**setHistoricalSnapshotDates** (historicalSnapshot)
Sets a list of historical snapshot dates.

**Syntax**
public Void setHistoricalSnapshotDates(List<String> historicalSnapshot)

**Parameters**
- historicalSnapshot
  Type: List<String>

Return Value
Type: Void

**setId** (id)
Sets the unique report ID.

**Signature**
public void setId(Id id)

**Parameters**
- id
  Type: Id
Return Value
Type: void

**setName**(name)
Sets the report name.

Signature
```
public void setName(String name)
```

Parameters
- **name**
  Type: String

Return Value
Type: void

**setReportBooleanFilter**(reportBooleanFilter)
Sets logic to parse custom field filters.

Syntax
```
public Void setReportBooleanFilter(String reportBooleanFilter)
```

Parameters
- **reportBooleanFilter**
  Type: String

Return Value
Type: Void

**setReportFilters**(reportFilters)
Sets a list of each custom filter in the report along with the field name, filter operator, and filter value.

Syntax
```
public Void setReportFilters(LIST<Reports.ReportFilter> reportFilters)
```

Parameters
- **reportFilters**
  Type: List<Reports.ReportFilter>
Return Value
Type: Void

**setReportFormat(format)**
Sets the format of the report.

**Signature**
```java
public void setReportFormat(Reports.ReportFormat format)
```

**Parameters**
- `format`
  Type: `Reports.ReportFormat`

**Return Value**
Type: void

**setReportType(reportType)**
Sets the unique API name and display name for the report type.

**Signature**
```java
public void setReportType(Reports.ReportType reportType)
```

**Parameters**
- `reportType`
  Type: `Reports.ReportType`

**Return Value**
Type: void

**setScope(scopeName)**
Sets the API name for the scope defined for the report. Scope values depend on the report type.

**Signature**
```java
public void setScope(String scopeName)
```

**Parameters**
- `scopeName`
  Type: `String`
Return Value
Type: void

`setShowGrandTotal(showGrandTotal)`
Specifies whether the report shows the grand total.

**Signature**

```
public void setShowGrandTotal(Boolean showGrandTotal)
```

**Parameters**

`showGrandTotal`
Type: `Boolean`

Return Value
Type: void

`setShowSubtotals(showSubtotals)`
Specifies whether the report shows subtotals, such as column or row totals.

**Signature**

```
public void setShowSubtotals(Boolean showSubtotals)
```

**Parameters**

`showSubtotals`
Type: `Boolean`

Return Value
Type: void

`setSortBy(column)`
Sets the list of columns on which the report is sorted. Currently, you can only sort on one column.

**Signature**

```
public void setSortBy(List<Reports.SortColumn> column)
```

**Parameters**

`column`
Type: `List<Reports.SortColumn>`
Return Value
Type: void

`setStandardDateFilter(dateFilter)`
Sets the standard date filter—which includes the start date, end date, date range, and date field API name—for the report.

Signature
`public void setStandardDateFilter(Reports.StandardDateFilter dateFilter)`

Parameters
`dateFilter`  
Type: `Reports.StandardDateFilter`

Return Value
Type: void

`setStandardFilters(filters)`
Sets one or more standard filters on the report.

Signature
`public void setStandardFilters(List<Reports.StandardFilter> filters)`

Parameters
`filters`  
Type: `List<Reports.StandardFilter>`

Return Value
Type: void

`setTopRows(topRows)`
Applies a row limit filter to a report.

Signature
`public Reports.TopRows setTopRows(Reports.TopRows topRows)`

Parameters
`topRows`  
Type: `Reports.TopRows`
**Return Value**

Type: void

---

**ReportResults Class**

Contains the results of running a report.

---

**Namespace**

Reports

---

**ReportResults Methods**

The following are methods for ReportResults. All are instance methods.

---

**IN THIS SECTION:**

- **getAllData()**
  Returns all report data.
- **getFactMap()**
  Returns summary-level data or summary and detailed data for each row or column grouping. Detailed data is available if the includeDetails parameter is set to true when the report is run.
- **getGroupingsAcross()**
  Returns a collection of column groupings, keys, and values.
- **getGroupingsDown()**
  Returns a collection of row groupings, keys, and values.
- **getHasDetailRows()**
  Returns information about whether the fact map has detail rows.
- **getReportExtendedMetadata()**
  Returns additional, detailed metadata about the report, including data type and label information for groupings and summaries.
- **getReportMetadata()**
  Returns metadata about the report, including grouping and summary information.

---

**getAllData()**

Returns all report data.

**Syntax**

```java
public Boolean getAllData()
```

**Return Value**

Type: Boolean
Usage
When true, indicates that all report results are returned.
When false, indicates that results are returned for the same number of rows as in a report run in Salesforce.

Note: For reports that contain too many records, use filters to refine results.

getFactMap()
Returns summary-level data or summary and detailed data for each row or column grouping. Detailed data is available if the includeDetails parameter is set to true when the report is run.

Syntax
public MAP<String,Reports.ReportFact> getFactMap()

Return Value
Type: Map<String,Reports.ReportFact>

getGroupingsAcross()
Returns a collection of column groupings, keys, and values.

Syntax
public Reports.Dimension getGroupingsAcross()

Return Value
Type: Reports.Dimension

getGroupingsDown()
Returns a collection of row groupings, keys, and values.

Syntax
public Reports.Dimension getGroupingsDown()

Return Value
Type: Reports.Dimension

getHasDetailRows()
Returns information about whether the fact map has detail rows.

Syntax
public Boolean getHasDetailRows()
Return Value
Type: Boolean

Usage
• When true, indicates that the fact map returns values for summary-level and record-level data.
• When false, indicates that the fact map returns summary values.

getReportExtendedMetadata() (getReportExtendedMetadata)
Returns additional, detailed metadata about the report, including data type and label information for groupings and summaries.

Syntax
public Reports.ReportExtendedMetadata getReportExtendedMetadata()

Return Value
Type: Reports.ReportExtendedMetadata

getReportMetadata() (getReportMetadata)
Returns metadata about the report, including grouping and summary information.

Syntax
public Reports.ReportMetadata getReportMetadata()

Return Value
Type: Reports.ReportMetadata

ReportScopeInfo Class
Contains information about possible scope values that you can choose. Scope values depend on the report type. For example, you can set the scope for opportunity reports to All opportunities, My team’s opportunities, or My opportunities.

Namespace
Reports

IN THIS SECTION:
  ReportScopeInfo Methods

ReportScopeInfo Methods
The following are methods for ReportScopeInfo.
IN THIS SECTION:

getDefaultValue()
Returns the default scope of the data to display in the report.

getValues()
Returns a list of scope values specified for the report.

**getDefaultValue()**

Returns the default scope of the data to display in the report.

**Signature**

```java
public String getDefaultValue()
```

**Return Value**

Type: `String`

**getValues()**

Returns a list of scope values specified for the report.

**Signature**

```java
public List<Reports.ReportScopeValue> getValues()
```

**Return Value**

Type: `List<Reports.ReportScopeValue>`

**ReportScopeValue Class**

Contains information about a possible scope value. Scope values depend on the report type. For example, you can set the scope for opportunity reports to **All opportunities**, **My team’s opportunities**, or **My opportunities**.

**Namespace**

```java
Reports
```

**ReportScopeValue Methods**

The following are methods for `ReportScopeValue`. 
IN THIS SECTION:
  - `getAllowsDivision()`
    Returns a boolean value that indicates whether you can segment the report by this scope.
  - `getLabel()`
    Returns the display name of the scope of the report.
  - `getValue()`
    Returns the scope value for the report.

`getAllowsDivision()`
Returns a boolean value that indicates whether you can segment the report by this scope.

**Signature**

```java
public Boolean getAllowsDivision()
```

**Return Value**

Type: `Boolean`

`getLabel()`
Returns the display name of the scope of the report.

**Signature**

```java
public String getLabel()
```

**Return Value**

Type: `String`

`getValue()`
Returns the scope value for the report.

**Signature**

```java
public String getValue()
```

**Return Value**

Type: `String`

**ReportType Class**

Contains the unique API name and display name for the report type.
Namespace

Reports

ReportType Methods

The following are methods for ReportType. All are instance methods.

IN THIS SECTION:

getLabel()  
Returns the localized display name of the report type.

type()  
Returns the unique identifier of the report type.

gGetLabel()  
Returns the localized display name of the report type.

Syntax

public String getLabel()

Return Value

Type: String

getType()  
Returns the unique identifier of the report type.

gType()  
Returns the unique identifier of the report type.

Syntax

public String getType()

Return Value

Type: String

ReportTypeColumn Class

Contains detailed report type metadata about a field, including data type, display name, and filter values.

Namespace

Reports
ReportTypeColumn Methods

The following are methods for ReportTypeColumn. All are instance methods.

IN THIS SECTION:
  - getDataType()
  - getFilterValues()
  - getFilterable()
  - getLabel()
  - getName()

**getDataType()**

Returns the data type of the field.

**Syntax**

```java
public Reports.ColumnDataType getDataType()
```

**Return Value**

Type: `Reports.ColumnDataType`

**getFilterValues()**

If the field data type is picklist, multi-select picklist, boolean, or checkbox, returns all filter values for a field. For example, checkbox fields always have a value of `true` or `false`. For fields of other data types, the filter value is an empty array, because their values can’t be determined.

**Syntax**

```java
public LIST<Reports.FilterValue> getFilterValues()
```

**Return Value**

Type: `List<Reports.FilterValue>`

**getFilterable()**

If the field is of a type that can’t be filtered, returns `False`. For example, fields of the type `Encrypted Text` can’t be filtered.

**getLabel()**

Returns the localized display name of the field.

**getName()**

Returns the unique API name of the field.
ReportTypeColumnCategory Class

Information about categories of fields in a report type.

Namespace

Reports

Usage

A report type column category is a set of fields that the report type grants access to. For example, an opportunity report has categories like Opportunity Information and Primary Contact. The Opportunity Information category has fields like Amount, Probability, and Close Date.

Get category information about a report by first getting the report metadata:

```java
// Get the report ID
List<Report> reportList = [SELECT Id, DeveloperName FROM Report where DeveloperName = 'Q1_Opportunities2'];
```
String reportId = (String)reportList.get(0).get('Id');

// Describe the report
Reports.ReportDescribeResult describeResults =

Reports.ReportManager.describeReport(reportId);

// Get report type metadata
Reports.ReportTypeMetadata reportTypeMetadata = describeResults.getReportTypeMetadata();

// Get report type column categories
List<Reports.ReportTypeColumnCategory> reportTypeColumnCategories =

reportTypeMetadata.getCategories();

System.debug('reportTypeColumnCategories: ' + reportTypeColumnCategories);

### ReportTypeColumnCategory Methods

The following are methods for `ReportTypeColumnCategory`. All are instance methods.

**IN THIS SECTION:**

- **getColumn()**
  
  Returns information for all fields in the report type. The information is organized by each section’s unique API name.

- **getLabel()**
  
  Returns the localized display name of a section in the report type under which fields are organized. For example, in an Accounts with Contacts custom report type, **Account General** is the display name of the section that contains fields on general account information.

**getColumn()**

Returns information for all fields in the report type. The information is organized by each section’s unique API name.

**Syntax**

```java
public Map<String, Reports.ReportTypeColumn> getColumn()
```

**Return Value**

Type: `Map<String, Reports.ReportTypeColumn>`

**getLabel()**

Returns the localized display name of a section in the report type under which fields are organized. For example, in an Accounts with Contacts custom report type, **Account General** is the display name of the section that contains fields on general account information.

**Syntax**

```java
public String getLabel()
```
ReportTypeMetadata Class
Contains report type metadata, which gives you information about the fields that are available in each section of the report type, plus filter information for those fields.

Namespace
Reports

IN THIS SECTION:
ReportTypeMetadata Methods

ReportTypeMetadata Methods
The following are methods for ReportTypeMetadata. All are instance methods.

IN THIS SECTION:
getCategories() Returns all fields in the report type. The fields are organized by section.
getDivisionInfo() Returns the default division and a list of all possible divisions that can be applied to this type of report.
getScopeInfo() Returns information about the scopes that can be applied to this type of report.
getStandardDateFilterDurationGroups() Returns information about the standard date filter groupings that can be applied to this type of report. Standard date filter groupings include Calendar Year, Calendar Quarter, Calendar Month, Calendar Week, Fiscal Year, Fiscal Quarter, Day and a custom value based on a user-defined date range.
getStandardFilterInfos() Returns information about standard date filters that can be applied to this type of report.

getCategories()
Returns all fields in the report type. The fields are organized by section.

Syntax
public LIST<Reports.ReportTypeColumnCategory> getCategories()

Return Value
Type: List<Reports.ReportTypeColumnCategory>
getDivisionInfo()

Returns the default division and a list of all possible divisions that can be applied to this type of report.

Signature

```java
public Reports.ReportDivisionInfo getDivisionInfo()
```

Return Value

Type: Reports.ReportDivisionInfo

getScopeInfo()

Returns information about the scopes that can be applied to this type of report.

Signature

```java
public Reports.ReportScopeInfo getScopeInfo()
```

Return Value

Type: Reports.ReportScopeInfo

getStandardDateFilterDurationGroups()

Returns information about the standard date filter groupings that can be applied to this type of report. Standard date filter groupings include Calendar Year, Calendar Quarter, Calendar Month, Calendar Week, Fiscal Year, Fiscal Quarter, Day and a custom value based on a user-defined date range.

Signature

```java
public List<Reports.StandardDateFilterDurationGroup> getStandardDateFilterDurationGroups()
```

Return Value

Type: List<Reports.StandardDateFilterDurationGroup>

getStandardFilterInfos()

Returns information about standard date filters that can be applied to this type of report.

Signature

```java
public Map<String,Reports.StandardFilterInfo> getStandardFilterInfos()
```

Return Value

Type: Map<String,Reports.StandardFilterInfo>
SortColumn Class
Contains information about the sort column used in the report.

Namespace
Reports

IN THIS SECTION:
SortColumn Methods

SortColumn Methods
The following are methods for SortColumn.

IN THIS SECTION:
getSortColumn()
Returns the column used to sort the records in the report.

getSortOrder()
Returns the sort order—ascending or descending—for the sort column.

setSortColumn(sortColumn)
Sets the column used to sort the records in the report.

setSortOrder(SortOrder)
Sets the sort order—ascending or descending—for the sort column.

getSortColumn()
Returns the column used to sort the records in the report.

Signature
public String getSortColumn()

Return Value
Type: String

getSortOrder()
Returns the sort order—ascending or descending—for the sort column.

Signature
public Reports.ColumnSortOrder getSortOrder()
Return Value
Type: Reports.ColumnSortOrder

`setSortColumn(sortColumn)`
Sets the column used to sort the records in the report.

Signature
`public void setSortColumn(String sortColumn)`

Parameters
`sortColumn`
Type: String

Return Value
Type: void

`setSortOrder(SortOrder)`
Sets the sort order—ascending or descending—for the sort column.

Signature
`public void setSortOrder(Reports.ColumnSortOrder sortOrder)`

Parameters
`sortOrder`
Type: Reports.ColumnSortOrder

Return Value
Type: void

**StandardDateFilter Class**
Contains information about standard date filter available in the report—for example, the API name, start date, and end date of the standard date filter duration as well as the API name of the date field on which the filter is placed.

**Namespace**
Reports

IN THIS SECTION:
StandardDateFilter Methods
StandardDateFilter Methods

The following are methods for StandardDateFilter.

IN THIS SECTION:

- **getColumn()**
  Returns the API name of the standard date filter column.

- **getDurationValue()**
  Returns duration information about a standard date filter, such as start date, end date, and display name and API name of the date filter.

- **getEndDate()**
  Returns the end date of the standard date filter.

- **getStartDate()**
  Returns the start date for the standard date filter.

- **setColumn(standardDateFilterColumnName)**
  Sets the API name of the standard date filter column.

- **setDurationValue(durationName)**
  Sets the API name of the standard date filter.

- **setEndDate(endDate)**
  Sets the end date for the standard date filter.

- **setStartDate(startDate)**
  Sets the start date for the standard date filter.

### getColumn()

Returns the API name of the standard date filter column.

**Signature**

```java
public String getColumn()
```

**Return Value**

Type: String

### getDurationValue()

Returns duration information about a standard date filter, such as start date, end date, and display name and API name of the date filter.

**Signature**

```java
public String getDurationValue()
```

**Return Value**

Type: String
**getEndDate()**
Returns the end date of the standard date filter.

**Signature**
```java
class StandardDateFilter {
    public String getEndDate()
}
```

**Return Value**
Type: String

**getStartDate()**
Returns the start date for the standard date filter.

**Signature**
```java
class StandardDateFilter {
    public String getStartDate()
}
```

**Return Value**
Type: String

**setColumn(standardDateFilterColumnName)**
Sets the API name of the standard date filter column.

**Signature**
```java
class StandardDateFilter {
    public void setColumn(String standardDateFilterColumnName)
}
```

**Parameters**

*standardDateFilterColumnName*  
Type: String

**Return Value**
Type: void

**setDurationValue(durationName)**
Sets the API name of the standard date filter.

**Signature**
```java
class StandardDateFilter {
    public void setDurationValue(String durationName)
}
```
Parameters

durationName
Type: String

Return Value
Type: void

setEndDate(endDate)
Sets the end date for the standard date filter.

Signature

public void setEndDate(String endDate)

Parameters

date
Type: String

Return Value
Type: void

setStartDate(startDate)
Sets the start date for the standard date filter.

Signature

public void setStartDate(String startDate)

Parameters

startDate
Type: String

Return Value
Type: void

StandardDateFilterDuration Class

Contains information about each standard date filter—also referred to as a relative date filter. It contains the API name and display label of the standard date filter duration as well as the start and end dates.

Namespace

Reports
StandardDateFilterDuration Methods

The following are methods for StandardDateFilterDuration.

getEndDate()
Returns the end date of the date filter.

getLabel()
Returns the display name of the date filter. Possible values are relative date filters—like Current FY and Current FQ—and custom date filters.

geteStartDate()
Returns the start date of the date filter.

getValue()
Returns the API name of the date filter. Possible values are relative date filters—like THIS_FISCAL_YEAR and NEXT_FISCAL_QUARTER—and custom date filters.

getEndDate()
Returns the end date of the date filter.

**Signature**

```java
public String getEndDate()
```

**Return Value**

Type: String

getLabel()
Returns the display name of the date filter. Possible values are relative date filters—like Current FY and Current FQ—and custom date filters.

**Signature**

```java
public String getLabel()
```

**Return Value**

Type: String

getStartDate()
Returns the start date of the date filter.
Signature

`public String getStartDate()`

Return Value

Type: `String`

getValue()

Returns the API name of the date filter. Possible values are relative date filters—like `THIS_FISCAL_YEAR` and `NEXT_FISCAL_QUARTER`—and custom date filters.

Signature

`public String getValue()`

Return Value

Type: `String`

**StandardDateFilterDurationGroup Class**

Contains information about the standard date filter groupings, such as the grouping display label and all standard date filters that fall under the grouping. Groupings include Calendar Year, Calendar Quarter, Calendar Month, Calendar Week, Fiscal Year, Fiscal Quarter, Day, and custom values based on user-defined date ranges.

**Namespace**

Reports

**IN THIS SECTION:**

**StandardDateFilterDurationGroup Methods**

The following are methods for `StandardDateFilterDurationGroup`.

**IN THIS SECTION:**

`getLabel()`

Returns the display label for the standard date filter grouping.

`getStandardDateFilterDurations()`

Returns the standard date filter groupings.

`getLabel()`

Returns the display label for the standard date filter grouping.
Signature

public String getLabel()

Return Value

Type: String

getStandardDateFilterDurations()

Returns the standard date filter groupings.

Signature

public List<Reports.StandardDateFilterDuration> getStandardDateFilterDurations()

Return Value

Type: List<Reports.StandardDateFilterDuration>

For example, a standard filter date grouping might look like this:

```
Reports.StandardDateFilterDuration[endDate=2015-12-31, label=Current FY, startDate=2015-01-01, value=THIS_FISCAL_YEAR],
Reports.StandardDateFilterDuration[endDate=2014-12-31, label=Previous FY, startDate=2014-01-01, value=LAST_FISCAL_YEAR],
Reports.StandardDateFilterDuration[endDate=2014-12-31, label=Previous 2 FY, startDate=2013-01-01, value=LAST_N_FISCAL_YEARS:2]
```

StandardFilter Class

Contains information about the standard filter defined in the report, such as the filter field API name and filter value.

Namespace

Reports

Usage

Use to get or set standard filters on a report. Standard filters vary by report type. For example, standard filters for reports on the Opportunity object are Show, Opportunity Status, and Probability.

IN THIS SECTION:

StandardFilter Methods

StandardFilter Methods

The following are methods for StandardFilter.
IN THIS SECTION:

getName()  
Return the API name of the standard filter.

getValue()  
Returns the standard filter value.

setName(name)  
Sets the API name of the standard filter.

setValue(value)  
Sets the standard filter value.

**getName()**  
Return the API name of the standard filter.

**Signature**  
public String getName()  

**Return Value**  
Type: String

**getValue()**  
Returns the standard filter value.

**Signature**  
public String getValue()  

**Return Value**  
Type: String

**setName(name)**  
Sets the API name of the standard filter.

**Signature**  
public void setName(String name)  

**Parameters**  

name  
Type: String
Return Value
Type: void

`setValue(value)`
Sets the standard filter value.

Signature
`public void setValue(String value)`

Parameters
`value`
Type: `String`

Return Value
Type: void

**StandardFilterInfo Class**
Is an abstract base class for an object that provides standard filter information.

**Namespace**
*Reports*

IN THIS SECTION:
- StandardFilterInfo Methods

**StandardFilterInfo Methods**
The following are methods for `StandardFilterInfo`.

IN THIS SECTION:
- `getLabel()`
  Returns the display label of the standard filter.
- `getType()`
  Returns the type of standard filter.

`getLabel()`
Returns the display label of the standard filter.
StandardFilterInfoPicklist Class

Contains information about the standard filter picklist, such as the display name and type of the filter field, the default picklist value, and a list of all possible picklist values.

Namespace

Reports

IN THIS SECTION:

StandardFilterInfoPicklist Methods

The following are methods for StandardFilterInfoPicklist.

IN THIS SECTION:

getDefaultValue()
Returns the default value for the standard filter picklist.

getFilterValues()
Returns a list of standard filter picklist values.

getLabel()
Returns the display name of the standard filter picklist.

getType()
Returns the type of the standard filter picklist.
**getDefaultValue()**
Returns the default value for the standard filter picklist.

**Signature**
```
public String getDefaultValue()
```

**Return Value**
Type: `String`

**getFilterValues()**
Returns a list of standard filter picklist values.

**Signature**
```
public List<Reports.FilterValue> getFilterValues()
```

**Return Value**
Type: `List<Reports.FilterValue>`

**getLabel()**
Returns the display name of the standard filter picklist.

**Signature**
```
public String getLabel()
```

**Return Value**
Type: `String`

**getType()**
Returns the type of the standard filter picklist.

**Signature**
```
public Reports.StandardFilterType getType()
```

**Return Value**
Type: `Reports.StandardFilterType`
StandardFilterType Enum

The StandardFilterType enum describes the type of standard filters in a report. The `getType()` method returns a `Reports.StandardFilterType` enum value.

Namespace

Reports

Enum Values

The following are the values of the `Reports.StandardFilterType` enum.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PICKLIST</td>
<td>Values for the standard filter type.</td>
</tr>
<tr>
<td>STRING</td>
<td>String values.</td>
</tr>
</tbody>
</table>

SummaryValue Class

Contains summary data for a cell of the report.

Namespace

Reports

SummaryValue Methods

The following are methods for `SummaryValue`. All are instance methods.

IN THIS SECTION:

getLabel()

Returns the formatted summary data for a specified cell.

getValue()

Returns the numeric value of the summary data for a specified cell.

getLabel ()

Returns the formatted summary data for a specified cell.

Syntax

```java
public String getLabel()
```

Return Value

Type: `String`
getValue()  
Returns the numeric value of the summary data for a specified cell.

Syntax  
public Object getValue()  

Return Value  
Type: Object

ThresholdInformation Class  
Contains a list of evaluated conditions for a report notification.

Namespace  
Reports
