ChangePasswordController Class 44
CommunityLogoController Class 44
EmployeeLoginLinkController Class 44
ForgotPasswordController Class 44
IdentityHeaderController Class 44
LoginFormController Class 45
SelfRegisterController Class 45
SocialLoginController Class 45
Approval Namespace 45
LockResult Class 46
ProcessRequest Class 48
ProcessResult Class 49
ProcessSubmitRequest Class 52
ProcessWorkitemRequest Class 56
UnlockResult Class 58
Auth Namespace 60
AuthConfiguration Class 63
AuthProviderCallbackState Class 74
AuthProviderPlugin Interface 76
AuthProviderPluginClass Class 79
AuthProviderTokenResponse Class 89
AuthToken Class 91
CommunitiesUtil Class 96
ConfigurableSelfRegHandler Interface 98

ConfirmUserRegistrationHandler Interface . . . 102
ConnectedAppPlugin Class . . . 105
HeadlessSelfRegistrationHandler Interface . . . 112
IntegratingAppType Enum . . . 114
InvocationContext Enum . . . 115
JWS Class . . . 115
JWT Class . . . 118
JWTBearerTokenExchange Class . . . 123
JWTUtil Class . . . 129
LightningLoginEligibility Enum . . . 131
LoginDiscoveryHandler Interface . . . 132
LoginDiscoveryMethod Enum . . . 139
MyDomainLoginDiscoveryHandler Interface . . . 140
Oauth2TokenExchangeHandler Class . . . 144
OAuth2TokenExchangeType Enum . . . 146
OAuthRefreshResult Class . . . 147
OauthToken Class . . . 149
OauthTokenType Enum . . . 151
RegistrationHandler Interface . . . 151
SamlJitHandler Interface . . . 156
SessionManagement Class . . . 160
SessionLevel Enum . . . 172
TokenValidationResult Class . . . 173
UserData Class . . . 179
VerificationMethod Enum . . . 184
VerificationPolicy Enum . . . 185
VerificationResult Class . . . 185
Auth Exceptions . . . 188

Cache Namespace . . . 190
CacheBuilder Interface . . . 191
Org Class . . . 192
OrgPartition Class . . . 210
Partition Class . . . 213
Session Class . . . 228
SessionPartition Class . . . 244
Cache Exceptions . . . 247
Visibility Enum . . . 249

Canvas Namespace . . . 249
ApplicationContext Interface . . . 250
CanvasLifecycleHandler Interface . . . 253
ContextTypeEnum Enum . . . 255
EnvironmentContext Interface . . . 255
RenderContext Interface . . . 262
Test Class . . . 264

Canvas Exceptions . . . 267
ChatterAnswers Namespace . . . 268
AccountCreator Interface . . . 268
CommerceOrders Namespace . . . 270
CommercePayments Namespace . . . 270
AbstractResponse Class . . . 273
AbstractTransactionResponse Class . . . 277
AddressRequest Class . . . 281
AlternativePaymentMethodRequest Class . . . 285
AlternativePaymentMethodResponse Class . . . 289
AuditParamsRequest . . . 292
AuthApiPaymentMethodRequest Class . . . 294
AuthorizationRequest Class . . . 296
AuthorizationResponse Class . . . 301
AuthorizationReversalRequest Class . . . 307
AuthorizationReversalResponse Class . . . 311
BaseApiPaymentMethodRequest Class . . . 316
BaseNotification Class . . . 320
BasePaymentMethodRequest Class . . . 324
BaseRequest Class . . . 326
CaptureNotification Class . . . 327
CaptureRequest Class . . . 332
CaptureResponse Class . . . 334
CardCategory Enum . . . 338
CardPaymentMethodRequest Class . . . 339
CardPaymentMethodResponse Class . . . 345
CardType Enum . . . 353
CustomMetadataTypeInfo Class . . . 354
GatewayErrorResponse Class . . . 355
GatewayNotificationResponse Class . . . 356
GatewayResponse Interface . . . 359
NotificationClient Class . . . 360
NotificationSaveResult Class . . . 361
NotificationStatus Enum . . . 362
PaymentGatewayAdapter Interface . . . 363
PaymentGatewayAsyncAdapter Interface . . . 364
PaymentGatewayContext Class . . . 367
PaymentGatewayNotificationContext Class . . . 369
PaymentGatewayNotificationRequest Class . . . 370
PaymentMethodDetailsResponse Class . . . 371
PaymentMethodTokenizationRequest Class . . . 373
PaymentMethodTokenizationResponse Class . . . 377
PaymentsHttp Class . . . 384
PostAuthApiPaymentMethodRequest Class . . . 385

PostAuthorizationRequest Class . . . 387
PostAuthorizationResponse Class . . . 390
ReferencedRefundNotification Class . . . 394
ReferencedRefundRequest . . . 398
ReferencedRefundResponse Class . . . 400
RefundRequest Class . . . 405
RequestType Enum . . . 406
SaleApiPaymentMethodRequest Class . . . 406
SaleRequest Class . . . 409
SaleResponse Class . . . 413
SalesforceResultCode Enum . . . 418
SalesforceResultCodeInfo . . . 419
CommerceTax Namespace . . . 420
AbstractTransactionResponse Class . . . 422
AddressesResponse Class . . . 428
AddressResponse Class . . . 430
AmountDetailsResponse Class . . . 431
CalculateTaxRequest Class . . . 434
CalculateTaxResponse Class . . . 437
CalculateTaxType Enum . . . 444
ErrorResponse Class . . . 445
HeaderTaxAddressesRequest Class . . . 447
ImpositionResponse Class . . . 451
JurisdictionResponse Class . . . 453
LineItemResponse Class . . . 457
LineTaxAddressesRequest Class . . . 462
RequestType Enum . . . 466
ResultCode Enum . . . 466
RuleDetailsResponse Class . . . 467
TaxAddressesRequest Class . . . 469
TaxAddressRequest Class . . . 473
TaxApiException Class . . . 478
TaxCustomerDetailsRequest Class . . . 480
TaxDetailsResponse Class . . . 484
TaxEngineAdapter Interface . . . 491
TaxEngineContext Class . . . 511
TaxLineItemRequest Class . . . 514
TaxSellerDetailsRequest Class . . . 519
TaxTransactionRequest Class . . . 522
TaxTransactionStatus Enum . . . 528
TaxTransactionType Enum . . . 529
Compression Namespace (Developer Preview) . . . 529

APEX REFERENCE GUIDE

Apex is a strongly typed, object-oriented programming language that allows developers to execute flow and transaction control statements on the Salesforce Platform server, in conjunction with calls to the API. This reference guide includes built-in Apex classes, interfaces, enums, and exceptions, grouped by namespace. It also includes Apex DML statements to insert, update, merge, delete, and restore data in Salesforce.

For information on the Apex development process, see Apex Developer Guide.

Note: In API version 51.0 and earlier, Apex Reference information was included in the Apex Developer Guide in the **Apex Language Reference** section.

IN THIS SECTION:

Apex Release Notes

Use the Salesforce Release Notes to learn about the most recent updates and changes to Apex.

Apex DML Operations

You can perform DML operations using the Apex DML statements or the methods of the `Database` class. For lead conversion, use the `convertLead` method of the `Database` class. There is no DML counterpart for it.

ApexPages Namespace

The `ApexPages` namespace provides classes used in Visualforce controllers.

AppLauncher Namespace

The `AppLauncher` namespace provides methods for managing the appearance of apps in the App Launcher, including their visibility and sort order.

Approval Namespace

The `Approval` namespace provides classes and methods for approval processes.

Auth Namespace

The `Auth` namespace provides an interface and classes for single sign-on into Salesforce and session security management.

Cache Namespace

The `Cache` namespace contains methods for managing the platform cache.

Canvas Namespace

The `Canvas` namespace provides an interface and classes for canvas apps in Salesforce.

ChatterAnswers Namespace

The `ChatterAnswers` namespace provides an interface for creating Account records.

CommerceOrders Namespace

The `CommerceOrders` namespace provides classes and methods to place orders with integrated pricing, configuration, and validation.

CommercePayments Namespace

Use the `CommercePayments` namespace to provide a safe and customizable platform for managing customer payments and refunds.

CommerceTax Namespace

Manage the communication between Salesforce and an external tax engine.

Compression Namespace (Developer Preview)

The Compression namespace provides classes and methods to create and extract zip files.

ConnectApi Namespace

The `ConnectApi` namespace (also called Connect in Apex) provides classes for accessing the same data available in Connect REST API. Use Connect in Apex to create custom experiences in Salesforce.

Database Namespace

The `Database` namespace provides classes used with DML operations.

Datacloud Namespace

The `Datacloud` namespace provides classes and methods for retrieving information about duplicate rules. Duplicate rules let you control whether and when users can save duplicate records within Salesforce.

DataSource Namespace

The `DataSource` namespace provides the classes for the Apex Connector Framework. Use the Apex Connector Framework to develop a custom adapter for Salesforce Connect. Then connect your Salesforce organization to any data anywhere via the Salesforce Connect custom adapter.

DataWeave Namespace

The DataWeave namespace provides classes and methods to support the invocation of DataWeave scripts from Apex.

Dom Namespace

The `Dom` namespace provides classes and methods for parsing and creating XML content.

EventBus Namespace

The `EventBus` namespace provides classes and methods for platform events and Change Data Capture events.

ExternalService Namespace

The `ExternalService` namespace provides dynamically generated Apex service interfaces and Apex classes for complex object data types.

Flow Namespace

The `Flow` namespace provides a class for advanced access to flows from Apex such as from Visualforce controllers and asynchronous Apex.

FormulaEval Namespace (Developer Preview)

The FormulaEval namespace provides classes and methods to evaluate user-defined dynamic formulas for Apex objects and SObjects. Use the methods to avoid unnecessary DML statements to recalculate formula field values or evaluate dynamic formula expressions. All class methods must be called within the context of a global Apex class.

Functions Namespace

The Functions namespace provides classes and methods used to invoke and manage Salesforce Functions.

Invocable Namespace

The `Invocable` namespace provides classes for calling invocable actions from Apex.

IsvPartners Namespace

The `IsvPartners` namespace provides a class associated with Salesforce ISV partner use cases, such as optimizing code, providing great customer trial experiences, and driving feature adoption.

KbManagement Namespace

The `KbManagement` namespace provides a class for managing knowledge articles.

LxScheduler Namespace

The `LxScheduler` namespace provides an interface and classes for integrating Salesforce Scheduler with external calendars.

Messaging Namespace

The `Messaging` namespace provides classes and methods for Salesforce outbound and inbound email functionality.

Metadata Namespace

The `Metadata` namespace provides classes and methods for working with custom metadata in Salesforce

PlaceQuote Namespace

The `PlaceQuote` namespace provides classes and methods to create or update quotes with pricing preferences and configuration options.

Pref_center Namespace

The Pref_center namespace provides an interface, classes, and methods to create and retrieve data in forms in Preference Manager. Preference Manager, previously called Preference Center, is a feature within the Privacy Center app.

Process Namespace

The `Process` namespace provides an interface and classes for passing data between your organization and a flow.

QuickAction Namespace

The `QuickAction` namespace provides classes and methods for quick actions.

Reports Namespace

The `Reports` namespace provides classes for accessing the same data as is available in the Salesforce Reports and Dashboards REST API.

RichMessaging Namespace

Provides objects and methods for handling content in enhanced Messaging channels.

Schema Namespace

The `Schema` namespace provides classes and methods for schema metadata information.

Search Namespace

The `Search` namespace provides classes for getting search results and suggestion results.

Sfc Namespace

The Sfc namespace contains classes used in Salesforce Files.

Sfdc_Checkout Namespace

The Sfdc_Checkout namespace provides an interface and classes for B2B Commerce apps in Salesforce.

sfdc_surveys Namespace

The `sfdc_surveys` namespace provides an interface for shortening survey invitations.

Site Namespace

The `Site` namespace provides an interface for rewriting Sites URLs.

Slack Namespace

The `Slack` Namespace provides tools designed to accelerate and ease the process of developing Slack apps on the Salesforce platform.

Support Namespace

The `Support` namespace provides an interface used for Case Feed.

System Namespace

The `System` namespace provides classes and methods for core Apex functionality.

TerritoryMgmt Namespace

The `TerritoryMgmt` namespace provides an interface used for territory management.

TxnSecurity Namespace

The `TxnSecurity` namespace provides an interface used for transaction security.

UserProvisioning Namespace

The `UserProvisioning` namespace provides methods for monitoring outbound user provisioning requests.

VisualEditor Namespace

The `VisualEditor` namespace provides classes and methods for interacting with the Lightning App Builder. The classes and methods in this namespace operate on Lightning components, which include Lightning web components and Aura components.

Wave Namespace

The classes in the `Wave` namespace are part of the CRM Analytics Analytics SDK, designed to facilitate querying CRM Analytics data from Apex code.

Appendices

Apex Release Notes

Use the Salesforce Release Notes to learn about the most recent updates and changes to Apex.

For Apex updates and changes that impact the Salesforce Platform, see the Apex Release Notes.

For new and changed Apex classes, methods, exceptions and interfaces, see Apex: New and Changed Items in the Salesforce Release Notes.

Apex DML Operations

You can perform DML operations using the Apex DML statements or the methods of the `Database` class. For lead conversion, use the `convertLead` method of the `Database` class. There is no DML counterpart for it.

SEE ALSO:

Apex Developer Guide: Working with Data in Apex

Database Class

Apex DML Statements

Use Data Manipulation Language (DML) statements to insert, update, merge, delete, and restore data in Salesforce.

The following Apex DML statements are available:

Insert Statement

The `insert` DML operation adds one or more sObjects, such as individual accounts or contacts, to your organization's data. `insert` is analogous to the INSERT statement in SQL.

Syntax

```
insert sObject
insert sObject[]
```

Example

The following example inserts an account named 'Acme':

```
Account newAcct = new Account(name = 'Acme');
try {
   insert newAcct;
} catch (DmlException e) {
// Process exception here
}
```

Note: For more information on processing `DmlExceptions`, see Bulk DML Exception Handling.

Update Statement

The `update` DML operation modifies one or more existing sObject records, such as individual accounts or contacts, in your organization's data. `update` is analogous to the UPDATE statement in SQL.

Syntax

`update` ***sObject***

`update` ***sObject[]***

Example

The following example updates the `BillingCity` field on a single account named 'Acme':

```
Account a = new Account(Name='Acme2');
insert(a);

Account myAcct = [SELECT Id, Name, BillingCity FROM Account WHERE Id = :a.Id];
myAcct.BillingCity = 'San Francisco';

try {
    update myAcct;
} catch (DmlException e) {
    // Process exception here
}
```

Note: For more information on processing `DmlExceptions`, see Bulk DML Exception Handling.

Upsert Statement

The `upsert` DML operation creates new records and updates sObject records within a single statement, using a specified field to determine the presence of existing objects, or the ID field if no field is specified.

Syntax

`upsert` ***sObject*** [***opt_field***]

`upsert` ***sObject[]*** [***opt_field***]

The `upsert` statement matches the sObjects with existing records by comparing values of one field. If you don't specify a field when calling this statement, the `upsert` statement uses the sObject's ID to match the sObject with existing records in Salesforce. Alternatively, you can specify a field to use for matching. For custom objects, specify a custom field marked as external ID. For standard objects, you can specify any field that has the `idLookup` attribute set to true. For example, the Email field of Contact or User has the `idLookup` attribute set. To check a field's attribute, see the Object Reference for Salesforce.

Also, you can use foreign keys to upsert sObject records if they have been set as reference fields. For more information, see Field Types in the *Object Reference for Salesforce*.

The optional field parameter, *`opt_field`*, is a field token (of type `Schema.SObjectField`). For example, to specify the MyExternalID custom field, the statement is:

```
upsert sObjectList Account.Fields.MyExternalId__c;
```

If the field used for matching doesn't have the `Unique` attribute set, the context user must have the "View All" object-level permission for the target object or the "View All Data" permission so that `upsert` doesn't accidentally insert a duplicate record.

Note: Custom field matching is case-insensitive only if the custom field has the **Unique** and **Treat "ABC" and "abc" as duplicate values (case insensitive)** attributes selected as part of the field definition. If so, "ABC123" is matched with "abc123." For more information, see "Create Custom Fields" in the Salesforce online help.

How Upsert Chooses to Insert or Update

Upsert uses the sObject record's primary key (the ID), an idLookup field, or an external ID field to determine whether it should create a record or update an existing one:

- If the key isn't matched, a new object record is created.
- If the key is matched once, the existing object record is updated.
- If the key is matched multiple times, an error is generated and the object record isn't inserted or updated.

Example

This example performs an upsert of a list of accounts.

```
List<Account> acctList = new List<Account>();
// Fill the accounts list with some accounts

try {
    upsert acctList;
} catch (DmlException e) {

}
```

This next example performs an upsert of a list of accounts using a foreign key for matching existing records, if any.

```
List<Account> acctList = new List<Account>();
// Fill the accounts list with some accounts

try {
    // Upsert using an external ID field
    upsert acctList myExtIDField__c;
} catch (DmlException e) {

}
```

Delete Statement

The `delete` DML operation deletes one or more existing sObject records, such as individual accounts or contacts, from your organization's data. `delete` is analogous to the `delete()` statement in the SOAP API.

Syntax

```
delete sObject
delete sObject[]
```

Example

The following example deletes all accounts that are named 'DotCom':

```
Account[] doomedAccts = [SELECT Id, Name FROM Account
                         WHERE Name = 'DotCom'];
try {
    delete doomedAccts;
} catch (DmlException e) {
    // Process exception here
}
```

Note: For more information on processing `DmlExceptions`, see Bulk DML Exception Handling.

Undelete Statement

The `undelete` DML operation restores one or more existing sObject records, such as individual accounts or contacts, from your organization's Recycle Bin. `undelete` is analogous to the UNDELETE statement in SQL.

Syntax

```
undelete sObject | ID
undelete sObject[] | ID[]
```

Example

The following example undeletes an account named 'Universal Containers'. The `ALL ROWS` keyword queries all rows for both top level and aggregate relationships, including deleted records and archived activities.

```
Account[] savedAccts = [SELECT Id, Name FROM Account WHERE Name = 'Universal Containers'
ALL ROWS];
try {
    undelete savedAccts;
} catch (DmlException e) {
    // Process exception here
}
```

Note: For more information on processing `DmlExceptions`, see Bulk DML Exception Handling.

Merge Statement

The `merge` statement merges up to three records of the same sObject type into one of the records, deleting the others, and re-parenting any related records.

Note: This DML operation does not have a matching Database system method.

Syntax

```
merge sObject sObject
merge sObject sObject[]
merge sObject ID
merge sObject ID[]
```

The first parameter represents the master record into which the other records are to be merged. The second parameter represents the one or two other records that should be merged and then deleted. You can pass these other records into the `merge` statement as a single sObject record or ID, or as a list of two sObject records or IDs.

Example

The following example merges two accounts named 'Acme Inc.' and 'Acme' into a single record:

```
List<Account> ls = new List<Account>{new Account(name='Acme Inc.'),new Account(name='Acme')};
insert ls;
Account masterAcct = [SELECT Id, Name FROM Account WHERE Name = 'Acme Inc.' LIMIT 1];
Account mergeAcct = [SELECT Id, Name FROM Account WHERE Name = 'Acme' LIMIT 1];
try {
    merge masterAcct mergeAcct;
} catch (DmlException e) {
    // Process exception here
}
```

Note: For more information on processing `DmlExceptions`, see Bulk DML Exception Handling.

ApexPages Namespace

The `ApexPages` namespace provides classes used in Visualforce controllers.

The following are the classes in the `ApexPages` namespace.

IN THIS SECTION:

Action Class

You can use `ApexPages.Action` to create an action method that you can use in a Visualforce custom controller or controller extension.

Component Class

Represents a dynamic Visualforce component in Apex.

IdeaStandardController Class

`IdeaStandardController` objects offer Ideas-specific functionality in addition to what is provided by the `StandardController`.

IdeaStandardSetController Class

`IdeaStandardSetController` objects offer Ideas-specific functionality in addition to what is provided by the `StandardSetController`.

KnowledgeArticleVersionStandardController Class

`KnowledgeArticleVersionStandardController` objects offer article-specific functionality in addition to what is provided by the `StandardController`.

Message Class

Contains validation errors that occur when the user saves the page that uses a standard controller.

StandardController Class

Use a StandardController when defining an extension for a standard controller.

StandardSetController Class

`StandardSetController` objects allow you to create list controllers similar to, or as extensions of, the pre-built Visualforce list controllers provided by Salesforce.

Action Class

You can use `ApexPages.Action` to create an action method that you can use in a Visualforce custom controller or controller extension.

Namespace

ApexPages

Usage

For example, you could create a `saveOver` method on a controller extension that performs a custom save.

Instantiation

The following code snippet illustrates how to instantiate a new `ApexPages.Action` object that uses the save action:

```
ApexPages.Action saveAction = new ApexPages.Action('{!save}');
```

IN THIS SECTION:

Action Constructors

Action Methods

Action Constructors

The following are constructors for `Action`.

IN THIS SECTION:

Action(action)
Creates a new instance of the `ApexPages.Action` class using the specified action.

`Action(action)`

Creates a new instance of the `ApexPages.Action` class using the specified action.

Signature

```
public Action(String action)
```

Parameters

`action`
Type: String

The action.

Action Methods

The following are methods for `Action`. All are instance methods.

IN THIS SECTION:

getExpression()
Returns the expression that is evaluated when the action is invoked.
invoke()
Invokes the action.

`getExpression()`

Returns the expression that is evaluated when the action is invoked.

Signature

```
public String getExpression()
```

Return Value

Type: String

`invoke()`

Invokes the action.

Signature

```
public System.PageReference invoke()
```

Return Value

Type: System.PageReference

Component Class

Represents a dynamic Visualforce component in Apex.

Namespace

ApexPages

Dynamic Component Properties

The following are properties for `Component`.

IN THIS SECTION:

childComponents
Returns a reference to the child components for the component.

expressions
Sets the content of an attribute using the expression language notation. The notation for this is `expressions.name_of_attribute`.

facets
Sets the content of a facet to a dynamic component. The notation is `facet.name_of_facet`.

`childComponents`

Returns a reference to the child components for the component.

Signature

```
public List <ApexPages.Component> childComponents {get; set;}
```

Property Value

Type: List<ApexPages.Component>

Example

```
Component.Apex.PageBlock pageBlk = new Component.Apex.PageBlock();

Component.Apex.PageBlockSection pageBlkSection = new
Component.Apex.PageBlockSection(title='dummy header');

pageBlk.childComponents.add(pageBlkSection);
```

`expressions`

Sets the content of an attribute using the expression language notation. The notation for this is `expressions.name_of_attribute`.

Signature

```
public String expressions {get; set;}
```

Property Value

Type: String

Example

```
Component.Apex.InputField inpFld = new
Component.Apex.InputField();
inpField.expressions.value = '{!Account.Name}';
inpField.expressions.id = '{!$User.FirstName}';
```

`facets`

Sets the content of a facet to a dynamic component. The notation is `facet.name_of_facet`.

Signature

```
public String facets {get; set;}
```

Property Value

Type: String

Usage

Note: This property is only accessible by components that support facets.

Example

```
Component.Apex.DataTable myDT = new
Component.Apex.DataTable();
Component.Apex.OutputText footer = new
Component.Apex.OutputText(value='Footer Copyright');
myDT.facets.footer = footer;
```

IdeaStandardController Class

`IdeaStandardController` objects offer Ideas-specific functionality in addition to what is provided by the `StandardController`.

Namespace

ApexPages

Usage

A method in the IdeaStandardController object is called by and operated on a particular instance of an IdeaStandardController.

Note: The `IdeaStandardSetController` and `IdeaStandardController` classes are currently available through a limited release program. For information on enabling these classes for your organization, contact your Salesforce representative.

In addition to the methods listed in this class, the `IdeaStandardController` class inherits all the methods associated with the `StandardController` class.

Instantiation

An IdeaStandardController object cannot be instantiated. An instance can be obtained through a constructor of a custom extension controller when using the standard ideas controller.

Example

The following example shows how an IdeaStandardController object can be used in the constructor for a custom list controller. This example provides the framework for manipulating the comment list data before displaying it on a Visualforce page.

```
public class MyIdeaExtension {

    private final ApexPages.IdeaStandardController ideaController;

    public MyIdeaExtension(ApexPages.IdeaStandardController controller) {
        ideaController = (ApexPages.IdeaStandardController)controller;
    }

    public List<IdeaComment> getModifiedComments() {
        IdeaComment[] comments = ideaController.getCommentList();
        // modify comments here
        return comments;
    }

}
```

The following Visualforce markup shows how the IdeaStandardController example shown above can be used in a page. This page must be named *`detailPage`* for this example to work.

Note: For the Visualforce page to display the idea and its comments, in the following example you need to specify the ID of a specific idea (for example, `/apex/detailPage?id=<ideaID>`) whose comments you want to view.

```
<!-- page named detailPage -->
<apex:page standardController="Idea" extensions="MyIdeaExtension">
    <apex:pageBlock title="Idea Section">
        <ideas:detailOutputLink page="detailPage" ideaId="{!idea.id}">{!idea.title}
        </ideas:detailOutputLink>
        <br/><br/>
        <apex:outputText >{!idea.body}</apex:outputText>
    </apex:pageBlock>
```

```
    <apex:pageBlock title="Comments Section">
        <apex:dataList var="a" value="{!modifiedComments}" id="list">
            {!a.commentBody}
        </apex:dataList>
        <ideas:detailOutputLink page="detailPage" ideaId="{!idea.id}"
               pageOffset="-1">Prev</ideas:detailOutputLink>
        |
        <ideas:detailOutputLink page="detailPage" ideaId="{!idea.id}"
               pageOffset="1">Next</ideas:detailOutputLink>
    </apex:pageBlock>
</apex:page>
```

SEE ALSO:

StandardController Class

IdeaStandardController Methods

The following are instance methods for `IdeaStandardController`.

IN THIS SECTION:

getCommentList()

Returns the list of read-only comments from the current page.

`getCommentList()`

Returns the list of read-only comments from the current page.

Signature

```
public IdeaComment[] getCommentList()
```

Return Value

Type: IdeaComment[]

This method returns the following comment properties:

- `id`
- `commentBody`
- `createdDate`
- `createdBy.Id`
- `createdBy.communityNickname`

IdeaStandardSetController Class

`IdeaStandardSetController` objects offer Ideas-specific functionality in addition to what is provided by the `StandardSetController`.

Namespace

ApexPages

Usage

Note: The `IdeaStandardSetController` and `IdeaStandardController` classes are currently available through a limited release program. For information on enabling these classes for your organization, contact your Salesforce representative.

In addition to the method listed above, the `IdeaStandardSetController` class inherits the methods associated with the `StandardSetController`.

Note: The methods inherited from the `StandardSetController` cannot be used to affect the list of ideas returned by the `getIdeaList` method.

Instantiation

An IdeaStandardSetController object cannot be instantiated. An instance can be obtained through a constructor of a custom extension controller when using the standard list controller for ideas.

Example: Displaying a Profile Page

The following example shows how an IdeaStandardSetController object can be used in the constructor for a custom list controller:

```
public class MyIdeaProfileExtension {
    private final ApexPages.IdeaStandardSetController ideaSetController;

    public MyIdeaProfileExtension(ApexPages.IdeaStandardSetController controller) {
        ideaSetController = (ApexPages.IdeaStandardSetController)controller;
    }

    public List<Idea> getModifiedIdeas() {
        Idea[] ideas = ideaSetController.getIdeaList();
        // modify ideas here
        return ideas;
    }

}
```

The following Visualforce markup shows how the IdeaStandardSetController example shown above and the `<ideas:profileListOutputLink>` component can display a profile page that lists the recent replies, submitted ideas, and votes associated with a user. Because this example does not identify a specific user ID, the page automatically shows the profile page for the current logged in user. This page must be named *`profilePage`* in order for this example to work:

```
<!-- page named profilePage -->
<apex:page standardController="Idea" extensions="MyIdeaProfileExtension"
recordSetVar="ideaSetVar">
    <apex:pageBlock >
        <ideas:profileListOutputLink sort="recentReplies" page="profilePage">
          Recent Replies</ideas:profileListOutputLink>
        |
        <ideas:profileListOutputLink sort="ideas" page="profilePage">Ideas Submitted
        </ideas:profileListOutputLink>
```

```
        |
        <ideas:profileListOutputLink sort="votes" page="profilePage">Ideas Voted
        </ideas:profileListOutputLink>
    </apex:pageBlock>
    <apex:pageBlock >
        <apex:dataList value="{!modifiedIdeas}" var="ideadata">
            <ideas:detailoutputlink ideaId="{!ideadata.id}" page="viewPage">
             {!ideadata.title}</ideas:detailoutputlink>
        </apex:dataList>
    </apex:pageBlock>
</apex:page>
```

In the previous example, the `<ideas:detailoutputlink>` component links to the following Visualforce markup that displays the detail page for a specific idea. This page must be named *viewPage* in order for this example to work:

```
<!-- page named viewPage -->
<apex:page standardController="Idea">
    <apex:pageBlock title="Idea Section">
        <ideas:detailOutputLink page="viewPage" ideaId="{!idea.id}">{!idea.title}
        </ideas:detailOutputLink>
        <br/><br/>
        <apex:outputText>{!idea.body}</apex:outputText>
    </apex:pageBlock>
</apex:page>
```

Example: Displaying a List of Top, Recent, and Most Popular Ideas and Comments

The following example shows how an IdeaStandardSetController object can be used in the constructor for a custom list controller:

Note: You must have created at least one idea for this example to return any ideas.

```
public class MyIdeaListExtension {
    private final ApexPages.IdeaStandardSetController ideaSetController;

    public MyIdeaListExtension (ApexPages.IdeaStandardSetController controller) {
        ideaSetController = (ApexPages.IdeaStandardSetController)controller;
    }

    public List<Idea> getModifiedIdeas() {
        Idea[] ideas = ideaSetController.getIdeaList();
        // modify ideas here
        return ideas;
    }
}
```

The following Visualforce markup shows how the IdeaStandardSetController example shown above can be used with the `<ideas:listOutputLink>` component to display a list of recent, top, and most popular ideas and comments. This page must be named *listPage* in order for this example to work:

```
<!-- page named listPage -->
<apex:page standardController="Idea" extensions="MyIdeaListExtension"
recordSetVar="ideaSetVar">
    <apex:pageBlock >
```

```
        <ideas:listOutputLink sort="recent" page="listPage">Recent Ideas
        </ideas:listOutputLink>
        |
        <ideas:listOutputLink sort="top" page="listPage">Top Ideas
        </ideas:listOutputLink>
        |
        <ideas:listOutputLink sort="popular" page="listPage">Popular Ideas
        </ideas:listOutputLink>
        |
        <ideas:listOutputLink sort="comments" page="listPage">Recent Comments
        </ideas:listOutputLink>
    </apex:pageBlock>
    <apex:pageBlock >
        <apex:dataList value="{!modifiedIdeas}" var="ideadata">
            <ideas:detailoutputlink ideaId="{!ideadata.id}" page="viewPage">
             {!ideadata.title}</ideas:detailoutputlink>
        </apex:dataList>
    </apex:pageBlock>
</apex:page>
```

In the previous example, the `<ideas:detailoutputlink>` component links to the following Visualforce markup that displays the detail page for a specific idea. This page must be named *viewPage*.

```
<!-- page named viewPage -->
<apex:page standardController="Idea">
    <apex:pageBlock title="Idea Section">
        <ideas:detailOutputLink page="viewPage" ideaId="{!idea.id}">{!idea.title}
        </ideas:detailOutputLink>
        <br/><br/>
        <apex:outputText>{!idea.body}</apex:outputText>
    </apex:pageBlock>
</apex:page>
```

SEE ALSO:

StandardSetController Class

IdeaStandardSetController Methods

The following are instance methods for `IdeaStandardSetController`.

IN THIS SECTION:

getIdeaList()

Returns the list of read-only ideas in the current page set.

`getIdeaList()`

Returns the list of read-only ideas in the current page set.

Signature

```
public Idea[] getIdeaList()
```

Return Value

Type: Idea[]

Usage

You can use the `<ideas:listOutputLink>`, `<ideas:profileListOutputLink>`, and `<ideas:detailOutputLink>` components to display profile pages as well as idea list and detail pages (see the examples below). The following is a list of properties returned by this method:

- `Body`
- `Categories`
- `Category`
- `CreatedBy.CommunityNickname`
- `CreatedBy.Id`
- `CreatedDate`
- `Id`
- `LastCommentDate`
- `LastComment.Id`
- `LastComment.CommentBody`
- `LastComment.CreatedBy.CommunityNickname`
- `LastComment.CreatedBy.Id`
- `NumComments`
- `Status`
- `Title`
- `VoteTotal`

KnowledgeArticleVersionStandardController Class

`KnowledgeArticleVersionStandardController` objects offer article-specific functionality in addition to what is provided by the `StandardController`.

Namespace

ApexPages

Usage

In addition to the method listed above, the `KnowledgeArticleVersionStandardController` class inherits all the methods associated with `StandardController`.

Note: Though inherited, the `edit`, `delete`, and `save` methods don't serve a function when used with the `KnowledgeArticleVersionStandardController` class.

Example

The following example shows how a `KnowledgeArticleVersionStandardController` object can be used to create a custom extension controller. In this example, you create a class named `AgentContributionArticleController` that allows customer-support agents to see pre-populated fields on the draft articles they create while closing cases.

Prerequisites:

1. Create an article type called *`FAQ`*. For instructions, see "Create Article Types" in the Salesforce online help.
2. Create a text custom field called `Details`. For instructions, see "Add Custom Fields to Article Types" in the Salesforce online help.
3. Create a category group called *`Geography`* and assign it to a category called *`USA`*. For instructions, see "Create and Modify Category Groups" and "Add Data Categories to Category Groups" in the Salesforce online help.
4. Create a category group called *`Topics`* and assign it a category called *`Maintenance`*.

```
/** Custom extension controller for the simplified article edit page that
    appears when an article is created on the close-case page.
*/
public class AgentContributionArticleController {
    // The constructor must take a ApexPages.KnowledgeArticleVersionStandardController as
 an argument
    public AgentContributionArticleController(
        ApexPages.KnowledgeArticleVersionStandardController ctl) {
        // This is the SObject for the new article.
        //It can optionally be cast to the proper article type.
        // For example, FAQ__kav article = (FAQ__kav) ctl.getRecord();
        SObject article = ctl.getRecord();
        // This returns the ID of the case that was closed.
        String sourceId = ctl.getSourceId();
        Case c = [SELECT Subject, Description FROM Case WHERE Id=:sourceId];

        // This overrides the default behavior of pre-filling the
        // title of the article with the subject of the closed case.
        article.put('title', 'From Case: '+c.subject);
        article.put('details__c',c.description);

        // Only one category per category group can be specified.
        ctl.selectDataCategory('Geography','USA');
        ctl.selectDataCategory('Topics','Maintenance');
    }
}
```

```
/** Test class for the custom extension controller.
*/
@isTest
private class AgentContributionArticleControllerTest {
    static testMethod void testAgentContributionArticleController() {
         String caseSubject = 'my test';
         String caseDesc = 'my test description';

         Case c = new Case();
         c.subject= caseSubject;
         c.description = caseDesc;
         insert c;
         String caseId = c.id;
```

```
        System.debug('Created Case: ' + caseId);

        ApexPages.currentPage().getParameters().put('sourceId', caseId);
        ApexPages.currentPage().getParameters().put('sfdc.override', '1');

        ApexPages.KnowledgeArticleVersionStandardController ctl =
           new ApexPages.KnowledgeArticleVersionStandardController(new FAQ__kav());

        new AgentContributionArticleController(ctl);

        System.assertEquals(caseId, ctl.getSourceId());
        System.assertEquals('From Case: '+caseSubject, ctl.getRecord().get('title'));
        System.assertEquals(caseDesc, ctl.getRecord().get('details__c'));
    }
}
```

If you created the custom extension controller for the purpose described in the previous example (that is, to modify submitted-via-case articles), complete the following steps after creating the class:

1. Log into your Salesforce organization and from Setup, enter *Knowledge Settings* in the Quick Find box, then select **Knowledge Settings**.
2. Click **Edit**.
3. Assign the class to the Use Apex customization field. This associates the article type specified in the new class with the article type assigned to closed cases.
4. Click **Save**.

KnowledgeArticleVersionStandardController Constructors

KnowledgeArticleVersionStandardController Methods

SEE ALSO:

StandardController Class

KnowledgeArticleVersionStandardController Constructors

The following are constructors for KnowledgeArticleVersionStandardController.

IN THIS SECTION:

KnowledgeArticleVersionStandardController(article)

Creates a new instance of the ApexPages.KnowledgeArticleVersionStandardController class using the specified knowledge article.

KnowledgeArticleVersionStandardController(article)

Creates a new instance of the ApexPages.KnowledgeArticleVersionStandardController class using the specified knowledge article.

Signature

```
public KnowledgeArticleVersionStandardController(SObject article)
```

Parameters

article
Type: SObject

The knowledge article, such as `FAQ_kav`.

KnowledgeArticleVersionStandardController Methods

The following are instance methods for `KnowledgeArticleVersionStandardController`.

IN THIS SECTION:

getSourceId()
Returns the ID for the source object record when creating a new article from another object.

setDataCategory(categoryGroup, category)
Specifies a default data category for the specified data category group when creating a new article.

`getSourceId()`

Returns the ID for the source object record when creating a new article from another object.

Signature

```
public String getSourceId()
```

Return Value

Type: String

`setDataCategory(categoryGroup, category)`

Specifies a default data category for the specified data category group when creating a new article.

Signature

```
public Void setDataCategory(String categoryGroup, String category)
```

Parameters

categoryGroup
Type: String

category
Type: String

Return Value

Type: Void

Message Class

Contains validation errors that occur when the user saves the page that uses a standard controller.

Namespace

ApexPages

Usage

When using a standard controller, all validation errors, both custom and standard, that occur when the user saves the page are automatically added to the page error collections. If an `inputField` component is bound to the field with an error, the message is added to the component's error collection. All messages are added to the page's error collection. For more information, see Validation Rules and Standard Controllers in the *Visualforce Developer's Guide*.

If your application uses a custom controller or extension, you must use the `message` class for collecting errors.

Instantiation

In a custom controller or controller extension, you can instantiate a Message in one of these ways:

- ```
  ApexPages.Message myMsg = new ApexPages.Message(ApexPages.severity, summary);
  ```

  where `ApexPages.severity` is the enum that determines how severe a message is, and `summary` is the String used to summarize the message. For example:

  ```
  ApexPages.Message myMsg = new ApexPages.Message(ApexPages.Severity.FATAL, 'my error msg');
  ```

- ```
  ApexPages.Message myMsg = new ApexPages.Message(ApexPages.severity, summary, detail);
  ```

  where `ApexPages. severity` is the enum that determines how severe a message is, `summary` is the String used to summarize the message, and `detail` is the String used to provide more detailed information about the error.

ApexPages.Severity Enum

To specify the severity of the message, use the `ApexPages.Severity` enum values. The following are the valid values:

- `CONFIRM`
- `ERROR`
- `FATAL`
- `INFO`
- `WARNING`

All enums have access to standard methods, such as `name` and `value`.

IN THIS SECTION:

Message Constructors

Message Methods

Message Constructors

The following are constructors for `Message`.

IN THIS SECTION:

Message(severity, summary)

Creates a new instance of the `ApexPages.Message` class using the specified message severity and summary.

Message(severity, summary, detail)

Creates a new instance of the `ApexPages.Message` class using the specified message severity, summary, and message detail.

Message(severity, summary, detail, id)

Creates a new instance of the `ApexPages.Message` class using the specified severity, summary, detail, and component ID.

`Message(severity, summary)`

Creates a new instance of the `ApexPages.Message` class using the specified message severity and summary.

Signature

```
public Message(ApexPages.Severity severity, String summary)
```

Parameters

severity

Type: ApexPages.Severity

The severity of a Visualforce message.

summary

Type: String

The summary Visualforce message.

`Message(severity, summary, detail)`

Creates a new instance of the `ApexPages.Message` class using the specified message severity, summary, and message detail.

Signature

```
public Message(ApexPages.Severity severity, String summary, String detail)
```

Parameters

severity

Type: ApexPages.Severity

The severity of a Visualforce message.

summary
Type: String

The summary Visualforce message.

detail
Type: String

The detailed Visualforce message.

Message(severity, summary, detail, id)

Creates a new instance of the `ApexPages.Message` class using the specified severity, summary, detail, and component ID.

Signature

```
public Message(ApexPages.Severity severity, String summary, String detail, String id)
```

Parameters

severity
Type: ApexPages.Severity

The severity of a Visualforce message.

summary
Type: String

The summary Visualforce message.

detail
Type: String

The detailed Visualforce message.

id
Type: String

The ID of the Visualforce component to associate with the message, for example, a form field with an error.

Message Methods

The following are methods for `Message`. All are instance methods.

IN THIS SECTION:

getComponentLabel()
Returns the label of the associated `inputField` component. If no label is defined, this method returns `null`.

getDetail()
Returns the value of the detail parameter used to create the message. If no detail String was specified, this method returns `null`.

getSeverity()
Returns the severity enum used to create the message.

getSummary()
Returns the summary String used to create the message.

`getComponentLabel()`

Returns the label of the associated `inputField` component. If no label is defined, this method returns `null`.

Signature

```
public String getComponentLabel()
```

Return Value

Type: String

`getDetail()`

Returns the value of the detail parameter used to create the message. If no detail String was specified, this method returns `null`.

Signature

```
public String getDetail()
```

Return Value

Type: String

`getSeverity()`

Returns the severity enum used to create the message.

Signature

```
public ApexPages.Severity getSeverity()
```

Return Value

Type: ApexPages.Severity

`getSummary()`

Returns the summary String used to create the message.

Signature

```
public String getSummary()
```

Return Value

Type: String

StandardController Class

Use a StandardController when defining an extension for a standard controller.

Namespace

ApexPages

Usage

StandardController objects reference the pre-built Visualforce controllers provided by Salesforce. The only time it is necessary to refer to a StandardController object is when defining an extension for a standard controller. StandardController is the data type of the single argument in the extension class constructor.

Instantiation

You can instantiate a StandardController in the following way:

```
ApexPages.StandardController sc = new ApexPages.StandardController(sObject);
```

Example

The following example shows how a StandardController object can be used in the constructor for a standard controller extension:

```
public class myControllerExtension {

    private final Account acct;

    // The extension constructor initializes the private member
    // variable acct by using the getRecord method from the standard
    // controller.
    public myControllerExtension(ApexPages.StandardController stdController) {
        this.acct = (Account)stdController.getRecord();
    }

    public String getGreeting() {
        return 'Hello ' + acct.name + ' (' + acct.id + ')';
    }
}
```

The following Visualforce markup shows how the controller extension from above can be used in a page:

```
<apex:page standardController="Account" extensions="myControllerExtension">
    {!greeting} <p/>
    <apex:form>
        <apex:inputField value="{!account.name}"/> <p/>
        <apex:commandButton value="Save" action="{!save}"/>
    </apex:form>
</apex:page>
```

IN THIS SECTION:

StandardController Constructors

StandardController Methods

StandardController Constructors

The following are constructors for `StandardController`.

IN THIS SECTION:

StandardController(controllerSObject)

Creates a new instance of the `ApexPages.StandardController` class for the specified standard or custom object.

`StandardController(controllerSObject)`

Creates a new instance of the `ApexPages.StandardController` class for the specified standard or custom object.

Signature

```
public StandardController(SObject controllerSObject)
```

Parameters

`controllerSObject`

Type: SObject

A standard or custom object.

StandardController Methods

The following are methods for `StandardController`. All are instance methods.

IN THIS SECTION:

addFields(fieldNames)

When a Visualforce page is loaded, the fields accessible to the page are based on the fields referenced in the Visualforce markup. This method adds a reference to each field specified in `fieldNames` so that the controller can explicitly access those fields as well.

cancel()

Returns the PageReference of the cancel page.

delete()

Deletes record and returns the PageReference of the delete page.

edit()

Returns the PageReference of the standard edit page.

getId()

Returns the ID of the record that is currently in context, based on the value of the `id` query string parameter in the Visualforce page URL.

getRecord()

Returns the record that is currently in context, based on the value of the `id` query string parameter in the Visualforce page URL.

reset()

Forces the controller to reacquire access to newly referenced fields. Any changes made to the record prior to this method call are discarded.

save()

Saves changes and returns the updated PageReference.

view()

Returns the PageReference object of the standard detail page.

addFields(fieldNames)

When a Visualforce page is loaded, the fields accessible to the page are based on the fields referenced in the Visualforce markup. This method adds a reference to each field specified in `fieldNames` so that the controller can explicitly access those fields as well.

Signature

```
public Void addFields(List<String> fieldNames)
```

Parameters

`fieldNames`
Type: List<String>

Return Value

Type: Void

Usage

This method should be called before a record has been loaded—typically, it's called by the controller's constructor. If this method is called outside of the constructor, you must use the `reset()` method before calling `addFields()`.

The strings in `fieldNames` can either be the API name of a field, such as AccountId, or they can be explicit relationships to fields, such as `something__r.myField__c`.

This method is only for controllers used by dynamicVisualforce bindings.

cancel()

Returns the PageReference of the cancel page.

Signature

```
public System.PageReference cancel()
```

Return Value

Type: System.PageReference

delete()

Deletes record and returns the PageReference of the delete page.

Signature

```
public System.PageReference delete()
```

Return Value

Type: System.PageReference

`edit()`

Returns the PageReference of the standard edit page.

Signature

```
public System.PageReference edit()
```

Return Value

Type: System.PageReference

`getId()`

Returns the ID of the record that is currently in context, based on the value of the `id` query string parameter in the Visualforce page URL.

Signature

```
public String getId()
```

Return Value

Type: String

`getRecord()`

Returns the record that is currently in context, based on the value of the `id` query string parameter in the Visualforce page URL.

Signature

```
public SObject getRecord()
```

Return Value

Type: sObject

Usage

Note that only the fields that are referenced in the associated Visualforce markup are available for querying on this SObject. All other fields, including fields from any related objects, must be queried using a SOQL expression.

Tip: You can work around this restriction by including a hidden component that references any additional fields that you want to query. Hide the component from display by setting the component's `rendered` attribute to `false`.

Example

```
<apex:outputText
value="{!account.billingcity}
{!account.contacts}"
rendered="false"/>
```

reset()

Forces the controller to reacquire access to newly referenced fields. Any changes made to the record prior to this method call are discarded.

Signature

```
public Void reset()
```

Return Value

Type: Void

Usage

This method is only used if `addFields` is called outside the constructor, and it must be called directly before `addFields`.

This method is only for controllers used by dynamicVisualforce bindings.

save()

Saves changes and returns the updated PageReference.

Signature

```
public System.PageReference save()
```

Return Value

Type: System.PageReference

view()

Returns the PageReference object of the standard detail page.

Signature

```
public System.PageReference view()
```

Return Value

Type: System.PageReference

StandardSetController Class

`StandardSetController` objects allow you to create list controllers similar to, or as extensions of, the pre-built Visualforce list controllers provided by Salesforce.

Namespace

ApexPages

Usage

The `StandardSetController` class also contains a *prototype object*. This is a single `sObject` contained within the Visualforce StandardSetController class. If the prototype object's fields are set, those values are used during the save action, meaning that the values are applied to every record in the set controller's collection. This is useful for writing pages that perform mass updates (applying identical changes to fields within a collection of objects).

Note: Fields that are required in other Salesforce objects will keep the same requiredness when used by the prototype object.

Instantiation

You can instantiate a StandardSetController in either of the following ways:

- From a list of sObjects:

```
List<account> accountList = [SELECT Name FROM Account LIMIT 20];
ApexPages.StandardSetController ssc = new ApexPages.StandardSetController(accountList);
```

- From a query locator:

```
ApexPages.StandardSetController ssc =
new ApexPages.StandardSetController(Database.getQueryLocator([SELECT Name,CloseDate FROM
 Opportunity]));
```

Note: The maximum record limit for StandardSetController is 10,000 records. Instantiating StandardSetController using a query locator returning more than 10,000 records causes a LimitException to be thrown. However, instantiating StandardSetController with a list of more than 10,000 records doesn't throw an exception, and instead truncates the records to the limit.

Example

The following example shows how a StandardSetController object can be used in the constructor for a custom list controller:

```
public class opportunityList2Con {
    // ApexPages.StandardSetController must be instantiated
    // for standard list controllers
    public ApexPages.StandardSetController setCon {
        get {
            if(setCon == null) {
                setCon = new ApexPages.StandardSetController(Database.getQueryLocator(
                    [SELECT Name, CloseDate FROM Opportunity]));
            }
            return setCon;
        }
```

```
        set;
    }

    // Initialize setCon and return a list of records
    public List<Opportunity> getOpportunities() {
        return (List<Opportunity>) setCon.getRecords();
    }
}
```

The following Visualforce markup shows how the controller above can be used in a page:

```
<apex:page controller="opportunityList2Con">
    <apex:pageBlock>
        <apex:pageBlockTable value="{!opportunities}" var="o">
            <apex:column value="{!o.Name}"/>
            <apex:column value="{!o.CloseDate}"/>
        </apex:pageBlockTable>
    </apex:pageBlock>
</apex:page>
```

IN THIS SECTION:

StandardSetController Constructors

StandardSetController Methods

StandardSetController Constructors

The following are constructors for `StandardSetController`.

IN THIS SECTION:

StandardSetController(queryLocator)

Creates an instance of the `ApexPages.StandardSetController` class for the list of objects returned by the query locator.

StandardSetController(controllerSObjects)

Creates an instance of the `ApexPages.StandardSetController` class for the specified list of standard or custom objects.

`StandardSetController(queryLocator)`

Creates an instance of the `ApexPages.StandardSetController` class for the list of objects returned by the query locator.

Signature

```
public StandardSetController(Database.QueryLocator queryLocator)
```

Parameters

`queryLocator`

Type: Database.QueryLocator

A query locator representing a list of sObjects.

`StandardSetController(controllerSObjects)`

Creates an instance of the `ApexPages.StandardSetController` class for the specified list of standard or custom objects.

Signature

```
public StandardSetController(List<sObject> controllerSObjects)
```

Parameters

`controllerSObjects`
Type: List on page 3405<sObject on page 3600>

A List of standard or custom objects.

Example

```
List<account> accountList = [SELECT Name FROM Account LIMIT 20];
ApexPages.StandardSetController ssc = new ApexPages.StandardSetController(accountList);
```

StandardSetController Methods

The following are methods for `StandardSetController`. All are instance methods.

IN THIS SECTION:

cancel()
Returns the PageReference of the original page, if known, or the home page.

first()
Changes the set of records that the controller returns to the first page of records.

getCompleteResult()
Indicates whether there are more records in the set than the maximum record limit. If this is false, there are more records than you can process using the list controller. The maximum record limit is 10,000 records.

getFilterId()
Returns the ID of the filter that is currently in context.

getHasNext()
Indicates whether there are more records after the current page set.

getHasPrevious()
Indicates whether there are more records before the current page set.

getListViewOptions()
Returns a list of the listviews available to the current user.

getPageNumber()
Returns the page number of the current page set. Note that the first page returns 1.

getPageSize()
Returns the number of records included in each page set.

getRecord()

Returns the sObject that represents the changes to the selected records. This retrieves the prototype object contained within the class, and is used for performing mass updates.

getRecords()

Returns the list of sObjects in the current page set. This list is immutable, i.e. you can't call `clear()` on it.

getResultSize()

Returns the number of records in the set.

getSelected()

Returns the list of sObjects that have been selected.

last()

Changes the set of records that the controller returns to the last page of records.

next()

Changes the set of records that the controller returns to the next page of records.

previous()

Changes the set of records that the controller returns to the previous page of records.

save()

Inserts new records or updates existing records that have been changed. After this operation is finished, it returns a PageReference to the original page, if known, or the home page.

setFilterID(filterId)

Sets the filter ID of the controller.

setpageNumber(pageNumber)

Sets the page number.

setPageSize(pageSize)

Sets the number of records in each page set.

setSelected(selectedRecords)

Set the selected records to the records specified in the *`selectedRecords`* argument.

`cancel()`

Returns the PageReference of the original page, if known, or the home page.

Signature

```
public System.PageReference cancel()
```

Return Value

Type: System.PageReference

SEE ALSO:

Visualforce Developer Guide: Standard List Controller Actions

first()

Changes the set of records that the controller returns to the first page of records.

Signature

```
public Void first()
```

Return Value

Type: Void

SEE ALSO:

Visualforce Developer Guide: Standard List Controller Actions

getCompleteResult()

Indicates whether there are more records in the set than the maximum record limit. If this is false, there are more records than you can process using the list controller. The maximum record limit is 10,000 records.

Signature

```
public Boolean getCompleteResult()
```

Return Value

Type: Boolean

getFilterId()

Returns the ID of the filter that is currently in context.

Note: The `getFilterID()` method doesn't support list views without filter IDs, such as the Recently Viewed list view. In these cases, the method returns the first filter ID of the object's available list views. If called within an `<apex:enhancedList>` component, the method returns the filter ID of the last used list view.

Signature

```
public String getFilterId()
```

Return Value

Type: String

SEE ALSO:

Visualforce Developer Guide: Standard List Controller Actions

Visualforce Developer Guide: List Views with Standard List Controllers

getHasNext()

Indicates whether there are more records after the current page set.

Signature

```
public Boolean getHasNext()
```

Return Value

Type: Boolean

getHasPrevious()

Indicates whether there are more records before the current page set.

Signature

```
public Boolean getHasPrevious()
```

Return Value

Type: Boolean

getListViewOptions()

Returns a list of the listviews available to the current user.

Signature

```
public System.SelectOption getListViewOptions()
```

Return Value

Type: System.SelectOption[]

SEE ALSO:

Visualforce Developer Guide: Standard List Controller Actions

Visualforce Developer Guide: List Views with Standard List Controllers

getPageNumber()

Returns the page number of the current page set. Note that the first page returns 1.

Signature

```
public Integer getPageNumber()
```

Return Value

Type: Integer

`getPageSize()`

Returns the number of records included in each page set.

Signature

```
public Integer getPageSize()
```

Return Value

Type: Integer

`getRecord()`

Returns the sObject that represents the changes to the selected records. This retrieves the prototype object contained within the class, and is used for performing mass updates.

Signature

```
public sObject getRecord()
```

Return Value

Type: sObject

SEE ALSO:

Visualforce Developer Guide: Building a Custom List Controller

`getRecords()`

Returns the list of sObjects in the current page set. This list is immutable, i.e. you can't call `clear()` on it.

Signature

```
public sObject[] getRecords()
```

Return Value

Type: sObject[]

SEE ALSO:

Visualforce Developer Guide: Building a Custom List Controller

`getResultSize()`

Returns the number of records in the set.

Signature

```
public Integer getResultSize()
```

Return Value

Type: Integer

`getSelected()`

Returns the list of sObjects that have been selected.

Signature

```
public sObject[] getSelected()
```

Return Value

Type: sObject[]

`last()`

Changes the set of records that the controller returns to the last page of records.

Signature

```
public Void last()
```

Return Value

Type: Void

SEE ALSO:

Visualforce Developer Guide: Standard List Controller Actions

`next()`

Changes the set of records that the controller returns to the next page of records.

Signature

```
public Void next()
```

Return Value

Type: Void

SEE ALSO:

Visualforce Developer Guide: Standard List Controller Actions

previous()

Changes the set of records that the controller returns to the previous page of records.

Signature

```
public Void previous()
```

Return Value

Type: Void

SEE ALSO:

Visualforce Developer Guide: Standard List Controller Actions

save()

Inserts new records or updates existing records that have been changed. After this operation is finished, it returns a PageReference to the original page, if known, or the home page.

Signature

```
public System.PageReference save()
```

Return Value

Type: System.PageReference

SEE ALSO:

Visualforce Developer Guide: Standard List Controller Actions

setFilterID(filterId)

Sets the filter ID of the controller.

Signature

```
public Void setFilterID(String filterId)
```

Parameters

filterId
Type: String

Return Value

Type: Void

setpageNumber(pageNumber)

Sets the page number.

Signature

```
public Void setpageNumber(Integer pageNumber)
```

Parameters

pageNumber
Type: Integer

Return Value

Type: Void

setPageSize(pageSize)

Sets the number of records in each page set.

Signature

```
public Void setPageSize(Integer pageSize)
```

Parameters

pageSize
Type: Integer

Return Value

Type: Void

setSelected(selectedRecords)

Set the selected records to the records specified in the *selectedRecords* argument.

Signature

```
public Void setSelected(sObject[] selectedRecords)
```

Parameters

selectedRecords
Type: sObject[]

Return Value

Type: Void

Usage

Use the `setSelected()` method in your Apex controller or controller extension to manually set the records displayed on a Visualforce page. The `setSelected()` method overwrites any previously selected records with the records specified in the *`selectedRecords`* argument.

Example

`AccountNamePage` shows a table of account names. `MyControllerExtension`'s constructor contains a SOQL query that returns a list of accounts. This list is passed into `setSelected()` so that the account records in the list are selected and displayed in the table.

```
<!-- AccountNamePage.page -->
<apex:page standardController="Account" recordSetVar="accounts"
extensions="MyControllerExtension">
    <apex:pageBlock>
        <apex:pageBlockTable value="{!accounts}" var="acc">
            <apex:column value="{!acc.name}"/>
        </apex:pageBlockTable>
    </apex:pageBlock>
</apex:page>

// MyControllerExtension.cls
public with sharing class MyControllerExtension {
    private ApexPages.StandardSetController setController;

    public MyControllerExtension(ApexPages.StandardSetController setController) {
        this.setController = setController;

        Account [] records = [SELECT Id, Name FROM Account LIMIT 30];
        setController.setSelected(records);
    }
}
```

Visualforce Developer Guide: Accessing Data with List Controllers

AppLauncher Namespace

The `AppLauncher` namespace provides methods for managing the appearance of apps in the App Launcher, including their visibility and sort order.

The following class is in the `AppLauncher` namespace.

IN THIS SECTION:

AppMenu Class

Contains methods to set the appearance of apps in the App Launcher.

ChangePasswordController Class

This class and its methods are for internal use only.

CommunityLogoController Class
This class and its methods are for internal use only.

EmployeeLoginLinkController Class
This class and its methods are for internal use only.

ForgotPasswordController Class
This class and its methods are for internal use only.

IdentityHeaderController Class
This class and its methods are for internal use only.

LoginFormController Class
This class and its methods are for internal use only.

SelfRegisterController Class
This class and its methods are for internal use only.

SocialLoginController Class
This class and its methods are for internal use only.

AppMenu Class

Contains methods to set the appearance of apps in the App Launcher.

Namespace

AppLauncher

IN THIS SECTION:

AppMenu Methods

AppMenu Methods

The following are methods for `AppMenu`.

IN THIS SECTION:

setAppVisibility(appMenuItemId, isVisible)
Shows or hides specific apps in the App Launcher.

setOrgSortOrder(appIds)
Sets the organization-wide default sort order for the App Launcher based on a List of app menu item IDs in the desired order.

setUserSortOrder(appIds)
Sets an individual user's default sort order for the App Launcher based on a List of app menu item IDs in the desired order.

`setAppVisibility(appMenuItemId, isVisible)`

Shows or hides specific apps in the App Launcher.

Signature

```
public static void setAppVisibility(Id appMenuItemId, Boolean isVisible)
```

Parameters

appMenuItemId
Type: Id

The 15-character application ID value for an app. For more information, see the `ApplicationId` field for AppMenuItem or the `AppMenuItemId` field for UserAppMenuItem in the *Salesforce Object Reference*

isVisible
Type: Boolean

If `true`, the app is visible.

Return Value

Type: void

setOrgSortOrder(appIds)

Sets the organization-wide default sort order for the App Launcher based on a List of app menu item IDs in the desired order.

Signature

```
public static void setOrgSortOrder(List<Id> appIds)
```

Parameters

appIds
Type: List<Id>

A list of application ID values. For more information, see the `ApplicationId` field for AppMenuItem in the *Salesforce Object Reference*.

Return Value

Type: void

setUserSortOrder(appIds)

Sets an individual user's default sort order for the App Launcher based on a List of app menu item IDs in the desired order.

Signature

```
public static void setUserSortOrder(List<Id> appIds)
```

Parameters

appIds
Type: List<Id>

A list of application ID values. For more information, see the `AppMenuItemId` field for UserAppMenuItem in the *Salesforce Object Reference*.

Return Value

Type: void

ChangePasswordController Class

This class and its methods are for internal use only.

Namespace

AppLauncher

CommunityLogoController Class

This class and its methods are for internal use only.

Namespace

AppLauncher

EmployeeLoginLinkController Class

This class and its methods are for internal use only.

Namespace

AppLauncher

ForgotPasswordController Class

This class and its methods are for internal use only.

Namespace

AppLauncher

IdentityHeaderController Class

This class and its methods are for internal use only.

Namespace

AppLauncher

LoginFormController Class

This class and its methods are for internal use only.

Namespace

AppLauncher

SelfRegisterController Class

This class and its methods are for internal use only.

Namespace

AppLauncher

SocialLoginController Class

This class and its methods are for internal use only.

Namespace

AppLauncher

Approval Namespace

The `Approval` namespace provides classes and methods for approval processes.

The following are the classes in the `Approval` namespace.

IN THIS SECTION:

LockResult Class
The result of a record lock returned by a `System.Approval.lock()` method.

ProcessRequest Class
The `ProcessRequest` class is the parent class for the `ProcessSubmitRequest` and `ProcessWorkitemRequest` classes. Use the `ProcessRequest` class to write generic Apex that can process objects from either class.

ProcessResult Class
After you submit a record for approval, use the `ProcessResult` class to process the results of an approval process.

ProcessSubmitRequest Class
Use the `ProcessSubmitRequest` class to submit a record for approval.

ProcessWorkitemRequest Class
Use the `ProcessWorkitemRequest` class for processing an approval request after it is submitted.

UnlockResult Class
The result of a record unlock, returned by a `System.Approval.unlock()` method.

LockResult Class

The result of a record lock returned by a `System.Approval.lock()` method.

Namespace

Approval

Usage

The `System.Approval.lock()` methods return Approval.LockResult objects. Each element in a LockResult array corresponds to an element in the ID or sObject array passed as a parameter to a `lock` method. The first element in the LockResult array corresponds to the first element in the ID or sObject array, the second element corresponds to the second element, and so on. If only one ID or sObject is passed in, the LockResult array contains a single element.

Example

The following example obtains and iterates through the returned Approval.LockResult objects. It locks some queried accounts using `Approval.lock` with a `false` second parameter to allow partial processing of records on failure. Next, it iterates through the results to determine whether the operation was successful for each record. It writes the ID of every record that was processed successfully to the debug log, or writes error messages and failed fields of the failed records.

```
// Query the accounts to lock
Account[] accts = [SELECT Id from Account WHERE Name LIKE 'Acme%'];
// Lock the accounts
Approval.LockResult[] lrList = Approval.lock(accts, false);

// Iterate through each returned result
for(Approval.LockResult lr : lrList) {
    if (lr.isSuccess()) {
        // Operation was successful, so get the ID of the record that was processed
        System.debug('Successfully locked account with ID: ' + lr.getId());
    }
    else {
        // Operation failed, so get all errors
        for(Database.Error err : lr.getErrors()) {
            System.debug('The following error has occurred.');
            System.debug(err.getStatusCode() + ': ' + err.getMessage());
            System.debug('Account fields that affected this error: ' + err.getFields());
        }
    }
}
```

IN THIS SECTION:

LockResult Methods

SEE ALSO:

Approval Class

LockResult Methods

The following are methods for `LockResult`.

IN THIS SECTION:

getErrors()
If an error occurred, returns an array of one or more database error objects, providing the error code and description.

getId()
Returns the ID of the sObject you are trying to lock.

isSuccess()
A Boolean value that is set to `true` if the lock operation is successful for this object, or `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects, providing the error code and description.

Signature

```
public List<Database.Error> getErrors()
```

Return Value

Type: List<Database.Error>

`getId()`

Returns the ID of the sObject you are trying to lock.

Signature

```
public Id getId()
```

Return Value

Type: Id

Usage

If the field contains a value, the object was locked. If the field is empty, the operation was not successful.

`isSuccess()`

A Boolean value that is set to `true` if the lock operation is successful for this object, or `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

ProcessRequest Class

The `ProcessRequest` class is the parent class for the `ProcessSubmitRequest` and `ProcessWorkitemRequest` classes. Use the `ProcessRequest` class to write generic Apex that can process objects from either class.

Namespace

Approval

Usage

The request must be instantiated via the child classes, `ProcessSubmitRequest` and `ProcessWorkItemRequest`.

ProcessRequest Methods

The following are methods for `ProcessRequest`. All are instance methods.

IN THIS SECTION:

getComments()
Returns the comments that have been added previously to the approval request.

getNextApproverIds()
Returns the list of user IDs of user specified as approvers.

setComments(comments)
Sets the comments to be added to the approval request.

setNextApproverIds(nextApproverIds)
If the next step in your approval process is another Apex approval process, you specify exactly one user ID as the next approver. If not, you cannot specify a user ID and this method must be `null`.

`getComments()`

Returns the comments that have been added previously to the approval request.

Signature

```
public String getComments()
```

Return Value

Type: String

`getNextApproverIds()`

Returns the list of user IDs of user specified as approvers.

Signature

```
public ID[] getNextApproverIds()
```

Return Value

Type: ID[]

`setComments(comments)`

Sets the comments to be added to the approval request.

Signature

```
public Void setComments(String comments)
```

Parameters

`comments`
Type: String

Return Value

Type: Void

`setNextApproverIds(nextApproverIds)`

If the next step in your approval process is another Apex approval process, you specify exactly one user ID as the next approver. If not, you cannot specify a user ID and this method must be `null`.

Signature

```
public Void setNextApproverIds(ID[] nextApproverIds)
```

Parameters

`nextApproverIds`
Type: ID[]

Must be a single-entry list.

Return Value

Type: Void

ProcessResult Class

After you submit a record for approval, use the `ProcessResult` class to process the results of an approval process.

Namespace

Approval

Usage

A ProcessResult object is returned by the `process` method. You must specify the Approval namespace when creating an instance of this class. For example:

```
Approval.ProcessResult result = Approval.process(req1);
```

ProcessResult Methods

The following are methods for `ProcessResult`. All are instance methods.

IN THIS SECTION:

getEntityId()
The ID of the record being processed.

getErrors()
If an error occurred, returns an array of one or more database error objects including the error code and description.

getInstanceId()
The ID of the approval process that has been submitted for approval.

getInstanceStatus()
The status of the current approval process. Valid values are: Approved, Rejected, Removed or Pending.

getNewWorkitemIds()
The IDs of the new items submitted to the approval process. There can be 0 or 1 approval processes.

isSuccess()
A Boolean value that is set to `true` if the approval process completed successfully; otherwise, it is set to `false`.

`getEntityId()`

The ID of the record being processed.

Signature

```
public String getEntityId()
```

Return Value

Type: String

`getErrors()`

If an error occurred, returns an array of one or more database error objects including the error code and description.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error[]

getInstanceId()

The ID of the approval process that has been submitted for approval.

Signature

```
public String getInstanceId()
```

Return Value

Type: String

getInstanceStatus()

The status of the current approval process. Valid values are: Approved, Rejected, Removed or Pending.

Signature

```
public String getInstanceStatus()
```

Return Value

Type: String

getNewWorkitemIds()

The IDs of the new items submitted to the approval process. There can be 0 or 1 approval processes.

Signature

```
public ID[] getNewWorkitemIds()
```

Return Value

Type: ID[]

isSuccess()

A Boolean value that is set to `true` if the approval process completed successfully; otherwise, it is set to `false`.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

ProcessSubmitRequest Class

Use the `ProcessSubmitRequest` class to submit a record for approval.

Namespace

Approval

Usage

You must specify the Approval namespace when creating an instance of this class. The constructor for this class takes no arguments. For example:

```
Approval.ProcessSubmitRequest psr = new Approval.ProcessSubmitRequest();
```

Inherited Methods

In addition to the methods listed, the `ProcessSubmitRequest` class has access to all the methods in its parent class, ProcessRequest Class.

- getComments()
- getNextApproverIds()
- setComments(comments)
- setNextApproverIds(nextApproverIds)

Example

To view sample code, refer to Approval Processing Example.

ProcessSubmitRequest Methods

The following are methods for `ProcessSubmitRequest`. All are instance methods.

IN THIS SECTION:

getObjectId()
Returns the ID of the record that has been submitted for approval. For example, it can return an account, contact, or custom object record.

getProcessDefinitionNameOrId()
Returns the developer name or ID of the process definition.

getSkipEntryCriteria()
If `getProcessDefinitionNameOrId()` returns a value other than `null`, `getSkipEntryCriteria()` determines whether to evaluate the entry criteria for the process (`true`) or not (`false`).

getSubmitterId()

Returns the user ID of the submitter requesting the approval record. The user must be one of the allowed submitters in the process definition setup.

setObjectId(recordId)

Sets the ID of the record to be submitted for approval. For example, it can specify an account, contact, or custom object record.

setProcessDefinitionNameOrId(nameOrId)

Sets the developer name or ID of the process definition to be evaluated.

setSkipEntryCriteria(skipEntryCriteria)

If the process definition name or ID is not null, `setSkipEntryCriteria()` determines whether to evaluate the entry criteria for the process (`true`) or not (`false`).

setSubmitterId(userID)

Sets the user ID of the submitter requesting the approval record. The user must be one of the allowed submitters in the process definition setup. If you don't set a submitter ID, the process uses the current user as the submitter.

`getObjectId()`

Returns the ID of the record that has been submitted for approval. For example, it can return an account, contact, or custom object record.

Signature

```
public String getObjectId()
```

Return Value

Type: String

`getProcessDefinitionNameOrId()`

Returns the developer name or ID of the process definition.

Signature

```
public String getProcessDefinitionNameOrId()
```

Return Value

Type: String

Usage

The default is null. If the return value is `null`, when a user submits a record for approval Salesforce evaluates the entry criteria for all processes applicable to the user.

`getSkipEntryCriteria()`

If `getProcessDefinitionNameOrId()` returns a value other than `null`, `getSkipEntryCriteria()` determines whether to evaluate the entry criteria for the process (`true`) or not (`false`).

Signature

```
public Boolean getSkipEntryCriteria()
```

Return Value

Type: Boolean

`getSubmitterId()`

Returns the user ID of the submitter requesting the approval record. The user must be one of the allowed submitters in the process definition setup.

Signature

```
public String getSubmitterId()
```

Return Value

Type: String

`setObjectId(recordId)`

Sets the ID of the record to be submitted for approval. For example, it can specify an account, contact, or custom object record.

Signature

```
public Void setObjectId(String recordId)
```

Parameters

recordId
Type: String

Return Value

Type: Void

`setProcessDefinitionNameOrId(nameOrId)`

Sets the developer name or ID of the process definition to be evaluated.

Signature

```
public Void setProcessDefinitionNameOrId(String nameOrId)
```

Parameters

nameOrId
Type: String

The process definition developer name or process definition ID. The record is submitted to this specific process. If set to `null`, submission of a record approval follows standard evaluation; that is, every entry criteria of the process definition in the process order is evaluated and the one that satisfies is picked and submitted.

Return Value

Type: Void

Usage

If the process definition name or ID is not set via this method, then by default it is null. If it is null, the submission of a record for approval evaluates entry criteria for all processes applicable to the submitter. The order of evaluation is based on the process order of the setup.

`setSkipEntryCriteria(skipEntryCriteria)`

If the process definition name or ID is not null, `setSkipEntryCriteria()` determines whether to evaluate the entry criteria for the process (`true`) or not (`false`).

Signature

```
public Void setSkipEntryCriteria(Boolean skipEntryCriteria)
```

Parameters

`skipEntryCriteria`
Type: Boolean

If set to `true`, request submission skips the evaluation of entry criteria for the process set in setProcessDefinitionNameOrId(nameOrId). If the process definition name or ID is not specified, this parameter is ignored and standard evaluation is followed based on process order. If set to `false`, or if this method isn't called, the entry criteria is not skipped.

Return Value

Type: Void

`setSubmitterId(userID)`

Sets the user ID of the submitter requesting the approval record. The user must be one of the allowed submitters in the process definition setup. If you don't set a submitter ID, the process uses the current user as the submitter.

Signature

```
public Void setSubmitterId(String userID)
```

Parameters

`userID`
Type: String

The user ID on behalf of which the record is submitted. If set to `null`, the current user is the submitter. If the submitter is not set with this method, the default submitter is null (the current user).

Return Value

Type: Void

ProcessWorkitemRequest Class

Use the `ProcessWorkitemRequest` class for processing an approval request after it is submitted.

Namespace

Approval

Usage

You must specify the Approval namespace when creating an instance of this class. The constructor for this class takes no arguments. For example:

```
Approval.ProcessWorkitemRequest pwr = new Approval.ProcessWorkitemRequest();
```

Inherited Methods

In addition to the methods listed, the `ProcessWorkitemRequest` class has access to all the methods in its parent class, ProcessRequest Class:

- getComments()
- getNextApproverIds()
- setComments(comments)
- setNextApproverIds(nextApproverIds)

ProcessWorkitemRequest Methods

The following are methods for `ProcessWorkitemRequest`. All are instance methods.

IN THIS SECTION:

getAction()
Returns the type of action already associated with the approval request. Valid values are: Approve, Reject, or Removed.

getWorkitemId()
Returns the ID of the approval request that is in the process of being approved, rejected, or removed.

setAction(actionType)
Sets the type of action to take for processing an approval request.

setWorkitemId(id)
Sets the ID of the approval request that is being approved, rejected, or removed.

`getAction()`

Returns the type of action already associated with the approval request. Valid values are: Approve, Reject, or Removed.

Signature

```
public String getAction()
```

Return Value

Type: String

`getWorkitemId()`

Returns the ID of the approval request that is in the process of being approved, rejected, or removed.

Signature

```
public String getWorkitemId()
```

Return Value

Type: String

`setAction(actionType)`

Sets the type of action to take for processing an approval request.

Signature

```
public Void setAction(String actionType)
```

Parameters

actionType
Type: String

Valid values are: Approve, Reject, or Removed. Only system administrators can specify Removed.

Return Value

Type: Void

`setWorkitemId(id)`

Sets the ID of the approval request that is being approved, rejected, or removed.

Signature

```
public Void setWorkitemId(String id)
```

Parameters

id
Type: String

Return Value

Type: Void

UnlockResult Class

The result of a record unlock, returned by a `System.Approval.unlock()` method.

Namespace

Approval

Usage

The `System.Approval.unlock()` methods return Approval.UnlockResult objects. Each element in an UnlockResult array corresponds to an element in the ID or sObject array passed as a parameter to an `unlock` method. The first element in the UnlockResult array corresponds to the first element in the ID or sObject array, the second element corresponds to the second element, and so on. If only one ID or sObject is passed in, the UnlockResult array contains a single element.

Example

The following example shows how to obtain and iterate through the returned Approval.UnlockResult objects. It locks some queried accounts using `Approval.unlock` with a `false` second parameter to allow partial processing of records on failure. Next, it iterates through the results to determine whether the operation was successful for each record. It writes the ID of every record that was processed successfully to the debug log, or writes error messages and failed fields of the failed records.

```
// Query the accounts to unlock
Account[] accts = [SELECT Id from Account WHERE Name LIKE 'Acme%'];

for(Account acct:accts) {
   // Create an approval request for the account
   Approval.ProcessSubmitRequest req1 =
           new Approval.ProcessSubmitRequest();
   req1.setComments('Submitting request for approval.');
   req1.setObjectId(acct.id);

   // Submit the record to specific process and skip the criteria evaluation
   req1.setProcessDefinitionNameOrId('PTO_Request_Process');
   req1.setSkipEntryCriteria(true);

   // Submit the approval request for the account
   Approval.ProcessResult result = Approval.process(req1);

   // Verify the result
   System.assert(result.isSuccess());
}

// Unlock the accounts
Approval.UnlockResult[] urList = Approval.unlock(accts, false);

// Iterate through each returned result
for(Approval.UnlockResult ur : urList) {
```

```
    if (ur.isSuccess()) {
        // Operation was successful, so get the ID of the record that was processed
        System.debug('Successfully unlocked account with ID: ' + ur.getId());
    }
    else {
        // Operation failed, so get all errors
        for(Database.Error err : ur.getErrors()) {
            System.debug('The following error has occurred.');
            System.debug(err.getStatusCode() + ': ' + err.getMessage());
            System.debug('Account fields that affected this error: ' + err.getFields());
        }
    }
}
```

IN THIS SECTION:

UnlockResult Methods

SEE ALSO:

Approval Class

UnlockResult Methods

The following are methods for `UnlockResult`.

IN THIS SECTION:

getErrors()

If an error occurred, returns an array of one or more database error objects, providing the error code and description.

getId()

Returns the ID of the sObject you are trying to unlock.

isSuccess()

A Boolean value that is set to `true` if the unlock operation is successful for this object, or `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects, providing the error code and description.

Signature

```
public List<Database.Error> getErrors()
```

Return Value

Type: List<Database.Error>

`getId()`

Returns the ID of the sObject you are trying to unlock.

Signature

```
public Id getId()
```

Return Value

Type: Id

Usage

If the field contains a value, the object was unlocked. If the field is empty, the operation was not successfult.

`isSuccess()`

A Boolean value that is set to `true` if the unlock operation is successful for this object, or `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

Auth Namespace

The `Auth` namespace provides an interface and classes for single sign-on into Salesforce and session security management.

The following is the interface in the `Auth` namespace.

IN THIS SECTION:

AuthConfiguration Class

Contains methods for configuring settings for users to log in to a Salesforce org using their authentication provider credentials instead of their Salesforce credentials. The authentication provider can be any authentication provider that supports the OpenID Connect protocol, such as Google, Facebook, or Twitter. Users log in to either an Experience Cloud site (`https://`*`MyDomainName`*`.my.site.com`) or your My Domain login URL (`https://`*`MyDomainName`*`.my.salesforce.com`).

AuthProviderCallbackState Class

Provides request HTTP headers, body, and query parameters to the `AuthProviderPlugin.handleCallback` method for user authentication. This class allows you to group the information passed in rather than passing headers, body, and query parameters individually.

AuthProviderPlugin Interface

This interface is deprecated. For new development, use the abstract class `Auth.AuthProviderPluginClass` to create a custom OAuth-based authentication provider plug-in for single sign-on in to Salesforce.

AuthProviderPluginClass Class

Contains methods to create a custom OAuth-based authentication provider plug-in for single sign-on in to Salesforce. Use this class to create a custom authentication provider plug-in if you can't use one of the authentication providers that Salesforce provides.

AuthProviderTokenResponse Class

Stores the response from the `AuthProviderPlugin.handleCallback` method.

AuthToken Class

Contains methods for providing the access token associated with an authentication provider for an authenticated user, except for the Janrain provider.

CommunitiesUtil Class

Contains methods for getting information about an Experience Cloud user.

ConfigurableSelfRegHandler Interface

Gives you more control over how customers or partners self-register for your Experience Cloud site by creating a class that implements `Auth.ConfigurableSelfRegHandler`. You choose the user information to collect, and how users identify themselves—with their email address, phone number, or another identifier. When verified, you create a customer or partner user and log in the user to your Experience Cloud site.

ConfirmUserRegistrationHandler Interface

Manages single sign-on (SSO) user mappings between Salesforce and a third-party identity provider. Use this interface to confirm user mappings before updating them.

ConnectedAppPlugin Class

Contains methods for extending the behavior of a connected app, for example, customizing how a connected app is invoked depending on the protocol used. This class gives you more control over the interaction between Salesforce and your connected app.

HeadlessSelfRegistrationHandler Interface

Creates customer and partner users during the Headless Registration Flow.

IntegratingAppType Enum

Specifies whether you're integrating your app as a connected app or as an external client app in methods used in your customized Apex token exchange handler, which extends the `Auth.Oauth2TokenExchangeHandler` class.

InvocationContext Enum

The context in which the connected app is invoked, such as the protocol flow used and the token type issued, if any. Developers can use the context information to write code that is unique to the type of invocation.

JWS Class

Contains methods that apply a digital signature to a JSON Web Token (JWT), using a JSON Web Signature (JWS) data structure. This class creates the signed JWT bearer token, which can be used to request an OAuth access token in the OAuth 2.0 JWT bearer token flow.

JWT Class

Generates the JSON Claims Set in a JSON Web Token (JWT). The resulting Base64-encoded payload can be passed as an argument to create an instance of the `Auth.JWS` class.

JWTBearerTokenExchange Class

Contains methods that POST the signed JWT bearer token to a token endpoint to request an access token, in the OAuth 2.0 JWT bearer token flow.

JWTUtil Class

Contains methods for validating a JSON Web Token (JWT) from an external identity provider as part of the OAuth 2.0 token exchange flow. Use these methods as part of the `validateIncomingToken` method in the `Auth.Oauth2TokenExchangeHandler` class.

LightningLoginEligibility Enum

Contains a Lightning Login eligibility value used by the `Auth.SessionManagement.getLightningLoginEligibility` method.

LoginDiscoveryHandler Interface

Salesforce gives you the ability to log in users based on other verification methods than username and password. For example, it can prompt users to log in with their email, phone number, or another identifier like a Federation ID or device identifier. Login Discovery is available to these licenses: Customer Community, Customer Community Plus, External Identity, Partner Community, and Partner Community Plus.

LoginDiscoveryMethod Enum

Contains methods used to verify the user's identity when the My Domain login process uses Login Discovery.

MyDomainLoginDiscoveryHandler Interface

The handler used to implement the My Domain Login Discovery page, which is an interview-based (two-step) login process. First the user is prompted for a unique identifier such as an email address or phone number. Then the handler determines (discovers) how to authenticate the user. Either the user enters a password or is directed to an identity provider's login page.

Oauth2TokenExchangeHandler Class

Use this class to create a token exchange handler that validates tokens from an external identity provider and maps the token's subject to a Salesforce user during the OAuth 2.0 token exchange flow. The handler can also be used to create users by setting up a new User object and returning it to Salesforce for automatic insertion.

OAuth2TokenExchangeType Enum

Used during the OAuth 2.0 token exchange flow to specify the type of token that's being exchanged for a Salesforce token.

OAuthRefreshResult Class

Stores the result of an `AuthProviderPluginClass` refresh method. OAuth authentication flow provides a refresh token that can be used to get a new access token. Access tokens have a limited lifetime as specified by the session timeout value. When an access token expires, use a refresh token to get a new access token.

OauthToken Class

Contains methods for revoking opaque OAuth access tokens and refresh tokens.

OauthTokenType Enum

Specifies the type of Salesforce-issued OAuth 2.0 token being revoked in the `OauthToken.revokeToken` method.

RegistrationHandler Interface

Salesforce provides the ability to use an authentication provider, such as Facebook© or Janrain©, for single sign-on into Salesforce.

SamlJitHandler Interface

Use this interface to control and customize Just-in-Time user provisioning logic during SAML single sign-on.

SessionManagement Class

Contains methods for verifying users' identity, creating custom login flows, customizing security levels, and defining trusted IP ranges for a current session.

SessionLevel Enum

An `Auth.SessionLevel` enum value is used by the `SessionManagement.setSessionLevel` method.

TokenValidationResult Class

Contains methods that describe the result of the token validation performed by a token exchange handler using the `validateIncomingToken` method during the OAuth 2.0 token exchange flow.

UserData Class

Stores user information for `Auth.RegistrationHandler`.

VerificationMethod Enum

Contains the different ways users can identify themselves when logging in. You can use it to implement mobile-centric passwordless login pages and to self-register (and deregister) verification methods.

VerificationPolicy Enum

The `Auth.VerificationPolicy` enum contains an identity verification policy value used by the `SessionManagement.generateVerificationUrl` method.

VerificationResult Class

Contains the result of a verification challenge that you invoke when you create your own Verify page. The challenge can be initiated by either the `System.UserManagement.verifyPasswordlessLogin` or `System.UserManagement.verifySelfRegistration` method.

Auth Exceptions

The `Auth` namespace contains some exception classes.

AuthConfiguration Class

Contains methods for configuring settings for users to log in to a Salesforce org using their authentication provider credentials instead of their Salesforce credentials. The authentication provider can be any authentication provider that supports the OpenID Connect protocol, such as Google, Facebook, or Twitter. Users log in to either an Experience Cloud site (`https://MyDomainName.my.site.com`) or your My Domain login URL (`https://MyDomainName.my.salesforce.com`).

Namespace

Auth

Example

This example shows how to call some methods on the `Auth.AuthConfiguration` class. Before you can run this sample, you must provide valid values for the URLs and developer name.

```
String communityUrl = 'MyDomainName.my.site.com';
String startUrl = '<Add URL>';
Auth.AuthConfiguration authConfig = new Auth.AuthConfiguration(communityUrl,startUrl);
List<AuthProvider> authPrvs = authConfig.getAuthProviders();
String bColor = authConfig.getBackgroundColor();
String fText = authConfig.getFooterText();

String sso = Auth.AuthConfiguration.getAuthProviderSsoUrl(communityUrl, startUrl,
'developerName');
```

AuthConfiguration Constructors

The following are constructors for `AuthConfiguration`.

Note: The `AuthConfiguration (networkId, startUrl)` constructor is deprecated in API version 56.0 and later.

`AuthConfiguration(communityOrCustomUrl, startUrl)`

Creates an instance of the `AuthConfiguration` class using the specified URL for an Experience Cloud site or a My Domain subdomain and the start URL for authenticated users.

Signature

```
public AuthConfiguration(String communityOrCustomUrl, String startUrl)
```

Parameters

`communityOrCustomUrl`
Type: String

The URL for the domain, which can be a Salesforce subdomain created with My Domain (`my.salesforce.com`) or a subdomain of an Experience Cloud site (`force.com`).

`startUrl`
Type: String

The page users see after successfully logging in to the Experience Cloud site or My Domain subdomain.

AuthConfiguration Methods

The following are methods for `AuthConfiguration`. Use these methods to manage and customize authentication for a Salesforce community.

IN THIS SECTION:

getAllowInternalUserLoginEnabled()
Indicates whether the Experience Cloud site allows internal users to log in using the Experience Cloud site login page. To enable, admins configure the setting **Allow internal users to log in directly to the experience** on the Login & Registration page in Experience Workspaces. It's disabled by default.

getAuthConfig()
Returns the AuthConfig sObject, which represents the authentication options for an Experience Cloud site or Salesforce My Domain subdomain.

getAuthConfigProviders()
Returns the list of authentication providers configured for an Experience Cloud site or Salesforce My Domain subdomain.

getAuthProviders()
Returns the list of authentication providers available for an Experience Cloud site or Salesforce My Domain subdomain.

getAuthProviderSsoDomainUrl(communityUrl, startUrl, developerName)
Returns the single sign-on URL for an Experience Cloud site subdomain.

getAuthProviderSsoUrl(communityUrl, startUrl, developerName)
Returns the single sign-on URL for an Experience Cloud site or Salesforce My Domain subdomain.

getBackgroundColor()
Returns the color for the background of the login page for a community.

getCertificateLoginEnabled(domainUrl)
Returns true if certificate-based authentication is enabled for the My Domain URL.

getCertificateLoginUrl(domainUrl, startUrl)

Returns the certificate-based authentication endpoint for the My Domain URL if the org has certificate-based authentication enabled.

getDefaultProfileForRegistration()

Returns the profile ID assigned to new community users.

getFooterText()

Returns the text at the bottom of the login page for a community.

getForgotPasswordUrl()

Returns the URL for the standard or custom Forgot Password page that is specified for an Experience Cloud site or portal by the administrator.

getHeadlessForgotPasswordEnabled()

Returns `true` if the Headless Forgot Password Flow is enabled.

getHeadlessFrgtPswEnabled()

This method will be deprecated in a future release. Use the `getHeadlessForgotPasswordEnabled()` method in this class instead.

getHeadlessPasswordlessLoginEnabled()

Determines if headless passwordless login is enabled.

getHeadlessRegistrationEnabled()

Determines if the Headless Registration Flow is enabled.

getLogoUrl()

Returns the location of the icon image at the bottom of the login page for a community.

getRightFrameUrl()

Returns the URL for the right-frame content to display on the right side of the Experience Cloud site login page. The admin supplies the URL.

getSamlProviders()

Returns the list of SAML-based authentication providers available for an Experience Cloud site or Salesforce My Domain subdomain.

getSamlSsoUrl(communityUrl, startURL, samlId)

Returns the single sign-on URL for an Experience Cloud site or Salesforce My Domain subdomain.

getSelfRegistrationEnabled()

Indicates whether the current community allows new users to create their own account by filling out a registration form.

getSelfRegistrationUrl()

Returns the location of the self-registration page for new users to sign up for an account with a community.

getStartUrl()

Returns the start page of an Experience Cloud site or Salesforce My Domain subdomain. This URL is the first page that users see when they log in.

getUsernamePasswordEnabled()

Indicates whether the current community is set to display a login form asking for a username and password. You can configure the community not to request a username and password if it is for unauthenticated users or users logging in with a third-party authentication provider.

isCommunityUsingSiteAsContainer()

Returns `true` if the Experience Cloud site uses Site.com pages; otherwise, returns `false`.

getAllowInternalUserLoginEnabled()

Indicates whether the Experience Cloud site allows internal users to log in using the Experience Cloud site login page. To enable, admins configure the setting **Allow internal users to log in directly to the experience** on the Login & Registration page in Experience Workspaces. It's disabled by default.

Signature

```
public Boolean getAllowInternalUserLoginEnabled()
```

Return Value

Type: Boolean

Usage

If true, internal users log in to an Experience Cloud site from the site's login page with their internal credentials. If they navigate to their internal org from the Experience Cloud site, they don't have to log in again.

getAuthConfig()

Returns the AuthConfig sObject, which represents the authentication options for an Experience Cloud site or Salesforce My Domain subdomain.

Signature

```
public AuthConfig getAuthConfig()
```

Return Value

Type: AuthConfig

The AuthConfig sObject for the Experience Cloud site or Salesforce My Domain subdomain.

getAuthConfigProviders()

Returns the list of authentication providers configured for an Experience Cloud site or Salesforce My Domain subdomain.

Signature

```
public List<AuthConfigProviders> getAuthConfigProviders()
```

Return Value

Type: List<AuthConfigProviders>

A list of authentication providers (AuthConfigProviders sObjects), which are children of the AuthProvider sObject.

getAuthProviders()

Returns the list of authentication providers available for an Experience Cloud site or Salesforce My Domain subdomain.

Signature

```
public List<AuthProvider> getAuthProviders()
```

Return Value

Type: List<AuthProvider>

A list of authentication providers (AuthProvider sObjects) for the Experience Cloud site or My Domain subdomain.

getAuthProviderSsoDomainUrl(communityUrl, startUrl, developerName)

Returns the single sign-on URL for an Experience Cloud site subdomain.

Note: For better performance, we recommend using this method instead of `getAuthProviderSsoUrl`. If the authentication provider has `User Subdomain for Callback` enabled, changing the single sign-on URL also changes the callback URL to use the Experience Cloud site subdomain. Before switching to this method, update the callback URL in your third-party applications to avoid getting an invalid callback URL error during single sign-on.

Signature

```
public static String getAuthProviderSsoDomainUrl(String communityUrl, String startUrl,
String developerName)
```

Parameters

communityUrl
Type: String

The URL for the Experience Cloud site subdomain. If null or specified as an empty string, you get the single sign-on URL for the org's My Domain.

startUrl
Type: String

The page that users see after logging in to the Experience Cloud site subdomain.

developerName
Type: String

The unique name of the authentication provider.

Return Value

Type: String

The Single Sign-On Initialization URL for the Experience Cloud site subdomain.

getAuthProviderSsoUrl(communityUrl, startUrl, developerName)

Returns the single sign-on URL for an Experience Cloud site or Salesforce My Domain subdomain.

Signature

```
public static String getAuthProviderSsoUrl(String communityUrl, String startUrl, String
developerName)
```

Parameters

communityUrl
Type: String

The URL for the Experience Cloud site or My Domain subdomain. If not null and not specified as an empty string, you get the URL for the Experience Cloud site. If null or specified as an empty string, you get the URL for a custom domain.

startUrl
Type: String

The page that users see after logging in to the Experience Cloud site or My Domain subdomain.

developerName
Type: String

The unique name of the authentication provider.

Return Value

Type: String

The Single Sign-On Initialization URL for the Experience Cloud site or Salesforce My Domain subdomain.

getBackgroundColor()

Returns the color for the background of the login page for a community.

Signature

```
public String getBackgroundColor()
```

Return Value

Type: String

getCertificateLoginEnabled(domainUrl)

Returns true if certificate-based authentication is enabled for the My Domain URL.

Signature

```
public Boolean getCertificateLoginEnabled(String domainUrl)
```

Parameters

domainUrl
Type: String

The My Domain URL that is being checked for certificate-based authentication.

Return Value

Type: Boolean

getCertificateLoginUrl(domainUrl, startUrl)

Returns the certificate-based authentication endpoint for the My Domain URL if the org has certificate-based authentication enabled.

Signature

```
public static String getCertificateLoginUrl(String domainUrl, String startUrl)
```

Parameters

domainUrl
Type: String

The My Domain URL being checked for its certificate-based authentication endpoint .

startUrl
Type: String

The page that the user is directed to after logging in to the My Domain with certificate-based authentication.

Return Value

Type: String

The certificate-based authentication endpoint for the My Domain URL:
mydomainURL`:8443/services/certauth?startURL=`***startURLParam***

getDefaultProfileForRegistration()

Returns the profile ID assigned to new community users.

Signature

```
public String getDefaultProfileForRegistration()
```

Return Value

Type: String

The profile ID.

getFooterText()

Returns the text at the bottom of the login page for a community.

Signature

```
public String getFooterText()
```

Return Value

Type: String

The text string displayed at the bottom of the login page, for example “Log in with an existing account.”

getForgotPasswordUrl()

Returns the URL for the standard or custom Forgot Password page that is specified for an Experience Cloud site or portal by the administrator.

Signature

```
public String getForgotPasswordUrl()
```

Return Value

Type: String

URL for the standard or custom Forgot Password page.

getHeadlessForgotPasswordEnabled()

Returns `true` if the Headless Forgot Password Flow is enabled.

Signature

```
public Boolean getHeadlessForgotPasswordEnabled()
```

Return Value

Type: Boolean

getHeadlessFrgtPswEnabled()

This method will be deprecated in a future release. Use the `getHeadlessForgotPasswordEnabled()` method in this class instead.

Signature

```
public Boolean getHeadlessFrgtPswEnabled()
```

Return Value

Type: Boolean

getHeadlessPasswordlessLoginEnabled()

Determines if headless passwordless login is enabled.

Signature

```
public Boolean getHeadlessPasswordlessLoginEnabled()
```

Return Value

Type: Boolean

Returns `true` if headless passwordless login is enabled.

getHeadlessRegistrationEnabled()

Determines if the Headless Registration Flow is enabled.

Signature

```
public Boolean getHeadlessRegistrationEnabled()
```

Return Value

Type: Boolean

Returns `true` if headless registration is enabled.

getLogoUrl()

Returns the location of the icon image at the bottom of the login page for a community.

Signature

```
public String getLogoUrl()
```

Return Value

Type: String

The path to the icon image.

getRightFrameUrl()

Returns the URL for the right-frame content to display on the right side of the Experience Cloud site login page. The admin supplies the URL.

Signature

```
public String getLoginRightFrameUrl()
```

Return Value

Type: String

URL for the right-frame content of the Experience Cloud site login page. Salesforce creates an inline (iframe) on the right side of the login page to display the contents specified by the URL.

getSamlProviders()

Returns the list of SAML-based authentication providers available for an Experience Cloud site or Salesforce My Domain subdomain.

Signature

```
public List<SamlSsoConfig> getSamlProviders()
```

Return Value

Type: List<SamlSsoConfig>

A list of SAML-based authentication providers, which are SamlSsoConfig sObjects.

getSamlSsoUrl(communityUrl, startURL, samlId)

Returns the single sign-on URL for an Experience Cloud site or Salesforce My Domain subdomain.

Signature

```
public static String getSamlSsoUrl(String communityUrl, String startURL, String samlId)
```

Parameters

communityUrl
Type: String

The URL for the Experience Cloud site or My Domain subdomain. If not `null` and not specified as an empty string, you get the URL for the Experience Cloud site. If `null` or specified as an empty string, you get the URL for a My Domain subdomain.

startUrl
Type: String

The page users see after successfully logging in to the Experience Cloud site or My Domain subdomain

samlId
Type: String

The unique identifier of the SamlSsoConfig standard object for the Experience Cloud site or My Domain subdomain

Return Value

Type: String

The Single Sign-On Initialization URL for the Experience Cloud site or Salesforce My Domain subdomain.

getSelfRegistrationEnabled()

Indicates whether the current community allows new users to create their own account by filling out a registration form.

Signature

```
public Boolean getSelfRegistrationEnabled()
```

Return Value

Type: Boolean

getSelfRegistrationUrl()

Returns the location of the self-registration page for new users to sign up for an account with a community.

Signature

```
public String getSelfRegistrationUrl()
```

Return Value

Type: String

The location of the self-registration page.

getStartUrl()

Returns the start page of an Experience Cloud site or Salesforce My Domain subdomain. This URL is the first page that users see when they log in.

Signature

```
public String getStartUrl()
```

Return Value

Type: String

The location of the start page for the Experience Cloud site or My Domain subdomain.

getUsernamePasswordEnabled()

Indicates whether the current community is set to display a login form asking for a username and password. You can configure the community not to request a username and password if it is for unauthenticated users or users logging in with a third-party authentication provider.

Signature

```
public Boolean getUsernamePasswordEnabled()
```

Return Value

Type: Boolean

isCommunityUsingSiteAsContainer()

Returns `true` if the Experience Cloud site uses Site.com pages; otherwise, returns `false`.

Signature

```
public Boolean isCommunityUsingSiteAsContainer()
```

Return Value

Type: Boolean

AuthProviderCallbackState Class

Provides request HTTP headers, body, and query parameters to the `AuthProviderPlugin.handleCallback` method for user authentication. This class allows you to group the information passed in rather than passing headers, body, and query parameters individually.

Namespace

Auth

IN THIS SECTION:

AuthProviderCallbackState Constructors

AuthProviderCallbackState Properties

SEE ALSO:

handleCallback(authProviderConfiguration, callbackState)

AuthProviderCallbackState Constructors

The following are constructors for `AuthProviderCallbackState`.

IN THIS SECTION:

AuthProviderCallbackState(headers, body, queryParameters)

Creates an instance of the `AuthProviderCallbackState` class using the specified HTTP headers, body, and query parameters of the authentication request.

`AuthProviderCallbackState(headers, body, queryParameters)`

Creates an instance of the `AuthProviderCallbackState` class using the specified HTTP headers, body, and query parameters of the authentication request.

Signature

```
public AuthProviderCallbackState(Map<String,String> headers, String body,
Map<String,String> queryParameters)
```

Parameters

`headers`

Type: Map<String,String>

The HTTP headers of the authentication request.

`body`

Type: String

The HTTP body of the authentication request.

queryParameters
Type: Map<String,String>

The HTTP query parameters of the authentication request.

AuthProviderCallbackState Properties

The following are properties for `AuthProviderCallbackState`.

IN THIS SECTION:

body
The HTTP body of the authentication request.

headers
The HTTP headers of the authentication request.

queryParameters
The HTTP query parameters of the authentication request.

body

The HTTP body of the authentication request.

Signature

```
public String body {get; set;}
```

Property Value

Type: String

headers

The HTTP headers of the authentication request.

Signature

```
public Map<String,String> headers {get; set;}
```

Property Value

Type: Map<String,String>

queryParameters

The HTTP query parameters of the authentication request.

Signature

```
public Map<String,String> queryParameters {get; set;}
```

Property Value

Type: Map<String,String>

AuthProviderPlugin Interface

This interface is deprecated. For new development, use the abstract class `Auth.AuthProviderPluginClass` to create a custom OAuth-based authentication provider plug-in for single sign-on in to Salesforce.

Namespace

Auth

Usage

Deprecated. Existing implementations that use `Auth.AuthProviderPlugin` still work. For new development, use `Auth.AuthProviderPluginClass`.

IN THIS SECTION:

AuthProviderPlugin Methods

AuthProviderPlugin Example Implementation

AuthProviderPlugin Methods

The following methods are for `AuthProviderPlugin`, which, as of API version 39.0, is deprecated. Use themethods in `AuthProviderPluginClass` instead.

IN THIS SECTION:

getCustomMetadataType()
Deprecated as of API version 39.0. Use the corresponding method in `Auth.AuthProviderPluginClass`.

getUserInfo(authProviderConfiguration, response)
Deprecated as of API version 39.0. Use the corresponding method in `Auth.AuthProviderPluginClass`.

handleCallback(authProviderConfiguration, callbackState)
Deprecated as of API version 39.0. Use the corresponding method in `Auth.AuthProviderPluginClass`.

initiate(authProviderConfiguration, stateToPropagate)
Deprecated as of API version 39.0. Use the corresponding method in `Auth.AuthProviderPluginClass`.

SEE ALSO:

Salesforce Help: Create a Custom External Authentication Provider

`getCustomMetadataType()`

Deprecated as of API version 39.0. Use the corresponding method in `Auth.AuthProviderPluginClass`.

Signature

```
public String getCustomMetadataType()
```

Return Value

Type: String

The custom metadata type API name for the authentication provider.

Usage

Returns the custom metadata type API name for a custom OAuth-based authentication provider for single sign-on to Salesforce. The `getCustomMetadataType()` method returns only custom metadata type names. It does not return custom metadata record names.

getUserInfo(authProviderConfiguration, response)

Deprecated as of API version 39.0. Use the corresponding method in `Auth.AuthProviderPluginClass`.

Signature

```
public Auth.UserData getUserInfo(Map<String,String> authProviderConfiguration,
Auth.AuthProviderTokenResponse response)
```

Parameters

authProviderConfiguration
Type: Map<String,String>

The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

response
Type: Auth.AuthProviderTokenResponse

The OAuth access token, OAuth secret or refresh token, and state provided by the authentication provider to authenticate the current user.

Return Value

Type: Auth.UserData

Creates a new instance of the `Auth.UserData` class.

Usage

Returns information from the custom authentication provider about the current user. The registration handler and other authentication provider flows use this information.

handleCallback(authProviderConfiguration, callbackState)

Deprecated as of API version 39.0. Use the corresponding method in `Auth.AuthProviderPluginClass`.

Signature

```
public Auth.AuthProviderTokenResponse handleCallback(Map<String,String>
authProviderConfiguration, Auth.AuthProviderCallbackState callbackState)
```

Parameters

authProviderConfiguration
Type: Map<StringString>

The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

callbackState
Type: Auth.AuthProviderCallbackState

The class that contains the HTTP headers, body, and queryParams of the authentication request.

Return Value

Type: Auth.AuthProviderTokenResponse

Creates an instance of the `AuthProviderTokenResponse` class.

Usage

Uses the authentication provider's supported authentication protocol to return an OAuth access token, OAuth secret or refresh token, and the state passed in when the request for the current user was initiated.

initiate(authProviderConfiguration, stateToPropagate)

Deprecated as of API version 39.0. Use the corresponding method in `Auth.AuthProviderPluginClass`.

Signature

```
public System.PageReference initiate(Map<String,String> authProviderConfiguration,
String stateToPropagate)
```

Parameters

authProviderConfiguration
Type: Map<StringString>

The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

stateToPropagate
Type: String

The state passed in to initiate the authentication request for the user.

Return Value

Type: System.PageReference

The URL of the page where the user is redirected for authentication.

Usage

Returns the URL where the user is redirected for authentication.

AuthProviderPlugin Example Implementation

We've removed the example implementation for the `Auth.AuthProviderPlugin` interface because we've deprecated the interface and replaced it with an abstract class. See AuthProviderPluginClass Class.

AuthProviderPluginClass Class

Contains methods to create a custom OAuth-based authentication provider plug-in for single sign-on in to Salesforce. Use this class to create a custom authentication provider plug-in if you can't use one of the authentication providers that Salesforce provides.

Namespace

Auth

Usage

To create a custom authentication provider for single sign-on, create a class that extends `Auth.AuthProviderPluginClass`. This class allows you to store the custom configuration for your authentication provider and handle authentication protocols when users log in to Salesforce with their login credentials for an external service provider. In Salesforce, the class that implements this interface appears in the `Provider Type` drop-down list in Auth. Providers in Setup. Make sure that the user you specify to run the class has "Customize Application" and "Manage Auth. Providers" permissions.

As of API version 39.0, use the abstract class `AuthProviderPluginClass` to create a custom external authentication provider. This class replaces the `AuthProviderPlugin` interface. If you've already implemented a custom authentication provider plug-in using the interface, it still works. However, use `AuthProviderPluginClass` to extend your plug-in. If you haven't created an interface, create a custom authentication provider plug-in by extending this abstract class. For more information, see AuthProviderPluginClass Code Example.

IN THIS SECTION:

AuthProviderPluginClass Methods

AuthProviderPluginClass Code Example

AuthProviderPluginClass Methods

The `AuthProviderPluginClass` methods don't support DML options.

IN THIS SECTION:

getCustomMetadataType()
Returns the custom metadata type API name for a custom OAuth-based authentication provider for single sign-on to Salesforce.

getUserInfo(authProviderConfiguration, response)
Returns information from the custom authentication provider about the current user. This information is used by the registration handler and in other authentication provider flows.

handleCallback(authProviderConfiguration, callbackState)
Uses the authentication provider's supported authentication protocol to return an OAuth access token, OAuth secret or refresh token, and the state passed in when the request for the current user was initiated.

initiate(authProviderConfiguration, stateToPropagate)
Returns the URL where the user is redirected for authentication.

refresh(authProviderConfiguration, refreshToken)
Returns a new access token, which is used to update an expired access token.

`getCustomMetadataType()`

Returns the custom metadata type API name for a custom OAuth-based authentication provider for single sign-on to Salesforce.

Signature

```
public String getCustomMetadataType()
```

Return Value

Type: String

The custom metadata type API name for the authentication provider.

Usage

The `getCustomMetadataType()` method returns only custom metadata type names. It does not return custom metadata record names. As of API version 39.0, use this method when extending `Auth.AuthProviderPluginClass` to create a custom external authentication provider.

`getUserInfo(authProviderConfiguration, response)`

Returns information from the custom authentication provider about the current user. This information is used by the registration handler and in other authentication provider flows.

Signature

```
public Auth.UserData getUserInfo(Map<String,String> authProviderConfiguration,
Auth.AuthProviderTokenResponse response)
```

Parameters

`authProviderConfiguration`
Type: Map<String,String>

The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates it with the custom metadata type default values. Or you can set the configuration with values that you enter when you create the custom provider in Auth. Providers in Setup.

response
Type: Auth.AuthProviderTokenResponse

The OAuth access token, OAuth secret or refresh token, and state provided by the authentication provider to authenticate the current user.

Return Value

Type: Auth.UserData

Creates a new instance of the `Auth.UserData` class.

Usage

As of API version 39.0, use this method when extending `Auth.AuthProviderPluginClass` to create a custom authentication provider.

Note: You might choose to get user information in the response from the `handleCallback` method or by another method. However, you must still call `getUserInfo` in the custom authentication handler to avoid getting errors about mixing objects. For example, if you don't call `getUserInfo`, and then try to insert a contact in the `Auth.RegistrationHandler.createUser` method, you get the error, "You cannot mix EntityObjects with different UddInfos within one transaction."

To avoid this error, call `getUserInfo` with dummy user information as follows.

```
HttpRequest req = new HttpRequest();
String url = 'https://login.salesforce.com/';
req.setEndpoint(url);
req.setMethod('GET');
Http http = new Http();
HTTPResponse res = http.send(req);
```

handleCallback(authProviderConfiguration, callbackState)

Uses the authentication provider's supported authentication protocol to return an OAuth access token, OAuth secret or refresh token, and the state passed in when the request for the current user was initiated.

Signature

```
public Auth.AuthProviderTokenResponse handleCallback(Map<String,String>
authProviderConfiguration, Auth.AuthProviderCallbackState callbackState)
```

Parameters

authProviderConfiguration
Type: Map<StringString>

The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

callbackState
Type: Auth.AuthProviderCallbackState

The class that contains the HTTP headers, body, and queryParams of the authentication request.

Return Value

Type: Auth.AuthProviderTokenResponse

Creates an instance of the `AuthProviderTokenResponse` class.

Usage

As of API version 39.0, use this method when extending `Auth.AuthProviderPluginClass` to create a custom authentication provider.

`initiate(authProviderConfiguration, stateToPropagate)`

Returns the URL where the user is redirected for authentication.

Signature

```
public System.PageReference initiate(Map<String,String> authProviderConfiguration,
String stateToPropagate)
```

Parameters

authProviderConfiguration
Type: Map<StringString>

The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

stateToPropagate
Type: String

The state passed in to initiate the authentication request for the user.

Return Value

Type: System.PageReference

The URL of the page where the user is redirected for authentication.

Usage

As of API version 39.0, use this method when extending `Auth.AuthProviderPluginClass` to create a custom authentication provider.

`refresh(authProviderConfiguration, refreshToken)`

Returns a new access token, which is used to update an expired access token.

Signature

```
public Auth.OAuthRefreshResult refresh(Map<String,String> authProviderConfiguration,
String refreshToken)
```

Parameters

authProviderConfiguration
Type: Map<String,String>

The configuration for the custom authentication provider. When you create a custom metadata type in Salesforce, the configuration populates with the custom metadata type default values. Or you can set the configuration with values you enter when you create the custom provider in Auth. Providers in Setup.

refreshToken
Type: String

The refresh token for the user who is logged in.

Return Value

Type: Auth.OAuthRefreshResult

Returns the new access token, or an error message if an error occurs.

Usage

A successful request returns a `Auth.OAuthRefreshResult` with the access token and refresh token in the response. If you receive an error, make sure that you set the error string to the error message. A `NULL` error string indicates no error.

The refresh method works only with named credentials; it doesn't respect the standard OAuth refresh flow. The refresh method with named credentials works only if the earlier request returns a 401.

AuthProviderPluginClass Code Example

The following example demonstrates how to implement a custom Auth. provider plug-in using the abstract class, `Auth.AuthProviderPluginClass`.

```
        global class Concur extends Auth.AuthProviderPluginClass {

        // Use this URL for the endpoint that the
        // authentication provider calls back to for configuration.
        public String redirectUrl;
        private String key;
        private String secret;

        // Application redirection to the Concur website for
        // authentication and authorization.
        private String authUrl;

        // URI to get the new access token from concur using the GET verb.
        private String accessTokenUrl;

        // Api name for the custom metadata type created for this auth provider.
```

```
        private String customMetadataTypeApiName;

        // Api URL to access the user in Concur
        private String userAPIUrl;

        // Version of the user api URL to access data from Concur
        private String userAPIVersionUrl;

        global String getCustomMetadataType() {

```

AuthProviderTokenResponse Class

Stores the response from the `AuthProviderPlugin.handleCallback` method.

Namespace

Auth

IN THIS SECTION:

AuthProviderTokenResponse Constructors

AuthProviderTokenResponse Properties

AuthProviderTokenResponse Constructors

The following are constructors for `AuthProviderTokenResponse`.

IN THIS SECTION:

AuthProviderTokenResponse(provider, oauthToken, oauthSecretOrRefreshToken, state)

Creates an instance of the `AuthProviderTokenResponse` class using the specified authentication provider, OAuth access token, OAuth secret or refresh token, and state for a custom authentication provider plug-in.

`AuthProviderTokenResponse(provider, oauthToken, oauthSecretOrRefreshToken, state)`

Creates an instance of the `AuthProviderTokenResponse` class using the specified authentication provider, OAuth access token, OAuth secret or refresh token, and state for a custom authentication provider plug-in.

Signature

```
public AuthProviderTokenResponse(String provider, String oauthToken, String
oauthSecretOrRefreshToken, String state)
```

Parameters

provider
Type: String

The custom authentication provider.

oauthToken
Type: String

The OAuth access token.

oauthSecretOrRefreshToken
Type: String

The OAuth secret or refresh token for the currently logged-in user.

state
Type: String

The state passed in to initiate the authentication request for the user.

AuthProviderTokenResponse Properties

The following are properties for `AuthProviderTokenResponse`.

IN THIS SECTION:

oauthSecretOrRefreshToken
The OAuth secret or refresh token for the currently logged-in user.

oauthToken
The OAuth access token.

provider
The authentication provider.

state
The state passed in to initiate the authentication request for the user.

`oauthSecretOrRefreshToken`

The OAuth secret or refresh token for the currently logged-in user.

Signature

```
public String oauthSecretOrRefreshToken {get; set;}
```

Property Value

Type: String

`oauthToken`

The OAuth access token.

Signature

```
public String oauthToken {get; set;}
```

Property Value

Type: String

`provider`

The authentication provider.

Signature

```
public String provider {get; set;}
```

Property Value

Type: String

`state`

The state passed in to initiate the authentication request for the user.

Signature

```
public String state {get; set;}
```

Property Value

Type: String

AuthToken Class

Contains methods for providing the access token associated with an authentication provider for an authenticated user, except for the Janrain provider.

Namespace

Auth

AuthToken Methods

The following are methods for `AuthToken`. All methods are static.

IN THIS SECTION:

getAccessToken(authProviderId, providerName)

Returns an access token for the current user using the specified 18-character identifier of an AuthProvider definition in your org and the proper name of the third party, such as Salesforce or Facebook. Note that querying the `ProviderType` field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the AuthProvider object, but the expected `providerName` is `Open ID Connect`.

getAccessTokenMap(authProviderId, providerName)

Returns a map from the third-party identifier to the access token for the currently logged-in Salesforce user. The identifier value depends on the third party. For example, for Salesforce it would be the user ID, while for Facebook it would be the user number. Note that querying the `ProviderType` field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the AuthProvider object, but the expected `providerName` is `Open ID Connect`.

refreshAccessToken(authProviderId, providerName, oldAccessToken)

Returns a map from the third-party identifier containing a refreshed access token for the currently logged-in Salesforce user. Note that querying the `ProviderType` field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the AuthProvider object, but the expected `providerName` is `Open ID Connect`.

revokeAccess(authProviderId, providerName, userId, remoteIdentifier)

Revokes the access token for a specified social sign-on user from a third-party service such as Facebook©. You can use this method only if the `IsNotSsoUsable` field on the associated ThirdPartyAccountLink object is set to `false`. Querying the `ProviderType` field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the AuthProvider object, but the expected `providerName` is `Open ID Connect`.

getAccessToken(authProviderId, providerName)

Returns an access token for the current user using the specified 18-character identifier of an AuthProvider definition in your org and the proper name of the third party, such as Salesforce or Facebook. Note that querying the `ProviderType` field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the AuthProvider object, but the expected `providerName` is `Open ID Connect`.

Signature

```
public static String getAccessToken(String authProviderId, String providerName)
```

Parameters

authProviderId
Type: String

providerName
Type: String

The proper name of the third party. For all providers except Janrain, the expected values are

- `Facebook`
- `Salesforce`

- `Open ID Connect`
- `Microsoft Access Control Service`
- `LinkedIn`
- `Twitter`
- `Google`

For Janrain providers, the parameter value is the proper name of the third party used. `Yahoo!` is an example of a Janrain provider value.

Return Value

Type: String

`getAccessTokenMap(authProviderId, providerName)`

Returns a map from the third-party identifier to the access token for the currently logged-in Salesforce user. The identifier value depends on the third party. For example, for Salesforce it would be the user ID, while for Facebook it would be the user number. Note that querying the `ProviderType` field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the AuthProvider object, but the expected `providerName` is `Open ID Connect`.

Signature

```
public static Map<String, String> getAccessTokenMap(String authProviderId, String
providerName)
```

Parameters

`authProviderId`
Type: String

`providerName`
Type: String

The proper name of the third party. For all providers except Janrain, the expected values are

- `Facebook`
- `Salesforce`
- `Open ID Connect`
- `Microsoft Access Control Service`
- `LinkedIn`
- `Twitter`
- `Google`

For Janrain providers, the parameter value is the proper name of the third party used. `Yahoo!` is an example of a Janrain provider value.

Return Value

Type: Map<String, String>

refreshAccessToken(authProviderId, providerName, oldAccessToken)

Returns a map from the third-party identifier containing a refreshed access token for the currently logged-in Salesforce user. Note that querying the `ProviderType` field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the AuthProvider object, but the expected `providerName` is `Open ID Connect`.

Signature

```
public static Map<String, String> refreshAccessToken(String authProviderId, String
providerName, String oldAccessToken)
```

Parameters

authProviderId
Type: String

providerName
Type: String

The proper name of the third party. For all providers except Janrain, the expected values are

- `Facebook`
- `Salesforce`
- `Open ID Connect`
- `Microsoft Access Control Service`
- `LinkedIn`
- `Twitter`
- `Google`

For Janrain providers, the parameter value is the proper name of the third party used. `Yahoo!` is an example of a Janrain provider value.

oldAccessToken
Type: String

Return Value

Type: Map<String, String>

Usage

This method works when using Salesforce or an OpenID Connect provider, but not when using Facebook or Janrain. The returned map contains `AccessToken` and `RefreshError` keys. Evaluate the keys in the response to check if the request was successful. For a successful request, the `RefreshError` value is `null`, and `AccessToken` is a token value. For an unsuccessful request, the `RefreshError` value is an error message, and the `AccessToken` value is `null`.

When successful, this method updates the token stored in the database, which you can get using `Auth.AuthToken.getAccessToken()`.

If you are using an OpenID Connect authentication provider, an `id_token` is not required in the response from the provider. If a **Token Issuer** is specified in the **Auth. Provider** settings and an `id_token` is provided anyway, Salesforce will verify it.

Example

```
String accessToken = Auth.AuthToken.getAccessToken('0SOD000000000DeOAI', 'Open ID connect');
Map<String, String> responseMap = Auth.AuthToken.refreshAccessToken('0SOD000000000DeOAI',
 'Open ID connect', accessToken);
```

A successful request includes the access token in the response.

```
 (RefreshError,null)(AccessToken,00DD00000007BhE!AQkAQFzj...)
```

revokeAccess(authProviderId, providerName, userId, remoteIdentifier)

Revokes the access token for a specified social sign-on user from a third-party service such as Facebook©. You can use this method only if the `IsNotSsoUsable` field on the associated ThirdPartyAccountLink object is set to `false`. Querying the `ProviderType` field on the AuthProvider object sometimes returns a value that differs from the expected provider name value. For example, for Open ID Connect providers, `OpenIdConnect` is the `ProviderType` value for the AuthProvider object, but the expected `providerName` is `Open ID Connect`.

Signature

```
public static Boolean revokeAccess(String authProviderId, String providerName, String
userId, String remoteIdentifier)
```

Parameters

authProviderId
Type: String

The ID of the Auth. Provider in the Salesforce organization.

providerName
Type: String

The proper name of the third party. For all providers except Janrain, the expected values are

- `Facebook`
- `Salesforce`
- `Open ID Connect`
- `Microsoft Access Control Service`
- `LinkedIn`
- `Twitter`
- `Google`

For Janrain providers, the parameter value is the proper name of the third party used. `Yahoo!` is an example of a Janrain provider value.

userId
Type: String

The 15-character ID for the user whose access is being revoked.

remoteIdentifier
Type: String

The unique ID for the user in the third-party system (this value is in the associated ThirdPartyAccountLink standard object).

Return Value

Type: Boolean

The return value is `true` if the `revokeAccess()` operation is successful; otherwise `false`.

Example

The following example revokes a Facebook user's access token.

```
Auth.AuthToken.revokeAccess('0SOxx00000#####', 'facebook', '005xx00000#####',
'ThirdPartyIdentifier_exist214176560#####');
```

CommunitiesUtil Class

Contains methods for getting information about an Experience Cloud user.

Namespace

Auth

Example

The following example directs a guest (unauthenticated) user to one page, and authenticated users of the Experience Cloud site's parent organization to another page.

```
if (Auth.CommunitiesUtil.isGuestUser())
    // Redirect to the login page if user is an unauthenticated user
    return new PageReference(LOGIN_URL);

if (Auth.CommunitiesUtil.isInternalUser())
    // Redirect to the home page if user is an internal user
    return new PageReference(HOME_URL);
```

CommunitiesUtil Methods

The following are methods for `CommunitiesUtil`. All methods are static.

IN THIS SECTION:

getLogoutUrl()
Returns the page to display after the current Experience Cloud user logs out.

getUserDisplayName()
Returns the current user's Experience Cloud display name.

isGuestUser()
Indicates whether the current user isn't logged in to the Experience Cloud site. Redirect the user to log in, if necessary.

isInternalUser()
Indicates whether the current user is logged in as a member of the parent Salesforce organization, such as an employee.

getLogoutUrl()

Returns the page to display after the current Experience Cloud user logs out.

Signature

```
public static String getLogoutUrl()
```

Return Value

Type: String

getUserDisplayName()

Returns the current user's Experience Cloud display name.

Signature

```
public static String getUserDisplayName()
```

Return Value

Type: String

isGuestUser()

Indicates whether the current user isn't logged in to the Experience Cloud site. Redirect the user to log in, if necessary.

Signature

```
public static Boolean isGuestUser()
```

Return Value

Type: Boolean

isInternalUser()

Indicates whether the current user is logged in as a member of the parent Salesforce organization, such as an employee.

Signature

```
public static Boolean isInternalUser()
```

Return Value

Type: Boolean

ConfigurableSelfRegHandler Interface

Gives you more control over how customers or partners self-register for your Experience Cloud site by creating a class that implements `Auth.ConfigurableSelfRegHandler`. You choose the user information to collect, and how users identify themselves—with their email address, phone number, or another identifier. When verified, you create a customer or partner user and log in the user to your Experience Cloud site.

Namespace

Auth

Usage

You set up site self-registration declaratively on the Login & Registration (L&R) page of the Administration workspace. When combined with a configurable self-registration setup, the handler class can programmatically fill in user fields, including custom fields, and determine how to create a user and log them in.

When you select the Configurable Self-Reg Page registration page, you choose the user fields to collect from the self-registration form, such as last name, first name, username, nickname, mobile, or email. You also determine the verification method that the user identifies themselves with, which can be email, mobile, or neither. Salesforce generates the `Auth.ConfigurableSelfRegHandler` handler, which contains logic on how to create an Experience Cloud site member. Modify the handler to change how users are created, and how collected user information is used.

You can add custom logic to ensure that the email or phone number is unique to the customer or partner who's registering. For example, you can add a custom unique field, and write a copy of the email or phone number to it. You can also change how the user is created. By default, the user is created as a contact associated with the account that you select on the L&R page.

The generated `ConfigurableSelfRegHandler` is located on the Setup Apex Classes page, and begins with `AutocreatedConfigSelfReg`, for example, `AutocreatedConfigSelfReg1532475901849`.

For an example, see ConfigurableSelfRegHandler Example Implementation. For more details, see Salesforce Customer Identity in *Salesforce Help*.

IN THIS SECTION:

ConfigurableSelfRegHandler Method

ConfigurableSelfRegHandler Example Implementation

This Apex code implements the `Auth.ConfigurableSelfRegHandler` interface. After the customer or partner fills out the sign-up page and submits it, the handler is invoked to create an Experience Cloud member with the supplied information. If the registration process requires email or phone verification, the verification process finishes before the `Auth.ConfigurableSelfRegHandler.createUser` is invoked. If verification isn't required, `createUser` is invoked when the customer or partner submits the page.

ConfigurableSelfRegHandler Method

The following is the method for `ConfigurableSelfRegHandler`.

IN THIS SECTION:

createUser(accountId, profileId, registrationAttributes, password)

Create a community member from the information that the visitor provided on your community's self-registration page.

createUser(accountId, profileId, registrationAttributes, password)

Create a community member from the information that the visitor provided on your community's self-registration page.

Signature

```
public Id createUser(Id accountId, Id profileId, Map<Schema.SObjectField,String>
registrationAttributes, String password)
```

Parameters

accountId
Type: Id

Default account with which the new user is associated. This value comes from the Account field setting on Login and Registration (L&R) page under Registration Page Configuration.

profileID
Type: Id

Profile to assign the new user. This value comes from the Profile field setting on the L&R page under Registration Page Configuration.

registrationAttributes
Type: Map<Schema.sObjectField,String>

A map of attributes that the registering user entered on the self-registration page. The fields that appear on the self-registration page come from the User Fields selected on the L&R page when the registration type is Configurable Self-Reg Page.

password
Type: String

The password entered by the user if "Include Password" is selected on the L&R page. (If a password isn't entered, the handler must generate one because a password is required to create a user.)

Return Value

Type: Id

Returns an identifier for the created User object. `Auth.ConfigurableSelfRegHandler` inserts a user and then returns the ID of that user.

ConfigurableSelfRegHandler Example Implementation

This Apex code implements the `Auth.ConfigurableSelfRegHandler` interface. After the customer or partner fills out the sign-up page and submits it, the handler is invoked to create an Experience Cloud member with the supplied information. If the registration process requires email or phone verification, the verification process finishes before the `Auth.ConfigurableSelfRegHandler.createUser` is invoked. If verification isn't required, `createUser` is invoked when the customer or partner submits the page.

Verification occurs by email if the admin chose Email as the verification method when setting up the Configurable Self-Reg handler on the Login & Registration (L&R) page. When a visitor clicks the sign-up link from the login page, Salesforce prompts for an email address and then sends a one-time password to the specified email address. If the visitor enters the verification code successfully on the verify page, the user is created and logged in. Likewise, if the admin chose Text Message as the verification method on the L&R page, the visitor is prompted to enter a phone number. Salesforce sends a challenge (verification code) via SMS to the user. If successful, the user is created and logged in. Requiring verification before creating a user reduces the number of dummy users cluttering your org.

The `Auth.ConfigurableSelfRegHandler` class contains logic for generating the user fields required to create a user in case the user doesn't supply them. The handler generates default values, ensuring that the values are unique by appending a timestamp. You can modify the handler to make sure that the email address and phone number of the customer or partner are also unique.

```
global class AutocreatedConfigSelfReg implements Auth.ConfigurableSelfRegHandler {

    private final Long CURRENT_TIME = Datetime.now().getTime();
    private final String[] UPPERCASE_CHARS = 'ABCDEFGHIJKLMNOPQRSTUVWXYZ'.split('');
    private final String[] LOWERCASE_CHARS = 'abcdefghijklmnopqrstuvwxyz'.split('');
    private final String[] NUMBER_CHARS = '1234567890'.split('');
    private final String[] SPECIAL_CHARS = '!#$%-_=+<>'.split('');

    // This method is called once after verification (if any was configured).
    // This method should create a user and insert it.
    // Password can be null.
    // Return null or throw an exception to fail creation.
    global Id createUser(Id accountId, Id profileId, Map<SObjectField, String>
registrationAttributes, String password) {
        User u = new User();
        u.ProfileId = profileId;
        for (SObjectField field : registrationAttributes.keySet()) {
            String value = registrationAttributes.get(field);
            u.put(field, value);
        }

        u = handleUnsetRequiredFields(u);
        generateContact(u, accountId);
        if (String.isBlank(password)) {
            password = generateRandomPassword();
        }
        Site.validatePassword(u, password, password);
        if (u.contactId == null) {
            return Site.createExternalUser(u, accountId, password);
        }
        u.languagelocalekey = UserInfo.getLocale();
        u.localesidkey = UserInfo.getLocale();
        u.emailEncodingKey = 'UTF-8';
        u.timeZoneSidKey = UserInfo.getTimezone().getID();
        insert u;
        System.setPassword(u.Id, password);
        return u.id;
    }
    // Method to autogenerate a password if one isn't passed in.
    // By setting a password for a user, we won't send a
    // welcome email to set the password.
    private String generateRandomPassword() {
        String[] characters = new List<String>(UPPERCASE_CHARS);
        characters.addAll(LOWERCASE_CHARS);
        characters.addAll(NUMBER_CHARS);
        characters.addAll(SPECIAL_CHARS);

        return 'externaluser' + CURRENT_TIME + '@company.com';
    }
    // Default implementation to try to provide uniqueness.
    private String generateCommunityNickname() {
        return 'ExternalUser' + CURRENT_TIME;
    }
}
```

ConfirmUserRegistrationHandler Interface

Manages single sign-on (SSO) user mappings between Salesforce and a third-party identity provider. Use this interface to confirm user mappings before updating them.

Namespace

Auth

Usage

When you set up SSO with a third-party identity provider, you create a class that implements a registration handler using the `Auth.RegistrationHandler` interface. This class manages the process of creating and updating users. For advanced use cases that require you to confirm user information during the update process, implement the `Auth.ConfirmUserRegistrationHandler` interface in your class. This interface must be implemented in addition to `Auth.RegistrationHandler`.

You can use the `Auth.ConfirmUserRegistrationHandler` interface to ensure that users are mapped correctly between Salesforce and the third party. When a user who has previously logged in with an authentication provider logs in again, you can confirm

that the incoming user data is consistent with the user's third-party identifier. If not, you can identify which user is supposed to be logged in.

You can also use the `Auth.ConfirmUserRegistrationHandler` interface to switch context for users with multiple records. For example, a user has two records—an admin user and a standard user. When the user logs in, the third-party identity provider confirms the account used to log in and sends the response to Salesforce via the UserInfo endpoint. You can then use this information to determine whether to log in the user as an admin or standard user.

IN THIS SECTION:

ConfirmUserRegistrationHandler Methods

ConfirmUserRegistrationHandler Example Implementation

ConfirmUserRegistrationHandler Methods

The following are methods for `ConfirmUserRegistrationHandler`.

IN THIS SECTION:

confirmUser(userId, tpalId, portalId, userdata)
Returns the ID of the user to be logged in based on their mapping to a third-party identifier. This method is called before calling the `updateUser()` method. It's called only if the incoming user has previously logged in and has a third-party account link to a Salesforce user.

confirmUser(userId, tpalId, portalId, userdata)

Returns the ID of the user to be logged in based on their mapping to a third-party identifier. This method is called before calling the `updateUser()` method. It's called only if the incoming user has previously logged in and has a third-party account link to a Salesforce user.

Signature

```
public Id confirmUser(Id userId, Id tpalId, Id portalId, Auth.UserData userdata)
```

Parameters

userId
Type: Id

The ID of the user who is mapped to the third-party identifier via a third-party account link.

tpalId
Type: Id

The third-party account link corresponding to the third-party identifier.

portalId
Type: Id

The portal ID the user is logging in to. If there's no portal configured, this value can be null.

userData
Type: Auth.UserData

Contains user information from the third-party identity provider.

Return Value

Type: Id

The Id of the user to be logged in. If null, login fails.

ConfirmUserRegistrationHandler Example Implementation

This example implements the `Auth.ConfirmUserRegistrationHandler` interface during the user update process to confirm that the correct user is logging in based on their email address and last name.

```
global class StandardUserRegistrationHandler implements Auth.RegistrationHandler,
Auth.ConfirmUserRegistrationHandler {
    global User createUser(Id portalId, Auth.UserData data){
        User u = new User();
        Profile p = [SELECT Id FROM profile WHERE name='Standard User'];
        u.username = data.username + '@salesforce.com';
        u.email = data.email;
        u.lastName = data.lastName;
        u.firstName = data.firstName;
        String alias = data.username;
        if(alias.length() > 8) {
            alias = alias.substring(0, 8);
        }
        u.alias = alias;
        u.languagelocalekey = data.attributeMap.get('language');
        u.localesidkey = data.locale;
        u.emailEncodingKey = 'UTF-8';
        u.timeZoneSidKey = 'America/Los_Angeles';
        u.profileId = p.Id;
        return u;
    }

    global void updateUser(Id userId, Id portalId, Auth.UserData data) {
        User u = new User(id=userId);
        u.username = data.username + '@salesforce.com';
        u.email = data.email;
        u.lastName = data.lastName;
        u.firstName = data.firstName;
        String alias = data.username;
        if(alias.length() > 8) {
            alias = alias.substring(0, 8);
        }
        u.alias = alias;
        u.languagelocalekey = data.attributeMap.get('language');
        u.localesidkey = data.locale;
        update(u);
    }

    global Id confirmUser(Id userId, Id tpalId, Id portalId, Auth.UserData data) {
        if (data.email.contains(data.lastName)) { // looks genuine
            return userId;
        } else { // find the right user
            User confirmedUser = [SELECT id FROM user WHERE email=:data.email];
            return confirmedUser.Id;
```

```
        }
    }
}
```

The following example tests the implementation:

```
@isTest
public class StandardUserRegistrationHandlerTest {
    static testMethod void testConfirmUser() {
        StandardUserRegistrationHandler handler = new StandardUserRegistrationHandler();
        Auth.UserData sampleData = new Auth.UserData('idA', 'firstName', 'A',
            'firstName A', 'userA@example.org', null, 'usernameA', 'en_US', 'facebook',
            null, new Map<String, String>{'language' => 'en_US'});
        User u = handler.createUser(null, sampleData);
        insert(u);
        String uid = u.id;

        sampleData = new Auth.UserData('idB', 'firstName', 'B',
            'firstName B', 'userA@example.org', null, 'usernameB', 'en_US', 'facebook',
            null, new Map<String, String>{}); // note that user B is using userA's email
       Id confirmedUserId = handler.confirmUser(uid, '060xx0000004Eh6', null, sampleData);

        System.assertEquals(uid, confirmedUserId); // we should see userA's id
    }
}
```

ConnectedAppPlugin Class

Contains methods for extending the behavior of a connected app, for example, customizing how a connected app is invoked depending on the protocol used. This class gives you more control over the interaction between Salesforce and your connected app.

Namespace

Auth

Usage

When you create a connected app, you specify general information about the app and settings for OAuth, web apps, mobile apps, and canvas apps. To customize how the app is invoked, create a connected app handler with this `ConnectedAppPlugin` Apex class. For example, use this class to support new authentication protocols or respond to user attributes in a way that benefits a business process.

When you create a connected app handler, you also configure the `ConnectedAppPlugin` class to run as an execution user. The execution user authorizes access for the connected app. For example, when you use the `authorize` method, the execution user authorizes the connected app to access data.

If you don't specify an execution user, the plug-in runs as an Automated Process User, which is a system user that executes tasks behind the scenes. Most `ConnectedAppPlugin` methods require that you specify an execution user, with the exception of the `customAttributes` method. For more information, see Create a Custom Connected App Handler.

Example

This example authorizes the connected app user to use the connected app if the context is SAML and the user has reached the quota tracked in a custom field. It returns the user's permission set assignments. The example uses `Auth.InvocationContext` to modify a SAML assertion before it's sent to the service provider.

```
global class ConnectedAppPluginExample extends Auth.ConnectedAppPlugin
{
    // Authorize the app if the user has achieved quota tracked in a custom field
   global override Boolean authorize(Id userId, Id connectedAppId, Boolean isAdminApproved,
 Auth.InvocationContext context)
    {
        // Create a custom boolean field HasAchievedQuota__c on the user record
        // and then uncomment the block below
        // User u = [select id, HasAchievedQuota__c from User where id =: userId].get(0);

        // return u.HasAchievedQuota__c;

        return isAdminApproved;
    }

    // Call a flow during refresh
    global override void refresh(Id userId, Id connectedAppId, Auth.InvocationContext
context)
    {
       try
       {
          Map<String, Object> inputVariables = new Map<String, Object>();
          inputVariables.put('userId', userId);
          inputVariables.put('connectedAppId', connectedAppId);

         // Create a custom trigger ready flow and uncomment the block below
         // Flow.Interview.MyCustomFlow interview = new
Flow.Interview.MyCustomFlow(inputVariables);
         // interview.start();
        } catch ( Exception e ) {
           System.debug('FLOW Exception:' + e);
        }
    }

    // Return a user's permission set assignments
    global override Map<String,String> customAttributes(Id userId, Id connectedAppId,
Map<String,String>
        formulaDefinedAttributes, Auth.InvocationContext context)
    {
        List<PermissionSetAssignment> psas = [SELECT id, PermissionSet.Name FROM
PermissionSetAssignment
        WHERE PermissionSet.IsOwnedByProfile = false AND (AssigneeId = :userId)];
        String permsets = '[';
        for (PermissionSetAssignment psa :psas)
        {
            permsets += psa.PermissionSet.Name + ';';
        }
        permsets += ']';
        formulaDefinedAttributes.put('PermissionSets', permsets);
```

```
        return formulaDefinedAttributes;
    }
}
```

IN THIS SECTION:

ConnectedAppPlugin Methods

ConnectedAppPlugin Methods

The following are methods for `ConnectedAppPlugin`.

IN THIS SECTION:

authorize(userId, connectedAppId, isAdminApproved)

Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use `authorize(userId, connectedAppId, isAdminApproved, context)` instead.

authorize(userId, connectedAppId, isAdminApproved, context)

Authorizes the specified user to access the connected app. If the connected app is set for users to self-authorize, this method isn't invoked.

customAttributes(userId, connectedAppId, formulaDefinedAttributes)

Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use `customAttributes(userId, connectedAppId, formulaDefinedAttributes, context)` instead.

customAttributes(userId, connectedAppId, formulaDefinedAttributes, context)

Sets new attributes for the specified user. When the connected app gets the user's attributes from the UserInfo endpoint or through a SAML assertion, use this method to update the attribute values.

modifySAMLResponse(authSession, connectedAppId, samlResponse)

Modifies the XML generated by the Salesforce SAML Identity Provider (IDP) before it's sent to the service provider.

refresh(userId, connectedAppId)

Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use `refresh(userId, connectedAppId, context)` instead.

refresh(userId, connectedAppId, context)

Salesforce calls this method during a refresh token exchange.

`authorize(userId, connectedAppId, isAdminApproved)`

Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use `authorize(userId, connectedAppId, isAdminApproved, context)` instead.

Signature

```
public Boolean authorize(Id userId, Id connectedAppId, Boolean isAdminApproved)
```

Parameters

`userId`
Type: Id

The 15-character ID of the user attempting to use the connected app.

connectedAppId
Type: String

The 15-character ID of the connected app.

isAdminApproved
Type: Boolean

The approval state of the specified user when the connected app requires approval.

Return Value

Type: Boolean

If the connected app requires admin approval, a returned value of `true` indicates that the current user is approved.

authorize(userId, connectedAppId, isAdminApproved, context)

Authorizes the specified user to access the connected app. If the connected app is set for users to self-authorize, this method isn't invoked.

Signature

```
public Boolean authorize(Id userId, Id connectedAppId, Boolean isAdminApproved,
Auth.InvocationContext context)
```

Parameters

userId
Type: Id

The 15-character ID of the user attempting to use the connected app.

connectedAppId
Type: Id

The 15-character ID of the connected app.

isAdminApproved
Type: Boolean

The approval state of the specified user when the connected app requires approval.

context
Type: InvocationContext

The context in which the connected app is invoked.

Return Value

Type: Boolean

If the connected app requires admin approval, a returned value of `true` indicates that the user is approved.

Usage

`ConnectedAppPlugin` runs on behalf of the current user. But the user must have permission to use the connected app for the plug-in to work. Use this method to authorize the user.

customAttributes(userId, connectedAppId, formulaDefinedAttributes)

Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use `customAttributes(userId, connectedAppId, formulaDefinedAttributes, context)` instead.

Signature

```
public Map<String,String> customAttributes(Id userId, Id connectedAppId,
Map<String,String> formulaDefinedAttributes,)
```

Parameters

userId
Type: Id

The 15-character ID of the user attempting to use the connected app.

connectedAppId
Type: Id

The 15-character ID of the connected app.

formulaDefinedAttributes
Type: Map<String,String>

A map of the new set of attributes from the UserInfo endpoint (OAuth) or from a SAML assertion. For more information, see The UserInfo Endpoint in the online help.

Return Value

Type: Map<String,String>

A map of the updated set of attributes.

customAttributes(userId, connectedAppId, formulaDefinedAttributes, context)

Sets new attributes for the specified user. When the connected app gets the user's attributes from the UserInfo endpoint or through a SAML assertion, use this method to update the attribute values.

Signature

```
public Map<String,String> customAttributes(Id userId, Id connectedAppId,
Map<String,String> formulaDefinedAttributes, Auth.InvocationContext context)
```

Parameters

userId
Type: Id

The 15-character ID of the user attempting to use the connected app.

connectedAppId
Type: Id

The 15-character ID for the connected app.

formulaDefinedAttributes
Type: Map<String,String>

A map of the current set of attributes from the UserInfo endpoint (OAuth) or from a SAML assertion. For more information, see The UserInfo Endpoint in the online help.

Type: InvocationContext

The context in which the connected app is invoked.

Return Value

Type: Map<String,String>

A map of the updated set of attributes.

modifySAMLResponse(authSession, connectedAppId, samlResponse)

Modifies the XML generated by the Salesforce SAML Identity Provider (IDP) before it's sent to the service provider.

Signature

```
public dom.XmlNode modifySAMLResponse(Map<String,String> authSession, Id connectedAppId,
dom.XmlNode samlResponse)
```

Parameters

authSession
Type: Map<String,String>

The attributes for the authorized user's session. The map includes the 15-character ID of the authorized user who's accessing the connected app.

connectedAppId
Type: Id

The 15-character ID of the connected app.

samlResponse
Type: Dom.XmlNode

Contains the SAML XML response generated by the IDP.

Return Value

Type: Dom.XmlNode

Returns an instance of Dom.XmlNode containing the modified SAML XML response.

Usage

Use this method to modify the XML SAML response to perform an action based on the context of the SAML request before it's verified, signed, and sent to the target service provider. This method enables developers to extend the connected app plug-in to meet their specific needs.

The developer assumes full responsibility for changes made within the connected app plug-in. The plug-in must include validation and error handling. If the plug-in throws an exception, catch it, log it, and stop the process. Don't send anything to the target service provider.

`refresh(userId, connectedAppId)`

Deprecated and available only in API versions 35.0 and 36.0. As of version 37.0, use `refresh(userId, connectedAppId, context)` instead.

Signature

```
public void refresh(Id userId, Id connectedAppId)
```

Parameters

`userId`
Type: Id

The 15-character ID of the user requesting the refresh token.

`connectedAppId`
Type: Id

The 15-character ID of the connected app.

Return Value

Type: void

`refresh(userId, connectedAppId, context)`

Salesforce calls this method during a refresh token exchange.

Signature

```
public void refresh(Id userId, Id connectedAppId, Auth.InvocationContext context)
```

Parameters

`userId`
Type: Id

The 15-character ID of the user requesting the refresh token.

`connectedAppId`
Type: Id

The 15-character ID of the connected app.

`context`
Type: InvocationContext

The context in which the connected app is invoked.

Return Value

Type: void

HeadlessSelfRegistrationHandler Interface

Creates customer and partner users during the Headless Registration Flow.

Namespace

Auth

Usage

The Headless Registration Flow allows you to control user registration experience in a third-party app while using Salesforce to authenticate users and manage their data access. When you set up this flow, add users in the class that is implementing the `Auth.HeadlessSelfRegistrationHandler` interface. This class runs after the user verifies their identity. For a detailed explanation of headless registration, see Headless Registration Flow for Private Clients or Headless Registration Flow for Public Clients, depending on your app type.

IN THIS SECTION:

HeadlessSelfRegistrationHandler Methods

The following are methods for `HeadlessSelfRegistrationHandler`.

HeadlessSelfRegistrationHandler Example Implementation

This example class implements the `Auth.HeadlessSelfRegistrationHandler` interface. The class creates a user based on information that your app sends to Headless Registration API. It associates the user with the default profile for new users, which you configure in your Experience Cloud settings. It also creates a contact for the user and assigns it to an account.

HeadlessSelfRegistrationHandler Methods

The following are methods for `HeadlessSelfRegistrationHandler`.

IN THIS SECTION:

createUser(profileId, data, customUserDataMap, experienceId, password)

Returns a User object using information submitted by your off-platform app to Headless Registration API. The User object can be a new user that hasn't been inserted in your org's database, or it can represent an existing user record. If it's a new User object, Salesforce inserts the user record for you.

`createUser(profileId, data, customUserDataMap, experienceId, password)`

Returns a User object using information submitted by your off-platform app to Headless Registration API. The User object can be a new user that hasn't been inserted in your org's database, or it can represent an existing user record. If it's a new User object, Salesforce inserts the user record for you.

Signature

```
public User createUser(Id profileId, Auth.UserData data, String customUserDataMap,
String experienceId, String password)
```

Parameters

profileId
Type: Id

The ID of the profile that is assigned to new users.

data
Type: Auth.UserData

A class that stores information about the user, such as their name and locale.

customUserDataMap
Type: String

A string representation of a JSON object containing custom user information passed in during registration. We recommend that you deserialize this string into the equivalent Apex class structure. Determine what custom information to collect when you build your app's registration experience.

experienceId
Type: String

A custom value that determines what the end user experiences.

password
Type: String

The user password.

Return Value

Type: User

HeadlessSelfRegistrationHandler Example Implementation

This example class implements the `Auth.HeadlessSelfRegistrationHandler` interface. The class creates a user based on information that your app sends to Headless Registration API. It associates the user with the default profile for new users, which you configure in your Experience Cloud settings. It also creates a contact for the user and assigns it to an account.

```
global class ExampleHeadlessReg implements Auth.HeadlessSelfRegistrationHandler {

    global User createUser(Id profileId, Auth.UserData data, String customUserDataMap,
String experienceId, String password){
        User u = new User();
        u.ProfileId = profileId;

        u = handleUnsetRequiredFields(u);
        u.email = data.email;
        Account a;
            List<Account> accounts = [SELECT Id FROM account WHERE name=:social_account];

            if(accounts.isEmpty())
            {
                a = new Account(name = social_account);
                insert(a);
            }else
                a = accounts[0];
        generateContact(u, a.Id);
```

```
        u.languagelocalekey = UserInfo.getLocale();
        u.localesidkey = UserInfo.getLocale();
        u.emailEncodingKey = 'UTF-8';
        u.timeZoneSidKey = UserInfo.getTimezone().getID();
        return u;
    }

    private User handleUnsetRequiredFields(User u) {
        return u;
    }

    // Method to construct a contact for a user
    private void generateContact(User u, Id accountId) {
        // Add logic here to build your own contact for the user
        Contact c = new Contact();
            c.accountId = accountId;
            c.firstName = u.firstName;
            c.lastName = u.lastName;
            insert(c);
            u.contactId = c.Id;

    }

    // Default implementation to try to provide uniqueness
    private String generateAlias() {
        String timeString = String.valueOf(CURRENT_TIME);
        return timeString.substring(timeString.length() - 8);
    }
}
```

IntegratingAppType Enum

Specifies whether you're integrating your app as a connected app or as an external client app in methods used in your customized Apex token exchange handler, which extends the `Auth.Oauth2TokenExchangeHandler` class.

Usage

See Token Exchange Handler Validation and Subject Mapping.

Enum Values

The following are the values of the `Auth.IntegratingAppType` enum.

Value	Description
`CA`	Indicates a Salesforce connected app.
`ECA`	Indicates a Salesforce external client app.

InvocationContext Enum

The context in which the connected app is invoked, such as the protocol flow used and the token type issued, if any. Developers can use the context information to write code that is unique to the type of invocation.

Enum Values

The following are the values of the `Auth.InvocationContext` enum.

Value	Description
`ASSET_TOKEN`	Reserved for future use.
`OAUTH1`	Context used when authentication is through an OAuth 1.0A flow.
`OAUTH2_JWT_BEARER_TOKEN`	Context used when authentication is through a JSON-based Web Token (JWT) bearer token flow.
`OAUTH2_SAML_ASSERTION`	Context used when authentication is through an OAuth 2.0 SAML assertion flow.
`OAUTH2_SAML_BEARER_ASSERTION`	Context used when authentication is through an OAuth 2.0 SAML bearer assertion flow.
`OAUTH2_USERNAME_PASSWORD`	Context used when authentication is through an OAuth 2.0 username-password flow.
`OAUTH2_USER_AGENT_ID_TOKEN`	Context used when issuing an ID token through an OAuth 2.0 user-agent flow.
`OAUTH2_USER_AGENT_TOKEN`	Context used when authentication is through an OAuth 2.0 user agent flow.
`OAUTH2_WEB_SERVER`	Context used when authentication is through a web server authentication flow.
`OPENIDCONNECT`	Context used when authentication is through an OpenID Connect authentication flow.
`REFRESH_TOKEN`	Context used when renewing tokens issued by a web server or user-agent flow.
`SAML_ASSERTION`	Context used when authentication is through a SAML assertion flow.
`UNKNOWN`	Context is unknown.
`USERID_ENDPOINT`	Context used when issuing an access token through a UserInfo endpoint.

Salesforce Help: Authenticating Apps with OAuth

JWS Class

Contains methods that apply a digital signature to a JSON Web Token (JWT), using a JSON Web Signature (JWS) data structure. This class creates the signed JWT bearer token, which can be used to request an OAuth access token in the OAuth 2.0 JWT bearer token flow.

Namespace

Auth

Usage

Use the methods in this class to sign the JWT bearer token with the X509 certificate.

IN THIS SECTION:

JWS Constructors

JWS Methods

JWS Constructors

The following are constructors for `JWS`.

IN THIS SECTION:

JWS(jwt, certDevName)
Creates an instance of the `JWS` class using the specified `Auth.JWT` payload and the certificate used for signing the JWT bearer token.

JWS(payload, certDevName)
Creates an instance of the `JWS` class using the specified payload and certificate used for signing the JWT bearer token.

`JWS(jwt, certDevName)`

Creates an instance of the `JWS` class using the specified `Auth.JWT` payload and the certificate used for signing the JWT bearer token.

Signature

```
public JWS(Auth.JWT jwt, String certDevName)
```

Parameters

`jwt`
Type: Auth.JWT

The Base64-encoded JSON Claims Set in the JWT bearer token generated by `Auth.JWT`.

`certDevName`
Type: String

The `Unique Name` for a certificate stored in the Salesforce org's Certificate and Key Management page to use for signing the JWT bearer token.

Usage

Calls the `toJSONString()` method in `Auth.JWT` and sets the resulting string as the payload of the JWT bearer token. Alternatively, you can specify the payload directly using `JWS(payload, certDevName)`.

`JWS(payload, certDevName)`

Creates an instance of the `JWS` class using the specified payload and certificate used for signing the JWT bearer token.

Signature

```
public JWS(String payload, String certDevName)
```

Parameters

`payload`
Type: String

The Base64-encoded JSON Claims Set in the JWT bearer token.

`certDevName`
Type: String

The `Unique Name` for a certificate stored in the Salesforce org's Certificate and Key Management page to use for signing the JWT bearer token.

Usage

Sets the *`payload`* string as the payload of the JWT bearer token. Alternatively, if you generate the payload using `Auth.JWT`, you can use `JWS(jwt, certDevName)` instead.

JWS Methods

The following are methods for `JWS`. All are instance methods.

IN THIS SECTION:

clone()
Makes a duplicate copy of the JWS object.

getCompactSerialization()
Returns the compact serialization representation of the JWS as a concatenated string, with the encoded JWS header, encoded JWS payload, and encoded JWS signature strings separated by period ('.') characters.

`clone()`

Makes a duplicate copy of the JWS object.

Signature

```
public Object clone()
```

Return Value

Type: JWS

`getCompactSerialization()`

Returns the compact serialization representation of the JWS as a concatenated string, with the encoded JWS header, encoded JWS payload, and encoded JWS signature strings separated by period ('.') characters.

Signature

```
public String getCompactSerialization()
```

Return Value

Type: String

JWT Class

Generates the JSON Claims Set in a JSON Web Token (JWT). The resulting Base64-encoded payload can be passed as an argument to create an instance of the `Auth.JWS` class.

Namespace

Auth

Usage

Use the methods in this class to generate the payload in a JWT bearer token.

IN THIS SECTION:

JWT Methods

JWT Methods

The following are methods for `JWT`. All are instance methods.

IN THIS SECTION:

clone()
Makes a duplicate copy of the JWT object.

getAdditionalClaims()
Returns a map of additional claims in the JWT, where the key string contains the name of the claim, and the value contains the value of the claim.

getAud()
Returns the audience claim that identifies the intended recipients of the JWT.

getIss()
Returns the issuer claim that identifies the issuer of the JWT.

getNbfClockSkew()
Returns the not before claim that identifies the time before which the JWT must not be accepted for processing, while allowing some leeway for clock skew.

getSub()
Returns the subject claim that identifies the current user of the JWT.

getValidityLength()
Returns the length of time (in seconds) that the JWT is valid, which affects the expiration claim.

setAdditionalClaims(additionalClaims)
Sets the additional claims in the JWT. Returned by the `getAdditionalClaims()` method.

setAud(aud)
Sets the audience claim in the JWT. Returned by the `getAud()` method.

setIss(iss)
Sets the issuer claim in the JWT. Returned by the `getIss()` method.

setNbfClockSkew(nbfClockSkew)
Sets the not before claim in the JWT. Returned by the `getNbfClockSkew()` method.

setSub(sub)
Sets the subject claim in the JWT. Returned by the `getSub()` method.

setValidityLength(validityLength)
Sets the length of time (in seconds) that the JWT is valid, which affects the expiration claim. Returned by the `getValidityLength()` method.

toJSONString()
Generates the JSON object representation of the Claims Set as an encoded JWT payload.

`clone()`

Makes a duplicate copy of the JWT object.

Signature

```
public Object clone()
```

Return Value

Type: JWT

`getAdditionalClaims()`

Returns a map of additional claims in the JWT, where the key string contains the name of the claim, and the value contains the value of the claim.

Signature

```
public Map<String,ANY> getAdditionalClaims()
```

Return Value

Type: Map<String,ANY>

getAud()

Returns the audience claim that identifies the intended recipients of the JWT.

Signature

```
public String getAud()
```

Return Value

Type: String

getIss()

Returns the issuer claim that identifies the issuer of the JWT.

Signature

```
public String getIss()
```

Return Value

Type: String

getNbfClockSkew()

Returns the not before claim that identifies the time before which the JWT must not be accepted for processing, while allowing some leeway for clock skew.

Signature

```
public Integer getNbfClockSkew()
```

Return Value

Type: Integer

getSub()

Returns the subject claim that identifies the current user of the JWT.

Signature

```
public String getSub()
```

Return Value

Type: String

`getValidityLength()`

Returns the length of time (in seconds) that the JWT is valid, which affects the expiration claim.

Signature

```
public Integer getValidityLength()
```

Return Value

Type: Integer

`setAdditionalClaims(additionalClaims)`

Sets the additional claims in the JWT. Returned by the `getAdditionalClaims()` method.

Signature

```
public void setAdditionalClaims(Map<String,ANY> additionalClaims)
```

Parameters

`additionalClaims`
Type: Map<String,ANY>

Return Value

Type: void

Usage

Additional claims must not include any standard claims.

`setAud(aud)`

Sets the audience claim in the JWT. Returned by the `getAud()` method.

Signature

```
public void setAud(String aud)
```

Parameters

`aud`
Type: String

Return Value

Type: void

`setIss(iss)`

Sets the issuer claim in the JWT. Returned by the `getIss()` method.

Signature

```
public void setIss(String iss)
```

Parameters

iss
Type: String

Return Value

Type: void

`setNbfClockSkew(nbfClockSkew)`

Sets the not before claim in the JWT. Returned by the `getNbfClockSkew()` method.

Signature

```
public void setNbfClockSkew(Integer nbfClockSkew)
```

Parameters

nbfClockSkew
Type: Integer

Return Value

Type: void

`setSub(sub)`

Sets the subject claim in the JWT. Returned by the `getSub()` method.

Signature

```
public void setSub(String sub)
```

Parameters

sub
Type: String

Return Value

Type: void

`setValidityLength(validityLength)`

Sets the length of time (in seconds) that the JWT is valid, which affects the expiration claim. Returned by the `getValidityLength()` method.

Signature

```
public void setValidityLength(Integer validityLength)
```

Parameters

validityLength
Type: Integer

Return Value

Type: void

`toJSONString()`

Generates the JSON object representation of the Claims Set as an encoded JWT payload.

Signature

```
public String toJSONString()
```

Return Value

Type: String

JWTBearerTokenExchange Class

Contains methods that POST the signed JWT bearer token to a token endpoint to request an access token, in the OAuth 2.0 JWT bearer token flow.

Namespace

Auth

Usage

Use the methods in this class to post a signed JWT bearer token to the OAuth token endpoint, in exchange for an access token.

Example

In the following example application, the Apex controller:

1. Creates the JSON Claims Set.
2. Specifies the scope of the request with additional claims.
3. Creates the signed JWT.

4. Specifies the token endpoint and POSTs to it.
5. Gets the access token from the HTTP response.

```
public class MyController{

     public MyController() {
        Auth.JWT jwt = new Auth.JWT();
        jwt.setSub('user@salesforce.com');
        jwt.setAud('https://login.salesforce.com');
        jwt.setIss('3MVG99OxTyEMCQ3gNp2PjkqeZKxnmAiG1xV4oHh9AKL_rSK.BoSVPGZHQ
ukXnVjzRgSuQqGn75NL7yfkQcyy7');

        //Additional claims to set scope
        Map<String, Object> claims = new Map<String, Object>();
        claims.put('scope', 'scope name');

        jwt.setAdditionalClaims(claims);

        //Create the object that signs the JWT bearer token
        Auth.JWS jws = new Auth.JWS(jwt, 'CertFromCertKeyManagement');

        //Get the resulting JWS in case debugging is required
        String token = jws.getCompactSerialization();

        //Set the token endpoint that the JWT bearer token is posted to
        String tokenEndpoint = 'https://login.salesforce.com/services/oauth2/token';

        //POST the JWT bearer token
       Auth.JWTBearerTokenExchange bearer = new Auth.JWTBearerTokenExchange(tokenEndpoint,
 jws);

        //Get the access token
        String accessToken = bearer.getAccessToken();

    }
}
```

IN THIS SECTION:

JWTBearerTokenExchange Constructors

JWTBearerTokenExchange Methods

JWTBearerTokenExchange Constructors

The following are constructors for `JWTBearerTokenExchange`.

IN THIS SECTION:

JWTBearerTokenExchange(tokenEndpoint, jws)

Creates an instance of the `JWTBearerTokenExchange` class using the specified token endpoint and the signed JWT bearer token.

JWTBearerTokenExchange()
Creates an instance of the `Auth.JWTBearerTokenExchange` class.

`JWTBearerTokenExchange(tokenEndpoint, jws)`

Creates an instance of the `JWTBearerTokenExchange` class using the specified token endpoint and the signed JWT bearer token.

Signature

```
public JWTBearerTokenExchange(String tokenEndpoint, Auth.JWS jws)
```

Parameters

`tokenEndpoint`
Type: String

The token endpoint that the signed JWT bearer token is POSTed to.

`jws`
Type: Auth.JWS

The signed JWT bearer token.

`JWTBearerTokenExchange()`

Creates an instance of the `Auth.JWTBearerTokenExchange` class.

Signature

```
public JWTBearerTokenExchange()
```

JWTBearerTokenExchange Methods

The following are methods for `JWTBearerTokenExchange`. All are instance methods.

IN THIS SECTION:

clone()
Makes a duplicate copy of the JWTBearerTokenExchange object.

getAccessToken()
Returns the `access_token` in the token response to the JWT bearer token request.

getGrantType()
Returns the grant type specified in the JWT bearer token request. The grant type value defaults to `urn:ietf:params:oauth:grant-type:jwt-bearer`.

getHttpResponse()
Returns the full `System.HttpResponse` token response to the JWT bearer token request.

getJWS()
Returns the JWS specified in the JWT bearer token request.

getTokenEndpoint()
Returns the token endpoint that the JWT bearer token request is POSTed to.

setGrantType(grantType)
Sets the grant type in the JWT bearer token request. Returned by the `getGrantType()` method.

setJWS(jws)
Sets the JWS in the JWT bearer token request. Returned by the `getJWS()` method.

setTokenEndpoint(tokenEndpoint)
Sets the token endpoint that the JWT bearer token request is POSTed to. Returned by the `getTokenEndpoint()` method.

`clone()`

Makes a duplicate copy of the JWTBearerTokenExchange object.

Signature

```
public Object clone()
```

Return Value

Type: JWTBearerTokenExchange

`getAccessToken()`

Returns the `access_token` in the token response to the JWT bearer token request.

Signature

```
public String getAccessToken()
```

Return Value

Type: String

Usage

This method extracts the `access_token` from the token response. If the token response issues the access token in a different parameter, the request fails.

If you want the full HTTP token response returned, use `getHttpResponse` instead.

`getGrantType()`

Returns the grant type specified in the JWT bearer token request. The grant type value defaults to `urn:ietf:params:oauth:grant-type:jwt-bearer`.

Signature

```
public String getGrantType()
```

Return Value

Type: String

`getHttpResponse()`

Returns the full `System.HttpResponse` token response to the JWT bearer token request.

Signature

```
public System.HttpResponse getHttpResponse()
```

Return Value

Type: System.HttpResponse

Usage

You can get the access token from the full `System.HttpResponse`. If you want only the `access_token` from the token response, you can use `getAccessToken` instead.

`getJWS()`

Returns the JWS specified in the JWT bearer token request.

Signature

```
public Auth.JWS getJWS()
```

Return Value

Type: Auth.JWS

`getTokenEndpoint()`

Returns the token endpoint that the JWT bearer token request is POSTed to.

Signature

```
public String getTokenEndpoint()
```

Return Value

Type: String

`setGrantType(grantType)`

Sets the grant type in the JWT bearer token request. Returned by the `getGrantType()` method.

Signature

```
public void setGrantType(String grantType)
```

Parameters

grantType
Type: String

Return Value

Type: void

setJWS(jws)

Sets the JWS in the JWT bearer token request. Returned by the `getJWS()` method.

Signature

```
public void setJWS(Auth.JWS jws)
```

Parameters

jws
Type: Auth.JWS

Return Value

Type: void

setTokenEndpoint(tokenEndpoint)

Sets the token endpoint that the JWT bearer token request is POSTed to. Returned by the `getTokenEndpoint()` method.

Signature

```
public void setTokenEndpoint(String tokenEndpoint)
```

Parameters

tokenEndpoint
Type: String

Return Value

Type: void

JWTUtil Class

Contains methods for validating a JSON Web Token (JWT) from an external identity provider as part of the OAuth 2.0 token exchange flow. Use these methods as part of the `validateIncomingToken` method in the `Auth.Oauth2TokenExchangeHandler` class.

Namespace

Auth

Usage

See Token Exchange Handler Validation and Subject Mapping.

If the methods in this class fail, Salesforce returns an `Auth.JWTValidationException` exception.

IN THIS SECTION:

JWTUtil Methods

JWTUtil Methods

The following are methods for `JWTUtil`.

IN THIS SECTION:

parseJWTFromStringWithoutValidation(incomingJWT)
Parses a JWT from an encoded string into a header, payload, and signature. Use this method to decode the JWT without validating it.

validateJWTWithCert(incomingJWT, certDeveloperName)
Parses and validates the JWT using a certificate saved in Salesforce. The certificate can be self-signed or signed by a certificate authority.

validateJWTWithKey(incomingJWT, publicKey)
Parses and validates the JWT using a public key from the external identity provider.

validateJWTWithKeysEndpoint(incomingJWT, keysEndpoint, shouldUseCache)
Parses and validates the JWT using a remote JSON Web Key Set (JWKS) endpoint on your external identity provider.

`parseJWTFromStringWithoutValidation(incomingJWT)`

Parses a JWT from an encoded string into a header, payload, and signature. Use this method to decode the JWT without validating it.

Signature

```
public static Auth.JWT parseJWTFromStringWithoutValidation(String incomingJWT)
```

Parameters

`incomingJWT`
Type: String

The JWT from your identity provider.

Return Value

Type:Auth.JWT

validateJWTWithCert(incomingJWT, certDeveloperName)

Parses and validates the JWT using a certificate saved in Salesforce. The certificate can be self-signed or signed by a certificate authority.

Signature

```
public static Auth.JWT validateJWTWithCert(String incomingJWT, String certDeveloperName)
```

Parameters

incomingJWT
Type: String

The JWT from your identity provider.

certDeveloperName
Type: String

A certificate saved in the Certificate and Key Management page in Setup.

Return Value

Type: Auth.JWT

validateJWTWithKey(incomingJWT, publicKey)

Parses and validates the JWT using a public key from the external identity provider.

Signature

```
public static Auth.JWT validateJWTWithKey(String incomingJWT, String publicKey)
```

Parameters

incomingJWT
Type: String

The JWT from your identity provider.

publicKey
Type: String

The public key from your identity provider.

Return Value

Type: Auth.JWT

`validateJWTWithKeysEndpoint(incomingJWT, keysEndpoint, shouldUseCache)`

Parses and validates the JWT using a remote JSON Web Key Set (JWKS) endpoint on your external identity provider.

Signature

```
public static Auth.JWT validateJWTWithKeysEndpoint(String incomingJWT, String
keysEndpoint, Boolean shouldUseCache)
```

Parameters

incomingJWT
Type: String

The JWT from your identity provider.

keysEndpoint
Type: String

A URL pointing to a valid JWKS endpoint on your identity provider. The JWKS returned by the endpoint must conform to the specification defined in RFC 7517: JSON Web Key (JWK).

shouldUseCache
Type: Boolean

Indicates whether the certificate from the keys endpoint is cached.

Return Value

Type: Auth.JWT

LightningLoginEligibility Enum

Contains a Lightning Login eligibility value used by the `Auth.SessionManagement.getLightningLoginEligibility` method.

Usage

If you use the Discovery page type, users can verify themselves with Lightning Login. Lightning Login lets internal users log in with Salesforce Authenticator instead of a password. Certain conditions must be met for Lightning Login to succeed.

Call `Auth.SessionManagement.getLightningLoginEligibility` before or after a login attempt to get the eligibility status. You can call after a login attempt to determine why the login attempt failed.

Enum Values

The following are the values of the `Auth.LightningLoginEligibility` enum.

Value	Description
`ELIGIBLE`	All eligibility conditions are met. The admin has enabled Salesforce Authenticator and Lightning Login, assigned the user Lightning Login user permission, and selected **Allow only for users with the Lightning Login User permission** from the Session

Value	Description
	Settings Setup page. The user has set up Salesforce Authenticator and enrolled in Lightning Login.
`ORG_AUTHENTICATOR_NOT_ENABLED`	The admin hasn't enabled Salesforce Authenticator.
`ORG_PREF_NOT_ENABLED`	The admin hasn't enabled Lightning Login. The Admin must select **Allow Lightning Login** from the Session Settings Setup page.
`USER_AUTHENTICATOR_NOT_CONNECTED`	The user hasn't set up Salesforce Authenticator.
`USER_NOT_ALLOWED`	The admin hasn't granted the user AllowLightningLogin user permission. Allowing Lightning Login to certain users requires the OnlyLLPermUserAllowed org preference. Admins must select **Allow only for users with the Lightning Login User permission** from the Session Settings Setup page.
`USER_NOT_ENROLLED`	The user hasn't enrolled in Lightning Login.
`USER_PERM_NOT_ENABLED`	The admin hasn't granted the user the Lightning Login Eligible user permission.

LoginDiscoveryHandler Interface

Salesforce gives you the ability to log in users based on other verification methods than username and password. For example, it can prompt users to log in with their email, phone number, or another identifier like a Federation ID or device identifier. Login Discovery is available to these licenses: Customer Community, Customer Community Plus, External Identity, Partner Community, and Partner Community Plus.

Namespace

Auth

Usage

Implement a `Auth.LoginDiscoveryHandler` for an interview-based log in. The handler looks up a user from the identifier entered, and can call `Site.passwordlessLogin` to determine which credential to use, such as email or SMS. Or the handler can redirect a user to a third-party identity provider for login. With this handler, the login page doesn't show a password field. However, you can use `Site.passwordlessLogin` to then prompt for a password.

From the user perspective, the user enters an identifier at the log in prompt. Then the user completes the login by entering a PIN or password. Or, if SSO-enabled, the user bypasses login.

For an example, see LoginDiscoveryHandler Example Implementation. For more details, see Salesforce Customer Identity in *Salesforce Help*.

IN THIS SECTION:

LoginDiscoveryHandler Method

LoginDiscoveryHandler Example Implementation

LoginDiscoveryHandler Method

Here's the method for `LoginDiscoveryHandler`.

IN THIS SECTION:

login(identifier, startUrl, requestAttributes)
Log in the customer or partner given the specified identifier, such as email or phone number. If successful, redirect the user to the Experience Cloud site page specified by the start URL.

`login(identifier, startUrl, requestAttributes)`

Log in the customer or partner given the specified identifier, such as email or phone number. If successful, redirect the user to the Experience Cloud site page specified by the start URL.

Signature

```
public System.PageReference login(String identifier, String startUrl,
Map<String,String>requestAttributes)
```

Parameters

`identifier`
Type: String

Identifier the customer or partner entered at the login prompt, for example, an email address or phone number.

`startUrl`
Type: String

Path to the Experience Cloud site page requested by the customer or partner. The user is redirected to this location after successful login.

`requestAttributes`
Type: Map<String,String>

Information about the login request based on the user's browser state when accessing the login page. `requestAttributes` passes in the CommunityUrl, IpAddress, UserAgent, Platform, Application, City, Country, and Subdivision values. The City, Country, and Subdivision values come from IP geolocation.

Return Value

Type: System.PageReference

The URL of the page where the user is redirected.

Example

Here's a sample `requestAttributes` response.

```
CommunityUrl=http://my-developer-edition.mycompany.com:5555/discover
IpAddress=55.555.0.0
UserAgent=Mozilla/5.0 (Macintosh; Intel Mac OS X 10_13_4) AppleWebKit/605.1.15 (KHTML,
like Gecko) Version/11.1 Safari/605.1.15
Platform=Mac OSX
```

```
Application=Browser
City=San Mateo
Country=United States
Subdivision=California
```

LoginDiscoveryHandler Example Implementation

This Apex code example implements the `Auth.LoginDiscoveryHandler` interface. It checks whether the user who is logging in has a verified email or phone number, depending on which identifier was supplied on the login page. If verified, with `Auth.VerificationMethod.EMAIL` or `Auth.VerificationMethod.SMS`, we send a challenge to the identifier, either the user's email address or mobile device. If the user enters the code correctly on the verify page, the user is redirected to the Experience Cloud site's page specified by the start URL. If the user isn't verified, the user must enter a password to log in. The handler also checks that the email and phone number are unique with this code: `users.size()==1`.

Note: Passwordless login works only with verified methods. You can check the verification status on the User object, for example, with User list view, a report, or the API. Make sure that your solution handles the case where the user doesn't have a verification method. This code example falls back to a password.

The default discoverable login handler checks whether the user entered a valid email address or phone number before redirecting the user to the verification page. If an invalid entry is made, the handler returns an error. Because this behavior is vulnerable to user enumeration attack, make sure that your solution prevents this attack. For example, you can create a dummy page similar to the verification page and redirect the user to the dummy page when invalid user identifier is entered. Also, use generic error messages to avoid providing additional information.

The `discoveryResult` function calls the `Site.passwordlessLogin` method to log the user in with the specified verification method. The `getSsoRedirect` function looks up whether the user logs in with SAML or an Auth Provider. Add the implementation-specific logic to handle the lookup.

```
global class AutocreatedDiscLoginHandler1535377170343 implements Auth.LoginDiscoveryHandler
 {

global PageReference login(String identifier, String startUrl, Map<String, String>
requestAttributes) {
    if (identifier != null && isValidEmail(identifier)) {
        // Search for user by email.
        List<User> users = [SELECT Id FROM User WHERE Email = :identifier AND IsActive =
TRUE];
        if (!users.isEmpty() && users.size() == 1) {
            // User must have a verified email before using this verification method.
            // We cannot send messages to unverified emails.
            // You can check if the user's email verified bit set and add the
            // password verification method as fallback.
            List<TwoFactorMethodsInfo> verifiedInfo = [SELECT HasUserVerifiedEmailAddress
 FROM TwoFactorMethodsInfo WHERE UserId = :users[0].Id];
            if (!verifiedInfo.isEmpty() && verifiedInfo[0].HasUserVerifiedEmailAddress ==
 true) {
                // Use email verification method if the user's email is verified.
                return discoveryResult(users[0], Auth.VerificationMethod.EMAIL, startUrl,
 requestAttributes);
            } else {
                // Use password verification method as fallback
                // if the user's email is unverified.
              return discoveryResult(users[0], Auth.VerificationMethod.PASSWORD, startUrl,
```

```

        }
    }
}
}
```

Code Example: Filter Login Discovery Users by Profile

Your production org can have multiple users with the same verified email address and mobile number. But your customers must have unique ones. To address this problem, you can add a few lines of code that filters users by profile to ensure uniqueness. This code example handles users with the External Identity User profile, but can be adapted to support other use cases. For example, you can modify the first line of code to address users with other user licenses or criteria.

Login Discovery is available with the following user licenses: Customer Community, Customer Community Plus, External Identity, Partner Community, and Partner Community Plus. It depends on which profiles have access to your Experience Cloud site.

```
global class AutocreatedDiscLoginHandler1551301979709 implements Auth.LoginDiscoveryHandler
 {

global PageReference login(String identifier, String startUrl, Map<String, String>
requestAttributes) {
    if (identifier != null && isValidEmail(identifier)) {
        // Ensure uniqueness by profile
        Profile p = [SELECT id FROM profile WHERE name = 'External Identity User'];
        List<User> users = [SELECT Id FROM User WHERE Email = :identifier AND IsActive =
TRUE AND profileId=:p.id];
        if (!users.isEmpty() && users.size() == 1) {
            // User must have verified email before using this verification method. We
cannot send messages to unverified emails.
            // You can check if the user has email verified bit on and add the password
verification method as fallback.
            List<TwoFactorMethodsInfo> verifiedInfo = [SELECT HasUserVerifiedEmailAddress
 FROM TwoFactorMethodsInfo WHERE UserId = :users[0].Id];
            if (!verifiedInfo.isEmpty() && verifiedInfo[0].HasUserVerifiedEmailAddress ==
 true) {
                // Use email verification method if the user's email is verified.
                return discoveryResult(users[0], Auth.VerificationMethod.EMAIL, startUrl,
 requestAttributes);
            } else {
                // Use password verification method as fallback if the user's email is
unverified.
              return discoveryResult(users[0], Auth.VerificationMethod.PASSWORD, startUrl,
 requestAttributes);
            }
        } else {

        }
    }
}
}
```

LoginDiscoveryMethod Enum

Contains methods used to verify the user's identity when the My Domain login process uses Login Discovery.

Usage

Specifies the verification method used to authenticate internal users when My Domain is set up for Login Discovery.

Enum Values

`Auth.LoginDiscoveryMethod` enum has the following values.

Value	Description
`LIGHTNING_LOGIN`	Verify identity by Lightning Login, which lets internal users log in with Salesforce Authenticator.
`PASSWORD`	Verify identity by entering a password.

MyDomainLoginDiscoveryHandler Interface

The handler used to implement the My Domain Login Discovery page, which is an interview-based (two-step) login process. First the user is prompted for a unique identifier such as an email address or phone number. Then the handler determines (discovers) how to authenticate the user. Either the user enters a password or is directed to an identity provider's login page.

Namespace

Auth

Usage

Implement `MyDomainLoginDiscoveryHandler` to let My Domain users log in with something other than their username and password. This handler contains the logic to look up the user based on the identifier value entered on the login page. The `Auth.MyDomainLoginDiscoveryHandler.login` method is invoked when the identifier page is submitted and finds the user that corresponds to the submitted identifier. The `Auth.SessionManagement.finishLoginDiscovery` method sends the user to the authentication mechanism and then logs in the user.

Register the handler from the My Domain Setup page. Under Authentication Configuration, select the **Discovery** Login Page Type. For Login Discovery Handler, select this handler from the list of Apex classes.

For an example, see MyDomainLoginDiscoveryHandler Example Implementation. For more details, search for My Domain Login Discovery in *Salesforce Help*.

IN THIS SECTION:

MyDomainLoginDiscoveryHandler Method

MyDomainLoginDiscoveryHandler Example Implementation

MyDomainLoginDiscoveryHandler Method

`MyDomainLoginDiscoveryHandler` has the following method.

IN THIS SECTION:

login(identifier, startUrl, requestAttributes)

Log in a Salesforce user given the specified identifier, such as email or phone number. If successful, redirect the user to the page specified by the start URL.

`login(identifier, startUrl, requestAttributes)`

Log in a Salesforce user given the specified identifier, such as email or phone number. If successful, redirect the user to the page specified by the start URL.

Signature

```
public System.PageReference login(String identifier, String startUrl, Map<String,String>
requestAttributes)
```

Parameters

identifier
Type: String

Identifier the Salesforce user entered at the login prompt, for example, an email address or phone number.

startUrl
Type: String

The page users see after successfully logging in to the My Domain subdomain.

requestAttributes
Type: Map <String, String>

Information about the login request based on the user's browser state when accessing the login page. `requestAttributes` passes in the MyDomainUrl, IpAddress, UserAgent, Platform, Application, City, Country, and Subdivision values. The City, Country, and Subdivision values come from IP address geolocation.

Return Value

Type: System.PageReference

The URL of the page where the user is redirected to complete authentication.

Example

Here's a sample `requestAttributes` response.

```
CommunityUrl=http://my-dev-ed.my.salesforce.com:5555/discover
IpAddress=55.255.0.0
UserAgent=Mozilla/5.0 (Macintosh; Intel Mac OS X 10_13_4) AppleWebKit/605.1.15 (KHTML,
like Gecko) Version/11.1 Safari/605.1.15
Platform=Mac OSX
Application=Browser
City=San Mateo
Country=United States
Subdivision=California
```

MyDomainLoginDiscoveryHandler Example Implementation

Here's an example of the `Auth.MyDomainLoginDiscoveryHandler` interface. This sample class contains the default logic for My Domain login discovery using password authentication. You can customize the code to ensure it meets your needs. The requestAttributes parameter provides additional information that you can use in the discovery logic. Attributes include MyDomainUrl,

IpAddress, UserAgent, and location information (such as Country and City). Use `Auth.DiscoveryCustomErrorException` to throw custom errors to display on the login page.

To implement this interface, the My Domain login page type must be set to Discovery.

```
// This sample class contains the default logic for My Domain login discovery by password.
// You can customize the code to ensure it meets your needs. The requestAttributes parameter
// provides additional information you can use in the discovery logic. Attributes include MyDomainUrl,
// IpAddress, UserAgent, and location information (such as Country and City).
// Use Auth.DiscoveryCustomErrorException to throw custom errors which will be shown on login page.
 global class MyDomainDiscLoginDefaultHandler implements Auth.MyDomainLoginDiscoveryHandler {
 global PageReference login(String identifier, String startUrl, Map<String, String> requestAttributes)
{
   if (identifier != null) {
        // Search for user by email
       List<User> users = [SELECT Id FROM User WHERE Email = :identifier AND IsActive = TRUE];
        if (!users.isEmpty() && users.size() == 1) {
            return discoveryResult(users[0], startUrl, requestAttributes);
        } else {
         throw new Auth.LoginDiscoveryException('No unique user found. User count=' + users.size());
        }
    }
    throw new Auth.LoginDiscoveryException('Invalid Identifier');
  }

private PageReference getSsoRedirect(User user, String startUrl, Map<String, String> requestAttributes) {
   // You can look up if the user should log in with SAML or an Auth Provider and return the URL to initialize SSO. For example:
    // SamlSsoConfig SSO = [select Id from SamlSsoConfig where DeveloperName='SamlTest' limit 1];

    // To get the URL for a My Domain subdomain, you can pass null in the communityURL
parameter.
    // String ssoUrl = Auth.AuthConfiguration.getSamlSsoUrl(null, startUrl, SSO.Id);
    // return new PageReference(ssoUrl);
    return null;
  }

private PageReference discoveryResult(User user, String startUrl, Map<String, String> requestAttributes)

     {
     PageReference ssoRedirect = getSsoRedirect(user, startUrl, requestAttributes);
      if (ssoRedirect != null) {
        return ssoRedirect;
      }
      else {
      return Auth.SessionManagement.finishLoginDiscovery(Auth.LoginDiscoveryMethod.password, user.Id);
      }
   }
}
```

Test Class for MyDomainDiscLoginDefaultHandler Class

The following is the test class for MyDomainDiscoveryLoginHandler. For the test to work, your org must have the My Domain login page type set to Discovery.

```
// Test class for MyDomainDiscLoginDefaultHandler
@isTest
class MyDomainDiscLoginDefaultHandlerTest {
    /* Test Discoverable handler login.
       Create a user with specific email identifier and invoke login.
       Expected : User should be discovered and pagereference should be returned.
     */
    @isTest static void testLogin() {
        // Create user
        String identifierEmail = getUniqueName() + '@test.org';
        createTestUser(identifierEmail);
        Map<String, String> requestAttributes = new Map<String, String>();
        String startUrl = '';
      MyDomainDiscLoginDefaultHandler myDomainDiscLoginDefaultHandler = new MyDomainDiscLoginDefaultHandler();
        // Invoke login method from handler with the email of user created
     PageReference  pageReference = myDomainDiscLoginDefaultHandler.login(identifierEmail, startUrl, requestAttributes);
        // Asser page reference is returned
        System.assertNotEquals(null, pageReference, 'Page reference was not returned');
    }
    /* Test Discoverable handler login with invalid (non-existing) user.
        Expected : Auth.LoginDiscoveryException
     */
    @isTest static void testLoginWithInvalidUser() {
        try {
            Map<String, String> requestAttributes = new Map<String, String>();
            String startUrl = '';
            String uniqueName = getUniqueName();
            String email = uniqueName + '@test.org';
        MyDomainDiscLoginDefaultHandler myDomainDiscLoginDefaultHandler = new MyDomainDiscLoginDefaultHandler();
            // Invoke login method from handler with non-existing user
            myDomainDiscLoginDefaultHandler.login(email, startUrl, requestAttributes);
        }catch (Auth.LoginDiscoveryException loginDiscoveryException) {
            // Assert exception message
       System.assert(loginDiscoveryException.getMessage().contains('No unique user found'), 'message=' + loginDiscoveryException.getMessage());
        }
    }
    /*
       Generate a random name
     */
    private static String getUniqueName() {
        String orgId = UserInfo.getOrganizationId();
      String dateString = String.valueof(Datetime.now()).replace(' ','').replace(':','').replace('-','');
        Integer randomInt = Integer.valueOf(math.rint(math.random()*1000000));
        String uniqueName = orgId + dateString + randomInt;
        return uniqueName;
    }
    /*
      Create user with given email.
     */
    private static void createTestUser(String identifierEmail)
```

```
    {
        String uniqueName = getUniqueName();
        Profile pf = [SELECT Id FROM Profile WHERE Name='Standard User'];
        String profileID = pf.Id;
        String fName = 'fname';
        String lName = uniqueName + '-lname';
        User tuser = new User(  firstname = fName,
                                lastName = lName,
                                email = identifierEmail,
                                Username = uniqueName + '@test.org',
                                EmailEncodingKey = 'ISO-8859-1',
                                Alias = uniqueName.substring(18, 23),
                                TimeZoneSidKey = 'America/Los_Angeles',
                                LocaleSidKey = 'en_US',
                                LanguageLocaleKey = 'en_US',
                                ProfileId = profileID);
        insert tuser;
    }
}
```

Oauth2TokenExchangeHandler Class

Use this class to create a token exchange handler that validates tokens from an external identity provider and maps the token's subject to a Salesforce user during the OAuth 2.0 token exchange flow. The handler can also be used to create users by setting up a new User object and returning it to Salesforce for automatic insertion.

Namespace

Auth

Usage

See Token Exchange Handler Validation and Subject Mapping.

IN THIS SECTION:

Oauth2TokenExchangeHandler Methods

Oauth2TokenExchangeHandler Methods

The following are methods for `Oauth2TokenExchangeHandler`.

IN THIS SECTION:

getUserForTokenSubject(networkId, result, canCreateUser, appDeveloperName, appType)

Finds the subject defined in the external identity provider's token so that it can be mapped to a Salesforce subject.

validateIncomingToken(appDeveloperName, appType, incomingToken, tokenType)

Validates an access token, refresh token, ID token, SAML 2.0 assertion, or JWT passed from an external identity provider during the OAuth 2.0 token exchange flow.

`getUserForTokenSubject(networkId, result, canCreateUser, appDeveloperName, appType)`

Finds the subject defined in the external identity provider's token so that it can be mapped to a Salesforce subject.

Signature

```
public User getUserForTokenSubject(Id networkId, Auth.TokenValidationResult result,
Boolean canCreateUser, String appDeveloperName, Auth.IntegratingAppType appType)
```

Parameters

networkId
Type: Id

The identifier for the Salesforce user, if one exists.

result
Type: Auth.TokenValidationResult

The result of the token validation performed by the `validateIncomingToken` method in the Auth.Oauth2TokenExchangeHandler class.

canCreateUser
Type: Boolean

Specifies whether the handler can set up a User object if no user exists. Salesforce automatically inserts the user into this object.

appDeveloperName
Type: String

The developer name of the Salesforce connected app or external client app that's being used to integrate your app with Salesforce.

appType
Type: Auth.IntegratingAppType

Specifies whether your app is integrated with Salesforce as a connected app or as an external client app.

Return Value

Type: User

Returns a User object with the user information obtained from the token, from Salesforce, and from callouts to the identity provider, if applicable. The User object can be an existing user record or a new user that hasn't been inserted in the database. If it's a new user, Salesforce automatically inserts the user on behalf of the token exchange handler.

`validateIncomingToken(appDeveloperName, appType, incomingToken, tokenType)`

Validates an access token, refresh token, ID token, SAML 2.0 assertion, or JWT passed from an external identity provider during the OAuth 2.0 token exchange flow.

Signature

```
public Auth.TokenValidationResult validateIncomingToken(String appDeveloperName,
Auth.IntegratingAppType appType, String incomingToken, Auth.OAuth2TokenExchangeType
tokenType)
```

Parameters

appDeveloperName
Type: String

The developer name of the Salesforce connected app or external client app that's being used to integrate your app with Salesforce.

appType
Type: Auth.IntegratingAppType

Specifies whether your app is integrated with Salesforce as a connected app or as an external client app.

incomingToken
Type: String

The token from the external identity provider.

tokenType
Type: Auth.OAuth2TokenExchangeType

The type of token from the external identity provider. It can be an access token, a refresh token, an ID token, a SAML 2.0 assertion, or any token that's formatted as a JSON Web Token (JWT).

Return Value

Type: Auth.TokenValidationResult

Returns information about whether the token is valid, data extracted from the token, the token itself, and the token type. It can also return a custom error message if the validation failed.

OAuth2TokenExchangeType Enum

Used during the OAuth 2.0 token exchange flow to specify the type of token that's being exchanged for a Salesforce token.

Usage

During the token exchange flow, your app requests a token from Salesforce by sending a POST request with a token from an external identity provider. The request includes a `subject_token_type` parameter to specify the type of token. The values specified in this enum must correspond to the `subject_token_type` in the token request.

Enum Values

The following are the values of the `Auth.OAuth2TokenExchangeType` enum.

Value	Description
`ACCESS_TOKEN`	An access token from the identity provider. The corresponding `subject_token_type` is `urn:ietf:params:oauth:token-type:access_token`.
`ID_TOKEN`	An ID token from the identity provider. The corresponding `subject_token_type` is `urn:ietf:params:oauth:token-type:id_token`.

Value	Description
`JWT`	A token from the identity provider that's formatted as a JSON Web Token (JWT). The corresponding `subject_token_type` is `urn:ietf:params:oauth:token-type:JWT`.
`REFRESH_TOKEN`	A refresh token from the identity provider. The corresponding `subject_token_type` is `urn:ietf:params:oauth:token-type:refresh_token`.
`SAML_2`	A SAML 2.0 assertion from the identity provider. The corresponding `subject_token_type` is `urn:ietf:params:oauth:token-type:saml2`.

OAuthRefreshResult Class

Stores the result of an `AuthProviderPluginClass` refresh method. OAuth authentication flow provides a refresh token that can be used to get a new access token. Access tokens have a limited lifetime as specified by the session timeout value. When an access token expires, use a refresh token to get a new access token.

Namespace

Auth

Usage

The `OAuthRefreshResult` class contains the parameters, `accessToken`, `refreshToken`, and `error`, all of which are of type `string`. For a code example, see .

IN THIS SECTION:

OAuthRefreshResult Constructors

OAuthRefreshResult Properties

OAuthRefreshResult Constructors

The following are constructors for `OAuthRefreshResult`.

IN THIS SECTION:

OAuthRefreshResult(accessToken, refreshToken, error)

Creates an instance of the `OAuthRefreshResult` class using the specified access token, refresh token, and error for a custom authentication provider plug-in.

OAuthRefreshResult(accessToken, refreshToken)

Creates an instance of the `OAuthRefreshResult` class using the specified access token and refresh token for a custom authentication provider plug-in. Use this method when you know that the refresh was successful.

`OAuthRefreshResult(accessToken, refreshToken, error)`

Creates an instance of the `OAuthRefreshResult` class using the specified access token, refresh token, and error for a custom authentication provider plug-in.

Signature

```
public OAuthRefreshResult(String accessToken, String refreshToken, String error)
```

Parameters

accessToken
Type: String

OAuth access token for the user who is currently logged in.

refreshToken
Type: String

OAuth refresh token for the user who is currently logged in.

error
Type: String

Error that occurred when a user attempted to authenticate with the custom authentication provider.

`OAuthRefreshResult(accessToken, refreshToken)`

Creates an instance of the `OAuthRefreshResult` class using the specified access token and refresh token for a custom authentication provider plug-in. Use this method when you know that the refresh was successful.

Signature

```
public OAuthRefreshResult(String accessToken, String refreshToken)
```

Parameters

accessToken
Type: String

The OAuth access token for the user who is logged in.

refreshToken
Type: String

The OAuth refresh token for the user who is logged in.

OAuthRefreshResult Properties

The following are properties for `OAuthRefreshResult`.

IN THIS SECTION:

accessToken
The OAuth access token for the user who is currently logged in.

error
Error that occurs when a user unsuccessfully attempts to authenticate with the custom authentication provider.

refreshToken
The OAuth refresh token for the user who is currently logged in.

accessToken

The OAuth access token for the user who is currently logged in.

Signature

```
public String accessToken {get; set;}
```

Property Value

Type: String

error

Error that occurs when a user unsuccessfully attempts to authenticate with the custom authentication provider.

Signature

```
public String error {get; set;}
```

Property Value

Type: String

refreshToken

The OAuth refresh token for the user who is currently logged in.

Signature

```
public String refreshToken {get; set;}
```

Property Value

Type: String

OauthToken Class

Contains methods for revoking opaque OAuth access tokens and refresh tokens.

Namespace

Auth

Usage

When a client completes an authorization flow and is authorized to access Salesforce data, they're issued an access token, which the client can use to make authenticated requests for protected Salesforce resources. The client can also use refresh tokens to get more access tokens. If you don't want the client to access Salesforce data anymore, revoke its Salesforce tokens.

This class is distinct from the `Auth.AuthToken` class, which contains a method to revoke tokens issued by a third-party provider instead of Salesforce tokens.

IN THIS SECTION:

OauthToken Methods

OauthToken Methods

The following are methods for `OauthToken`.

IN THIS SECTION:

revokeToken(type, authToken)
Revokes Salesforce-issued OAuth tokens.

`revokeToken(type, authToken)`

Revokes Salesforce-issued OAuth tokens.

Signature

```
public static Boolean revokeToken(Auth.OauthTokenType type, String authToken)
```

Parameters

`type`
Type: Auth.OauthTokenType

Specifies the type of token to be revoked. To revoke an access token, use the `ACCESS_TOKEN` value. To revoke a refresh token and any associated access tokens, use the `REFRESH_TOKEN` value. To revoke a refresh token and associated access tokens, use the `DELETE_TOKEN` value.

`authToken`
Type: String

The access token, refresh token, or delete token issued by Salesforce.

Return Value

Type: Boolean

The method returns `true` if successful, and `false` if not. For invalid or expired tokens, the method returns a `NoDataFoundException` exception.

OauthTokenType Enum

Specifies the type of Salesforce-issued OAuth 2.0 token being revoked in the `OauthToken.revokeToken` method.

Enum Values

The following are the values of the `Auth.OauthTokenType` enum.

Value	Description
`ACCESS_TOKEN`	An access token, which Salesforce grants to a client when it successfully completes an authorization flow.
`DELETE_TOKEN`	A delete token, which can be queried and used to revoke refresh tokens and associated access tokens.
`REFRESH_TOKEN`	A refresh token, which Salesforce grants to a client as a result of the refresh token flow. Refresh tokens are used to get more access tokens.

RegistrationHandler Interface

Salesforce provides the ability to use an authentication provider, such as Facebook© or Janrain©, for single sign-on into Salesforce.

Namespace

Auth

Usage

To set up single sign-on, you must create a class that implements `Auth.RegistrationHandler`. Classes implementing the `Auth.RegistrationHandler` interface are specified as the `Registration Handler` in authentication provider definitions, and enable single sign-on into Salesforce portals and organizations from third-party services such as Facebook. Using information from the authentication providers, your class must perform the logic of creating and updating user data as appropriate, including any associated account and contact records.

Note: During the user update process, you can use the `confirmUser()` method to ensure that users are correctly mapped between Salesforce and the third party. For more information, see the ConfirmUserRegistrationHandler Interface.

IN THIS SECTION:

RegistrationHandler Methods

Storing User Information and Getting Access Tokens

Auth.RegistrationHandler Example Implementation

Auth.RegistrationHandler Error Example

This example implements the `Auth.RegistrationHandler` interface and shows how to use a custom exception to display an error message in the URL of the page. If you don't use a custom exception, the error code and description appear in the URL and the error description appears on the page.

RegistrationHandler Methods

The following are methods for `RegistrationHandler`.

IN THIS SECTION:

createUser(portalId, userData)

Returns a User object using the specified portal ID and user information from the third party, such as the username and email address. The User object corresponds to the third party's user information. It can be a new user that hasn't been inserted in your org's database, or it can represent an existing user record in the database. If it's a new User object, Salesforce inserts a user record for you.

updateUser(userId, portalId, userData)

Updates the specified user's information. This method is called if the user has logged in before with the authentication provider and then logs in again.

createUser(portalId, userData)

Returns a User object using the specified portal ID and user information from the third party, such as the username and email address. The User object corresponds to the third party's user information. It can be a new user that hasn't been inserted in your org's database, or it can represent an existing user record in the database. If it's a new User object, Salesforce inserts a user record for you.

Signature

```
public User createUser(ID portalId, Auth.UserData userData)
```

Parameters

portalId
Type: ID

userData
Type: Auth.UserData

Return Value

Type: User

Usage

The *portalID* value can be null or an empty key if there's no portal configured with this provider.

updateUser(userId, portalId, userData)

Updates the specified user's information. This method is called if the user has logged in before with the authentication provider and then logs in again.

Signature

```
public Void updateUser(ID userId, ID portalId, Auth.UserData userData)
```

Parameters

userId
Type: ID

portalId
Type: ID

userData
Type: Auth.UserData

Return Value

Type: Void

Usage

The *portalID* value can be null or an empty key if there's no portal configured with this provider.

Storing User Information and Getting Access Tokens

The `Auth.UserData` class is used to store user information for `Auth.RegistrationHandler`. The third-party authentication provider can send back a large collection of data about the user, including their username, email address, locale, and so on. Frequently used data is converted into a common format with the `Auth.UserData` class and sent to the registration handler.

If the registration handler wants to use the rest of the data, the `Auth.UserData` class has an `attributeMap` variable. The attribute map is a map of strings (`Map<String, String>`) for the raw values of all the data from the third party. Because the map is `<String, String>`, values that the third party returns that aren't strings (like an array of URLs or a map) are converted into an appropriate string representation. The map includes everything returned by the third-party authentication provider, including the items automatically converted into the common format.

The constructor for `Auth.UserData` has the following syntax:

```
Auth.UserData(String identifier,
              String firstName,
              String lastName,
              String fullName,
              String email,
              String link,
              String userName,
              String locale,
              String provider,
              String siteLoginUrl,
              Map<String, String> attributeMap)
```

To learn about `Auth.UserData` properties, see Auth.UserData Class.

Note: You can only perform DML operations on additional sObjects in the same transaction with User objects under certain circumstances. For more information, see sObjects That Cannot Be Used Together in DML Operations.

For all authentication providers except Janrain, after a user is authenticated using a provider, the access token associated with that provider for this user can be obtained in Apex using the `Auth.AuthToken` Apex class. `Auth.AuthToken` provides two methods to retrieve access tokens. One is `getAccessToken`, which obtains a single access token. Use this method if the user ID is mapped to a single third-party user. If the user ID is mapped to multiple third-party users, use `getAccessTokenMap`, which returns a map

of access tokens for each third-party user. For more information about authentication providers, see Authentication Providers in *Salesforce Help*.

When using Janrain as an authentication provider, you must use the Janrain `accessCredentials` dictionary values to retrieve the access token or its equivalent. Only some providers supported by Janrain provide an access token, while other providers use other fields. The Janrain `accessCredentials` fields are returned in the `attributeMap` variable of the `Auth.UserData` class. See the Janrain `auth_info` documentation for more information on `accessCredentials`.

Note: Not all Janrain account types return `accessCredentials`. Sometimes you must change your account type to receive the information.

To learn about the `Auth.AuthToken` methods, see Auth.AuthToken Class.

Auth.RegistrationHandler Example Implementation

This example implements the `Auth.RegistrationHandler` interface that creates as well as updates a standard user based on data provided by the authentication provider. Error checking has been omitted to keep the example simple.

```
global class StandardUserRegistrationHandler implements Auth.RegistrationHandler{
global User createUser(Id portalId, Auth.UserData data){
    User u = new User();
    Profile p = [SELECT Id FROM profile WHERE name='Standard User'];
    u.username = data.username + '@salesforce.com';
    u.email = data.email;
    u.lastName = data.lastName;
    u.firstName = data.firstName;
    String alias = data.username;
    if(alias.length() > 8) {
        alias = alias.substring(0, 8);
    }
    u.alias = alias;
    u.languagelocalekey = data.attributeMap.get('language');
    u.localesidkey = data.locale;
    u.emailEncodingKey = 'UTF-8';
    u.timeZoneSidKey = 'America/Los_Angeles';
    u.profileId = p.Id;
    return u;
}

global void updateUser(Id userId, Id portalId, Auth.UserData data){
    User u = new User(id=userId);
    u.username = data.username + '@salesforce.com';
    u.email = data.email;
    u.lastName = data.lastName;
    u.firstName = data.firstName;
    String alias = data.username;
    if(alias.length() > 8) {
        alias = alias.substring(0, 8);
    }
    u.alias = alias;
    u.languagelocalekey = data.attributeMap.get('language');
    u.localesidkey = data.locale;
    update(u);
}
}
```

The following example tests the above code.

```
@isTest
private class StandardUserRegistrationHandlerTest {
static testMethod void testCreateAndUpdateUser() {
    StandardUserRegistrationHandler handler = new StandardUserRegistrationHandler();
    Auth.UserData sampleData = new Auth.UserData('testId', 'testFirst', 'testLast',
        'testFirst testLast', 'testuser@example.org', null, 'testuserlong', 'en_US',
'facebook',
        null, new Map<String, String>{'language' => 'en_US'});
    User u = handler.createUser(null, sampleData);
    System.assertEquals('testuserlong@salesforce.com', u.userName);
    System.assertEquals('testuser@example.org', u.email);
    System.assertEquals('testLast', u.lastName);
    System.assertEquals('testFirst', u.firstName);
    System.assertEquals('testuser', u.alias);
    insert(u);
    String uid = u.id;

    sampleData = new Auth.UserData('testNewId', 'testNewFirst', 'testNewLast',
        'testNewFirst testNewLast', 'testnewuser@example.org', null, 'testnewuserlong',
'en_US', 'facebook',
        null, new Map<String, String>{});
    handler.updateUser(uid, null, sampleData);

   User updatedUser = [SELECT userName, email, firstName, lastName, alias FROM user WHERE
 id=:uid];
    System.assertEquals('testnewuserlong@salesforce.com', updatedUser.userName);
    System.assertEquals('testnewuser@example.org', updatedUser.email);
    System.assertEquals('testNewLast', updatedUser.lastName);
    System.assertEquals('testNewFirst', updatedUser.firstName);
    System.assertEquals('testnewu', updatedUser.alias);
}
}
```

Auth.RegistrationHandler Error Example

This example implements the `Auth.RegistrationHandler` interface and shows how to use a custom exception to display an error message in the URL of the page. If you don't use a custom exception, the error code and description appear in the URL and the error description appears on the page.

To limit this example to the custom exception, some code was omitted.

```
global class RegHandler implements Auth.RegistrationHandler {

    class RegHandlerException extends Exception {}

        global User createUser(Id portalId, Auth.UserData data){
            List<Profile> profiles = [SELECT Id, Name, UserType FROM Profile WHERE Name =
 'Power User'];
            Profile profile = profiles.isEmpty() ? null : profiles[0];
            if(profile==null)
               throw new RegHandlerException('Cannot find the profile. For help, contact
your administrator.');
...
```

```
        }

        global void updateUser(Id userId, Id portalId, Auth.UserData data){
            User u = new User(id=userId);
            u.lastName = data.lastName;
            u.firstName = data.firstName;
            update(u);
        }
}
```

SamlJitHandler Interface

Use this interface to control and customize Just-in-Time user provisioning logic during SAML single sign-on.

Namespace

Auth

Usage

To use custom logic for user provisioning during SAML single sign-on, you must create a class that implements `Auth.SamlJitHandler`. This allows you to incorporate organization-specific logic (such as populating custom fields) when users log in to Salesforce with single sign-on. Keep in mind that your class must perform the logic of creating and updating user data as appropriate, including any associated account and contact records.

In Salesforce, you specify your class that implements this interface in the `SAML JIT Handler` field in SAML Single Sign-On Settings. Make sure that the user you specify to run the class has "Manage Users" permission.

IN THIS SECTION:

SamlJitHandler Methods

SamlJitHandler Example Implementation

SamlJitHandler Methods

The following are methods for `SamlJitHandler`.

IN THIS SECTION:

createUser(samlSsoProviderId, communityId, portalId, federationId, attributes, assertion)

Returns a User object using the specified Federation ID. The User object corresponds to the user information. This object can be a new user that hasn't been inserted in the database or an existing user record in the database.

updateUser(userId, samlSsoProviderId, communityId, portalId, federationId, attributes, assertion)

Updates the specified user's information. This method is called if the user has logged in before with SAML single sign-on and then logs in again, or if your application is using the `Existing User Linking URL`.

createUser(samlSsoProviderId, communityId, portalId, federationId, attributes, assertion)

Returns a User object using the specified Federation ID. The User object corresponds to the user information. This object can be a new user that hasn't been inserted in the database or an existing user record in the database.

Signature

```
public User createUser(Id samlSsoProviderId, Id communityId, Id portalId, String federationId, Map<String,String> attributes, String assertion)
```

Parameters

samlSsoProviderId
Type: Id

The ID of the SamlSsoConfig standard object.

communityId
Type: Id

The ID of the Experience Cloud site. This parameter can be `null` if you're not creating an Experience Cloud user.

portalId
Type: Id

The ID of the portal. This parameter can be `null` if you're not creating a portal user.

federationId
Type: String

The ID Salesforce expects to be used for this user.

attributes
Type: Map<String,String>

All attributes in the SAML assertion that were added to the default assertion; for example, custom attributes. Attributes are case-sensitive.

If the assertion is encrypted, the attribute map contains a decrypted assertion stored as a value with the key `Sfdc.SamlAssertion`.

assertion
Type: String

The default SAML assertion, base-64 encoded.

If the assertion is encrypted, this parameter is also encrypted. To access the decrypted assertion, see the `Sfdc.SamlAssertion` key in the attribute map.

Return Value

Type: User

A User sObject.

Usage

The *communityId* and *portalId* parameter values can be `null` or the associated keys can be empty if there's no Experience Cloud site or portal configured with this organization.

updateUser(userId, samlSsoProviderId, communityId, portalId, federationId, attributes, assertion)

Updates the specified user's information. This method is called if the user has logged in before with SAML single sign-on and then logs in again, or if your application is using the `Existing User Linking URL`.

Signature

```
public void updateUser(Id userId, Id samlSsoProviderId, Id communityId, Id portalId,
String federationId, Map<String,String> attributes, String assertion)
```

Parameters

userId
Type: Id

The ID of the Salesforce user.

samlSsoProviderId
Type: Id

The ID of the SamlSsoConfig object.

communityId
Type: Id

The ID of the Experience Cloud site. This type can be `null` if you're not updating an Experience Cloud user.

portalId
Type: Id

The ID of the portal. This type can be `null` if you're not updating a portal user.

federationId
Type: String

The ID Salesforce expects to be used for this user.

attributes
Type: Map<String,String>

All attributes in the SAML assertion that were added to the default assertion; for example, custom attributes. Attributes are case-sensitive.

If the assertion is encrypted, the attribute map also contains a decrypted assertion stored as a value with the key `Sfdc.SamlAssertion`.

assertion
Type: String

The default SAML assertion, base-64 encoded.

If the assertion is encrypted, this parameter is also encrypted. To access the decrypted assertion, see the `Sfdc.SamlAssertion` key in the attribute map.

Return Value

Type: void

SamlJitHandler Example Implementation

This is an example implementation of the `Auth.SamlJitHandler` interface. This code uses private methods to handle accounts and contacts (handleContact() and handleAccount()), which aren't included in this example.

```
global class StandardUserHandler implements Auth.SamlJitHandler {
    private class JitException extends Exception{}
    private void handleUser(boolean create, User u, Map<String, String> attributes,
        String federationIdentifier, boolean isStandard) {
        if(create && attributes.containsKey('User.Username')) {
            u.Username = attributes.get('User.Username');
        }
        if(create) {
            if(attributes.containsKey('User.FederationIdentifier')) {
                u.FederationIdentifier = attributes.get('User.FederationIdentifier');
            } else {
                u.FederationIdentifier = federationIdentifier;
            }
        }
        if(attributes.containsKey('User.ProfileId')) {
            String profileId = attributes.get('User.ProfileId');
            Profile p = [SELECT Id FROM Profile WHERE Id=:profileId];
            u.ProfileId = p.Id;
        }
        if(attributes.containsKey('User.UserRoleId')) {
            String userRole = attributes.get('User.UserRoleId');
            UserRole r = [SELECT Id FROM UserRole WHERE Id=:userRole];
            u.UserRoleId = r.Id;
        }
        if(attributes.containsKey('User.Phone')) {
            u.Phone = attributes.get('User.Phone');
        }
        if(attributes.containsKey('User.Email')) {
            u.Email = attributes.get('User.Email');
        }

 //More attributes here - removed for length

        //Handle custom fields here

        if(!create) {
            update(u);
        }
    }

    private void handleJit(boolean create, User u, Id samlSsoProviderId, Id communityId,
Id portalId,
        String federationIdentifier, Map<String, String> attributes, String assertion) {
        if(communityId != null || portalId != null) {
            String account = handleAccount(create, u, attributes);
```

```
            handleContact(create, account, u, attributes);
            handleUser(create, u, attributes, federationIdentifier, false);
        } else {
            handleUser(create, u, attributes, federationIdentifier, true);
        }
    }

    global User createUser(Id samlSsoProviderId, Id communityId, Id portalId,
        String federationIdentifier, Map<String, String> attributes, String assertion) {
        User u = new User();
        handleJit(true, u, samlSsoProviderId, communityId, portalId,
            federationIdentifier, attributes, assertion);
        return u;
    }

    global void updateUser(Id userId, Id samlSsoProviderId, Id communityId, Id portalId,
        String federationIdentifier, Map<String, String> attributes, String assertion) {
        User u = [SELECT Id FROM User WHERE Id=:userId];
        handleJit(false, u, samlSsoProviderId, communityId, portalId,
            federationIdentifier, attributes, assertion);
    }
}
```

SessionManagement Class

Contains methods for verifying users' identity, creating custom login flows, customizing security levels, and defining trusted IP ranges for a current session.

Namespace

Auth

IN THIS SECTION:

SessionManagement Methods

SessionManagement Methods

The following are methods for `SessionManagement`. All methods are static. Use these methods to customize your user identity verification flows, manage the use of time-based one-time password (TOTP) apps like Google Authenticator, or create custom login flows. Other methods validate a user's incoming IP address against trusted IP range settings for an organization or profile.

IN THIS SECTION:

finishLoginDiscovery(method, userId)

Finishes the My Domain Login Discovery login process.

finishLoginFlow()

Finish the Visualforce Page login flow process, and redirect the user to the default home page.

finishLoginFlow(startUrl)

Finish the Visualforce Page login flow process, and redirect the user to the specified start URL.

generateVerificationUrl(policy, description, destinationUrl)

Initiates a user identity verification flow with the verification method that the user registered with, and returns a URL to the identity verification screen. For example, if you have a custom Visualforce page that displays sensitive account details, you can prompt the user to verify identity before viewing it.

getCurrentSession()

Returns a map of attributes for the current session.

getLightningLoginEligibility(userId)

Returns the eligibility status for a user who's logging in with Lightning Login when you set up your org with My Domain and use the Login Discovery page type. Use this method to redirect the user to a custom login flow. For example, use after a login attempt to redirect the user to password flow if the user is ineligible for Lightning Login.

getQrCode()

Returns a map containing a URL to a quick response (QR) code and a time-based one-time password (TOTP) shared secret to configure authenticator apps or devices for multi-factor authentication (MFA).

getRequiredSessionLevelForProfile(profileId)

Indicates the required login security session level for the given profile.

ignoreForConcurrentSessionLimit(sessions)

This method is reserved for internal Salesforce use.

inOrgNetworkRange(ipAddress)

Indicates whether the given IP address is within the organization's trusted IP range according to the organization's Network Access settings.

isIpAllowedForProfile(profileId, ipAddress)

Indicates whether the given IP address is within the trusted IP range for the given profile.

setSessionLevel(level)

Sets the user's current session security level.

validateTotpTokenForKey(sharedKey, totpCode)

Deprecated. Use `validateTotpTokenForKey(totpSharedKey, totpCode, description)` instead.

validateTotpTokenForKey(totpSharedKey, totpCode, description)

Indicates whether a time-based one-time password (TOTP) code (token) is valid for the given shared key.

validateTotpTokenForUser(totpCode)

Deprecated. Use `validateTotpTokenForUser(totpCode, description)` instead.

validateTotpTokenForUser(totpCode, description)

Indicates whether a time-based one-time password (TOTP) code (token) is valid for the current user.

verifyDeviceFlow(userCode, startUrl)

Verifies the user code entered during the device authentication flow and redirects users to the OAuth approval page. If users aren't logged in, they must log in. After successful login, users are prompted to allow the device to access Salesforce data.

`finishLoginDiscovery(method, userId)`

Finishes the My Domain Login Discovery login process.

Signature

```
public static System.PageReference finishLoginDiscovery(Auth.LoginDiscoveryMethod
method, Id userId)
```

Parameters

method

Type: Auth.LoginDiscoveryMethod LoginDiscoveryMethod Enum

Verification method used with My Domain Login Discovery.

userId

Type: Id

ID used to log in the user. The user must be active.

Return Value

Type: System.PageReference

Usage

Include this method when implementing the `MyDomainLoginDiscoveryHandler` interface to direct users to an authentication mechanism, and then log them in. If users enter a username in the login page, they are sent to the password page for authentication. If users are enrolled in Lightning Login, they are directed to the Salesforce Authenticator to authenticate. If users are SSO-enabled, they are sent to the suitable identity provider (IdP) to authenticate.

The calling user requires Manage Users permission. If the user passed in is frozen or inactive, the method throws an exception.

After implementing the `MyDomainLoginDiscoveryHandler` interface, register the Login Discovery handler from the My Domain Setup page. Under Authentication Configuration, select this handler from the list of Apex classes.

`finishLoginFlow()`

Finish the Visualforce Page login flow process, and redirect the user to the default home page.

Signature

```
public static System.PageReference finishLoginFlow()
```

Return Value

Type: System.PageReference

Usage

Include this method in the Apex controller of the Visualforce Page login flow when creating login flows programmatically. This method indicates that the login flow is finished and redirects the user to the Experience Cloud site's default home page. The login process runs in a restricted session until users complete the process. Calling this method indicates that the login flow is complete, lifts the restriction, and gives users full access to the Experience Cloud site.

`finishLoginFlow(startUrl)`

Finish the Visualforce Page login flow process, and redirect the user to the specified start URL.

Signature

```
public static System.PageReference finishLoginFlow(String startUrl)
```

Parameters

`startUrl`
Type: String

Path to the page that users see when they access the Experience Cloud site.

Return Value

Type: System.PageReference

Usage

Include this method in the Apex controller of the Visualforce Page login flow when creating login flows programmatically. This method indicates that the login flow is finished and redirects the user to the specified location in the Experience Cloud site. The login process runs in a restricted session until users complete the process. Calling this method indicates that the login flow is complete, lifts the restriction, and gives users full access to the Experience Cloud site.

`generateVerificationUrl(policy, description, destinationUrl)`

Initiates a user identity verification flow with the verification method that the user registered with, and returns a URL to the identity verification screen. For example, if you have a custom Visualforce page that displays sensitive account details, you can prompt the user to verify identity before viewing it.

Signature

```
public static String generateVerificationUrl(Auth.VerificationPolicy policy, String
description, String destinationUrl)
```

Parameters

`policy`
Type: Auth.VerificationPolicy

The session security policy required to initiate identity verification for the user's session. For example, if the policy is set to High Assurance level of session security, and the user's current session has the standard level of session security, the user's session is raised to high assurance after successful verification of identity. In the Setup user interface, this value is shown in the Triggered By column of Identity Verification History.

`description`
Type: String

The custom description that describes the activity requiring identity verification; for example, "Complete purchase and check out". This text appears to users when they verify their identity in Salesforce and, if they use Salesforce Authenticator version 2 or later, in

the Salesforce Authenticator mobile app. In addition, in the Setup user interface, this text is shown in the Activity Message column of Identity Verification History.

destinationUrl
Type: String

The relative or absolute Salesforce URL that you want to redirect the user to after identity verification—for example, `/apex/mypage`. The user is redirected to *destinationUrl* when the identity verification flow is complete, regardless of success. For example, if a user chooses to not respond to the identity challenge and cancels it, the user is still redirected to *destinationUrl*. As a best practice, ensure that your code for this page manually checks that the security policy was satisfied (and the user didn't just manually type the URL in the browser). For example, if the *policy* is High Assurance, the target page checks that the user's session is high assurance before allowing access.

Return Value

Type: String

The URL where the user is redirected to verify identity.

Usage

- If the user is already registered to confirm identity using a time-based one-time password (TOTP), then the user is redirected to the one-time password identity verification flow and asked to provide a code.
- If the user isn't registered with any verification method (such as one-time password or Salesforce Authenticator version 2 or later), the user is prompted to download and verify identity using Salesforce Authenticator. The user can also choose a different verification method.

getCurrentSession()

Returns a map of attributes for the current session.

Signature

```
public static Map<String, String> getCurrentSession()
```

Return Value

Type: Map<String, String>

Usage

The map includes a `ParentId` value, which is the 18-character ID for the parent session, if one exists (for example, if the current session is for a canvas app). If the current session doesn't have a parent, this value is null. The map also includes the `LogoutUrl` assigned to the current session.

If you create an Apex test method that calls this method, the test fails with an error such as, "Unexpected Exception: Current session unavailable." An error occurs because there isn't a session in the context through which the test is being run.

When a session is reused, Salesforce updates the `LoginHistoryId` with the value from the most recent login.

Example

The following example shows the name-value pairs in a map returned by `getCurrentSession()`. Note that `UsersId` includes an "s" in the name to match the name of the corresponding field in the AuthSession object.

```
{
SessionId=0Ak###############,
UserType=Standard,
ParentId=0Ak###############,
NumSecondsValid=7200,
LoginType=SAML Idp Initiated SSO,
LoginDomain=null,
LoginHistoryId=0Ya###############,
Username=user@domain.com,
CreatedDate=Wed Jul 30 19:09:29 GMT 2014,
SessionType=Visualforce,
LastModifiedDate=Wed Jul 30 19:09:16 GMT 2014,
LogoutUrl=https://google.com,
SessionSecurityLevel=STANDARD,
UsersId=005###############,
SourceIp=1.1.1.1
}
```

`getLightningLoginEligibility(userId)`

Returns the eligibility status for a user who's logging in with Lightning Login when you set up your org with My Domain and use the Login Discovery page type. Use this method to redirect the user to a custom login flow. For example, use after a login attempt to redirect the user to password flow if the user is ineligible for Lightning Login.

Signature

```
public static Auth.LightningLoginEligibility getLightningLoginEligibility(Id userId)
```

Parameters

userId
Type: Id

ID of the user who is logging in.

Return Value

Type: Auth.LightningLoginEligibility

Returns the current eligibility status.

Example

```
Auth.LightningLoginEligibility eligibility =
    Auth.SessionManagement.getLightningLoginEligibility(id);
if (eligibility == Auth.LightningLoginEligibility.ELIGIBLE) {
    // success
}
```

getQrCode()

Returns a map containing a URL to a quick response (QR) code and a time-based one-time password (TOTP) shared secret to configure authenticator apps or devices for multi-factor authentication (MFA).

Signature

```
public static Map<String, String> getQrCode()
```

Return Value

Type: Map<String, String>

Usage

The QR code encodes the returned secret as well as the current user's username. The keys are `qrCodeUrl` and `secret`. Calling this method does not change any state for the user, nor does it read any state from the user. This method returns a brand new secret every time it is called, does not save that secret anywhere, and does not validate the TOTP token. The admin must explicitly save the values for the user after verifying a TOTP token with the secret.

The `secret` is a base32-encoded string of a 20-byte shared key.

Example

The following is an example of how to request the QR code.

```
public String getGetQRCode() {
        return getQRCode();
    }
    public String getQRCode() {
       Map<String, String> codeResult = Auth.SessionManagement.getQrCode();
       String result = 'URL: '+codeResult.get('qrCodeUrl') + ' SECRET:  ' +
codeResult.get('secret');
       return result;
    }
```

The following is an example of a returned map.

```
{qrCodeUrl=https://www.salesforce.com/secur/qrCode?w=200&h=200&t=tf&u=user%0000000000.com&s=AAAAA7B5BBBB5AAAAAAA66BBBB,

      secret=AAAAA7B5AAAAAA5BBBBBBBBB66AAA}
```

getRequiredSessionLevelForProfile(profileId)

Indicates the required login security session level for the given profile.

Signature

```
public static Auth.SessionLevel getRequiredSessionLevelForProfile(String profileId)
```

Parameters

profileId
Type: String

The 15-character profile ID.

Return Value

Type: Auth.SessionLevel

The session security level required at login for the profile with the ID *profileId*. You can customize the assignment of each level in Session Settings. For example, you can set the High Assurance level to apply only to users who authenticated with multi-factor authentication (MFA) or through a specific identity provider.

ignoreForConcurrentSessionLimit(sessions)

This method is reserved for internal Salesforce use.

Signature

```
public static Map<String,String> ignoreForConcurrentSessionLimit(Object sessions)
```

Parameters

sessions
Type: Object

Return Value

Type: Map<String, String>

inOrgNetworkRange(ipAddress)

Indicates whether the given IP address is within the organization's trusted IP range according to the organization's Network Access settings.

Signature

```
public static Boolean inOrgNetworkRange(String ipAddress)
```

Parameters

ipAddress
Type: String

The IP address to validate.

Return Value

Type: Boolean

Usage

If a trusted IP range is not defined, this returns `false`, and throws an exception if the IP address is not valid.

Trusted IP Range Exists?	User is in the Trusted IP Range?	Return Value
Yes	Yes	`true`
Yes	No	`false`
No	N/A	`false`

`isIpAllowedForProfile(profileId, ipAddress)`

Indicates whether the given IP address is within the trusted IP range for the given profile.

Signature

```
public static Boolean isIpAllowedForProfile(String profileId, String ipAddress)
```

Parameters

`profileId`
Type: String

The 15-character alphanumeric string for the current user's profile ID.

`ipAddress`
Type: String

The IP address to validate.

Return Value

Type: Boolean

Usage

If a trusted IP range is not defined, this returns `true`, and throws an exception if the IP address is not valid or if the profile ID is not valid.

Trusted IP Range Exists?	User is in the Trusted IP Range?	Return Value
Yes	Yes	`true`
Yes	No	`false`
No	N/A	`true`

`setSessionLevel(level)`

Sets the user's current session security level.

Signature

```
public static Void setSessionLevel(Auth.SessionLevel level)
```

Parameters

level
Type: Auth.SessionLevel

The session security level to assign to the user. The meaning of each level can be customized in the Session Settings for each organization, such as setting the High Assurance level to apply only to users who authenticated with multi-factor authentication (MFA) or through a specific identity provider.

Return Value

Type: Void

Usage

This setting affects the session level of all sessions associated with the current session, such as Visualforce or UI access.

If you create an Apex test method that calls this method, the test fails with an error such as, "Unexpected Exception: Current session unavailable." An error occurs because there isn't a session in the context through which the test is being run.

Example

The following is an example class for setting the session level.

```
public class RaiseSessionLevel{
    public void setLevelHigh() {
        Auth.SessionManagement.setSessionLevel(Auth.SessionLevel.HIGH_ASSURANCE);
    }
    public void setLevelStandard() {
        Auth.SessionManagement.setSessionLevel(Auth.SessionLevel.STANDARD);
    }
}
```

validateTotpTokenForKey(sharedKey, totpCode)

Deprecated. Use `validateTotpTokenForKey(totpSharedKey, totpCode, description)` instead.

Signature

```
public static Boolean validateTotpTokenForKey(String sharedKey, String totpCode)
```

Parameters

sharedKey
Type: String

The shared (secret) key. The *sharedKey* must be a base32-encoded string of a 20-byte shared key.

totpCode
Type: String

The time-based one-time password (TOTP) code to validate.

Return Value

Type: Boolean

Usage

If the key is invalid or doesn't exist, this method throws an invalid parameter value exception or a no data found exception, respectively. If the current user exceeds the maximum of 10 token validation attempts, this method throws a security exception.

validateTotpTokenForKey(totpSharedKey, totpCode, description)

Indicates whether a time-based one-time password (TOTP) code (token) is valid for the given shared key.

Signature

```
public static Boolean validateTotpTokenForKey(String totpSharedKey, String totpCode,
String description)
```

Parameters

totpSharedKey
Type: String

The shared (secret) key. The *totpSharedKey* must be a base32-encoded string of a 20-byte shared key.

totpCode
Type: String

The time-based one-time password (TOTP) code to validate.

description
Type: String

The custom description that describes the activity requiring identity verification; for example, "Complete purchase and check out". In the Setup user interface, this text is shown in the Activity Message column of Identity Verification History. The *description* must be 128 characters or fewer. If you provide a value that's longer, it's truncated to 128 characters.

Return Value

Type: Boolean

Usage

If the key is invalid or doesn't exist, this method throws an invalid parameter value exception or a no data found exception, respectively. If the current user exceeds the maximum of 10 token validation attempts, this method throws a security exception.

validateTotpTokenForUser(totpCode)

Deprecated. Use `validateTotpTokenForUser(totpCode, description)` instead.

Signature

```
public static Boolean validateTotpTokenForUser(String totpCode)
```

Parameters

totpCode
Type: String

The time-based one-time password (TOTP) code to validate.

Return Value

Type: Boolean

Usage

If the current user does not have a TOTP code, this method throws an exception. If the current user has attempted too many validations, this method throws an exception.

validateTotpTokenForUser(totpCode, description)

Indicates whether a time-based one-time password (TOTP) code (token) is valid for the current user.

Signature

```
public static Boolean validateTotpTokenForUser(String totpCode, String description)
```

Parameters

totpCode
Type: String

The time-based one-time password (TOTP) code to validate.

description
Type: String

The custom description that describes the activity requiring identity verification; for example, "Complete purchase and check out". This text appears to users when they verify their identity in Salesforce and, if they use Salesforce Authenticator version 2 or later, in the Salesforce Authenticator mobile app. In addition, in the Setup user interface, this text is shown in the Activity Message column of Identity Verification History. The *description* must be 128 characters or fewer. If you provide a value that's longer, it's truncated to 128 characters.

Return Value

Type: Boolean

Usage

If the current user does not have a TOTP code, or if the current user has attempted too many validations, this method throws an exception.

verifyDeviceFlow(userCode, startUrl)

Verifies the user code entered during the device authentication flow and redirects users to the OAuth approval page. If users aren't logged in, they must log in. After successful login, users are prompted to allow the device to access Salesforce data.

Signature

```
public static System.PageReference verifyDeviceFlow(String userCode, String startUrl)
```

Parameters

userCode
Type: String

Human-readable user code provided to the user by Salesforce. The user must enter this code at the verification URL to approve device access to Salesforce data.

startURL
Type: String

The URL for the page that the user is redirected to after successful login and approval of the device to access Salesforce data. If you don't specify a start URL, the user is redirected to the Home page.

Return Value

Type:System.PageReference

Usage

Include this method in the Apex controller when creating a custom Visualforce User Code Verification page for the OAuth 2.0 device authentication flow. This method verifies the user code, prompts the user to log in as needed, and prompts the user to allow the device access to Salesforce data. Upon successful verification and authentication, the user is redirected to the page defined by the start URL.

SessionLevel Enum

An `Auth.SessionLevel` enum value is used by the `SessionManagement.setSessionLevel` method.

Namespace

Auth

Enum Values

Value	Description
`LOW`	The user's security level for the current session meets the lowest requirements. Note: This low level is not available, nor used, in the Salesforce UI. User sessions through the Salesforce UI are either standard or high assurance. You can set this level using the API, but users assigned this level will experience unpredictable and reduced functionality in their Salesforce organization.
`STANDARD`	The user's security level for the current session meets the Standard requirements set in the current organization Session Security Levels.
`HIGH_ASSURANCE`	The user's security level for the current session meets the High Assurance requirements set in the current organization Session Security Levels.

Usage

With session-level security, you control user access to features that support it, such as connected apps and reporting. For example, you can customize an organization's Session Settings to require users to log in with multi-factor authentication (MFA) to get a High Assurance session. Then, you can restrict access to a specific connected app by requiring a High Assurance session level in the settings for the connected app.

TokenValidationResult Class

Contains methods that describe the result of the token validation performed by a token exchange handler using the `validateIncomingToken` method during the OAuth 2.0 token exchange flow.

Namespace

Auth

Usage

See Token Exchange Handler Validation and Subject Mapping.

Example

Here's an example class.

```
global class TokenValidationResult {
    global TokenValidationResult(Boolean valid) { this.isValid = valid; }

    global TokenValidationResult(Boolean isValid, Object data, Auth.UserData userData,
        String token, Auth.OAuth2TokenExchangeType tokenType, String customErrorMsg) {

        this.isValid = isValid;
        this.data = data;
        this.userData = userData;
        this.token = token;
        this.tokenType = tokenType;
        this.customErrorMsg = customErrorMsg;

    }

    global Boolean isValid;
    global Object data;
    global Auth.UserData userData;
    global String token;
    global Auth.OAuth2TokenExchangeType tokenType; //Enum
    global String customErrorMsg; //Custom error message that's returned to the client if
 token validation fails

    global Boolean isValid(){
        return isValid;
    }
    global Object getData(){
        return data;
```

```
    }
    global Auth.UserData getUserData(){
        return userData;
    }
    global String getToken(){
        return token;
    }
    global OAuth2TokenExchangeType getTokenType(){
        return tokenType;
    }
    global String getCustomErrorMessage(){
        return customErrorMsg;
    }
}
```

IN THIS SECTION:

TokenValidationResult Constructors

TokenValidationResult Properties

TokenValidationResult Methods

TokenValidationResult Constructors

The following are constructors for `TokenValidationResult`.

IN THIS SECTION:

TokenValidationResult(isValid, data, userData, token, tokenType, customErrorMsg)
Creates an instance of the `Auth.TokenValidationResult` class to describe the result of token validation performed during the OAuth 2.0 token exchange flow.

TokenValidationResult(valid)
Creates an instance of the `Auth.TokenValidationResult` class to describe a valid token validation result during the OAuth 2.0 token exchange flow.

`TokenValidationResult(isValid, data, userData, token, tokenType, customErrorMsg)`

Creates an instance of the `Auth.TokenValidationResult` class to describe the result of token validation performed during the OAuth 2.0 token exchange flow.

Signature

```
public TokenValidationResult(Boolean isValid, Object data, Auth.UserData userData,
String token, Auth.OAuth2TokenExchangeType tokenType, String customErrorMsg)
```

Parameters

`isValid`
Type: Boolean

If `true`, the token is valid.

`data`
Type: Object

Stores custom data that isn't stored in `userData`.

`userData`
Type: Auth.UserData

Stores information about a Salesforce user.

`token`
Type: String

The token from the external identity provider.

`tokenType`
Type: Auth.OAuth2TokenExchangeType

The type of token from the external identity provider.

`customErrorMsg`
Type: String

A custom error message that's returned if the token validation fails.

`TokenValidationResult(valid)`

Creates an instance of the `Auth.TokenValidationResult` class to describe a valid token validation result during the OAuth 2.0 token exchange flow.

Signature

```
public TokenValidationResult(Boolean valid)
```

Parameters

`valid`
Type: Boolean

Indicates a valid token validation result.

TokenValidationResult Properties

The following are properties for `TokenValidationResult`.

IN THIS SECTION:

customErrorMsg
A custom error message that's returned if token validation fails.

data
Contains information about the user that isn't stored in the `Auth.UserData` class, such as information obtained via callouts to the external identity provider.

isValid
Indicates whether the token is valid or not, based on the custom validation logic in your token exchange handler.

token
The token from the external identity provider.

tokenType
The type of token from the external identity provider. It can be an access token, refresh token, ID token, SAML 2.0 assertion, or a JSON Web Token (JWT).

userData
Information about the user that's obtained from the identity provider's token.

customErrorMsg

A custom error message that's returned if token validation fails.

Signature

```
public String customErrorMsg {get; set;}
```

Property Value

Type: String

data

Contains information about the user that isn't stored in the `Auth.UserData` class, such as information obtained via callouts to the external identity provider.

Signature

```
public Object data {get; set;}
```

Property Value

Type: Object

isValid

Indicates whether the token is valid or not, based on the custom validation logic in your token exchange handler.

Signature

```
public Boolean isValid {get; set;}
```

Property Value

Type: Boolean

token

The token from the external identity provider.

Signature

```
public String token {get; set;}
```

Property Value

Type: String

`tokenType`

The type of token from the external identity provider. It can be an access token, refresh token, ID token, SAML 2.0 assertion, or a JSON Web Token (JWT).

Signature

```
public Auth.OAuth2TokenExchangeType tokenType {get; set;}
```

Property Value

Type: Auth.OAuth2TokenExchangeType

`userData`

Information about the user that's obtained from the identity provider's token.

Signature

```
public Auth.UserData userData {get; set;}
```

Property Value

Type: Auth.UserData

TokenValidationResult Methods

The following are methods for `TokenValidationResult`.

IN THIS SECTION:

getCustomErrorMessage()
Retrieves the `CustomErrorMsg` that's returned when token validation fails.

getData()
Retrieves data from the identity provider token. This data can include custom data that isn't stored in the `userData` property.

getToken()
Retrieves the token that was passed from the external identity provider.

getTokenType()
Retrieves the type of token that was passed from the external identity provider.

getUserData()
Retrieves information about the user. The user information can be obtained from the identity provider's token or from callouts to the identity provider, if applicable.

isValid
Indicates whether the token is valid or not, based on the custom validation logic in your token exchange handler.

`getCustomErrorMessage()`

Retrieves the `CustomErrorMsg` that's returned when token validation fails.

Signature

```
public String getCustomErrorMessage()
```

Return Value

Type: String

`getData()`

Retrieves data from the identity provider token. This data can include custom data that isn't stored in the `userData` property.

Signature

```
public Object getData()
```

Return Value

Type: Object

`getToken()`

Retrieves the token that was passed from the external identity provider.

Signature

```
public String getToken()
```

Return Value

Type: String

`getTokenType()`

Retrieves the type of token that was passed from the external identity provider.

Signature

```
public Auth.OAuth2TokenExchangeType getTokenType()
```

Return Value

Type: Auth.OAuth2TokenExchangeType

`getUserData()`

Retrieves information about the user. The user information can be obtained from the identity provider's token or from callouts to the identity provider, if applicable.

Signature

```
public Auth.UserData getUserData()
```

Return Value

Type: Auth.UserData

`isValid`

Indicates whether the token is valid or not, based on the custom validation logic in your token exchange handler.

Signature

```
public Boolean isValid {get; set;}
```

Property Value

Type: Boolean

UserData Class

Stores user information for `Auth.RegistrationHandler`.

Namespace

Auth

IN THIS SECTION:

UserData Constructors

UserData Properties

UserData Constructors

The following are constructors for `UserData`.

IN THIS SECTION:

UserData(identifier, firstName, lastName, fullName, email, link, userName, locale, provider, siteLoginUrl, attributeMap)
Creates a new instance of the `Auth.UserData` class using the specified arguments.

UserData(identifier, firstName, lastName, fullName, email, link, userName, locale, provider, siteLoginUrl, attributeMap)

Creates a new instance of the `Auth.UserData` class using the specified arguments.

Signature

```
public UserData(String identifier, String firstName, String lastName, String fullName,
String email, String link, String userName, String locale, String provider, String
siteLoginUrl, Map<String,String> attributeMap)
```

Parameters

identifier
Type: String

An identifier from the third party for the authenticated user, such as the Facebook user number or the Salesforce user ID.

firstName
Type: String

The first name of the authenticated user, according to the third party.

lastName
Type: String

The last name of the authenticated user, according to the third party.

fullName
Type: String

The full name of the authenticated user, according to the third party.

email
Type: String

The email address of the authenticated user, according to the third party.

link
Type: String

A stable link for the authenticated user such as `https://www.facebook.com/MyUsername`.

userName
Type: String

The username of the authenticated user in the third party.

locale
Type: String

The standard locale string for the authenticated user.

provider
Type: String

The service used to log in, such as Facebook or Janrain.

siteLoginUrl
Type: String

The site login page URL passed in if used with a site; `null` otherwise.

attributeMap
Type: Map<String, String>

A map of data from the third party, in case the handler has to access non-standard values. For example, when using Janrain as a provider, the fields Janrain returns in its `accessCredentials` dictionary are placed into the `attributeMap`. These fields vary by provider.

UserData Properties

The following are properties for `UserData`.

IN THIS SECTION:

identifier
An identifier from the third party for the authenticated user, such as the Facebook user number or the Salesforce user ID.

firstName
The first name of the authenticated user, according to the third party.

lastName
The last name of the authenticated user, according to the third party.

fullName
The full name of the authenticated user, according to the third party.

email
The email address of the authenticated user, according to the third party.

link
A stable link for the authenticated user such as `https://www.facebook.com/MyUsername`.

username
The username of the authenticated user in the third party.

locale
The standard locale string for the authenticated user.

provider
The service used to log in, such as Facebook or Janrain.

siteLoginUrl
The site login page URL passed in if used with a site; `null` otherwise.

attributeMap
A map of data from the third party, in case the handler has to access non-standard values. For example, when using Janrain as a provider, the fields Janrain returns in its `accessCredentials` dictionary are placed into the `attributeMap`. These fields vary by provider.

identifier

An identifier from the third party for the authenticated user, such as the Facebook user number or the Salesforce user ID.

Signature

```
public String identifier {get; set;}
```

Property Value

Type: String

`firstName`

The first name of the authenticated user, according to the third party.

Signature

```
public String firstName {get; set;}
```

Property Value

Type: String

`lastName`

The last name of the authenticated user, according to the third party.

Signature

```
public String lastName {get; set;}
```

Property Value

Type: String

`fullName`

The full name of the authenticated user, according to the third party.

Signature

```
public String fullName {get; set;}
```

Property Value

Type: String

`email`

The email address of the authenticated user, according to the third party.

Signature

```
public String email {get; set;}
```

Property Value

Type: String

link

A stable link for the authenticated user such as `https://www.facebook.com/MyUsername`.

Signature

```
public String link {get; set;}
```

Property Value

Type: String

username

The username of the authenticated user in the third party.

Signature

```
public String username {get; set;}
```

Property Value

Type: String

locale

The standard locale string for the authenticated user.

Signature

```
public String locale {get; set;}
```

Property Value

Type: String

provider

The service used to log in, such as Facebook or Janrain.

Signature

```
public String provider {get; set;}
```

Property Value

Type: String

siteLoginUrl

The site login page URL passed in if used with a site; `null` otherwise.

Signature

```
public String siteLoginUrl {get; set;}
```

Property Value

Type: String

`attributeMap`

A map of data from the third party, in case the handler has to access non-standard values. For example, when using Janrain as a provider, the fields Janrain returns in its `accessCredentials` dictionary are placed into the `attributeMap`. These fields vary by provider.

Signature

```
public Map<String, String> attributeMap {get; set;}
```

Property Value

Type: Map<String, String>

VerificationMethod Enum

Contains the different ways users can identify themselves when logging in. You can use it to implement mobile-centric passwordless login pages and to self-register (and deregister) verification methods.

Usage

The enum value is an argument in `System.Site.passwordlessLogin`, `System.UserManagement.registerVerificationMethod`, and `System.UserManagement.deregisterVerificationMethod` on page 3792 methods. The value indicates the method used to verify a user's identity.

Enum Values

The following are the values of the `Auth.VerificationMethod` enum.

Value	Description
`BUILT_IN_AUTHENTICATOR`	Identity verified with a built-in authenticator.
`EMAIL`	Identity verified with a verification code sent in an email message.
`PASSWORD`	Identity verified with a password.
`SALESFORCE_AUTHENTICATOR`	Identity verified by Salesforce Authenticator.
`SECURITY_KEY`	Identity verified by a WebAuthn-compatible physical security key. Includes all security keys registered or used after Summer '22.
`SMS`	Identity verified with a verification code sent via SMS message.
`TOTP`	Identity verified with a time-based one-time password (TOTP).

Value	Description
`U2F`	Identity verified by a U2F physical security key, such as a YubiKey. Note: For U2F security keys registered or used after Summer '22, use SECURITY_KEY instead.

VerificationPolicy Enum

The `Auth.VerificationPolicy` enum contains an identity verification policy value used by the `SessionManagement.generateVerificationUrl` method.

Usage

The enum value is an argument in the `SessionManagement.generateVerificationUrl` method. The value indicates the session security policy required to initiate identity verification for the user's session.

Enum Values

The `Auth.VerificationPolicy` enum has this value.

Value	Description
`HIGH_ASSURANCE`	The security level for the user's current session must be High Assurance.

VerificationResult Class

Contains the result of a verification challenge that you invoke when you create your own Verify page. The challenge can be initiated by either the `System.UserManagement.verifyPasswordlessLogin` or `System.UserManagement.verifySelfRegistration` method.

Namespace

Auth

Usage

When users sign up for or log in to your Experience Cloud site with an email address or phone number, Salesforce sends them a verification code. At the same time, Salesforce generates the Verify page for users to enter the code to verify their identity. You can replace the Salesforce-generated Verify page with one that you create with Visualforce. Then invoke the verification challenge and, if the verification code is entered correctly, log in the user. For sign-up, you use the `System.UserManagement.verifySelfRegistration` method. For passwordless login, you use the System.UserManagement.verifyPasswordlessLogin method. The methods return the verification result, which contains the message displayed as a result of the challenge. This message also indicates whether the challenge is successful and where to direct the user when the verification code is entered correctly.

Example

This code contains the result of a verification challenge that registers a new user.

```
String id = System.UserManagement.initSelfRegistration
          (Auth.VerificationMethod.SMS, user);
        Auth.VerificationResult res = System.UserManagement.verifySelfRegistration
          (Auth.VerificationMethod.SMS, id, '123456', null);
        if(res.success == true){
     //redirect
}
```

IN THIS SECTION:

VerificationResult Constructor

VerificationResult Properties

VerificationResult Method

VerificationResult Constructor

`VerificationResult` has the following constructor.

IN THIS SECTION:

VerificationResult(redirect, success, message)

Creates an instance of the `VerificationResult` class that contains the verification result from `System.UserManagement.verifySelfRegistration`.

`VerificationResult(redirect, success, message)`

Creates an instance of the `VerificationResult` class that contains the verification result from `System.UserManagement.verifySelfRegistration`.

Signature

```
public VerificationResult(System.PageReference redirect, Boolean success, String message)
```

Parameters

`redirect`

Type: System.PageReferenceSystem.PageReference

Where user is directed upon successful verification.

`success`

Type: Boolean

Indicates whether verification succeeded.

`message`

Type: String

Message that displays as a result of a verification challenge.

VerificationResult Properties

The following are properties for `VerificationResult`.

IN THIS SECTION:

message

Message that displays as a result of a verification challenge. SUCCESS if the identity verification is successful. Other values are FAILURE, PENDING, RATE_LIMITED, or FAILURE_REPORT.

redirect

Where the user is directed after entering the verification code successfully, for example, the Experience Cloud site's home page or location specified by the start URL.

success

The verification challenge is successful.

message

Message that displays as a result of a verification challenge. SUCCESS if the identity verification is successful. Other values are FAILURE, PENDING, RATE_LIMITED, or FAILURE_REPORT.

Signature

```
public String message {get; set;}
```

Property Value

Type: String

redirect

Where the user is directed after entering the verification code successfully, for example, the Experience Cloud site's home page or location specified by the start URL.

Signature

```
public System.PageReference redirect {get; set;}
```

Property Value

Type: System.PageReferenceSystem.PageReference

success

The verification challenge is successful.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

VerificationResult Method

`VerificationResult` has the following method.

IN THIS SECTION:

clone()
Duplicates the Auth.VerificationResult object.

`clone()`

Duplicates the Auth.VerificationResult object.

Signature

```
public Object clone()
```

Return Value

Type: VerificationResult

Auth Exceptions

The `Auth` namespace contains some exception classes.

All exception classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions.

The `Auth` namespace contains the following exception.

Exception	Description
`Auth.AuthProviderPluginException`	Throw this exception to indicate that an error occurred when using the auth provider plug-in. Use to display a custom error message to the user. To get the error message and write it to debug log, use the `String getMessage()`.
`Auth.ConnectedAppPluginException`	Throw this exception to indicate that an error occurred while running the custom behavior for a connected app. To get the error message and write it to debug log, use the `String getMessage()`.
`Auth.DiscoveryCustomErrorException`	Throw this exception to customize error messages that appear on Discovery logins and Configurable Self-Registration pages. An error message can have up to 200 characters. Use custom error exceptions to localize error messages. Include this exception in: • `Auth.MyDomainLoginDiscoveryHandler` to show a custom error message on the My Domain login page

Exception	Description
	• `Auth.LoginDiscoveryHandler` to show an error message on the Experience Cloud site login page • `Auth.ConfigurableSelfRegHandler` to show an error message on the Experience Cloud site self-registration Verify page The Verify page shows up if you configured self-registration with either an **Email** or **Text Message** verification method. If you didn't set up sign-up with a verification method, the error message appears on the self-registration page. To get the error message and write it to debug log, use the `String getMessage()`.
`Auth.JWTBearerTokenExchange.JWTBearerTokenExchangeException`	Throw this exception to indicate a problem with the response from the token endpoint in the JWTBearerTokenExchange class. This exception occurs during the OAuth 2.0 JWT bearer token flow when the HTTP response: • Fails to return an access token • Isn't in JSON format • Returns a response code other than a 200 "OK" success code To get the error message and write it to debug log, use the `String getMessage()`.
`Auth.JWTValidationException`	Throws this exception to indicate failure to validate a JWT using methods in the `JWTUtil` class. This exception occurs during the OAuth 2.0 token exchange flow in these scenarios. • Can't parse the JWT • Can't validate the JWT using a certificate, a public key, or the remote keys endpoint, depending on which method you use
`Auth.LoginDiscoveryException`	Throw this exception to indicate that an error occurred when executing the Login Discovery handler. For an example, see LoginDiscoveryHandler Example Implementation. To get the error message and write it to debug log, use the `String getMessage()`.
`Auth.VerificationException`	Throw this exception to trigger verification based on the passed-in policy. You can throw this exception in an Apex trigger or Visualforce controller. The system automatically sends you to the verification endpoint, if possible. Note: You can't catch this exception. The exception immediately triggers the verification.

Examples

This example uses `AuthProviderPluginException` to throw a custom exception in a custom authentication provider implementation. Use this exception if you want the end user to see a specific message, passing in the error message as a parameter. If you use another exception, users see a standard Salesforce error message.

```
global override Auth.OAuthRefreshResult refresh(Map<string,string>
authProviderConfiguration,String refreshToken){
            HttpRequest req = new HttpRequest();
            String accessToken = null;
            String error  = null;
            try {
```

```
            // DEVELOPER TODO: Make a refresh token flow using refreshToken passed
            // in as an argument to get the new access token
            // accessToken = ...
            } catch (System.CalloutException e) {
            error = e.getMessage();
            }
            catch(Exception e) {
            error = e.getMessage();
            throw new Auth.AuthProviderPluginException('My custom error');
            }

            return new Auth.OAuthRefreshResult(accessToken,refreshToken, error);

            }
```

This example uses `Auth.VerificationException` to trigger verification if a user attempts to create an account without a high assurance session.

```
trigger testTrigger on Account (before insert) {
    Map<String, String> sessionMap = auth.SessionManagement.getCurrentSession();
    if(!sessionMap.get('SessionSecurityLevel').equals('HIGH_ASSURANCE')) {
        throw new Auth.VerificationException(
            Auth.VerificationPolicy.HIGH_ASSURANCE, 'Insert Account');
    }
}
```

Cache Namespace

The `Cache` namespace contains methods for managing the platform cache.

The following are the classes in the `Cache` namespace.

IN THIS SECTION:

CacheBuilder Interface

An interface for safely retrieving and removing values from a session or org cache. Use the interface to generate a value that you want to store in the cache. The interface checks for cache misses, which means you no longer need to check for null cache values yourself.

Org Class

Use the `Cache.Org` class to add, retrieve, and manage values in the org cache. Unlike the session cache, the org cache is not tied to any session and is available to the organization across requests and to all users.

OrgPartition Class

Contains methods to manage cache values in the org cache of a specific partition. Unlike the session cache, the org cache is not tied to any session. It's available to the organization across requests and to all users.

Partition Class

Base class of `Cache.OrgPartition` and `Cache.SessionPartition`. Use the subclasses to manage the cache partition for org caches and session caches.

Session Class

Use the `Cache.Session` class to add, retrieve, and manage values in the session cache. The session cache is active as long as the user's Salesforce session is valid (the user is logged in, and the session is not expired).

SessionPartition Class

Contains methods to manage cache values in the session cache of a specific partition.

Cache Exceptions

The `Cache` namespace contains exception classes.

Visibility Enum

Use the `Cache.Visibility` enumeration in the `Cache.Session` or `Cache.Org` methods to indicate whether a cached value is visible only in the value's namespace or in all namespaces.

SEE ALSO:

Apex Developer Guide: Platform Cache

CacheBuilder Interface

An interface for safely retrieving and removing values from a session or org cache. Use the interface to generate a value that you want to store in the cache. The interface checks for cache misses, which means you no longer need to check for null cache values yourself.

Namespace

Cache

IN THIS SECTION:

CacheBuilder Methods

CacheBuilder Example Implementation

SEE ALSO:

Apex Developer Guide: Safely Cache Values with the CacheBuilder Interface

CacheBuilder Methods

The following are methods for `CacheBuilder`.

IN THIS SECTION:

doLoad(var)

Contains the logic that builds a cached value. You don't call this method directly. Instead, it's called indirectly when you reference the class that implements the `CacheBuilder` interface.

`doLoad(var)`

Contains the logic that builds a cached value. You don't call this method directly. Instead, it's called indirectly when you reference the class that implements the `CacheBuilder` interface.

Signature

```
public Object doLoad(String var)
```

Parameters

var
Type: String

A case-sensitive string value used to build a cached value. This parameter is also used as part of the unique key that identifies the cached value.

Return Value

Type: Object

The value that was cached. Cast the return value to the appropriate type.

CacheBuilder Example Implementation

This example creates a class called `UserInfoCache` that implements the `CacheBuilder` interface. The class caches the results of a SOQL query run against the User object.

```
class UserInfoCache implements Cache.CacheBuilder {
    public Object doLoad(String userid) {
        User u = (User)[SELECT Id, IsActive, username FROM User WHERE id =: userid];
        return u;
    }
}
```

This example gets a cached User record based on a user ID. If the value exists in the org cache, it is returned. If the value doesn't exist, the `doLoad(String var)` method is re-executed, and the new value is cached and returned.

```
User batman = (User) Cache.Org.get(UserInfoCache.class, '00541000000ek4c');
```

Org Class

Use the `Cache.Org` class to add, retrieve, and manage values in the org cache. Unlike the session cache, the org cache is not tied to any session and is available to the organization across requests and to all users.

Namespace

Cache

Usage

Cache Key Format

This table lists the format of the key parameter that some methods in this class take, such as `put`, `get`, and `contains`.

Key Format	Description
namespace.partition.key	Fully qualified key name.

Key Format	Description
key	Refers to a partition marked as default when the *namespace.partition* prefix is omitted.
local.*partition.key*	Use the local prefix to refer to the org's namespace when the org doesn't have a namespace defined. If the org has a namespace defined, the local prefix also refers to that org's namespace.

Note:

- If no default partition is specified in the org, calling a cache method without fully qualifying the key name causes a Cache.Org.OrgCacheException to be thrown.
- The local prefix in an installed managed package refers to the namespace of the subscriber org and not the package's namespace. The cache put calls aren't allowed in a partition that the invoking class doesn't own.

Example

This class is the controller for a sample Visualforce page (shown in the subsequent code sample). The cached values are initially added to the cache by the init() method, which the Visualforce page invokes when it loads through the action attribute. The cache keys don't contain the namespace.partition prefix. They all refer to the default partition in your org. To run this sample, create a partition and mark it as default.

The Visualforce page contains four output components. These components call get methods on the controller that returns the following values from the cache: a date, data based on the MyData inner class, a counter, a text value, and a list. The size of the list is also returned.

The Visualforce page also contains two buttons. The Rerender button invokes the go() method on the controller. This method increases the values of the counter and the custom data in the cache. When you click **Rerender**, the two counters increase by one each time. The go() method retrieves the values of these counters from the cache, increments their values by one, and stores them again in the cache.

The Remove datetime Key button deletes the date-time value (with key datetime) from the cache. As a result, the value next to Cached datetime: is cleared on the page.

Note: If another user logs in and runs this sample, this user gets the cache values that were last added or updated by the previous user. For example, if the counter value was five, the next user sees the counter value as increased to six.

```
public class OrgCacheController {

    // Inner class.
    // Used as the data type of a cache value.
    class MyData {
        public String value { get; set; }
        public Integer counter { get; set; }

        public MyData(String value) {
            this.value = value;
            this.counter = 0;
        }

        public void inc() {
            counter++;
```

```
        }

        override public String toString() {
            return this.value + ':' + this.counter;
        }
    }

    // Apex List.
    // Used as the data type of a cached value.
    private List<String> numbers =
            new List<String> { 'ONE', 'TWO', 'THREE', 'FOUR', 'FIVE' };

    // Constructor of the controller for the Visualforce page.
    public OrgCacheController() {
    }

    // Adds various values to the cache.
    // This method is called when the Visualforce page loads.
    public void init() {
        // All key values are not qualified by the namespace.partition
        // prefix because they use the default partition.

        // Add counter to the cache with initial value of 0
        //  or increment it if it's already there.
        if (!Cache.Org.contains('counter')) {
            Cache.Org.put('counter', 0);
        } else {
            Cache.Org.put('counter', getCounter() + 1);
        }

        // Add the datetime value to the cache only if it's not already there.
        if (!Cache.Org.contains('datetime')) {
            DateTime dt = DateTime.now();
            Cache.Org.put('datetime', dt);
        }

        // Add the custom data to the cache only if it's not already there.
        if (!Cache.Org.contains('data')) {
            Cache.Org.put('data', new MyData('Some custom value'));
        }

        // Add a list of number to the cache if not already there.
        if (!Cache.Org.contains('list')) {
            Cache.Org.put('list', numbers);
        }

        // Add a string value to the cache if not already there.
        if (!Cache.Org.contains('output')) {
            Cache.Org.put('output', 'Cached text value');
        }
    }

    // Return counter from the cache.
    public Integer getCounter() {
```

```
    return (Integer)Cache.Org.get('counter');
}

// Return datetime value from the cache.
public String getCachedDatetime() {
    DateTime dt = (DateTime)Cache.Org.get('datetime');
    return dt != null ? dt.format() : null;
}

// Return cached value whose type is the inner class MyData.
public String getCachedData() {
    MyData mydata = (MyData)Cache.Org.get('data');
    return mydata != null ? mydata.toString() : null;
}

// Return output from the cache.
public String getOutput() {
    return (String)Cache.Org.get('output');
}

// Return list from the cache.
public List<String> getList() {
    return (List<String>)Cache.Org.get('list');
}

// Method invoked by the Rerender button on the Visualforce page.
// Updates the values of various cached values.
// Increases the values of counter and the MyData counter if those
//   cache values are still in the cache.
public PageReference go() {
    // Increase the cached counter value or set it to 0
    //  if it's not cached.
    if (Cache.Org.contains('counter')) {
        Cache.Org.put('counter', getCounter() + 1);
    } else {
        Cache.Org.put('counter', 0);
    }

    // Get the custom data value from the cache.
    MyData d = (MyData)Cache.Org.get('data');
    // Only if the data is already in the cache, update it.
    if (Cache.Org.contains('data')) {
        d.inc();
        Cache.Org.put('data', d);
    }

    return null;
}

// Method invoked by the Remove button on the Visualforce page.
// Removes the datetime cached value from the org cache.
public PageReference remove() {
    Cache.Org.remove('datetime');
```

```
        return null;
    }
}
```

This is the Visualforce page that corresponds to the `OrgCacheController` class.

```
<apex:page controller="OrgCacheController" action="{!init}">

    <apex:outputPanel id="output">
        <br/>Cached datetime: <apex:outputText value="{!cachedDatetime}"/>
        <br/>Cached data: <apex:outputText value="{!cachedData}"/>
        <br/>Cached counter: <apex:outputText value="{!counter}"/>
        <br/>Output: <apex:outputText value="{!output}"/>
        <br/>Repeat: <apex:repeat var="item" value="{!list}">
            <apex:outputText value="{!item}"/> 
        </apex:repeat>
        <br/>List size: <apex:outputText value="{!list.size}"/>
    </apex:outputPanel>

    <br/><br/>
    <apex:form >
        <apex:commandButton id="go" action="{!go}" value="Rerender" rerender="output"/>
        <apex:commandButton id="remove" action="{!remove}" value="Remove datetime Key"
rerender="output"/>
    </apex:form>

</apex:page>
```

This is the output of the page after clicking the **Rerender** button twice. The counter value could differ in your case if a key named `counter` was already in the cache before running this sample.

```
Cached datetime:8/11/2015 1:58 PM
Cached data:Some custom value:2
Cached counter:2
Output:Cached text value
Repeat:ONE TWO THREE FOUR FIVE
List size:5
```

IN THIS SECTION:

Org Constants
The Org class provides a constant that you can use when setting the time-to-live (TTL) value.

Org Methods

SEE ALSO:

Apex Developer Guide: Platform Cache

Org Constants

The Org class provides a constant that you can use when setting the time-to-live (TTL) value.

Constant	Description
`MAX_TTL_SECS`	Represents the maximum amount of time, in seconds, to keep the cached value in the org cache.

Org Methods

The following are methods for `Org`. All methods are static.

IN THIS SECTION:

contains(key)

Returns `true` if the org cache contains a cached value corresponding to the specified key.

contains(keys)

Returns `true` if the org cache contains values for the specified key entries.

contains(setOfKeys)

Returns `true` if the org cache contains values for a specified set of keys.

get(key)

Returns the cached value corresponding to the specified key from the org cache.

get(cacheBuilder, key)

Returns the cached value corresponding to the specified key from the org cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

get(keys)

Returns the cached values corresponding to the specified set of keys from the org cache.

getAvgGetSize()

Returns the average item size of all the keys fetched from the org cache, in bytes.

getAvgGetTime()

Returns the average time taken to get a key from the org cache, in nanoseconds.

getAvgValueSize()

Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the org cache, in bytes.

getCapacity()

Returns the percentage of org cache capacity that has been used.

getKeys()

Returns a set of all keys that are stored in the org cache and visible to the invoking namespace.

getMaxGetSize()

Returns the maximum item size of all the keys fetched from the org cache, in bytes.

getMaxGetTime()

Returns the maximum time taken to get a key from the org cache, in nanoseconds.

getMaxValueSize()

Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the org cache, in bytes.

getMissRate()
Returns the miss rate in the org cache.

getName()
Returns the name of the default cache partition.

getNumKeys()
Returns the total number of keys in the org cache.

getPartition(partitionName)
Returns a partition from the org cache that corresponds to the specified partition name.

put(key, value)
Stores the specified key/value pair as a cached entry in the org cache. The `put` method can write only to the cache in your org's namespace.

put(key, value, visibility)
Stores the specified key/value pair as a cached entry in the org cache and sets the cached value's visibility.

put(key, value, ttlSecs)
Stores the specified key/value pair as a cached entry in the org cache and sets the cached value's lifetime.

put(key, value, ttlSecs, visibility, immutable)
Stores the specified key/value pair as a cached entry in the org cache. This method also sets the cached value's lifetime, visibility, and whether it can be overwritten by another namespace.

remove(key)
Deletes the cached value corresponding to the specified key from the org cache.

remove(cacheBuilder, key)
Deletes the cached value corresponding to the specified key from the org cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

`contains(key)`

Returns `true` if the org cache contains a cached value corresponding to the specified key.

Signature

```
public static Boolean contains(String key)
```

Parameters

`key`
Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

Return Value

Type: Boolean

`true` if a cache entry is found. Othewise, `false`.

`contains(keys)`

Returns `true` if the org cache contains values for the specified key entries.

Signature

```
public static List<Boolean> contains(List<String> keys)
```

Parameters

`keys`
Type: List<String>

A list of keys that identifies cached values. For information about the format of the key name, see Usage.

Return Value

Type: List<Boolean>

`true` if the key entries are found. Othewise, `false`.

contains(setOfKeys)

Returns `true` if the org cache contains values for a specified set of keys.

Signature

```
public static Map <String, Boolean> contains (Set<String> keys)
```

Parameters

`setOfKeys`
Type: Set <String>

A set of keys that uniquely identifies cached values. For information about the format of the key name, see Usage

Return Value

Type: Map <String, Boolean>

Returns the cache key and corresponding Boolean value indicating that the key entry exists. The Boolean value is `false` if the key entry doesn't exist.

Usage

The number of input keys cannot exceed the maximum limit of 10.

Example

In this example, the code checks for the presence of multiple keys on the default partition. It fetches the cache key and the corresponding Boolean value for the key entry from the org cache of the default partition.

```
Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Map<String,Boolean> result = Cache.Org.contains(keys);
```

```
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('Is Key Present in the cache : ' +  result.get(key));
}
```

In this example, the code checks for the presence of multiple keys on different partitions. It fetches the cache key and the corresponding Boolean value for the key entry from the org cache of different partitions.

```
// Assuming there are three partitions p1, p2, p3 with default 'local' namespace

Set<String> keys = new Set<String>{'local.p1.key','local.p2.key', 'local.p3.key'};
Map<String,Boolean> result = Cache.Org.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('Is Key Present in the cache : +  result.get(key));
}
```

`get(key)`

Returns the cached value corresponding to the specified key from the org cache.

Signature

```
public static Object get(String key)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

Return Value

Type: Object

The cached value as a generic object type. Cast the returned value to the appropriate type.

Usage

Because `Cache.Org.get()` returns an object, cast the returned value to a specific type to facilitate use of the returned value.

```
// Get a cached value
Object obj = Cache.Org.get('ns1.partition1.orderDate');
// Cast return value to a specific data type
DateTime dt2 = (DateTime)obj;
```

If a `Cache.Org.get()` call doesn't find the referenced key, it returns `null`.

`get(cacheBuilder, key)`

Returns the cached value corresponding to the specified key from the org cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

Signature

```
public static Object get(System.Type cacheBuilder, String key)
```

Parameters

cacheBuilder
Type: System.Type

The Apex class that implements the `CacheBuilder` interface.

key
Type: String

A case-sensitive string value that, combined with the class name corresponding to the *cacheBuilder* parameter, uniquely identifies a cached value.

Return Value

Type: Object

The cached value as a generic object type. Cast the returned value to the appropriate type.

Usage

Because `Cache.Org.get(`*cacheBuilder*`, `*key*`)` returns an object, cast the returned value to a specific type to facilitate use of the returned value.

```
return ((DateTime)Cache.Org.get(DateCache.class, 'datetime')).format();
```

get(keys)

Returns the cached values corresponding to the specified set of keys from the org cache.

Signature

```
public static Map <String, Object> get (Set <String> keys)
```

Parameters

keys
Type: Set <String>

A set of keys that uniquely identify cached values. For information about the format of the key name, see Usage.

Return Value

Type: Map <String, Object>

Returns the cache key and corresponding value. Returns null when no corresponding value is found for an input key.

Usage

The number of input keys cannot exceed the maximum limit of 10.

Examples

Fetch multiple keys from the org cache of the default partition.

```
Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Map<String,Object> result = Cache.Org.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' +  result.get(key));
}
```

Fetch multiple keys from the org cache of different partitions.

```
// Assuming there are three partitions p1, p2, p3 with default 'local' namespace

Set<String> keys = new Set<String>{'local.p1.key','local.p2.key', 'local.p3.key'};
Map<String,Object> result = Cache.Org.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' +  result.get(key));
}
```

`getAvgGetSize()`

Returns the average item size of all the keys fetched from the org cache, in bytes.

Signature

```
public static Long getAvgGetSize()
```

Return Value

Type: Long

Example

In this example the following keys and their corresponding value sizes are inserted. The code then fetches the keys: key 1, key 2, key 3 and key 4 and returns the average item size of the fetched keys.

Key	Key Value Size
key 1	42
key 2	42
key 3	58
key 4	36
key 5	36

```
// Inserting keys key1, key2, key3, key4, key5
Cache.Org.put('key1', 'value1');
Cache.Org.put('key2', 'value2');
```

```
Cache.Org.put('key3', 'this is a big value !!!!');
Cache.Org.put('key4', 4);
Cache.Org.put('key5', 5);

// Fetching keys - key1, key2, key3, key4
Object v1 = Cache.Org.get('key1');
Object v2 = Cache.Org.get('key2');
Object v3 = Cache.Org.get('key3');
Object v4 = Cache.Org.get('key4');

// Fetching average get size
Long val = Cache.Org.getAvgGetSize();
// Avg item size returned is 44 ( average of 42(key1), 42(key2), 58(key3) and 36(key4)
keys that were fetched )
System.debug('Avg Get Size :' + val);
```

`getAvgGetTime()`

Returns the average time taken to get a key from the org cache, in nanoseconds.

Signature

```
public static Long getAvgGetTime()
```

Return Value

Type: Long

`getAvgValueSize()`

Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the org cache, in bytes.

Signature

```
public static Long getAvgValueSize()
```

Return Value

Type: Long

`getCapacity()`

Returns the percentage of org cache capacity that has been used.

Signature

```
public static Double getCapacity()
```

Return Value

Type: Double

Used cache as a percentage number.

getKeys()

Returns a set of all keys that are stored in the org cache and visible to the invoking namespace.

Signature

```
public static Set<String> getKeys()
```

Return Value

Type: Set<String>

A set containing all cache keys.

getMaxGetSize()

Returns the maximum item size of all the keys fetched from the org cache, in bytes.

Signature

```
public static Long getMaxGetSize()
```

Return Value

Type: Long

Example

In this example the following keys and their corresponding value sizes are inserted. The code fetches the keys: key 1, key 2 and key 4 and returns the maximum key value size from the fetched keys.

Key	Key Value Size
key 1	42
key 2	42
key 3	58
key 4	36
key 5	36

```
// Inserting keys key1, key2, key3, key4, key5
Cache.Org.put('key1', 'value1');
Cache.Org.put('key2', 'value2');
Cache.Org.put('key3', 'this is a big value !!!');
Cache.Org.put('key4', 4);
Cache.Org.put('key5', 5);
```

```
// Fetching keys - key1, key2, key4
Object v1 = Cache.Org.get('key1');
Object v2 = Cache.Org.get('key2');
Object v4 = Cache.Org.get('key4');

// Fetching max get size
Long val = Cache.Org.getMaxGetSize();
// Max item size returned is 42 ( max of 42(key1), 42(key2), and 36(key4) keys that were
fetched )
System.debug('Max Get Size :' + val);
```

getMaxGetTime()

Returns the maximum time taken to get a key from the org cache, in nanoseconds.

Signature

```
public static Long getMaxGetTime()
```

Return Value

Type: Long

getMaxValueSize()

Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the org cache, in bytes.

Signature

```
public static Long getMaxValueSize()
```

Return Value

Type: Long

getMissRate()

Returns the miss rate in the org cache.

Signature

```
public static Double getMissRate()
```

Return Value

Type: Double

getName()

Returns the name of the default cache partition.

Signature

```
public String getName()
```

Return Value

Type: String

The name of the default cache partition.

getNumKeys()

Returns the total number of keys in the org cache.

Signature

```
public static Long getNumKeys()
```

Return Value

Type: Long

getPartition(partitionName)

Returns a partition from the org cache that corresponds to the specified partition name.

Signature

```
public static cache.OrgPartition getPartition(String partitionName)
```

Parameters

partitionName
Type: String

A partition name that is qualified by the namespace, for example, *namespace.partition*.

Return Value

Type: Cache.OrgPartition

Example

After you get the org partition, you can add and retrieve the partition's cache values.

```
// Get partition
Cache.OrgPartition orgPart = Cache.Org.getPartition('myNs.myPartition');
// Retrieve cache value from the partition
if (orgPart.contains('BookTitle')) {
    String cachedTitle = (String)orgPart.get('BookTitle');
}

// Add cache value to the partition
```

```
orgPart.put('OrderDate', Date.today());

// Or use dot notation to call partition methods
String cachedAuthor = (String)Cache.Org.getPartition('myNs.myPartition').get('BookAuthor');
```

put(key, value)

Stores the specified key/value pair as a cached entry in the org cache. The `put` method can write only to the cache in your org's namespace.

Signature

```
public static void put(String key, Object value)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

Return Value

Type: void

put(key, value, visibility)

Stores the specified key/value pair as a cached entry in the org cache and sets the cached value's visibility.

Signature

```
public static void put(String key, Object value, Cache.Visibility visibility)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

visibility
Type: Cache.Visibility

Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

Return Value

Type: void

put(key, value, ttlSecs)

Stores the specified key/value pair as a cached entry in the org cache and sets the cached value's lifetime.

Signature

```
public static void put(String key, Object value, Integer ttlSecs)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer

The amount of time, in seconds, to keep the cached value in the org cache. The maximum is 172,800 seconds (48 hours). The minimum value is 300 seconds or 5 minutes. The default value is 86,400 seconds (24 hours).

Return Value

Type: void

put(key, value, ttlSecs, visibility, immutable)

Stores the specified key/value pair as a cached entry in the org cache. This method also sets the cached value's lifetime, visibility, and whether it can be overwritten by another namespace.

Signature

```
public static void put(String key, Object value, Integer ttlSecs, cache.Visibility
visibility, Boolean immutable)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer

The amount of time, in seconds, to keep the cached value in the org cache. The maximum is 172,800 seconds (48 hours). The minimum value is 300 seconds or 5 minutes. The default value is 86,400 seconds (24 hours).

visibility
Type: Cache.Visibility

Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

immutable
Type: Boolean

Indicates whether the cached value can be overwritten by another namespace (`false`) or not (`true`).

Return Value

Type: void

remove(key)

Deletes the cached value corresponding to the specified key from the org cache.

Signature

```
public static Boolean remove(String key)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

Return Value

Type: Boolean

`true` if the cache value was successfully removed. Otherwise, `false`.

remove(cacheBuilder, key)

Deletes the cached value corresponding to the specified key from the org cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

Signature

```
public static Boolean remove(System.Type cacheBuilder, String key)
```

Parameters

cacheBuilder
Type: System.Type

The Apex class that implements the `CacheBuilder` interface.

key
Type: String

A case-sensitive string value that, combined with the class name corresponding to the *cacheBuilder* parameter, uniquely identifies a cached value.

Return Value

Type: Boolean

`true` if the cache value was successfully removed. Otherwise, `false`.

OrgPartition Class

Contains methods to manage cache values in the org cache of a specific partition. Unlike the session cache, the org cache is not tied to any session. It's available to the organization across requests and to all users.

Namespace

Cache

Usage

This class extends Cache.Partition and inherits all its non-static methods. Utility methods for creating and validating keys aren't supported and can be called only from the `Cache.Partition` parent class. For a list of `Cache.Partition` methods, see Partition Methods.

To get an org partition, call `Cache.Org.getPartition` and pass in a fully qualified partition name, as follows.

```
Cache.OrgPartition orgPartition = Cache.Org.getPartition('namespace.myPartition');
```

See Cache Key Format for Partition Methods.

Example

This class is the controller for a sample Visualforce page (shown in the subsequent code sample). The controller shows how to use the methods of `Cache.OrgPartition` to manage a cache value on a particular partition. The controller takes inputs from the Visualforce page for the partition name, key name for a counter, and initial counter value. The controller contains default values for these inputs. When you click **Rerender** on the Visualforce page, the `go()` method is invoked and increases the counter by one. When you click **Remove Key**, the counter key is removed from the cache. The counter value gets reset to its initial value when it's re-added to the cache.

Note: If another user logs in and runs this sample, the user gets the cache values that were last added or updated by the previous user. For example, if the counter value was five, the next user sees the counter value as increased to six.

```
public class OrgPartitionController {

    // Name of a partition
    String partitionInput = 'local.myPartition';
```

```
// Name of the key
String counterKeyInput = 'counter';
// Key initial value
Integer counterInitValue = 0;
// Org partition object
Cache.OrgPartition orgPartition;

// Constructor of the controller for the Visualforce page.
public OrgPartitionController() {
}

// Adds counter value to the cache.
// This method is called when the Visualforce page loads.
public void init() {
    // Create the partition instance based on the partition name
    orgPartition = getPartition();

    // Create the partition instance based on the partition name
    // given in the Visualforce page or the default value.
    orgPartition = Cache.Org.getPartition(partitionInput);

    // Add counter to the cache with an initial value
    //  or increment it if it's already there.
    if (!orgPartition.contains(counterKeyInput)) {
        orgPartition.put(counterKeyInput, counterInitValue);
    } else {
        orgPartition.put(counterKeyInput, getCounter() + 1);
    }
}

// Returns the org partition based on the partition name
// given in the Visualforce page or the default value.
private Cache.OrgPartition getPartition() {
   if (orgPartition == null) {
        orgPartition = Cache.Org.getPartition(partitionInput);
   }

   return orgPartition;
 }

// Return counter from the cache.
public Integer getCounter() {
    return (Integer)getPartition().get(counterKeyInput);
}

// Invoked by the Submit button to save input values
//  supplied by the user.
public PageReference save() {
    // Reset the initial key value in the cache
    getPartition().put(counterKeyInput, counterInitValue);

    return null;
}
```

```
    // Method invoked by the Rerender button on the Visualforce page.
    // Updates the values of various cached values.
    // Increases the values of counter and the MyData counter if those
    //   cache values are still in the cache.
    public PageReference go() {
        // Get the org partition object
        orgPartition = getPartition();
        // Increase the cached counter value or set it to 0
        //  if it's not cached.
        if (orgPartition.contains(counterKeyInput)) {
            orgPartition.put(counterKeyInput, getCounter() + 1);
        } else {
            orgPartition.put(counterKeyInput, counterInitValue);
        }

        return null;
    }

    // Method invoked by the Remove button on the Visualforce page.
    // Removes the datetime cached value from the org cache.
    public PageReference remove() {
        getPartition().remove(counterKeyInput);

        return null;
    }

    // Get and set methods for accessing variables
    // that correspond to the input text fields on
    // the Visualforce page.
    public String getPartitionInput() {
        return partitionInput;
    }

    public String getCounterKeyInput() {
        return counterKeyInput;
    }

    public Integer getCounterInitValue() {
        return counterInitValue;
    }

    public void setPartitionInput(String partition) {
        this.partitionInput = partition;
    }

    public void setCounterKeyInput(String keyName) {
        this.counterKeyInput = keyName;
    }

    public void setCounterInitValue(Integer counterValue) {
        this.counterInitValue = counterValue;
    }
}
```

This is the Visualforce page that corresponds to the `OrgPartitionController` class.

```
<apex:page controller="OrgPartitionController" action="{!init}">

    <apex:form >
        <br/>Partition with Namespace Prefix: <apex:inputText value="{!partitionInput}"/>

        <br/>Counter Key Name: <apex:inputText value="{!counterKeyInput}"/>
        <br/>Counter Initial Value: <apex:inputText value="{!counterInitValue}"/>
        <apex:commandButton action="{!save}" value="Save Key Input Values"/>
    </apex:form>

    <apex:outputPanel id="output">
        <br/>Cached Counter: <apex:outputText value="{!counter}"/>
    </apex:outputPanel>

    <br/>
    <apex:form >
        <apex:commandButton id="go" action="{!go}" value="Rerender" rerender="output"/>
        <apex:commandButton id="remove" action="{!remove}" value="Remove Key"
rerender="output"/>
    </apex:form>

</apex:page>
```

Apex Developer Guide: Platform Cache

Partition Class

Base class of `Cache.OrgPartition` and `Cache.SessionPartition`. Use the subclasses to manage the cache partition for org caches and session caches.

Namespace

Cache

Cache Key Format for Partition Methods

After you obtain the partition object (an instance of `Cache.OrgPartition` or `Cache.SessionPartition`), the methods to add, retrieve, and manage the cache values in a partition take the key name. The key name that you supply to these methods (`get()`, `put()`, `remove()`, and `contains()`) doesn't include the `namespace.partition` prefix.

IN THIS SECTION:

Partition Methods

SEE ALSO:

OrgPartition Class
SessionPartition Class
Apex Developer Guide: Platform Cache

Partition Methods

The following are methods for `Partition`.

IN THIS SECTION:

contains(key)
Returns `true` if the cache partition contains a cached value corresponding to the specified key.

contains(setOfKeys)
Returns `true` if the cache partition contains values for a specified set of keys.

createFullyQualifiedKey(namespace, partition, key)
Generates a fully qualified key from the passed-in key components. The format of the generated key string is `namespace.partition.key`.

createFullyQualifiedPartition(namespace, partition)
Generates a fully qualified partition name from the passed-in namespace and partition. The format of the generated partition string is `namespace.partition`.

get(key)
Returns the cached value corresponding to the specified key from the cache partition.

get(keys)
Returns the cached values corresponding to the specified set of keys from the cache partition.

get(cacheBuilder, key)
Returns the cached value corresponding to the specified key from the partition cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

getAvgGetSize()
Returns the average item size of all the keys fetched from the partition, in bytes.

getAvgGetTime()
Returns the average time taken to get a key from the partition, in nanoseconds.

getAvgValueSize()
Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the partition, in bytes.

getCapacity()
Returns the percentage of cache used of the total capacity for this partition.

getKeys()
Returns a set of all keys that are stored in the cache partition and visible to the invoking namespace.

getMaxGetSize()

Returns the maximum item size of all the keys fetched from the partition, in bytes.

getMaxGetTime()

Returns the maximum time taken to get a key from the partition, in nanoseconds.

getMaxValueSize()

Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the partition, in bytes.

getMissRate()

Returns the miss rate in the partition.

getName()

Returns the name of this cache partition.

getNumKeys()

Returns the total number of keys in the partition.

isAvailable()

Returns `true` if the Salesforce session is available. Only applies to `Cache.SessionPartition`. The session cache isn't available when an active session isn't present, such as in asynchronous Apex or code called by asynchronous Apex. For example, if batch Apex causes an Apex trigger to execute, the session cache isn't available in the trigger because the trigger runs in asynchronous context.

put(key, value)

Stores the specified key/value pair as a cached entry in the cache partition. The `put` method can write only to the cache in your org's namespace.

put(key, value, visibility)

Stores the specified key/value pair as a cached entry in the cache partition and sets the cached value's visibility.

put(key, value, ttlSecs)

Stores the specified key/value pair as a cached entry in the cache partition and sets the cached value's lifetime.

put(key, value, ttlSecs, visibility, immutable)

Stores the specified key/value pair as a cached entry in the cache partition. This method also sets the cached value's lifetime, visibility, and whether it can be overwritten by another namespace.

remove(key)

Deletes the cached value corresponding to the specified key from this cache partition.

remove(cacheBuilder, key)

Deletes the cached value corresponding to the specified key from the partition cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

validateCacheBuilder(cacheBuilder)

Validates that the specified class implements the `CacheBuilder` interface.

validateKey(isDefault, key)

Validates a cache key. This method throws a `Cache.InvalidParamException` if the key is not valid. A valid key is not `null` and contains alphanumeric characters.

validateKeyValue(isDefault, key, value)

Validates a cache key and ensures that the cache value is non-null. This method throws a `Cache.InvalidParamException` if the key or value is not valid. A valid key is not `null` and contains alphanumeric characters.

validateKeys(isDefault, keys)

Validates the specified cache keys. This method throws a `Cache.InvalidParamException` if the key is not valid. A valid key is not `null` and contains alphanumeric characters.

validatePartitionName(name)

Validates the partition name — for example, that it is not null.

`contains(key)`

Returns `true` if the cache partition contains a cached value corresponding to the specified key.

Signature

```
public Boolean contains(String key)
```

Parameters

key

Type: String

A case-sensitive string value that uniquely identifies a cached value.

Return Value

Type: Boolean

`true` if a cache entry is found. Othewise, `false`.

contains(setOfKeys)

Returns `true` if the cache partition contains values for a specified set of keys.

Signature

```
public Map <String, Boolean> contains (Set<String> keys)
```

Parameters

setOfKeys

Type: Set <String>

A set of keys that uniquely identifies cached values. For information about the format of the key name, see Usage.

Return Value

Type: Map <String, Boolean>

Returns the cache key and corresponding Boolean value indicating that the key entry exists. The Boolean value is `false` if the key entry doesn't exist.

Usage

The number of input keys cannot exceed the maximum limit of 10.

Example

In this example, the code checks for the presence of multiple keys on a partition. It fetches the cache key and the corresponding Boolean value for the key entry from the org cache of the partition.

```
// Assuming there is a partition p1 in the default 'local' namespace

Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Cache.OrgPartition orgPart = Cache.Org.getPartition('local.p1');
Map<String,Boolean> result = orgPart.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('Is Key Present in the cache:' +  result.get(key));
}
```

In this example, the code checks for the presence of multiple keys on a partition. It fetches the cache key and the corresponding Boolean value for the key entry from the session cache of the partition.

```
// Assuming there are three partitions p1, p2, p3 with default 'local' namespace

Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Cache.SessionPartition sessionPart = Cache.Session.getPartition('local.p1');
Map<String,Boolean> result = sessionPart.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' +  result.get(key));
}
```

`createFullyQualifiedKey(namespace, partition, key)`

Generates a fully qualified key from the passed-in key components. The format of the generated key string is `namespace.partition.key`.

Signature

```
public static String createFullyQualifiedKey(String namespace, String partition, String key)
```

Parameters

`namespace`
Type: String

The namespace of the cache key.

`partition`
Type: String

The partition of the cache key.

`key`
Type: String

The name of the cache key.

Return Value

Type: String

createFullyQualifiedPartition(namespace, partition)

Generates a fully qualified partition name from the passed-in namespace and partition. The format of the generated partition string is `namespace.partition`.

Signature

```
public static String createFullyQualifiedPartition(String namespace, String partition)
```

Parameters

namespace
Type: String

The namespace of the cache key.

partition
Type: String

The partition of the cache key.

Return Value

Type: String

get(key)

Returns the cached value corresponding to the specified key from the cache partition.

Signature

```
public Object get(String key)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value.

Return Value

Type: Object

The cached value as a generic object type. Cast the returned value to the appropriate type.

get(keys)

Returns the cached values corresponding to the specified set of keys from the cache partition.

Signature

```
public Map <String, Object> get (Set <String> keys)
```

Parameters

keys
Type: Set <String>

A set of keys that uniquely identify cached values. For information about the format of the key name, see Usage.

Return Value

Type: Map <String, Object>

Returns the cache key and corresponding value. Returns null when no corresponding value is found for an input key.

Usage

The number of input keys cannot exceed the maximum limit of 10.

Examples

Fetch multiple keys from the org cache of a partition.

```
// Assuming there is a partition p1 in the default 'local' namespace

Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Cache.OrgPartition orgPart = Cache.Org.getPartition('local.p1');
Map<String,Object> result = orgPart.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' +  result.get(key));
}
```

Fetch multiple keys from the session cache of a partition.

```
// Assuming there is a partition p1 in the default 'local' namespace

Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Cache.SessionPartition sessionPart = Cache.Session.getPartition('local.p1');
Map<String,Object> result = sessionPart.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' +  result.get(key));
}
```

`get(cacheBuilder, key)`

Returns the cached value corresponding to the specified key from the partition cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

Signature

```
public Object get(System.Type cacheBuilder, String key)
```

Parameters

cacheBuilder
Type: System.Type

The Apex class that implements the `CacheBuilder` interface.

key
Type: String

A case-sensitive string value that, combined with the class name corresponding to the *cacheBuilder* parameter, uniquely identifies a cached value.

Return Value

Type: Object

The cached value as a generic object type. Cast the returned value to the appropriate type.

getAvgGetSize()

Returns the average item size of all the keys fetched from the partition, in bytes.

Signature

```
public Long getAvgGetSize()
```

Return Value

Type: Long

getAvgGetTime()

Returns the average time taken to get a key from the partition, in nanoseconds.

Signature

```
public Long getAvgGetTime()
```

Return Value

Type: Long

getAvgValueSize()

Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the partition, in bytes.

Signature

```
public Long getAvgValueSize()
```

Return Value

Type: Long

getCapacity()

Returns the percentage of cache used of the total capacity for this partition.

Signature

```
public Double getCapacity()
```

Return Value

Type: Double

Used partition cache as a percentage number.

getKeys()

Returns a set of all keys that are stored in the cache partition and visible to the invoking namespace.

Signature

```
public Set<String> getKeys()
```

Return Value

Type: Set<String>

A set containing all cache keys.

getMaxGetSize()

Returns the maximum item size of all the keys fetched from the partition, in bytes.

Signature

```
public Long getMaxGetSize()
```

Return Value

Type: Long

getMaxGetTime()

Returns the maximum time taken to get a key from the partition, in nanoseconds.

Signature

```
public Long getMaxGetTime()
```

Return Value

Type: Long

`getMaxValueSize()`

Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the partition, in bytes.

Signature

```
public Long getMaxValueSize()
```

Return Value

Type: Long

`getMissRate()`

Returns the miss rate in the partition.

Signature

```
public Double getMissRate()
```

Return Value

Type: Double

`getName()`

Returns the name of this cache partition.

Signature

```
public String getName()
```

Return Value

Type: String

The name of this cache partition.

`getNumKeys()`

Returns the total number of keys in the partition.

Signature

```
public Long getNumKeys()
```

Return Value

Type: Long

isAvailable()

Returns `true` if the Salesforce session is available. Only applies to `Cache.SessionPartition`. The session cache isn't available when an active session isn't present, such as in asynchronous Apex or code called by asynchronous Apex. For example, if batch Apex causes an Apex trigger to execute, the session cache isn't available in the trigger because the trigger runs in asynchronous context.

Signature

```
public Boolean isAvailable()
```

Return Value

Type: Boolean

put(key, value)

Stores the specified key/value pair as a cached entry in the cache partition. The `put` method can write only to the cache in your org's namespace.

Signature

```
public void put(String key, Object value)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

Return Value

Type: void

put(key, value, visibility)

Stores the specified key/value pair as a cached entry in the cache partition and sets the cached value's visibility.

Signature

```
public void put(String key, Object value, cache.Visibility visibility)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

visibility
Type: Cache.Visibility

Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

Return Value

Type: void

put(key, value, ttlSecs)

Stores the specified key/value pair as a cached entry in the cache partition and sets the cached value's lifetime.

Signature

```
public void put(String key, Object value, Integer ttlSecs)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer

The amount of time, in seconds, to keep the cached value in the cache.

Return Value

Type: void

put(key, value, ttlSecs, visibility, immutable)

Stores the specified key/value pair as a cached entry in the cache partition. This method also sets the cached value's lifetime, visibility, and whether it can be overwritten by another namespace.

Signature

```
public void put(String key, Object value, Integer ttlSecs, cache.Visibility visibility,
Boolean immutable)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer

The amount of time, in seconds, to keep the cached value in the cache.

visibility
Type: Cache.Visibility

Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

immutable
Type: Boolean

Indicates whether the cached value can be overwritten by another namespace (`false`) or not (`true`).

Return Value

Type: void

remove(key)

Deletes the cached value corresponding to the specified key from this cache partition.

Signature

```
public Boolean remove(String key)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value.

Return Value

Type: Boolean

`true` if the cache value was successfully removed. Otherwise, `false`.

remove(cacheBuilder, key)

Deletes the cached value corresponding to the specified key from the partition cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

Signature

```
public Boolean remove(System.Type cacheBuilder, String key)
```

Parameters

cacheBuilder
Type: System.Type

The Apex class that implements the `CacheBuilder` interface.

key
Type: String

A case-sensitive string value that, combined with the class name corresponding to the *`cacheBuilder`* parameter, uniquely identifies a cached value.

Return Value

Type: Boolean

`true` if the cache value was successfully removed. Otherwise, `false`.

validateCacheBuilder(cacheBuilder)

Validates that the specified class implements the `CacheBuilder` interface.

Signature

```
public static void validateCacheBuilder(System.Type cacheBuilder)
```

Parameters

cacheBuilder
Type: System.Type

The class to validate.

Return Value

Type: void

validateKey(isDefault, key)

Validates a cache key. This method throws a `Cache.InvalidParamException` if the key is not valid. A valid key is not `null` and contains alphanumeric characters.

Signature

```
public static void validateKey(Boolean isDefault, String key)
```

Parameters

isDefault
Type: Boolean

Set to `true` if the key references a default partition. Otherwise, set to `false`.

key
Type: String

The key to validate.

Return Value

Type: void

validateKeyValue(isDefault, key, value)

Validates a cache key and ensures that the cache value is non-null. This method throws a `Cache.InvalidParamException` if the key or value is not valid. A valid key is not `null` and contains alphanumeric characters.

Signature

```
public static void validateKeyValue(Boolean isDefault, String key, Object value)
```

Parameters

isDefault
Type: Boolean

Set to `true` if the key references a default partition. Otherwise, set to `false`.

key
Type: String

The key to validate.

value
Type: Object

The cache value to validate.

Return Value

Type: void

validateKeys(isDefault, keys)

Validates the specified cache keys. This method throws a `Cache.InvalidParamException` if the key is not valid. A valid key is not `null` and contains alphanumeric characters.

Signature

```
public static void validateKeys(Boolean isDefault, Set<String> keys)
```

Parameters

isDefault
Type: Boolean

Set to `true` if the key references a default partition. Otherwise, set to `false`.

keys
Type: Set<String>

A set of key string values to validate.

Return Value

Type: void

validatePartitionName(name)

Validates the partition name — for example, that it is not null.

Signature

```
public static void validatePartitionName(String name)
```

Parameters

name
Type: String

The name of the partition to validate.

Return Value

Type: void

Session Class

Use the `Cache.Session` class to add, retrieve, and manage values in the session cache. The session cache is active as long as the user's Salesforce session is valid (the user is logged in, and the session is not expired).

Namespace

Cache

Usage

Cache Key Format

This table lists the format of the key parameter that some methods in this class take, such as `put`, `get`, and `contains`.

Key Format	Description
namespace.partition.key	Fully qualified key name.

Key Format	Description
key	Refers to a partition marked as default when the *namespace.partition* prefix is omitted.
local.*partition.key*	Use the local prefix to refer to the org's namespace when the org doesn't have a namespace defined. If the org has a namespace defined, the local prefix also refers to that org's namespace.

Note:

- If no default partition is specified in the org, calling a cache method without fully qualifying the key name causes a Cache.Session.SessionCacheException to be thrown.
- The local prefix in an installed managed package refers to the namespace of the subscriber org and not the package's namespace. The cache put calls are not allowed in a partition that the invoking class doesn't own.

Example

This class is the controller for a sample Visualforce page (shown in the subsequent code sample). The cached values are initially added to the cache by the init() method, which the Visualforce page invokes when it loads through the action attribute. The cache keys don't contain the namespace.partition prefix. They all refer to a default partition in your org. The Visualforce page expects a partition named myPartition. To run this sample, create a default partition in your org with the name myPartition.

The Visualforce page contains four output components. The first three components call get methods on the controller that return the following values from the cache: a date, data based on the MyData inner class, and a counter. The next output component uses the $Cache.Session global variable to get the cached string value for the key named output. Next, the $Cache.Session global variable is used again in the Visualforce page to iterate over the elements of a cached value of type List. The size of the list is also returned.

The Visualforce page also contains two buttons. The Rerender button invokes the go() method on the controller. This method increases the values of the counter and the custom data in the cache. If you click **Rerender**, the two counters increase by one each time. The go() method retrieves the values of these counters from the cache, increments their values by one, and stores them again in the cache.

The Remove button deletes the date-time value (with key datetime) from the cache. As a result, the value next to Cached datetime: is cleared on the page.

```
public class SessionCacheController {

    // Inner class.
    // Used as the data type of a cache value.
    class MyData {
        public String value { get; set; }
        public Integer counter { get; set; }

        public MyData(String value) {
            this.value = value;
            this.counter = 0;
        }

        public void inc() {
            counter++;
```

```
        }

        override public String toString() {
            return this.value + ':' + this.counter;
        }
    }

    // Apex List.
    // Used as the data type of a cached value.
    private List<String> numbers =
            new List<String> { 'ONE', 'TWO', 'THREE', 'FOUR', 'FIVE' };

    // Constructor of the controller for the Visualforce page.
    public SessionCacheController() {
    }

    // Adds various values to the cache.
    // This method is called when the Visualforce page loads.
    public void init() {
        // All key values are not qualified by the namespace.partition
        // prefix because they use the default partition.

        // Add counter to the cache with initial value of 0
        //  or increment it if it's already there.
        if (!Cache.Session.contains('counter')) {
            Cache.Session.put('counter', 0);
        } else {
            Cache.Session.put('counter', getCounter() + 1);
        }

        // Add the datetime value to the cache only if it's not already there.
        if (!Cache.Session.contains('datetime')) {
            DateTime dt = DateTime.now();
            Cache.Session.put('datetime', dt);
        }

        // Add the custom data to the cache only if it's not already there.
        if (!Cache.Session.contains('data')) {
            Cache.Session.put('data', new MyData('Some custom value'));
        }

        // Add a list of number to the cache if not already there.
        if (!Cache.Session.contains('list')) {
            Cache.Session.put('list', numbers);
        }

        // Add a string value to the cache if not already there.
        if (!Cache.Session.contains('output')) {
            Cache.Session.put('output', 'Cached text value');
        }
    }

    // Return counter from the cache.
    public Integer getCounter() {
```

```
        return (Integer)Cache.Session.get('counter');
    }

    // Return datetime value from the cache.
    public String getCachedDatetime() {
        DateTime dt = (DateTime)Cache.Session.get('datetime');
        return dt != null ? dt.format() : null;
    }

    // Return cached value whose type is the inner class MyData.
    public String getCachedData() {
        MyData mydata = (MyData)Cache.Session.get('data');
        return mydata != null ? mydata.toString() : null;
    }

    // Method invoked by the Rerender button on the Visualforce page.
    // Updates the values of various cached values.
    // Increases the values of counter and the MyData counter if those
    //   cache values are still in the cache.
    public PageReference go() {
        // Increase the cached counter value or set it to 0
        //  if it's not cached.
        if (Cache.Session.contains('counter')) {
            Cache.Session.put('counter', getCounter() + 1);
        } else {
            Cache.Session.put('counter', 0);
        }

        // Get the custom data value from the cache.
        MyData d = (MyData)Cache.Session.get('data');
        // Only if the data is already in the cache, update it.
        if (Cache.Session.contains('data')) {
            d.inc();
            Cache.Session.put('data', d);
        }

        return null;
    }

    // Method invoked by the Remove button on the Visualforce page.
    // Removes the datetime cached value from the session cache.
    public PageReference remove() {
        Cache.Session.remove('datetime');

        return null;
    }
}
```

This is the Visualforce page that corresponds to the `SessionCacheController` class.

```
<apex:page controller="SessionCacheController" action="{!init}">

    <apex:outputPanel id="output">
        <br/>Cached datetime: <apex:outputText value="{!cachedDatetime}"/>
        <br/>Cached data: <apex:outputText value="{!cachedData}"/>
```

```
        <br/>Cached counter: <apex:outputText value="{!counter}"/>
       <br/>Output: <apex:outputText value="{!$Cache.Session.local.myPartition.output}"/>

        <br/>Repeat: <apex:repeat var="item"
value="{!$Cache.Session.local.myPartition.list}">
            <apex:outputText value="{!item}"/> 
        </apex:repeat>
        <br/>List size: <apex:outputText
value="{!$Cache.Session.local.myPartition.list.size}"/>
    </apex:outputPanel>

    <br/><br/>
    <apex:form >
        <apex:commandButton id="go" action="{!go}" value="Rerender" rerender="output"/>
        <apex:commandButton id="remove" action="{!remove}" value="Remove datetime Key"
rerender="output"/>
    </apex:form>

</apex:page>
```

This is the output of the page after clicking the Rerender button twice. The counter value could differ in your case if a key named `counter` was already in the cache before running this sample.

```
Cached datetime:8/11/2015 1:58 PM
Cached data:Some custom value:2
Cached counter:2
Output:Cached text value
Repeat:ONE TWO THREE FOUR FIVE
List size:5
```

IN THIS SECTION:

Session Constants

The Session class provides a constant that you can use when setting the time-to-live (TTL) value.

Session Methods

SEE ALSO:

Apex Developer Guide: Platform Cache

Session Constants

The Session class provides a constant that you can use when setting the time-to-live (TTL) value.

Constant	Description
`MAX_TTL_SECS`	Represents the maximum amount of time, in seconds, to keep the cached value in the session cache.

Session Methods

The following are methods for `Session`. All methods are static.

IN THIS SECTION:

contains(key)

Returns `true` if the session cache contains a cached value corresponding to the specified key.

contains(setOfKeys)

Returns `true` if the cache contains values for a specified set of keys.

get(key)

Returns the cached value corresponding to the specified key from the session cache.

get(keys)

Returns the cached values corresponding to the specified set of keys from the session cache.

get(cacheBuilder, key)

Returns the cached value corresponding to the specified key from the session cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

getAvgGetSize()

Returns the average item size of all the keys fetched from the session cache, in bytes.

getAvgGetTime()

Returns the average time taken to get a key from the session cache, in nanoseconds.

getAvgValueSize()

Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the session cache, in bytes.

getCapacity()

Returns the percentage of session cache capacity that has been used.

getKeys()

Returns all keys that are stored in the session cache and visible to the invoking namespace.

getMaxGetSize()

Returns the maximum item size of all the keys fetched from the session cache, in bytes.

getMaxGetTime()

Returns the maximum time taken to get a key from the session cache, in nanoseconds.

getMaxValueSize()

Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the session cache, in bytes.

getMissRate()

Returns the miss rate in the session cache.

getName()

Returns the name of the default cache partition.

getNumKeys()

Returns the total number of keys in the session cache.

getPartition(partitionName)

Returns a partition from the session cache that corresponds to the specified partition name.

isAvailable()

Returns `true` if the session cache is available for use. The session cache isn't available when an active session isn't present, such as in asynchronous Apex or code called by asynchronous Apex. For example, if batch Apex causes an Apex trigger to execute, the session cache isn't available in the trigger because the trigger runs in asynchronous context.

put(key, value)

Stores the specified key/value pair as a cached entry in the session cache. The `put` method can write only to the cache in your org's namespace.

put(key, value, visibility)

Stores the specified key/value pair as a cached entry in the session cache and sets the cached value's visibility.

put(key, value, ttlSecs)

Stores the specified key/value pair as a cached entry in the session cache and sets the cached value's lifetime.

put(key, value, ttlSecs, visibility, immutable)

Stores the specified key/value pair as a cached entry in the session cache. This method also sets the cached value's lifetime, visibility, and whether it can be overwritten by another namespace.

remove(key)

Deletes the cached value corresponding to the specified key from the session cache.

remove(cacheBuilder, key)

Deletes the cached value corresponding to the specified key from the session cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

`contains(key)`

Returns `true` if the session cache contains a cached value corresponding to the specified key.

Signature

```
public static Boolean contains(String key)
```

Parameters

key

Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

Return Value

Type: Boolean

`true` if a cache entry is found. Othewise, `false`.

contains(setOfKeys)

Returns `true` if the cache contains values for a specified set of keys.

Signature

```
public static Map <String, Boolean> contains (Set<String> keys)
```

Parameters

setOfKeys
Type: Set <String>

A set of keys that uniquely identifies cached values. For information about the format of the key name, see Usage.

Return Value

Type: Map <String, Boolean>

Returns the cache key and corresponding Boolean value indicating that the key entry exists. The Boolean value is `false` if the key entry doesn't exist.

Usage

The number of input keys cannot exceed the maximum limit of 10.

Example

In this example, the code checks for the presence of multiple keys on the default partition. It fetches the cache key and the corresponding Boolean value for the key entry from the session cache of the default partition.

```
Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Map<String,Boolean> result = Cache.Session.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('Is Key Present in the cache : ' +  result.get(key));
}
```

In this example, the code checks for the presence of multiple keys on different partitions. It fetches the cache key and the corresponding Boolean value for the key entry from the session cache of different partitions.

```
// Assuming there are three partitions p1, p2, p3 with default 'local' namespace

Set<String> keys = new Set<String>{'local.p1.key','local.p2.key', 'local.p3.key'};
Map<String,Boolean> result = Cache.Session.contains(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('Is Key Present in the cache : +  result.get(key));
}
```

`get(key)`

Returns the cached value corresponding to the specified key from the session cache.

Signature

```
public static Object get(String key)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

Return Value

Type: Object

The cached value as a generic object type. Cast the returned value to the appropriate type.

Usage

Because `Cache.Session.get()` returns an object, we recommend that you cast the returned value to a specific type to facilitate use of the returned value.

```
// Get a cached value
Object obj = Cache.Session.get('ns1.partition1.orderDate');
// Cast return value to a specific data type
DateTime dt2 = (DateTime)obj;
```

If a `Cache.Session.get()` call doesn't find the referenced key, it returns `null`.

get(keys)

Returns the cached values corresponding to the specified set of keys from the session cache.

Signature

```
public static Map <String, Object> get (Set <String> keys)
```

Parameters

keys

Type: Set <String>

A set of keys that uniquely identify cached values. For information about the format of the key name, see Usage.

Return Value

Type: Map <String, Object>

Returns the cache key and corresponding value. Returns null when no corresponding value is found for an input key.

Usage

The number of input keys cannot exceed the maximum limit of 10.

Example

Fetch multiple keys from the session cache of the default partition.

```
Set<String> keys = new Set<String>{'key1','key2','key3','key4','key5'};
Map<String,Object> result = Cache.Session.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
```

```
    system.debug('value: ' +  result.get(key));
}
```

Fetch multiple keys from the session cache of different partitions.

```
// Assuming there are three partitions p1, p2, p3 with default 'local' namespace

Set<String> keys = new Set<String>{'local.p1.key','local.p2.key', 'local.p3.key'};
Map<String,Object> result = Cache.Session.get(keys);
for(String key : result.keySet()) {
    system.debug('key: ' + key);
    system.debug('value: ' +  result.get(key));
}
```

get(cacheBuilder, key)

Returns the cached value corresponding to the specified key from the session cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

Signature

```
public static Object get(System.Type cacheBuilder, String key)
```

Parameters

cacheBuilder
Type: System.Type

The Apex class that implements the `CacheBuilder` interface.

key
Type: String

A case-sensitive string value that, combined with the class name corresponding to the *cacheBuilder* parameter, uniquely identifies a cached value.

Return Value

Type: Object

The cached value as a generic object type. Cast the returned value to the appropriate type.

Usage

Because `Cache.Session.get(`*cacheBuilder*`, `*key*`)` returns an object, cast the returned value to a specific type to facilitate use of the returned value.

```
return ((DateTime)Cache.Session.get(DateCache.class, 'datetime')).format();
```

getAvgGetSize()

Returns the average item size of all the keys fetched from the session cache, in bytes.

Signature

```
public static Long getAvgGetSize()
```

Return Value

Type: Long

`getAvgGetTime()`

Returns the average time taken to get a key from the session cache, in nanoseconds.

Signature

```
public static Long getAvgGetTime()
```

Return Value

Type: Long

`getAvgValueSize()`

Deprecated and available only in API versions 49.0 and earlier. Returns the average item size for keys in the session cache, in bytes.

Signature

```
public static Long getAvgValueSize()
```

Return Value

Type: Long

`getCapacity()`

Returns the percentage of session cache capacity that has been used.

Signature

```
public static Double getCapacity()
```

Return Value

Type: Double

Used cache as a percentage number.

`getKeys()`

Returns all keys that are stored in the session cache and visible to the invoking namespace.

Signature

```
public static Set<String> getKeys()
```

Return Value

Type: Set<String>

A set containing all cache keys.

`getMaxGetSize()`

Returns the maximum item size of all the keys fetched from the session cache, in bytes.

Signature

```
public static Long getMaxGetSize()
```

Return Value

Type: Long

`getMaxGetTime()`

Returns the maximum time taken to get a key from the session cache, in nanoseconds.

Signature

```
public static Long getMaxGetTime()
```

Return Value

Type: Long

`getMaxValueSize()`

Deprecated and available only in API versions 49.0 and earlier. Returns the maximum item size for keys in the session cache, in bytes.

Signature

```
public static Long getMaxValueSize()
```

Return Value

Type: Long

`getMissRate()`

Returns the miss rate in the session cache.

Signature

```
public static Double getMissRate()
```

Return Value

Type: Double

`getName()`

Returns the name of the default cache partition.

Signature

```
public String getName()
```

Return Value

Type: String

The name of the default cache partition.

`getNumKeys()`

Returns the total number of keys in the session cache.

Signature

```
public static Long getNumKeys()
```

Return Value

Type: Long

`getPartition(partitionName)`

Returns a partition from the session cache that corresponds to the specified partition name.

Signature

```
public static cache.SessionPartition getPartition(String partitionName)
```

Parameters

`partitionName`
Type: String

A partition name that is qualified by the namespace, for example, *`namespace.partition`*.

Return Value

Type: Cache.SessionPartition

Example

After you get the session partition, you can add and retrieve the partition's cache values.

```
// Get partition
Cache.SessionPartition sessionPart = Cache.Session.getPartition('myNs.myPartition');
// Retrieve cache value from the partition
if (sessionPart.contains('BookTitle')) {
    String cachedTitle = (String)sessionPart.get('BookTitle');
}

// Add cache value to the partition
sessionPart.put('OrderDate', Date.today());

// Or use dot notation to call partition methods
String cachedAuthor =
(String)Cache.Session.getPartition('myNs.myPartition').get('BookAuthor');
```

`isAvailable()`

Returns `true` if the session cache is available for use. The session cache isn't available when an active session isn't present, such as in asynchronous Apex or code called by asynchronous Apex. For example, if batch Apex causes an Apex trigger to execute, the session cache isn't available in the trigger because the trigger runs in asynchronous context.

Signature

```
public static Boolean isAvailable()
```

Return Value

Type: Boolean

`true` if the session cache is available. Otherwise, `false`.

`put(key, value)`

Stores the specified key/value pair as a cached entry in the session cache. The `put` method can write only to the cache in your org's namespace.

Signature

```
public static void put(String key, Object value)
```

Parameters

`key`
Type: String

A string that uniquely identifies the value to be cached. For information about the format of the key name, see Usage.

`value`
Type: Object

The value to store in the cache. The cached value must be serializable.

Return Value

Type: void

put(key, value, visibility)

Stores the specified key/value pair as a cached entry in the session cache and sets the cached value's visibility.

Signature

```
public static void put(String key, Object value, Cache.Visibility visibility)
```

Parameters

key
Type: String

A string that uniquely identifies the value to be cached. For information about the format of the key name, see Usage.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

visibility
Type: Cache.Visibility

Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

Return Value

Type: void

put(key, value, ttlSecs)

Stores the specified key/value pair as a cached entry in the session cache and sets the cached value's lifetime.

Signature

```
public static void put(String key, Object value, Integer ttlSecs)
```

Parameters

key
Type: String

A string that uniquely identifies the value to be cached. For information about the format of the key name, see Usage.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer

The amount of time, in seconds, to keep the cached value in the session cache. The cached values remain in the cache as long as the Salesforce session hasn't expired. The maximum value is 28,800 seconds or eight hours. The minimum value is 300 seconds or five minutes.

Return Value

Type: void

put(key, value, ttlSecs, visibility, immutable)

Stores the specified key/value pair as a cached entry in the session cache. This method also sets the cached value's lifetime, visibility, and whether it can be overwritten by another namespace.

Signature

```
public static void put(String key, Object value, Integer ttlSecs, cache.Visibility visibility, Boolean immutable)
```

Parameters

key
Type: String

A string that uniquely identifies the value to be cached. For information about the format of the key name, see Usage.

value
Type: Object

The value to store in the cache. The cached value must be serializable.

ttlSecs
Type: Integer

The amount of time, in seconds, to keep the cached value in the session cache. The cached values remain in the cache as long as the Salesforce session hasn't expired. The maximum value is 28,800 seconds or eight hours. The minimum value is 300 seconds or five minutes.

visibility
Type: Cache.Visibility

Indicates whether the cached value is available only to Apex code that is executing in the same namespace or to Apex code executing from any namespace.

immutable
Type: Boolean

Indicates whether the cached value can be overwritten by another namespace (`false`) or not (`true`).

Return Value

Type: void

remove(key)

Deletes the cached value corresponding to the specified key from the session cache.

Signature

```
public static Boolean remove(String key)
```

Parameters

key
Type: String

A case-sensitive string value that uniquely identifies a cached value. For information about the format of the key name, see Usage.

Return Value

Type: Boolean

`true` if the cache value was successfully removed. Otherwise, `false`.

`remove(cacheBuilder, key)`

Deletes the cached value corresponding to the specified key from the session cache. Use this method if your cached value is a class that implements the `CacheBuilder` interface.

Signature

```
public static Boolean remove(System.Type cacheBuilder, String key)
```

Parameters

cacheBuilder
Type: System.Type

The Apex class that implements the `CacheBuilder` interface.

key
Type: String

A case-sensitive string value that, combined with the class name corresponding to the *cacheBuilder* parameter, uniquely identifies a cached value.

Return Value

Type: Boolean

`true` if the cache value was successfully removed. Otherwise, `false`.

SessionPartition Class

Contains methods to manage cache values in the session cache of a specific partition.

Namespace

Cache

Usage

This class extends Cache.Partition and inherits all of its non-static methods. Utility methods for creating and validating keys are not supported and can be called only from the `Cache.Partition` parent class. For a list of `Cache.Partition` methods, see Partition Methods.

To get a session partition, call `Cache.Session.getPartition` and pass in a fully qualified partition name, as follows.

```
Cache.SessionPartition sessionPartition =
Cache.Session.getPartition('namespace.myPartition');
```

See Cache Key Format for Partition Methods.

Example

This class is the controller for a sample Visualforce page (shown in the subsequent code sample). The controller shows how to use the methods of `Cache.SessionPartition` to manage a cache value on a particular partition. The controller takes inputs from the Visualforce page for the partition name, key name for a counter, and initial counter value. The controller contains default values for these inputs. When you click **Rerender** on the Visualforce page, the `go()` method is invoked and increases the counter by one. When you click **Remove Key**, the counter key is removed from the cache. The counter value gets reset to its initial value when it's re-added to the cache.

```
public class SessionPartitionController {

   // Name of a partition in the local namespace
   String partitionInput = 'local.myPartition';
   // Name of the key
   String counterKeyInput = 'counter';
   // Key initial value
   Integer counterInitValue = 0;
   // Session partition object
   Cache.SessionPartition sessionPartition;

    // Constructor of the controller for the Visualforce page.
    public SessionPartitionController() {
    }

    // Adds counter value to the cache.
    // This method is called when the Visualforce page loads.
    public void init() {
        // Create the partition instance based on the partition name
        sessionPartition = getPartition();

        // Add counter to the cache with an initial value
        //  or increment it if it's already there.
        if (!sessionPartition.contains(counterKeyInput)) {
            sessionPartition.put(counterKeyInput, counterInitValue);
        } else {
            sessionPartition.put(counterKeyInput, getCounter() + 1);
        }
    }

    // Returns the session partition based on the partition name
    // given in the Visualforce page or the default value.
```

```
private Cache.SessionPartition getPartition() {
   if (sessionPartition == null) {
        sessionPartition = Cache.Session.getPartition(partitionInput);
   }

   return sessionPartition;
 }

// Return counter from the cache.
public Integer getCounter() {
    return (Integer)getPartition().get(counterKeyInput);
}

// Invoked by the Submit button to save input values
//  supplied by the user.
public PageReference save() {
    // Reset the initial key value in the cache
    getPartition().put(counterKeyInput, counterInitValue);

    return null;
}

// Method invoked by the Rerender button on the Visualforce page.
// Updates the values of various cached values.
// Increases the values of counter and the MyData counter if those
//   cache values are still in the cache.
public PageReference go() {
    // Get the partition object
    sessionPartition = getPartition();
    // Increase the cached counter value or set it to 0
    //  if it's not cached.
    if (sessionPartition.contains(counterKeyInput)) {
        sessionPartition.put(counterKeyInput, getCounter() + 1);
    } else {
        sessionPartition.put(counterKeyInput, counterInitValue);
    }

    return null;
}

// Method invoked by the Remove button on the Visualforce page.
// Removes the datetime cached value from the session cache.
public PageReference remove() {
    getPartition().remove(counterKeyInput);

    return null;
}

// Get and set methods for accessing variables
// that correspond to the input text fields on
// the Visualforce page.
public String getPartitionInput() {
    return partitionInput;
}
```

```
    public String getCounterKeyInput() {
        return counterKeyInput;
    }

    public Integer getCounterInitValue() {
        return counterInitValue;
    }

    public void setPartitionInput(String partition) {
        this.partitionInput = partition;
    }

    public void setCounterKeyInput(String keyName) {
        this.counterKeyInput = keyName;
    }

    public void setCounterInitValue(Integer counterValue) {
        this.counterInitValue = counterValue;
    }
}
```

This is the Visualforce page that corresponds to the `SessionPartitionController` class.

```
<apex:page controller="SessionPartitionController" action="{!init}">

    <apex:form >
        <br/>Partition with Namespace Prefix: <apex:inputText value="{!partitionInput}"/>

        <br/>Counter Key Name: <apex:inputText value="{!counterKeyInput}"/>
        <br/>Counter Initial Value: <apex:inputText value="{!counterInitValue}"/>
        <apex:commandButton action="{!save}" value="Save Key Input Values"/>
    </apex:form>

    <apex:outputPanel id="output">
        <br/>Cached Counter: <apex:outputText value="{!counter}"/>
    </apex:outputPanel>

    <br/>
    <apex:form >
        <apex:commandButton id="go" action="{!go}" value="Rerender" rerender="output"/>
        <apex:commandButton id="remove" action="{!remove}" value="Remove Key"
rerender="output"/>
    </apex:form>

</apex:page>
```

Apex Developer Guide: Platform Cache

Cache Exceptions

The `Cache` namespace contains exception classes.

All exception classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions on page 3302 in the *Apex Developer Guide*.

The `Cache` namespace contains these exceptions.

Exception	Thrown when
`Cache.Session.SessionCacheException`	An error occurred while adding or retrieving a value in the session cache.
`Cache.Session.SessionCacheNoSessionException`	An attempt is made to access the cache when the session cache isn't available.
`Cache.Org.OrgCacheException`	An attempt is made to access a partition that doesn't exist or whose name is invalid.
`Cache.InvalidParamException`	An invalid parameter value is passed into a method of `Cache.Session` or `Cache.Org`. This error occurs when: • The key referenced is null or empty or is not alphanumeric. • The key isn't qualified with the namespace and partition in the format `<namespace>.<partition>.<key>`. • The key isn't qualified in the format `<key>` for the default partition, or for a key inserted through the partition object. • The namespace referenced is null or empty. • The partition name is null or empty or is not alphanumeric. • Another referenced value is null.
`Cache.ItemSizeLimitExceededException`	A cache `put` call is made with an item that exceeds the maximum size limit. To fix this error, break the item into multiple, smaller items.
`Cache.BulkApiKeysLimitExceededException`	The number of key parameters passed into a bulk method - `get(keys)` or `contains(setOfKeys)` exceeds the maximum limit of 10.
`Cache.PlatformCacheInvalidOperationException`	A cache `put` or `remove` call is made that is not allowed. For example, when calling `put` or `remove` inside a Visualforce constructor.
`Cache.CacheBuilderExecutionException`	This error occurs when the execution of the CacheBuilder fails; this could be due to an error in parsing, a permissions error while accessing records, or an issue with Apex callouts.
`Cache.InvalidCacheBuilderException`	A `get(CacheBuilder cb, String key)`, `remove(CacheBuilder cb, String key)`, or `validateCacheBuilder(CacheBuilder cb)` method is called but the `cb` parameter is a class that does not implement the `Cache.CacheBuilder` interface.

Visibility Enum

Use the `Cache.Visibility` enumeration in the `Cache.Session` or `Cache.Org` methods to indicate whether a cached value is visible only in the value's namespace or in all namespaces.

Enum Values

The following are the values of the `Cache.Visibility` enum.

Value	Description
`ALL`	The cached value is available to Apex code executing from any namespace. This is the default state.
`NAMESPACE`	The cached value is available to Apex code executing from the same namespace. If a key has the `Visibility.NAMESPACE` attribute, a `get` method initiated from a different namespace returns `null`.

Canvas Namespace

The `Canvas` namespace provides an interface and classes for canvas apps in Salesforce.

The following are the interfaces and classes in the `Canvas` namespace.

IN THIS SECTION:

ApplicationContext Interface
Use this interface to retrieve application context information, such as the application version or URL.

CanvasLifecycleHandler Interface
Implement this interface to control context information and add custom behavior during the application render phase.

ContextTypeEnum Enum
Describes context data that can be excluded from canvas app context data. You specify which context types to exclude in the `excludeContextTypes()` method in your `CanvasLifecycleHandler` implementation.

EnvironmentContext Interface
Use this interface to retrieve environment context information, such as the app display location or the configuration parameters.

RenderContext Interface
A wrapper interface that is used to retrieve application and environment context information.

Test Class
Contains methods for automated testing of your Canvas classes.

Canvas Exceptions
The `Canvas` namespace contains exception classes.

ApplicationContext Interface

Use this interface to retrieve application context information, such as the application version or URL.

Namespace

Canvas

Usage

The `ApplicationContext` interface provides methods to retrieve application information about the canvas app that's being rendered. Most of the methods are read-only. For this interface, you don't need to create an implementation. Use the default implementation that Salesforce provides.

IN THIS SECTION:

ApplicationContext Methods

ApplicationContext Methods

The following are methods for `ApplicationContext`.

IN THIS SECTION:

getCanvasUrl()
Retrieves the fully qualified URL of the canvas app.

getDeveloperName()
Retrieves the internal API name of the canvas app.

getName()
Retrieves the name of the canvas app.

getNamespace()
Retrieves the namespace prefix of the canvas app.

getVersion()
Retrieves the current version of the canvas app.

setCanvasUrlPath(newPath)
Overrides the URL of the canvas app for the current request.

`getCanvasUrl()`

Retrieves the fully qualified URL of the canvas app.

Signature

```
public String getCanvasUrl()
```

Return Value

Type: String

Usage

Use this method to get the URL of the canvas app, for example: `http://instance.salesforce.com:8080/canvas_app_path/canvas_app.jsp`.

getDeveloperName()

Retrieves the internal API name of the canvas app.

Signature

```
public String getDeveloperName()
```

Return Value

Type: String

Usage

Use this method to get the API name of the canvas app. You specify this value in the `API Name` field when you expose the canvas app by creating a connected app.

getName()

Retrieves the name of the canvas app.

Signature

```
public String getName()
```

Return Value

Type: String

Usage

Use this method to get the name of the canvas app.

getNamespace()

Retrieves the namespace prefix of the canvas app.

Signature

```
public String getNamespace()
```

Return Value

Type: String

Usage

Use this method to get the Salesforce namespace prefix that's associated with the canvas app.

getVersion()

Retrieves the current version of the canvas app.

Signature

```
public String getVersion()
```

Return Value

Type: String

Usage

Use this method to get the current version of the canvas app. This value changes after you update and republish a canvas app in an organization. If you are in a Developer Edition organization, using this method always returns the latest version.

setCanvasUrlPath(newPath)

Overrides the URL of the canvas app for the current request.

Signature

```
public void setCanvasUrlPath(String newPath)
```

Parameters

newPath
Type: String

The URL (not including domain) that you need to use to override the canvas app URL.

Return Value

Type: Void

Usage

Use this method to override the URL path and query string of the canvas app. Do not provide a fully qualified URL, because the provided URL string will be appended to the original canvas URL domain.

For example, if the current canvas app URL is `https://myserver.com:6000/myAppPath` and you call `setCanvasUrlPath('/alternatePath/args?arg1=1&arg2=2')`, the adjusted canvas app URL will be `https://myserver.com:6000/alternatePath/args?arg1=1&arg2=2`.

If the provided path results in a malformed URL, or a URL that exceeds 2,048 characters, a System.CanvasException will be thrown.

This method overrides the canvas app URL for the current request and does not permanently change the canvas app URL as configured in the UI for the Salesforce canvas app settings.

CanvasLifecycleHandler Interface

Implement this interface to control context information and add custom behavior during the application render phase.

Namespace

Canvas

Usage

Use this interface to specify what canvas context information is provided to your app by implementing the `excludeContextTypes()` method. Use this interface to call custom code when the app is rendered by implementing the `onRender()` method.

If you provide an implementation of this interface, you must implement `excludeContextTypes()` and `onRender()`.

Example Implementation

The following example shows a simple implementation of CanvasLifecycleHandler that specifies that organization context information will be excluded and prints a debug message when the app is rendered.

```
public class MyCanvasListener
implements Canvas.CanvasLifecycleHandler{
    public Set<Canvas.ContextTypeEnum> excludeContextTypes(){
        Set<Canvas.ContextTypeEnum> excluded = new Set<Canvas.ContextTypeEnum>();
        excluded.add(Canvas.ContextTypeEnum.ORGANIZATION);
        return excluded;
    }

    public void onRender(Canvas.RenderContext renderContext){
        System.debug('Canvas lifecycle called.');
    }
}
```

IN THIS SECTION:

CanvasLifecycleHandler Methods

CanvasLifecycleHandler Methods

The following are methods for `CanvasLifecycleHandler`.

IN THIS SECTION:

excludeContextTypes()

Lets the implementation exclude parts of the CanvasRequest context, if the application does not need it.

onRender(renderContext)

Invoked when a canvas app is rendered. Provides the ability to set and retrieve canvas application and environment context information during the application render phase.

excludeContextTypes()

Lets the implementation exclude parts of the CanvasRequest context, if the application does not need it.

Signature

```
public Set<Canvas.ContextTypeEnum> excludeContextTypes()
```

Return Value

Type: SET<Canvas.ContextTypeEnum>

This method must return `null` or a set of zero or more ContextTypeEnum values. Returning `null` enables all attributes by default. ContextTypeEnum values that can be set are:

- Canvas.ContextTypeEnum.ORGANIZATION
- Canvas.ContextTypeEnum.RECORD_DETAIL
- Canvas.ContextTypeEnum.USER

See ContextTypeEnum on page 255 for more details on these values.

Usage

Implement this method to specify which attributes to disable in the context of the canvas app. A disabled attribute will set the associated canvas context information to null.

Disabling attributes can help improve performance by reducing the size of the signed request and canvas context. Also, disabled attributes do not need to be retrieved by Salesforce, which further improves performance.

See the *Canvas Developer Guide* for more information on context information in the Context object that's provided in the CanvasRequest.

Example

This example implementation specifies that the organization information will be disabled in the canvas context.

```
public Set<Canvas.ContextTypeEnum> excludeContextTypes() {
    Set<Canvas.ContextTypeEnum> excluded = new Set<Canvas.ContextTypeEnum>();
    excluded.add(Canvas.ContextTypeEnum.ORGANIZATION);
    return excluded;
}
```

onRender(renderContext)

Invoked when a canvas app is rendered. Provides the ability to set and retrieve canvas application and environment context information during the application render phase.

Signature

```
public void onRender(Canvas.RenderContext renderContext)
```

Parameters

renderContext
Type: Canvas.RenderContext

Return Value

Type: Void

Usage

If implemented, this method is called whenever the canvas app is rendered. The implementation can set and retrieve context information by using the provided Canvas.RenderContext.

This method is called whenever signed request or context information is retrieved by the client. See the *Canvas Developer Guide* for more information on signed request authentication.

Example

This example implementation prints 'Canvas lifecycle called.' to the debug log when the canvas app is rendered.

```
public void onRender(Canvas.RenderContext renderContext) {
    System.debug('Canvas lifecycle called.');
}
```

ContextTypeEnum Enum

Describes context data that can be excluded from canvas app context data. You specify which context types to exclude in the `excludeContextTypes()` method in your `CanvasLifecycleHandler` implementation.

Namespace

Canvas

Enum Values

Value	Description
`ORGANIZATION`	Exclude context information about the organization in which the canvas app is running.
`RECORD_DETAIL`	Exclude context information about the object record on which the canvas app appears.
`USER`	Exclude context information about the current user.

EnvironmentContext Interface

Use this interface to retrieve environment context information, such as the app display location or the configuration parameters.

Namespace

Canvas

Usage

The `EnvironmentContext` interface provides methods to retrieve environment information about the current canvas app. For this interface, you don't need to create an implementation. Use the default implementation that Salesforce provides.

IN THIS SECTION:

EnvironmentContext Methods

EnvironmentContext Methods

The following are methods for `EnvironmentContext`.

IN THIS SECTION:

addEntityField(fieldName)
Adds a field to the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that's placed on an object.

addEntityFields(fieldNames)
Adds a set of fields to the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that's placed on an object.

getDisplayLocation()
Retrieves the display location where the canvas app is being called from. For example, a value of Visualforce page.

getEntityFields()
Retrieves the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that's placed on an object.

getLocationUrl()
Retrieves the location URL of the canvas app.

getParametersAsJSON()
Retrieves the current custom parameters for the canvas app. Parameters are returned as a JSON string.

getSublocation()
Retrieves the display sublocation where the canvas app is being called from.

setParametersAsJSON(jsonString)
Sets the custom parameters for the canvas app.

`addEntityField(fieldName)`

Adds a field to the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that's placed on an object.

Signature

```
public void addEntityField(String fieldName)
```

Parameters

fieldName
Type: String

The object field name that you need to add to the list of returned fields., Using '*' adds all fields that the user has permission to view.

Return Value

Type: Void

Usage

When you use the `<apex:canvasApp>` component to display a canvas app on a Visualforce page, and that page is associated with an object (placed on the page layout, for example), you can specify fields to be returned from the related object. See the Canvas Developer Guide for more information on the Record object.

Use `addEntityField()` to add a field to the list of object fields that are returned in the signed request Record object. By default the list of fields includes ID. You can add fields by name or add all fields that the user has permission to view by calling `addEntityField('*')`.

You can inspect the configured list of fields by using Canvas.EnvironmentContext.`getEntityFields()`.

Example

This example adds the Name and BillingAddress fields to the list of object fields. This example assumes the canvas app will appear in a Visualforce page that's associated with the Account page layout.

```
Canvas.EnvironmentContext env = renderContext.getEnvironmentContext();

// Add Name and BillingAddress to fields (assumes we'll run from the Account detail page)
env.addEntityField('Name');
env.addEntityField('BillingAddress');
```

addEntityFields(fieldNames)

Adds a set of fields to the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that's placed on an object.

Signature

```
public void addEntityFields(Set<String> fieldNames)
```

Parameters

fieldNames
Type: SET<String>

The set of object field names that you need to add to the list of returned fields. If an item in the set is '*', all fields that the user has permission to view are added.

Return Value

Type: Void

Usage

When you use the `<apex:canvasApp>` component to display a canvas app on a Visualforce page, and that page is associated with an object (placed on the page layout, for example), you can specify fields to be returned from the related object. See the *Canvas Developer Guide* for more information on the Record object.

Use `addEntityFields()` to add a set of one or more fields to the list of object fields that are returned in the signed request Record object. By default the list of fields includes ID. You can add fields by name or add all fields that the user has permission to view by adding a set that includes '*' as one of the strings.

You can inspect the configured list of fields by using Canvas.EnvironmentContext.`getEntityFields()`.

Example

This example adds the Name, BillingAddress, and YearStarted fields to the list of object fields. This example assumes that the canvas app will appear in a Visualforce page that's associated with the Account page layout.

```
Canvas.EnvironmentContext env = renderContext.getEnvironmentContext();

// Add Name, BillingAddress and YearStarted to fields (assumes we'll run from the Account
 detail page)
Set<String> fields = new Set<String>{'Name','BillingAddress','YearStarted'};
env.addEntityFields(fields);
```

`getDisplayLocation()`

Retrieves the display location where the canvas app is being called from. For example, a value of Visualforce page.

Signature

```
public String getDisplayLocation()
```

Return Value

Type: String

The return value can be one of the following strings:

- Chatter—The canvas app was called from the Chatter tab.
- ChatterFeed—The canvas app was called from a Chatter canvas feed item.
- MobileNav—The canvas app was called from the navigation menu.
- OpenCTI—The canvas app was called from an Open CTI component.
- PageLayout—The canvas app was called from an element within a page layout. If the displayLocation is PageLayout, one of the subLocation values might be returned.
- Publisher—The canvas app was called from a canvas custom quick action.
- ServiceDesk—The canvas app was called from a Salesforce Console component.
- Visualforce—The canvas app was called from a Visualforce page.
- None—The canvas app was called from the Canvas App Previewer.

Usage

Use this method to obtain the display location for the canvas app.

getEntityFields()

Retrieves the list of object fields that are returned in the signed request Record object when the component appears on a Visualforce page that's placed on an object.

Signature

```
public List<String> getEntityFields()
```

Return Value

Type: LIST<String>

Usage

When you use the <apex:canvasApp> component to display a canvas app on a Visualforce page, and that page is associated with an object (placed on the page layout, for example), you can specify fields to be returned from the related object. See the *Canvas Developer Guide* for more information on the Record object.

Use getEntityFields() to retrieve the list of object fields that are returned in the signed request Record object. By default the list of fields includes ID. The list of fields can be configured by using the Canvas.EnvironmentContext.addEntityField(fieldName) or Canvas.EnvironmentContext.addEntityFields(fieldNames) methods.

Example

This example gets the current list of object fields and retrieves each item in the list, printing each field name to the debug log.

```
Canvas.EnvironmentContext env = renderContext.getEnvironmentContext();

List<String> entityFields = env.getEntityFields();
for (String fieldVal : entityFields) {
    System.debug('Environment Context entityField: ' + fieldVal);
}
```

If the canvas app that's using this lifecycle code was run from the detail page of an Account, the debug log output might look like:

```
Environment Context entityField: Id
```

getLocationUrl()

Retrieves the location URL of the canvas app.

Signature

```
public String getLocationUrl()
```

Return Value

Type: String

Usage

Use this method to obtain the URL of the page where the user accessed the canvas app. For example, if the user accessed your app by clicking a link on the Chatter tab, this method returns the URL of the Chatter tab, which would be similar to 'https://*MyDomainName*.my.salesforce.com/_ui/core/chatter/ui/ChatterPage'.

`getParametersAsJSON()`

Retrieves the current custom parameters for the canvas app. Parameters are returned as a JSON string.

Signature

```
public String getParametersAsJSON()
```

Return Value

Type: String

Usage

Use this method to get the current custom parameters for the canvas app. The parameters are returned in a JSON string that can be de-serialized by using the System.JSON.`deserializeUntyped(jsonString)` method.

Custom parameters can be modified by using the Canvas.EnvironmentContext.`setParametersAsJSON(jsonString)` string.

Example

This example gets the current custom parameters, de-serializes them into a map, and prints the results to the debug log.

```
Canvas.EnvironmentContext env = renderContext.getEnvironmentContext();

// Get current custom params
Map<String, Object> currentParams =
    (Map<String, Object>) JSON.deserializeUntyped(env.getParametersAsJSON());
System.debug('Environment Context custom paramters: ' + currentParams);
```

`getSublocation()`

Retrieves the display sublocation where the canvas app is being called from.

Signature

```
public String getSublocation()
```

Return Value

Type: String

The return value can be one of the following strings:

- S1MobileCardFullview—The canvas app was called from a mobile card.
- S1MobileCardPreview—The canvas app was called from a mobile card preview. The user must click the preview to open the app.

- S1RecordHomePreview—The canvas app was called from a record detail page preview. The user must click the preview to open the app.
- S1RecordHomeFullview—The canvas app was called from a page layout.

Usage

Use this method to obtain the display sublocation for the canvas app. Use only if the primary display location can be displayed on mobile devices.

`setParametersAsJSON(jsonString)`

Sets the custom parameters for the canvas app.

Signature

```
public void setParametersAsJSON(String jsonString)
```

Parameters

`jsonString`
Type: String

The custom parameters that you need to set, serialized into a JSON format string.

Return Value

Type: Void

Usage

Use this method to set the current custom parameters for the canvas app. The parameters must be provided in a JSON string. You can use the System.JSON.`serialize(objectToSerialize)` method to serialize a map into a JSON string.

Setting the custom parameters will overwrite the custom parameters that are set for the current request. If you need to modify the current custom parameters, first get the current set of custom parameters by using `getParametersAsJSON()`, modify the retrieved parameter set as needed, and then use this modified set in your call to setParametersAsJSON().

If the provided JSON string exceeds 32KB, a System.CanvasException will be thrown.

Example

This example gets the current custom parameters, adds a new `newCustomParam` parameter with a value of 'TESTVALUE', and sets the current custom parameters.

```
Canvas.EnvironmentContext env = renderContext.getEnvironmentContext();

// Get current custom params
Map<String, Object> previousParams =
    (Map<String, Object>) JSON.deserializeUntyped(env.getParametersAsJSON());

// Add a new custom param
previousParams.put('newCustomParam','TESTVALUE');
```

```
// Now replace the parameters with the current parameters plus our new custom param
env.setParametersAsJSON(JSON.serialize(previousParams));
```

RenderContext Interface

A wrapper interface that is used to retrieve application and environment context information.

Namespace

Canvas

Usage

Use this interface to retrieve application and environment context information for your canvas app. For this interface, you don't need to create an implementation. Use the default implementation that Salesforce provides.

IN THIS SECTION:

RenderContext Methods

RenderContext Methods

The following are methods for `RenderContext`.

IN THIS SECTION:

getApplicationContext()
Retrieves the application context information.

getEnvironmentContext()
Retrieves the environment context information.

`getApplicationContext()`

Retrieves the application context information.

Signature

```
public Canvas.ApplicationContext getApplicationContext()
```

Return Value

Type: Canvas.ApplicationContext

Usage

Use this method to get the application context information for your canvas app.

Example

The following example implementation of the CanvasLifecycleHandler onRender() method uses the provided RenderContext to retrieve the application context information and then checks the namespace, version, and app URL.

```
public void onRender(Canvas.RenderContext renderContext){
    Canvas.ApplicationContext app = renderContext.getApplicationContext();
    if (!'MyNamespace'.equals(app.getNamespace())){
        // This application is installed, add code as needed
        ...
    }

    // Check the application version
    Double currentVersion = Double.valueOf(app.getVersion());

    if (currentVersion <= 5){
        // Add version specific code as needed
        ...
        // Tell the canvas application to operate in deprecated mode
        app.setCanvasUrlPath('/canvas?deprecated=true');
    }
}
```

`getEnvironmentContext()`

Retrieves the environment context information.

Signature

```
public Canvas.EnvironmentContext getEnvironmentContext()
```

Return Value

Type: Canvas.EnvironmentContext

Usage

Use this method to get the environment context information for your canvas app.

Example

The following example implementation of the CanvasLifecycleHandler onRender() method uses the provided RenderContext to retrieve the environment context information and then modifies the custom parameters.

```
public void onRender(Canvas.RenderContext renderContext) {
   Canvas.EnvironmentContext env =
        renderContext.getEnvironmentContext();

    // Retrieve the custom params
    Map<String, Object> previousParams = (Map<String, Object>)
          JSON.deserializeUntyped(env.getParametersAsJSON());

    previousParams.put('param1',1);
    previousParams.put('param2',3.14159);
```

```
    ...

    // Now, add in some opportunity record IDs
    Opportunity[] o = [select id, name from opportunity];
    previousParams.put('opportunities',o);

    // Now, replace the parameters
    env.setParametersAsJSON(JSON.serialize(previousParams));
}
```

Test Class

Contains methods for automated testing of your Canvas classes.

Namespace

Canvas

Usage

Use this class to test your implementation of Canvas.CanvasLifecycleHandler with mock test data. You can create a test Canvas.RenderContext with mock application and environment context data and use this data to verify that your CanvasLifecycleHandler is being invoked correctly.

IN THIS SECTION:

Test Constants
The Test class provides constants that are used as keys when you set mock application and environment context data.

Test Methods
The Test class provides methods for creating test contexts and invoking your CanvasLifecycleHandler with mock data.

Test Constants

The Test class provides constants that are used as keys when you set mock application and environment context data.

When you call Canvas.Test.`mockRenderContext(applicationContextTestValues, environmentContextTestValues)`, you need to provide maps of key-value pairs to represent your mock application and environment context data. The Test class provides static constant strings that you can use as keys for various parts of the application and environment context.

Constant	Description
`KEY_CANVAS_URL`	Represents the canvas app URL key in the ApplicationContext.
`KEY_DEVELOPER_NAME`	Represents the canvas app developer or API name key in the ApplicationContext.
`KEY_DISPLAY_LOCATION`	Represents the canvas app display location key in the EnvironmentContext.
`KEY_LOCATION_URL`	Represents the canvas app location URL key in the EnvironmentContext.

Constant	Description
KEY_NAME	Represents the canvas app name key in the ApplicationContext.
KEY_NAMESPACE	Represents the canvas app namespace key in the ApplicationContext.
KEY_SUB_LOCATION	Represents the canvas app sublocation key in the EnvironmentContext.
KEY_VERSION	Represents the canvas app version key in the ApplicationContext.

Test Methods

The Test class provides methods for creating test contexts and invoking your CanvasLifecycleHandler with mock data.

The following are methods for `Test`. All are static methods.

IN THIS SECTION:

mockRenderContext(applicationContextTestValues, environmentContextTestValues)
Creates and returns a test Canvas.RenderContext based on the provided application and environment context parameters.

testCanvasLifecycle(lifecycleHandler, mockRenderContext)
Calls the canvas test framework to invoke a CanvasLifecycleHandler with the provided RenderContext.

mockRenderContext(applicationContextTestValues, environmentContextTestValues)

Creates and returns a test Canvas.RenderContext based on the provided application and environment context parameters.

Signature

```
public static Canvas.RenderContext mockRenderContext(Map<String,String>
applicationContextTestValues, Map<String,String> environmentContextTestValues)
```

Parameters

applicationContextTestValues
Type: Map<String,String>

Specifies a map of key-value pairs that provide mock application context data. Use constants that are provided by Canvas.Test as keys. If `null` is provided for this parameter, the canvas framework generates some default mock application context values.

environmentContextTestValues
Type: Map<String,String>

Specifies a map of key-value pairs that provide mock environment context data. Use constants provided by Canvas.Test as keys. If `null` is provided for this parameter, the canvas framework generates some default mock environment context values.

Return Value

Type: Canvas.RenderContext

Usage

Use this method to create a mock Canvas.RenderContext. Use the returned RenderContext in calls to Canvas.Test.testCanvasLifecycle(lifecycleHandler, mockRenderContext) for testing Canvas.CanvasLifecycleHandler implementations.

Example

The following example creates maps to represent mock application and environment context data and generates a test Canvas.RenderContext. This test RenderContext can be used in a call to Canvas.Test.testCanvasLifecycle(lifecycleHandler, mockRenderContext).

```
Map<String,String> appValues = new Map<String,String>();
appValues.put(Canvas.Test.KEY_NAMESPACE,'alternateNamespace');
appValues.put(Canvas.Test.KEY_VERSION,'3.0');

Map<String,String> envValues = new Map<String,String>();
envValues.put(Canvas.Test.KEY_DISPLAY_LOCATION,'Chatter');
envValues.put(Canvas.Test.KEY_LOCATION_URL,'https://MyDomainName.my.salesforce.com/_ui/core/chatter/ui/ChatterPage');

Canvas.RenderContext mock = Canvas.Test.mockRenderContext(appValues,envValues);
```

testCanvasLifecycle(lifecycleHandler, mockRenderContext)

Calls the canvas test framework to invoke a CanvasLifecycleHandler with the provided RenderContext.

Signature

```
public static Void testCanvasLifecycle(Canvas.CanvasLifecycleHandler
lifecycleHandler,Canvas.RenderContext mockRenderContext)
```

Parameters

lifecycleHandler
Type: Canvas.CanvasLifecycleHandler

Specifies the CanvasLifecycleHandler implementation that you need to invoke.

mockRenderContext
Type: Canvas.RenderContext

Specifies the RenderContext information that you need to provide to the invoked CanvasLifecycleHandler. If `null` is provided for this parameter, the canvas framework generates and uses a default mock RenderContext.

Return Value

Type: Void

Usage

Use this method to invoke an implementation of Canvas.CanvasLifecycleHandler.onRender(renderContext) with a mock Canvas.RenderContext that you provide.

Example

The following example creates maps to represent mock application and environment context data and generates a test Canvas.RenderContext. This test RenderContext is then used to invoke a Canvas.CanvasLifecycleHandler.

```
// Set some application context data in a Map
Map<String,String> appValues = new Map<String,String>();
appValues.put(Canvas.Test.KEY_NAMESPACE,'alternateNamespace');
appValues.put(Canvas.Test.KEY_VERSION,'3.0');

// Set some environment context data in a MAp
Map<String,String> envValues = new Map<String,String>();
envValues.put(Canvas.Test.KEY_DISPLAY_LOCATION,'Chatter');
envValues.put(Canvas.Test.KEY_LOCATION_URL,'https://MyDomainName.my.salesforce.com/_ui/core/chatter/ui/ChatterPage');

// Create a mock RenderContext using the test application and environment context data
Maps
Canvas.RenderContext mock = Canvas.Test.mockRenderContext(appValues,envValues);

// Set some custom params on the mock RenderContext
mock.getEnvironmentContext().setParametersAsJSON('{\"param1\":1,\"boolParam\":true,\"stringParam\":\"test
 string\"}');

// Use the mock RenderContext to invoke a CanvasLifecycleHandler
Canvas.Test.testCanvasLifecycle(handler,mock)
```

Canvas Exceptions

The `Canvas` namespace contains exception classes.

All exception classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions.

The `Canvas` namespace contains this exception:

Exception	Description
`Canvas.CanvasRenderException`	Use this class in your implementation of Canvas.CanvasLifecycleHandler.`onRender(renderContext)`. To show an error to the user in your `onRender()` implementation, throw a `Canvas.CanvasRenderException`, and the canvas framework will render the error message to the user. This exception will be managed only within the `onRender()` method.

Example

The following example implementation of `onRender()` catches a CanvasException that was thrown because a canvas URL was set with a string that exceeded the maximum length. A CanvasRenderException is created and thrown to display the error to the user.

```
public class MyCanvasListener
implements Canvas.CanvasLifecycleHandler {

    public void onRender(Canvas.RenderContext renderContext) {
```

```
        Canvas.ApplicationContext app = renderContext.getApplicationContext();

        // Code to generate a URL string that is too long

        // ...

        // Try to set the canvas app URL using the invalid URL string
        try {
            app.setCanvasUrlPath(aUrlPathThatIsTooLong);
        } catch (CanvasException e) {
            // Display error to user by throwing a new CanvasRenderException
            throw new Canvas.CanvasRenderException(e.getMessage());
        }
    }
}
```

See the *Canvas Developer Guide* for additional examples that use CanvasRenderException.

ChatterAnswers Namespace

The `ChatterAnswers` namespace provides an interface for creating Account records.

The following is the interface in the `ChatterAnswers` namespace.

IN THIS SECTION:

AccountCreator Interface
Creates Account records that will be associated with Chatter Answers users.

AccountCreator Interface

Creates Account records that will be associated with Chatter Answers users.

Namespace

ChatterAnswers

Usage

The `ChatterAnswers.AccountCreator` is specified in the `registrationClassName` attribute of a `chatteranswers:registration` Visualforce component. This interface is called by Chatter Answers and allows for custom creation of Account records used for portal users.

To implement the `ChatterAnswers.AccountCreator` interface, you must first declare a class with the `implements` keyword as follows:

```
public class ChatterAnswersRegistration implements ChatterAnswers.AccountCreator {
```

Next, your class must provide an implementation for the following method:

```
public String createAccount(String firstname, String lastname, Id siteAdminId) {
    // Your code here
}
```

The implemented method must be declared as `global` or `public`.

IN THIS SECTION:

AccountCreator Methods

AccountCreator Example Implementation

AccountCreator Methods

The following are methods for `AccountCreator`.

IN THIS SECTION:

createAccount(firstName, lastName, siteAdminId)
Accepts basic user information and creates an Account record. The implementation of this method returns the account ID.

`createAccount(firstName, lastName, siteAdminId)`

Accepts basic user information and creates an Account record. The implementation of this method returns the account ID.

Signature

```
public String createAccount(String firstName, String lastName, Id siteAdminId)
```

Parameters

`firstName`
Type: String

The first name of the user who is registering.

`lastName`
Type: String

The last name of the user who is registering.

`siteAdminId`
Type: ID

The user ID of the Site administrator, used for notification if any exceptions occur.

Return Value

Type: String

AccountCreator Example Implementation

This is an example implementation of the `ChatterAnswers.AccountCreator` interface. The `createAccount` method implementation accepts user information and creates an Account record. The method returns a String value for the Account ID.

```
public class ChatterAnswersRegistration implements ChatterAnswers.AccountCreator {
    public String createAccount(String firstname, String lastname, Id siteAdminId) {
        Account a = new Account(name = firstname + ' ' + lastname, ownerId = siteAdminId);

         insert a;
         return a.Id;
    }
}
```

This example tests the code above.

```
@isTest
private class ChatterAnswersCreateAccountTest {
    static testMethod void validateAccountCreation() {
       User[] user = [SELECT Id, Firstname, Lastname from User WHERE UserType='Standard'];

        if (user.size() == 0) { return; }
        String firstName = user[0].FirstName;
        String lastName = user[0].LastName;
        String userId = user[0].Id;
        String accountId = new ChatterAnswersRegistration().createAccount(firstName,
lastName, userId);
        Account acct = [SELECT name, ownerId from Account where Id =: accountId];
        System.assertEquals(firstName + ' ' + lastName, acct.name);
        System.assertEquals(userId, acct.ownerId);
  }
}
```

CommerceOrders Namespace

The `CommerceOrders` namespace provides classes and methods to place orders with integrated pricing, configuration, and validation.

See CommerceOrders namespace for more information about the available classes and methods.

CommercePayments Namespace

Use the `CommercePayments` namespace to provide a safe and customizable platform for managing customer payments and refunds.

To review `CommercePayments` use cases and walkthroughs, go to Use Cases for the CommercePayments Namespace.

The following are the classes in the `CommercePayments` namespace.

IN THIS SECTION:

AbstractResponse Class
Contains the normalized response fields from payment gateways that are common to all the other gateway responses.

AbstractTransactionResponse Class

Abstract class for storing normalized information sent from payment gateways about a payment transaction. Holds the common response fields sent from payment gateways for authorization, sale, capture, and refund transactions.

AddressRequest Class

Contains address request data that is sent to a gateway adapter during a service call.

AlternativePaymentMethodRequest Class

The class contains information about the alternative payment method that are required for a gateway to process the request.

AlternativePaymentMethodResponse Class

The class contains the response details of the alternative payment method.

AuditParamsRequest

`AuditParamsRequest` is used for audit parameters in a transaction request. This is an abstract request class that is extended by the `BaseRequest` class.

AuthApiPaymentMethodRequest Class

Sends information about a payment method to a gateway adapter during an authorization service call.

AuthorizationRequest Class

Sends information about an authorization request to a gateway adapter during a service call.

AuthorizationResponse Class

Response sent by the payment gateway adapter for an authorization service.

AuthorizationReversalRequest Class

Sends information about an authorization reversal request to a gateway adapter during a service call.

AuthorizationReversalResponse Class

Response sent by the payment gateway following a payment authorization reversal service.

BaseApiPaymentMethodRequest Class

Abstract class used to send information about a payment method to a gateway adapter during a service call.

BaseNotification Class

Abstract class for storing notification information sent from payment gateways.

BasePaymentMethodRequest Class

Abstract class for storing information about payment methods.

BaseRequest Class

`BaseRequest` is extended by all the request classes.

CaptureNotification Class

When a payment gateway sends a notification for a capture transaction, the payment gateway adapter creates the `CaptureNotification` object to store information about the notification.

CaptureRequest Class

Represents a capture request. This class extends the `BaseRequest` class and inherits all its methods.

CaptureResponse Class

The payment gateway adapter sends this response for the capture request type. This class extends `AbstractResponse` and inherits its methods.

CardCategory Enum

Defines whether the payment method represents a credit card or a debit card.

CardPaymentMethodRequest Class

Sends data related to a card payment method to a gateway adapter during a service call.

CardPaymentMethodResponse Class

This class contains details about the card payment method.

CardType Enum

Specifies the credit card issuer.

CustomMetadataTypeInfo Class

Access information about custom metadata. The `PaymentGatewayAdapter` can send `CustomMetadataTypeInfo` to transaction requests through the response object's `SalesforceResultCodeInfo`.

GatewayErrorResponse Class

Use to respond with an error indication following errors from the `PaymentGateway` adapter, such as request-forbidden responses, custom validation errors, or expired API tokens.

GatewayNotificationResponse Class

When the payment gateway sends a notification to the payments platform, the platform responds with a `GatewayNotificationResponse` indicating whether the platform succeeded or failed at receiving the notification.

GatewayResponse Interface

Generic payment gateway response interface. This class extends the `CaptureResponse` on page 334, `AbstractTransactionResponse` on page 277, and `AbstractResponse` on page 273 classes and inherits all their properties. It has no unique methods or parameters.

NotificationClient Class

Communicates with the payment platform regarding the gateway's notification.

NotificationSaveResult Class

Contains the result of the payment platform's attempt to record data from the gateway's notification.

NotificationStatus Enum

Shows whether the payments platform successfully received the notification from the gateway.

PaymentGatewayAdapter Interface

`PaymentGatewayAdapters` can implement this interface in order to process requests.

PaymentGatewayAsyncAdapter Interface

Implement the interface to allow customers to process payments asynchronously.

PaymentGatewayContext Class

Wraps the information related to a payment request.

PaymentGatewayNotificationContext Class

Wraps the information related to a gateway notification.

PaymentGatewayNotificationRequest Class

Contains the notification request data from the gateway.

PaymentMethodDetailsResponse Class

This class contains the details about the payment method.

PaymentMethodTokenizationRequest Class

Stores data about a request to tokenize a card payment method. The tokenization process occurs in the payment gateway. This process replaces sensitive customer data, such as a card number or CVV, with unique identification symbols. The symbols are used while the data is handled by Salesforce, the payment gateway, and the customer bank, allowing Salesforce to store the token without storing sensitive customer data.

PaymentMethodTokenizationResponse Class

Gateway response sent by payment gateway adapters for the payment method tokenization request. The response includes the payment method's token ID value.

PaymentsHttp Class

Makes an HTTP request to start the interaction with the payment gateway.

PostAuthApiPaymentMethodRequest Class

Sends information about a payment method to a gateway adapter during a postauthorization service call.

PostAuthorizationRequest Class

Sends information about a postauthorization request to a gateway adapter during a service call.

PostAuthorizationResponse Class

Response sent by the payment gateway adapter for a postauthorization service.

ReferencedRefundNotification Class

When a payment gateway sends a notification for a refund transaction, the payment gateway adapter creates the `ReferencedRefundNotification` object to store information about notification.

ReferencedRefundRequest

Access information about the referenced refund requests. Extends the `RefundRequest` class.

ReferencedRefundResponse Class

The payment gateway adapter sends this response for the `ReferencedRefund` request type.

RefundRequest Class

Sends data related to a refund to the payment gateway adapter.

RequestType Enum

Defines the type of payment transaction request made to the payment gateway.

SaleApiPaymentMethodRequest Class

Sends data related to a card payment method to a gateway adapter during a sale service call.

SaleRequest Class

Stores information about a sales request.

SaleResponse Class

Response sent by payment gateway adapters for a sales service.

SalesforceResultCode Enum

Defines the gateway call status values in Salesforce based on the call status values that the payment gateway returned.

SalesforceResultCodeInfo

Stores Salesforce result code information from payment gateway adapters.

AbstractResponse Class

Contains the normalized response fields from payment gateways that are common to all the other gateway responses.

Namespace

CommercePayments

Usage

You must specify the `CommercePayments` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```
CommercePayments.AbstractResponse abr = new CommercePayments.AbstractResponse();
```

This class can't be instantiated on its own. This class implements the GatewayResponse class. Other GatewayResponse classes extend this class to inherit common properties.

IN THIS SECTION:

AbstractResponse Methods

AbstractResponse Methods

The following are methods for `AbstractResponse`.

IN THIS SECTION:

setGatewayAvsCode(gatewayAvsCode)
Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)
Sets the date that the transaction occurred. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)
Sets error messages that the gateway returned for the payment request. Maximum length of 255 characters.

setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

`setGatewayAvsCode(gatewayAvsCode)`

Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

Signature

```
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

`gatewayAvsCode`
Type: String

Code sent by gateways that use an address verification system.

Return Value

Type: void

`setGatewayDate(gatewayDate)`

Sets the date that the transaction occurred. Some gateways don't send this value.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

`gatewayDate`
Type: Datetime

Date and time of the gateway communication.

Return Value

Type: void

`setGatewayMessage(gatewayMessage)`

Sets error messages that the gateway returned for the payment request. Maximum length of 255 characters.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

`gatewayMessage`
Type: String

Information on error messages sent from the gateway.

Return Value

Type: void

`setGatewayResultCode(gatewayResultCode)`

Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Must be used to map a Salesforce-specific result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the gateway's result code. Use this field to learn more about why the gateway returned a certain result code.

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
Type: commercepayments.SalesforceResultCodeInfo on page 419

Description of the Salesforce result code value.

Return Value

Type: void

AbstractTransactionResponse Class

Abstract class for storing normalized information sent from payment gateways about a payment transaction. Holds the common response fields sent from payment gateways for authorization, sale, capture, and refund transactions.

Namespace

CommercePayments

Usage

Specify the `CommercePayments` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```
CommercePayments.AbstractTransactionResponse atr = new
CommercePayments.AbstractTransactionResponse();
```

IN THIS SECTION:

AbstractTransactionResponse Methods

AbstractTransactionResponse Methods

The following are methods for `AbstractTransactionResponse`.

IN THIS SECTION:

setAmount(amount)
Sets the transaction amount. Must be a non-negative value.

setGatewayAvsCode(gatewayAvsCode)
Sets the AVS (address verification system) result code that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)
Sets the date that the notification occurred. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)
Sets error messages that the gateway returned for the notification request. Maximum length of 255 characters.

setGatewayReferenceDetails(gatewayReferenceDetails)
Sets the payment gateway's reference details.

setGatewayReferenceNumber(gatewayReferenceNumber)
Sets the payment gateway's reference number.

setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. You can map the result code to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the Salesforce-specific result code information.

`setAmount(amount)`

Sets the transaction amount. Must be a non-negative value.

Signature

```
global void setAmount(Double amount)
```

Parameters

amount
Type: Double

The amount of the transaction.

Return Value

Type: void

`setGatewayAvsCode(gatewayAvsCode)`

Sets the AVS (address verification system) result code that the gateway returned. Maximum length of 64 characters.

Signature

```
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

gatewayAvsCode
Type: String

Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.

Return Value

Type: void

`setGatewayDate(gatewayDate)`

Sets the date that the notification occurred. Some gateways don't send this value.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

The date that the transaction occurred.

Return Value

Type: void

`setGatewayMessage(gatewayMessage)`

Sets error messages that the gateway returned for the notification request. Maximum length of 255 characters.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

`gatewayMessage`
Type: String

The message that the gateway returned with the transaction request. Contains additional information about the transaction.

Return Value

Type: void

`setGatewayReferenceDetails(gatewayReferenceDetails)`

Sets the payment gateway's reference details.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

`gatewayReferenceDetails`
Type: String

Provides information about the gateway communication.

Return Value

Type: void

`setGatewayReferenceNumber(gatewayReferenceNumber)`

Sets the payment gateway's reference number.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique transaction ID created by the payment gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. You can map the result code to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Must be mapped to a Salesforce-specific result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Provides additional information about the result code and why the gateway returned the specific code. Descriptions vary between different gateways.

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo

Type: commercepayments.SalesforceResultCodeInfo on page 419

Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Return Value

Type: void

AddressRequest Class

Contains address request data that is sent to a gateway adapter during a service call.

Namespace

CommercePayments

Usage

Contains information about the payment method's address. Use this information in authorization, sale, and tokenization requests. The payment gateway adapter uses information in an AddressRequest object to construct a JSON request to send to the payment gateway.

The constructor of this class takes no arguments. For example:

```
CommercePayments.AddressRequest adr = new CommercePayments.AddressRequest();
```

IN THIS SECTION:

AddressRequest Constructors

AddressRequest Properties

AddressRequest Methods

AddressRequest Constructors

The following are constructors for `AddressRequest`.

IN THIS SECTION:

AddressRequest(street, city, state, country, postalCode)

Constructs a sample address. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`AddressRequest(street, city, state, country, postalCode)`

Constructs a sample address. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global AddressRequest(String street, String city, String state, String country, String postalCode)
```

Parameters

street
Type: String

Street for the payment method's address.

city
Type: String

City for the payment method's address.

state
Type: String

State for the payment method's address.

country
Type: String

Country for the payment method's address.

postalCode
Type: String

Postal code for the payment method's address.

AddressRequest Properties

The following are properties for `AddressRequest`.

IN THIS SECTION:

city
City of the payment method address.

companyName
Company name of the payment method address.

country
Country for the payment method address.

postalCode
Postal code for the payment method address.

state
State for the payment method address.

street
Street for the payment method address.

city

City of the payment method address.

Signature

```
global String city {get; set;}
```

Property Value

Type: String

companyName

Company name of the payment method address.

Signature

```
global String companyName {get; set;}
```

Property Value

Type: String

country

Country for the payment method address.

Signature

```
global String country {get; set;}
```

Property Value

Type: String

postalCode

Postal code for the payment method address.

Signature

```
global String postalCode {get; set;}
```

Property Value

Type: String

state

State for the payment method address.

Signature

```
global String state {get; set;}
```

Property Value

Type: String

`street`

Street for the payment method address.

Signature

```
global String street {get; set;}
```

Property Value

Type: String

AddressRequest Methods

The following are methods for `AddressRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `AddressRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type `AddressRequest`.

toString()
Converts a date to a string.

`equals(obj)`

Maintains the integrity of lists of type `AddressRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `AddressRequest`.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

AlternativePaymentMethodRequest Class

The class contains information about the alternative payment method that are required for a gateway to process the request.

Namespace

CommercePayments

Example

```
commercepayments.PostAuthApiPaymentMethodRequest apiPaymentMethod
=(commercepayments.PostAuthApiPaymentMethodRequest) postAuthRequest.paymentMethod;
commercepayments.AlternativePaymentMethodRequest alternativePaymentMethod=
(commercepayments.AlternativePaymentMethodRequest) apiPaymentMethod.alternativePaymentMethod;
String gatewayToken = (String)alternativePaymentMethod.gatewayToken;
String gatewayTokenDetails = (String)alternativePaymentMethod.gatewayTokenDetails;
String name = (String)alternativePaymentMethod.name;
String accountId = (String)alternativePaymentMethod.accountId;
String email = (String)alternativePaymentMethod.email;
```

IN THIS SECTION:

AlternativePaymentMethodRequest Constructors

AlternativePaymentMethodRequest Properties

AlternativePaymentMethodRequest Methods

AlternativePaymentMethodRequest Constructors

The following are constructors for `AlternativePaymentMethodRequest`.

IN THIS SECTION:

AlternativePaymentMethodRequest(gatewayToken)
Creates a new instance of the `CommercePayments.AlternativePaymentMethodRequest` class.

`AlternativePaymentMethodRequest(gatewayToken)`

Creates a new instance of the `CommercePayments.AlternativePaymentMethodRequest` class.

Signature

```
public AlternativePaymentMethodRequest(String gatewayToken)
```

Parameters

`gatewayToken`
Type: String

A unique, alphanumeric ID, called a token, that a payment gateway generates when it first processes a payment. The token replaces the actual payment data so that the data is kept secure. This token is stored as encrypted text, and can be used for recurring payments.

AlternativePaymentMethodRequest Properties

The following are properties for `AlternativePaymentMethodRequest`.

IN THIS SECTION:

accountId
Salesforce account ID to which this payment method is linked.

email
Email address of the card holder.

gatewayToken
A unique, alphanumeric ID, that a payment gateway generates when it first processes a payment.

gatewayTokenDetails
Information about the gateway token.

name
Name that you assign to the PaymentMethod object.

accountId

Salesforce account ID to which this payment method is linked.

Signature

```
public String accountId {get; set;}
```

Property Value

Type: String

email

Email address of the card holder.

Signature

```
public String email {get; set;}
```

Property Value

Type: String

gatewayToken

A unique, alphanumeric ID, that a payment gateway generates when it first processes a payment.

The token replaces the actual payment data so that the data is kept secure. This token is stored as encrypted text, and can be used for recurring payments.

Signature

```
public String gatewayToken {get; set;}
```

Property Value

Type: String

gatewayTokenDetails

Information about the gateway token.

Signature

```
public String gatewayTokenDetails {get; set;}
```

Property Value

Type: String

name

Name that you assign to the PaymentMethod object.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

AlternativePaymentMethodRequest Methods

The following are methods for `AlternativePaymentMethodRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `AlternativePaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type `AlternativePaymentMethodRequest` by determining the uniqueness of the external object records in a list.

toString()
Converts a date to a string.

equals(obj)

Maintains the integrity of lists of type `AlternativePaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

Signature

```
public Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `AlternativePaymentMethodRequest` by determining the uniqueness of the external object records in a list.

Signature

```
public Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a date to a string.

Signature

```
public String toString()
```

Return Value

Type: String

AlternativePaymentMethodResponse Class

The class contains the response details of the alternative payment method.

Namespace

CommercePayments

Example

```
commercepayments.AlternativePaymentMethodResponse response = new
commercepayments.AlternativePaymentMethodResponse();
response.setEmail('alternativePaymentMethod');
response.setEmail('foo@foo.com');
response.setGatewayToken('NMoPoIOnTZSaRaWcV7gUUXe');
response.setGatewayTokenDetails('gateway token details');
```

IN THIS SECTION:

AlternativePaymentMethodResponse Methods

AlternativePaymentMethodResponse Methods

The following are methods for `AlternativePaymentMethodResponse`.

IN THIS SECTION:

setAccountId(accountId)
Sets the ID of the Salesforce payments account to which the payment method is linked.

setComments(comments)
Sets the notes about the payment method added by users.

setEmail(email)
Sets the email ID of the card holder.

setGatewayToken(gatewayToken)
Sets the token ID that a payment gateway generates when it first processes a payment.

setGatewayTokenDetails(gatewayTokenDetails)
Sets the details about the payment gateway token.

setName(name)
Sets the name that is assigned to the PaymentMethod object.

`setAccountId(accountId)`

Sets the ID of the Salesforce payments account to which the payment method is linked.

Signature

```
public void setAccountId(Id accountId)
```

Parameters

`accountId`
Type: Id

Salesforce payments account ID.

Return Value

Type: void

`setComments(comments)`

Sets the notes about the payment method added by users.

Signature

```
public void setComments(String comments)
```

Parameters

`comments`
Type: String

Notes about the payment method added by users, maximum 1000 characters.

Return Value

Type: void

`setEmail(email)`

Sets the email ID of the card holder.

Signature

```
public void setEmail(String email)
```

Parameters

email
Type: String

Email ID of the card holder.

Return Value

Type: void

`setGatewayToken(gatewayToken)`

Sets the token ID that a payment gateway generates when it first processes a payment.

Signature

```
public void setGatewayToken(String gatewayToken)
```

Parameters

gatewayToken
Type: String

A unique, alphanumeric ID, called a token, that a payment gateway generates when it first processes a payment. The token replaces the actual payment data so that the data is kept secure. This token is stored as encrypted text, and can be used for recurring payments.

Return Value

Type: void

`setGatewayTokenDetails(gatewayTokenDetails)`

Sets the details about the payment gateway token.

Signature

```
public void setGatewayTokenDetails(String gatewayTokenDetails)
```

Parameters

gatewayTokenDetails
Type: String

Detailed information about the gateway token.

Return Value

Type: void

setName(name)

Sets the name that is assigned to the PaymentMethod object.

Signature

```
public void setName(String name)
```

Parameters

name
Type: String

Name that you assign to the payment method object.

Return Value

Type: void

AuditParamsRequest

`AuditParamsRequest` is used for audit parameters in a transaction request. This is an abstract request class that is extended by the `BaseRequest` class.

Namespace

CommercePayments

Usage

`AuditParamsRequest` is an abstract class that holds attributes related to audit parameters such as email, IP address, MAC address, and phone number. This class can't be instantiated on its own. All `CommercePayments` request classes extend this class.

IN THIS SECTION:

AuditParamsRequest Constructors

AuditParamsRequest Properties

AuditParamsRequest Constructors

The following are constructors for `AuditParamsRequest`.

IN THIS SECTION:

AuditParamsRequest(email, macAddress, ipAddress, phone)
This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`AuditParamsRequest(email, macAddress, ipAddress, phone)`

This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
AuditParamsRequest(String email, String macAddress, String ipAddress, String phone)
```

Parameters

email
Type: String

Email of the client that initiated the request.

macAddress
Type: String

Mac address of the customer's device. Gateways often use this data in risk checks.

ipAddress
Type: String

The customer's IP address. Gateways often use this data in risk checks.

phone
Type: String

Phone number of the client that initiated the request.

AuditParamsRequest Properties

The following are properties for `AuditParamsRequest`.

IN THIS SECTION:

email
Email of the client that initiated the request.

ipAddress
The customer's IP address. Gateways often use this data in risk checks.

macAddress
Mac address of the customer's device. Gateways often use this data in risk checks.

phone
Phone number of the client that initiated the request.

email

Email of the client that initiated the request.

Property Value

Type: String

ipAddress

The customer's IP address. Gateways often use this data in risk checks.

Property Value

Type: String

macAddress

Mac address of the customer's device. Gateways often use this data in risk checks.

Property Value

Type: String

phone

Phone number of the client that initiated the request.

Property Value

Type: String

AuthApiPaymentMethodRequest Class

Sends information about a payment method to a gateway adapter during an authorization service call.

Namespace

CommercePayments

Usage

Contains information about the payment method that is used for an authorization request. It contains all available payment methods as fields, but populates only one field for each request. The gateway adapter uses this class when constructing an authorization request. An object of this class is available through the `paymentMethod` field on the `AuthorizationRequest Class` object.

IN THIS SECTION:

AuthApiPaymentMethodRequest Constructors

AuthApiPaymentMethodRequest Properties

AuthApiPaymentMethodRequest Constructors

The following are constructors for `AuthApiPaymentMethodRequest`.

IN THIS SECTION:

AuthApiPaymentMethodRequest(cardPaymentMethodRequest)
Constructs a sample `cardPaymentMethodRequest`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

AuthApiPaymentMethodRequest()
Constructor for `AuthApiPaymentMethodRequest`.

`AuthApiPaymentMethodRequest(cardPaymentMethodRequest)`

Constructs a sample `cardPaymentMethodRequest`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global AuthApiPaymentMethodRequest(commercepayments.CardPaymentMethodRequest
cardPaymentMethodRequest)
```

Parameters

`cardPaymentMethodRequest`
Type: commercepayments.CardPaymentMethodRequest on page 339

Contains information about the card payment method. Used to send information to a gateway adapter during a service call.

`AuthApiPaymentMethodRequest()`

Constructor for `AuthApiPaymentMethodRequest`.

Signature

```
global AuthApiPaymentMethodRequest()
```

AuthApiPaymentMethodRequest Properties

The following are properties for `AuthApiPaymentMethodRequest`.

IN THIS SECTION:

cardPaymentMethod
The card payment method object used in a payment method request.

`cardPaymentMethod`

The card payment method object used in a payment method request.

Signature

```
global commercepayments.CardPaymentMethodRequest cardPaymentMethod {get; set;}
```

Property Value

Type: commercepayments.CardPaymentMethodRequest on page 339

AuthorizationRequest Class

Sends information about an authorization request to a gateway adapter during a service call.

Namespace

CommercePayments

Usage

This class contains information about a transaction authorization request. The gateway adapter reads fields from this class while constructing an authorization JSON request to send to the payment gateway. An object of this class is available by calling `getPaymentRequest()` in the `PaymentGatewayContext Class`.

Example

Creating a `buildAuthRequest` class to store information about the authorization request.

```
private String buildAuthRequest(commercepayments.AuthorizationRequest authRequest) {
        // Multiply amount by 100.0 to convert to cents
        String requestBody =
createRequestBody(String.ValueOf((authRequest.amount*100.0).intValue()), authRequest);
        return requestBody;

      private String createRequestBody(String amount, commercepayments.AuthorizationRequest
 authRequest) {
        JSONGenerator jsonGeneratorInstance = JSON.createGenerator(true);
        String currencyIso = authRequest.currencyIsoCode;
        commercepayments.AuthApiPaymentMethodRequest paymentMethod =
authRequest.paymentMethod;
        commercepayments.GatewayErrorResponse error;
        // Write data to the JSON string.
        jsonGeneratorInstance.writeStartObject();
      jsonGeneratorInstance.writeStringField('merchantAccount', '{!$Credential.Username}');

        jsonGeneratorInstance.writeStringField('reference', authRequest.comments == null
? 'randomstring' : authRequest.comments);

        if(currencyIso == null) {
            currencyIso = UserInfo.getDefaultCurrency();
        }

        jsonGeneratorInstance.writeFieldName('amount');
        jsonGeneratorInstance.writeStartObject();
```

```
        jsonGeneratorInstance.writeStringField('value', amount);
        jsonGeneratorInstance.writeStringField('currency', currencyIso);
        jsonGeneratorInstance.writeEndObject();

        commercepayments.CardPaymentMethodRequest cardPaymentMethod;
        if(paymentMethod != null) {
            cardPaymentMethod = paymentMethod.cardPaymentMethod;
            if (cardPaymentMethod != null) {
                if (cardPaymentMethod.CardCategory != null) {
                    if (commercepayments.CardCategory.CreditCard ==
cardPaymentMethod.CardCategory) {
                        jsonGeneratorInstance.writeFieldName('card');
                        jsonGeneratorInstance.writeStartObject();
                        if (cardPaymentMethod.cvv != null)
                            jsonGeneratorInstance.writeStringField('cvc',
String.ValueOf(cardPaymentMethod.cvv));
                        if (cardPaymentMethod.cardholdername != null)
                            jsonGeneratorInstance.writeStringField('holderName',
cardPaymentMethod.cardholdername);
                        if (cardPaymentMethod.cardnumber != null)
                            jsonGeneratorInstance.writeStringField('number',
cardPaymentMethod.cardnumber);
                        if (cardPaymentMethod.expiryMonth != null &&
cardPaymentMethod.expiryYear != null ) {
                            String expMonth =
((String.ValueOf(cardPaymentMethod.expiryMonth)).length() == 1 ? '0' : '') +
String.ValueOf(cardPaymentMethod.expiryMonth);
                         jsonGeneratorInstance.writeStringField('expiryMonth', expMonth);

                            jsonGeneratorInstance.writeStringField('expiryYear',
String.ValueOf(cardPaymentMethod.expiryYear));
                        }
                        jsonGeneratorInstance.writeEndObject();
                    } else {
                    //Support for other card type
                    }
                } else {
                    throw new SampleValidationException('Required Field Missing :
CardCategory');
                }
            } else {
                throw new SampleValidationException('Required Field Missing :
CardPaymentMethod');
            }
        } else {
           throw new SampleValidationException('Required Field Missing : PaymentMethod');

        }
        jsonGeneratorInstance.writeEndObject();
        return jsonGeneratorInstance.getAsString();
    }
```

IN THIS SECTION:

AuthorizationRequest Constructors

AuthorizationRequest Properties

AuthorizationRequest Methods

AuthorizationRequest Constructors

The following are constructors for `AuthorizationRequest`.

IN THIS SECTION:

AuthorizationRequest(amount)
Constructor for building the amount in an authorization request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`AuthorizationRequest(amount)`

Constructor for building the amount in an authorization request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global AuthorizationRequest(Double amount)
```

Parameters

amount
Type: Double

The amount of the authorization.

AuthorizationRequest Properties

The following are properties for `AuthorizationRequest`.

IN THIS SECTION:

accountId
The customer account where the authorization is performed.

amount
The total amount of the authorization. Can be positive or negative.

comments
Comments about the authorization. Users can enter comments to provide additional information.

currencyIsoCode
The ISO currency code for the authorization request.

paymentMethod
The payment method used to process the authorization in the authorization request.

accountId

The customer account where the authorization is performed.

Signature

```
global String accountId {get; set;}
```

Property Value

Type: String

amount

The total amount of the authorization. Can be positive or negative.

Signature

```
global Double amount {get; set;}
```

Property Value

Type: Double

comments

Comments about the authorization. Users can enter comments to provide additional information.

Signature

```
global String comments {get; set;}
```

Property Value

Type: String

currencyIsoCode

The ISO currency code for the authorization request.

Signature

```
global String currencyIsoCode {get; set;}
```

Property Value

Type: String

paymentMethod

The payment method used to process the authorization in the authorization request.

Signature

```
global AuthApiPaymentMethodRequest paymentMethod {get; set;}
```

Property Value

Type: AuthApiPaymentMethodRequest on page 294

AuthorizationRequest Methods

The following are methods for `AuthorizationRequest`.

IN THIS SECTION:

equals(obj)

Maintains the integrity of lists of type `AuthorizationRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

hashCode()

Maintains the integrity of lists of type `AuthorizationRequest` by determining the uniqueness of the external object in a list.

toString()

Converts a date to a string.

`equals(obj)`

Maintains the integrity of lists of type `AuthorizationRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj

Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `AuthorizationRequest` by determining the uniqueness of the external object in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

AuthorizationResponse Class

Response sent by the payment gateway adapter for an authorization service.

Namespace

CommercePayments

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.AuthorizationResponse authr = new
CommercePayments.AuthorizationResponse();
```

Contains information about the payment gateway's response following an authorization transaction. The gateway adapter uses the payment gateway's response to populate the `AuthorizationResponse` fields. The payments platform uses the information from this class to construct the authorization gateway response shown to the user.

Example

```
private commercepayments.GatewayResponse createAuthResponse(HttpResponse response, Double
 amount) {
        Map<String, Object> mapOfResponseValues = (Map
                            <String, Object>) JSON.deserializeUntyped(response.getBody());

        commercepayments.AuthorizationResponse authResponse = new
commercepayments.AuthorizationResponse();

        String resultCode = (String)mapOfResponseValues.get('resultCode');

        if(resultCode != null){
            system.debug('Response - success');
            if(resultCode.equals('Authorised')){
                system.debug('status - authorised');
```

```
            authResponse.setGatewayAuthCode((String)mapOfResponseValues.get('authCode'));

                authResponse.setSalesforceResultCodeInfo(new
commercepayments.SalesforceResultCodeInfo(commercepayments.SalesforceResultCode.Success));

            } else {
                //Sample returns 200 with refused status in some cases
                system.debug('status - refused');

authResponse.setGatewayResultCodeDescription((String)mapOfResponseValues.get('refusalReason'));

                authResponse.setSalesforceResultCodeInfo(new
commercepayments.SalesforceResultCodeInfo(commercepayments.SalesforceResultCode.Decline));

            }

authResponse.setGatewayReferenceNumber((String)mapOfResponseValues.get('pspReference'));
            authResponse.setAmount(amount);
            authResponse.setGatewayDate(system.now());
            return authResponse;
        } else {
            system.debug('Response - failed');
            system.debug('Validation error');
            String statusCode = (String)mapOfResponseValues.get('errorType');
            String message = (String)mapOfResponseValues.get('message');
            commercepayments.GatewayErrorResponse error = new
commercepayments.GatewayErrorResponse(statusCode, message);
            return error;
        }
    }
```

IN THIS SECTION:

AuthorizationResponse Methods

AuthorizationResponse Methods

The following are methods for `AuthorizationResponse`.

IN THIS SECTION:

setAmount(amount)

Sets the amount of the authorization. Must be a non-zero value.

setAuthorizationExpirationDate(authExpDate)

Sets the expiration date of the authorization request.

setGatewayAuthCode(gatewayAuthCode)

Sets the authorization code that the gateway returned. Maximum length of 64 characters.

setGatewayAvsCode(gatewayAvsCode)

Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)

Sets the date that the authorization occurred. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the authorization request. Maximum length of 255 characters.

setGatewayReferenceDetails(gatewayReferenceDetails)

Stores data that you can use for subsequent authorizations. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse)

Sets information from the gateway about the tokenized payment method.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

`setAmount(amount)`

Sets the amount of the authorization. Must be a non-zero value.

Signature

```
global void setAmount(Double amount)
```

Parameters

amount

Type: Double

Return Value

Type: void

`setAuthorizationExpirationDate(authExpDate)`

Sets the expiration date of the authorization request.

Signature

```
global void setAuthorizationExpirationDate(Datetime authExpDate)
```

Parameters

authExpDate
Type: Datetime

Return Value

Type: void

setGatewayAuthCode(gatewayAuthCode)

Sets the authorization code that the gateway returned. Maximum length of 64 characters.

Signature

```
global void setGatewayAuthCode(String gatewayAuthCode)
```

Parameters

gatewayAuthCode
Type: String

The authorization code returned by the gateway.

Return Value

Type: void

setGatewayAvsCode(gatewayAvsCode)

Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

Signature

```
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

gatewayAvsCode
Type: String

Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.

Return Value

Type: void

setGatewayDate(gatewayDate)

Sets the date that the authorization occurred. Some gateways don't send this value.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

Return Value

Type: void

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the authorization request. Maximum length of 255 characters.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Return Value

Type: void

setGatewayReferenceDetails(gatewayReferenceDetails)

Stores data that you can use for subsequent authorizations. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

gatewayReferenceDetails
Type: String

Return Value

Type: void

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique authorization ID created by the payment gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Must be used to map a Salesforce-specific result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the gateway's result code. Use this field to learn more about why the gateway returned a certain result code.

Return Value

Type: void

`setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse)`

Sets information from the gateway about the tokenized payment method.

Signature

```
global void
setPaymentMethodTokenizationResponse(commercepayments.PaymentMethodTokenizationResponse
paymentMethodTokenizationResponse)
```

Parameters

paymentMethodTokenizationResponse
PaymentMethodTokenizationResponse on page 377

Gateway response sent by payment gateway adapters for the payment method tokenization request.

Return Value

Type: void

`setSalesforceResultCodeInfo(salesforceResultCodeInfo)`

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
Type: SalesforceResultCodeInfo on page 419

Description of the Salesforce result code value.

Return Value

Type: void

AuthorizationReversalRequest Class

Sends information about an authorization reversal request to a gateway adapter during a service call.

Namespace

CommercePayments on page 270

Example

Add your reversal classes to your payment gateway adapter. We recommend adding `AuthorizationReversal` as a possible requestType value when calling processRequest on the gateway's response.

```
global commercepayments.GatewayResponse processRequest(commercepayments.paymentGatewayContext
 gatewayContext) {
       commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();

        commercepayments.GatewayResponse response;

        try {
        //add other requestType values here
        //..
        else if (requestType == commercepayments.RequestType.AuthorizationReversal) {
                response =
createAuthReversalResponse((commercepayments.AuthorizationReversalRequest)gatewayContext.getPaymentRequest());}

        return response;
```

Then, add a class that sets the amount of the authorization reversal request, as well as gateway information and the Salesforce result code.

```
global commercepayments.GatewayResponse
createAuthReversalResponse(commercepayments.AuthorizationReversalRequest authReversalRequest)
 {
        commercepayments.AuthorizationReversalResponse authReversalResponse = new
commercepayments.AuthorizationReversalResponse();
        if(authReversalRequest.amount!=null )
        {
            authReversalResponse.setAmount(authReversalRequest.amount);
        }
        else
        {
             throw new SalesforceValidationException('Required Field Missing : Amount');

        }

        system.debug('Response - success');
        authReversalResponse.setGatewayDate(system.now());
        authReversalResponse.setGatewayResultCode('00');
        authReversalResponse.setGatewayResultCodeDescription('Transaction Normal');
        authReversalResponse.setGatewayReferenceNumber('SF'+getRandomNumber(6));

authReversalResponse.setSalesforceResultCodeInfo(SUCCESS_SALESFORCE_RESULT_CODE_INFO);
        return authReversalResponse;
    }
```

IN THIS SECTION:

AuthorizationReversalRequest Constructors

AuthorizationReversalRequest Properties

AuthorizationReversalRequest Methods

AuthorizationReversalRequest Constructors

The following are constructors for `AuthorizationReversalRequest`.

IN THIS SECTION:

AuthorizationReversalRequest(amount, authorizationId)
Constructor for building the amount in an authorization reversal request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`AuthorizationReversalRequest(amount, authorizationId)`

Constructor for building the amount in an authorization reversal request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global AuthorizationReversalRequest(Double amount, String authorizationId)
```

Parameters

amount
Type: Double

The amount of the authorization reversal request.

authorizationId
Type: String

The authorization request to be reversed.

AuthorizationReversalRequest Properties

The following are properties for `AuthorizationReversalRequest`.

IN THIS SECTION:

accountId
References the customer account for the transaction where the authorization reversal was performed.

amount
The total amount of the authorization reversal request. Can be positive or negative.

paymentAuthorizationId
References the payment authorization to be reversed.

`accountId`

References the customer account for the transaction where the authorization reversal was performed.

Signature

```
global String accountId {get; set;}
```

Property Value

Type: String

amount

The total amount of the authorization reversal request. Can be positive or negative.

Signature

```
global Double amount {get; set;}
```

Property Value

Type: Double

paymentAuthorizationId

References the payment authorization to be reversed.

Signature

```
global String paymentAuthorizationId {get; set;}
```

Property Value

Type: String

AuthorizationReversalRequest Methods

The following are methods for `AuthorizationReversalRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `AuthorizationReversalRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type `AuthorizationReversalRequest` by determining the uniqueness of the external object in a list.

toString()
Converts a date to a string.

`equals(obj)`

Maintains the integrity of lists of type `AuthorizationReversalRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `AuthorizationReversalRequest` by determining the uniqueness of the external object in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

AuthorizationReversalResponse Class

Response sent by the payment gateway following a payment authorization reversal service.

Namespace

CommercePayments

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.AuthorizationReversalResponse authRevRes = new
CommercePayments.AuthorizationResponse();
```

Contains information about the payment gateway's response following an authorization reversal transaction. The gateway adapter uses the payment gateway's response to populate the `AuthorizationReversalResponse` fields. The payments platform uses the information from this class to construct the authorization gateway response shown to the user.

Example

This class builds an authorization reversal response that contains the amount of the original reversal request, gateway information, and the Salesforce result code.

```
global commercepayments.GatewayResponse
createAuthReversalResponse(commercepayments.AuthorizationReversalRequest authReversalRequest)
 {
        commercepayments.AuthorizationReversalResponse authReversalResponse = new
commercepayments.AuthorizationReversalResponse();
        if(authReversalRequest.amount!=null )
        {
            authReversalResponse.setAmount(authReversalRequest.amount);
        }
        else
        {
             throw new SalesforceValidationException('Required Field Missing : Amount');

        }

        system.debug('Response - success');
        authReversalResponse.setGatewayDate(system.now());
        authReversalResponse.setGatewayResultCode('00');
        authReversalResponse.setGatewayResultCodeDescription('Transaction Normal');
        authReversalResponse.setGatewayReferenceNumber('SF'+getRandomNumber(6));

authReversalResponse.setSalesforceResultCodeInfo(SUCCESS_SALESFORCE_RESULT_CODE_INFO);
        return authReversalResponse;
    }
```

IN THIS SECTION:

AuthorizationReversalResponse Methods

AuthorizationReversalResponse Methods

The following are methods for `AuthorizationReversalResponse`.

IN THIS SECTION:

setAmount(amount)
Contains the amount of the authorization reversal. Must be a non-zero value.

setGatewayAvsCode(gatewayAvsCode)
Sets the AVS (Address Verification System) result code that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)
Sets the date that the authorization reversal request occurred in the payment gateway. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)
Sets error messages that the gateway returned for the authorization reversal request. Maximum length of 255 characters.

setGatewayReferenceDetails(gatewayReferenceDetails)
Stores data that you can use for subsequent authorizations. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

setGatewayReferenceNumber(gatewayReferenceNumber)
Sets a unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

`setAmount(amount)`

Contains the amount of the authorization reversal. Must be a non-zero value.

Signature

```
global void setAmount(Double amount)
```

Parameters

amount
Type: Double

Return Value

Type: void

`setGatewayAvsCode(gatewayAvsCode)`

Sets the AVS (Address Verification System) result code that the gateway returned. Maximum length of 64 characters.

Signature

```
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

gatewayAvsCode
Type: String

Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.

Return Value

Type: void

setGatewayDate(gatewayDate)

Sets the date that the authorization reversal request occurred in the payment gateway. Some gateways don't send this value.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

Return Value

Type: void

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the authorization reversal request. Maximum length of 255 characters.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Return Value

Type: void

setGatewayReferenceDetails(gatewayReferenceDetails)

Stores data that you can use for subsequent authorizations. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

gatewayReferenceDetails
Type: String

Return Value

Type: void

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets a unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique reference ID created by the payment gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Must be used to map a Salesforce-specific result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the gateway's result code. Use this field to learn more about why the gateway returned a certain result code.

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
Type: SalesforceResultCodeInfo

Description of the Salesforce result code value.

Return Value

Type: void

BaseApiPaymentMethodRequest Class

Abstract class used to send information about a payment method to a gateway adapter during a service call.

Namespace

CommercePayments

Usage

`BaseApiPaymentMethodRequest` is the base class for `SaleApiPaymentMethodRequest` and `AuthApiPaymentMethodRequest`.

IN THIS SECTION:

BaseApiPaymentMethodRequest Constructors

BaseApiPaymentMethodRequest Properties

BaseApiPaymentMethodRequest Methods

BaseApiPaymentMethodRequest Constructors

The following are constructors for `BaseApiPaymentMethodRequest`.

IN THIS SECTION:

BaseApiPaymentMethodRequest(address, id, saveForFuture)
Constructs a payment method. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`BaseApiPaymentMethodRequest(address, id, saveForFuture)`

Constructs a payment method. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global BaseApiPaymentMethodRequest(commercepayments.AddressRequest address, String id,
Boolean saveForFuture)
```

Parameters

address
Type: commercepayments.AddressRequest on page 281

Sends data related on address request to a gateway adapter during a service call.

id
Type: String

saveForFuture
Type: Boolean

Indicates whether Salesforce saves the payment method for future use.

BaseApiPaymentMethodRequest Properties

The following are properties for `BaseApiPaymentMethodRequest`.

IN THIS SECTION:

address
The payment method's address.

id
ID of the payment method request.

saveForFuture
Indicates whether the payment method is saved as a record in Salesforce for future use.

address

The payment method's address.

Signature

```
global commercepayments.AddressRequest address {get; set;}
```

Property Value

Type: AddressRequest on page 281

id

ID of the payment method request.

Signature

```
global String id {get; set;}
```

Property Value

Type: String

saveForFuture

Indicates whether the payment method is saved as a record in Salesforce for future use.

Signature

```
global Boolean saveForFuture {get; set;}
```

Property Value

Type: Boolean

BaseApiPaymentMethodRequest Methods

The following are methods for `BaseApiPaymentMethodRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `BaseApiPaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type `BaseApiPaymentMethodRequest` by determining the uniqueness of the external object records in a list.

toString()
Converts a date to a string.

equals(obj)

Maintains the integrity of lists of type `BaseApiPaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

hashCode()

Maintains the integrity of lists of type `BaseApiPaymentMethodRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

toString()

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

BaseNotification Class

Abstract class for storing notification information sent from payment gateways.

Namespace

CommercePayments

Usage

An abstract class that contains the common fields from payment gateways. `BaseNotification` can't be instantiated on its own.

The constructor of this class takes no arguments. For example:

```
CommercePayments.BaseNotification bnt = new CommercePayments.BaseNotification();
```

Example

```
commercepayments.BaseNotification notification = null;
        if ('CAPTURE'.equals(eventCode)) {
            notification = new commercepayments.CaptureNotification();
        } else if ('REFUND'.equals(eventCode)) {
            notification = new commercepayments.ReferencedRefundNotification();
        }
```

IN THIS SECTION:

BaseNotification Methods

BaseNotification Methods

The following are methods for `BaseNotification`.

IN THIS SECTION:

setAmount(amount)

Sets the transaction amount. Must be a non-negative value.

setGatewayDate(gatewayDate)

Sets the date that the notification occurred. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the notification request. Maximum length of 255 characters.

setGatewayReferenceDetails(gatewayReferenceDetails)

Sets the payment gateway's reference details.

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the payment gateway's reference number.

setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setId(id)
Sets the ID of the notification sent by the gateway.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the information about the Salesforce-specific result code used to match a result code from a payment gateway.

setStatus(status)
Sets the status of the notification sent by the gateway.

`setAmount(amount)`

Sets the transaction amount. Must be a non-negative value.

Signature

```
global void setAmount(Double amount)
```

Parameters

amount
Type: Double

The amount of the transaction.

Return Value

Type: void

`setGatewayDate(gatewayDate)`

Sets the date that the notification occurred. Some gateways don't send this value.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

The date that the notification occurred.

Return Value

Type: void

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the notification request. Maximum length of 255 characters.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

The message that the gateway returned with the notification request. Contains additional information about the notification.

Return Value

Type: void

setGatewayReferenceDetails(gatewayReferenceDetails)

Sets the payment gateway's reference details.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

gatewayReferenceDetails
Type: String

Provides information about the gateway communication.

Return Value

Type: void

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the payment gateway's reference number.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique transaction ID created by the payment gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Must be used to map a Salesforce-specific result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Provides additional information about the result code and why the gateway returned the code. Descriptions vary between different gateways.

Return Value

Type: void

setId(id)

Sets the ID of the notification sent by the gateway.

Signature

```
global void setId(String id)
```

Parameters

id
Type: String

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the information about the Salesforce-specific result code used to match a result code from a payment gateway.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
Type: commercepayments.SalesforceResultCodeInfo on page 419

Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Return Value

Type: void

setStatus(status)

Sets the status of the notification sent by the gateway.

Signature

```
global void setStatus(commercepayments.NotificationStatus status)
```

Parameters

status
Type: commercepayments.NotificationStatus on page 362

Shows whether the payments platform successfully received the notification from the gateway.

Return Value

Type: void

BasePaymentMethodRequest Class

Abstract class for storing information about payment methods.

Namespace

CommercePayments

Usage

The `BasePaymentMethodRequest` class contains fields common to `CardPaymentMethodRequest` on page 339

.

IN THIS SECTION:

BasePaymentMethodRequest Methods

BasePaymentMethodRequest Methods

The following are methods for `BasePaymentMethodRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `BasePaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type `BasePaymentMethodRequest` by determining the uniqueness of the external object records in a list.

toString()
Converts a date to a string.

`equals(obj)`

Maintains the integrity of lists of type `BasePaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `BasePaymentMethodRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

BaseRequest Class

`BaseRequest` is extended by all the request classes.

Namespace

CommercePayments

IN THIS SECTION:

BaseRequest Methods

BaseRequest Methods

The following are methods for `BaseRequest`.

IN THIS SECTION:

BaseRequest(AdditionalData, IdempotencyKey)
Used for testing.

`BaseRequest(AdditionalData, IdempotencyKey)`

Used for testing.

Signature

```
global Void BaseRequest(String AdditionalData, Map<String, String> IdempotencyKey)
```

Parameters

AdditionalData
Type: String

Contains additional data that may be required for a payment request. The `additionalData` object consists of key-value pairs. You can retrieve the `additionalData` object from the request object: `Map<String, String> additionalData=request.additionalData`

IdempotencyKey
Type: Map<String, String>

Unique value that's generated by a client and sent to the server in the request. The server stores the value and uses the it to keep track of the request status.

Return Value

Type: Void

CaptureNotification Class

When a payment gateway sends a notification for a capture transaction, the payment gateway adapter creates the `CaptureNotification` object to store information about the notification.

Namespace

CommercePayments

Usage

`CaptureNotification` is used in asynchronous payment gateway adapters.

Specify the `CommercePayments` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```
CommercePayments.CaptureNotification crn = new CommercePayments.CaptureNotification();
```

Example

```
commercepayments.BaseNotification notification = null;
        if ('CAPTURE'.equals(eventCode)) {
            notification = new commercepayments.CaptureNotification();
        } else if ('REFUND'.equals(eventCode)) {
            notification = new commercepayments.ReferencedRefundNotification();
        }
```

IN THIS SECTION:

CaptureNotification Methods

CaptureNotification Methods

The following are methods for `CaptureNotification`.

IN THIS SECTION:

setAmount(amount)
Sets the transaction amount. Must be a non-negative value.

setGatewayDate(gatewayDate)
Sets the date that the transaction occurred. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)
Sets error messages that the gateway returned for the payment request. Maximum length of 255 characters.

setGatewayReferenceDetails(gatewayReferenceDetails)
Sets additional data that you can use for subsequent transactions. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

setGatewayReferenceNumber(gatewayReferenceNumber)
Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets a description of the gateway-specific result code that a gateway returned. Maximum length of 1000 characters.

setId(id)
Sets the ID of a notification sent by the payment gateway.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

setStatus(status)
Sets the notification status to the same value that was sent by the gateway.

`setAmount(amount)`

Sets the transaction amount. Must be a non-negative value.

Signature

```
global void setAmount(Double amount)
```

Parameters

amount
Type: Double

The amount to be debited or captured.

Return Value

Type: void

setGatewayDate(gatewayDate)

Sets the date that the transaction occurred. Some gateways don't send this value.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

Date and time of the gateway communication.

Return Value

Type: void

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the payment request. Maximum length of 255 characters.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Information on error messages sent from the gateway.

Return Value

Type: void

setGatewayReferenceDetails(gatewayReferenceDetails)

Sets additional data that you can use for subsequent transactions. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

gatewayReferenceDetails
Type: String

Return Value

Type: void

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique transaction ID created by the payment gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code can be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Map this value to a Salesforce-specific result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a gateway returned. Maximum length of 1000 characters.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the gateway's result code. Use this field to learn more about why the gateway returned a certain result code.

Return Value

Type: void

setId(id)

Sets the ID of a notification sent by the payment gateway.

Signature

```
global void setId(String id)
```

Parameters

id
Type: String

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
Type: commercepayments.SalesforceResultCodeInfo on page 419

Description of the Salesforce result code value.

Return Value

Type: void

setStatus(status)

Sets the notification status to the same value that was sent by the gateway.

Signature

```
global void setStatus(commercepayments.NotificationStatus status)
```

Parameters

status
Type: NotificationStatus on page 362

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Return Value

Type: void

CaptureRequest Class

Represents a capture request. This class extends the `BaseRequest` class and inherits all its methods.

Namespace

CommercePayments on page 270

Usage

The `CaptureRequest` class's `buildCaptureRequest` method creates a CaptureRequest object to store payment information, such as value and currency, as JSON strings.

Example

Builds a CaptureRequest object for a multicurrency org.

```
    private String buildCaptureRequest(commercepayments.CaptureRequest captureRequest) {
        Boolean IS_MULTICURRENCY_ORG = UserInfo.isMultiCurrencyOrganization();
        QueryUtils qBuilderForAuth = new QueryUtils(PaymentAuthorization.SObjectType);
        // Add required fields
        qBuilderForAuth.getSelectClause().addField('GatewayRefNumber', false);
        if (IS_MULTICURRENCY_ORG) {
            // addField also takes a boolean to enable translation (uses label instead of
actual value)
            qBuilderForAuth.getSelectClause().addField('CurrencyIsoCode', false);
        }
```

IN THIS SECTION:

CaptureRequest Constructors

CaptureRequest Properties

CaptureRequest Constructors

The following are constructors for `CaptureRequest`.

IN THIS SECTION:

CaptureRequest(amount, authorizationId)
This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`CaptureRequest(amount, authorizationId)`

This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Parameters

`amount`
Type: Double

The amount to be debited or captured.

`authorizationId`
Type: String

Represents a payment authorization record.

CaptureRequest Properties

The following are properties for `CaptureRequest`.

IN THIS SECTION:

accountId
Account ID value. References an account record.

amount
Amount of currency that needs to be captured.

paymentAuthorizationId
ID value that references a PaymentAuthorization.

`accountId`

Account ID value. References an account record.

Property Value

Type: String

`amount`

Amount of currency that needs to be captured.

Property Value

Type: Double

`paymentAuthorizationId`

ID value that references a PaymentAuthorization.

Property Value

Type: String

CaptureResponse Class

The payment gateway adapter sends this response for the capture request type. This class extends `AbstractResponse` and inherits its methods.

Namespace

CommercePayments on page 270

Usage

You must specify the `CommercePayments` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```
CommercePayments.Capture Response ctr = new CommercePayments.CaptureResponse();
```

IN THIS SECTION:

CaptureResponse Methods

CaptureResponse Methods

The following are methods for `CaptureResponse`.

IN THIS SECTION:

setAmount(amount)
Sets the transaction amount.

setAsync(async)
Indicates whether the payment gateway adapter used in the payment capture was asynchronous (`True`) or synchronous (`False`).

setGatewayAvsCode(gatewayAvsCode)
Sets the payment gateway's AVS (address verification system) code.

setGatewayDate(gatewayDate)
Sets the payment gateway's date.

setGatewayMessage(gatewayMessage)
Sets information or messages that the gateway returned.

setGatewayReferenceDetails(gatewayReferenceDetails)
Sets the payment gateway's reference details.

setGatewayReferenceNumber(gatewayReferenceNumber)
Sets the payment gateway's reference number.

setGatewayResultCode(gatewayResultCode)
Sets the payment gateway's result code.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets the payment gateway's result code description.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets Salesforce result code information.

`setAmount(amount)`

Sets the transaction amount.

Signature

```
global void setAmount(Double amount)
```

Parameters

amount
Type: Double

The amount to be debited or captured.

Return Value

Type: void

`setAsync(async)`

Indicates whether the payment gateway adapter used in the payment capture was asynchronous (`True`) or synchronous (`False`).

Signature

```
global void setAsync(Boolean async)
```

Parameters

async
Type: Boolean

Return Value

Type: void

setGatewayAvsCode(gatewayAvsCode)

Sets the payment gateway's AVS (address verification system) code.

Signature

```
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

gatewayAvsCode
Type: String

Payment gateways that use an AVS system return this code.

Return Value

Type: void

setGatewayDate(gatewayDate)

Sets the payment gateway's date.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

The date that communication happened with the gateway.

Return Value

Type: void

setGatewayMessage(gatewayMessage)

Sets information or messages that the gateway returned.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Information or error messages returned by the gateway.

Return Value

Type: void

`setGatewayReferenceDetails(gatewayReferenceDetails)`

Sets the payment gateway's reference details.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

`gatewayReferenceDetails`
Type: String

Provides information about the gateway communication.

Return Value

Type: void

`setGatewayReferenceNumber(gatewayReferenceNumber)`

Sets the payment gateway's reference number.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

`gatewayReferenceNumber`
Type: String

Unique transaction ID created by the payment gateway.

Return Value

Type: void

`setGatewayResultCode(gatewayResultCode)`

Sets the payment gateway's result code.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

The gateway result code. You must map this to a Salesforce result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets the payment gateway's result code description.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the GatewayResultCode. Provides additional context about the result code that the gateway returned.

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets Salesforce result code information.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
SalesforceResultCodeInfoType: commercepayments.SalesforceResultCodeInfo

Description of the Salesforce result code value.

Return Value

Type: void

CardCategory Enum

Defines whether the payment method represents a credit card or a debit card.

Namespace

CommercePayments on page 270

Enum Values

The following are the values of the `commercepayments.CardCategory` enum.

Value	Description
`CreditCard`	Shows that the payment method is a credit card.
`DebitCard`	Shows that the payment method is a debit card.

CardPaymentMethodRequest Class

Sends data related to a card payment method to a gateway adapter during a service call.

Namespace

CommercePayments on page 270

Usage

This class contains details about the card used as a payment method for authorization, sale, or tokenization transaction requests. The gateway adapter reads the fields of this class object while constructing a transaction JSON request to send to the payment gateway. The object of this class is available as the `cardPaymentMethod` field in the `SaleApiPaymentMethodRequest Class`, `AuthApiPaymentMethodRequest Class`, and `PaymentMethodTokenizationRequest Class`.

Example: This code sample retrieves the `cardPaymentMethodRequest` object from the `paymentMethod` class.

```
commercepayments.CardPaymentMethodRequest cardPaymentMethod =
paymentMethod.cardPaymentMethod;
```

IN THIS SECTION:

CardPaymentMethodRequest Constructors

CardPaymentMethodRequest Properties

CardPaymentMethodRequest Methods

CardPaymentMethodRequest Constructors

The following are constructors for `CardPaymentMethodRequest`.

IN THIS SECTION:

CardPaymentMethodRequest(cardCategory)

Sets the `cardCategory` value for the card payment method request.

`CardPaymentMethodRequest(cardCategory)`

Sets the `cardCategory` value for the card payment method request.

Signature

```
global CardPaymentMethodRequest(commercepayments.CardCategory cardCategory)
```

Parameters

`cardCategory`
Type: CardCategory on page 338

Defines whether the card payment method is a credit card or a debit card.

CardPaymentMethodRequest Properties

The following are properties for `CardPaymentMethodRequest`.

IN THIS SECTION:

accountId
Customer account for this payment method.

autoPay
Indicates whether a token is being requested so that the payment method can be used for recurring payments.

cardCategory
Indicates whether a card payment method is for a credit card or debit card.

cardHolderFirstName
The first name of the cardholder for the card payment method.

cardHolderLastName
The last name of the cardholder for the card payment method.

cardHolderName
Full name of the cardholder on the card payment method.

cardNumber
System-defined unique ID for the card payment method.

cardType
Defines the credit card bank. Possible values are `AmericanExpress`, `DinersClub`, `JCB`, `Maestro`, `MasterCard`, and`Visa`.

cvv
The card security code for the credit or debit card on a card payment method.

email
Email address of the cardholder for the credit or debit card on a card payment method.

expiryMonth
Expiration month for the credit or debit card on a card payment method.

expiryYear
Expiration year of the credit or debit card for the card payment method.

inputCardType
Input field for the card type. This field doesn't store the card type directly, but instead populates CardBin, LastFour, and DisplayCardNumber based on the value entered in `inputCardType`.

startMonth
The credit or debit card becomes valid on the first day of the `startMonth` in the `startYear`

startYear
Year during which the credit or debit card becomes valid.

accountId

Customer account for this payment method.

Signature

```
global String accountId {get; set;}
```

Property Value

Type: String

autoPay

Indicates whether a token is being requested so that the payment method can be used for recurring payments.

Signature

```
global Boolean autoPay {get; set;}
```

Property Value

Type: Boolean

cardCategory

Indicates whether a card payment method is for a credit card or debit card.

Signature

```
global commercepayments.CardCategory cardCategory {get; set;}
```

Property Value

Type: CardCategory on page 338

cardHolderFirstName

The first name of the cardholder for the card payment method.

Signature

```
global String cardHolderFirstName {get; set;}
```

Property Value

Type: String

cardHolderLastName

The last name of the cardholder for the card payment method.

Signature

```
global String cardHolderLastName {get; set;}
```

Property Value

Type: String

cardHolderName

Full name of the cardholder on the card payment method.

Signature

```
global String cardHolderName {get; set;}
```

Property Value

Type: String

cardNumber

System-defined unique ID for the card payment method.

Signature

```
global String cardNumber {get; set;}
```

Property Value

Type: String

cardType

Defines the credit card bank. Possible values are `AmericanExpress`, `DinersClub`, `JCB`, `Maestro`, `MasterCard`, and `Visa`.

Signature

```
global commercepayments.CardType cardType {get; set;}
```

Property Value

Type: CardType

cvv

The card security code for the credit or debit card on a card payment method.

Signature

```
global String cvv {get; set;}
```

Property Value

Type: String

email

Email address of the cardholder for the credit or debit card on a card payment method.

Signature

```
global String email {get; set;}
```

Property Value

Type: String

expiryMonth

Expiration month for the credit or debit card on a card payment method.

Signature

```
global Integer expiryMonth {get; set;}
```

Property Value

Type: Integer

expiryYear

Expiration year of the credit or debit card for the card payment method.

Signature

```
global Integer expiryYear {get; set;}
```

Property Value

Type: Integer

inputCardType

Input field for the card type. This field doesn't store the card type directly, but instead populates CardBin, LastFour, and DisplayCardNumber based on the value entered in `inputCardType`.

Signature

```
global String inputCardType {get; set;}
```

Property Value

Type: String

startMonth

The credit or debit card becomes valid on the first day of the `startMonth` in the `startYear`

Signature

```
global Integer startMonth {get; set;}
```

Property Value

Type: Integer

startYear

Year during which the credit or debit card becomes valid.

Signature

```
global Integer startYear {get; set;}
```

Property Value

Type: Integer

CardPaymentMethodRequest Methods

The following are methods for `CardPaymentMethodRequest`.

IN THIS SECTION:

equals(obj)

Maintains the integrity of lists of type `CardPaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

hashCode()

Maintains the integrity of lists of type `CardPaymentMethodRequest`.

toString()

Converts a date to a string.

equals(obj)

Maintains the integrity of lists of type `CardPaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

hashCode()

Maintains the integrity of lists of type `CardPaymentMethodRequest`.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

toString()

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

CardPaymentMethodResponse Class

This class contains details about the card payment method.

Namespace

CommercePayments

IN THIS SECTION:

CardPaymentMethodResponse Methods

CardPaymentMethodResponse Methods

The following are methods for `CardPaymentMethodResponse`.

IN THIS SECTION:

setAccountId(accountId)
Sets the Salesforce payments account to which this payment method is linked.

setAutoPay(autoPay)
Sets whether a token for recurring payments is being requested or not.

setCardBin(cardBin)
Sets the card Bank Identification Number (BIN).

setCardCategory(cardCategory)
Sets the card category.

setCardHolderFirstName(cardHolderFirstName)
Sets the first name of the card holder.

setCardHolderLastName(cardHolderLastName)
Sets the last name of the card holder.

setCardHolderName(cardHolderName)
Sets the name of the card holder.

setCardLastFour(cardLastFour)
Sets the last four digits of the card.

setCardType(cardType)
Specifies the type of the credit card issuer.

setCardTypeCategory(cardTypeCategory)
Sets the credit card issuer.

setComments(comments)
Sets the notes added by a user for card payment.

setDisplayCardNumber(displayCardNumber)
Sets the display card number.

setEmail(email)
Sets the email address of the card holder.

setExpiryMonth(expiryMonth)
Sets the month of expiry of the card.

setExpiryYear(expiryYear)
Sets the year of expiry of the card.

setNickName(nickName)
Sets the nickname of the card.

setStartMonth(startMonth)
Sets the month the card becomes active.

setStartYear(startYear)
Sets the year the card becomes active.

setAccountId(accountId)

Sets the Salesforce payments account to which this payment method is linked.

Signature

```
public void setAccountId(Id accountId)
```

Parameters

accountId
Type: Id

Salesforce Payments account to which this payment method is linked.

Return Value

Type: void

setAutoPay(autoPay)

Sets whether a token for recurring payments is being requested or not.

Signature

```
public void setAutoPay(Boolean autoPay)
```

Parameters

autoPay
Type: Boolean

Indicates whether a token for recurring payments is being requested (`true`) or not (`false`). The token lets the payment method be used for recurring payments.

Return Value

Type: void

setCardBin(cardBin)

Sets the card Bank Identification Number (BIN).

Signature

```
public void setCardBin(String cardBin)
```

Parameters

cardBin
Type: String

Bank Identification Number (BIN). The BIN is the first 4-6 numbers on a payment card that identifies the card issuer.

Return Value

Type: void

setCardCategory(cardCategory)

Sets the card category.

Signature

```
public void setCardCategory(commercepayments.CardCategory cardCategory)
```

Parameters

cardCategory
Type: CommercePayments.CardCategory

Specifies whether it is a credit card or debit card.

Return Value

Type: void

setCardHolderFirstName(cardHolderFirstName)

Sets the first name of the card holder.

Signature

```
public void setCardHolderFirstName(String cardHolderFirstName)
```

Parameters

cardHolderFirstName
Type: String

First name of the card holder.

Return Value

Type: void

setCardHolderLastName(cardHolderLastName)

Sets the last name of the card holder.

Signature

```
public void setCardHolderLastName(String cardHolderLastName)
```

Parameters

cardHolderLastName
Type: String

Last name of the card holder.

Return Value

Type: void

setCardHolderName(cardHolderName)

Sets the name of the card holder.

Signature

```
public void setCardHolderName(String cardHolderName)
```

Parameters

cardHolderName
Type: String

Card holder name.

Return Value

Type: void

setCardLastFour(cardLastFour)

Sets the last four digits of the card.

Signature

```
public void setCardLastFour(String cardLastFour)
```

Parameters

cardLastFour
Type: String

Last four digits of the card.

Return Value

Type: void

`setCardType(cardType)`

Specifies the type of the credit card issuer.

Signature

```
public void setCardType(String cardType)
```

Parameters

`cardType`
Type: String

Type of the credit card issuer.

Return Value

Type: void

`setCardTypeCategory(cardTypeCategory)`

Sets the credit card issuer.

Signature

```
public void setCardTypeCategory(commercepayments.CardType cardTypeCategory)
```

Parameters

`cardTypeCategory`
Type: CommercePayments.CardType

Credit card issuer.

Return Value

Type: void

`setComments(comments)`

Sets the notes added by a user for card payment.

Signature

```
public void setComments(String comments)
```

Parameters

`comments`
Type: String

Details about a record added by a user, maximum is 1000 characters.

Return Value

Type: void

setDisplayCardNumber(displayCardNumber)

Sets the display card number.

Signature

```
public void setDisplayCardNumber(String displayCardNumber)
```

Parameters

displayCardNumber
Type: String

Displayed card number.

Return Value

Type: void

setEmail(email)

Sets the email address of the card holder.

Signature

```
public void setEmail(String email)
```

Parameters

email
Type: String

Email address of the card holder.

Return Value

Type: void

setExpiryMonth(expiryMonth)

Sets the month of expiry of the card.

Signature

```
public void setExpiryMonth(Integer expiryMonth)
```

Parameters

expiryMonth
Type: Integer

Month of expiry of the card.

Return Value

Type: void

setExpiryYear(expiryYear)

Sets the year of expiry of the card.

Signature

```
public void setExpiryYear(Integer expiryYear)
```

Parameters

expiryYear
Type: Integer

Year of expiry of the card.

Return Value

Type: void

setNickName(nickName)

Sets the nickname of the card.

Signature

```
public void setNickName(String nickName)
```

Parameters

nickName
Type: String

Card nickname.

Return Value

Type: void

setStartMonth(startMonth)

Sets the month the card becomes active.

Signature

```
public void setStartMonth(Integer startMonth)
```

Parameters

startMonth
Type: Integer

Determines from which month the card becomes active.

Return Value

Type: void

setStartYear(startYear)

Sets the year the card becomes active.

Signature

```
public void setStartYear(Integer startYear)
```

Parameters

startYear
Type: Integer

Determines from which year the card becomes active.

Return Value

Type: void

CardType Enum

Specifies the credit card issuer.

Enum Values

The following are the values of the `commercepayments.CardType` enum.

Value	Description
`AmericanExpress`	American Express card
`DinersClub`	Diners Club card
`Jcb`	Japan Credit Bureau (JCB) card
`Maestro`	Maestro card
`MasterCard`	Master card

Value	Description
`Visa`	Visa card

CustomMetadataTypeInfo Class

Access information about custom metadata. The `PaymentGatewayAdapter` can send `CustomMetadataTypeInfo` to transaction requests through the response object's `SalesforceResultCodeInfo`.

Namespace

CommercePayments on page 270

IN THIS SECTION:

CustomMetadataTypeInfo Constructors

CustomMetadataTypeInfo Methods

CustomMetadataTypeInfo Constructors

The following are constructors for `CustomMetadataTypeInfo`.

IN THIS SECTION:

CustomMetadataTypeInfo(cmtRecordId, cmtSfResultCodeFieldName)
Constructor for providing custom metadata type information.

`CustomMetadataTypeInfo(cmtRecordId, cmtSfResultCodeFieldName)`

Constructor for providing custom metadata type information.

Signature

```
global CustomMetadataTypeInfo(String cmtRecordId, String cmtSfResultCodeFieldName)
```

Parameters

`cmtRecordId`
Type: String

ID of the matchedcustom metadata type record

`cmtSfResultCodeFieldName`
Type: String

Field that contains the Salesforce result code values. Belongs to the custom metadata type.

CustomMetadataTypeInfo Methods

The following are methods for `CustomMetadataTypeInfo`.

GatewayErrorResponse Class

Use to respond with an error indication following errors from the `PaymentGateway` adapter, such as request-forbidden responses, custom validation errors, or expired API tokens.

Namespace

CommercePayments on page 270

Usage

Use `GatewayErrorResponse` to create an object that stores information about error responses sent by the payment gateway adapter.

Example

If `GatewayResponse` receives an exception rather than a valid request, it calls `GatewayErrorResponse` to create an error object with information about the exception.

```
global commercepayments.GatewayResponse processRequest(commercepayments.paymentGatewayContext
 gatewayContext) {
       commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();

        commercepayments.GatewayResponse response;
        try {
            if (requestType == commercepayments.RequestType.Authorize) {
                response =
createAuthResponse((commercepayments.AuthorizationRequest)gatewayContext.getPaymentRequest());

            } else if (requestType == commercepayments.RequestType.Capture) {
                response =
createCaptureResponse((commercepayments.CaptureRequest)gatewayContext.getPaymentRequest())
 ;
            } else if (requestType == commercepayments.RequestType.ReferencedRefund) {
                response =
createRefundResponse((commercepayments.ReferencedRefundRequest)gatewayContext.getPaymentRequest());

            }
            return response;
        } catch(SalesforceValidationException e) {
             commercepayments.GatewayErrorResponse error = new
commercepayments.GatewayErrorResponse('400', e.getMessage());
             return error;
        }
    }
```

IN THIS SECTION:

GatewayErrorResponse Constructors

GatewayErrorResponse Constructors

The following are constructors for `GatewayErrorResponse`.

IN THIS SECTION:

GatewayErrorResponse(errorCode, errorMessage)
Constructor to create a GatewayErrorResponse object that accepts `errorCode` and `errorMessage`.

`GatewayErrorResponse(errorCode, errorMessage)`

Constructor to create a GatewayErrorResponse object that accepts `errorCode` and `errorMessage`.

Signature

```
global GatewayErrorResponse(String errorCode, String errorMessage)
```

Parameters

`errorCode`
Type: String

Should match with the HTTP status code to be returned to the user. Here are a few examples.

- If the status code is for a bad request, the errorCode should be 400.
- If the status code is for a forbidden request, errorCode should be 403.
- If errorCode isn't a valid HTTP status code, a 500 internal server error is returned.

Note: *`errorCode`* must have a value, otherwise the platform throws an error.

`errorMessage`
Type: String

The message response to users following an error.

Note: *`errorMessage`* must have a value, otherwise the platform throws an error.

GatewayNotificationResponse Class

When the payment gateway sends a notification to the payments platform, the platform responds with a `GatewayNotificationResponse` indicating whether the platform succeeded or failed at receiving the notification.

Namespace

CommercePayments on page 270

Usage

You must specify the `CommercePayments` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```
CommercePayments.GatewayNotificationResponse gnr = new
CommercePayments.GatewayNotificationResponse();
```

When an asynchronous payment gateway sends a notification, the gateway requires the platform to acknowledge that it has either succeeded or failed in receiving the notification. Payment gateway adapters use this class to construct the acknowledgment response, which gateways expect for a notification. `GatewayNotificationResponse` is the return type of the `processNotification` method.

Example

```
commercepayments.GatewayNotificationResponse gnr = new
commercepayments.GatewayNotificationResponse();
if (saveResult.isSuccess()) {
    system.debug('Notification accepted by platform');
} else {
    system.debug('Errors in the result '+ Blob.valueOf(saveResult.getErrorMessage()));
}
gnr.setStatusCode(200);
gnr.setResponseBody(Blob.valueOf('[accepted]'));
return gnr;
```

IN THIS SECTION:

GatewayNotificationResponse Methods

GatewayNotificationResponse Methods

The following are methods for `GatewayNotificationResponse`.

IN THIS SECTION:

setResponseBody(responseBody)

Sets the body of the response to the gateway. Some gateways expect the payments platform to acknowledge the notification with a response regardless of whether the notification was accepted.

setStatusCode(statusCode)

Sets the HTTP status code sent to the gateway as part of the payments platform's response notification.

`setResponseBody(responseBody)`

Sets the body of the response to the gateway. Some gateways expect the payments platform to acknowledge the notification with a response regardless of whether the notification was accepted.

Signature

```
global void setResponseBody(Blob responseBody)
```

Parameters

`responseBody`
Type: Blob

Common response values include `accepted` for successfully receiving the response. For example:

```
commercepayments.GatewayNotificationResponse gnr = new
commercepayments.GatewayNotificationResponse();
if (saveResult.isSuccess()) {
    system.debug('Notification accepted by platform');
} else {
    system.debug('Errors in the result '+ Blob.valueOf(saveResult.getErrorMessage()));
}
gnr.setStatusCode(200);
gnr.setResponseBody(Blob.valueOf('[accepted]'));
return gnr;
```

Return Value

Type: void

setStatusCode(statusCode)

Sets the HTTP status code sent to the gateway as part of the payments platform's response notification.

Signature

```
global void setStatusCode(Integer statusCode)
```

Parameters

statusCode

Type: Integer

The status code will vary based on the type of payments platform response. Users should configure their `GatewayNotificationResponse` class to account for all values that their payments platform can possibly return. For example:

```
commercepayments.GatewayNotificationResponse gnr = new
commercepayments.GatewayNotificationResponse();
if (saveResult.isSuccess()) {
    system.debug('Notification accepted by platform');
} else {
    system.debug('Errors in the result '+ Blob.valueOf(saveResult.getErrorMessage()));
}
gnr.setStatusCode(200);
gnr.setResponseBody(Blob.valueOf('[accepted]'));
return gnr;
```

Return Value

Type: void

GatewayResponse Interface

Generic payment gateway response interface. This class extends the `CaptureResponse` on page 334, `AbstractTransactionResponse` on page 277, and `AbstractResponse` on page 273 classes and inherits all their properties. It has no unique methods or parameters.

Namespace

CommercePayments on page 270

IN THIS SECTION:

GatewayResponse Example Implementation

GatewayResponse Example Implementation

This is an example implementation of the `commercepayments.GatewayResponse` interface.

```
/**
     * Abstract function to build gateway response for a Transaction
     * The input is the response from gateway
     * It creates and returns GatewayResponse from the HttpResponse
     */
    public abstract commercepayments.GatewayResponse buildResponse(HttpResponse response);

    /**
     * Function to process transaction requests
     * Steps involved are:
     * 1. Build HttpRequest with the input Request from gateway context
     * 2. Send request and get the response from gateway
     * 3. Parse the response from gateway and return GatewayResponse
     */
    public commercepayments.GatewayResponse execute(){
                HttpRequest req;
        try{
            //Building a new request
            req = buildRequest();
        } catch(PayeezeValidationException e) {
            return getValidationExceptionError(e);
        }
        commercepayments.PaymentsHttp http = new commercepayments.PaymentsHttp();
        HttpResponse res = null;
        try{
            //Sending the request
            res = http.send(req);
        } catch(CalloutException ce) {
            return getCalloutExceptionError(ce);
        }
        try{
            //Parsing the response from gateway
            return buildResponse(res);
        } catch(Exception e) {
```

```
            return getParseExceptionError(e);
        }
    }
```

For additional context, review the complete Sample Gateway Adapter in the CommercePayments Gateway Reference Implementation.

NotificationClient Class

Communicates with the payment platform regarding the gateway's notification.

Namespace

CommercePayments on page 270

Usage

Specify the `CommercePayments` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```
CommercePayments.NotificationClient ntc = new CommercePayments.NotificationClient();
```

This class is used in asynchronous payment gateway adapters. The notification client contains API for communicating with the payments platform regarding the gateway's notification. When the gateway sends a notification, the gateway adapter invokes the `record` method in `NotificationClient` to request that the platform updates notification details.

Example

The `NotificationSaveResult` class creates a saveResult object to store the result of the save request made to the payment gateway.

```
commercepayments.NotificationSaveResult saveResult =
commercepayments.NotificationClient.record(notification);
```

IN THIS SECTION:

NotificationClient Methods

NotificationClient Methods

The following are methods for `NotificationClient`.

IN THIS SECTION:

record(notification)

Stores the results of a notification request.

`record(notification)`

Stores the results of a notification request.

Signature

```
global static commercepayments.NotificationSaveResult
record(commercepayments.BaseNotification notification)
```

Parameters

notification
Type: BaseNotification on page 320

Return Value

Type: NotificationSaveResult on page 361

NotificationSaveResult Class

Contains the result of the payment platform's attempt to record data from the gateway's notification.

Namespace

CommercePayments on page 270

Usage

This class is used with asynchronous payments. It is the return type of the `NotificiationClient.record` operation and contains the result of the payment platform's attempt to save notification details.

The constructor of this class takes no arguments. For example:

```
CommercePayments.NotificationSaveResult nsr = new
CommercePayments.NotificationSaveResult();
```

Example

```
commercepayments.NotificationSaveResult saveResult =
commercepayments.NotificationClient.record(notification);
```

IN THIS SECTION:

NotificationSaveResult Methods

NotificationSaveResult Methods

The following are methods for `NotificationSaveResult`.

IN THIS SECTION:

getErrorMessage()
Gets the error message, if any, from the payment platform regarding its attempt to save the notification sent from the payment gateway.

getStatusCode()
Gets the status code from the payment platform's attempt to save the notification sent from the payment gateway.

isSuccess()
Gets the status of whether the payment platform successfully saved the notification sent from the payment gateway.

`getErrorMessage()`

Gets the error message, if any, from the payment platform regarding its attempt to save the notification sent from the payment gateway.

Signature

```
global String getErrorMessage()
```

Return Value

Type: String

`getStatusCode()`

Gets the status code from the payment platform's attempt to save the notification sent from the payment gateway.

Signature

```
global Integer getStatusCode()
```

Return Value

Type: Integer

`isSuccess()`

Gets the status of whether the payment platform successfully saved the notification sent from the payment gateway.

Signature

```
global Boolean isSuccess()
```

Return Value

Type: Boolean

NotificationStatus Enum

Shows whether the payments platform successfully received the notification from the gateway.

Usage

When the gateway sends a notification for a payment request, the payments platform delegates the notification request to the gateway adapter. First, the adapter evaluates the signature from the notification request. If the signature is valid, the adapter builds a notification

object to store information about the notification. During this process, the adapter sets the `NotificationStatus` to `Failed` or `Success` based on information from the notification request.

Enum Values

The following are the values of the `commercepayments.NotificationStatus` enum.

Value	Description
`Failed`	The payments platform couldn't receive the notification due to an error.
`Success`	The payments platform received the notification.

PaymentGatewayAdapter Interface

`PaymentGatewayAdapters` can implement this interface in order to process requests.

Namespace

CommercePayments on page 270

IN THIS SECTION:

PaymentGatewayAdapter Methods

PaymentGatewayAdapter Methods

The following are methods for `PaymentGatewayAdapter`.

IN THIS SECTION:

processRequest(var1)

The entry point for processing payment requests. Returns the response from the payment gateway.

`processRequest(var1)`

The entry point for processing payment requests. Returns the response from the payment gateway.

Signature

```
global commercepayments.GatewayResponse
processRequest(commercepayments.PaymentGatewayContext var1)
```

Parameters

`var1`

Type: commercepayments.PaymentGatewayContext

You can retrieve the request type and the request from the Context object.

Return Value

Type: commercepayments.GatewayResponse

The response from the payment gateway.

PaymentGatewayAsyncAdapter Interface

Implement the interface to allow customers to process payments asynchronously.

Namespace

CommercePayments on page 270

Usage

Implementing an asynchronous adapter also requires the `processNotification` method from the GatewayNotificationResponse on page 356 class.

Example

```
global with sharing class SampleAsyncAdapter implements
commercepayments.PaymentGatewayAsyncAdapter, commercepayments.PaymentGatewayAdapter {
    global SampleAsyncAdapter() {}

    global commercepayments.GatewayResponse
processRequest(commercepayments.paymentGatewayContext gatewayContext) {
    }

    global commercepayments.GatewayNotificationResponse
processNotification(commercepayments.PaymentGatewayNotificationContext
gatewayNotificationContext) {
    }
}
```

IN THIS SECTION:

PaymentGatewayAsyncAdapter Methods

PaymentGatewayAsyncAdapter Example Implementation

PaymentGatewayAsyncAdapter Methods

The following are methods for `PaymentGatewayAsyncAdapter`.

IN THIS SECTION:

processNotification(paymentGatewayNotificationContext)

Entry point for processing notifications from payment gateways.

processNotification(paymentGatewayNotificationContext)

Entry point for processing notifications from payment gateways.

Signature

```
global commercepayments.GatewayNotificationResponse
processNotification(commercepayments.PaymentGatewayNotificationContext var1)
```

Parameters

paymentGatewayNotificationContext
Type: PaymentGatewayNotificationContext on page 369

The `PaymentGatewayNotificationContext` object wraps all the information related to a gateway notification.

Return Value

Type: GatewayNotificationResponse on page 356

When the payment gateway sends a notification to the payments platform, the platform responds with a `GatewayNotificationResponse` indicating whether the platform succeeded or failed at receiving the notification.

PaymentGatewayAsyncAdapter Example Implementation

This is a sample implementation of the `commercepayments.PaymentGatewayAsyncAdapter` interface.

```
global with sharing class AdyenAdapter implements
commercepayments.PaymentGatewayAsyncAdapter, commercepayments.PaymentGatewayAdapter {
    global AdyenAdapter() {}

    global commercepayments.GatewayResponse
processRequest(commercepayments.paymentGatewayContext gatewayContext) {
    }

    global commercepayments.GatewayNotificationResponse
processNotification(commercepayments.PaymentGatewayNotificationContext
gatewayNotificationContext) {
    }
}

commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();
if (requestType == commercepayments.RequestType.Capture) {
   req.setEndpoint('/pal/servlet/Payment/v52/capture');
   // Refer to the end of this doc for sample buildCaptureRequest implementation
    body =
buildCaptureRequest((commercepayments.CaptureRequest)gatewayContext.getPaymentRequest());
} else if (requestType == commercepayments.RequestType.ReferencedRefund) {
    req.setEndpoint('/pal/servlet/Payment/v52/refund');
    body =
buildRefundRequest((commercepayments.ReferencedRefundRequest)gatewayContext.getPaymentRequest());
}

req.setBody(body);
```

```
req.setMethod('POST');
commercepayments.PaymentsHttp http = new commercepayments.PaymentsHttp();
HttpResponse res = null;
try {
    res = http.send(req);
} catch(CalloutException ce) {
    commercepayments.GatewayErrorResponse error = new
commercepayments.GatewayErrorResponse('500', ce.getMessage());
    return error;
}

if ( requestType == commercepayments.RequestType.Capture) {
   // Refer to the end of this doc for sample createCaptureResponse implementation
    response =  createCaptureResponse(res);
} else if ( requestType == commercepayments.RequestType.ReferencedRefund) {
    response =  createRefundResponse(res);
}
return response;

commercepayments.PaymentGatewayNotificationRequest notificationRequest =
gatewayNotificationContext.getPaymentGatewayNotificationRequest();
Blob request = notificationRequest.getRequestBody();
Map<String, Object> jsonReq = (Map<String,
Object>)JSON.deserializeUntyped(request.toString());
List<Object> notificationItems = (List<Object>)jsonReq.get('notificationItems');
Map<String, Object> notificationRequestItem =
    (Map<String, Object>)((Map<String,
Object>)notificationItems[0]).get('NotificationRequestItem');
Boolean success = Boolean.valueOf(notificationRequestItem.get('success'));
String pspReference = (String)notificationRequestItem.get('pspReference');
String eventCode = (String)notificationRequestItem.get('eventCode');
Double amount = (Double)((Map<String,
Object>)notificationRequestItem.get('amount')).get('value');

commercepayments.NotificationStatus notificationStatus = null;
if (success) {
    notificationStatus = commercepayments.NotificationStatus.Success;
} else {
    notificationStatus = commercepayments.NotificationStatus.Failed;
}
commercepayments.BaseNotification notification = null;
if ('CAPTURE'.equals(eventCode)) {
    notification = new commercepayments.CaptureNotification();
} else if ('REFUND'.equals(eventCode)) {
    notification = new commercepayments.ReferencedRefundNotification();
}
notification.setStatus(notificationStatus);
notification.setGatewayReferenceNumber(pspReference);
notification.setAmount(amount);

commercepayments.NotificationSaveResult saveResult =
commercepayments.NotificationClient.record(notification);

commercepayments.GatewayNotificationResponse gnr = new
```

```
commercepayments.GatewayNotificationResponse();
if (saveResult.isSuccess()) {
    system.debug('Notification accepted by platform');
} else {
    system.debug('Errors in the result '+ Blob.valueOf(saveResult.getErrorMessage()));
}
gnr.setStatusCode(200);
gnr.setResponseBody(Blob.valueOf('[accepted]'));
return gnr;
```

PaymentGatewayContext Class

Wraps the information related to a payment request.

Namespace

CommercePayments on page 270

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.PaymentGatewayContext pgc = new
CommercePayments.PaymentGatewayContext();
```

Example

```
global commercepayments.GatewayResponse processRequest(commercepayments.PaymentGatewayContext
 gatewayContext) {
    commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();
    if (requestType == commercepayments.RequestType.Capture) {
       commercepayments.CaptureRequest captureRequest = (commercepayments.CaptureRequest)
 gatewayContext.getPaymentRequest();
    }
}
```

IN THIS SECTION:

PaymentGatewayContext Constructors

PaymentGatewayContext Methods

PaymentGatewayContext Constructors

The following are constructors for `PaymentGatewayContext`.

IN THIS SECTION:

PaymentGatewayContext(request, requestType)

Constructor to enable instance creation. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`PaymentGatewayContext(request, requestType)`

Constructor to enable instance creation. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global PaymentGatewayContext(commercepayments.PaymentGatewayRequest request, String requestType)
```

Parameters

request
Type: commercepayments.PaymentGatewayRequest

Raw payload. Sensitive attributes are masked to ensure PCI compliance.

requestType
Type: commercepayments.RequestType Enum

Defines the type of request made to the gateway

PaymentGatewayContext Methods

The following are methods for `PaymentGatewayContext`.

IN THIS SECTION:

getPaymentRequest()
Returns the payment request object.

getPaymentRequestType()
Returns the payment request type.

`getPaymentRequest()`

Returns the payment request object.

Signature

```
global commercepayments.PaymentGatewayRequest getPaymentRequest()
```

Return Value

Type: PaymentGatewayRequest

`getPaymentRequestType()`

Returns the payment request type.

Signature

```
global String getPaymentRequestType()
```

Return Value

Type: String

PaymentGatewayNotificationContext Class

Wraps the information related to a gateway notification.

Namespace

CommercePayments on page 270

Usage

This class is used with asynchronous payments. It wraps all of the information related to a notification from the payment gateway. The payments platform provides its context to the payment gateway adapters.

The constructor of this class takes no arguments. For example:

```
CommercePayments.PaymentGatewayNotificationContext pgnc = new
CommercePayments.PaymentGatewayNotificationContext();
```

Example

```
global commercepayments.GatewayNotificationResponse
processNotification(commercepayments.PaymentGatewayNotificationContext
gatewayNotificationContext) {
commercepayments.PaymentGatewayNotificationRequest notificationRequest =
gatewayNotificationContext.getPaymentGatewayNotificationRequest();
}
```

IN THIS SECTION:

PaymentGatewayNotificationContext Methods

PaymentGatewayNotificationContext Methods

The following are methods for `PaymentGatewayNotificationContext`.

IN THIS SECTION:

getPaymentGatewayNotificationRequest()

Returns the payment gateway's notification request.

`getPaymentGatewayNotificationRequest()`

Returns the payment gateway's notification request.

Signature

```
global commercepayments.PaymentGatewayNotificationRequest
getPaymentGatewayNotificationRequest()
```

Return Value

Type: PaymentGatewayNotificationRequest on page 370

PaymentGatewayNotificationRequest Class

Contains the notification request data from the gateway.

Namespace

CommercePayments on page 270

Usage

When the payment gateway sends a notification for a payment request, the payments platform sends the notification request to the gateway adapter. If the notification payload contains an `eventCode` of `CAPTURE`, the adapter constructs a `CaptureNotification`. If the notification payload contains an `eventCode` of `REFUND`, the adapter constructs a `ReferencedRefundNotification`. If the notification payload contains `eventCode` of `AUTHORISATION`, the adapter constructs a `GatewayNotificationResponse`.

You can obtain a notification request from `PaymentGatewayNotificationContext` on page 369 by invoking its `getPaymentGatewayNotificationRequest` method.

Example

```
global commercepayments.GatewayNotificationResponse
    processNotification(commercepayments.PaymentGatewayNotificationContext
gatewayNotificationContext) {
        commercepayments.PaymentGatewayNotificationRequest notificationRequest =
gatewayNotificationContext.getPaymentGatewayNotificationRequest();
}
```

IN THIS SECTION:

PaymentGatewayNotificationRequest Properties

PaymentGatewayNotificationRequest Methods

PaymentGatewayNotificationRequest Properties

The following are properties for `PaymentGatewayNotificationRequest`.

IN THIS SECTION:

requestBody

Body of the notification request sent by the payment gateway.

requestBody

Body of the notification request sent by the payment gateway.

Signature

```
global Blob requestBody {get; set;}
```

Property Value

Type: Blob

PaymentGatewayNotificationRequest Methods

The following are methods for `PaymentGatewayNotificationRequest`.

IN THIS SECTION:

getHeaders()
Gets HTTP headers from the notification request sent by the payment gateway.

getRequestBody()
Stores the notification request body information from the payment gateway's notification request.

getHeaders()

Gets HTTP headers from the notification request sent by the payment gateway.

Signature

```
global Map<String,String> getHeaders()
```

Return Value

Type: Map<String,String>

getRequestBody()

Stores the notification request body information from the payment gateway's notification request.

Signature

```
global Blob getRequestBody()
```

Return Value

Type: Blob

PaymentMethodDetailsResponse Class

This class contains the details about the payment method.

Namespace

CommercePayments

Example

```
commercepayments.AlternativePaymentMethodResponse alternativePaymentMethodResponse = new
commercepayments.AlternativePaymentMethodResponse();
alternativePaymentMethodResponse.setEmail('alternativePaymentMethod');
alternativePaymentMethodResponse.setEmail('foo@foo.com');
alternativePaymentMethodResponse.setGatewayToken('NMoPoIOnTZSaRaWcV7gUUXe');
alternativePaymentMethodResponse.setGatewayTokenDetails('gateway token details');
commercepayments.PaymentMethodDetailsResponse response = new
commercepayments.PaymentMethodDetailsResponse();
response.setAlternativePaymentMethod(alternativePaymentMethodResponse);
```

IN THIS SECTION:

PaymentMethodDetailsResponse Methods

PaymentMethodDetailsResponse Methods

The following are methods for `PaymentMethodDetailsResponse`.

IN THIS SECTION:

setAlternativePaymentMethod(alternativePaymentMethod)
Sets the alternative payment method details.

setCardPaymentMethod(cardPaymentMethod)
Sets the details about the card payment method.

`setAlternativePaymentMethod(alternativePaymentMethod)`

Sets the alternative payment method details.

Signature

```
public void setAlternativePaymentMethod(commercepayments.AlternativePaymentMethodResponse
alternativePaymentMethod)
```

Parameters

`alternativePaymentMethod`
Type: CommercePayments.AlternativePaymentMethodResponse

Details of the alternative payment method.

Return Value

Type: void

`setCardPaymentMethod(cardPaymentMethod)`

Sets the details about the card payment method.

Signature

```
public void setCardPaymentMethod(commercepayments.CardPaymentMethodResponse
cardPaymentMethod)
```

Parameters

`cardPaymentMethod`
Type: CommercePayments.CardPaymentMethodResponse

Details about the card payment method.

Return Value

Type: void

PaymentMethodTokenizationRequest Class

Stores data about a request to tokenize a card payment method. The tokenization process occurs in the payment gateway. This process replaces sensitive customer data, such as a card number or CVV, with unique identification symbols. The symbols are used while the data is handled by Salesforce, the payment gateway, and the customer bank, allowing Salesforce to store the token without storing sensitive customer data.

Namespace

CommercePayments on page 270

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.PaymentMethodTokenizationRequest pmtr = new
CommercePayments.PaymentMethodTokenizationRequest();
```

This class holds all the required details about the tokenize request. Gateway adapters read the information in this class while constructing a tokenization JSON request, which is sent to the payment gateway.

Example

The following code is used within your payment gateway adapter Apex class.

Use the `GatewayResponse` class's `processRequest` method to build responses based on the request type that it receives from an instance of `PaymentGatewayContext on page 367`. If the request type is Tokenize, `GatewayResponse on page 359` calls the `createTokenizeResponse` method and passes an instance of the

`PaymentMethodTokenizationRequest` class. The passed `PaymentMethodTokenizationRequest` object contains the address and cardPaymentMethod information that the payment gateway needs to manage the tokenization process. For example:

```
global commercepayments.GatewayResponse processRequest(commercepayments.paymentGatewayContext
 gatewayContext) {
        commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();

         commercepayments.GatewayResponse response;
         try
         {
             if (requestType == commercepayments.RequestType.Tokenize) {
                     response =
createTokenizeResponse((commercepayments.PaymentMethodTokenizationRequest)gatewayContext.getPaymentRequest());

             }
             //Add other else if statements for different request types as needed.
             return response;
         }
         catch(SalesforceValidationException e)
         {
              commercepayments.GatewayErrorResponse error = new
commercepayments.GatewayErrorResponse('400', e.getMessage());
              return error;
         }
     }
```

Configure the `createTokenizeResponse` method to accept an instance of `PaymentMethodTokenizationRequest`. Then, build an instance of `PaymentMethodTokenizationResponse` based on the values received from the payment gateway.

```
     public commercepayments.GatewayResponse
createTokenizeResponse(commercepayments.PaymentMethodTokenizationRequest tokenizeRequest)
 {
         commercepayments.PaymentMethodTokenizationResponse tokenizeResponse = new
commercepayments.PaymentMethodTokenizationResponse();
         tokenizeResponse.setGatewayTokenEncrypted(encryptedValue);
         tokenizeResponse.setGatewayTokenDetails(tokenDetails);
         tokenizeResponse.setGatewayAvsCode(avsCode);
         tokenizeResponse.setGatewayMessage(gatewayMessage);
         tokenizeResponse.setGatewayResultCode(resultcode);
         tokenizeResponse.setGatewayResultCodeDescription(resultCodeDescription);
         tokenizeResponse.setSalesforceResultCodeInfo(resultCodeInfo);
         tokenizeResponse.setGatewayDate(system.now());
         return tokenizeResponse;
     }
```

The `tokenizeResponse` contains the results of the gateway's tokenization process, and if successful, the tokenized value.

IN THIS SECTION:

PaymentMethodTokenizationRequest Constructors

PaymentMethodTokenizationRequest Properties

PaymentMethodTokenizationRequest Methods

PaymentMethodTokenizationRequest Constructors

The following are constructors for `PaymentMethodTokenizationRequest`.

IN THIS SECTION:

PaymentMethodTokenizationRequest(paymentGatewayId)

Payment gateway ID constructor used with `paymentMethodTokenizationRequest`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

PaymentMethodTokenizationRequest()

The following are constructors for `PaymentMethodTokenizationRequest`.

`PaymentMethodTokenizationRequest(paymentGatewayId)`

Payment gateway ID constructor used with `paymentMethodTokenizationRequest`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global PaymentMethodTokenizationRequest(String paymentGatewayId)
```

Parameters

`paymentGatewayId`

Type: String

The payment method's payment gateway ID that will be tokenized.

`PaymentMethodTokenizationRequest()`

The following are constructors for `PaymentMethodTokenizationRequest`.

Signature

```
global PaymentMethodTokenizationRequest()
```

PaymentMethodTokenizationRequest Properties

The following are properties for `PaymentMethodTokenizationRequest`.

IN THIS SECTION:

address

The card payment method address to be tokenized.

cardPaymentMethod

The card payment method containing data to be tokenized.

`address`

The card payment method address to be tokenized.

Signature

```
global commercepayments.AddressRequest address {get; set;}
```

Property Value

Type: AddressRequest on page 281

cardPaymentMethod

The card payment method containing data to be tokenized.

Signature

```
global commercepayments.CardPaymentMethodRequest cardPaymentMethod {get; set;}
```

Property Value

Type: CardPaymentMethodRequest on page 339

PaymentMethodTokenizationRequest Methods

The following are methods for `PaymentMethodTokenizationRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `PaymentMethodTokenizationRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type `PaymentMethodTokenizationRequest` by determining the uniquness of the external object records in a list.

toString()
Converts a date to a string.

equals(obj)

Maintains the integrity of lists of type `PaymentMethodTokenizationRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `PaymentMethodTokenizationRequest` by determining the uniquness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

PaymentMethodTokenizationResponse Class

Gateway response sent by payment gateway adapters for the payment method tokenization request. The response includes the payment method's token ID value.

Namespace

CommercePayments on page 270

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.PaymentMethodTokenizationResponse pmtr = new
CommercePayments.PaymentMethodTokenizationResponse();
```

After the payment gateway processes a tokenization request, the fields of `PaymentMethodTokenizationResponse` receive and store information from the gateway's response. The gateway's response shows whether the tokenization request was successful, the token value, and any additional messages or information about the tokenization process. You can then pass an instance of `PaymentMethodTokenizationResponse` to an authorization response or a sale response. This class is mapped to a response class in the Java layer.

Example

This constructor builds a new instance of the `PaymentMethodTokenizationResponse` class.

```
commercepayments.PaymentMethodTokenizationResponse tokenizeResponse = new
commercepayments.PaymentMethodTokenizationResponse();
```

`PaymentMethodTokenizationResponse` contains only setter methods. Each setter accepts a value from the payment gateway and use it to set an attribute of `PaymentMethodTokenizationResponse`.

The most important method in `PaymentMethodTokenizationResponse` is `setGatewayTokenEncrypted`, which uses Salesforce encryption to set an encrypted token value for a payment method. The `setGatewayTokenEncrypted` method is available in Salesforce API v52.0 and later. We recommend using it to ensure your tokenized payment method values are encrypted and secure. While the `setGatewayToken` method (available in earlier API versions) also returns a payment method token, the tokenized value isn't encrypted.

If the instantiated class already has a gateway token, `setGatewayTokenEncrypted` throws an error.

```
    /** @description Method to set Gateway token to persist in Encrypted Text */
    global void setGatewayTokenEncrypted(String gatewayTokenEncrypted) {
        if (gatewayTokenSet)  {
            throwTokenError();
        }
        this.delegate.setGatewayTokenEncrypted(gatewayTokenEncrypted);
        gatewayTokenEncryptedSet = true;
    }
```

A typical instantiation of `PaymentMethodTokenizationResponse` sets the encrypted gateway token alongside the other tokenization response values sent by the gateway.

```
    public commercepayments.GatewayResponse
createTokenizeResponse(commercepayments.PaymentMethodTokenizationRequest tokenizeRequest)
 {
        commercepayments.PaymentMethodTokenizationResponse tokenizeResponse = new
commercepayments.PaymentMethodTokenizationResponse();
        tokenizeResponse.setGatewayTokenEncrypted(gatewayTokenEncrypted);
        tokenizeResponse.setGatewayTokenDetails(gatewayTokenDetails);
        tokenizeResponse.setGatewayAvsCode(gatewayAvsCode);
        tokenizeResponse.setGatewayMessage(gatewayMessage);
        tokenizeResponse.setGatewayResultCode(gatewayResultCode);
        tokenizeResponse.setGatewayResultCodeDescription(gatewayResultCodeDescription);
       tokenizeResponse.setSalesforceResultCodeInfo(SUCCESS_SALESFORCE_RESULT_CODE_INFO);

        tokenizeResponse.setGatewayDate(system.now());
        return tokenizeResponse;
    }
```

After you've built a PaymentMethodTokenizationResponse object and set the encrypted gateway token, pass the object to the `setPaymentMethodTokenizationResponse` method of an authorization response or a sale response.

Authorization Response

```
    public commercepayments.GatewayResponse
createAuthResponse(commercepayments.AuthorizationRequest authRequest) {
        commercepayments.AuthorizationResponse authResponse = new
commercepayments.AuthorizationResponse();
        commercepayments.PaymentMethodTokenizationResponse
```

```
paymentMethodTokenizationResponse = new
commercepayments.PaymentMethodTokenizationResponse();
         if(authRequest.amount!=null )
         {
             authResponse.setAmount(authRequest.amount);
         }
         else
         {
            throw new SalesforceValidationException('Required Field Missing : Amount');

         }

         authResponse.setGatewayResultCode('00');
         authResponse.setGatewayResultCodeDescription('Transaction Normal');
         authResponse.setGatewayAuthCode('SF'+getRandomNumber(6));
         authResponse.setGatewayReferenceNumber(getRandomNumber(10));
        authResponse.setSalesforceResultCodeInfo(SUCCESS_SALESFORCE_RESULT_CODE_INFO);

         authResponse.setGatewayDate(system.now());

paymentMethodTokenizationResponse.setGatewayTokenEncrypted(gatewayTokenEncrypted);

authResponse.setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse);
         return authResponse;
     }
```

Sale Response

```
     public commercepayments.GatewayResponse
createSaleResponse(commercepayments.SaleRequest saleRequest) {
        commercepayments.SaleResponse saleResponse = new commercepayments.SaleResponse();

         commercepayments.PaymentMethodTokenizationResponse
paymentMethodTokenizationResponse = new
commercepayments.PaymentMethodTokenizationResponse();
         if(saleRequest.amount!=null )
         {
             saleResponse.setAmount(saleRequest.amount);
         }
         else
         {
            throw new SalesforceValidationException('Required Field Missing : Amount');

         }

         system.debug('Response - success');
         saleResponse.setGatewayDate(system.now());
         saleResponse.setGatewayResultCode('00');
         saleResponse.setGatewayResultCodeDescription('Transaction Normal');
         saleResponse.setGatewayReferenceNumber('SF'+getRandomNumber(6));
        saleResponse.setSalesforceResultCodeInfo(SUCCESS_SALESFORCE_RESULT_CODE_INFO);

paymentMethodTokenizationResponse.setGatewayTokenEncrypted(gatewayTokenEncrypted);
```

```
saleResponse.setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse);
        return saleResponse;
    }
```

IN THIS SECTION:

PaymentMethodTokenizationResponse Methods

PaymentMethodTokenizationResponse Methods

The following are methods for `PaymentMethodTokenizationResponse`.

IN THIS SECTION:

setGatewayAvsCode(gatewayAvsCode)
Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)
Sets the date that the tokenization occurred. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)
Sets error messages that the gateway returned for the tokenization request. Maximum length of 255 characters.

setGatewayResultCode(gatewayResultCode)
Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setGatewayToken(gatewayToken)
Sets the gateway token value that the gateway returned.

setGatewayTokenDetails(gatewayTokenDetails)
Sets any additional information that the gateway returned about the payment token.

setGatewayTokenEncrypted(gatewayTokenEncrypted)
Sets the value of the `gatewayTokenEncrypted` field on a CardPaymentMethod or DigitalWallet object.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

`setGatewayAvsCode(gatewayAvsCode)`

Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

Signature

```
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

`gatewayAvsCode`
Type: String

Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.

Return Value

Type: void

setGatewayDate(gatewayDate)

Sets the date that the tokenization occurred. Some gateways don't send this value.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

Return Value

Type: void

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the tokenization request. Maximum length of 255 characters.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Must be used to map a Salesforce-specific result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Provides additional information about the result code and why the gateway returned the specific code. Descriptions will vary between different gateways.

Return Value

Type: void

setGatewayToken(gatewayToken)

Sets the gateway token value that the gateway returned.

Signature

```
global void setGatewayToken(String gatewayToken)
```

Parameters

gatewayToken
Type: String

The gateway token that the payment gateway sends following a tokenization request.

For the CardPaymentMethod and DigitalWallet objects, use the *gatewyTokenEncrypted* parameter, which encrypts the token value.

Return Value

Type: void

setGatewayTokenDetails(gatewayTokenDetails)

Sets any additional information that the gateway returned about the payment token.

Signature

```
global void setGatewayTokenDetails(String gatewayTokenDetails)
```

Parameters

gatewayTokenDetails
Type: String

Return Value

Type: void

setGatewayTokenEncrypted(gatewayTokenEncrypted)

Sets the value of the `gatewayTokenEncrypted` field on a CardPaymentMethod or DigitalWallet object.

Signature

```
global void setGatewayTokenEncrypted(String gatewayTokenEncrypted)
```

Parameters

gatewayTokenEncrypted
Type: String

The gateway token that the payment gateway sends following a tokenization request. Salesforce Payments uses Salesforce encryption to encrypt the token value.

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
Type: SalesforceResultCodeInfo on page 419

Description of the Salesforce result code value.

Return Value

Type: void

PaymentsHttp Class

Makes an HTTP request to start the interaction with the payment gateway.

Namespace

CommercePayments on page 270

Usage

You must specify the `CommercePayments` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example:

```
CommercePayments.PaymentsHttp payhttp = new CommercePayments.PaymentsHttp();
```

IN THIS SECTION:

PaymentsHttp Methods

PaymentsHttp Constructors

PaymentsHttp Methods

The following are methods for `PaymentsHttp`. All methods are instance methods.

IN THIS SECTION:

send(Request)
Sends an HttpRequest and returns the response.

`send(Request)`

Sends an HttpRequest and returns the response.

Signature

```
global HttpResponse send(HttpRequest request)
```

Parameters

`request`
Type: System.HttpRequest

Return Value

Type: System.HttpResponse

PaymentsHttp Constructors

The following are constructors for `PaymentsHttp`.

IN THIS SECTION:

PaymentsHttp()
Initiates an HTTP request and response.

`PaymentsHttp()`

Initiates an HTTP request and response.

Signature

```
global PaymentsHttp()
```

PostAuthApiPaymentMethodRequest Class

Sends information about a payment method to a gateway adapter during a postauthorization service call.

Namespace

CommercePayments

Usage

Contains information about the payment method that is used for a postauthorization request. It contains all available payment methods as fields, but populates only one field for each request. The gateway adapter uses this class when constructing a postauthorization request. An object of this class is available through the `paymentMethod` field on the `PostAuthorizationRequest Class` object.

IN THIS SECTION:

PostAuthApiPaymentMethodRequest Constructors
Lists the constructors for the PostAuthApiPaymentMethodRequest.

PostAuthApiPaymentMethodRequest Properties
Lists the properties for PostAuthApiPaymentMethodRequest.

PostAuthApiPaymentMethodRequest Constructors

Lists the constructors for the PostAuthApiPaymentMethodRequest.

The following are constructors for `PostAuthApiPaymentMethodRequest`.

IN THIS SECTION:

PostAuthApiPaymentMethodRequest(cardPaymentMethodRequest)
Constructs a sample `cardPaymentMethodRequest`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

PostAuthApiPaymentMethodRequest(AlternativePaymentMethodRequest)
Constructs a sample `alternativePaymentMethodRequest`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

PostAuthApiPaymentMethodRequest()
Constructor for `PostAuthApiPaymentMethodRequest`.

PostAuthApiPaymentMethodRequest(cardPaymentMethodRequest)

Constructs a sample `cardPaymentMethodRequest`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global PostAuthApiPaymentMethodRequest(commercepayments.CardPaymentMethodRequest
cardPaymentMethodRequest)
```

Parameters

cardPaymentMethodRequest
Type: commercepayments.CardPaymentMethodRequest on page 339

Contains information about the card payment method. Used to send information to a gateway adapter during a service call.

PostAuthApiPaymentMethodRequest(AlternativePaymentMethodRequest)

Constructs a sample `alternativePaymentMethodRequest`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global
PostAuthApiPaymentMethodRequest(commercepayments.AlternativePaymentMethodRequestPaymentMethodRequest)
```

Parameters

alternativePaymentMethodRequest
Type: commercepayments.AlternativePaymentMethodRequest on page 339

Contains information about the alternative payment method. Used to send information to a gateway adapter during a service call.

PostAuthApiPaymentMethodRequest()

Constructor for `PostAuthApiPaymentMethodRequest`.

Signature

```
global PostAuthApiPaymentMethodRequest()
```

PostAuthApiPaymentMethodRequest Properties

Lists the properties for PostAuthApiPaymentMethodRequest.

The following are properties for `PostAuthApiPaymentMethodRequest`.

IN THIS SECTION:

cardPaymentMethod
The card payment method object used in a postauthorizaiton payment method request.

alternativePaymentMethod
The alternative payment method object used in a postauthorizaiton payment method request.

`cardPaymentMethod`

The card payment method object used in a postauthorizaiton payment method request.

Signature

```
global commercepayments.CardPaymentMethodRequest cardPaymentMethod {get; set;}
```

Property Value

Type: commercepayments.CardPaymentMethodRequest on page 339

`alternativePaymentMethod`

The alternative payment method object used in a postauthorizaiton payment method request.

Signature

```
global commercepayments.AlternativePaymentMethodRequest PaymentMethod {get; set;}
```

Property Value

Type: commercepayments.alternativePaymentMethodRequest

PostAuthorizationRequest Class

Sends information about a postauthorization request to a gateway adapter during a service call.

Namespace

CommercePayments

Usage

This class extends `BaseRequest` and contains information about a transaction postauthorization request. The gateway adapter reads fields from this class to validate the client-side transaction with the payment gateway. An object of this class is available by calling `getPaymentRequest()` in the `PaymentGatewayContext Class`).

```
((commercepayments.PostAuthorizationRequest)gatewayContext.getPaymentRequest());
```

IN THIS SECTION:

PostAuthorizationRequest Constructors
Lists the constructors for postauthorization requests.

PostAuthorizationRequest Properties
Lists properties for a postauthorizaiton request.

PostAuthorizationRequest Constructors

Lists the constructors for postauthorization requests.

The following are constructors for `PostAuthorizationRequest`.

IN THIS SECTION:

PostAuthorizationRequest(amount)
Constructor for building the amount in a postauthorization request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`PostAuthorizationRequest(amount)`

Constructor for building the amount in a postauthorization request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global PostAuthorizationRequest(Double amount)
```

Parameters

amount
Type: Double

The amount of the authorization.

PostAuthorizationRequest Properties

Lists properties for a postauthorizaiton request.

The following are properties for a `PostAuthorizationRequest`.

IN THIS SECTION:

accountId
The customer account that is settled when the postauthorization is performed.

amount
The total amount of the postauthorization request.

comments
Comments about the postauthorization. Users can enter comments to provide additional information.

currencyIsoCode
The ISO currency code for the postauthorization request.

paymentMethod
The payment method used to process the postauthorization request.

accountId

The customer account that is settled when the postauthorization is performed.

Signature

```
global String accountId {get; set;}
```

Property Value

Type: String

amount

The total amount of the postauthorization request.

Signature

```
global Double amount {get; set;}
```

Property Value

Type: Double

comments

Comments about the postauthorization. Users can enter comments to provide additional information.

Signature

```
global String comments {get; set;}
```

Property Value

Type: String

currencyIsoCode

The ISO currency code for the postauthorization request.

Signature

```
global String currencyIsoCode {get; set;}
```

Property Value

Type: String

paymentMethod

The payment method used to process the postauthorization request.

Signature

```
global PostAuthApiPaymentMethodRequest paymentMethod {get; set;}
```

Property Value

Type: AuthApiPaymentMethodRequest on page 294

PostAuthorizationResponse Class

Response sent by the payment gateway adapter for a postauthorization service.

Namespace

CommercePayments

Usage

This class extends AbstractTransactionResponse. The constructor of this class takes no arguments. For example:

```
CommercePayments.PostAuthorizationResponse authr = new
CommercePayments.PostAuthorizationResponse();
```

Contains information about the payment gateway's response following an authorization transaction. The gateway adapter uses the payment gateway's response to populate the `PostAuthorizationResponse` fields. The payments platform uses the information from this class to settle the transaction.

IN THIS SECTION:

PostAuthorizationResponse Methods
Lists the methods for the `PostAuthorizationResponse`.

PostAuthorizationResponse Methods

Lists the methods for the `PostAuthorizationResponse`.

The following are methods for `PostAuthorizationResponse`.

IN THIS SECTION:

setPaymentMethodDetailsResponse(PaymentMethodDetailsResponsepaymentMethodDetails)
Sets details from the gateway about the authorized payment method.

setCardPaymentMethodResponse(CardPaymentMethodResponsecardPaymentMethod)
Sets details from the gateway about the authorized card payment method.

setAlternativePaymentMethodResponse(AlternativePaymentMethodResponsealternativePaymentMethod)
Sets details from the gateway about the authorized alternative payment method.

setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse)
Sets information from the gateway about the tokenized payment method.

setGatewayAuthCode(gatewayAuthCode)
Sets the authorization code that the gateway returned. Maximum length of 64 characters.

setAuthorizationExpirationDate(authExpDate)
Sets the expiration date of the authorization request.

setAsync(async)
Sets whether the payment capture or authorization is asynchronous (`True`) or synchronous (`False`). If `True`, then the payment or payment authorization record created has a status of `Pending`.

`setPaymentMethodDetailsResponse(PaymentMethodDetailsResponsepaymentMethodDetails)`

Sets details from the gateway about the authorized payment method.

Signature

```
global void setPaymentMethodDetailsResponse(commercepayments.PaymentMethodDetailsResponse
paymentMethodDetailsResponse)
```

Parameters

`paymentMethodDetailsResponse`
Gateway response sent by payment gateway adapters for the payment method details request.

Return Value

Type: void

`setCardPaymentMethodResponse(CardPaymentMethodResponsecardPaymentMethod)`

Sets details from the gateway about the authorized card payment method.

Signature

```
global void setCardPaymentMethodResponse(commercepaymentsCardPaymentMethodResponse
cardpaymentMethodResponse)
```

Parameters

cardPaymentMethodResponse
Gateway response sent by payment gateway adapter for the card payment method request.

Return Value

Type: void

setAlternativePaymentMethodResponse(AlternativePaymentMethodResponsealternativePaymentMethod)

Sets details from the gateway about the authorized alternative payment method.

Signature

```
global void
setAlternativePaymentMethodResponse(commercepayments.AlternativePaymentMethodResponse
paymentMethodResponse)
```

Parameters

alternativePaymentMethodResponse
Gateway response sent by payment gateway adapter for the alternative payment method request.

Return Value

Type: void

setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse)

Sets information from the gateway about the tokenized payment method.

Signature

```
global void
setPaymentMethodTokenizationResponse(commercepayments.PaymentMethodTokenizationResponse
paymentMethodTokenizationResponse)
```

Parameters

paymentMethodTokenizationResponse
PaymentMethodTokenizationResponse on page 377

Gateway response sent by payment gateway adapters for the payment method tokenization request.

Return Value

Type: void

setGatewayAuthCode(gatewayAuthCode)

Sets the authorization code that the gateway returned. Maximum length of 64 characters.

Signature

```
global void setGatewayAuthCode(String gatewayAuthCode)
```

Parameters

gatewayAuthCode
Type: String

The authorization code returned by the gateway.

Return Value

Type: void

setAuthorizationExpirationDate(authExpDate)

Sets the expiration date of the authorization request.

Signature

```
global void setAuthorizationExpirationDate(Datetime authExpDate)
```

Parameters

authExpDate
Type: Datetime

Return Value

Type: void

setAsync(async)

Sets whether the payment capture or authorization is asynchronous (`True`) or synchronous (`False`). If `True`, then the payment or payment authorization record created has a status of `Pending`.

Signature

```
global void setAsync(Boolean async)
```

Parameters

async
Type: Boolean

Return Value

Type: void

ReferencedRefundNotification Class

When a payment gateway sends a notification for a refund transaction, the payment gateway adapter creates the `ReferencedRefundNotification` object to store information about notification.

Namespace

CommercePayments on page 270

Usage

This class is used with asynchronous payments. When a payment gateway sends a notification for a refund transcation, the gateway adapter creates an object of type `ReferencedRefundNotification` to populate the respective values.

The constructor of this class takes no arguments. For example:

```
CommercePayments.ReferencedRefundNotification rrn = new
CommercePayments.ReferencedRefundNotification();
```

Example

```
commercepayments.NotificationStatus notificationStatus = null;
        if (success) {
            notificationStatus = commercepayments.NotificationStatus.Success;
        } else {
            notificationStatus = commercepayments.NotificationStatus.Failed;
        }
        commercepayments.BaseNotification notification = null;
        if ('CAPTURE'.equals(eventCode)) {
            notification = new commercepayments.CaptureNotification();
        } else if ('REFUND'.equals(eventCode)) {
            notification = new commercepayments.ReferencedRefundNotification();
        }
```

IN THIS SECTION:

ReferencedRefundNotification Methods

ReferencedRefundNotification Methods

The following are methods for `ReferencedRefundNotification`.

IN THIS SECTION:

setAmount(amount)
Sets the transaction amount. Can be positive, negative, or zero.

setGatewayDate(gatewayDate)
Sets the date that communication for the refund notification occurred with the payment gateway.

setGatewayMessage(gatewayMessage)
Sets information or messages that the gateway returned.

setGatewayReferenceDetails(gatewayReferenceDetails)
Sets the payment gateway's reference details.

setGatewayReferenceNumber(gatewayReferenceNumber)
Sets the payment gateway's reference number.

setGatewayResultCode(gatewayResultCode)
Sets the payment gateway's result code.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets the payment gateway's result code description.

setId(id)
Sets the ID of a notification sent by the payment gateway.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Sets Salesforce result code information.

setStatus(status)
Sets the notification status value on the notification object.

`setAmount(amount)`

Sets the transaction amount. Can be positive, negative, or zero.

Signature

```
global void setAmount(Double amount)
```

Parameters

amount
Type: Double

The amount to be debited or captured.

Return Value

Type: void

`setGatewayDate(gatewayDate)`

Sets the date that communication for the refund notification occurred with the payment gateway.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

The date that communication happened with the gateway.

Return Value

Type: void

setGatewayMessage(gatewayMessage)

Sets information or messages that the gateway returned.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Return Value

Type: void

setGatewayReferenceDetails(gatewayReferenceDetails)

Sets the payment gateway's reference details.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

gatewayReferenceDetails
Type: String

Provides information about the gateway communication.

Return Value

Type: void

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the payment gateway's reference number.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique transaction ID created by the payment gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets the payment gateway's result code.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

The gateway result code. You must map this to a Salesforce-specific result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets the payment gateway's result code description.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the gateway result code. Provides additional context about the result code .

Return Value

Type: void

setId(id)

Sets the ID of a notification sent by the payment gateway.

Signature

```
global void setId(String id)
```

Parameters

id
Type: String

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets Salesforce result code information.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
Type: SalesforceResultCodeInfo on page 419

Description of the Salesforce result code value.

Return Value

Type: void

setStatus(status)

Sets the notification status value on the notification object.

Signature

```
global void setStatus(commercepayments.NotificationStatus status)
```

Parameters

status
Type: NotificationStatus on page 362

Indicates whether the payments platform successfully received the notification from the payment gateway.

Return Value

Type: void

ReferencedRefundRequest

Access information about the referenced refund requests. Extends the `RefundRequest` class.

Namespace

CommercePayments on page 270

Example

```
global commercepayments.GatewayResponse processRequest(commercepayments.PaymentGatewayContext
 gatewayContext) {
    commercepayments.RequestType requestType = gatewayContext.getPaymentRequestType();
    if (requestType == commercepayments.RequestType.ReferencedRefund) {
        commercepayments.*ReferencedRefundRequest* refundRequest =
(commercepayments.*ReferencedRefundRequest*) gatewayContext.getPaymentRequest();
    }
}
```

IN THIS SECTION:

ReferencedRefundRequest Constructors

ReferencedRefundRequest Properties

ReferencedRefundRequest Methods

ReferencedRefundRequest Constructors

The following are constructors for `ReferencedRefundRequest`.

IN THIS SECTION:

ReferencedRefundRequest(amount, paymentId)
This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`ReferencedRefundRequest(amount, paymentId)`

This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Parameters

`amount`
Type: Double

The amount to be debited or captured.

`paymentId`
Type: String

The payment record.

ReferencedRefundRequest Properties

The following are properties for `ReferencedRefundRequest`.

IN THIS SECTION:

PaymentId
References a payment object.

accountId
References an account.

amount
References an amount.

`PaymentId`

References a payment object.

Property Value

Type: String

`accountId`

References an account.

Property Value

Type: String

`amount`

References an amount.

Property Value

Type: Double

ReferencedRefundRequest Methods

The following are methods for `ReferencedRefundRequest`.

ReferencedRefundResponse Class

The payment gateway adapter sends this response for the `ReferencedRefund` request type.

Namespace

CommercePayments on page 270

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.ReferencedRefundResponse refr = new
CommercePayments.ReferencedRefundResponse();
```

IN THIS SECTION:

ReferencedRefundResponse Methods

ReferencedRefundResponse Methods

The following are methods for `ReferencedRefundResponse`.

IN THIS SECTION:

setAmount(amount)
Sets the transaction amount. The value must be a postive number.

setGatewayAvsCode(gatewayAvsCode)
Sets the payment gateway's address verification system (AVS) code.

setGatewayDate(gatewayDate)
Sets the payment gateway's date.

setGatewayMessage(gatewayMessage)
Sets information or messages that the gateway returned.

setGatewayReferenceDetails(gatewayReferenceDetails)
Sets the payment gateway's reference details.

setGatewayReferenceNumber(gatewayReferenceNumber)
Sets the payment gateway's reference number.

setGatewayResultCode(gatewayResultCode)
Sets the payment gateway's result code.

setGatewayResultCodeDescription(gatewayResultCodeDescription)
Sets the payment gateway's result code description.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)
Set the Salesforce result code info.

`setAmount(amount)`

Sets the transaction amount. The value must be a postive number.

Signature

```
global void setAmount(Double amount)
```

Parameters

`amount`
Type: Double

The amount to be debited or captured.

Return Value

Type: void

`setGatewayAvsCode(gatewayAvsCode)`

Sets the payment gateway's address verification system (AVS) code.

Signature

```
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

gatewayAvsCode
Type: String

Code sent by gateways that use an address verification system.

Return Value

Type: void

`setGatewayDate(gatewayDate)`

Sets the payment gateway's date.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

Date and time of the gateway communication.

Return Value

Type: void

`setGatewayMessage(gatewayMessage)`

Sets information or messages that the gateway returned.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Information or error messages returned by the gateway.

Return Value

Type: void

setGatewayReferenceDetails(gatewayReferenceDetails)

Sets the payment gateway's reference details.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

gatewayReferenceDetails
Type: String

Information about the gateway communication.

Return Value

Type: void

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the payment gateway's reference number.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique transaction ID created by the payment gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets the payment gateway's result code.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

The gateway result code. Must be mapped to a Salesforce result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets the payment gateway's result code description.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the `GatewayResultCode`. Provides more information about the result code returned by the gateway.

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Set the Salesforce result code info.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
Type: commercepayments.SalesforceResultCodeInfo on page 419

Describes the Salesforce result code value.

Return Value

Type: void

RefundRequest Class

Sends data related to a refund to the payment gateway adapter.

Namespace

CommercePayments on page 405

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.RefundRequest rrq = new CommercePayments.RefundRequest();
```

Example

```
commercepayments.ReferencedRefundRequest refundRequest = new
commercepayments.ReferencedRefundRequest(80, pmt.id);
```

IN THIS SECTION:

RefundRequest Methods

RefundRequest Methods

The following are methods for `RefundRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `RefundRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type `RefundRequest` by determining the uniqueness of the external object records in a list.

`equals(obj)`

Maintains the integrity of lists of type `RefundRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `RefundRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

RequestType Enum

Defines the type of payment transaction request made to the payment gateway.

Enum Values

The following are the values of the `commercepayments.RequestType` enum.

Value	Description
`Authorize`	Payment authorization request
`PostAuth`	Post authorization request
`Capture`	Payment capture request
`AuthorizationReversal`	Authorization Reversal request
`ReferencedRefund`	Payment refund request
`Sale` `commercepayments.RequestType, Sale`	Sale request
`Tokenize` `commercepayments.RequestType, Tokenize`	Payment tokenize request

SaleApiPaymentMethodRequest Class

Sends data related to a card payment method to a gateway adapter during a sale service call.

Namespace

CommercePayments on page 270

Usage

This class holds information about a payment method that was used for a Sale request. `SaleApiPaymentMethodRequest` contains all the possible payment methods as fields, but only one value is populated for a given request. Gateway adapters use this class when constructing a sale request. The object of this class is obtained through the `paymentMethod` field on the `SaleRequest` object.

Example: This code sample retrieves the `SaleApiPaymentMethodRequest` object from the `SaleRequest` class.

```
commercepayments.SaleApiPaymentMethodRequest paymentMethod = saleRequest.paymentMethod;
```

IN THIS SECTION:

SaleApiPaymentMethodRequest Constructors

SaleApiPaymentMethodRequest Properties

SaleApiPaymentMethodRequest Methods

SaleApiPaymentMethodRequest Constructors

The following are constructors for `SaleApiPaymentMethodRequest`.

IN THIS SECTION:

SaleApiPaymentMethodRequest(cardPaymentMethodRequest)

Sends data related to a card payment method to a gateway adapter during a sale service call.

SaleApiPaymentMethodRequest()

Constructor for building a sale payment method request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`SaleApiPaymentMethodRequest(cardPaymentMethodRequest)`

Sends data related to a card payment method to a gateway adapter during a sale service call.

Signature

```
global SaleApiPaymentMethodRequest(commercepayments.CardPaymentMethodRequest
cardPaymentMethodRequest)
```

Parameters

`cardPaymentMethodRequest`

Type: CardPaymentMethodRequest on page 339

SaleApiPaymentMethodRequest()

Constructor for building a sale payment method request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global SaleApiPaymentMethodRequest()
```

SaleApiPaymentMethodRequest Properties

The following are properties for `SaleApiPaymentMethodRequest`.

IN THIS SECTION:

cardPaymentMethod
Contains details of the card used in a payment method.

cardPaymentMethod

Contains details of the card used in a payment method.

Signature

```
global commercepayments.CardPaymentMethodRequest cardPaymentMethod {get; set;}
```

Property Value

Type: CardPaymentMethodRequest on page 339

SaleApiPaymentMethodRequest Methods

The following are methods for `SaleApiPaymentMethodRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `SaleApiPaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

hashCode()
Maintains the integrity of lists of type `SaleApiPaymentMethodRequest` by determining the uniqueness of the external object records in a list.

toString()
Converts a date to a string.

equals(obj)

Maintains the integrity of lists of type `SaleApiPaymentMethodRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the equals method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

Return Value

Type: Boolean

hashCode()

Maintains the integrity of lists of type `SaleApiPaymentMethodRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

toString()

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

SaleRequest Class

Stores information about a sales request.

Namespace

CommercePayments on page 270

Usage

This class holds all the required details about a sale request. Gateway adapters read the fields of this class object while constructing a sale JSON request thatis sent to the payment gateway. The object of this class is made available through `commercepayments.paymentGatewayContext` by calling `getPaymentRequest()`.

Example

This code sample retrieves the SaleRequest object from the `PaymentGatewayContext` class.

```
commercepayments.SaleRequest =
(commercepayments.SaleRequest)gatewayContext.getPaymentRequest()
```

IN THIS SECTION:

SaleRequest Constructors

SaleRequest Properties

SaleRequest Methods

SaleRequest Constructors

The following are constructors for `SaleRequest`.

IN THIS SECTION:

SaleRequest(amount)

Constructor for defining an amount for the sale request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`SaleRequest(amount)`

Constructor for defining an amount for the sale request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global SaleRequest(Double amount)
```

Parameters

amount

Type: Double

Amount of the sale request.

SaleRequest Properties

The following are properties for `SaleRequest`.

IN THIS SECTION:

accountId
Customer account ID for the sale request.

amount
Amount of the sale request. Can be positive only.

comments
Additional information about the sale request.

currencyIsoCode
Currency code for the sale request.

paymentMethod
Payment method used in the sale request.

accountId

Customer account ID for the sale request.

Signature

```
global String accountId {get; set;}
```

Property Value

Type: String

amount

Amount of the sale request. Can be positive only.

Signature

```
global Double amount {get; set;}
```

Property Value

Type: Double

comments

Additional information about the sale request.

Signature

```
global String comments {get; set;}
```

Property Value

Type: String

currencyIsoCode

Currency code for the sale request.

Signature

```
global String currencyIsoCode {get; set;}
```

Property Value

Type: String

paymentMethod

Payment method used in the sale request.

Signature

```
global commercepayments.SaleApiPaymentMethodRequest paymentMethod {get; set;}
```

Property Value

Type: SaleApiPaymentMethodRequest on page 406

SaleRequest Methods

The following are methods for `SaleRequest`.

IN THIS SECTION:

equals(obj)
Compares this object with the specified object and returns `true` if both objects are equal; otherwise, returns `false`.

hashCode()
Maintains the integrity of lists of type `SaleRequest` by determining the uniqueness of the external object records in a list.

toString()
Converts a date to a string.

equals(obj)

Compares this object with the specified object and returns `true` if both objects are equal; otherwise, returns `false`.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `SaleRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

SaleResponse Class

Response sent by payment gateway adapters for a sales service.

Namespace

CommercePayments on page 270

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.SaleResponse slr CommercePayments.SaleResponse();
```

This class contains details about a customer card that was used as a payment method for Authorization, Sale, or Tokenization request. The gateway adapter reads the fields of this class while constructing a transaction JSON request, which it then sends to the payment gateway. The object of this class is made available by the `cardPaymentMethod` field in `SaleApiPaymentMethodRequest on page 406` and `AuthApiPaymentMethodRequest on page 294`.

Example

This code sample builds a `SaleResponse` object.

```
commercepayments.SaleResponse saleResponse = new commercepayments.SaleResponse();
saleResponse.setGatewayReferenceDetails("refDetailString");
saleResponse.setGatewayResultCode("res_code");
saleResponse.setGatewayResultCodeDescription("");
saleResponse.setGatewayReferenceNumber("");
saleResponse.setSalesforceResultCodeInfo(getSalesforceResultCodeInfo(commercepayments.SalesforceResultCode.SUCCESS.name()));
```

IN THIS SECTION:

SaleResponse Methods

SaleResponse Methods

The following are methods for `SaleResponse`.

IN THIS SECTION:

setAmount(amount)

Sets the transaction amount. Must be a non-negative value.

setGatewayAvsCode(gatewayAvsCode)

Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

setGatewayDate(gatewayDate)

Sets the date that the sale occurred. Some gateways don't send this value.

setGatewayMessage(gatewayMessage)

Sets error messages that the gateway returned for the sale request. Maximum length of 255 characters.

setGatewayReferenceDetails(gatewayReferenceDetails)

Sets additional data that you can use for subsequent sales. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

setGatewayReferenceNumber(gatewayReferenceNumber)

Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse)

Sets information from the gateway about the tokenized payment method.

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

`setAmount(amount)`

Sets the transaction amount. Must be a non-negative value.

Signature

```
global void setAmount(Double amount)
```

Parameters

amount
Type: Double

The amount of the transaction.

Return Value

Type: void

`setGatewayAvsCode(gatewayAvsCode)`

Sets the AVS (address verification system) result code information that the gateway returned. Maximum length of 64 characters.

Signature

```
global void setGatewayAvsCode(String gatewayAvsCode)
```

Parameters

gatewayAvsCode
Type: String

Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.

Return Value

Type: void

`setGatewayDate(gatewayDate)`

Sets the date that the sale occurred. Some gateways don't send this value.

Signature

```
global void setGatewayDate(Datetime gatewayDate)
```

Parameters

gatewayDate
Type: Datetime

Return Value

Type: void

`setGatewayMessage(gatewayMessage)`

Sets error messages that the gateway returned for the sale request. Maximum length of 255 characters.

Signature

```
global void setGatewayMessage(String gatewayMessage)
```

Parameters

gatewayMessage
Type: String

Return Value

Type: void

`setGatewayReferenceDetails(gatewayReferenceDetails)`

Sets additional data that you can use for subsequent sales. You can use any data that isn't normalized in financial entities. This field has a maximum length of 1000 characters and can store data as JSON or XML.

Signature

```
global void setGatewayReferenceDetails(String gatewayReferenceDetails)
```

Parameters

gatewayReferenceDetails
Type: String

Return Value

Type: void

`setGatewayReferenceNumber(gatewayReferenceNumber)`

Sets the unique gateway reference number for the transaction that the gateway returned. Maximum length of 255 characters.

Signature

```
global void setGatewayReferenceNumber(String gatewayReferenceNumber)
```

Parameters

gatewayReferenceNumber
Type: String

Unique authorization ID created by the payment gateway.

Return Value

Type: void

setGatewayResultCode(gatewayResultCode)

Sets a gateway-specific result code. The code may be mapped to a Salesforce-specific result code. Maximum length of 64 characters.

Signature

```
global void setGatewayResultCode(String gatewayResultCode)
```

Parameters

gatewayResultCode
Type: String

Gateway-specific result code. Must be used to map a Salesforce-specific result code.

Return Value

Type: void

setGatewayResultCodeDescription(gatewayResultCodeDescription)

Sets a description of the gateway-specific result code that a payment gateway returned. Maximum length of 1000 characters.

Signature

```
global void setGatewayResultCodeDescription(String gatewayResultCodeDescription)
```

Parameters

gatewayResultCodeDescription
Type: String

Description of the gateway's result code. Use this field to learn more about why the gateway returned a certain result code.

Return Value

Type: void

setPaymentMethodTokenizationResponse(paymentMethodTokenizationResponse)

Sets information from the gateway about the tokenized payment method.

Signature

```
global void
setPaymentMethodTokenizationResponse(commercepayments.PaymentMethodTokenizationResponse
paymentMethodTokenizationResponse)
```

Parameters

paymentMethodTokenizationResponse
Type: PaymentMethodTokenizationResponse on page 377

Gateway response sent by payment gateway adapters for the payment method tokenization request. The response includes the payment method's token ID value.

Return Value

Type: void

setSalesforceResultCodeInfo(salesforceResultCodeInfo)

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Signature

```
global void setSalesforceResultCodeInfo(commercepayments.SalesforceResultCodeInfo
salesforceResultCodeInfo)
```

Parameters

salesforceResultCodeInfo
Type: SalesforceResultCodeInfo on page 419

Sets the Salesforce-specific result code information. Payment gateways have many response codes for payment calls. Salesforce uses the result code information to map payment gateway codes to a predefined set of standard Salesforce result codes.

Return Value

Type: void

SalesforceResultCode Enum

Defines the gateway call status values in Salesforce based on the call status values that the payment gateway returned.

Usage

Payment gateways can return many different responses. Salesforce maps these responses into one of seven possible Salesforce response values.

Enum Values

The following are the values of the `commercepayments.SalesforceResultCode` enum.

Value	Description
`Decline`	The gateway call failed, but it may still work if you try again. For example, the customer had insufficient funds or briefly lost their connection to the internet. This is also known as a "soft decline."
`Indeterminate`	The gateway didn't respond to the call and the user has to check the transaction request's status. Indeterminate responses often occur following server timeouts, system failure, or any action that interrupts the gateway's ability to process the payment.
`PermanentFail`	The customer's bank recognized the payment account as closed, terminated, or fraudulent. The gateway won't further calls from the payment method associate with the transaction. After a permanent fail response, the transaction changes its gateway status to Permanent Fail.
`RequiresReview`	The gateway call initially failed, but the payment method may still work after further evaluation. This response often happens when the customer bank requires more information about the payment request. In this case, the bank provides an authorization code manually when the payment manager calls the processor.
`Success`	The gateway processed the transaction successfully.
`SystemError`	Salesforce ended the payment request call before receiving a gateway response. System error responses often occur due to gateway server errors, invalid customer credentials, or anytime the request times out before receiving a gateway response. The failure occurs before the request reaches the gateway, so there's no risk of an unaccounted payment remaining in the gateway. You can continue with the transaction by manually creating a payment.
`ValidationError`	The gateway received incorrect customer payment information, such as misspelled credit card names or a CVV with missing numbers.

SalesforceResultCodeInfo

Stores Salesforce result code information from payment gateway adapters.

Namespace

CommercePayments on page 270

Usage

The constructor of this class takes no arguments. For example:

```
CommercePayments.SalesforceResultCodeInfo srci = new
CommercePayments.SalesforceResultCodeInfo();
```

Gateways can return the transaction result as either `CustomMetadata` or `SalesforceResultCode`.

IN THIS SECTION:

SalesforceResultCodeInfo Constructors

SalesforceResultCodeInfo Constructors

The following are constructors for `SalesforceResultCodeInfo`.

IN THIS SECTION:

SalesforceResultCodeInfo(customMetadataTypeInfo)
Constructor for providing the `customMetadataTypeInfo` for the result of the transaction.

SalesforceResultCodeInfo(salesforceResultCode)
Constructor that provides the `salesforceResultCode` for the transaction result.

`SalesforceResultCodeInfo(customMetadataTypeInfo)`

Constructor for providing the `customMetadataTypeInfo` for the result of the transaction.

Signature

```
global SalesforceResultCodeInfo(commercepayments.CustomMetadataTypeInfo
customMetadataTypeInfo)
```

Parameters

`customMetadataTypeInfo`
Type: CustomMetadataTypeInfo on page 354

Information about the metadata type.

`SalesforceResultCodeInfo(salesforceResultCode)`

Constructor that provides the `salesforceResultCode` for the transaction result.

Signature

```
global SalesforceResultCodeInfo(commercepayments.SalesforceResultCode
salesforceResultCode)
```

Parameters

`salesforceResultCode`
Type: SalesforceResultCode on page 418

The enum value for the result code.

CommerceTax Namespace

Manage the communication between Salesforce and an external tax engine.

The `CommerceTax` namespace includes these classes.

IN THIS SECTION:

AbstractTransactionResponse Class

Abstract class that contains methods for setting tax fields based on the external tax provider's response. Response classes that extend `AbstractTransactionResponse` inherit these methods.

AddressesResponse Class

Sets the tax address fields based on a response from the external tax engine. Contains setter methods for the Ship From, Ship To, and Sold To addresses.

AddressResponse Class

Contains a location code sent from the external tax engine.

AmountDetailsResponse Class

Sets tax amount fields based on a response from the external tax engine.

CalculateTaxRequest Class

Represents a request to an external tax engine to calculate tax. Extends the TaxTransactionRequest class and is the top-level request class.

CalculateTaxResponse Class

Sets the values of the tax transaction following a response from the external tax engine. Extends the AbstractTransactionResponse class and is the top-level response class.

CalculateTaxType Enum

Shows whether a tax calculation request is for estimated or actual tax.

ErrorResponse Class

Use to respond with an error after receiving errors from the PaymentGatewayAdapter methods of the CommercePayments namespace, such as request-forbidden responses, custom validation errors, or expired API tokens.

HeaderTaxAddressesRequest Class

Captures the address values that are applicable for the quote or order transaction.

ImpositionResponse Class

Stores details of tax impositions from the external tax engine.

JurisdictionResponse Class

Stores details from the external tax engine about the tax jurisdiction used in the tax calculation process. A tax jurisdiction represents a government entity that collects tax.

LineItemResponse Class

Response class that stores details of a list of one or more line items on which the tax engine has calculated tax.

LineTaxAddressesRequest Class

Stores details of the addresses applied per line item in a tax calculation request.

RequestType Enum

Shows the type of tax request made to the tax engine.

ResultCode Enum

Code that represents the results of a tax request made to the tax engine.

RuleDetailsResponse Class

Contains details about the tax rules used for tax calculation.

TaxAddressesRequest Class
Contains methods to get and set tax address values.

TaxAddressRequest Class
Contains address details used for tax calculation.

TaxApiException Class
Contains details about any exceptions during the tax calculation process. Extends the `ApexBaseException` class.

TaxCustomerDetailsRequest Class
Contains customer details used in tax calculation.

TaxDetailsResponse Class
Stores details of the tax values that an external tax engine calculates in response to a tax calculation request.

TaxEngineAdapter Interface
Retrieves information from the tax engine and evaluates the information to define tax details.

TaxEngineContext Class
Wrapper class that stores details about the type of a tax calculation request.

TaxLineItemRequest Class
Contains line item details of a tax request.

TaxSellerDetailsRequest Class
Contains tax code details used in the tax calculation request.

TaxTransactionRequest Class
Abstract class for storing customer details used in tax calculation and estimation requests.

TaxTransactionStatus Enum
Shows whether the tax transaction has been committed or uncommitted.

TaxTransactionType Enum
Shows whether the tax transaction is for a credit or debit transaction.

AbstractTransactionResponse Class

Abstract class that contains methods for setting tax fields based on the external tax provider's response. Response classes that extend `AbstractTransactionResponse` inherit these methods.

Namespace

CommerceTax

IN THIS SECTION:

AbstractTransactionResponse Methods
Learn more about the methods for AbstractTransactionResponse class.

AbstractTransactionResponse Methods

Learn more about the methods for AbstractTransactionResponse class.

The `AbstractTransactionResponse` class includes these methods.

IN THIS SECTION:

setAddresses(addresses)
Uses an instance of `AddressesResponse` to set the values of tax address fields.

setAmountDetails(amountDetails)
Uses an instance of `AmountDetailsResponse` to set tax amount fields such as exemption amount and tax amount.

setCurrencyIsoCode(currencyIsoCode)
Sets the currencyIsoCode field.

setDescription(dscptn)
Sets the Description field.

setDocumentCode(documentCode)
Sets the DocumentCode field. Document codes are often used to reference tax documents that the external tax engine uses in the tax calculation process. Document code acts as a unique link to chain-related transactions, such as amendment or refunds.

setEffectiveDate(effectiveDate)
Sets the EffectiveDate field. Effective Date fields are optional fields that store the date that a transaction takes effect. We provide these fields only for recordkeeping purposes – for example, if you must report an effective date to an external general ledger system. Salesforce doesn't use them to calculate any tax or payment values.

setLineItems(lineItems)
Uses an instance of the `LineItemResponse` class to set a list of line items. Each line item represents an item sent to an external tax engine for tax calculation.

setReferenceDocumentCode(referenceDocumentCode)
Sets the ReferenceDocumentCode field. Use this field to store the code of an additional document used in the tax calculation process. For example, use this field in case of a refund for a previously taxed purchase.

setReferenceEntityId(referenceEntityId)
Sets the ID of a reference entity. In Commerce Tax, a reference entity represents a record related to the items sent to the external tax engine for tax calculation. For example, if you sent order items for tax calculation, you could define the parent order as the reference entity.

setTaxTransactionId(taxTrxnId)
Sets the TaxTransactionId field using the ID of a tax transaction record. In Commerce Tax, a tax transaction record stores information about a specific tax calculation process.

setTransactionDate(transactionDate)
Sets the TransactionDate field.

`setAddresses(addresses)`

Uses an instance of `AddressesResponse` to set the values of tax address fields.

Signature

```
global void setAddresses(commercetax.AddressesResponse addresses)
```

Parameters

`addresses`
Type: AddressesResponse

Class that contains methods to set the Ship To, Ship From, and Sold To address information.

Return Value

Type: void

setAmountDetails(amountDetails)

Uses an instance of `AmountDetailsResponse` to set tax amount fields such as exemption amount and tax amount.

Signature

```
global void setAmountDetails(commercetax.AmountDetailsResponse amountDetails)
```

Parameters

amountDetails
Type: AmountDetailsResponse

Class that contains methods to set the tax exemption amount, tax amount, total amount, and total amount with tax.

Return Value

Type: void

setCurrencyIsoCode(currencyIsoCode)

Sets the currencyIsoCode field.

Signature

```
global void setCurrencyIsoCode(String currencyIsoCode)
```

Parameters

currencyIsoCode
Type: String

Three-letter ISO 4217 currency code associated with a tax object.

Return Value

Type: void

setDescription(dscptn)

Sets the Description field.

Signature

```
global void setDescription(String dscptn)
```

Parameters

dscptn
Type: String

Optional field for providing additional information about a record.

Return Value

Type: void

setDocumentCode(documentCode)

Sets the DocumentCode field. Document codes are often used to reference tax documents that the external tax engine uses in the tax calculation process. Document code acts as a unique link to chain-related transactions, such as amendment or refunds.

Signature

```
global void setDocumentCode(String documentCode)
```

Parameters

documentCode
Type: String

Code for a tax document used in the tax calculation process.

Return Value

Type: void

setEffectiveDate(effectiveDate)

Sets the EffectiveDate field. Effective Date fields are optional fields that store the date that a transaction takes effect. We provide these fields only for recordkeeping purposes – for example, if you must report an effective date to an external general ledger system. Salesforce doesn't use them to calculate any tax or payment values.

Signature

```
global void setEffectiveDate(Datetime effectiveDate)
```

Parameters

effectiveDate
Type: Datetime

Optional field that stores the date that a transaction takes effect.

Return Value

Type: void

`setLineItems(lineItems)`

Uses an instance of the `LineItemResponse` class to set a list of line items. Each line item represents an item sent to an external tax engine for tax calculation.

Signature

```
global void setLineItems(List<commercetax.LineItemResponse> lineItems)
```

Parameters

`lineItems`
Type: List<LineItemResponse>

A list of line items sent to an external tax engine for tax calculation.

Return Value

Type: void

`setReferenceDocumentCode(referenceDocumentCode)`

Sets the ReferenceDocumentCode field. Use this field to store the code of an additional document used in the tax calculation process. For example, use this field in case of a refund for a previously taxed purchase.

Signature

```
global void setReferenceDocumentCode(String referenceDocumentCode)
```

Parameters

`referenceDocumentCode`
Type: String

The code for a document used in the tax calculation process.

Return Value

Type: void

`setReferenceEntityId(referenceEntityId)`

Sets the ID of a reference entity. In Commerce Tax, a reference entity represents a record related to the items sent to the external tax engine for tax calculation. For example, if you sent order items for tax calculation, you could define the parent order as the reference entity.

Signature

```
global void setReferenceEntityId(String referenceEntityId)
```

Parameters

referenceEntityId
Type: String

ID of a record related to the items sent for tax calculation.

Return Value

Type: void

setTaxTransactionId(taxTrxnId)

Sets the TaxTransactionId field using the ID of a tax transaction record. In Commerce Tax, a tax transaction record stores information about a specific tax calculation process.

Signature

```
global void setTaxTransactionId(String taxTrxnId)
```

Parameters

taxTrxnId
Type: String

The ID of a tax transaction record in Commerce Tax.

Return Value

Type: void

setTransactionDate(transactionDate)

Sets the TransactionDate field.

Signature

```
global void setTransactionDate(Datetime transactionDate)
```

Parameters

transactionDate
Type: Datetime

Date that a tax transaction occurred.

Return Value

Type: void

AddressesResponse Class

Sets the tax address fields based on a response from the external tax engine. Contains setter methods for the Ship From, Ship To, and Sold To addresses.

Namespace

CommerceTax

Usage

Because `AddressesResponse` contains multiple addresses, we recommend using multiple instances of `AddressResponse` to set unique values for each address.

Example

This code sample represents a portion of the code used in a mock tax adapter. In this example, you create three `AddressResponse` classes, set their location codes, and pass them to the `Ship To`, `Ship From`, and `Sold To` setter methods in `AddressesResponse`. In an actual implementation, your `AddressResponse` classes already have a location code based on the response from the external tax engine.

```
commercetax.AddressesResponse addressesRes = new commercetax.AddressesResponse();

//AddressResponse containing ShipTo information
commercetax.AddressResponse shipToAddress = new commercetax.AddressResponse();
shipToAddress.setLocationCode('1234567');

//AddressResponse containing ShipFrom information
commercetax.AddressResponse shipFromAddress = new commercetax.AddressResponse();
shipFromAddress.setLocationCode('84720385');

//AddressResponse containing Sold To information
commercetax.AddressResponse soldToAddress = new commercetax.AddressResponse();
soldToAddress.setLocationCode('92381749');

//set values of addressesRes
addressesRes.setShipFrom(shipFromAddress);
addressesRes.setShipTo(shipToAddress);
addressesRes.setSoldTo(soldToAddress);
```

IN THIS SECTION:

AddressesResponse Methods
Learn more about the methods for AddressesResponse class.

AddressesResponse Methods

Learn more about the methods for AddressesResponse class.

The `AddressesResponse` class includes these methods.

IN THIS SECTION:

setShipFrom(shipFrom)
Sets the value of a ShipFrom address field.

setShipTo(shipTo)
Sets the value of a ShipTo address field.

setSoldTo(soldTo)
Sets the value of a SoldTo address field.

setShipFrom(shipFrom)

Sets the value of a ShipFrom address field.

Signature

```
global void setShipFrom(commercetax.AddressResponse shipFrom)
```

Parameters

shipFrom
Type: AddressResponse

A single address. Use this generic address parameter to store any type of address, such as Ship From, Ship To, and Sold To details. Users set the specific address in an `AddressResponse` instance and then pass that instance to the `AddressesResponse`'s `setShipTo()`, `setShipFrom()`, and `setSoldTo()` methods as needed.

Return Value

Type: void

setShipTo(shipTo)

Sets the value of a ShipTo address field.

Signature

```
global void setShipTo(commercetax.AddressResponse shipTo)
```

Parameters

shipTo
Type: AddressResponse

Stores a single address. This is a generic address parameter and can be used to store any type of address, such as Ship From, Ship To, and Sold To details. Users set the specific address in an `AddressResponse` instance and then pass that instance to the `AddressesResponse`'s `setShipTo()`, `setShipFrom()`, and `setSoldTo()` methods as needed.

Return Value

Type: void

`setSoldTo(soldTo)`

Sets the value of a SoldTo address field.

Signature

```
global void setSoldTo(commercetax.AddressResponse soldTo)
```

Parameters

`soldTo`
Type: AddressResponse

Stores a single address. This is a generic address parameter and can be used to store any type of address, such as Ship From, Ship To, Sold To details. Users set the specific address in an AddressResponse instance and then pass that instance to the `AddressesResponse`'s `setShipTo()`, `setShipFrom()`, and `setSoldTo()` methods as needed.

Return Value

Type: void

AddressResponse Class

Contains a location code sent from the external tax engine.

Namespace

CommerceTax

Usage

Use the `AddressResponse` class to set unique values for each address.

```
commercetax.AddressesResponse addressesRes = new commercetax.AddressesResponse();

//AddressResponse containing ShipTo information
commercetax.AddressResponse shipToAddress = new commercetax.AddressResponse();
shipToAddress.setLocationCode('1234567');

//AddressResponse containing ShipFrom information
commercetax.AddressResponse shipFromAddress = new commercetax.AddressResponse();
shipFromAddress.setLocationCode('84720385');

//AddressResponse containing Sold To information
commercetax.AddressResponse soldToAddress = new commercetax.AddressResponse();
soldToAddress.setLocationCode('92381749');

//set values of addressesRes
addressesRes.setShipFrom(shipFromAddress);
addressesRes.setShipTo(shipToAddress);
addressesRes.setSoldTo(soldToAddress);
```

IN THIS SECTION:

AddressResponse Methods
Learn more about the available methods with the `AddressResponse` class.

AddressResponse Methods

Learn more about the available methods with the `AddressResponse` class.

The `AddressResponse` class includes these methods.

IN THIS SECTION:

setLocationCode(locationCode)
Sets the value of a LocationCode field.

`setLocationCode(locationCode)`

Sets the value of a LocationCode field.

Signature

```
global void setLocationCode(String locationCode)
```

Parameters

`locationCode`
Type: String

A code that contains address information. This value can be passed to a method that sets the value of an address field.

Return Value

Type: void

AmountDetailsResponse Class

Sets tax amount fields based on a response from the external tax engine.

Namespace

CommerceTax

Example

In this example, an instance of `AmountDetailsResponse` class in a mock adapter calculates several tax amount fields. The `totalTax` and `totalAmount` parameters were defined in an instance of `LineItemResponse` class. The adapter then assigns the instance to `lineItemResponse`.

```
commercetax.AmountDetailsResponse amountResponse = new commercetax.AmountDetailsResponse();
amountResponse.setTotalAmountWithTax(totalTax+totalAmount);
```

```
amountResponse.setExemptAmount(0);
amountResponse.setTotalAmount(totalAmount);
amountResponse.setTaxAmount(totalTax);
lineItemResponse.setAmountDetails(amountResponse);
```

IN THIS SECTION:

AmountDetailsResponse Methods
Learn more about the methods available from the `AmountDetailsResponse` class.

AmountDetailsResponse Methods

Learn more about the methods available from the `AmountDetailsResponse` class.

The following are methods for `AmountDetailsResponse`.

IN THIS SECTION:

setExemptAmount(exemptAmount)
Sets the value of the ExemptAmount field.

setTaxAmount(taxAmount)
Sets the value of the TaxAmount field.

setTotalAmount(totalAmount)
Sets the value of the TotalAmount field.

setTotalAmountWithTax(totalAmtWithTax)
Sets the value of the TotalAmountWithTax field.

`setExemptAmount(exemptAmount)`

Sets the value of the ExemptAmount field.

Signature

```
global void setExemptAmount(Double exemptAmount)
```

Parameters

`exemptAmount`
Type: Double

The amount of a line item's total amount that's exempt from tax calculation.

Return Value

Type: void

`setTaxAmount(taxAmount)`

Sets the value of the TaxAmount field.

Signature

```
global void setTaxAmount(Double taxAmount)
```

Parameters

taxAmount
Type: Double

The calculated amount of tax for a line item.

Return Value

Type: void

setTotalAmount(totalAmount)

Sets the value of the TotalAmount field.

Signature

```
global void setTotalAmount(Double totalAmount)
```

Parameters

totalAmount
Type: Double

The total amount of a line item, excluding tax.

Return Value

Type: void

setTotalAmountWithTax(totalAmtWithTax)

Sets the value of the TotalAmountWithTax field.

Signature

```
global void setTotalAmountWithTax(Double totalAmtWithTax)
```

Parameters

totalAmtWithTax
Type: Double

The total amount of a line item combined with the calculated tax for that line item.

Return Value

Type: void

CalculateTaxRequest Class

Represents a request to an external tax engine to calculate tax. Extends the TaxTransactionRequest class and is the top-level request class.

Namespace

CommerceTax

Example

See TaxEngineAdapter Example Implementation for more details on how to access information from the `CalculateTaxRequest` class.

IN THIS SECTION:

CalculateTaxRequest Constructors
Learn more about the constructors that are available with the `CalculateTaxRequest` class. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

CalculateTaxRequest Properties
Learn more about the available properties with the `CalculateTaxRequest` class.

CalculateTaxRequest Methods
Learn more about the available methods with the `CalculateTaxRequest` class.

CalculateTaxRequest Constructors

Learn more about the constructors that are available with the `CalculateTaxRequest` class. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

The `CalculateTaxRequest` class includes these constructors.

IN THIS SECTION:

CalculateTaxRequest(taxType)
This constructor is intended for test usage only and throws an exception if used outside of the Apex test context.

`CalculateTaxRequest(taxType)`

This constructor is intended for test usage only and throws an exception if used outside of the Apex test context.

Signature

```
global CalculateTaxRequest(commercetax.CalculateTaxType taxType)
```

Parameters

`taxType`
Type: CalculateTaxType

Indicates whether the tax calculation is for estimated tax or actual tax.

CalculateTaxRequest Properties

Learn more about the available properties with the `CalculateTaxRequest` class.

The `CalculateTaxRequest` class includes these properties.

IN THIS SECTION:

isCommit
Indicates whether the tax calculation has to be committed or reported to government authorities.

taxTransactionType
Shows whether the tax transaction is for a credit or debit transaction.

taxType
Shows whether the tax calculation is for estimated or actual tax wherein only actual tax can be submitted.

`isCommit`

Indicates whether the tax calculation has to be committed or reported to government authorities.

Signature

```
global Boolean isCommit {get; set;}
```

Property Value

Type: Boolean

`taxTransactionType`

Shows whether the tax transaction is for a credit or debit transaction.

Signature

```
global commercetax.TaxTransactionType taxTransactionType {get; set;}
```

Property Value

Type: TaxTransactionType

`taxType`

Shows whether the tax calculation is for estimated or actual tax wherein only actual tax can be submitted.

Signature

```
global commercetax.CalculateTaxType taxType {get; set;}
```

Property Value

Type: CalculateTaxType

CalculateTaxRequest Methods

Learn more about the available methods with the `CalculateTaxRequest` class.

The `CalculateTaxRequest` class includes these methods.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `CalculateTaxRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

hashCode()
Maintains the integrity of lists of type `CalculateTaxRequest` by determining the uniqueness of the external object records in a list.

toString()
Converts a value to a string.

`equals(obj)`

Maintains the integrity of lists of type `CalculateTaxRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `CalculateTaxRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a value to a string.

Signature

```
global String toString()
```

Return Value

Type: String

CalculateTaxResponse Class

Sets the values of the tax transaction following a response from the external tax engine. Extends the AbstractTransactionResponse class and is the top-level response class.

Namespace

CommerceTax

Example

```
if(requestType == commercetax.RequestType.CalculateTax){
             commercetax.calculatetaxtype type = request.taxtype;
             String docCode='';
             if(request.DocumentCode == 'simulateEmptyDocumentCode')
                 docCode = '';
             else if(request.DocumentCode != null)
                 docCode =request.DocumentCode;
           else if(request.ReferenceEntityId != null) docCode = request.ReferenceEntityId;

             else docCode =  String.valueOf(getRandomInteger(0,2147483647));
             commercetax.CalculateTaxResponse response = new
commercetax.CalculateTaxResponse();
             if(request.isCommit == true) {
                 response.setStatus(commercetax.TaxTransactionStatus.Committed);
             } else {
                 response.setStatus(commercetax.TaxTransactionStatus.Uncommitted);
             }
             response.setDocumentCode(docCode);
             response.setReferenceDocumentCode(request.referenceDocumentCode);
             response.setTaxType(type);
             response.setStatusDescription('statusDescription');
             if(request.sellerDetails.code == 'testSellerCode') {
                 response.setDescription('SellerCode fetched from TaxEngine entity');
             }
             else {
                 response.setDescription('description');
             }
            response.setEffectiveDate(system.now());
            if(request.transactionDate == null) {
```

```
                response.setTransactionDate(system.now());
            } else {
                response.setTransactionDate(request.transactionDate);
            }
            if(request.taxTransactionType == null) {
                response.setTaxTransactionType(commercetax.TaxTransactionType.Debit);
            } else {
                response.setTaxTransactionType(request.taxTransactionType);
            }
             if(request.currencyIsoCode == null || request.currencyIsoCode == '') {
                response.setCurrencyIsoCode('USD');
             } else {
                response.setCurrencyIsoCode(request.currencyIsoCode);
             }
             response.setReferenceEntityId(request.ReferenceEntityId);
}
```

IN THIS SECTION:

CalculateTaxResponse Methods

Learn more about the available methods with the `CalculateTaxResponse` class.

CalculateTaxResponse Methods

Learn more about the available methods with the `CalculateTaxResponse` class.

The `CalculateTaxResponse` class includes these methods.

IN THIS SECTION:

setAddresses(addresses)

Sets the value of the Addresses field using the addresses contained in an instance of the AddressesResponse class.

setAmountDetails(amountDetails)

Sets the value of the AmountDetails field using an instance of `AmountDetailsResponse`.

setCurrencyIsoCode(currencyIsoCode)

Sets the value of the CurrencyIsoCode field of the `CalculateTaxResponse` object.

setDescription(dscptn)

Sets the value of the Description field of the `CalculateTaxResponse` object.

setDocumentCode(documentCode)

Sets the value of the DocumentCode field of the `CalculateTaxResponse` object.

setEffectiveDate(effectiveDate)

Sets the value of the EffectiveDate field of the `CalculateTaxResponse` object.

setLineItems(lineItems)

Sets the value of the LineItems field of the `CalculateTaxResponse` object.

setReferenceDocumentCode(referenceDocumentCode)

Sets the value of the ReferenceDocumentCode field of the `CalculateTaxResponse` object.

setReferenceEntityId(referenceEntityId)
Sets the value of the ReferenceEntityId field of the `CalculateTaxResponse` object.

setStatus(status)
Sets the value of the Status field of the `CalculateTaxResponse` object.

setStatusDescription(statusDescription)
Sets the value of the StatusDescription field of the `CalculateTaxResponse` object.

setTaxTransactionId(taxTrxnId)
Sets the value of the TaxTransactionId field of the `CalculateTaxResponse` object.

setTaxTransactionType(taxTransactionType)
Sets the value of the TaxTransactionType field of the `CalculateTaxResponse` object.

setTaxType(taxType)
Sets the value of the TaxType field of the `CalculateTaxResponse` object.

setTransactionDate(transactionDate)
Sets the value of the TransactionDate field of the `CalculateTaxResponse` object.

`setAddresses(addresses)`

Sets the value of the Addresses field using the addresses contained in an instance of the AddressesResponse class.

Signature

```
global void setAddresses(commercetax.AddressesResponse addresses)
```

Parameters

addresses
Type: AddressesResponse

Contains Ship To, Ship From, and Sold To addresses.

Return Value

Type: void

`setAmountDetails(amountDetails)`

Sets the value of the AmountDetails field using an instance of `AmountDetailsResponse`.

Signature

```
global void setAmountDetails(commercetax.AmountDetailsResponse amountDetails)
```

Parameters

amountDetails
Type: AmountDetailsResponse

The tax amount details for a line item on which tax was calculated.

Return Value

Type: void

`setCurrencyIsoCode(currencyIsoCode)`

Sets the value of the CurrencyIsoCode field of the `CalculateTaxResponse` object.

Signature

```
global void setCurrencyIsoCode(String currencyIsoCode)
```

Parameters

`currencyIsoCode`
Type: String

Three-letter ISO 4217 currency code associated with a tax object.

Return Value

Type: void

`setDescription(dscptn)`

Sets the value of the Description field of the `CalculateTaxResponse` object.

Signature

```
global void setDescription(String dscptn)
```

Parameters

`dscptn`
Type: String

Optional description for providing more information about the calculate tax response.

Return Value

Type: void

`setDocumentCode(documentCode)`

Sets the value of the DocumentCode field of the `CalculateTaxResponse` object.

Signature

```
global void setDocumentCode(String documentCode)
```

Parameters

documentCode
Type: String

Code for a tax document that's created by the tax engine for the calculation process.

Return Value

Type: void

setEffectiveDate(effectiveDate)

Sets the value of the EffectiveDate field of the `CalculateTaxResponse` object.

Signature

```
global void setEffectiveDate(Datetime effectiveDate)
```

Parameters

effectiveDate
Type: Datetime

The date a tax calculation action takes effect. This parameter is optional and is provided only for recordkeeping purpose. Additionally, this parameter is used to determine the tax rates or rules and overrides the transaction date. For example, if the tax calculation request is placed on January 3 and the transaction date is January 1, you can set the effective date as January 1.

Return Value

Type: void

setLineItems(lineItems)

Sets the value of the LineItems field of the `CalculateTaxResponse` object.

Signature

```
global void setLineItems(List<commercetax.LineItemResponse> lineItems)
```

Parameters

lineItems
Type: List<LineItemResponse>

Response object that the tax adapter populates from the response of the external tax engine.

Return Value

Type: void

`setReferenceDocumentCode(referenceDocumentCode)`

Sets the value of the ReferenceDocumentCode field of the `CalculateTaxResponse` object.

Signature

```
global void setReferenceDocumentCode(String referenceDocumentCode)
```

Parameters

`referenceDocumentCode`
Type: String

Code for a reference document used in the tax calculation process.

Return Value

Type: void

`setReferenceEntityId(referenceEntityId)`

Sets the value of the ReferenceEntityId field of the `CalculateTaxResponse` object.

Signature

```
global void setReferenceEntityId(String referenceEntityId)
```

Parameters

`referenceEntityId`
Type: String

ID of an entity related to the line items submitted for tax calculation. For example, if order items were sent for tax calculation, you could use the ID of their parent order.

Return Value

Type: void

`setStatus(status)`

Sets the value of the Status field of the `CalculateTaxResponse` object.

Signature

```
global void setStatus(commercetax.TaxTransactionStatus status)
```

Parameters

`status`
Type: TaxTransactionStatus

Indicates whether a tax transaction has been committed.

Return Value

Type: void

setStatusDescription(statusDescription)

Sets the value of the StatusDescription field of the `CalculateTaxResponse` object.

Signature

```
global void setStatusDescription(String statusDescription)
```

Parameters

statusDescription
Type: String

Optional value for providing more information about a tax transaction's status.

Return Value

Type: void

setTaxTransactionId(taxTrxnId)

Sets the value of the TaxTransactionId field of the `CalculateTaxResponse` object.

Signature

```
public void setTaxTransactionId(String taxTrxnId)
```

Parameters

taxTrxnId
Type: String

The ID of the Salesforce tax transaction entity that stores information about the tax calculation transaction.

Return Value

Type: void

setTaxTransactionType(taxTransactionType)

Sets the value of the TaxTransactionType field of the `CalculateTaxResponse` object.

Signature

```
global void setTaxTransactionType(commercetax.TaxTransactionType taxTransactionType)
```

Parameters

taxTransactionType
Type: TaxTransactionType

Whether the tax transaction was for a credit or debit transacation.

Return Value

Type: void

setTaxType(taxType)

Sets the value of the TaxType field of the `CalculateTaxResponse` object.

Signature

```
global void setTaxType(commercetax.CalculateTaxType taxType)
```

Parameters

taxType
Type: CalculateTaxType

Indicates whether a tax calculation request is for estimated or actual tax.

Return Value

Type: void

setTransactionDate(transactionDate)

Sets the value of the TransactionDate field of the `CalculateTaxResponse` object.

Signature

```
global void setTransactionDate(Datetime transactionDate)
```

Parameters

transactionDate
Type: Datetime

The date that the tax transaction occurred.

Return Value

Type: void

CalculateTaxType Enum

Shows whether a tax calculation request is for estimated or actual tax.

Usage

Used by the CalculateTaxRequest and CalculateTaxResponse class methods.

Enum Values

The `commercetax.CalculateTaxType` enum includes these values.

Value	Description
`Actual`	Specifies that the tax calculation service should calculate the finalized (actual) tax for the requested line items.
`Estimated`	Specifies that the tax calculation service should estimate the tax for the requested line items.

ErrorResponse Class

Use to respond with an error after receiving errors from the PaymentGatewayAdapter methods of the CommercePayments namespace, such as request-forbidden responses, custom validation errors, or expired API tokens.

Namespace

CommerceTax

Example

This example snippet of a mock tax adapter shows a hypothetical scenario to demo an error response. The adapter receives request information from `TaxEngineContext` and stores it in an instance of `CalculateTaxRequest`. If the request's `documentCode` property is null or indicates an error, the adapter returns an error response with information about the error.

```
global virtual class MockAdapter implements commercetax.TaxEngineAdapter {

     global commercetax.TaxEngineResponse processRequest(commercetax.TaxEngineContext
taxEngineContext) {
         commercetax.RequestType requestType = taxEngineContext.getRequestType();
         commercetax.CalculateTaxRequest request =
(commercetax.CalculateTaxRequest)taxEngineContext.getRequest();

if(request.documentCode == null) {
             return new commercetax.ErrorResponse(commercetax.resultcode.TaxEngineError,
'404', 'documentCode  is mandatory');
         }
         if(request.documentCode == 'TaxEngineError') {
             return new commercetax.ErrorResponse(commercetax.resultcode.TaxEngineError,
'504', 'documentCode  - not supported');
         }
         if(request.documentCode == 'simulateValidationFailureInAdapter') {
             return new commercetax.ErrorResponse(commercetax.resultcode.TaxEngineError,
'400', 'validations for documentCode failed in adapter');
```

```
        }
        if(request.documentCode == 'simulateMalformedErrorInAdapter') {
                    return new
commercetax.ErrorResponse(commercetax.resultcode.TaxEngineError, null, 'malformed adapter
 error response');
        }
        if(request.documentCode == 'simulateTaxEngineProcessFailure') {
            return new commercetax.ErrorResponse(commercetax.resultcode.TaxEngineError,
'500', 'Tax Engine couldnt process your request');
        }
```

IN THIS SECTION:

ErrorResponse Constructors

Learn more about the available constructors with the `ErrorResponse` class.

ErrorResponse Constructors

Learn more about the available constructors with the `ErrorResponse` class.

The `ErrorResponse` class includes these constructors.

IN THIS SECTION:

ErrorResponse(resultCode, errorCode, errorMessage)

Constructor to initialize an `ErrorResponse` object from the result code, error code, and error message sent from the tax engine.

`ErrorResponse(resultCode, errorCode, errorMessage)`

Constructor to initialize an `ErrorResponse` object from the result code, error code, and error message sent from the tax engine.

Signature

```
global ErrorResponse(commercetax.ResultCode resultCode, String errorCode, String
errorMessage)
```

Parameters

`resultCode`

Type: ResultCode

Code for the type of result sent by the tax engine.

`errorCode`

Type: String

Code for the type of error sent by the tax engine.

Codes must match the HTTP status codes to be returned to the user. Here are a few examples:

- If the status code is for a bad request, set `errorCode` to `400`.
- If the status code is for a forbidden request, set `errorCode` to `403`.
- If `errorCode` isn't a valid HTTP status code, a 500 internal server error is returned.

errorMessage
Type: String

The error message sent by the tax engine.

HeaderTaxAddressesRequest Class

Captures the address values that are applicable for the quote or order transaction.

Namespace

CommerceTax

IN THIS SECTION:

HeaderTaxAddressesRequest Constructors
Learn more about the constructors available with the `HeaderTaxAddressesRequest` class.

HeaderTaxAddressesRequest Properties
Learn more about the available properties with the `HeaderTaxAddressesRequest` class.

HeaderTaxAddressesRequest Methods
Learn more about the available methods with the `HeaderTaxAddressesRequest` class.

HeaderTaxAddressesRequest Constructors

Learn more about the constructors available with the `HeaderTaxAddressesRequest` class.

The `HeaderTaxAddressesRequest` class includes these constructors.

IN THIS SECTION:

HeaderTaxAddressesRequest(shipFrom, shipTo, soldTo, billTo, taxEngineAddress)
Constructor for initializing the required addresses of the tax addresses request such as the ship from, ship to, sold to, and bill to addresses. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`HeaderTaxAddressesRequest(shipFrom, shipTo, soldTo, billTo, taxEngineAddress)`

Constructor for initializing the required addresses of the tax addresses request such as the ship from, ship to, sold to, and bill to addresses. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global HeaderTaxAddressesRequest(commercetax.TaxAddressRequest shipFrom,
commercetax.TaxAddressRequest shipTo, commercetax.TaxAddressRequest soldTo,
commercetax.TaxAddressRequest billTo, commercetax.TaxAddressRequest taxEngineAddress)
```

Parameters

shipFrom
Type: TaxAddressRequest

Address where a line item was shipped from.

shipTo
Type: TaxAddressRequest

Address where a line item was shipped to.

soldTo
Type: TaxAddressRequest

Address of the line item's buyer.

billTo
Type: TaxAddressRequest

Person or group who was billed for the line item.

taxEngineAddress
Type: TaxAddressRequest

Address that the tax engine uses to calculate tax.

HeaderTaxAddressesRequest Properties

Learn more about the available properties with the `HeaderTaxAddressesRequest` class.

The `HeaderTaxAddressesRequest` class includes these properties.

IN THIS SECTION:

billTo
Specifies the billTo address for a line item on which tax was calculated.

shipFrom
Specifies the shipFrom address for a line item on which tax was calculated.

shipTo
Specifies the shipTo address for a line item on which tax was calculated.

soldTo
Specifies the soldTo address for a line item on which tax was calculated.

taxEngineAddress
Address used by the tax engine when calculating tax for a line item.

billTo

Specifies the billTo address for a line item on which tax was calculated.

Signature

```
global commercetax.TaxAddressRequest billTo {get; set;}
```

Property Value

Type: TaxAddressRequest

shipFrom

Specifies the shipFrom address for a line item on which tax was calculated.

Signature

```
global commercetax.TaxAddressRequest shipFrom {get; set;}
```

Property Value

Type: TaxAddressRequest

shipTo

Specifies the shipTo address for a line item on which tax was calculated.

Signature

```
global commercetax.TaxAddressRequest shipTo {get; set;}
```

Property Value

Type: TaxAddressRequest

soldTo

Specifies the soldTo address for a line item on which tax was calculated.

Signature

```
global commercetax.TaxAddressRequest soldTo {get; set;}
```

Property Value

Type: TaxAddressRequest

taxEngineAddress

Address used by the tax engine when calculating tax for a line item.

Signature

```
global commercetax.TaxAddressRequest taxEngineAddress {get; set;}
```

Property Value

Type: TaxAddressRequest

HeaderTaxAddressesRequest Methods

Learn more about the available methods with the `HeaderTaxAddressesRequest` class.

The `HeaderTaxAddressesRequest` class includes these methods.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `HeaderTaxAddressesRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

hashCode()
Maintains the integrity of lists of type `TaxAddressesRequest` by determining the uniqueness of the external objects in a list.

toString()
Converts a value to a string.

`equals(obj)`

Maintains the integrity of lists of type `HeaderTaxAddressesRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `TaxAddressesRequest` by determining the uniqueness of the external objects in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a value to a string.

Signature

```
global String toString()
```

Return Value

Type: String

ImpositionResponse Class

Stores details of tax impositions from the external tax engine.

Namespace

CommerceTax

Example

In this mock adapter example, the adapter sets the `TaxDetailsResponse.setImposition()` method parameter to null if the request's document code indicates that the tax calculation didn't require any exceptions. Otherwise, it creates an instance of `ImpositionResponse` and sets its SubType and Type values, and then assigns it to `TaxDetailsResponse`.

```
if(request.DocumentCode == 'SetsNullForResponseWithoutException'){
  taxDetailsResponse.setImposition(null);
                      }else{
                         commercetax.ImpositionResponse imposition = new
commercetax.ImpositionResponse();
                         imposition.setSubType('subtype');
                         imposition.setType('type');
                         taxDetailsResponse.setImposition(imposition);
                    }
```

IN THIS SECTION:

ImpositionResponse Methods
Learn more about the available methods with the `ImpositionResponse` class.

ImpositionResponse Methods

Learn more about the available methods with the `ImpositionResponse` class.

The `ImpositionResponse` class includes these methods.

IN THIS SECTION:

setId(id)
Sets the ID field of the `ImpositionResponse` class.

setName(name)
Sets the Name field of the `ImpositionResponse` class.

setSubType(subType)
Sets the SubType field of the `ImpositionResponse` class.

setType(type)
Sets the Type field of the `ImpositionResponse` class.

setId(id)

Sets the ID field of the `ImpositionResponse` class.

Signature

```
global void setId(String id)
```

Parameters

id
Type: String

User-defined ID value used for referencing the tax imposition.

Return Value

Type: void

setName(name)

Sets the Name field of the `ImpositionResponse` class.

Signature

```
global void setName(String name)
```

Parameters

name
Type: String

Optional user-defined name for the tax imposition response.

Return Value

Type: void

setSubType(subType)

Sets the SubType field of the `ImpositionResponse` class.

Signature

```
global void setSubType(String subType)
```

Parameters

subType
Type: String

Many tax calculation organizations use types and subtypes to categorize their tax imposition procedures. If the tax engine you use follows this process, set the subtype with this parameter.

Return Value

Type: void

`setType(type)`

Sets the Type field of the `ImpositionResponse` class.

Signature

```
public void setType(String type)
```

Parameters

type
Type: String

Many tax calculation organizations use types and subtypes to categorize their tax imposition procedures. If the tax engine you use follows this process, set the type with this parameter.

Return Value

Type: void

JurisdictionResponse Class

Stores details from the external tax engine about the tax jurisdiction used in the tax calculation process. A tax jurisdiction represents a government entity that collects tax.

Namespace

CommerceTax

Example

In this mock adapter example, the adapter sets the `TaxDetailsResponse.setJurisdiction()` method parameter to null if the request's document code indicates that the tax calculation didn't require any exceptions. Otherwise, it creates an instance of `JurisdictionResponse` and sets its address values. Because this code represents a mock adapter, the example defines the address parameters directly. In a standard implementation, the jurisdiction's setters receive values passed from the eternal tax engine.

```
if(request.DocumentCode == 'SetsNullForResponseWithoutException'){
                        taxDetailsResponse.setJurisdiction(null);
                    }else{
                       commercetax.JurisdictionResponse jurisdiction = new
```

```
commercetax.JurisdictionResponse();
                        jurisdiction.setCountry('country');
                        jurisdiction.setRegion('region');
                        jurisdiction.setName('name');
                        jurisdiction.setStateAssignedNumber('stateAssignedNo');
                        jurisdiction.setId('id');
                        jurisdiction.setLevel('level');
                        taxDetailsResponse.setJurisdiction(jurisdiction);

}
```

IN THIS SECTION:

JurisdictionResponse Methods

Learn more about the available methods with the `JurisdictionResponse` class.

The `JurisdictionResponse` class includes these methods.

IN THIS SECTION:

setCountry(country)
Sets the Country field of the `JurisdictionResponse` class.

setId(id)
Sets the ID field of the `JurisdictionResponse` class.

setLevel(level)
Sets the Level field of the `JurisdictionResponse` class.

setName(name)
Sets the Name field of the `JurisdictionResponse` class.

setRegion(region)
Sets the Region value of the `JurisdictionResponse` class.

setStateAssignedNumber(stateAssignedNo)
Sets the StateAssignedNumber field of the `JurisdictionResponse` class.

`setCountry(country)`

Sets the Country field of the `JurisdictionResponse` class.

Signature

```
global void setCountry(String country)
```

Parameters

country
Type: String

The country of the tax jurisdiction entity's address.

Return Value

Type: void

setId(id)

Sets the ID field of the `JurisdictionResponse` class.

Signature

```
global void setId(String id)
```

Parameters

id
Type: String

User-defined Id value used to reference the jurisdiction response.

Return Value

Type: void

setLevel(level)

Sets the Level field of the `JurisdictionResponse` class.

Signature

```
global void setLevel(String level)
```

Parameters

level
Type: String

Level value used in the jurisdiction entity's address.

Return Value

Type: void

setName(name)

Sets the Name field of the `JurisdictionResponse` class.

Signature

```
global void setName(String name)
```

Parameters

name
Type: String

Optional user-defined name field for referencing the jurisdiction response.

Return Value

Type: void

setRegion(region)

Sets the Region value of the `JurisdictionResponse` class.

Signature

```
global void setRegion(String region)
```

Parameters

region
Type: String

Region value used in the tax jurisdiction entity's address.

Return Value

Type: void

setStateAssignedNumber(stateAssignedNo)

Sets the StateAssignedNumber field of the `JurisdictionResponse` class.

Signature

```
global void setStateAssignedNumber(String stateAssignedNo)
```

Parameters

stateAssignedNo
Type: String

State assigned number value of the tax jurisdiction entity's address.

Return Value

Type: void

LineItemResponse Class

Response class that stores details of a list of one or more line items on which the tax engine has calculated tax.

Namespace

CommerceTax

Example

This example uses a `LineItemResponse` list to store information about each line item that was processed as part of the request. For simplicity, the sample code uses a static value of 1 for the tax rate. However, most integrations typically have a more complex process for determining a tax rate. Most integrations also build a `TaxDetailsResponse` list to store the actual tax value information that they assign to each line item in the `LineItemResponse` list.

```
Double totalTax = 0.0;
             Double totalAmount = 0.0;
             List<commercetax.LineItemResponse> lineItemResponses = new
List<commercetax.LineItemResponse>();
             for(Commercetax.TaxLineItemRequest lineItem : request.lineItems){
                 commercetax.AddressesResponse addressesRes = new
commercetax.AddressesResponse();
                 if(request.DocumentCode == 'SetsNullForResponseWithoutException'){
                     addressesRes.setShipFrom(null);
                     addressesRes.setShipTO(null);
                     addressesRes.setSoldTo(null);
                 }else{
                  commercetax.AddressResponse addRes = new commercetax.AddressResponse();

                     addRes.setLocationCode('locationCode');
                     addressesRes.setShipFrom(addRes);
                     addressesRes.setShipTO(addRes);
                     addressesRes.setSoldTo(addRes);
                 }
                 commercetax.LineItemResponse lineItemResponse = new
commercetax.LineItemResponse();
                 Double totalLineTax = 0;
                 List<commercetax.TaxDetailsResponse> taxDetailsResponses = new
List<commercetax.TaxDetailsResponse>();
                 for(integer i =0;i<1;i++){
                     Integer rate  = 1;
                     Double taxableAmount = lineItem.amount;
                     commercetax.TaxDetailsResponse taxDetailsResponse = new
commercetax.TaxDetailsResponse();
                     taxDetailsResponse.setRate(Double.valueOf(rate));
                     taxDetailsResponse.setTaxableAmount(taxableAmount);
                     Double tax = taxableAmount*rate;
                     totalLineTax+=tax;
                     taxDetailsResponse.setTax(taxableAmount*rate);
                     taxDetailsResponse.setExemptAmount(0);
                     taxDetailsResponse.setExemptReason('exemptReason');
                     taxDetailsResponse.setTaxRegionId('taxRegionId');
```

```
taxDetailsResponse.setTaxId(String.valueOf(getRandomInteger(0,2323233)));
                    taxDetailsResponse.setSerCode('serCode');
                    taxDetailsResponse.setTaxAuthorityTypeId('taxAuthorityTypeId');
                    if(request.DocumentCode == 'SetsNullForResponseWithoutException'){
                        taxDetailsResponse.setImposition(null);
                    }else{
                        commercetax.ImpositionResponse imposition = new
commercetax.ImpositionResponse();
                        imposition.setSubType('subtype');
                        imposition.setType('type');
                        taxDetailsResponse.setImposition(imposition);
                    }

                    if(request.DocumentCode == 'SetsNullForResponseWithoutException'){
                        taxDetailsResponse.setJurisdiction(null);
                    }else{
                        commercetax.JurisdictionResponse jurisdiction = new
commercetax.JurisdictionResponse();
                        jurisdiction.setCountry('country');
                        jurisdiction.setRegion('region');
                        jurisdiction.setName('name');
                        jurisdiction.setStateAssignedNumber('stateAssignedNo');
                        jurisdiction.setId('id');
                        jurisdiction.setLevel('level');
                        taxDetailsResponse.setJurisdiction(jurisdiction);
                    }

                    taxDetailsResponses.add(taxDetailsResponse);
                }
                lineItemResponse.setTaxes(taxDetailsResponses);
                totalTax +=totalLineTax;
                totalAmount+=lineItem.amount;
```

IN THIS SECTION:

LineItemResponse Methods
Learn more about the available methods with the `LineItemResponse` class.

LineItemResponse Methods

Learn more about the available methods with the `LineItemResponse` class.

The `LineItemResponse` class includes these methods.

IN THIS SECTION:

setAddresses(addresses)
Sets the Addresses field on the `LineItemResponse` using an instance of `AddressesResponse` class.

setAmountDetails(amountDetails)
Sets the Amount Details field on the `LineItemResponse` using an instance of `AmountDetails`.

setEffectiveDate(effectiveDate)

Sets the EffectiveDate field on the `LineItemResponse` class. Effective Date fields are optional fields that store the date that a transaction takes effect. We provide these fields only for recordkeeping purposes – for example, if you must report an effective date to an external general ledger system. Salesforce doesn't use them to calculate any tax or payment values.

setIsTaxable(isTaxable)

Sets the IsTaxable field on the `LineItemResponse` class.

setLineNumber(lineNumber)

Sets the LineNumber field on the `LineItemResponse` class.

setProductCode(productCode)

Sets the ProductCode field on the `LineItemResponse` class.

setQuantity(quantity)

Sets the Quantity field on the `LineItemResponse` class.

setTaxCode(taxCode)

Sets the TaxCode field on the `LineItemResponse`.

setTaxes(taxes)

Sets the Taxes field on a `LineItemResponse`.

`setAddresses(addresses)`

Sets the Addresses field on the `LineItemResponse` using an instance of `AddressesResponse` class.

Signature

```
global void setAddresses(commercetax.AddressesResponse addresses)
```

Parameters

`addresses`

Type: AddressesResponse

Class that contains methods to set the Ship To, Ship From, and Sold To address information.

Return Value

Type: void

`setAmountDetails(amountDetails)`

Sets the Amount Details field on the `LineItemResponse` using an instance of `AmountDetails`.

Signature

```
global void setAmountDetails(commercetax.AmountDetailsResponse amountDetails)
```

Parameters

`amountDetails`

Type: AmountDetailsResponse

Class that contains methods to set the tax amount, total amount with tax, total amount, and exempt amount.

Return Value

Type: void

`setEffectiveDate(effectiveDate)`

Sets the EffectiveDate field on the `LineItemResponse` class. Effective Date fields are optional fields that store the date that a transaction takes effect. We provide these fields only for recordkeeping purposes – for example, if you must report an effective date to an external general ledger system. Salesforce doesn't use them to calculate any tax or payment values.

Signature

```
global void setEffectiveDate(Datetime effectiveDate)
```

Parameters

`effectiveDate`
Type: Datetime

Optional field that stores the date that a transaction takes effect.

Return Value

Type: void

`setIsTaxable(isTaxable)`

Sets the IsTaxable field on the `LineItemResponse` class.

Signature

```
global void setIsTaxable(Boolean isTaxable)
```

Parameters

`isTaxable`
Type: Boolean

Whether line items were taxed as part of the tax calculation request.

Return Value

Type: void

`setLineNumber(lineNumber)`

Sets the LineNumber field on the `LineItemResponse` class.

Signature

```
global void setLineNumber(String lineNumber)
```

Parameters

lineNumber
Type: String

User-defined number used to identify a line item.

Return Value

Type: void

setProductCode(productCode)

Sets the ProductCode field on the `LineItemResponse` class.

Signature

```
global void setProductCode(String productCode)
```

Parameters

productCode
Type: String

Code for the product that a line item represents.

Return Value

Type: void

setQuantity(quantity)

Sets the Quantity field on the `LineItemResponse` class.

Signature

```
global void setQuantity(Double quantity)
```

Parameters

quantity
Type: Double

Quantity of a line item.

Return Value

Type: void

`setTaxCode(taxCode)`

Sets the TaxCode field on the `LineItemResponse`.

Signature

```
global void setTaxCode(String taxCode)
```

Parameters

`taxCode`
Type: String

Federal code that an individual or business uses to pay their taxes to a federal or state government. The tax engine uses this code during the tax calculation process.

Return Value

Type: void

`setTaxes(taxes)`

Sets the Taxes field on a `LineItemResponse`.

Signature

```
global void setTaxes(List<commercetax.TaxDetailsResponse> taxes)
```

Parameters

`taxes`
Type: List<TaxDetailsResponse>

Tax values applied to a line item in the `LineItemResponse` list. This information is stored in a list of `TaxDetailsResponses`, which contains values such as tax, taxable amount, and tax rate.

Return Value

Type: void

LineTaxAddressesRequest Class

Stores details of the addresses applied per line item in a tax calculation request.

The `LineTaxAddressesRequest` class includes these constructors.

IN THIS SECTION:

LineTaxAddressesRequest(shipFrom, shipTo, soldTo, billTo, taxEngineAddress)

Constructor for initializing the required addresses for a line item of the tax addresses request such as the ship to, ship from, and bill to addresses. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`LineTaxAddressesRequest(shipFrom, shipTo, soldTo, billTo, taxEngineAddress)`

Constructor for initializing the required addresses for a line item of the tax addresses request such as the ship to, ship from, and bill to addresses. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global LineTaxAddressesRequest(commercetax.TaxAddressRequest shipFrom,
commercetax.TaxAddressRequest shipTo, commercetax.TaxAddressRequest soldTo,
commercetax.TaxAddressRequest billTo, commercetax.TaxAddressRequest taxEngineAddress)
```

Parameters

shipFrom
TaxAddressRequest

Address where a line item was shipped from.

shipTo
TaxAddressRequest

Address where a line item is shipped to.

soldTo
TaxAddressRequest

Address of the line item's buyer.

billTo
TaxAddressRequest

Person or group who was billed for the line item.

taxEngineAddress
TaxAddressRequest

Address that the tax engine uses to calculate tax.

LineTaxAddressesRequest Properties

Learn more about the available properties with the `LineTaxAddressesRequest` class.

The `LineTaxAddressesRequest` class includes these properties.

IN THIS SECTION:

billTo
The Bill To address for a line item.

shipFrom
The Ship From address for a line item.

shipTo
The Ship To address for a line item.

soldTo
The Sold To address for a line item.

billTo

The Bill To address for a line item.

Signature

```
global commercetax.TaxAddressRequest billTo {get; set;}
```

Property Value

Type: TaxAddressRequest

shipFrom

The Ship From address for a line item.

Signature

```
global commercetax.TaxAddressRequest shipFrom {get; set;}
```

Property Value

Type: TaxAddressRequest

shipTo

The Ship To address for a line item.

Signature

```
global commercetax.TaxAddressRequest shipTo {get; set;}
```

Property Value

Type: TaxAddressRequest

`soldTo`

The Sold To address for a line item.

Signature

```
global commercetax.TaxAddressRequest soldTo {get; set;}
```

Property Value

Type: TaxAddressRequest

LineTaxAddressesRequest Methods

Learn more about the available methods with the `LineTaxAddressesRequest` class.

The `LineTaxAddressesRequest` class includes these methods.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `LineTaxAddressesRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

hashCode()
Maintains the integrity of lists of type `LineTaxAddressesRequest` by determining the uniquness of the external object records in a list.

toString()
Converts a value to a string.

`equals(obj)`

Maintains the integrity of lists of type `LineTaxAddressesRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj

Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `LineTaxAddressesRequest` by determining the uniquness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a value to a string.

Signature

```
global String toString()
```

Return Value

Type: String

RequestType Enum

Shows the type of tax request made to the tax engine.

Usage

Used by the TaxEngineContext class method.

Enum Values

The `commercetax.RequestType` enum includes these values.

Value	Description
`CalculateTax`	Represents a request to calculate tax on a list of taxable line items.

ResultCode Enum

Code that represents the results of a tax request made to the tax engine.

Usage

Used by the ErrorResponse class method.

Enum Values

The `commercetax.ResultCode` enum includes these values.

Value	Description
`TaxEngineError`	Represents an error that occurred during the tax request process.

RuleDetailsResponse Class

Contains details about the tax rules used for tax calculation.

Namespace

CommerceTax

The `RuleDetailsResponse` includes these methods.

IN THIS SECTION:

RuleDetailsResponse()
Contains information about the tax rules used when calculating tax for line items.

setNonTaxableRuleId(nonTaxableRuleId)
Sets the NonTaxableRuleId field of the `RuleDetailsResponse`.

setNonTaxableType(nonTaxableType)
Sets the NonTaxableType field of the `RuleDetailsResponse`.

setRateRuleId(rateRuleId)
Sets the RateRuleId field of the `RuleDetailsResponse`.

setRateSourceId(rateSourceId)
Sets the RateSourceId field on the `RuleDetailsResponse`.

`RuleDetailsResponse()`

Contains information about the tax rules used when calculating tax for line items.

Signature

```
global void RuleDetailsResponse()
```

Return Value

Type: void

setNonTaxableRuleId(nonTaxableRuleId)

Sets the NonTaxableRuleId field of the `RuleDetailsResponse`.

Signature

```
global void setNonTaxableRuleId(String nonTaxableRuleId)
```

Parameters

nonTaxableRuleId
Type: String

ID of the tax rule applied to non-taxable line items.

Return Value

Type: void

setNonTaxableType(nonTaxableType)

Sets the NonTaxableType field of the `RuleDetailsResponse`.

Signature

```
global void setNonTaxableType(String nonTaxableType)
```

Parameters

nonTaxableType
Type: String

Reason (from several possible types) that a line item is non-taxable.

Return Value

Type: void

setRateRuleId(rateRuleId)

Sets the RateRuleId field of the `RuleDetailsResponse`.

Signature

```
global void setRateRuleId(String rateRuleId)
```

Parameters

rateRuleId
Type: String

ID of the tax rule used to determine a tax rate.

Return Value

Type: void

setRateSourceId(rateSourceId)

Sets the RateSourceId field on the `RuleDetailsResponse`.

Signature

```
global void setRateSourceId(String rateSourceId)
```

Parameters

rateSourceId
Type: String

ID of the source object used for calculating tax rate.

Return Value

Type: void

TaxAddressesRequest(shipFrom, shipTo, soldTo, billTo, taxEngineAddress)
Constructor for defining addresses for the tax addresses request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`TaxAddressesRequest(shipFrom, shipTo, soldTo, billTo, taxEngineAddress)`

Constructor for defining addresses for the tax addresses request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global TaxAddressesRequest(commercetax.TaxAddressRequest shipFrom,
commercetax.TaxAddressRequest shipTo, commercetax.TaxAddressRequest soldTo,
commercetax.TaxAddressRequest billTo, commercetax.TaxAddressRequest taxEngineAddress)
```

Parameters

shipFrom
TaxAddressRequest

The address where a line item was shipped from.

shipTo
TaxAddressRequest

The address where a line item is shipped to.

soldTo
TaxAddressRequest

The address of the line item's buyer.

billTo
TaxAddressRequest

The person or group who was billed for the line item.

taxEngineAddress
TaxAddressRequest

The address that the tax engine uses to calculate tax.

shipTo
The Ship To address for a line item.

soldTo
The Sold To address for a line item.

taxEngineAddress
The Tax Engine Address for a line item.

billTo

The Bill To address for a line item.

Signature

```
global commercetax.TaxAddressRequest billTo {get; set;}
```

Property Value

TaxAddressRequest

shipFrom

The Ship From address for a line item.

Signature

```
global commercetax.TaxAddressRequest shipFrom {get; set;}
```

Property Value

TaxAddressRequest

shipTo

The Ship To address for a line item.

Signature

```
public commercetax.TaxAddressRequest shipTo {get; set;}
```

Property Value

TaxAddressRequest

soldTo

The Sold To address for a line item.

Signature

```
global commercetax.TaxAddressRequest soldTo {get; set;}
```

Property Value

TaxAddressRequest

`taxEngineAddress`

The Tax Engine Address for a line item.

Signature

```
global commercetax.TaxAddressRequest taxEngineAddress {get; set;}
```

Property Value

TaxAddressRequest

`TaxAddressRequest(city, country, latitude, longitude, postalCode, state, street, locationCode)`

Initializes the `TaxAddressRequest` object using address details. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global TaxAddressRequest(String city, String country, Double latitude, Double longitude,
String postalCode, String state, String street, String locationCode)
```

Parameters

city
Type: String

City used in an address required for tax calculation.

country
Type: String

Country used in an address required for tax calculation.

latitude
Type: Double

Latitude used in an address required for tax calculation.

longitude
Type: Double

Longitude used in an address required for tax calculation.

postalCode
Type: String

Postal code used in an address required for tax calculation.

state
Type: String

State used in an address required for tax calculation.

street
Type: String

Street used in an address required for tax calculation.

locationCode
Type: String

Location code used in an address required for tax calculation.

Maintains the integrity of lists of type TaxAddressRequest by determining the equality of external objects in a list. This method is dynamic and based on the `equals()` method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `TaxAddressRequest` by determining the uniqueness of the external object in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

TaxApiException Class

TaxApiException(var1, var2)

Initializes the `TaxApiException` class using an `Exception` and a string to provide more details about the exception. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

TaxApiException(var1)

Initializes the `TaxApiException` class using an `Exception`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

TaxApiException()

Initializes the `TaxApiException` class without any initialized parameters. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`TaxApiException(var1, var2)`

Initializes the `TaxApiException` class using an `Exception` and a string to provide more details about the exception. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global TaxApiException(String var1, Exception var2)
```

Parameters

var1

Type: String

Text that provides more information about the returned exception.

var2

Type: Exception

An exception denotes an error that disrupts the normal flow of code execution. You can use Apex built-in exceptions or create custom exceptions. All exceptions have common methods.

`TaxApiException(var1)`

Initializes the `TaxApiException` class using an `Exception`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global TaxApiException(Exception var1)
```

Parameters

var1
Type: Exception

An exception denotes an error that disrupts the normal flow of code execution. You can use Apex built-in exceptions or create custom exceptions. All exceptions have common methods.

`TaxApiException()`

Initializes the `TaxApiException` class without any initialized parameters. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global TaxApiException()
```

TaxCustomerDetailsRequest Class

Contains customer details used in tax calculation.

Namespace

CommerceTax

IN THIS SECTION:

TaxCustomerDetailsRequest Constructors

TaxCustomerDetailsRequest Properties
Learn more about the available properties with the `TaxCustomerDetailsRequest` class.

TaxCustomerDetailsRequest Methods
Learn more about the available methods with the `TaxCustomerDetailsRequest` class.

TaxCustomerDetailsRequest Constructors

Learn more about the available constructors with the `TaxCustomerDetailsRequest` class.

The `TaxCustomerDetailsRequest` class includes these constructors.

IN THIS SECTION:

TaxCustomerDetailsRequest(accountId, code, exemptionNo, exemptionReason, taxCertificateId)
Initializes the `TaxCustomerDetailsRequest` object. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`TaxCustomerDetailsRequest(accountId, code, exemptionNo, exemptionReason, taxCertificateId)`

Initializes the `TaxCustomerDetailsRequest` object. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global TaxCustomerDetailsRequest(String accountId, String code, String exemptionNo,
String exemptionReason, String taxCertificateId)
```

Parameters

accountId
Type: String

The customer account ID for the line items sent for tax calculation.

code
Type: String

The tax code used during tax calculation.

exemptionNo
Type: String

The exemption number applied to any tax exempt line items.

exemptionReason
Type: String

The reason that certain line items are tax exempt.

taxCertificateId
Type: String

ID of the tax certificate used in tax calculation.

TaxCustomerDetailsRequest Properties

Learn more about the available properties with the `TaxCustomerDetailsRequest` class.

The `TaxCustomerDetailsRequest` class includes these properties.

IN THIS SECTION:

accountId
Customer account that contains the line items sent for tax calculation.

code
Tax code used during tax calculation.

exemptionNo
Number used to qualify a line item for tax exemption.

exemptionReason
Reason why a line item qualifies for tax exemption.

taxCertificateId
ID of a tax certificate used for tax calculation.

accountId

Customer account that contains the line items sent for tax calculation.

Signature

```
global String accountId {get; set;}
```

Property Value

Type: String

code

Tax code used during tax calculation.

Signature

```
global String code {get; set;}
```

Property Value

Type: String

exemptionNo

Number used to qualify a line item for tax exemption.

Signature

```
global String exemptionNo {get; set;}
```

Property Value

Type: String

exemptionReason

Reason why a line item qualifies for tax exemption.

Signature

```
global String exemptionReason {get; set;}
```

Property Value

Type: String

`taxCertificateId`

ID of a tax certificate used for tax calculation.

Signature

```
global String taxCertificateId {get; set;}
```

Property Value

Type: String

TaxCustomerDetailsRequest Methods

Learn more about the available methods with the `TaxCustomerDetailsRequest` class.

The `TaxCustomerDetailsRequest` class includes these methods.

IN THIS SECTION:

equals(obj)

Maintains the integrity of lists of type `TaxCustomerDetailsRequest` by determining the equality of external objects in a list. This method is dynamic and based on the `equals()` method in Java.

hashCode()

Maintains the integrity of lists of type `TaxCustomerDetailsRequest` by determining the uniqueness of the external objects in a list.

toString()

Converts a value to a string.

`equals(obj)`

Maintains the integrity of lists of type `TaxCustomerDetailsRequest` by determining the equality of external objects in a list. This method is dynamic and based on the `equals()` method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj

Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

hashCode()

Maintains the integrity of lists of type `TaxCustomerDetailsRequest` by determining the uniqueness of the external objects in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

toString()

Converts a value to a string.

Signature

```
global String toString()
```

Return Value

Type: String

TaxDetailsResponse Class

Stores details of the tax values that an external tax engine calculates in response to a tax calculation request.

Namespace

CommerceTax

Usage

If your tax calculation request contains multiple line items, we recommend building your adapter using a list of `TaxDetailsResponse` instances. Each instance represents the tax details calculated for a given line item.

Example

```
List<commercetax.TaxDetailsResponse> taxDetailsResponses = new
List<commercetax.TaxDetailsResponse>();
                for(integer i =0;i<1;i++){
                    Integer rate  = 1;
                    Double taxableAmount = lineItem.amount;
                    commercetax.TaxDetailsResponse taxDetailsResponse = new
commercetax.TaxDetailsResponse();
                    taxDetailsResponse.setRate(Double.valueOf(rate));
                    taxDetailsResponse.setTaxableAmount(taxableAmount);
                    Double tax = taxableAmount*rate;
```

```
                    totalLineTax+=tax;
                    taxDetailsResponse.setTax(taxableAmount*rate);
                    taxDetailsResponse.setExemptAmount(0);
                    taxDetailsResponse.setExemptReason('exemptReason');
                    taxDetailsResponse.setTaxRegionId('taxRegionId');

taxDetailsResponse.setTaxId(String.valueOf(getRandomInteger(0,2323233)));
                    taxDetailsResponse.setSerCode('serCode');
                    taxDetailsResponse.setTaxAuthorityTypeId('taxAuthorityTypeId');
                    if(request.DocumentCode == 'SetsNullForResponseWithoutException'){
                        taxDetailsResponse.setImposition(null);
                    }else{
                        commercetax.ImpositionResponse imposition = new
commercetax.ImpositionResponse();
                        imposition.setSubType('subtype');
                        imposition.setType('type');
                        taxDetailsResponse.setImposition(imposition);
                    }

                    if(request.DocumentCode == 'SetsNullForResponseWithoutException'){
                        taxDetailsResponse.setJurisdiction(null);
                    }else{
                        commercetax.JurisdictionResponse jurisdiction = new
commercetax.JurisdictionResponse();
                        jurisdiction.setCountry('country');
                        jurisdiction.setRegion('region');
                        jurisdiction.setName('name');
                        jurisdiction.setStateAssignedNumber('stateAssignedNo');
                        jurisdiction.setId('id');
                        jurisdiction.setLevel('level');
                        taxDetailsResponse.setJurisdiction(jurisdiction);
                    }

                    taxDetailsResponses.add(taxDetailsResponse);
                }
                lineItemResponse.setTaxes(taxDetailsResponses);
                totalTax +=totalLineTax;
                totalAmount+=lineItem.amount;
```

TaxDetailsResponse Methods

Learn more about the available methods with the `TaxDetailsResponse` class.

TaxDetailsResponse Methods

Learn more about the available methods with the `TaxDetailsResponse` class.

The `TaxDetailsResponse` class includes these methods.

IN THIS SECTION:

setExemptAmount(exemptAmount)
Sets the ExemptAmount field of the `TaxDetailsResponse` class.

setExemptReason(reason)
Sets the ExemptReason field of the `TaxDetailsResponse` class.

setImposition(imposition)
Sets the Imposition field of the `TaxDetailsResponse` class using an instance of the `ImpositionResponse` class.

setJurisdiction(jurisdiction)
Sets the Jurisdiction field of the `TaxDetailsResponse` using an instance of the `JurisdictionResponse` class.

setRate(rate)
Sets the Rate field of the `TaxDetailsResponse` class.

setSerCode(serCode)
Sets the Service Code field of the `TaxDetailsResponse` class.

setTax(tax)
Sets the Tax field of the `TaxDetailsResponse` class.

setTaxAuthorityTypeId(taxAuthorityTypeId)
Sets the TaxAuthorityTypeId field of the `TaxDetailsResponse` class.

setTaxId(taxId)
Sets the TaxId field of the `TaxDetailsResponse` class.

setTaxRegionId(taxRegionId)
Sets the TaxRegionId field on the `TaxDetailsResponse` class.

setTaxRuleDetails(taxRuleDetails)
Sets the TaxRuleDetails field of the `TaxDetailsResponse` class.

setTaxableAmount(taxableAmount)
Sets the TaxableAmount field of the `TaxDetailsResponse class`.

`setExemptAmount(exemptAmount)`

Sets the ExemptAmount field of the `TaxDetailsResponse` class.

Signature

```
global void setExemptAmount(Double exemptAmount)
```

Parameters

`exemptAmount`
Type: Double

Amount of tax on a line item that is exempt from tax calculation.

Return Value

Type: void

`setExemptReason(reason)`

Sets the ExemptReason field of the `TaxDetailsResponse` class.

Signature

```
global void setExemptReason(String reason)
```

Parameters

`reason`
Type: String

Optional user-defined information on why a tax exemption applies to a line item.

Return Value

Type: void

`setImposition(imposition)`

Sets the Imposition field of the `TaxDetailsResponse` class using an instance of the `ImpositionResponse` class.

Signature

```
global void setImposition(commercetax.ImpositionResponse imposition)
```

Parameters

`imposition`
Type: ImpositionResponse

Contains information about why tax was imposed on a line item.

Return Value

Type: void

`setJurisdiction(jurisdiction)`

Sets the Jurisdiction field of the `TaxDetailsResponse` using an instance of the `JurisdictionResponse` class.

Signature

```
global void setJurisdiction(commercetax.JurisdictionResponse jurisdiction)
```

Parameters

`jurisdiction`
Type: JurisdictionResponse

Contains address information about the tax jurisdiction used in the tax calculation process.

Return Value

Type: void

`setRate(rate)`

Sets the Rate field of the `TaxDetailsResponse` class.

Signature

```
global void setRate(Double rate)
```

Parameters

`rate`
Type: Double

Tax used during tax calculation. This value is often a decimal amount, such as 0.1 or 0.06, based on the applied tax percentage.

Return Value

Type: void

`setSerCode(serCode)`

Sets the Service Code field of the `TaxDetailsResponse` class.

Signature

```
global void setSerCode(String serCode)
```

Parameters

`serCode`
Type: String

Service code used in tax calculation.

Return Value

Type: void

`setTax(tax)`

Sets the Tax field of the `TaxDetailsResponse` class.

Signature

```
global void setTax(Double tax)
```

Parameters

tax
Type: Double

Amount of tax for a line item.

Return Value

Type: void

setTaxAuthorityTypeId(taxAuthorityTypeId)

Sets the TaxAuthorityTypeId field of the `TaxDetailsResponse` class.

Signature

```
global void setTaxAuthorityTypeId(String taxAuthorityTypeId)
```

Parameters

taxAuthorityTypeId
Type: String

ID of the organization that oversees tax collection.

Return Value

Type: void

setTaxId(taxId)

Sets the TaxId field of the `TaxDetailsResponse` class.

Signature

```
global void setTaxId(String taxId)
```

Parameters

taxId
Type: String

ID value used to determine the tax for an individual or business.

Return Value

Type: void

setTaxRegionId(taxRegionId)

Sets the TaxRegionId field on the `TaxDetailsResponse` class.

Signature

```
global void setTaxRegionId(String taxRegionId)
```

Parameters

taxRegionId
Type: String

ID of the tax region used in tax calculation. A tax region represents a geographical area where tax is applied.

Return Value

Type: void

setTaxRuleDetails(taxRuleDetails)

Sets the TaxRuleDetails field of the `TaxDetailsResponse` class.

Signature

```
global void setTaxRuleDetails(commercetax.RuleDetailsResponse taxRuleDetails)
```

Parameters

taxRuleDetails
Type: RuleDetailsResponse

Information about the Salesforce tax rules used during tax calculation.

Return Value

Type: void

setTaxableAmount(taxableAmount)

Sets the TaxableAmount field of the `TaxDetailsResponse class`.

Signature

```
global void setTaxableAmount(Double taxableAmount)
```

Parameters

taxableAmount
Type: Double

Amount that can be taxed on a line item.

Return Value

Type: void

TaxEngineAdapter Interface

Retrieves information from the tax engine and evaluates the information to define tax details.

Namespace

CommerceTax

IN THIS SECTION:

TaxEngineAdapter Methods

Learn more about the available methods with the `TaxEngineAdapter` class.

TaxEngineAdapter Example Implementation

Refer to the example implementation of the `TaxEngineAdapter` interface to accept information from a tax engine and evaluate the information to define tax details.

TaxEngineAdapter Methods

Learn more about the available methods with the `TaxEngineAdapter` class.

The `TaxEngineAdapter` class includes these methods.

IN THIS SECTION:

processRequest(requestType)

The `processRequest` method takes an instance of `TaxEngineContext` class and returns a response with the calculated tax details through the `TaxDetailsResponse` class or an error response through the `ErrorResponse` class.

`processRequest(requestType)`

The `processRequest` method takes an instance of `TaxEngineContext` class and returns a response with the calculated tax details through the `TaxDetailsResponse` class or an error response through the `ErrorResponse` class.

Signature

```
global commercetax.TaxEngineResponse processRequest(commercetax.TaxEngineContext var1)
```

Parameters

`var1`

Type: TaxEngineContext

Wrapper class that stores information about the type of a tax calculation request.

Return Value

Type: TaxEngineResponse

Generic interface representing a response from an external tax engine.

TaxEngineAdapter Example Implementation

Refer to the example implementation of the `TaxEngineAdapter` interface to accept information from a tax engine and evaluate the information to define tax details.

Namespace

commercetax

Usage

The `TaxEngineAdapter` interface accepts information from the tax engine through the `TaxEngineContext` class. The interface evaluates the information to define tax in the response with details, such as tax amount and addresses. The response is used to update and create entities in the Salesforce org.

Use these steps to build a sample tax adapter implementation. Each tax adapter implementation varies based on your implementation requirements. Customize this example to suit your business requirements.

Example:

- The custom adapter class implements the `TaxEngineAdapter` interface. The `processRequest` method takes an instance of `TaxEngineContext` class and returns a response with the calculated tax details through the `TaxDetailsResponse` class or an error response through the `ErrorResponse` class.

```
global virtual class AvalaraAdapter implements commercetax.TaxEngineAdapter {
    global commercetax.TaxEngineResponse processRequest(commercetax.TaxEngineContext
 taxEngineContext) {
        commercetax.RequestType requestType = taxEngineContext.getRequestType();
        if(requestType == commercetax.RequestType.CalculateTax){
            return CalculateTaxService.getTax(taxEngineContext);
        }
        else
            return null;
    }
}
```

- This example shows the `CalculateTaxService` class.

```
global class CalculateTaxService {
    // ================================================================================

    // CONSTANT
    // ================================================================================

                }
            }
                jsonGeneratorInstance.writeEndArray();
```

```
            jsonGeneratorInstance.writeEndObject();
            return jsonGeneratorInstance.getAsString();
        }
        catch (Exception e)
        {
             throw e;
        }
    }
}
```

- Use the `JsonErrorParser` class to extract the error details, if any.

```
global with sharing class JsonErrorParser
{
    public cls_error error;

    public class cls_error
    {
        public String code;
        public String message;
        public String target;
        public cls_details[] details;
    }

    public class cls_details
    {
        public String code;
        public String message;
        public String description;
        public String faultCode;
        public String helpLink;
        public String severity;
    }
    public static JsonErrorParser parse(String json)
    {
       return (JsonErrorParser) System.JSON.deserialize(json, JsonErrorParser.class);

    }
}
```

TaxEngineContext Class

Wrapper class that stores details about the type of a tax calculation request.

Namespace

CommerceTax

Example

At the beginning of a tax adapter, use `TaxEngineContext` class to pass the value of a request type to an instance of `RequestType`.

```
global virtual class MockAdapter implements commercetax.TaxEngineAdapter {

     global commercetax.TaxEngineResponse processRequest(commercetax.TaxEngineContext
taxEngineContext) {
          commercetax.RequestType requestType = taxEngineContext.getRequestType();
          commercetax.CalculateTaxRequest request =
(commercetax.CalculateTaxRequest)taxEngineContext.getRequest();
```

Build the rest of your adapter based on the type of request that you got from `TaxEngineContext` class.

```
if(requestType == commercetax.RequestType.CalculateTax){
              commercetax.calculatetaxtype type = request.taxtype;
              String docCode='';
              if(request.DocumentCode == 'simulateEmptyDocumentCode')
                  docCode = '';
              else if(request.DocumentCode != null)
                  docCode =request.DocumentCode;
            else if(request.ReferenceEntityId != null) docCode = request.ReferenceEntityId;

              else docCode =  String.valueOf(getRandomInteger(0,2147483647));
              commercetax.CalculateTaxResponse response = new
commercetax.CalculateTaxResponse();
              if(request.isCommit == true) {
                  response.setStatus(commercetax.TaxTransactionStatus.Committed);
              } else {
                  response.setStatus(commercetax.TaxTransactionStatus.Uncommitted);
              }
}
```

TaxEngineContext Constructors

Learn more about the available constructors with the `TaxEngineContext` class.

TaxEngineContext Methods

Learn more about the available methods with the `TaxEngineContext` class.

TaxEngineContext Constructors

Learn more about the available constructors with the `TaxEngineContext` class.

The `TaxEngineContext` class includes these constructors.

IN THIS SECTION:

TaxEngineContext(request, requestType, namedUri)

Initializes the `TaxEngineContext` object. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`TaxEngineContext(request, requestType, namedUri)`

Initializes the `TaxEngineContext` object. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
TaxEngineContext(commercetax.TaxEngineRequest request, commercetax.RequestType requestType, String namedUri)
```

Parameters

request
Type: TaxEngineRequest

Information about the request.

requestType
Type: RequestType

Whether the tax request is to calculate or estimate tax.

namedUri
Type: String

URI that was called as part of the tax calculation request.

TaxEngineContext Methods

Learn more about the available methods with the `TaxEngineContext` class.

The `TaxEngineContext` class includes these methods.

IN THIS SECTION:

getNamedUri()
Retrieves the value of the NamedUri field of the `TaxEngineContext` class.

getRequest()
Gets the value of the `TaxEngineContext`'s Request field.

getRequestType()
Gets the value of the RequestType field of the `TaxEngineContext` class.

`getNamedUri()`

Retrieves the value of the NamedUri field of the `TaxEngineContext` class.

Signature

```
global String getNamedUri()
```

Return Value

Type: String

`getRequest()`

Gets the value of the `TaxEngineContext`'s Request field.

Signature

```
global commercetax.TaxEngineRequest getRequest()
```

Return Value

Type: TaxEngineRequest

An implemented instance of an external tax engine's interface for processing requests. We've provided the `TaxEngineRequest` interface for you to test within mock adapters with classes that implement it, such as CalculateTaxRequest. However, don't use it outside of a testing context.

`getRequestType()`

Gets the value of the RequestType field of the `TaxEngineContext` class.

Signature

```
global commercetax.RequestType getRequestType()
```

Return Value

Type: RequestType

Indicates whether the calculation request was for actual or calculated tax.

TaxLineItemRequest Class

Contains line item details of a tax request.

Namespace

CommerceTax

IN THIS SECTION:

TaxLineItemRequest Constructors

Learn more about the constructors available with the `TaxLineItemRequest` class.

TaxLineItemRequest Properties

Learn more about the available properties with the `TaxLineItemRequest` class.

TaxLineItemRequest Methods

Learn more about the available methods with the `TaxLineItemRequest` class.

TaxLineItemRequest Constructors

Learn more about the constructors available with the `TaxLineItemRequest` class.

The `TaxLineItemRequest` class includes these constructors.

IN THIS SECTION:

TaxLineItemRequest(addresses, amount, description, productCode, quantity, lineNumber, taxCode, effectiveDate)
Initializes the request for the tax line item. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`TaxLineItemRequest(addresses, amount, description, productCode, quantity, lineNumber, taxCode, effectiveDate)`

Initializes the request for the tax line item. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global TaxLineItemRequest(commercetax.LineTaxAddressesRequest addresses, Double amount, String description, String productCode, Double quantity, String lineNumber, String taxCode, Datetime effectiveDate)
```

Parameters

addresses
Type: LineTaxAddressesRequest

Information about the addresses applied to each line item in a tax calculation request.

amount
Type: Double

Total amount (in a given currency) represented by a line item sent for tax calculation.

description
Type: String

User-defined description for a tax line item.

productCode
Type: String

Catalog code for the product represented by the tax line item.

quantity
Type: Double

The number of units of a given product that the tax line item represents.

lineNumber
Type: String

Unique number used to identify a tax line item.

taxCode
Type: String

Code used to identify how tax is calculated for a tax line item.

effectiveDate
Type: Datetime

This is a user-defined date used for reporting only.

TaxLineItemRequest Properties

Learn more about the available properties with the `TaxLineItemRequest` class.

The `TaxLineItemRequest` class includes these properties.

IN THIS SECTION:

addresses
Contains the list of addresses of a line item.

amount
Total amount (in a given currency) represented by a line item sent for tax calculation.

description
User-defined description for a tax line item.

effectiveDate
The date that a tax transaction takes effect on a line item. This is a user-defined date used for reporting only.

lineNumber
Unique number used to identify a tax line item.

productCode
Catalog code for the product represented by the tax line item.

quantity
Number of units of a given product that the tax line item represents.

taxCode
Code used to identify how tax is calculated for a tax line item.

addresses

Contains the list of addresses of a line item.

Signature

```
public commercetax.LineTaxAddressesRequest addresses {get; set;}
```

Property Value

Type: commercetax.LineTaxAddressesRequest

amount

Total amount (in a given currency) represented by a line item sent for tax calculation.

Signature

```
global Double amount {get; set;}
```

Property Value

Type: Double

`description`

User-defined description for a tax line item.

Signature

```
global String description {get; set;}
```

Property Value

Type: String

`effectiveDate`

The date that a tax transaction takes effect on a line item. This is a user-defined date used for reporting only.

Signature

```
global Datetime effectiveDate {get; set;}
```

Property Value

Type: Datetime

`lineNumber`

Unique number used to identify a tax line item.

Signature

```
global String lineNumber {get; set;}
```

Property Value

Type: String

`productCode`

Catalog code for the product represented by the tax line item.

Signature

```
global String productCode {get; set;}
```

Property Value

Type: String

quantity

Number of units of a given product that the tax line item represents.

Signature

```
global Double quantity {get; set;}
```

Property Value

Type: Double

taxCode

Code used to identify how tax is calculated for a tax line item.

Signature

```
global String taxCode {get; set;}
```

Property Value

Type: String

TaxLineItemRequest Methods

Learn more about the available methods with the `TaxLineItemRequest` class.

The `TaxLineItemRequest` class includes these methods.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `TaxLineItemRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

hashCode()
Maintains the integrity of lists of type `TaxLineItemRequest` by determining the uniqueness of the external object records in a list.

toString()
Converts a value to a string.

equals(obj)

Maintains the integrity of lists of type `TaxLineItemRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `TaxLineItemRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a value to a string.

Signature

```
global String toString()
```

Return Value

Type: String

TaxSellerDetailsRequest Class

Contains tax code details used in the tax calculation request.

Namespace

CommerceTax

IN THIS SECTION:

TaxSellerDetailsRequest Constructors
Learn more about the available constructors with the `TaxSellerDetailsRequest` class.

TaxSellerDetailsRequest Properties
Learn more about the available properties with the `TaxSellerDetailsRequest` class.

TaxSellerDetailsRequest Constructors

Learn more about the available constructors with the `TaxSellerDetailsRequest` class.

The `TaxSellerDetailsRequest` class includes these constructors.

IN THIS SECTION:

TaxSellerDetailsRequest(code)

Initializes the request for the tax seller details. This constructor is intended for test usage and throws an exception if used outside of the Apex test context

`TaxSellerDetailsRequest(code)`

Initializes the request for the tax seller details. This constructor is intended for test usage and throws an exception if used outside of the Apex test context

Signature

```
global TaxSellerDetailsRequest(String code)
```

Parameters

code

Type: String

Tax code used for tax calculation.

TaxSellerDetailsRequest Properties

Learn more about the available properties with the `TaxSellerDetailsRequest` class.

The `TaxSellerDetailsRequest` class includes these properties.

IN THIS SECTION:

code

Tax code used for tax calculation.

`code`

Tax code used for tax calculation.

Signature

```
global String code {get; set;}
```

Property Value

Type: String

TaxSellerDetailsRequest Methods

Learn more about the available methods with the `TaxSellerDetailsRequest` class.

The `TaxSellerDetailsRequest` class includes these methods.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `TaxSellerDetailsRequest` by determining the equality of the external objects in a list. This method is dynamic and based on the `equals()` method in Java.

hashCode()
Maintains the integrity of lists of type `TaxSellerDetailsRequest` by determining the uniqueness of the external objects in a list.

toString()
Converts a value to a string.

`equals(obj)`

Maintains the integrity of lists of type `TaxSellerDetailsRequest` by determining the equality of the external objects in a list. This method is dynamic and based on the `equals()` method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `TaxSellerDetailsRequest` by determining the uniqueness of the external objects in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a value to a string.

Signature

```
global String toString()
```

Return Value

Type: String

TaxTransactionRequest Class

Abstract class for storing customer details used in tax calculation and estimation requests.

Namespace

CommerceTax

Usage

Specify the `CommerceTax` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example, let's say you create an instance of `CalculateTaxRequest` class, which extends the `TaxTransactionRequest` class.

IN THIS SECTION:

TaxTransactionRequest Constructors
Learn more about the available constructors with the `TaxTransactionRequest` class.

TaxTransactionRequest Properties
Learn more about the available properties with the `TaxTransactionRequest` class.

TaxTransactionRequest Methods

TaxTransactionRequest Constructors

Learn more about the available constructors with the `TaxTransactionRequest` class.

The `TaxTransactionRequest` class includes these constructors.

IN THIS SECTION:

TaxTransactionRequest(addresses, currencyIsoCode, customerDetails, description, documentCode, referenceDocumentCode, transactionDate, effectiveDate, lineItems, referenceEntityId, sellerDetails)
Initializes the request for the tax transaction. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`TaxTransactionRequest(addresses, currencyIsoCode, customerDetails, description, documentCode, referenceDocumentCode, transactionDate, effectiveDate, lineItems, referenceEntityId, sellerDetails)`

Initializes the request for the tax transaction. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global TaxTransactionRequest(commercetax.HeaderTaxAddressesRequest addresses, String currencyIsoCode, commercetax.TaxCustomerDetailsRequest customerDetails, String description, String documentCode, String referenceDocumentCode, Datetime transactionDate, Datetime effectiveDate, List<commercetax.TaxLineItemRequest> lineItems, String referenceEntityId, commercetax.TaxSellerDetailsRequest sellerDetails)
```

Parameters

addresses
Type: HeaderTaxAddressesRequest

Tax addresses, such as Ship To and Bill From.

currencyIsoCode
Type: String

Three-letter ISO 4217 currency code associated with the `TaxTransactionRequest`.

customerDetails
Type: TaxCustomerDetailsRequest

Customer information used in tax calculation.

description
Type: String

Optional user-defined description for providing more information about the tax transaction request.

documentCode
Type: String

Code for documents that are used to provide more information in the tax calculation process.

referenceDocumentCode
Type: String

Code for additional documents that are used in the tax calculation process.

transactionDate
Type: Datetime

The date that the tax transaction occurred.

effectiveDate
Type: Datetime

The date that the tax transaction takes effect. User-defined and used only for reporting purposes.

lineItems
Type: List<TaxLineItemRequest>

A list of line items on which tax is calculated.

referenceEntityId
Type: String

ID of an object related to the line items sent for tax calculation.

sellerDetails
Type: TaxSellerDetailsRequest

Contains tax code information used in a tax calculation request.

TaxTransactionRequest Properties

Learn more about the available properties with the `TaxTransactionRequest` class.

The `TaxTransactionRequest` class includes these properties.

IN THIS SECTION:

addresses
A list of addresses (such as Ship To and Sold To) used as part of the tax transaction.

currencyIsoCode
Three-letter ISO 4217 currency code associated with the `TaxTransactionRequest`.

customerDetails
Customer information used in tax calculation.

description
Optional user-defined description for providing more information about the tax transaction request.

documentCode
Code for documents used to provide more information in the tax calculation process.

effectiveDate
The date that the tax transaction takes effect. User-defined and used only for reporting purposes.

lineItems
A list of line items on which tax will be calculated.

referenceDocumentCode
Code for documents used to provide more information in the tax calculation process.

referenceEntityId
ID of an object related to the line items sent for tax calculation.

sellerDetails
Contains tax code information used in a tax calculation request.

transactionDate
The date that the tax transaction occurred.

addresses

A list of addresses (such as Ship To and Sold To) used as part of the tax transaction.

Signature

```
global commercetax.HeaderTaxAddressesRequest addresses {get; set;}
```

Property Value

Type: HeaderTaxAddressesRequest

currencyIsoCode

Three-letter ISO 4217 currency code associated with the `TaxTransactionRequest`.

Signature

```
global String currencyIsoCode {get; set;}
```

Property Value

Type: String

customerDetails

Customer information used in tax calculation.

Signature

```
global CommerceTax.TaxCustomerDetailsRequest customerDetails {get; set;}
```

Property Value

Type: TaxCustomerDetailsRequest

description

Optional user-defined description for providing more information about the tax transaction request.

Signature

```
global String description {get; set;}
```

Property Value

Type: String

documentCode

Code for documents used to provide more information in the tax calculation process.

Signature

```
global String documentCode {get; set;}
```

Property Value

Type: String

`effectiveDate`

The date that the tax transaction takes effect. User-defined and used only for reporting purposes.

Signature

```
global Datetime effectiveDate {get; set;}
```

Property Value

Type: Datetime

`lineItems`

A list of line items on which tax will be calculated.

Signature

```
global List<CommerceTax.TaxLineItemRequest> lineItems {get; set;}
```

Property Value

Type: List<TaxLineItemRequest>

`referenceDocumentCode`

Code for documents used to provide more information in the tax calculation process.

Signature

```
global String referenceDocumentCode {get; set;}
```

Property Value

Type: String

`referenceEntityId`

ID of an object related to the line items sent for tax calculation.

Signature

```
global String referenceEntityId {get; set;}
```

Property Value

Type: String

sellerDetails

Contains tax code information used in a tax calculation request.

Signature

```
global commercetax.TaxSellerDetailsRequest sellerDetails {get; set;}
```

Property Value

Type: TaxSellerDetailsRequest

transactionDate

The date that the tax transaction occurred.

Signature

```
global Datetime transactionDate {get; set;}
```

Property Value

Type: Datetime

TaxTransactionRequest Methods

The following are methods for `TaxTransactionRequest`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `TaxTransactionRequest` by determining the equality of external objects in a list. This method is dynamic and based on the `equals()` method in Java.

hashCode()
Maintains the integrity of lists of type `TaxTransactionRequest` by determining the uniqueness of the external object records in a list.

toString()
Converts a value to a string.

equals(obj)

Maintains the integrity of lists of type `TaxTransactionRequest` by determining the equality of external objects in a list. This method is dynamic and based on the `equals()` method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `TaxTransactionRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a value to a string.

Signature

```
global String toString()
```

Return Value

Type: String

TaxTransactionStatus Enum

Shows whether the tax transaction has been committed or uncommitted.

Usage

Used by the CalculateTaxResponse class method.

Enum Values

The `commercetax.TaxTransactionStatus` enum includes these values.

Value	Description
`Committed`	Tax has been calculated and committed.
`Uncommitted`	Tax has been calculated but hasn't been committed.

TaxTransactionType Enum

Shows whether the tax transaction is for a credit or debit transaction.

Usage

Used by the CalculateTaxResponse and CalculateTaxRequest class methods.

Enum Values

The `commercetax.TaxTransactionType` enum includes these values.

Value	Description
`Credit`	Represents a credit transaction.
`Debit`	Represents a debit transaction.

Compression Namespace (Developer Preview)

The Compression namespace provides classes and methods to create and extract zip files.

Note: Feature is available as a developer preview. Feature isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. All commands, parameters, and other features are subject to change or deprecation at any time, with or without notice. Don't implement functionality developed with these commands or tools in a production environment.

The following are the classes and enums in the `Compression` namespace.

IN THIS SECTION:

Level Enum
Specifies the compression level for creating a zip file.

Method Enum
Specifies the compression method for the zip entries.

ZipEntry Class
Contains methods to get and set information about a zip file entry.

ZipReader Class
Contains methods to get information about zip entries and to extract content for specified zip entries from the zip file.

ZipWriter Class
Contains methods to add zip entries, generate a zipped archive, and return the result as an Apex blob.

Compression Exceptions
The `Compression` namespace contains exception classes.

Level Enum

Specifies the compression level for creating a zip file.

Usage

Use `Level` enum with the `getLevel()` and `setLevel(value)` methods in the `ZipWriter` class.

Enum Values

The following are the values of the `Compression.Level` enum.

Value	Description
`BEST_COMPRESSION`	Compression level for best compression.
`BEST_SPEED`	Compression level for fastest compression.
`DEFAULT_LEVEL`	Default compression level.
`NO_COMPRESSION`	Compression level for no compression.

Method Enum

Specifies the compression method for the zip entries.

Usage

Use the `Method` enum with the `getMethod()` and `setMethod(method)` methods in the `ZipEntry` and `ZipWriter` classes.

Enum Values

The following are the values of the `Compression.Method` enum.

Value	Description
`DEFLATED`	Deflated compression method for compressed entries.
`STORED`	No compression method for zip entries.

ZipEntry Class

Contains methods to get and set information about a zip file entry.

Namespace

Compression

IN THIS SECTION:

ZipEntry Methods

ZipEntry Methods

The following are methods for `ZipEntry`.

IN THIS SECTION:

equals(obj)

Compares this object with the specified object and returns `true` if both objects are equal; otherwise, returns `false`.

hashcode()

Returns the hash code value for the zip entry.

getComment()

Gets the comment string for the zip entry.

getCompressedSize()

Gets the size in bytes of the compressed zip entry.

getContent()

Gets the content of the zip entry. For Developer Preview, this method doesn't work with the `ZipReader` class.

getCrc()

Gets the cyclic redundancy check (CRC) value for the zip entry.

getLastModifiedTime()

Gets the last modification timestamp of the zip entry.

getMethod()

Gets the compression method of the zip entry.

getName()

Gets the name of the zip entry.

getUncompressedSize()

Gets the uncompressed size in bytes of the zip entry content.

setComment(comment)

Sets the comment string for the zip entry that's written to the Zip archive. For Developer Preview, this method doesn't work with the `ZipReader` class.

setContent(blob)

Sets the content of the zip entry that's written to the Zip archive. For Developer Preview, this method doesn't work with the `ZipReader` class.

setLastModifiedTime(modTime)

Sets the last modification time of the zip entry that's written to the Zip archive. For Developer Preview, this method doesn't work with the `ZipReader` class.

setMethod(method)

Sets the compression method for the zip entry that's written to the zip archive. For Developer Preview, this method doesn't work with the `ZipReader` class.

toString()

Returns a string representation of the zip entry.

equals(obj)

Compares this object with the specified object and returns `true` if both objects are equal; otherwise, returns `false`.

Signature

```
public Boolean equals(Object obj)
```

Parameters

obj
Type: Object

Return Value

Type: Boolean

hashcode()

Returns the hash code value for the zip entry.

Signature

```
public Integer hashcode()
```

Return Value

Type: Integer

getComment()

Gets the comment string for the zip entry.

Signature

```
public string getComment()
```

Return Value

Type: string

getCompressedSize()

Gets the size in bytes of the compressed zip entry.

Signature

```
public long getCompressedSize()
```

Return Value

Type: long

getContent()

Gets the content of the zip entry. For Developer Preview, this method doesn't work with the `ZipReader` class.

Signature

```
public blob getContent()
```

Return Value

Type: blob

getCrc()

Gets the cyclic redundancy check (CRC) value for the zip entry.

Signature

```
public long getCrc()
```

Return Value

Type: long

getLastModifiedTime()

Gets the last modification timestamp of the zip entry.

Signature

```
public Datetime getLastModifiedTime()
```

Return Value

Type: Datetime

getMethod()

Gets the compression method of the zip entry.

Signature

```
public Compression.Method getMethod()
```

Return Value

Type: Compression.Method

Uses values from the `Method` enum and indicates whether the zip entry has *`DEFLATED`* or *`STORED`* method.

`getName()`

Gets the name of the zip entry.

Signature

```
public string getName()
```

Return Value

Type: string

`getUncompressedSize()`

Gets the uncompressed size in bytes of the zip entry content.

Signature

```
public long getUncompressedSize()
```

Return Value

Type: long

`setComment(comment)`

Sets the comment string for the zip entry that's written to the Zip archive. For Developer Preview, this method doesn't work with the `ZipReader` class.

Signature

```
public Compression.ZipEntry setComment(String comment)
```

Parameters

`comment`
Type: String

Return Value

Type: Compression.ZipEntry

`setContent(blob)`

Sets the content of the zip entry that's written to the Zip archive. For Developer Preview, this method doesn't work with the `ZipReader` class.

Signature

```
public Compression.ZipEntry setContent(Blob blob)
```

Parameters

blob
Type: Blob

Return Value

Type: Compression.ZipEntry

setLastModifiedTime(modTime)

Sets the last modification time of the zip entry that's written to the Zip archive. For Developer Preview, this method doesn't work with the `ZipReader` class.

Signature

```
public Compression.ZipEntry setLastModifiedTime(Datetime modTime)
```

Parameters

modTime
Type: Datetime

Return Value

Type: Compression.ZipEntry

setMethod(method)

Sets the compression method for the zip entry that's written to the zip archive. For Developer Preview, this method doesn't work with the `ZipReader` class.

Signature

```
public Compression.ZipEntry setMethod(Compression.Method method)
```

Parameters

method
Type: Compression.Method

Uses the `Method` enum values and sets the compression method as `DEFLATED` or `STORED`.

Return Value

Type: Compression.ZipEntry

`toString()`

Returns a string representation of the zip entry.

Signature

```
public string toString()
```

Return Value

Type: string

ZipReader Class

Contains methods to get information about zip entries and to extract content for specified zip entries from the zip file.

Namespace

Compression

IN THIS SECTION:

ZipReader Constructors
ZipReader Methods

ZipReader Constructors

The following are constructors for `ZipReader`.

IN THIS SECTION:

ZipReader(data)
Creates a new instance of the `ZipReader` class using the specified blob data.

`ZipReader(data)`

Creates a new instance of the `ZipReader` class using the specified blob data.

Signature

```
global ZipReader(Blob data)
```

Parameters

`data`
Type: Blob

Apex blob that contains the compressed content.

ZipReader Methods

The following are methods for `ZipReader`.

IN THIS SECTION:

extract(name)
Extracts the bytes for the specified zip entry name and decompresses the content.

extract(entry)
Extracts the bytes for the specified zip entry and decompresses the content.

getEntries()
Gets a list of all the entries from the zip file.

getEntriesMap()
Gets a map of names and the corresponding zip entries from the zip file.

getEntry(name)
Gets a zip entry for the specified name from the zip file.

getEntryNames()
Gets a list of all the zip entry names from the zip file.

`extract(name)`

Extracts the bytes for the specified zip entry name and decompresses the content.

Signature

```
public blob extract(string name)
```

Parameters

`name`
Type: string

Species the zip entry name to extract and decompress.

Return Value

Type: blob

Apex blob that contains the decompressed content.

`extract(entry)`

Extracts the bytes for the specified zip entry and decompresses the content.

Signature

```
public blob extract(Compression.ZipEntry entry)
```

Parameters

entry
Type: Compression.ZipEntry

Species the zip entry to extract and decompress.

Return Value

Type: blob

Apex blob that contains the decompressed content.

getEntries()

Gets a list of all the entries from the zip file.

Signature

```
public List<compression.ZipEntry> getEntries()
```

Return Value

Type: List<Compression.ZipEntry>

getEntriesMap()

Gets a map of names and the corresponding zip entries from the zip file.

Signature

```
public Map<String,Compression.ZipEntry> getEntriesMap()
```

Return Value

Type: Map<string,Compression.ZipEntry>

getEntry(name)

Gets a zip entry for the specified name from the zip file.

Signature

```
public compression.ZipEntry getEntry(string name)
```

Parameters

name
Type: string

Name of the zip entry.

Return Value

Type: Compression.ZipEntry

Throws a `ZipException` if the specified name isn't found.

`getEntryNames()`

Gets a list of all the zip entry names from the zip file.

Signature

```
public List<String> getEntryNames()
```

Return Value

Type: List<String>

ZipWriter Class

Contains methods to add zip entries, generate a zipped archive, and return the result as an Apex blob.

Namespace

Compression

Example

This sample code compresses email attachments into a single file.

```
ZipWriter writer = new ZipWriter();

List<id> contentDocumentIds = new List<id>();
// Add IDs of documents to be compressed to contentDocumentIds

for ( ContentVersion cv : [SELECT PathOnClient, Versiondata
  FROM ContentVersion
  WHERE ContentDocumentId IN :contentDocumentIds]) {
    writer.addEntry(cv.PathOnClient, cv.versiondata);
}

blob zipAttachment = writer.getArchive();

Messaging.EmailFileAttachment efa1 = new Messaging.EmailFileAttachment();
efa.setFileName('attachments.zip');
efa.setBody(zipAttachment);
fileAttachments.add(efa);

Messaging.SingleEmailMessage email = new Messaging.SingleEmailMessage();
// Set all the other email fields, like addresses, subject and body

email.setEntityAttachments(fileAttachments);
```

```
Messaging.sendEmail(new Messaging.SingleEmailMessage[] { email });
```

IN THIS SECTION:

ZipWriter Constructors

ZipWriter Methods

ZipWriter Constructors

The following are constructors for `ZipWriter`.

IN THIS SECTION:

ZipWriter()
Creates a new instance of the `ZipWriter` class.

`ZipWriter()`

Creates a new instance of the `ZipWriter` class.

Signature

```
global ZipWriter()
```

ZipWriter Methods

The following are methods for `ZipWriter`.

IN THIS SECTION:

addEntry(name, data)
Adds an entry to the zip file with the specified name and content.

addEntry(prototype)
Adds a copy of the specified prototype entry to the zip file and includes details such as the zip entry name, comment, last modification time, and content.

getArchive()
Compresses the zip entries and generates a ZIP archive.

getEntries()
Gets a list of all the entries in the zip file.

getEntry(name)
Gets the entry with the specified name from the zip file.

getLevel()
Gets the compression level of the zip file.

getMethod()
Gets the compression method of the zip file.

removeEntry(name)

Removes the entry with the specified name from the zip file.

setLevel(level)

Sets the compression level of the zip file.

setMethod(method)

Sets the compression method for the zip file.

addEntry(name, data)

Adds an entry to the zip file with the specified name and content.

Signature

```
public Compression.ZipEntry addEntry(string name, blob data)
```

Parameters

name

Type: string

The name of the zip entry.

name

Type: blob

The content of the zip entry.

Return Value

Type: Compression.ZipEntry

Zip entry added to the zip file.

addEntry(prototype)

Adds a copy of the specified prototype entry to the zip file and includes details such as the zip entry name, comment, last modification time, and content.

Signature

```
public Compression.ZipEntry addEntry(compression.ZipEntry prototype)
```

Parameters

prototype

Type: Compression.ZipEntry

Details of the entry to be added to the zip file.

Return Value

Type: Compression.ZipEntry

`getArchive()`

Compresses the zip entries and generates a ZIP archive.

Signature

```
public blob getArchive()
```

Return Value

Type: blob

Apex blob that contains the bytes of the compression operation.

`getEntries()`

Gets a list of all the entries in the zip file.

Signature

```
public List<Compression.ZipEntry> getEntries()
```

Return Value

Type: List<Compression.ZipEntry>

`getEntry(name)`

Gets the entry with the specified name from the zip file.

Signature

```
public compression.ZipEntry getEntry(string name)
```

Parameters

name

Type: string

Name of the zip entry to be retrieved.

Return Value

Type: Compression.ZipEntry

`getLevel()`

Gets the compression level of the zip file.

Signature

```
public Compression.Level getLevel()
```

Return Value

Type: Compression.Level

Uses the `Level` enum values to indicate the compression level as `BEST_COMPRESSION`, `BEST_SPEED`, `DEFAULT_LEVEL`, or `NO_COMPRESSION`.

`getMethod()`

Gets the compression method of the zip file.

Signature

```
public Compression.Method getMethod()
```

Return Value

Type: Compression.Method

Uses the `Method` enum values to indicate the compression method as `DEFLATED` or `STORED`.

`removeEntry(name)`

Removes the entry with the specified name from the zip file.

Signature

```
public Void removeEntry(string name)
```

Parameters

`name`

Type: string

Name of the zip entry to be removed. If an entry with this name isn't found, the method throws a `ZipException` exception.

Return Value

Type: Void

`setLevel(level)`

Sets the compression level of the zip file.

Signature

```
public Compression.ZipWriter setLevel(compression.Level value)
```

Parameters

`value`

Type: Compression.Level

Uses the `Level` enum to set the compression level.

Return Value

Type: Compression.ZipWriter

Returns the zip file set with the specified compression level.

`setMethod(method)`

Sets the compression method for the zip file.

Signature

```
public Compression.ZipWriter setMethod(compression.Method value)
```

Parameters

value
Type: Compression.Method

Uses the `Method` enum to set the compression method.

Return Value

Type: Compression.ZipWriter

Returns the zip file set with the specified compression method.

Compression Exceptions

The `Compression` namespace contains exception classes.

All exception classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions.

The `Compression` namespace contains this exception:

Exception	Description
`Compression.ZipException`	Any problem with the zip operations, such as a zip entry name isn't found.

`ConnectApi` Namespace

The `ConnectApi` namespace (also called Connect in Apex) provides classes for accessing the same data available in Connect REST API. Use Connect in Apex to create custom experiences in Salesforce.

For information about working with the `ConnectApi` classes, see Connect in Apex.

IN THIS SECTION:

ActionLinks Class
Create, delete, and get information about an action link group definition; get information about an action link group; get action link diagnostic information.

Announcements Class

Access information about announcements and post announcements.

BotVersionActivation Class

Access and update activation information of a bot version.

CdpCalculatedInsight Class

Create, delete, get, run, and update Data Cloud calculated insights.

CdpIdentityResolution Class

Create, delete, get, run, and update Data Cloud identity resolution rulesets.

CdpQuery Class

Get Data Cloud metadata and query data.

CdpSegment Class

Create, delete, get, publish, and update Data Cloud segments. Get segment members.

Chatter Class

Access information about followers and subscriptions for records.

ChatterFavorites Class

Chatter favorites give you easy access to topics, list views, and feed searches.

ChatterFeeds Class

Get, post, and delete feed elements, likes, comments, and bookmarks. You can also search feed elements, share feed elements, and vote on polls.

ChatterGroups Class

Information about groups, such as the group's members, photo, and the groups the specified user is a member of. Add members to a group, remove members, and change the group photo.

ChatterMessages Class

Get, send, search, and reply to private messages. You can also get and search private conversations, mark conversations as read, and get a count of unread private messages.

ChatterUsers Class

Access information about users, such as activity, followers, subscriptions, files, and groups.

Clm Class

Create and update Contract Lifecycle Management (CLM) contracts using object ID.

CommerceBuyerExperience Class

Create, delete, or get commerce addresses. Get order delivery group, order item, order shipments, shipment items, and order summaries. Get adjustments for order items and order summaries.

CommerceCart Class

Get, create, update, and delete carts. Get cart items, add items to carts, update and delete cart items.

CommerceCatalog Class

Get products, product categories, and product category paths.

CommercePromotions Class

Evaluate promotions for Commerce orders. Get coupon code redemption usage.

CommerceSearch Class

Get sort rules for the live search index. Get product search suggestions. Search products.

CommerceSearchConnectFamily Class

Search products by search term or category in a webstore.

CommerceSearchSettings Class

Get indexes. Get index logs. Create an index of a product catalog.

CommerceStorePricing Class

Get product prices.

CommerceWishlist Class

Get, create, update, and delete wishlists. Add wishlists to carts. Get wishlist items, add items to wishlists, and delete wishlist items.

Communities Class

Get information about Experience Cloud sites in your org.

CommunityModeration Class

Get information about flagged feed items and comments in an Experience Cloud site. Add and remove flags from comments and feed items.

ContentHub Class

Access Files Connect repositories and their files and folders.

ConversationApplicationDefinition Class

Access information about a conversation application definition.

Datacloud Class

Purchase Data.com contact or company records, and retrieve purchase information.

EinsteinLLM Class

Generate responses for prompt templates.

EmailMergeFieldService Class

Extract a list of merge fields for an object. A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

EmployeeProfiles Class

Get, set and crop, and delete employee banner photos and photos.

Exchanges Class

Preview and submit cart to exchange orders.

ExternalEmailServices Class

Access information about integration with external email services, such as sending email within Salesforce through an external email account.

ExternalManagedAccount Class

Get externally managed accounts.

FieldService Class

Preview and create shifts from a pattern or filter fields on recordset filter criteria.

FulfillmentOrder Class

Fulfill orders in Order Management.

Knowledge Class

Get information about trending articles in Experience Cloud sites.

LightningScheduler Class

Create and update service appointments.

ManagedContent Class

Get managed content versions. Get a managed content space.

ManagedContentDelivery Class

Get collection items. Get a managed content channel. Get managed content.

ManagedTopics Class

Get managed topics in an Experience Cloud site. Create, delete, and reorder managed topics.

MarketingIntegration Class

Get, save, and submit a microsites marketing integration form for an Experience Cloud site.

Mentions Class

Access information about mentions. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.

Missions Class

Export and purge mission activity for users. Get a user's mission progress. Update mission activity counts for users.

NamedCredentials Class

Create, refresh, get, delete, replace, and update credentials. Create and get external credentials. Create and get named credentials. Get the URL for the OAuth token flow for an external credential.

NavigationMenu Class

Get navigation menu items for an Experience Cloud site.

NextBestAction Class

Execute recommendation strategies, get recommendations, manage recommendation reactions.

OmnichannelInventoryService Class

Route orders to inventory locations in Order Management.

OMSAnalytics Class

Get products with return rates, get text classified into different classifications using text analysis, and capture the return reasons from external sources based on the product ids.

Orchestration Class

Get orchestration instances.

OrderPaymentSummary Class

Work with payments in Order Management.

OrderSummary Class

Work with orders in Order Management.

OrderSummaryCreation Class

Create Order Summaries in Order Management.

Organization Class

Access information about an org.

PardotBusinessUnitContext Class

Get the Pardot business units the context user has access to.

Payments Class

Authorize a payment, capture an authorized payment, and refund an authorized payment.

Personalization Class

Get assigned personalization audiences that match the user context. Create, get, update, and delete an audience. Get personalization targets that match the user context, based on the assigned audiences that include the user. Create and update targets. Get and delete a target.

PickTicket Class

Create tickets to fulfill orders.

QuestionAndAnswers Class

Access question and answers suggestions.

Recommendations Class

Get and reject Chatter, custom, and static recommendations. Create, get, update, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Records Class

Access information about record motifs, which are small icons used to distinguish record types in the Salesforce UI.

RegisterGuestBuyer Class

Register a guest buyer for a webstore using an account ID, enabling a guest buyer to order on behalf of another buyer.

Repricing Class

Perform functions related to repricing orders in Order Management.

ReturnOrder Class

Process ReturnOrders in Order Management.

Routing Class

Route orders to inventory locations in Order Management.

SalesforceInbox Class

Access information about Automated Activity Capture, which is available in Einstein and Salesforce Inbox.

Sites Class

Search an Experience Cloud site.

SmartDataDiscovery Class

Get predictions on Salesforce objects.

SocialEngagement Class

Manage information about social accounts or fan pages for social networks.

Surveys Class

Send survey invitations by email.

TaxPlatform Class

Apply or cancel tax.

Topics Class

Access information about topics, such as their descriptions, the number of people talking about them, related topics, and information about groups contributing to the topic. Update a topic's name or description, merge topics, and add and remove topics from records and feed items.

UserProfiles Class

Access user profile data. The user profile data populates the profile page (also called the Chatter profile page). This data includes user information (such as address, manager, and phone number), some user capabilities (permissions), and a set of subtab apps, which are custom tabs on the profile page.

Zones Class

Access information about Chatter Answers zones in your organization. Zones organize questions into logical groups, with each zone having its own focus and unique questions.

ConnectApi Input Classes

Some `ConnectApi` methods take arguments that are instances of `ConnectApi` input classes.

ConnectApi Output Classes

Most `ConnectApi` methods return instances of `ConnectApi` output classes.

ConnectApi Enums

Enums specific to the `ConnectApi` namespace.

ConnectApi Exceptions

The `ConnectApi` namespace contains exception classes.

ConnectApi Utilities

The `ConnectApi` namespace contains a utility class.

ConnectApi Release Notes

Use the Salesforce Release Notes to learn about the most recent updates and changes to the ConnectApi namespace in Apex.

ActionLinks Class

Create, delete, and get information about an action link group definition; get information about an action link group; get action link diagnostic information.

Namespace

ConnectApi

Usage

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can drive productivity and accelerate innovation.

There are two views of an action link and an action link group: the definition, and the context user's view. The definition includes potentially sensitive information, such as authentication information. The context user's view is filtered by visibility options and the values reflect the state of the context user.

Action link definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission. Use these methods to operate on action link group definitions (which contain action link definitions).

- createActionLinkGroupDefinition(communityId, actionLinkGroup)
- deleteActionLinkGroupDefinition(communityId, actionLinkGroupId)
- getActionLinkGroupDefinition(communityId, actionLinkGroupId)

Use these methods to operate on a context user's view of an action link or an action link group.

- getActionLink(communityId, actionLinkId)

- getActionLinkGroup(communityId, actionLinkGroupId)
- getActionLinkDiagnosticInfo(communityId, actionLinkId)

For information about how to use action links, see Working with Action Links.

ActionLinks Methods

These are methods for `ActionLinks`. All methods are static.

IN THIS SECTION:

createActionLinkGroupDefinition(communityId, actionLinkGroup)
Create an action link group definition. To associate an action link group with a feed element, first create an action link group definition. Then post a feed element with an associated actions capability.

deleteActionLinkGroupDefinition(communityId, actionLinkGroupId)
Delete an action link group definition. Deleting an action link group definition removes all references to it from feed elements.

getActionLink(communityId, actionLinkId)
Get information about an action link, including state for the context user.

getActionLinkDiagnosticInfo(communityId, actionLinkId)
Get diagnostic information returned when an action link executes. Diagnostic information is given only for users who can access the action link.

getActionLinkGroup(communityId, actionLinkGroupId)
Get information about an action link group including state for the context user.

getActionLinkGroupDefinition(communityId, actionLinkGroupId)
Get information about an action link group definition.

`createActionLinkGroupDefinition(communityId, actionLinkGroup)`

Create an action link group definition. To associate an action link group with a feed element, first create an action link group definition. Then post a feed element with an associated actions capability.

API Version

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.ActionLinkGroupDefinition createActionLinkGroupDefinition(String
communityId, ConnectApi.ActionLinkGroupDefinitionInput actionLinkGroup)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`actionLinkGroup`
Type: `ConnectApi.ActionLinkGroupDefinitionInput`

A `ConnectApi.ActionLinkGroupDefinitionInput` object that defines the action link group.

Return Value

Type: `ConnectApi.ActionLinkGroupDefinition`

Usage

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can drive productivity and accelerate innovation.

All action links must belong to a group. Action links in a group are mutually exclusive and share some properties. Define standalone actions in their own action group.

Information in the action link group definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link group definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

Note: Invoking `ApiAsync` action links from an app requires a call to set the status. However, there isn't currently a way to set the status of an action link using Apex. To set the status, use Connect REST API. See the Action Link resource in the Connect REST API Developer Guidefor more information.

Example for Defining an Action Link and Posting with a Feed Element

For more information about this example, see Define an Action Link and Post with a Feed Element.

```
ConnectApi.ActionLinkGroupDefinitionInput actionLinkGroupDefinitionInput = new
ConnectApi.ActionLinkGroupDefinitionInput();
ConnectApi.ActionLinkDefinitionInput actionLinkDefinitionInput = new
ConnectApi.ActionLinkDefinitionInput();
ConnectApi.RequestHeaderInput requestHeaderInput1 = new ConnectApi.RequestHeaderInput();
ConnectApi.RequestHeaderInput requestHeaderInput2 = new ConnectApi.RequestHeaderInput();

// Create the action link group definition.
actionLinkGroupDefinitionInput.actionLinks = New
List<ConnectApi.ActionLinkDefinitionInput>();
actionLinkGroupDefinitionInput.executionsAllowed =
ConnectApi.ActionLinkExecutionsAllowed.OncePerUser;
actionLinkGroupDefinitionInput.category = ConnectApi.PlatformActionGroupCategory.Primary;
// To Do: Verify that the date is in the future.
// Action link groups are removed from feed elements on the expiration date.
datetime myDate = datetime.newInstance(2016, 3, 1);
actionLinkGroupDefinitionInput.expirationDate = myDate;

// Create the action link definition.
actionLinkDefinitionInput.actionType = ConnectApi.ActionLinkType.Api;
actionLinkDefinitionInput.actionUrl = '/services/data/v33.0/chatter/feed-elements';
actionLinkDefinitionInput.headers = new List<ConnectApi.RequestHeaderInput>();
```

```
actionLinkDefinitionInput.labelKey = 'Post';
actionLinkDefinitionInput.method = ConnectApi.HttpRequestMethod.HttpPost;
actionLinkDefinitionInput.requestBody = '{\"subjectId\": \"me\",\"feedElementType\":
\"FeedItem\",\"body\": {\"messageSegments\": [{\"type\": \"Text\",\"text\": \"This is a
test post created via an API action link.\"}]}}';
actionLinkDefinitionInput.requiresConfirmation = true;

// To Do: Substitute an OAuth value for your Salesforce org.
requestHeaderInput1.name = 'Authorization';
requestHeaderInput1.value = 'OAuth
00DD00000007WNP!ARsAQCwoeV0zzAV847FTl4zF.85w.EwsPbUgXR4SAjsp';
actionLinkDefinitionInput.headers.add(requestHeaderInput1);

requestHeaderInput2.name = 'Content-Type';
requestHeaderInput2.value = 'application/json';
actionLinkDefinitionInput.headers.add(requestHeaderInput2);

// Add the action link definition to the action link group definition.
actionLinkGroupDefinitionInput.actionLinks.add(actionLinkDefinitionInput);

// Instantiate the action link group definition.
ConnectApi.ActionLinkGroupDefinition actionLinkGroupDefinition =
ConnectApi.ActionLinks.createActionLinkGroupDefinition(Network.getNetworkId(),
actionLinkGroupDefinitionInput);

ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
ConnectApi.AssociatedActionsCapabilityInput associatedActionsCapabilityInput = new
ConnectApi.AssociatedActionsCapabilityInput();
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

// Set the properties of the feedItemInput object.
feedItemInput.body = messageBodyInput;
feedItemInput.capabilities = feedElementCapabilitiesInput;
feedItemInput.subjectId = 'me';

// Create the text for the post.
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
textSegmentInput.text = 'Click to post a feed item.';
messageBodyInput.messageSegments.add(textSegmentInput);

// The feedElementCapabilitiesInput object holds the capabilities of the feed item.
// Define an associated actions capability to hold the action link group.
// The action link group ID is returned from the call to create the action link group
definition.
feedElementCapabilitiesInput.associatedActions = associatedActionsCapabilityInput;
associatedActionsCapabilityInput.actionLinkGroupIds = new List<String>();
associatedActionsCapabilityInput.actionLinkGroupIds.add(actionLinkGroupDefinition.id);

// Post the feed item.
```

```
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);
```

Example for Defining an Action Link in a Template and Posting with a Feed Element

For more information about this example, see Define an Action Link in a Template and Post with a Feed Element.

```
// Get the action link group template Id.
ActionLinkGroupTemplate template = [SELECT Id FROM ActionLinkGroupTemplate WHERE
DeveloperName='Doc_Example'];

// Add binding name-value pairs to a map.
// The names are defined in the action link template(s) associated with the action link
group template.
// Get them from Setup UI or SOQL.
Map<String, String> bindingMap = new Map<String, String>();
bindingMap.put('ApiVersion', 'v33.0');
bindingMap.put('Text', 'This post was created by an API action link.');
bindingMap.put('SubjectId', 'me');

// Create ActionLinkTemplateBindingInput objects from the map elements.
List<ConnectApi.ActionLinkTemplateBindingInput> bindingInputs = new
List<ConnectApi.ActionLinkTemplateBindingInput>();

for (String key : bindingMap.keySet()) {
    ConnectApi.ActionLinkTemplateBindingInput bindingInput = new
ConnectApi.ActionLinkTemplateBindingInput();
    bindingInput.key = key;
    bindingInput.value = bindingMap.get(key);
    bindingInputs.add(bindingInput);
}

// Set the template Id and template binding values in the action link group definition.
ConnectApi.ActionLinkGroupDefinitionInput actionLinkGroupDefinitionInput = new
ConnectApi.ActionLinkGroupDefinitionInput();
actionLinkGroupDefinitionInput.templateId = template.id;
actionLinkGroupDefinitionInput.templateBindings = bindingInputs;

// Instantiate the action link group definition.
ConnectApi.ActionLinkGroupDefinition actionLinkGroupDefinition =
 ConnectApi.ActionLinks.createActionLinkGroupDefinition(Network.getNetworkId(),
actionLinkGroupDefinitionInput);

ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
ConnectApi.AssociatedActionsCapabilityInput associatedActionsCapabilityInput = new
ConnectApi.AssociatedActionsCapabilityInput();
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

// Define the FeedItemInput object to pass to postFeedElement
feedItemInput.body = messageBodyInput;
feedItemInput.capabilities = feedElementCapabilitiesInput;
```

```
feedItemInput.subjectId = 'me';

// The MessageBodyInput object holds the text in the post
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

textSegmentInput.text = 'Click to post a feed item.';
messageBodyInput.messageSegments.add(textSegmentInput);

// The FeedElementCapabilitiesInput object holds the capabilities of the feed item.
// For this feed item, we define an associated actions capability to hold the action link
 group.
// The action link group ID is returned from the call to create the action link group
definition.
feedElementCapabilitiesInput.associatedActions = associatedActionsCapabilityInput;
associatedActionsCapabilityInput.actionLinkGroupIds = new List<String>();
associatedActionsCapabilityInput.actionLinkGroupIds.add(actionLinkGroupDefinition.id);

// Post the feed item.
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);
```

`deleteActionLinkGroupDefinition(communityId, actionLinkGroupId)`

Delete an action link group definition. Deleting an action link group definition removes all references to it from feed elements.

API Version

33.0

Requires Chatter

No

Signature

```
public static void deleteActionLinkGroupDefinition(String communityId, String
actionLinkGroupId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`actionLinkGroupId`
Type: String

The ID of the action link group.

Return Value

Type: Void

Usage

Information in the action link group definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link group definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

`getActionLink(communityId, actionLinkId)`

Get information about an action link, including state for the context user.

API Version

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.PlatformAction getActionLink(String communityId, String actionLinkId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`actionLinkId`
Type: String

The ID of the action link.

Return Value

Type: `ConnectApi.PlatformAction`

`getActionLinkDiagnosticInfo(communityId, actionLinkId)`

Get diagnostic information returned when an action link executes. Diagnostic information is given only for users who can access the action link.

API Version

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.ActionLinkDiagnosticInfo getActionLinkDiagnosticInfo(String communityId, String actionLinkId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

actionLinkId
Type: String

The ID of the action link.

Return Value

Type: `ConnectApi.ActionLinkDiagnosticInfo`

getActionLinkGroup(communityId, actionLinkGroupId)

Get information about an action link group including state for the context user.

API Version

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.PlatformActionGroup getActionLinkGroup(String communityId, String actionLinkGroupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

actionLinkGroupId
Type: String

The ID of the action link group.

Return Value

Type: `ConnectApi.PlatformActionGroup`

Usage

All action links must belong to a group. Action links in a group are mutually exclusive and share some properties. Action link groups are accessible by clients, unlike action link group definitions.

`getActionLinkGroupDefinition(communityId, actionLinkGroupId)`

Get information about an action link group definition.

API Version

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.ActionLinkGroupDefinition getActionLinkGroupDefinition(String communityId, String actionLinkGroupId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`actionLinkGroupId`
Type: String

The ID of the action link group.

Return Value

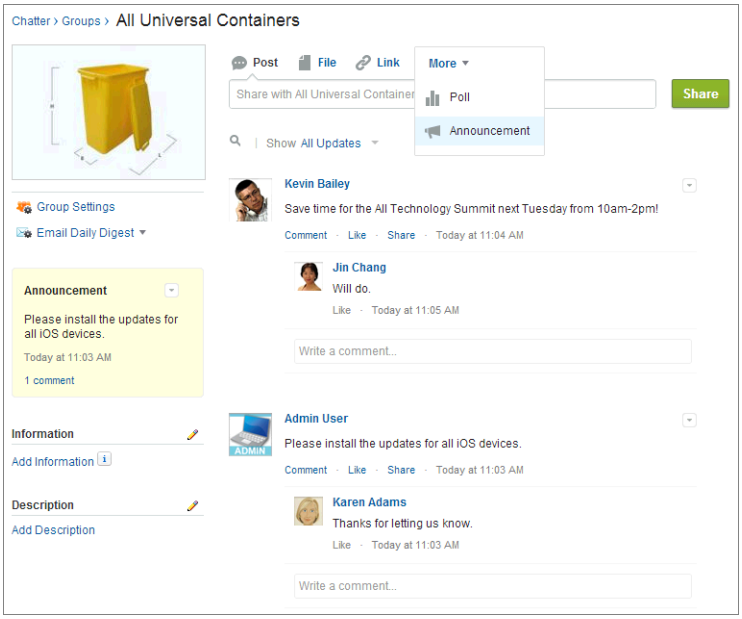
Type: `ConnectApi.ActionLinkGroupDefinition`

Usage

Information in the action link group definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link group definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

Announcements Class

Access information about announcements and post announcements.



Namespace

ConnectApi

Usage

Use the `ConnectApi.Announcements` class to get, create, update, and delete announcements. Use an announcement to highlight information. Users can discuss, like, and post comments on announcements. Deleting the feed post deletes the announcement.

This image shows an announcement displayed in a group. Creating an announcement also creates a feed item with the announcement text.

An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.

Announcements Methods

The following are methods for `Announcements`. All methods are static.

IN THIS SECTION:

deleteAnnouncement(communityId, announcementId)
Delete an announcement.

getAnnouncement(communityId, announcementId)
Get an announcement.

getAnnouncements(communityId, parentId)
Get the first page of announcements.

getAnnouncements(communityId, parentId, pageParam, pageSize)
Get a page of announcements.

postAnnouncement(communityId, announcement)
Post an announcement.

updateAnnouncement(communityId, announcementId, expirationDate)
Update the expiration date of an announcement.

deleteAnnouncement(communityId, announcementId)

Delete an announcement.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static void deleteAnnouncement(String communityId, String announcementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

announcementId
Type: String

An announcement ID, which has a prefix of 0BT.

Return Value

Type: Void

Usage

To get a list of announcements in a group, call `getAnnouncements(communityId, parentId)` or `getAnnouncements(communityId, parentId, pageParam, pageSize)`.

To post an announcement to a group, call `postAnnouncement(communityId, announcement)` .

getAnnouncement(communityId, announcementId)

Get an announcement.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Announcement getAnnouncement(String communityId, String
announcementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

announcementId
Type: String

An announcement ID, which has a prefix of 0BT.

Return Value

Type: `ConnectApi.Announcement`

Usage

To get a list of announcements in a group, call `getAnnouncements(communityId, parentId)` or `getAnnouncements(communityId, parentId, pageParam, pageSize)`.

To post an announcement to a group, call `postAnnouncement(communityId, announcement)` .

`getAnnouncements(communityId, parentId)`

Get the first page of announcements.

API Version

36.0

Available to Guest Users

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.AnnouncementPage getAnnouncements(String communityId, String
parentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

parentId
Type: String

ID of the parent entity for the announcement, that is, a group ID when the announcement appears in a group.

Return Value

Type: `ConnectApi.AnnouncementPage`

getAnnouncements(communityId, parentId, pageParam, pageSize)

Get a page of announcements.

API Version

36.0

Available to Guest Users

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.AnnouncementPage getAnnouncements(String communityId, String
parentId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

parentId
Type: String

ID of the parent entity for the announcement, that is, a group ID when the announcement appears in a group.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of announcements per page.

Return Value

Type: ConnectApi.AnnouncementPage

postAnnouncement(communityId, announcement)

Post an announcement.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Announcement postAnnouncement(String communityId,
ConnectApi.AnnouncementInput announcement)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

announcement
Type: ConnectApi.AnnouncementInput

A `ConnectApi.AnnouncementInput` object.

Return Value

Type: ConnectApi.Announcement

updateAnnouncement(communityId, announcementId, expirationDate)

Update the expiration date of an announcement.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Announcement updateAnnouncement(String communityId, String
announcementId, Datetime expirationDate)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

announcementId
Type: String

An announcement ID, which has a prefix of 0BT.

expirationDate
Type: Datetime

The Salesforce UI displays an announcement until 11:59 p.m. on this date unless another announcement is posted first. The Salesforce UI ignores the time value in the `expirationDate`. However, you can use the time value to create your own display logic in your own UI.

Return Value

Type: `ConnectApi.Announcement`

Usage

To get a list of announcements in a group, call `getAnnouncements(communityId, parentId)` or `getAnnouncements(communityId, parentId, pageParam, pageSize)`.

To post an announcement to a group, call `postAnnouncement(communityId, announcement)` .

BotVersionActivation Class

Access and update activation information of a bot version.

Namespace

ConnectApi

BotVersionActivation Methods

The following are methods for `BotVersionActivation`. All methods are static.

IN THIS SECTION:

getVersionActivationInfo(botVersionId)
Get the active or inactive status of the bot version.

updateVersionStatus(botVersionId, status, postBody)
Update the status of the specified bot version.

`getVersionActivationInfo(botVersionId)`

Get the active or inactive status of the bot version.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.BotVersionActivationInfo getVersionActivationInfo(String
botVersionId)
```

Parameters

botVersionId
Type: String

ID of the bot version.

Return Value

Type: ConnectApi.BotVersionActivationInfo

Usage

To access this method, enable the bot feature, and the user must be an admin or have the Manage Bots or Manage Bots Training Data user permissions.

updateVersionStatus(botVersionId, status, postBody)

Update the status of the specified bot version.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.BotVersionActivationInfo updateVersionStatus(String
botVersionId, ConnectApi.BotVersionActivationStatus status,
ConnectApi.BotVersionActivationInput postBody)
```

Parameters

botVersionId
Type: String

ID of the bot version.

status
Type: ConnectApi.BotVersionActivationStatus

Activation status of the bot version. Values are:

- Active
- Inactive

Activation status must be specified in the *status* or *postBody* parameter.

postBody
Type: ConnectApi.BotVersionActivationInput

Parameters to update for the bot version. Activation status must be specified in the *status* or *postBody* parameter.

Return Value

Type: ConnectApi.BotVersionActivationInfo

Usage

To access this method, enable the bot feature, and the user must be an admin or have the Manage Bots or Manage Bots Training Data user permissions.

CdpCalculatedInsight Class

Create, delete, get, run, and update Data Cloud calculated insights.

Namespace

ConnectApi

CdpCalculatedInsight Methods

The following are methods for `CdpCalculatedInsight`. All methods are static.

IN THIS SECTION:

createCalculatedInsight(input)
Create a calculated insight.

deleteCalculatedInsight(apiName)
Delete a calculated insight.

getCalculatedInsight(apiName)
Get a calculated insight.

getCalculatedInsights(definitionType, batchSize, offset, orderby, dataspace)
Get calculated insights.

getCalculatedInsights(definitionType, batchSize, offset, orderby, dataspace, pageToken)
Get a page of calculated insights.

runCalculatedInsight(apiName)
Run a calculated insight.

updateCalculatedInsight(apiName, input)
Update a calculated insight.

createCalculatedInsight(input)

Create a calculated insight.

API Version

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpCalculatedInsightOutput
createCalculatedInsight(ConnectApi.CdpCalculatedInsightInput input)
```

Parameters

input
Type: ConnectApi.CdpCalculatedInsightInput
Input representation for a calculated insight.

Return Value

Type: ConnectApi.CdpCalculatedInsightOutput

deleteCalculatedInsight(apiName)

Delete a calculated insight.

API Version

57.0

Requires Chatter

No

Signature

```
public static Void deleteCalculatedInsight(String apiName)
```

Parameters

apiName
Type: String

API name of the calculated insight to delete.

Return Value

Type: Void

getCalculatedInsight(apiName)

Get a calculated insight.

API Version

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpCalculatedInsightOutput getCalculatedInsight(String apiName)
```

Parameters

apiName
Type: String

API name of the calculated insight to get.

Return Value

Type: ConnectApi.CdpCalculatedInsightOutput

getCalculatedInsights(definitionType, batchSize, offset, orderby, dataspace)

Get calculated insights.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpCalculatedInsightPage getCalculatedInsights(String
definitionType, Integer batchSize, Integer offset, String orderby, String dataspace)
```

Parameters

definitionType
Type: String

Definition type of the calculated insight. Values are:

- `CalculatedMetric`
- `ExternalMetric`
- `StreamingMetric`

batchSize
Type: Integer

Number of items to return. Values are from 1–300. If unspecified, the default value is `25`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderby
Type: String

Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

dataspace
Type: String

Name of the data space.

Return Value

Type: `ConnectApi.CdpCalculatedInsightPage`

`getCalculatedInsights(definitionType, batchSize, offset, orderby, dataspace, pageToken)`

Get a page of calculated insights.

API Version

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpCalculatedInsightPage getCalculatedInsights(String definitionType, Integer batchSize, Integer offset, String orderby, String dataspace, String pageToken)
```

Parameters

definitionType
Type: String

Definition type of the calculated insight. Values are:

- `CalculatedMetric`
- `ExternalMetric`
- `StreamingMetric`

batchSize
Type: Integer

Number of items to return. Values are from 1–300. If unspecified, the default value is `25`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderby
Type: String

Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

dataspace
Type: String

Name of the data space.

pageToken
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: `ConnectApi.CdpCalculatedInsightPage`

`runCalculatedInsight(apiName)`

Run a calculated insight.

API Version

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpCalculatedInsightStandardActionesponseRepresentation
runCalculatedInsight(String apiName)
```

Parameters

apiName
Type: String

API name of the calculated insight to run.

Return Value

Type: ConnectApi.CdpCalculatedInsightStandardActionResponseRepresentation

updateCalculatedInsight(apiName, input)

Update a calculated insight.

API Version

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpCalculatedInsightOutput updateCalculatedInsight(String apiName, ConnectApi.CdpCalculatedInsightInput input)
```

Parameters

apiName
Type: String

API name of the calculated insight to update.

input
Type: ConnectApi.CdpCalculatedInsightInput

Input representation for a calculated insight.

Return Value

Type: ConnectApi.CdpCalculatedInsightOutput

CdpIdentityResolution Class

Create, delete, get, run, and update Data Cloud identity resolution rulesets.

Namespace

ConnectApi

CdpIdentityResolution Methods

The following are methods for `CdpIdentityResolution`. All methods are static.

IN THIS SECTION:

createIdentityResolution(input)
Create an identity resolution ruleset.

deleteIdentityResolution(identityResolution)
Delete an identity resolution ruleset.

getIdentityResolution(identityResolution)
Get an identity resolution ruleset.

getIdentityResolutions()
Get identity resolution rulesets.

runIdentityResolutionNow(identityResolution, input)
Trigger an immediate identity resolution ruleset job run.

updateIdentityResolution(identityResolution, input)
Update an identity resolution ruleset.

`createIdentityResolution(input)`

Create an identity resolution ruleset.

API Version

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpIdentityResolutionOutput
createIdentityResolution(ConnectApi.CdpIdentityResolutionConfigInput input)
```

Parameters

input
Type: `ConnectApi.CdpIdentityResolutionConfigInput`

Input representation for creating an identity resolution ruleset.

Return Value

Type: `ConnectApi.CdpIdentityResolutionOutput`

deleteIdentityResolution(identityResolution)

Delete an identity resolution ruleset.

API Version

57.0

Requires Chatter

No

Signature

```
public static Void deleteIdentityResolution(String identityResolution)
```

Parameters

identityResolution
Type: String

Developer name or ID of the ruleset.

Return Value

Type: Void

getIdentityResolution(identityResolution)

Get an identity resolution ruleset.

API Version

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpIdentityResolutionOutput getIdentityResolution(String
identityResolution)
```

Parameters

identityResolution
Type: String

Developer name or ID of the ruleset.

Return Value

Type: ConnectApi.CdpIdentityResolutionOutput

getIdentityResolutions()

Get identity resolution rulesets.

API Version

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpIdentityResolutionsOutput getIdentityResolutions()
```

Return Value

Type: ConnectApi.CdpIdentityResolutionsOutput

runIdentityResolutionNow(identityResolution, input)

Trigger an immediate identity resolution ruleset job run.

API Version

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpIdentityResolutionRunNowOutput
runIdentityResolutionNow(String identityResolution,
ConnectApi.CdpIdentityResolutionRunNowInput input)
```

Parameters

identityResolution
Type: String

Developer name of the ruleset.

input
Type: ConnectApi.CdpIdentityResolutionRunNowInput

Input representation for running an identity resolution ruleset job on demand.

Return Value

Type: `ConnectApi.CdpIdentityResolutionRunNowOutput`

`updateIdentityResolution(identityResolution, input)`

Update an identity resolution ruleset.

API Version

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpIdentityResolutionOutput updateIdentityResolution(String identityResolution, ConnectApi.CdpIdentityResolutionConfigPatchInput input)
```

Parameters

identityResolution
Type: String

Developer name or ID of the ruleset.

input
Type: `ConnectApi.CdpIdentityResolutionConfigPatchInput`

Input representation for updating an identity resolution ruleset.

Return Value

Type: `ConnectApi.CdpIdentityResolutionOutput`

CdpQuery Class

Get Data Cloud metadata and query data.

Namespace

ConnectApi

CdpQuery Methods

The following are methods for `CdpQuery`. All methods are static.

IN THIS SECTION:

getAllMetadata()
Get all metadata, including Calculated Insights, Engagement, Profile, and other objects, as well as their relationships to other objects.

getAllMetadata(entityType, entityCategory, entityName)
Get all metadata, filtering for entity type, category, and name.

getInsightsMetadata()
Get Insight metadata, including Calculated Insight objects, their dimensions and measures.

getInsightsMetadata(ciName)
Get metadata for a Calculated Insight object. Metadata includes dimensions and measures.

getProfileMetadata()
Get metadata for data model objects in the profile category, including Individual, Contact Point Email, Unified Individual, and Contact Point Address objects. Metadata includes the objects, their fields, and category.

getProfileMetadata(dataModelName)
Get metadata for a data model object in the profile category, such as Individual, Contact Point Email, Unified Individual, and Contact Point Address. Metadata includes the list of fields, data types, and indexes available for lookup.

nextBatchAnsiSqlV2(nextBatchId)
Get the next batch of data across data model, lake, unified, and linked objects.

queryANSISql(input)
Synchronously query data across data model, lake, unified, and linked objects. This query returns up to 4,999 rows.

queryANSISql(input, batchSize, offset, orderby)
Synchronously query data across data model, lake, unified, and linked objects. Specify batch size, offset, and order of the results. This query returns up to 4,999 rows.

queryAnsiSqlV2(input)
Query up to 8 MB of data across data model, lake, unified, and linked objects.

queryCalculatedInsights(ciName, dimensions, measures, orderby, filters, batchSize, offset)
Query a Calculated Insight object.

queryCalculatedInsights(ciName, dimensions, measures, orderby, filters, batchSize, offset, timeGranularity)
Query a Calculated Insight object within a specified time range.

queryProfileApi(dataModelName, filters, fields, batchSize, offset, orderby)
Query a Profile data model object using filters.

queryProfileApi(dataModelName, id, searchKey, filters, fields, batchSize, offset, orderby)
Query a Profile data model object using filters and a search key.

queryProfileApi(dataModelName, id, childDataModelName, searchKey, filters, fields, batchSize, offset, orderby)
Query a Profile data model object and a child object using filters and a search key.

queryProfileApi(dataModelName, id, ciName, searchKey, dimensions, measures, filters, fields, batchSize, offset, orderby)
Query a Profile data model object and a Calculated Insight object using filters and a search key.

queryProfileApi(dataModelName, id, ciName, searchKey, dimensions, measures, filters, fields, batchSize, offset, orderby, timeGranularity)
Query a Profile data model object and a Calculated Insight object using filters, a search key, and a time range.

universalIdLookupBySourceId(entityName, dataSourceId, dataSourceObjectId, sourceRecordId)
Look up objects by source ID.

`getAllMetadata()`

Get all metadata, including Calculated Insights, Engagement, Profile, and other objects, as well as their relationships to other objects.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryMetadataOutput getAllMetadata()
```

Return Value

Type: `ConnectApi.CdpQueryMetadataOutput`

`getAllMetadata(entityType, entityCategory, entityName)`

Get all metadata, filtering for entity type, category, and name.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryMetadataOutput getAllMetadata(String entityType, String
entityCategory, String entityName)
```

Parameters

`entityType`
Type: String

Type of metadata entity requested. Valid values are `DataLakeObject`, `DataModelObject`, and `CalculatedInsight`. If unspecified, all types are returned.

`entityCategory`
Type: String

Category of the metadata entity. Valid values are `Profile`, `Engagement`, and `Related`. If unspecified, all category entities are returned.

`entityName`
Type: String

Metadata name of the entity, for example `UnifiedIndividual__dlm`. If unspecified, a complete list of entities is returned.

Return Value

Type: `ConnectApi.CdpQueryMetadataOutput`

`getInsightsMetadata()`

Get Insight metadata, including Calculated Insight objects, their dimensions and measures.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryMetadataOutput getInsightsMetadata()
```

Return Value

Type: `ConnectApi.CdpQueryMetadataOutput`

`getInsightsMetadata(ciName)`

Get metadata for a Calculated Insight object. Metadata includes dimensions and measures.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryMetadataOutput getInsightsMetadata(String ciName)
```

Parameters

`ciName`
Type: String

Name of the Calculated Insight object, for example, `IndividualChildrenCount__cio`.

Return Value

Type: `ConnectApi.CdpQueryMetadataOutput`

getProfileMetadata()

Get metadata for data model objects in the profile category, including Individual, Contact Point Email, Unified Individual, and Contact Point Address objects. Metadata includes the objects, their fields, and category.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryMetadataOutput getProfileMetadata()
```

Return Value

Type: ConnectApi.CdpQueryMetadataOutput

getProfileMetadata(dataModelName)

Get metadata for a data model object in the profile category, such as Individual, Contact Point Email, Unified Individual, and Contact Point Address. Metadata includes the list of fields, data types, and indexes available for lookup.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryMetadataOutput getProfileMetadata(String dataModelName)
```

Parameters

dataModelName
Type: String

Name of the data model object, for example, `UnifiedIndividual__dlm`.

Return Value

Type: ConnectApi.CdpQueryMetadataOutput

nextBatchAnsiSqlV2(nextBatchId)

Get the next batch of data across data model, lake, unified, and linked objects.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutputV2 nextBatchAnsiSqlV2(String nextBatchId)
```

Parameters

nextBatchId
Type: String

ID of the next batch. See the Usage section for more information.

Return Value

Type: `ConnectApi.CdpQueryOutputV2`

Usage

Initially, use the `queryAnsiSqlV2(input)` method to query up to 8 MB of data. Use the `nextBatchId` from the `ConnectApi.CdpQueryOutputV2` output class as the *nextBatchId* parameter in this method to get the next batch of data. You can continue using subsequent next batch IDs for up to an hour.

queryANSISql(input)

Synchronously query data across data model, lake, unified, and linked objects. This query returns up to 4,999 rows.

Note: A newer version of the Query API is available. We recommend using `queryAnsiSqlV2(input)` and `nextBatchAnsiSqlV2(nextBatchId)` to take advantage of subsequent requests and larger response sizes.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryANSISql(ConnectApi.CdpQueryInput input)
```

Parameters

input
Type: `ConnectApi.CdpQueryInput`

A `ConnectApi.CdpQueryInput` body with the SQL query.

Return Value

Type: `ConnectApi.CdpQueryOutput`

`queryANSISql(input, batchSize, offset, orderby)`

Synchronously query data across data model, lake, unified, and linked objects. Specify batch size, offset, and order of the results. This query returns up to 4,999 rows.

Note: A newer version of the Query API is available. We recommend using `queryAnsiSqlV2(input)` and `nextBatchAnsiSqlV2(nextBatchId)` to take advantage of subsequent requests and larger response sizes.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryANSISql(ConnectApi.CdpQueryInput input,
Integer batchSize, Integer offset, String orderby)
```

Parameters

input
Type: `ConnectApi.CdpQueryInput`

A `ConnectApi.CdpQueryInput` body with the SQL query.

batchSize
Type: Integer

Number of records to return. Values are from 1–4999. The default value is 4999.

offset
Type: Integer

Number of rows to skip before returning results. The sum of *offset* and *batchSize* must be less than 2147483647. The default value is 0.

orderby
Type: String

Comma-separated values to sort the results in ascending or descending order, for example, `GenderId__c ASC,Occupation__c DESC`.

Return Value

Type: `ConnectApi.CdpQueryOutput`

queryAnsiSqlV2(input)

Query up to 8 MB of data across data model, lake, unified, and linked objects.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutputV2 queryAnsiSqlV2(ConnectApi.CdpQueryInput input)
```

Parameters

input
Type: ConnectApi.CdpQueryInput

A ConnectApi.CdpQueryInput body with the SQL query.

Return Value

Type: ConnectApi.CdpQueryOutputV2

Usage

Use the nextBatchId in the ConnectApi.CdpQueryOutputV2 output class as the *nextBatchId* parameter in the nextBatchAnsiSqlV2(nextBatchId) method to continue getting batches of data for up to an hour.

queryCalculatedInsights(ciName, dimensions, measures, orderby, filters, batchSize, offset)

Query a Calculated Insight object.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryCalculatedInsights(String ciName, String dimensions, String measures, String orderby, String filters, Integer batchSize, Integer offset)
```

Parameters

ciName
Type: String

Name of the Calculated Insight object, for example, `IndividualChildrenCount__cio`.

dimensions
Type: String

Comma-separated list of up to 10 dimensions, such as `GenderId__c`, to project. If unspecified, this parameter includes all of the available dimensions.

measures
Type: String

Comma-separated list of up to 5 measures, such as `TotalSales__c`, to project. If unspecified, this parameter includes all of the available measures.

orderby
Type: String

Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

filters
Type: String

Filter the result set to a more narrow scope or specific type, such as `[GenderId__c=Male,FirstName__c=Angel]`.

batchSize
Type: Integer

Number of items to return. Values are from 1–4,999. If unspecified, the default value is `4999`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

Return Value

Type: `ConnectApi.CdpQueryOutput`

queryCalculatedInsights(ciName, dimensions, measures, orderby, filters, batchSize, offset, timeGranularity)

Query a Calculated Insight object within a specified time range.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryCalculatedInsights(String ciName, String dimensions, String measures, String orderby, String filters, Integer batchSize, Integer offset, String timeGranularity)
```

Parameters

ciName
Type: String

Name of the Calculated Insight object, for example, `IndividualChildrenCount__cio`.

dimensions
Type: String

Comma-separated list of up to 10 dimensions, such as `GenderId__c`, to project. If unspecified, this parameter includes all of the available dimensions.

measures
Type: String

Comma-separated list of up to 5 measures, such as `TotalSales__c`, to project. If unspecified, this parameter includes all of the available measures.

orderby
Type: String

Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

filters
Type: String

Filter the result set to a more narrow scope or specific type, such as `[GenderId__c=Male,FirstName__c=Angel]`.

batchSize
Type: Integer

Number of items to return. Values are from 1–4,999. If unspecified, the default value is `4999`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

timeGranularity
Type: String

Time range for the measures. Values are:

- `HOUR`
- `DAY`
- `MONTH`
- `QUARTER`
- `YEAR`

If unspecified, no time range is applied.

Return Value

Type: ConnectApi.CdpQueryOutput

queryProfileApi(dataModelName, filters, fields, batchSize, offset, orderby)

Query a Profile data model object using filters.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryProfileApi(String dataModelName, String filters, String fields, Integer batchSize, Integer offset, String orderby)
```

Parameters

dataModelName
Type: String

Name of the data model object, for example, `UnifiedIndividual__dlm`.

filters
Type: String

Comma-separated list of equality expressions within square brackets, for example, `[FirstName__c=DON]`.

fields
Type: String

Comma-separated list of up to 50 field names that you want to include in the result, for example, `Id__c,FirstName__c, GenderId__c,Occupation__c`. If unspecified, `Id__c` is returned.

batchSize
Type: Integer

Number of items to return. Values are from 1–4,999. If unspecified, the default value is `100`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderby
Type: String

Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

Return Value

Type: ConnectApi.CdpQueryOutput

`queryProfileApi(dataModelName, id, searchKey, filters, fields, batchSize, offset, orderby)`

Query a Profile data model object using filters and a search key.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryProfileApi(String dataModelName, String id, String searchKey, String filters, String fields, Integer batchSize, Integer offset, String orderby)
```

Parameters

dataModelName
Type: String

Name of the data model object, for example, `UnifiedIndividual__dlm`.

id
Type: String

Value of the primary or secondary key field, for example, `John`. If unspecified, defaults to the value of the primary key field.

searchKey
Type: String

If a field other than the primary key is used, name of the key field, for example, `FirstName__c`.

filters
Type: String

Comma-separated list of equality expressions within square brackets, for example, `[FirstName__c=DON]`.

fields
Type: String

Comma-separated list of up to 50 field names that you want to include in the result, for example, `Id__c,FirstName__c, GenderId__c,Occupation__c`. If unspecified, `Id__c` is returned.

batchSize
Type: Integer

Number of items to return. Values are from 1–4,999. If unspecified, the default value is `100`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderby
Type: String

Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

Return Value

Type: `ConnectApi.CdpQueryOutput`

queryProfileApi(dataModelName, id, childDataModelName, searchKey, filters, fields, batchSize, offset, orderby)

Query a Profile data model object and a child object using filters and a search key.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryProfileApi(String dataModelName, String id, String childDataModelName, String searchKey, String filters, String fields, Integer batchSize, Integer offset, String orderby)
```

Parameters

dataModelName
Type: String

Name of the data model object, for example, `UnifiedIndividual__dlm`.

id
Type: String

Value of the primary or secondary key field, for example, `John`. If unspecified, defaults to the value of the primary key field.

childDataModelName
Type: String

Name of the child data model object, for example, `UnifiedContactPointEmail__dlm`.

searchKey
Type: String

If a field other than the primary key is used, name of the key field, for example, `FirstName__c`.

filters
Type: String

Comma-separated list of equality expressions within square brackets, for example, `[FirstName__c=DON]`. Filters are applied to the parent object only.

fields
Type: String

Comma-separated list of child object field names that you want to include in the result, for example, `Id__c,EmailAddress__c`. If unspecified, the first 10 alphabetically sorted fields are returned.

batchSize
Type: Integer

Number of items to return. Values are from 1–4,999. If unspecified, the default value is `100`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderby
Type: String

Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

Return Value

Type: `ConnectApi.CdpQueryOutput`

queryProfileApi(dataModelName, id, ciName, searchKey, dimensions, measures, filters, fields, batchSize, offset, orderby)

Query a Profile data model object and a Calculated Insight object using filters and a search key.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryProfileApi(String dataModelName, String id, String ciName, String searchKey, String dimensions, String measures, String filters, String fields, Integer batchSize, Integer offset, String orderby)
```

Parameters

dataModelName
Type: String

Name of the data model object, for example, `UnifiedIndividual__dlm`.

id
Type: String

Value of the primary or secondary key field, for example, `John`. If unspecified, defaults to the value of the primary key field.

ciName
Type: String

Name of the Calculated Insight object, for example, `IndividualChildrenCount__cio`.

searchKey
Type: String

If a field other than the primary key is used, name of the key field, for example, `FirstName__c`.

dimensions
Type: String

Comma-separated list of up to 10 dimensions, such as `GenderId__c`, to project. If unspecified, this parameter includes all of the available dimensions.

measures
Type: String

Comma-separated list of up to 5 measures, such as `TotalSales__c`, to project. If unspecified, this parameter includes all of the available measures.

filters
Type: String

Comma-separated list of equality expressions within square brackets, for example, `[FirstName__c=DON]`.

fields
Type: String

Comma-separated list of up to 50 field names that you want to include in the result, for example, `Id__c,FirstName__c, GenderId__c,Occupation__c`. If unspecified, `Id__c` is returned.

batchSize
Type: Integer

Number of items to return. Values are from 1–4,999. If unspecified, the default value is `100`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderby
Type: String

Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

Return Value

Type: `ConnectApi.CdpQueryOutput`

`queryProfileApi(dataModelName, id, ciName, searchKey, dimensions, measures, filters, fields, batchSize, offset, orderby, timeGranularity)`

Query a Profile data model object and a Calculated Insight object using filters, a search key, and a time range.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryOutput queryProfileApi(String dataModelName, String id, String ciName, String searchKey, String dimensions, String measures, String filters, String fields, Integer batchSize, Integer offset, String orderby, String timeGranularity)
```

Parameters

dataModelName
Type: String

Name of the data model object, for example, `UnifiedIndividual__dlm`.

id
Type: String

Value of the primary or secondary key field, for example, `John`. If unspecified, defaults to the value of the primary key field.

ciName
Type: String

Name of the Calculated Insight object, for example, `IndividualChildrenCount__cio`.

searchKey
Type: String

If a field other than the primary key is used, name of the key field, for example, `FirstName__c`.

dimensions
Type: String

Comma-separated list of up to 10 dimensions, such as `GenderId__c`, to project. If unspecified, this parameter includes all of the available dimensions.

measures
Type: String

Comma-separated list of up to 5 measures, such as `TotalSales__c`, to project. If unspecified, this parameter includes all of the available measures.

filters
Type: String

Comma-separated list of equality expressions within square brackets, for example, `[FirstName__c=DON]`.

fields
Type: String

Comma-separated list of up to 50 field names that you want to include in the result, for example, `Id__c,FirstName__c, GenderId__c,Occupation__c`. If unspecified, `Id__c` is returned.

batchSize
Type: Integer

Number of items to return. Values are from 1–4,999. If unspecified, the default value is `100`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderby
Type: String

Sort order for the result set, such as `GenderId__c ASC,Occupation__c DESC`. If unspecified, items are returned in the order they are retrieved.

timeGranularity
Type: String

Time range for the measures. Values are:

- `HOUR`
- `DAY`
- `MONTH`
- `QUARTER`
- `YEAR`

If unspecified, no time range is applied.

Return Value

Type: `ConnectApi.CdpQueryOutput`

`universalIdLookupBySourceId(entityName, dataSourceId, dataSourceObjectId, sourceRecordId)`

Look up objects by source ID.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpQueryDataOutput universalIdLookupBySourceId(String
entityName, String dataSourceId, String dataSourceObjectId, String sourceRecordId)
```

Parameters

entityName
Type: String

Entity name.

dataSourceId
Type: String

Data source ID.

dataSourceObjectId
Type: String

Data source object ID.

sourceRecordId
Type: String

Source record ID.

Return Value

Type: `ConnectApi.CdpQueryDataOutput`

CdpSegment Class

Create, delete, get, publish, and update Data Cloud segments. Get segment members.

Namespace

ConnectApi

CdpSegment Methods

The following are methods for `CdpSegment`. All methods are static.

IN THIS SECTION:

createSegment(input)
Create a segment.

createSegment(input, dataspace)
Create a segment in a dataspace.

deactivateSegmentByApiName(segmentApiName)
Deactivate a segment by API name.

deactivateSegmentById(segmentId)
Deactivate a segment by ID.

deleteSegment(segmentApiName)
Delete a segment.

executePublishAdhoc(segmentId)
Publish a segment.

getSegment(segmentApiName)
Get a segment.

getSegmentMembers(limit, offset, orderBy, segmentApiName, filters, fields)
Get segment members.

getSegments()
Get segments.

getSegmentsPaginated(batchSize, offset, orderBy)
Get an ordered batch of segments.

getSegmentsPaginated(batchSize, offset, orderBy, dataspace)
Get paginated segments in a dataspace.

updateSegment(segmentApiName, input)
Update a segment.

createSegment(input)

Create a segment.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpSegmentOutput createSegment(ConnectApi.CdpSegmentInput
input)
```

Parameters

input
Type: ConnectApi.CdpSegmentInput

A ConnectApi.CdpSegmentInput class.

Return Value

Type: ConnectApi.CdpSegmentOutput

createSegment(input, dataspace)

Create a segment in a dataspace.

API Version

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpSegmentOutput createSegment(ConnectApi.CdpSegmentInput
input, String dataspace)
```

Parameters

input
Type: ConnectApi.CdpSegmentInput

A ConnectApi.CdpSegmentInput class.

dataspace
Type: String

Name of the dataspace in which to perform the action. User must have permission to this dataspace. Optional when bulk-listing segments. If unspecified, default is the `default` dataspace.

Return Value

Type: ConnectApi.CdpSegmentOutput

deactivateSegmentByApiName(segmentApiName)

Deactivate a segment by API name.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpSegmentActionOutput deactivateSegmentByApiName(String
segmentApiName)
```

Parameters

segmentApiName
Type: String

API name of the segment.

Return Value

Type: ConnectApi.CdpSegmentActionOutput

deactivateSegmentById(segmentId)

Deactivate a segment by ID.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpSegmentActionOutput deactivateSegmentById(String segmentId)
```

Parameters

segmentId
Type: String

ID of the segment.

Return Value

Type: ConnectApi.CdpSegmentActionOutput

deleteSegment(segmentApiName)

Delete a segment.

API Version

56.0

Requires Chatter

No

Signature

```
public static Void deleteSegment(String segmentApiName)
```

Parameters

segmentApiName
Type: String

API name of the segment.

Return Value

Type: Void

executePublishAdhoc(segmentId)

Publish a segment.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpSegmentActionOutput executePublishAdhoc(String segmentId)
```

Parameters

segmentId
Type: String

ID of the segment to publish.

Return Value

Type: ConnectApi.CdpSegmentActionOutput

getSegment(segmentApiName)

Get a segment.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpSegmentContainerOutput getSegment(String segmentApiName)
```

Parameters

segmentApiName
Type: String

API name of the segment.

Return Value

Type: ConnectApi.CdpSegmentContainerOutput

getSegmentMembers(limit, offset, orderBy, segmentApiName, filters, fields)

Get segment members.

API Version

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpSegmentMemberOutput getSegmentMembers(Integer limit, Integer offset, String orderBy, String segmentApiName, String filters, List<String> fields)
```

Parameters

limit
Type: Integer

Maximum number of rows to return from `1–1000`. If unspecified, the default number of rows is `100`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderBy
Type: String

Sort order for the result set, such as `Name ASC` or `MarketSegmentType DESC`. If unspecified, items are returned by ID in ascending order.

segmentApiName
Type: String

API name of the segment.

filters
Type: String

Filter the result set to a more narrow scope or specific type, such as `[Delta_Type__C in('new') AND timestamp__C > '2023-04-02']`.

fields
Type: List<String>

Comma-separated list of up to 50 field names that you want to include in the result, for example, `Id__c, Delta_Type__C`. If unspecified, `Id__c` is returned.

Return Value

Type: `ConnectApi.CdpSegmentMemberOutput`

`getSegments()`

Get segments.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpSegmentContainerOutput getSegments()
```

Return Value

Type: ConnectApi.CdpSegmentContainerOutput

getSegmentsPaginated(batchSize, offset, orderBy)

Get an ordered batch of segments.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpSegmentContainerOutput getSegmentsPaginated(Integer
batchSize, Integer offset, String orderBy)
```

Parameters

batchSize
Type: Integer

Number of items to return. Values are from 1–200. If unspecified, the default value is `20`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderBy
Type: String

Sort order for the result set, such as `Name ASC` or `MarketSegmentType DESC`. If unspecified, items are returned by ID in ascending order.

Return Value

Type: ConnectApi.CdpSegmentContainerOutput

`getSegmentsPaginated(batchSize, offset, orderBy, dataspace)`

Get paginated segments in a dataspace.

API Version

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpSegmentContainerOutput getSegmentsPaginated(Integer
batchSize, Integer offset, String orderBy, String dataspace)
```

Parameters

batchSize
Type: Integer

Number of items to return. Values are from 1–200. If unspecified, the default value is `20`.

offset
Type: Integer

Number of rows to skip before returning results. If unspecified, no rows are skipped.

orderBy
Type: String

Sort order for the result set, such as `Name ASC` or `MarketSegmentType DESC`. If unspecified, items are returned by ID in ascending order.

dataspace
Type: String

Name of the dataspace in which to perform the action. User must have permission to this dataspace. Optional when bulk-listing segments. If unspecified, default is the `default` dataspace.

Return Value

Type: `ConnectApi.CdpSegmentContainerOutput`

`updateSegment(segmentApiName, input)`

Update a segment.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.CdpSegmentOutput updateSegment(String segmentApiName,
ConnectApi.CdpSegmentInput input)
```

Parameters

segmentApiName
Type: String

API name of the segment.

input
Type: `ConnectApi.CdpSegmentInput`

A `ConnectApi.CdpSegmentInput` class with the updates.

Return Value

Type: `ConnectApi.CdpSegmentOutput`

Chatter Class

Access information about followers and subscriptions for records.

Namespace

ConnectApi

Chatter Methods

The following are methods for `Chatter`. All methods are static.

IN THIS SECTION:

deleteSubscription(communityId, subscriptionId)
Delete a subscription. Use this method to stop following a record, a user, or a file.

getFollowers(communityId, recordId)
Get the first page of followers for a record.

getFollowers(communityId, recordId, pageParam, pageSize)
Get a page of followers for a record.

getSubscription(communityId, subscriptionId)
Get information about a subscription.

submitDigestJob(period)
Submit a daily or weekly Chatter email digest job.

deleteSubscription(communityId, subscriptionId)

Delete a subscription. Use this method to stop following a record, a user, or a file.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static void deleteSubscription(String communityId, String subscriptionId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subscriptionId
Type: String

The ID for a subscription.

Return Value

Type: Void

Usage

"Following" a user, group, or record is the same as "subscribing" to a user, group, or record. A "follower" is the user who followed the user, group, or record. A "subscription" is an object describing the relationship between the follower and the user, group, or record they followed.

To leave a group, call `deleteMember(communityId, membershipId)`.

Example

When you follow a user, the call to `ConnectApi.ChatterUsers.follow` returns a `ConnectApi.Subscription` object. To stop following the user, pass the `id` property of that object to this method.

```
ConnectApi.Chatter.deleteSubscription(null, '0E8RR0000004CnK0AU');
```

SEE ALSO:

Follow a Record

follow(communityId, userId, subjectId)

getFollowers(communityId, recordId)

Get the first page of followers for a record.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowerPage getFollowers(String communityId, String recordId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID for a record or the keyword `me`.

Return Value

Type: `ConnectApi.FollowerPage`

Usage

"Following" a user, group, or record is the same as "subscribing" to a user, group, or record. A "follower" is the user who followed the user, group, or record. A "subscription" is an object describing the relationship between the follower and the user, group, or record they followed.

SEE ALSO:

Follow a Record

getFollowers(communityId, recordId, pageParam, pageSize)

Get a page of followers for a record.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowerPage getFollowers(String communityId, String recordId,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID for a record or the keyword `me`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.FollowerPage`

Usage

"Following" a user, group, or record is the same as "subscribing" to a user, group, or record. A "follower" is the user who followed the user, group, or record. A "subscription" is an object describing the relationship between the follower and the user, group, or record they followed.

SEE ALSO:

Follow a Record

`getSubscription(communityId, subscriptionId)`

Get information about a subscription.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Subscription getSubscription(String communityId, String subscriptionId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subscriptionId
Type: String

The ID for a subscription.

Return Value

Type: `ConnectApi.Subscription`

Usage

"Following" a user, group, or record is the same as "subscribing" to a user, group, or record. A "follower" is the user who followed the user, group, or record. A "subscription" is an object describing the relationship between the follower and the user, group, or record they followed.

SEE ALSO:

Follow a Record

`submitDigestJob(period)`

Submit a daily or weekly Chatter email digest job.

API Version

37.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.DigestJobRepresentation submitDigestJob(ConnectApi.DigestPeriod period)
```

Parameters

period
Type: `ConnectApi.DigestPeriod`

Time period that's included in a Chatter email digest. Values are:

- `DailyDigest`—The email includes up to the 50 latest posts from the previous day.
- `WeeklyDigest`—The email includes up to the 50 latest posts from the previous week.

Return Value

Type: `ConnectApi.DigestJob`

Usage

The times when Chatter sends email digests are not configurable in the UI. To control when email digests are sent and to use this method, contact Salesforce to enable API-only Chatter Digests.

Warning: Enabling API-only Chatter Digests disables the scheduled digests for your org. You must call the API for your users to receive their digests.

We recommend scheduling digest jobs by implementing the Apex `Schedulable` interface with this method. To monitor your digest jobs from Setup, enter *`Background Jobs`* in the `Quick Find` box, then select **Background Jobs**.

Example

Schedule daily digests:

```
global class ExampleDigestJob1 implements Schedulable {
   global void execute(SchedulableContext context) {
      ConnectApi.Chatter.submitDigestJob(ConnectApi.DigestPeriod.DailyDigest);
   }
}
```

Schedule weekly digests:

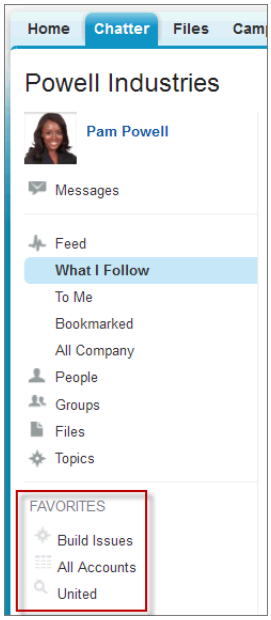
```
global class ExampleDigestJob2 implements Schedulable {
   global void execute(SchedulableContext context) {
      ConnectApi.Chatter.submitDigestJob(ConnectApi.DigestPeriod.WeeklyDigest);
   }
}
```

SEE ALSO:

Apex Scheduler

ChatterFavorites Class

Chatter favorites give you easy access to topics, list views, and feed searches.



Namespace

ConnectApi

Usage

Use Connect in Apex to get and delete topics, list views, and feed searches that have been added as favorites. Add topics and feed searches as favorites, and update the last view date of a feed search or list view feed to the current system time.

In this image of Salesforce, “Build Issues” is a topic, “All Accounts” is a list view, and “United” is a feed search.

ChatterFavorites Methods

The following are methods for `ChatterFavorites`. All methods are static.

IN THIS SECTION:

addFavorite(communityId, subjectId, searchText)
Add a feed search favorite for a user.

addRecordFavorite(communityId, subjectId, targetId)
Add a topic as a favorite.

deleteFavorite(communityId, subjectId, favoriteId)
Delete a favorite.

getFavorite(communityId, subjectId, favoriteId)
Get information about a favorite.

getFavorites(communityId, subjectId)
Get a list of favorites for a user.

getFeedElements(communityId, subjectId, favoriteId)
Get the first page of feed elements for a favorite.

getFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)
Get a page of sorted feed elements for a favorite.

getFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam)
Get a page of sorted feed elements for a favorite. Include no more than the specified number of comments per feed element.

updateFavorite(communityId, subjectId, favoriteId, updateLastViewDate)
Update the last view date of the saved search or list view feed to the current system time.

addFavorite(communityId, subjectId, searchText)

Add a feed search favorite for a user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedFavorite addFavorite(String communityId, String subjectId,
String searchText)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

searchText
Type: String

Specify the text of the search to be saved as a favorite. This method can only create a feed search favorite, not a list view favorite or a topic.

Return Value

Type: `ConnectApi.FeedFavorite`

addRecordFavorite(communityId, subjectId, targetId)

Add a topic as a favorite.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedFavorite addRecordFavorite(String communityId, String subjectId, String targetId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

targetId
Type: String

The ID of the topic to add as a favorite.

Return Value

Type: `ConnectApi.FeedFavorite`

deleteFavorite(communityId, subjectId, favoriteId)

Delete a favorite.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static Void deleteFavorite(String communityId, String subjectId, String favoriteId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

Return Value

Type: Void

getFavorite(communityId, subjectId, favoriteId)

Get information about a favorite.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedFavorite getFavorite(String communityId, String subjectId,
String favoriteId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

Return Value

Type: `ConnectApi.FeedFavorite`

getFavorites(communityId, subjectId)

Get a list of favorites for a user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedFavorites getFavorites(String communityId, String subjectId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

Return Value

Type: `ConnectApi.FeedFavorites`

getFeedElements(communityId, subjectId, favoriteId)

Get the first page of feed elements for a favorite.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElements(String communityId, String
subjectId, String favoriteId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElements(communityId, subjectId, favoriteId, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)`

Get a page of sorted feed elements for a favorite.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElements(String communityId, String subjectId, String favoriteId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`subjectId`
Type: String

ID of the context user or the alias `me`.

`favoriteId`
Type: String

ID of a favorite.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam)`

Get a page of sorted feed elements for a favorite. Include no more than the specified number of comments per feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElements(String communityId, String
subjectId, String favoriteId, Integer recentCommentCount, Integer elementsPerBundle,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`updateFavorite(communityId, subjectId, favoriteId, updateLastViewDate)`

Update the last view date of the saved search or list view feed to the current system time.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedFavorite updateFavorite(String communityId, String
subjectId, String favoriteId, Boolean updateLastViewDate)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`subjectId`
Type: String

ID of the context user or the alias `me`.

`favoriteId`
Type: String

ID of a favorite.

`updateLastViewDate`
Type: Boolean

Specify whether to update the last view date of the specified favorite to the current system time (`true`) or not (`false`).

Return Value

Type: `ConnectApi.FeedFavorite`

ChatterFavorites Test Methods

The following are the test methods for `ChatterFavorites`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

IN THIS SECTION:

setTestGetFeedElements(communityId, subjectId, favoriteId, result)
Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)
Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam, result)
Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

`setTestGetFeedElements(communityId, subjectId, favoriteId, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElements(String communityId, String subjectId, String favoriteId, ConnectApi.FeedElementPage result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`subjectId`
Type: String

ID of the context user or the alias `me`.

`favoriteId`
Type: String

ID of a favorite.

result
Type: ConnectApi.FeedElementPage

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElements(communityId, subjectId, favoriteId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElements(String communityId, String subjectId, String favoriteId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result

Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElements` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElements(String communityId, String subjectId, String favoriteId, Integer recentCommentCount, Integer elementsPerBundle, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

Retired ChatterFavorites Methods

The following methods for `ChatterFavorites` are retired.

IN THIS SECTION:

getFeedItems(communityId, subjectId, favoriteId)
Get the first page of feed items for a favorite.

getFeedItems(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)
Get a page of sorted feed items for a favorite.

getFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam)
Get a page of sorted feed items for a favorite. Include no more than the specified number of comments per feed item.

setTestGetFeedItems(communityId, subjectId, favoriteId, result)
Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItems` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItems(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)
Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItems` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam, result)
Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItems` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

`getFeedItems(communityId, subjectId, favoriteId)`

Get the first page of feed items for a favorite.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElements(communityId, subjectId, favoriteId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItems(String communityId, String subjectId,
String favoriteId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedItems(communityId, subjectId, favoriteId, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedItems(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)`

Get a page of sorted feed items for a favorite.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElements(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItems(String communityId, String subjectId,
String favoriteId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder
sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedItems(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam)`

Get a page of sorted feed items for a favorite. Include no more than the specified number of comments per feed item.

API Version

29.0–31.0

Important: In version 32.0 and later, use getFeedElements(communityId, subjectId, favoriteId, recentCommentCount, elementsPerBundle, pageParam, pageSize, sortParam).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItems(String communityId, String subjectId,
String favoriteId, Integer recentCommentCount, String pageParam, Integer pageSize,
FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedItems(communityId, subjectId, favoriteId, result)`

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItems` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItems(String communityId, String subjectId, String favoriteId, ConnectApi.FeedItemPage result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`subjectId`
Type: String

ID of the context user or the alias `me`.

`favoriteId`
Type: String

ID of a favorite.

`result`
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItems(communityId, subjectId, favoriteId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedItems(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItems` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItems(String communityId, String subjectId, String favoriteId, String pageParam, Integer pageSize, FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Isolated, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

result
Type: ConnectApi.FeedItemPage

Object containing test data.

Return Value

Type: Void

getFeedItems(communityId, subjectId, favoriteId, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam, result)

Register a ConnectApi.FeedItemPage object to be returned when getFeedItems is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

29.0–31.0

Signature

```
public static Void setTestGetFeedItems(String communityId, String subjectId, String favoriteId, Integer recentCommentCount, String pageParam, Integer pageSize, FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, internal, or null.

subjectId
Type: String

ID of the context user or the alias `me`.

favoriteId
Type: String

ID of a favorite.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItems(communityId, subjectId, favoriteId, recentCommentCount, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

ChatterFeeds Class

Get, post, and delete feed elements, likes, comments, and bookmarks. You can also search feed elements, share feed elements, and vote on polls.

Namespace

ConnectApi

Usage

The Chatter feed is a container of feed elements. The abstract class `ConnectApi.FeedElement` is a parent class to the `ConnectApi.FeedItem` class, representing feed posts, and the `ConnectApi.GenericFeedElement` class, representing bundles and recommendations in the feed. For detailed information, see Working with Feeds and Feed Elements.

Important: Feed item methods aren't available in version 32.0. In version 32.0 and later, use feed element methods.

Message segments in a feed item are typed as `ConnectApi.MessageSegment`. Feed item capabilities are typed as `ConnectApi.FeedItemCapability`. Record fields are typed as `ConnectApi.AbstractRecordField`. These classes are all abstract and have several concrete subclasses. At runtime you can use `instanceof` to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

Important: The composition of a feed can change between releases. Write your code to handle instances of unknown subclasses.

ChatterFeeds Methods

The following are methods for `ChatterFeeds`. All methods are static.

IN THIS SECTION:

createStream(communityId, streamInput)
Create a Chatter feed stream.

deleteComment(communityId, commentId)
Delete a comment.

deleteFeedElement(communityId, feedElementId)
Delete a feed element.

deleteLike(communityId, likeId)
Delete a like on a comment or post.

deleteStream(communityId, streamId)
Delete a Chatter feed stream.

getComment(communityId, commentId)
Get a comment.

getCommentBatch(communityId, commentIds)
Get a list of comments.

getCommentInContext(communityId, commentId, pageSize)
Get a threaded comment in the context of its parent comments and post.

getCommentsForFeedElement(communityId, feedElementId)
Get comments for a feed element.

getCommentsForFeedElement(communityId, feedElementId, threadedCommentsCollapsed)
Get comments in a threaded style for a feed element.

getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize)
Get a page of comments for a feed element.

getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize, threadedCommentsCollapsed)
Get a page of comments in a threaded style for a feed element.

getCommentsForFeedElement(communityId, feedElementId, threadedCommentsCollapsed, sortParam)
Get sorted comments in a threaded style for a feed element.

getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize, threadedCommentsCollapsed, sortParam)
Get a page of sorted comments in a threaded style for a feed element.

getCommentsForFeedElement(communityId, feedElementId, sortParam)
Get sorted comments for a feed element.

getCommentsForFeedElement(communityId, feedElementId, sortParam, threadedCommentsCollapsed)
Get sorted comments in a threaded style for a feed element.

getExtensions(communityId, pageParam, pageSize)
Get extensions.

getFeed(communityId, feedType)
Get a feed.

getFeed(communityId, feedType, sortParam)
Get a sorted feed.

getFeed(communityId, feedType, subjectId)
Get a feed for a record or user.

getFeed(communityId, feedType, subjectId, sortParam)
Get a sorted feed for a record or user.

getFeedDirectory(String)
Get a list of all feeds available to the context user.

getFeedElement(communityId, feedElementId)
Get a feed element.

getFeedElement(communityId, feedElementId, commentSort)
Get a feed element with sorted comments.

getFeedElement(communityId, feedElementId, threadedCommentsCollapsed)
Get a feed element and its comments in a threaded style.

getFeedElement(communityId, feedElementId, threadedCommentsCollapsed, commentSort)
Get a feed element and its sorted comments in a threaded style.

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle)
Get a feed element with the specified number of elements per bundle including no more than the specified number of comments per feed element.

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, threadedCommentsCollapsed)

Get a feed element with its comments in a threaded style with the specified number of elements per bundle and comments per feed element.

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, threadedCommentsCollapsed, commentSort)

Get a feed element with its sorted comments in a threaded style with the specified number of elements per bundle and comments per feed element.

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, commentSort)

Get a feed element with the specified number of elements per bundle including no more than the specified number of sorted comments per feed element.

getFeedElementBatch(communityId, feedElementIds)

Get a list of feed elements.

getFeedElementPoll(communityId, feedElementId)

Get the poll associated with a feed element.

getFeedElementsFromBundle(communityId, feedElementId)

Get feed elements from a bundle.

getFeedElementsFromBundle(communityId, feedElementId, pageParam, pageSize, elementsPerBundle, recentCommentCount)

Get a page of feed elements from a bundle. Specify the number of elements per bundle and include no more than the specified number of comments per feed element.

getFeedElementsFromFeed(communityId, feedType)

Get feed elements from the `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview` feeds.

getFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from the `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview` feeds.

getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from the `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview` feeds. Each feed element contains no more than the specified number of comments.

getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter)

Get a page of sorted and filtered feed elements from the `Home` feed. Each feed element contains no more than the specified number of comments.

getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed)

Get a page of filtered and sorted feed elements with comments in a threaded style from the `Home` feed. Each feed element contains no more than the specified number of comments.

getFeedElementsFromFeed(communityId, feedType, subjectId)

Get feed elements from any feed other than `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview` for a user or record.

getFeedElementsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from any feed other than `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from any feed other than `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`. Each feed element includes no more than the specified number of comments.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)

Get a page of sorted feed elements from a record feed. Each feed element includes no more than the specified number of comments. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter)

Get a page of sorted and filtered feed elements from the `UserProfile` feed.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed)

Get a page of feed elements with comments in a threaded style from the `UserProfile` feed.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, customFilter)

Get a page of sorted and filtered feed elements from the case feed.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly)

Get a page of sorted feed elements from a record feed. Specify the number of elements per bundle and include no more than the specified number of comments per feed element. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter)

Get a page of sorted and filtered feed elements from a record feed. Specify the number of elements per bundle and include no more than the specified number of comments per feed element. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter, threadedCommentsCollapsed)

Get a page of sorted and filtered feed elements with comments in a threaded style for a record feed. Specify the number of elements per bundle and include no more than the specified number of comments per feed element. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, customFilter)

Get a page of sorted and filtered feed elements from a case feed.

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, customFilter, threadedCommentsCollapsed)

Get a page of filtered and sorted feed elements with comments in a threaded style from a case feed.

getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix)

Get feed elements from a feed filtered by a key prefix for a user.

getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from a feed filtered by a key prefix for a user.

getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam)

Get a page of sorted feed elements from a feed filtered by a key prefix for a user. Each feed element contains no more than the specified number of comments.

getFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince)

Get a page of feed elements from a feed filtered by a key prefix for a user. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter.

getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince)

Get a page of feed elements from the `Company`, `DirectMessageModeration`, `Home`, and `Moderation` feeds. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter. Each feed element contains no more than the specified number of comments.

getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, filter)

Get a page of filtered feed elements from the `Home` feed. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter. Each feed element contains no more than the specified number of comments.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince)

Get a page of feed elements from the `Files`, `Groups`, `News`, `People`, and `Record` feeds. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter. Each feed element contains no more than the specified number of comments.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly)

Get a page of feed elements from a record feed. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, filter)

Get a page of filtered feed elements from a `UserProfile` feed. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, customFilter)

Get a page of filtered feed elements from a case feed. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly)

Get a page of feed elements from a record feed. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter. Specify the maximum number of feed elements in a bundle and whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, filter)

Get a page of filtered feed elements from a record feed. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter. Specify the maximum number of feed elements in a bundle and whether to return feed elements posted by internal (non-Experience Cloud site) users only.

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, customFilter)

Get a page of filtered feed elements from a case feed. Include only feed elements that have been updated since the time specified in the `updatedSince` parameter.

getFeedWithFeedElements(communityId, feedType, pageSize)

Get information about a feed and a page of feed elements from the feed.

getFeedWithFeedElements(communityId, feedType, pageSize, recentCommentCount)

Get a page of information about the feed and the feed elements with the specified number of comments per feed element from the feed.

getFilterFeed(communityId, subjectId, keyPrefix)

Get a feed filtered by a key prefix for a user.

getFilterFeed(communityId, subjectId, keyPrefix, sortParam)

Get a sorted feed filtered by a key prefix for a user.

getFilterFeedDirectory(communityId, subjectId)

Get a feed directory of filter feeds available to the context user.

getLike(communityId, likeId)

Get a like on a post or comment.

getLikesForComment(communityId, commentId)

Get likes for a comment.

getLikesForComment(communityId, commentId, pageParam, pageSize)

Get a page of likes for a comment.

getLikesForFeedElement(communityId, feedElementId)

Get likes for a feed element.

getLikesForFeedElement(communityId, feedElementId, pageParam, pageSize)

Get a page of likes for a feed element.

getLinkMetadata(communityId, urls)

Get link metadata for URLs.

getPinnedFeedElementsFromFeed(communityId, feedType, subjectId)

Get pinned feed elements from a group or topic feed.

getReadByForFeedElement(communityId, feedElementId)

Get information about who read a feed element and when.

getReadByForFeedElement(communityId, feedElementId, pageParam, pageSize)

Get a page of information about who read a feed element and when.

getRelatedPosts(communityId, feedElementId, filter, maxResults)

Get posts related to the context feed element.

getStream(communityId, streamId)

Get information about a Chatter feed stream.

getStream(communityId, streamId, globalScope)

Get information about a Chatter feed stream, regardless of Experience Cloud site.

getStreams(communityId)

Get the Chatter feed streams for the context user.

getStreams(communityId, sortParam)
Get and sort the Chatter feed streams for the context user.

getStreams(communityId, pageParam, pageSize)
Get a page of Chatter feed streams for the context user.

getStreams(communityId, pageParam, pageSize, sortParam)
Get a sorted page of Chatter feed streams for the context user.

getStreams(communityId, pageParam, pageSize, sortParam, globalScope)
Get a sorted page of Chatter feed streams from all Enterprise Cloud sites for the context user.

getSupportedEmojis()
Get supported emojis for the org.

getThreadsForFeedComment(communityId, commentId)
Get threaded comments for a comment.

getThreadsForFeedComment(communityId, commentId, pageParam, pageSize)
Get a page of threaded comments for a comment.

getThreadsForFeedComment(communityId, commentId, threadedCommentsCollapsed)
Access the comments capability for a comment.

getTopUnansweredQuestions(communityId) (Pilot)
Get top unanswered questions for the context user in aExperience Cloud site.

getTopUnansweredQuestions(communityId, filter) (Pilot)
Get filtered top unanswered questions for the context user in an Experience Cloud site.

getTopUnansweredQuestions(communityId, pageSize) (Pilot)
Get a page of top unanswered questions for the context user in an Experience Cloud site.

getTopUnansweredQuestions(communityId, filter, pageSize) (Pilot)
Get a page of filtered top unanswered questions for the context user in an Experience Cloud site.

getVotesForComment(communityId, commentId, vote)
Get the first page of users who upvoted or downvoted a comment.

getVotesForComment(communityId, commentId, vote, pageParam, pageSize)
Get a page of users who upvoted or downvoted a comment.

getVotesForFeedElement(communityId, feedElementId, vote)
Get the first page of users who upvoted or downvoted a feed element.

getVotesForFeedElement(communityId, feedElementId, vote, pageParam, pageSize)
Get a page of users who upvoted or downvoted a feed element.

isCommentEditableByMe(communityId, commentId)
Discover whether the context user can edit a comment.

isFeedElementEditableByMe(communityId, feedElementId)
Discover whether the context user can edit a feed element.

isModified(communityId, feedType, subjectId, since)
Discover whether a news feed has been updated or changed. Use this method to poll a news feed for updates.

likeComment(communityId, commentId)
Like a comment for the context user.

likeFeedElement(communityId, feedElementId)

Like a feed element.

postCommentToFeedElement(communityId, feedElementId, text)

Post a plain-text comment to a feed element.

postCommentToFeedElement(communityId, feedElementId, comment, feedElementFileUpload)

Post a rich-text comment to a feed element. Use this method to include mentions and to attach a file.

postFeedElement(communityId, subjectId, feedElementType, text)

Post a plain-text feed element.

postFeedElement(communityId, feedElement)

Post a rich-text feed element. Include mentions and hashtag topics, attach already uploaded files to a feed element, and associate action link groups with a feed element. You can also use this method to share a feed element and add a comment.

postFeedElementBatch(communityId, feedElements)

Post a list of feed elements.

publishDraftFeedElement(communityId, feedElementId, feedElement)

Publish a draft feed element.

searchFeedElements(communityId, q)

Get the first page of feed elements that match the search criteria.

searchFeedElements(communityId, q, sortParam)

Get the first page of sorted feed elements that match the search criteria.

searchFeedElements(communityId, q, threadedCommentsCollapsed)

Get the feed elements and comments that match the search criteria.

searchFeedElements(communityId, q, pageParam, pageSize)

Get a page of feed elements that match the search criteria.

searchFeedElements(communityId, q, pageParam, pageSize, sortParam)

Get a page of sorted feed elements that match the search criteria.

searchFeedElements(communityId, q, pageParam, pageSize, threadedCommentsCollapsed)

Get a page of feed elements with comments in a threaded style that match the search criteria.

searchFeedElements(communityId, q, recentCommentCount, pageParam, pageSize, sortParam)

Get a page of sorted feed elements that match the search criteria. Each feed element includes no more than the specified number of comments.

searchFeedElementsInFeed(communityId, feedType, q)

Get the feed elements from the `Company`, `DirectMessageModeration`, `Home`, `Isolated`, `Moderation`, and `PendingReview` feeds that match the search criteria.

searchFeedElementsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q)

Get a page of sorted feed elements from the `Company`, `DirectMessageModeration`, `Home`, `Isolated`, `Moderation`, and `PendingReview` feeds that match the search criteria.

searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Get a page of sorted feed elements from the `Company`, `DirectMessageModeration`, `Home`, `Isolated`, `Moderation`, and `PendingReview` feeds that match the search criteria. Each feed element includes no more than the specified number of comments.

searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)

Get a page of sorted and filtered feed elements from the `Home` feed that match the search criteria. Each feed element includes no more than the specified number of comments.

searchFeedElementsInFeed(communityId, feedType, subjectId, q)

Search up to 5,000 of the most recent feed elements in a feed for a subject ID that match the search string. Feed elements are returned in order of most recent activity.

searchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)

Get a page of sorted feed elements from a feed for a record or user that match the search criteria.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Get a page of sorted feed elements from a feed that match the search criteria. Each feed element includes no more than the specified number of comments.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)

Get a page of sorted and filtered feed elements from a `UserProfile` feed that match the search criteria.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, customFilter)

Get a page of sorted and filtered feed elements from a case feed that match the search criteria.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly)

Get a page of sorted feed elements from a feed for a record or user that match the search criteria. Each feed element includes no more than the specified number of comments. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, filter)

Get a page of sorted and filtered feed elements from a feed for a record or user that match the search criteria. Each feed element includes no more than the specified number of comments. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, customFilter)

Get a page of sorted and filtered feed elements from a case feed that match the search criteria.

searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q)

Get the feed elements from a feed filtered by a key prefix that match the search criteria.

searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q)

Get a page of sorted feed elements from a feed filtered by a key prefix that match the search criteria.

searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Get a page of sorted feed elements from a feed filtered by a key prefix that match the search criteria. Each feed element includes no more than the specified number of comments.

searchStreams(communityId, q)

Search the Chatter feed streams for the context user.

searchStreams(communityId, q, sortParam)

Search and sort the Chatter feed streams for the context user.

searchStreams(communityId, q, pageParam, pageSize)
Search the Chatter feed streams for the context user and return a page of results.

searchStreams(communityId, q, pageParam, pageSize, sortParam)
Search the Chatter feed streams for the context user and return a sorted page of results.

searchStreams(communityId, q, pageParam, pageSize, sortParam, globalScope)
Search the Chatter feed streams from all Experience Cloud sites for the context user and return a sorted page of results.

setCommentIsVerified(communityId, commentId, isVerified)
Mark a comment as verified or unverified.

setCommentIsVerifiedByAnonymized(communityId, commentId, isVerified, isVerifiedByAnonymized)
Mark a comment as verified by an anonymous user.

setCommentVote(communityId, commentId, upDownVote)
Upvote or downvote a comment.

setFeedCommentStatus(communityId, commentId, status)
Set the status of a comment.

setFeedElementIsClosed(communityId, feedElementId, isClosed)
Set a feed element to closed.

setFeedElementVote(communityId, feedElementId, upDownVote)
Upvote or downvote a feed element.

setFeedEntityStatus(communityId, feedElementId, status)
Set the status of a feed post.

setIsMutedByMe(communityId, feedElementId, isMutedByMe)
Mute or unmute a feed element.

setIsReadByMe(communityId, feedElementId, readBy)
Mark a feed element as read for the context user using an input class.

setIsReadByMe(communityId, feedElementId, isReadByMe)
Mark a feed element as read for the context user.

updateComment(communityId, commentId, comment)
Edit a comment.

updateDirectMessage(communityId, feedElementId, directMessage)
Update the members of a direct message.

updateFeedElement(communityId, feedElementId, feedElement)
Edit a feed element.

updateFeedElementBookmarks(communityId, feedElementId, bookmarks)
Bookmark a feed element or remove a bookmark from a feed element using an input class.

updateFeedElementBookmarks(communityId, feedElementId, isBookmarkedByCurrentUser)
Bookmark a feed element or remove a bookmark from a feed element.

updateFeedElementReadByCapabilityBatch(communityId, feedElementIds, readBy)
Mark multiple feed elements as read by the context user at the same time using an input class.

updateFeedElementReadByCapabilityBatch(communityId, feedElementIds, isReadByMe)
Mark multiple feed elements as read by the context user at the same time.

updateLikeForComment(communityId, commentId, isLikedByCurrentUser)
Like or unlike a comment.

updateLikeForFeedElement(communityId, feedElementId, isLikedByCurrentUser)
Like or unlike a feed element.

updatePinnedFeedElements(communityId, feedType, subjectId, pin)
Pin or unpin feed elements to a group or topic feed.

updateStream(communityId, streamId, streamInput)
Update a Chatter feed stream.

voteOnFeedElementPoll(communityId, feedElementId, myChoiceId)
Vote on a poll or change your vote on a poll.

createStream(communityId, streamInput)

Create a Chatter feed stream.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStream createStream(String communityId,
ConnectApi.ChatterStreamInput streamInput)
```

Parameters

communityId
Type: String
ID for an Experience Cloud site, `internal`, or `null`.

streamInput
Type: `ConnectApi.ChatterStreamInput`
A `ConnectApi.ChatterStreamInput` body.

Return Value

Type: `ConnectApi.ChatterStream`

deleteComment(communityId, commentId)

Delete a comment.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static Void deleteComment(String communityId, String commentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

Return Value

Type: Void

deleteFeedElement(communityId, feedElementId)

Delete a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static deleteFeedElement(String communityId, String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: Void

deleteLike(communityId, likeId)

Delete a like on a comment or post.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static Void deleteLike(String communityId, String likeId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

likeId
Type: String

ID for a like.

Return Value

Type: Void

deleteStream(communityId, streamId)

Delete a Chatter feed stream.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static Void deleteStream(String communityId, String streamId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

streamId
Type: String

ID of the Chatter feed stream.

Return Value

Type: Void

getComment(communityId, commentId)

Get a comment.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment getComment(String communityId, String commentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

Return Value

Type: `ConnectApi.Comment`

getCommentBatch(communityId, commentIds)

Get a list of comments.

API Version

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getCommentBatch(String communityId, List<String>
commentIds)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentIds
Type: List<String>

A list of up to 100 comment IDs.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.Comment` object and errors for comments that didn't load.

getCommentInContext(communityId, commentId, pageSize)

Get a threaded comment in the context of its parent comments and post.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getCommentInContext(String communityId, String
commentId, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID of the comment.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 25.

Return Value

Type: `ConnectApi.FeedElement`

If the comment doesn't support the `comments` capability, the return value is `ConnectApi.NotFoundException`.

getCommentsForFeedElement(communityId, feedElementId)

Get comments for a feed element.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getCommentsForFeedElement(String communityId,
String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: `ConnectApi.CommentPage`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

getCommentsForFeedElement(communityId, feedElementId, threadedCommentsCollapsed)

Get comments in a threaded style for a feed element.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getCommentsForFeedElement(String communityId,
String feedElementId, Boolean threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.CommentPage`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize)

Get a page of comments for a feed element.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getCommentsForFeedElement(String communityId,
String feedElementId, String pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of comments per page. Valid values are from 1 through 100. If you pass `null`, the default size is 25.

Return Value

Type: `ConnectApi.CommentPage`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

`getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize, threadedCommentsCollapsed)`

Get a page of comments in a threaded style for a feed element.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getCommentsForFeedElement(String communityId,
String feedElementId, String pageParam, Integer pageSize, Boolean
threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of comments per page. Valid values are from 1 through 100. If you pass `null`, the default size is 25.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.CommentPage`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

getCommentsForFeedElement(communityId, feedElementId, threadedCommentsCollapsed, sortParam)

Get sorted comments in a threaded style for a feed element.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentsCapability getCommentsForFeedElement(String communityId, String feedElementId, Boolean threadedCommentsCollapsed, ConnectApi.FeedCommentSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

sortParam
Type: `ConnectApi.FeedCommentSortOrder`

Order of comments. Values are:

- `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order.
- `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order.
- `Relevance`—Sorts by most relevant content.

Sorting in descending order isn't supported.

Return Value

Type: `ConnectApi.CommentPage`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

`getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize, threadedCommentsCollapsed, sortParam)`

Get a page of sorted comments in a threaded style for a feed element.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getCommentsForFeedElement(String communityId,
String feedElementId, String pageParam, Integer pageSize, Boolean
threadedCommentsCollapsed, ConnectApi.FeedCommentSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of comments per page. Valid values are from 1 through 100. If you pass `null`, the default size is 25.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

sortParam
Type: `ConnectApi.FeedCommentSortOrder`

Order of comments. Values are:

- `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order.
- `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order.
- `Relevance`—Sorts by most relevant content.

Sorting in descending order isn't supported.

Return Value

Type: `ConnectApi.CommentPage`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

`getCommentsForFeedElement(communityId, feedElementId, sortParam)`

Get sorted comments for a feed element.

API Version

41.0

Available to Guest Users

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentsCapability getCommentsForFeedElement(String communityId,
String feedElementId, ConnectApi.FeedCommentSortOrder sortParam)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`
Type: String

ID of the feed element.

`sortParam`
Type: `ConnectApi.FeedCommentSortOrder`

Order of comments. Values are:

- `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order.
- `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order.
- `Relevance`—Sorts by most relevant content.

Sorting in descending order isn't supported.

Return Value

Type: `ConnectApi.CommentsCapability`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

`getCommentsForFeedElement(communityId, feedElementId, sortParam, threadedCommentsCollapsed)`

Get sorted comments in a threaded style for a feed element.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentsCapability getCommentsForFeedElement(String communityId, String feedElementId, ConnectApi.FeedCommentSortOrder sortParam, Boolean threadedCommentsCollapsed)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`
Type: String

ID of the feed element.

`sortParam`
Type: `ConnectApi.FeedCommentSortOrder`

Order of comments. Values are:

- `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order.
- `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order.
- `Relevance`—Sorts by most relevant content.

Sorting in descending order isn't supported.

`threadedCommentsCollapsed`
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.CommentsCapability`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

getExtensions(communityId, pageParam, pageSize)

Get extensions.

API Version

40.0

Available to Guest Users

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ExtensionDefinitions getExtensions(String communityId, String pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 15.

Return Value

Type: `ConnectApi.ExtensionDefinitions`

getFeed(communityId, feedType)

Get a feed.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFeed(String communityId, ConnectApi.FeedType feedType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

Return Value

Type: `ConnectApi.Feed`

`getFeed(communityId, feedType, sortParam)`

Get a sorted feed.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFeed(String communityId, ConnectApi.FeedType feedType,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

If *feedType* is `DirectMessages`, *sortParam* must be `LastModifiedDateDesc`.

Return Value

Type: `ConnectApi.Feed`

getFeed(communityId, feedType, subjectId)

Get a feed for a record or user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFeed(String communityId, ConnectApi.FeedType feedType,
String subjectId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

Return Value

Type: `ConnectApi.Feed`

getFeed(communityId, feedType, subjectId, sortParam)

Get a sorted feed for a record or user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFeed(String communityId, ConnectApi.FeedType feedType,
String subjectId, ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`.

`subjectId`
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.Feed`

`getFeedDirectory(String)`

Get a list of all feeds available to the context user.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedDirectory getFeedDirectory(String communityId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: ConnectApi.FeedDirectory

getFeedElement(communityId, feedElementId)

Get a feed element.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: ConnectApi.FeedElement

getFeedElement(communityId, feedElementId, commentSort)

Get a feed element with sorted comments.

API Version

41.0

Available to Guest Users

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String
feedElementId, ConnectApi.FeedCommentSortOrder commentSort)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

commentSort
Type: `ConnectApi.FeedCommentSortOrder`

Order of comments.

- `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order.
- `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order.
- `Relevance`—Sorts by most relevant content.

The default value is `CreatedDateLatestAsc`.

Sorting in descending order isn't supported.

Return Value

Type: `ConnectApi.FeedElement`

`getFeedElement(communityId, feedElementId, threadedCommentsCollapsed)`

Get a feed element and its comments in a threaded style.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String
feedElementId, Boolean threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.FeedElement`

`getFeedElement(communityId, feedElementId, threadedCommentsCollapsed, commentSort)`

Get a feed element and its sorted comments in a threaded style.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String
feedElementId, Boolean threadedCommentsCollapsed, ConnectApi.FeedCommentSortOrder
commentSort)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

commentSort
Type: `ConnectApi.FeedCommentSortOrder`

Order of comments.

- `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order.
- `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order.
- `Relevance`—Sorts by most relevant content.

Sorting in descending order isn't supported.

Return Value

Type: `ConnectApi.FeedElement`

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle)

Get a feed element with the specified number of elements per bundle including no more than the specified number of comments per feed element.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String
feedElementId, Integer recentCommentCount, Integer elementsPerBundle)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`
Type: String

ID of the feed element.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

`elementsPerBundle`
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

Return Value

Type: `ConnectApi.FeedElement`

`getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, threadedCommentsCollapsed)`

Get a feed element with its comments in a threaded style with the specified number of elements per bundle and comments per feed element.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String feedElementId, Integer recentCommentCount, Integer elementsPerBundle, Boolean threadedCommentsCollapsed)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`
Type: String

ID of the feed element.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.FeedElement`

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, threadedCommentsCollapsed, commentSort)

Get a feed element with its sorted comments in a threaded style with the specified number of elements per bundle and comments per feed element.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String
feedElementId, Integer recentCommentCount, Integer elementsPerBundle, Boolean
threadedCommentsCollapsed, ConnectApi.FeedCommentSortOrder commentSort)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

commentSort
Type: `ConnectApi.FeedCommentSortOrder`

Order of comments.

- `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order.
- `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order.
- `Relevance`—Sorts by most relevant content.

Sorting in descending order isn't supported.

Return Value

Type: `ConnectApi.FeedElement`

getFeedElement(communityId, feedElementId, recentCommentCount, elementsPerBundle, commentSort)

Get a feed element with the specified number of elements per bundle including no more than the specified number of sorted comments per feed element.

API Version

41.0

Available to Guest Users

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement getFeedElement(String communityId, String
feedElementId, Integer recentCommentCount, Integer elementsPerBundle,
ConnectApi.FeedCommentSortOrder commentSort)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

commentSort
Type: `ConnectApi.FeedCommentSortOrder`

Order of comments.

- `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order.
- `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order.
- `Relevance`—Sorts by most relevant content.

The default value is `CreatedDateLatestAsc`.

Sorting in descending order isn't supported.

Return Value

Type: `ConnectApi.FeedElement`

`getFeedElementBatch(communityId, feedElementIds)`

Get a list of feed elements.

API Version

31.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getFeedElementBatch(String communityId,
List<String> feedElementIds)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementIds
Type: List<String>

A list of up to 500 feed element IDs.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.FeedElement` object and errors for feed elements that didn't load.

getFeedElementPoll(communityId, feedElementId)

Get the poll associated with a feed element.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.PollCapability getFeedElementPoll(String communityId, String
feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: `ConnectApi.PollCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Note: Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that `ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information may not be available in the trigger.

`getFeedElementsFromBundle(communityId, feedElementId)`

Get feed elements from a bundle.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromBundle(String communityId,
String feedElementId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`
Type: String

ID of the feed element.

Return Value

Type: `ConnectApi.FeedElementPage`

`getFeedElementsFromBundle(communityId, feedElementId, pageParam, pageSize, elementsPerBundle, recentCommentCount)`

Get a page of feed elements from a bundle. Specify the number of elements per bundle and include no more than the specified number of comments per feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromBundle(String communityId,
String feedElementId, String pageParam, Integer pageSize, Integer elementsPerBundle,
Integer recentCommentCount)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

Return Value

Type: `ConnectApi.FeedElementPage`

getFeedElementsFromFeed(communityId, feedType)

Get feed elements from the `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview` feeds.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElementsFromFeed(communityId, feedType, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)`

Get a page of sorted feed elements from the `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview` feeds.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

If *feedType* is `DirectMessages`, *sortParam* must be `LastModifiedDateDesc`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)`

Get a page of sorted feed elements from the `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview` feeds. Each feed element contains no more than the specified number of comments.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

If *`feedType`* is `DirectMessages`, *`sortParam`* must be `LastModifiedDateDesc`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter)`

Get a page of sorted and filtered feed elements from the `Home` feed. Each feed element contains no more than the specified number of comments.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam,
ConnectApi.FeedFilter filter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. The only valid value is `Home`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

When the *sortParam* is `MostViewed`, you must pass in `null` for the *pageParam*.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

When the *sortParam* is `MostViewed`, the *pageSize* must be a value from 1 to 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter

Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed)`

Get a page of filtered and sorted feed elements with comments in a threaded style from the `Home` feed. Each feed element contains no more than the specified number of comments.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam,
ConnectApi.FeedFilter filter, Boolean threadedCommentsCollapsed)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

The type of feed. The only valid value is `Home`.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

When the *sortParam* is MostViewed, you must pass in null for the *pageParam*.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

When the *sortParam* is MostViewed, the *pageSize* must be a value from 1 to 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Isolated, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

filter
Type: ConnectApi.FeedFilter

Specifies the feed filters.

- AllQuestions—Feed elements that are questions.
- AuthoredBy—Feed elements authored by the user profile owner. This value is valid only for the UserProfile feed.
- CommunityScoped—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the UserProfile feed.
- QuestionsWithCandidateAnswers—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- QuestionsWithCandidateAnswersReviewedPublished—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.

- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

`threadedCommentsCollapsed`
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, subjectId)`

Get feed elements from any feed other than `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview` for a user or record.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example for Getting the Context User's News Feed

```
ConnectApi.FeedElementPage fep =
ConnectApi.ChatterFeeds.getFeedElementsFromFeed(Network.getNetworkId(),
ConnectApi.FeedType.News, 'me');
```

Example for Getting Another User's Profile Feed

```
ConnectApi.FeedElementPage fep =
ConnectApi.ChatterFeeds.getFeedElementsFromFeed(Network.getNetworkId(),
ConnectApi.FeedType.UserProfile, '005R0000000HwMA');
```

Example for Getting Another User's Record Feed

```
ConnectApi.FeedElementPage fep =
ConnectApi.ChatterFeeds.getFeedElementsFromFeed(Network.getNetworkId(),
ConnectApi.FeedType.Record, '005R0000000HwMA');
```

SEE ALSO:

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`.

`subjectId`
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

The number of feed elements per page.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter)`

Get a page of sorted and filtered feed elements from the `UserProfile` feed.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped` or `ConnectApi.FeedFilter.AuthoredBy`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets only community-specific feed elements.

```
ConnectApi.FeedElementPage fep =
ConnectApi.ChatterFeeds.getFeedElementsFromFeed(Network.getNetworkId(),
ConnectApi.FeedType.UserProfile, 'me', 3, ConnectApi.FeedDensity.FewerUpdates, null, null,
 ConnectApi.FeedSortOrder.LastModifiedDateDesc, ConnectApi.FeedFilter.CommunityScoped);
```

Apex Developer Guide: Testing ConnectApi Code

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed)

Get a page of feed elements with comments in a threaded style from the `UserProfile` feed.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter, Boolean
threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped` or `ConnectApi.FeedFilter.AuthoredBy`.

`threadedCommentsCollapsed`
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, customFilter)`

Get a page of sorted and filtered feed elements from the case feed.

API Version

40.0

Available to Guest Users

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String customFilter)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

customFilter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, customFilter, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly)`

Get a page of sorted feed elements from a record feed. Specify the number of elements per bundle and include no more than the specified number of comments per feed element. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedFilter
filter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

```
public static ConnectApi.FeedElementPage getFeedElementsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedFilter
filter, Boolean threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.

- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

`threadedCommentsCollapsed`
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, String customFilter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

`customFilter`
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, String customFilter,
Boolean threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix)`

Get feed elements from a feed filtered by a key prefix for a user.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFilterFeed(String
communityId, String subjectId, String keyPrefix)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam)`

Get a page of sorted feed elements from a feed filtered by a key prefix for a user.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFilterFeed(String
communityId, String subjectId, String keyPrefix, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam)`

Get a page of sorted feed elements from a feed filtered by a key prefix for a user. Each feed element contains no more than the specified number of comments.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFilterFeed(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.

- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince)`

Get a page of feed elements from a feed filtered by a key prefix for a user. Include only feed elements that have been updated since the time specified in the *`updatedSince`* parameter.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsFromFilterFeedUpdatedSince(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

Opaque token defining the modification timestamp of the feed and the sort order.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

Return Value

Type: ConnectApi.FeedElementPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, result)

Apex Developer Guide: Testing ConnectApi Code

getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince)

Get a page of feed elements from the Company, DirectMessageModeration, Home, and Moderation feeds. Include only feed elements that have been updated since the time specified in the *updatedSince* parameter. Each feed element contains no more than the specified number of comments.

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `Home`, and `Moderation`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedFilter filter)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

The type of feed. The only valid value is `Home`.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

```
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

One of these values:

- `Files`
- `Groups`
- `News`
- `People`

- `Record`

`subjectId`
Type: String

If *`feedType`* is `ConnectApi.Record`, *`subjectId`* can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`updatedSince`
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *`updatedSince`* parameter doesn't return feed elements that are created in the same second as the call.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly)

Get a page of feed elements from a record feed. Include only feed elements that have been updated since the time specified in the *updatedSince* parameter. Specify whether to return feed elements posted by internal (non-Experience Cloud site) users only.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
Boolean showInternalOnly)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.

- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`updatedSince`
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *`updatedSince`* parameter doesn't return feed elements that are created in the same second as the call.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, filter)`

Get a page of filtered feed elements from a `UserProfile` feed. Include only feed elements that have been updated since the time specified in the *`updatedSince`* parameter.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

Signature

```
public static ConnectApi.FeedElementPage getFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, ConnectApi.FeedFilter filter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`updatedSince`
Type: String

Opaque token defining the modification timestamp of the feed and the sort order.

The *`updatedSince`* parameter doesn't return feed elements that are created in the same second as the call.

`filter`
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

String updatedSince, String customFilter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

Opaque token defining the modification timestamp of the feed and the sort order.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

customFilter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, Boolean showInternalOnly)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

String updatedSince, Boolean showInternalOnly, ConnectApi.FeedFilter filter)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

`subjectId`
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.

- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

customFilter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`getFeedWithFeedElements(communityId, feedType, pageSize)`

Get information about a feed and a page of feed elements from the feed.

API Version

40.0

Available to Guest Users

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFeedWithFeedElements(String communityId,
ConnectApi.FeedType feedType, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`. `Landing` is valid only when *communityId* is `internal`.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in 0, feed elements aren't returned with the feed.

Return Value

Type: ConnectApi.Feed

getFeedWithFeedElements(communityId, feedType, pageSize, recentCommentCount)

Get a page of information about the feed and the feed elements with the specified number of comments per feed element from the feed.

API Version

40.0

Available to Guest Users

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFeedWithFeedElements(String communityId,
ConnectApi.FeedType feedType, Integer pageSize, Integer recentCommentCount)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`. `Landing` is valid only when *communityId* is `internal`.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in 0, feed elements aren't returned with the feed.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

Return Value

Type: `ConnectApi.Feed`

getFilterFeed(communityId, subjectId, keyPrefix)

Get a feed filtered by a key prefix for a user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFilterFeed(String communityId, String subjectId, String keyPrefix)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A *key prefix* is the first three characters of a record ID, which specifies the object type.

Return Value

Type: `ConnectApi.Feed`

getFilterFeed(communityId, subjectId, keyPrefix, sortParam)

Get a sorted feed filtered by a key prefix for a user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFilterFeed(String communityId, String subjectId, String keyPrefix, ConnectApi.FeedType sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

sortParam
Type: `ConnectApi.FeedType`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.Feed`

`getFilterFeedDirectory(communityId, subjectId)`

Get a feed directory of filter feeds available to the context user.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedDirectory getFilterFeedDirectory(String communityId, String subjectId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

Return Value

Type: `ConnectApi.FeedDirectory`

This feed directory contains a list of filter feeds, which are the news feed filtered to include feed items whose parent is a specific entity type.

Usage

Call this method to return a directory containing a list of `ConnectApi.FeedDirectoryItem` objects. Each object contains a key prefix associated with an entity type the context user is following. A *key prefix* is the first three characters of a record ID, which specifies the object type.

Use key prefixes to filter the news feed so that it contains only feed items whose parent is the entity type associated with the key prefix. For example, get all the feed items whose parent is an Account. To get the feed items, pass a key prefix to the `ConnectApi.getFeedItemsFromFilterFeed` method.

The information about filter feeds never contains the key prefixes for users (`005`) or groups (`0F9`), but all users can use those key prefixes as filters.

The `ConnectApi.FeedDirectory.favorites` property is always empty when returned by a call to `getFilterFeedDirectory` because you can't filter a news feed by favorites.

Example

This example calls `getFilterFeedDirectory` and loops through the returned `FeedDirectoryItem` objects to find the key prefixes the context user can use to filter their news feed. It then copies each `keyPrefix` value to a list. Finally, it passes one of

the key prefixes from the list to the `getFeedItemsFromFilterFeed` method. The returned feed items include every feed item from the news feed whose parent is the entity type specified by the passed key prefix.

```
String communityId = null;
String subjectId = 'me';

// Create a list to populate with key prefixes.
List<String> keyPrefixList = new List<String>();

// Prepopulate with User and Group record types
// which are available to all users.
keyPrefixList.add('005');
keyPrefixList.add('0F9');

System.debug(keyPrefixList);

// Get the key prefixes available to the context user.
ConnectApi.FeedDirectory myFeedDirectory =
   ConnectApi.ChatterFeeds.getFilterFeedDirectory(null, 'me');

// Loop through the returned feeds list.
for (ConnectApi.FeedDirectoryItem i : myFeedDirectory.feeds) {

   // Grab each key prefix and add it to the list.
   keyPrefixList.add(i.keyPrefix);
}
System.debug(keyPrefixList);

// Use a key prefix from the list to filter the feed items in the news feed.
ConnectApi.FeedItemPage myFeedItemPage =
   ConnectApi.ChatterFeeds.getFeedItemsFromFilterFeed(communityId, subjectId,
keyPrefixList[0]);
System.debug(myFeedItemPage);
```

`getLike(communityId, likeId)`

Get a like on a post or comment.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLike getLike(String communityId, String likeId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

likeId
Type: String

ID for a like.

Return Value

Type: `ConnectApi.ChatterLike`

getLikesForComment(communityId, commentId)

Get likes for a comment.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForComment(String communityId, String commentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

Return Value

Type: `ConnectApi.ChatterLikePage`

getLikesForComment(communityId, commentId, pageParam, pageSize)

Get a page of likes for a comment.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForComment(String communityId, String commentId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterLikePage`

getLikesForFeedElement(communityId, feedElementId)

Get likes for a feed element.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForFeedElement(String communityId,
String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: `ConnectApi.ChatterLikePage`

If the feed element doesn't support the `ChatterLikes` capability, the return value is `ConnectApi.NotFoundException`.

getLikesForFeedElement(communityId, feedElementId, pageParam, pageSize)

Get a page of likes for a feed element.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForFeedElement(String communityId,
String feedElementId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterLikePage`

If the feed element doesn't support the `ChatterLikes` capability, the return value is `ConnectApi.NotFoundException`.

`getLinkMetadata(communityId, urls)`

Get link metadata for URLs.

API Version

42.0

Available to Guest Users

42.0

Requires Chatter

No

Signature

```
public static ConnectApi.LinkMetadataCollection getLinkMetadata(String communityId,
String urls)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

urls
Type: String

Comma-separated list of URL-encoded URLs.

Return Value

Type: ConnectApi.LinkMetadataCollection

getPinnedFeedElementsFromFeed(communityId, feedType, subjectId)

Get pinned feed elements from a group or topic feed.

API Version

41.0

Available to Guest Users

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.PinnedFeedElements getPinnedFeedElementsFromFeed(String
communityId, ConnectApi.FeedType feedType, String subjectId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

The type of feed. Valid values are `Record` and `Topics`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* must be a group ID. If *feedType* is `Topics`, *subjectId* must be a topic ID.

Return Value

Type: ConnectApi.PinnedFeedElements

If the feed doesn't support this capability, the return value is ConnectApi.NotFoundException.

Usage

In the UI, pinned feed elements don't show all auxiliary information, such as comments, likes, interaction counts, or read by information. As a result, the `ConnectApi.PinnedFeedElements` output class doesn't include all the information for these capabilities.

`getReadByForFeedElement(communityId, feedElementId)`

Get information about who read a feed element and when.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ReadByPage getReadByForFeedElement(String communityId, String feedElementId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`
Type: String

ID of the feed element.

Return Value

Type: `ConnectApi.ReadByPage`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`getReadByForFeedElement(communityId, feedElementId, pageParam, pageSize)`

Get a page of information about who read a feed element and when.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ReadByPage getReadByForFeedElement(String communityId, String feedElementId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ReadByPage`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`getRelatedPosts(communityId, feedElementId, filter, maxResults)`

Get posts related to the context feed element.

API Version

37.0

Available to Guest Users

37.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RelatedFeedPosts getRelatedPosts(String communityId, String feedElementId, ConnectApi.RelatedFeedPostType filter, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element. The feed element must be a question.

filter
Type: `ConnectApi.RelatedFeedPostType`

Specifies the type of related post. Values are:

- `Answered`—Related questions that have at least one answer.
- `BestAnswer`—Related questions that have a best answer.
- `Generic`—All types of related questions, including answered, with a best answer, and unanswered.
- `Unanswered`—Related questions that don't have answers.

`Generic` is the default value.

maxResults
Type: Integer

The maximum number of results to return. You can return up to 25 results; 5 is the default.

Return Value

Type: `ConnectApi.RelatedFeedPosts`

In version 37.0 and later, related feed posts are questions.

Each related feed post has a score indicating how closely it's related to the context feed post. We return related feed posts sorted by score, with the highest score first.

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`getStream(communityId, streamId)`

Get information about a Chatter feed stream.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStream getStream(String communityId, String streamId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

streamId
Type: String

ID of the Chatter feed stream.

Return Value

Type: `ConnectApi.ChatterStream`

getStream(communityId, streamId, globalScope)

Get information about a Chatter feed stream, regardless of Experience Cloud site.

API Version

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStream getStream(String communityId, String streamId,
Boolean globalScope)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

streamId
Type: String

ID of the Chatter feed stream.

globalScope
Type: Boolean

Specifies whether to get streams from all the context user's Experience Cloud sites, regardless of the *communityId* value.

Tip: If you know the *communityId* for the stream, we recommend setting *globalScope* to `false`.

Return Value

Type: ConnectApi.ChatterStream

getStreams(communityId)

Get the Chatter feed streams for the context user.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage getStreams(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: ConnectApi.ChatterStreamPage

getStreams(communityId, sortParam)

Get and sort the Chatter feed streams for the context user.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage getStreams(String communityId,
ConnectApi.SortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

sortParam
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

Return Value

Type: `ConnectApi.ChatterStreamPage`

`getStreams(communityId, pageParam, pageSize)`

Get a page of Chatter feed streams for the context user.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage getStreams(String communityId, Integer
pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

Return Value

Type: `ConnectApi.ChatterStreamPage`

getStreams(communityId, pageParam, pageSize, sortParam)

Get a sorted page of Chatter feed streams for the context user.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage getStreams(String communityId, Integer pageParam, Integer pageSize, ConnectApi.SortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

Return Value

Type: `ConnectApi.ChatterStreamPage`

getStreams(communityId, pageParam, pageSize, sortParam, globalScope)

Get a sorted page of Chatter feed streams from all Enterprise Cloud sites for the context user.

API Version

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage getStreams(String communityId, Integer
pageParam, Integer pageSize, ConnectApi.SortOrder sortParam, Boolean globalScope)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

globalScope
Type: Boolean

Specifies whether to get streams from all the context user's Experience Cloud sites, regardless of the *communityId* value.

Tip: If you know the *communityId* for the streams, we recommend setting *globalScope* to `false`.

Return Value

Type: `ConnectApi.ChatterStreamPage`

getSupportedEmojis()

Get supported emojis for the org.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.SupportedEmojis getSupportedEmojis()
```

Return Value

Type: `ConnectApi.SupportedEmojis`

Usage

To get the list, emojis must be enabled in your org.

`getThreadsForFeedComment(communityId, commentId)`

Get threaded comments for a comment.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getThreadsForFeedComment(String communityId, String commentId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`commentId`
Type: String

ID of the comment.

Return Value

Type: `ConnectApi.CommentPage`

If the comment doesn't support the `comments` capability, the return value is `ConnectApi.NotFoundException`.

`getThreadsForFeedComment(communityId, commentId, pageParam, pageSize)`

Get a page of threaded comments for a comment.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getThreadsForFeedComment(String communityId, String commentId, String pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`commentId`
Type: String

ID of the comment.

`pageParam`
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.CommentPage`

If the comment doesn't support the `comments` capability, the return value is `ConnectApi.NotFoundException`.

`getThreadsForFeedComment(communityId, commentId, threadedCommentsCollapsed)`

Access the comments capability for a comment.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentsCapability getThreadsForFeedComment(String communityId,
String commentId, Boolean threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID of the comment.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.CommentsCapability`

If the comment doesn't support the `comments` capability, the return value is `ConnectApi.NotFoundException`.

`getTopUnansweredQuestions(communityId)` (Pilot)

Get top unanswered questions for the context user in aExperience Cloud site.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getTopUnansweredQuestions(String communityId)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTopUnansweredQuestions(communityId, result) (Pilot)

Apex Developer Guide: Testing ConnectApi Code

`getTopUnansweredQuestions(communityId, filter)` (Pilot)

Get filtered top unanswered questions for the context user in an Experience Cloud site.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getTopUnansweredQuestions(String communityId,
ConnectApi.TopUnansweredQuestionsFilterType filter)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

filter
Type: `ConnectApi.FeedFilter`

Specifies the filter for the feed. `UnansweredQuestionsWithCandidateAnswers` is the only valid value.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTopUnansweredQuestions(communityId, filter, result) (Pilot)

Apex Developer Guide: Testing ConnectApi Code

`getTopUnansweredQuestions(communityId, pageSize)` (Pilot)

Get a page of top unanswered questions for the context user in an Experience Cloud site.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getTopUnansweredQuestions(String communityId,
Integer pageSize)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 0 through 10. If you pass in `null`, the default size is 5.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTopUnansweredQuestions(communityId, pageSize, result) (Pilot)

Apex Developer Guide: Testing ConnectApi Code

`getTopUnansweredQuestions(communityId, filter, pageSize)` (Pilot)

Get a page of filtered top unanswered questions for the context user in an Experience Cloud site.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage getTopUnansweredQuestions(String communityId,
ConnectApi.FeedFilter filter, Integer pageSize)
```

Parameters

communityId

Type: String

ID of the Experience Cloud site.

filter

Type: `ConnectApi.FeedFilter`

Specifies the filter for the feed. `UnansweredQuestionsWithCandidateAnswers` is the only valid value.

pageSize

Type: Integer

Specifies the number of items per page. Valid values are from 0 through 10. If you pass in `null`, the default size is 5.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`getVotesForComment(communityId, commentId, vote)`

Get the first page of users who upvoted or downvoted a comment.

API Version

42.0

Available to Guest Users

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.VotePage getVotesForComment(String communityId, String
commentId, ConnectApi.UpDownVoteValue vote)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`commentId`
Type: String

ID of the comment.

`vote`
Type: `ConnectApi.UpDownVoteValue`

Specifies the value of the vote for the feed element. Values are:

- `Down`
- `Up`

You can't specify `None`.

Return Value

Type: `ConnectApi.VotePage`

If the comment doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`getVotesForComment(communityId, commentId, vote, pageParam, pageSize)`

Get a page of users who upvoted or downvoted a comment.

API Version

42.0

Available to Guest Users

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.VotePage getVotesForComment(String communityId, String
commentId, ConnectApi.UpDownVoteValue vote, Integer pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`commentId`
Type: String

ID of the comment.

`vote`
Type: `ConnectApi.UpDownVoteValue`

Specifies the value of the vote for the feed element. Values are:

- `Down`
- `Up`

You can't specify `None`.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.VotePage`

If the comment doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`getVotesForFeedElement(communityId, feedElementId, vote)`

Get the first page of users who upvoted or downvoted a feed element.

API Version

42.0

Available to Guest Users

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.VotePage getVotesForFeedElement(String communityId, String
feedElementId, ConnectApi.UpDownVoteValue vote)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

vote
Type: `ConnectApi.UpDownVoteValue`

Specifies the value of the vote for the feed element. Values are:

- `Down`
- `Up`

You can't specify `None`.

Return Value

Type: `ConnectApi.VotePage`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`getVotesForFeedElement(communityId, feedElementId, vote, pageParam, pageSize)`

Get a page of users who upvoted or downvoted a feed element.

API Version

42.0

Available to Guest Users

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.VotePage getVotesForFeedElement(String communityId, String
feedElementId, ConnectApi.UpDownVoteValue vote, Integer pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`
Type: String

ID of the feed element.

`vote`
Type: `ConnectApi.UpDownVoteValue`

Specifies the value of the vote for the feed element. Values are:

- `Down`
- `Up`

You can't specify `None`.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.VotePage`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`isCommentEditableByMe(communityId, commentId)`

Discover whether the context user can edit a comment.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedEntityIsEditable isCommentEditableByMe(String communityId,
String commentId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`commentId`
Type: String

ID of the comment.

Return Value

Type: `ConnectApi.FeedEntityIsEditable`

If the comment doesn't support the `edit` capability, the return value is `ConnectApi.NotFoundException`.

SEE ALSO:

Edit a Comment

`isFeedElementEditableByMe(communityId, feedElementId)`

Discover whether the context user can edit a feed element.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedEntityIsEditable isFeedElementEditableByMe(String
communityId, String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element. Feed items are the only type of feed element that can be edited.

Return Value

Type: `ConnectApi.FeedEntityIsEditable`

If the feed element doesn't support the `edit` capability, the return value is `ConnectApi.NotFoundException`.

SEE ALSO:

Edit a Feed Element

Edit a Question Title and Post

isModified(communityId, feedType, subjectId, since)

Discover whether a news feed has been updated or changed. Use this method to poll a news feed for updates.

Important: This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedModifiedInfo isModified(String communityId,
ConnectApi.FeedType feedType, String subjectId, String since)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Specifies the type of feed. The only supported type is `News`

subjectId
Type: String

ID of the context user or the alias `me`.

since
Type: String

An opaque token containing information about the last modified date of the feed. Retrieve this token from the `FeedElementPage.isModifiedToken` property.

Return Value

Type: `ConnectApi.FeedModifiedInfo`

`likeComment(communityId, commentId)`

Like a comment for the context user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLike likeComment(String communityId, String commentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

Return Value

Type: ConnectApi.ChatterLike

If the context user has already liked the comment, this method is a non-operation and returns the existing like.

likeFeedElement(communityId, feedElementId)

Like a feed element.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLike likeFeedElement(String communityId, String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: ConnectApi.ChatterLike

If the feed element doesn't support the `ChatterLikes` capability, the return value is ConnectApi.NotFoundException.

Example

```
ConnectApi.ChatterLike chatterLike = ConnectApi.ChatterFeeds.likeFeedElement(null, '0D5D0000000KuGh');
```

postCommentToFeedElement(communityId, feedElementId, text)

Post a plain-text comment to a feed element.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment postCommentToFeedElement(String communityId, String feedElementId, String text)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

text
Type: String

Text of the comment. A comment can contain up to 10,000 characters.

Return Value

Type: `ConnectApi.Comment`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

Example

```
ConnectApi.Comment comment = ConnectApi.ChatterFeeds.postCommentToFeedElement(null, '0D5D0000000KuGh', 'I agree with the proposal.' );
```

postCommentToFeedElement(communityId, feedElementId, comment, feedElementFileUpload)

Post a rich-text comment to a feed element. Use this method to include mentions and to attach a file.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment postCommentToFeedElement(String communityId, String
feedElementId, ConnectApi.CommentInput comment, ConnectApi.BinaryInput
feedElementFileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

comment
Type: `ConnectApi.CommentInput`

The comment body, including text and mentions, and capabilities, such as information about an attached file. A comment can contain up to 10,000 characters.

feedElementFileUpload
Type: `ConnectApi.BinaryInput`

A new binary file to attach to the comment, or `null`. If you specify a binary file, specify the title and description of the file in the *comment* parameter.

Return Value

Type: `ConnectApi.Comment`

If the feed element doesn't support the `Comments` capability, the return value is `ConnectApi.NotFoundException`.

Example for Posting a Comment with Mentions

You can post comments with mentions two ways. Use the ConnectApiHelper repository on GitHub to write a single line of code, or use this method example.

```
String communityId = null;
String feedElementId = '0D5D0000000KtW3';

ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput();
ConnectApi.MentionSegmentInput mentionSegmentInput = new ConnectApi.MentionSegmentInput();
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

textSegmentInput.text = 'Does anyone in this group have an idea? ';
messageBodyInput.messageSegments.add(textSegmentInput);

mentionSegmentInput.id = '005D00000000oOT';
messageBodyInput.messageSegments.add(mentionSegmentInput);
```

```
commentInput.body = messageBodyInput;

ConnectApi.Comment commentRep = ConnectApi.ChatterFeeds.postCommentToFeedElement(communityId,
 feedElementId, commentInput, null);
```

Example for Posting a Comment with an Existing File

```
String feedElementId = '0D5D0000000KtW3';

ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput();

ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

textSegmentInput.text = 'I attached this file from Salesforce Files.';

messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageBodyInput.messageSegments.add(textSegmentInput);
commentInput.body = messageBodyInput;

ConnectApi.CommentCapabilitiesInput commentCapabilitiesInput = new
ConnectApi.CommentCapabilitiesInput();
ConnectApi.ContentCapabilityInput contentCapabilityInput = new
ConnectApi.ContentCapabilityInput();

commentCapabilitiesInput.content = contentCapabilityInput;
contentCapabilityInput.contentDocumentId = '069D00000001rNJ';

commentInput.capabilities = commentCapabilitiesInput;

ConnectApi.Comment commentRep =
ConnectApi.ChatterFeeds.postCommentToFeedElement(Network.getNetworkId(), feedElementId,
commentInput, null);
```

Example for Posting a Comment with a New File

```
String feedElementId = '0D5D0000000KtW3';

ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput();

ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

textSegmentInput.text = 'Enjoy this new file.';

messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageBodyInput.messageSegments.add(textSegmentInput);
commentInput.body = messageBodyInput;

ConnectApi.CommentCapabilitiesInput commentCapabilitiesInput = new
ConnectApi.CommentCapabilitiesInput();
ConnectApi.ContentCapabilityInput contentCapabilityInput = new
```

```
ConnectApi.ContentCapabilityInput();

commentCapabilitiesInput.content = contentCapabilityInput;
contentCapabilityInput.title = 'Title';

commentInput.capabilities = commentCapabilitiesInput;

String text = 'These are the contents of the new file.';
Blob myBlob = Blob.valueOf(text);
ConnectApi.BinaryInput binInput = new ConnectApi.BinaryInput(myBlob, 'text/plain',
'fileName');

ConnectApi.Comment commentRep =
ConnectApi.ChatterFeeds.postCommentToFeedElement(Network.getNetworkId(), feedElementId,
commentInput, binInput);
```

Example for Posting a Rich-Text Comment with an Inline Image

You can post rich-text comments with inline images and mentions two ways. Use the ConnectApiHelper repository on GitHub to write a single line of code, or use this method example. In this example, the image file is existing content that has already been uploaded to Salesforce.

```
String communityId = null;
String feedElementId = '0D5R0000000SBEr';
String imageId = '069R00000000IgQ';
String mentionedUserId = '005R0000000DiMz';

ConnectApi.CommentInput input = new ConnectApi.CommentInput();
ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MentionSegmentInput mentionSegment;
ConnectApi.MarkupBeginSegmentInput markupBeginSegment;
ConnectApi.MarkupEndSegmentInput markupEndSegment;
ConnectApi.InlineImageSegmentInput inlineImageSegment;

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

markupBeginSegment = new ConnectApi.MarkupBeginSegmentInput();
markupBeginSegment.markupType = ConnectApi.MarkupType.Bold;
messageInput.messageSegments.add(markupBeginSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'Hello ';
messageInput.messageSegments.add(textSegment);

mentionSegment = new ConnectApi.MentionSegmentInput();
mentionSegment.id = mentionedUserId;
messageInput.messageSegments.add(mentionSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = '!';
messageInput.messageSegments.add(textSegment);
```

```
markupEndSegment = new ConnectApi.MarkupEndSegmentInput();
markupEndSegment.markupType = ConnectApi.MarkupType.Bold;
messageInput.messageSegments.add(markupEndSegment);

inlineImageSegment = new ConnectApi.InlineImageSegmentInput();
inlineImageSegment.altText = 'image one';
inlineImageSegment.fileId = imageId;
messageInput.messageSegments.add(inlineImageSegment);

input.body = messageInput;

ConnectApi.ChatterFeeds.postCommentToFeedElement(communityId, feedElementId, input, null);
```

Example for Posting a Rich-Text Comment with a Code Block

```
String communityId = null;
String feedElementId = '0D5R0000000SBEr';
String codeSnippet = '<html>\n\t<body>\n\t\tHello, world!\n\t</body>\n</html>';

ConnectApi.CommentInput input = new ConnectApi.CommentInput();
ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MarkupBeginSegmentInput markupBeginSegment;
ConnectApi.MarkupEndSegmentInput markupEndSegment;

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

markupBeginSegment = new ConnectApi.MarkupBeginSegmentInput();
markupBeginSegment.markupType = ConnectApi.MarkupType.Code;
messageInput.messageSegments.add(markupBeginSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = codeSnippet;
messageInput.messageSegments.add(textSegment);

markupEndSegment = new ConnectApi.MarkupEndSegmentInput();
markupEndSegment.markupType = ConnectApi.MarkupType.Code;
messageInput.messageSegments.add(markupEndSegment);

input.body = messageInput;

ConnectApi.ChatterFeeds.postCommentToFeedElement(communityId, feedElementId, input, null);
```

postFeedElement(communityId, subjectId, feedElementType, text)

Post a plain-text feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement postFeedElement(String communityId, String
subjectId, ConnectApi.FeedElementType feedElementType, String text)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

The ID of the parent this feed element is being posted to. This value can be the ID of a user, group, or record, or the string `me` to indicate the context user.

feedElementType
Type: `ConnectApi.FeedElementType`

The only possible value is `FeedItem`.

text
Type: String

The text of the feed element. A feed element can contain up to 10,000 characters.

Return Value

Type: `ConnectApi.FeedElement`

Example

```
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), '0F9d0000000TreH',
ConnectApi.FeedElementType.FeedItem, 'On vacation this week.');
```

postFeedElement(communityId, feedElement)

Post a rich-text feed element. Include mentions and hashtag topics, attach already uploaded files to a feed element, and associate action link groups with a feed element. You can also use this method to share a feed element and add a comment.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement postFeedElement(String communityId,
ConnectApi.FeedElementInput feedElement)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElement
Type: `ConnectApi.FeedElementInput`

Specify rich text, including mentions. Optionally, specify a link, a poll, or up to 10 existing files.

Return Value

Type: `ConnectApi.FeedElement`

Example for Posting a Feed Element with a Mention

You can post feed elements with mentions two ways. Use the ConnectApiHelper repository on GitHub to write a single line of code, or use this method example.

```
ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
ConnectApi.MentionSegmentInput mentionSegmentInput = new ConnectApi.MentionSegmentInput();
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

mentionSegmentInput.id = '005RR000000Dme9';
messageBodyInput.messageSegments.add(mentionSegmentInput);

textSegmentInput.text = 'Could you take a look?';
messageBodyInput.messageSegments.add(textSegmentInput);

feedItemInput.body = messageBodyInput;
feedItemInput.feedElementType = ConnectApi.FeedElementType.FeedItem;
feedItemInput.subjectId = '0F9RR0000004CPw';

ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);
```

Example for Posting a Feed Element with Existing Content

```
// Define the FeedItemInput object to pass to postFeedElement
ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
feedItemInput.subjectId = 'me';

ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();
textSegmentInput.text = 'Would you please review these docs?';
```

```
// The MessageBodyInput object holds the text in the post
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageBodyInput.messageSegments.add(textSegmentInput);
feedItemInput.body = messageBodyInput;

// The FeedElementCapabilitiesInput object holds the capabilities of the feed item.
// For this feed item, we define a files capability to hold the file(s).

List<String> fileIds = new List<String>();
fileIds.add('069xx00000000QO');
fileIds.add('069xx00000000QT');
fileIds.add('069xx00000000Qn');
fileIds.add('069xx00000000Qi');
fileIds.add('069xx00000000Qd');

ConnectApi.FilesCapabilityInput filesInput = new ConnectApi.FilesCapabilityInput();
filesInput.items = new List<ConnectApi.FileIdInput>();

for (String fileId : fileIds) {
    ConnectApi.FileIdInput idInput = new ConnectApi.FileIdInput();
    idInput.id = fileId;
    filesInput.items.add(idInput);
}

ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
feedElementCapabilitiesInput.files = filesInput;

feedItemInput.capabilities = feedElementCapabilitiesInput;

// Post the feed item.
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);
```

Example for Posting a Rich-Text Feed Element with an Inline Image

You can post rich-text feed elements with inline images and mentions two ways. Use the ConnectApiHelper repository on GitHub to write a single line of code, or use this method example. In this example, the image file is existing content that has already been uploaded to Salesforce. The post also includes text and a mention.

```
String communityId = null;
String imageId = '069D00000001INA';
String mentionedUserId = '005D0000001QNpr';
String targetUserOrGroupOrRecordId  = '005D0000001Gif0';
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.subjectId = targetUserOrGroupOrRecordId;
input.feedElementType = ConnectApi.FeedElementType.FeedItem;

ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MentionSegmentInput mentionSegment;
ConnectApi.MarkupBeginSegmentInput markupBeginSegment;
ConnectApi.MarkupEndSegmentInput markupEndSegment;
```

```
ConnectApi.InlineImageSegmentInput inlineImageSegment;

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

markupBeginSegment = new ConnectApi.MarkupBeginSegmentInput();
markupBeginSegment.markupType = ConnectApi.MarkupType.Bold;
messageInput.messageSegments.add(markupBeginSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'Hello ';
messageInput.messageSegments.add(textSegment);

mentionSegment = new ConnectApi.MentionSegmentInput();
mentionSegment.id = mentionedUserId;
messageInput.messageSegments.add(mentionSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = '!';
messageInput.messageSegments.add(textSegment);

markupEndSegment = new ConnectApi.MarkupEndSegmentInput();
markupEndSegment.markupType = ConnectApi.MarkupType.Bold;
messageInput.messageSegments.add(markupEndSegment);

inlineImageSegment = new ConnectApi.InlineImageSegmentInput();
inlineImageSegment.altText = 'image one';
inlineImageSegment.fileId = imageId;
messageInput.messageSegments.add(inlineImageSegment);

input.body = messageInput;

ConnectApi.ChatterFeeds.postFeedElement(communityId, input);
```

Example for Posting a Rich-Text Feed Element with a Code Block

```
String communityId = null;
String targetUserOrGroupOrRecordId  = 'me';
String codeSnippet = '<html>\n\t<body>\n\t\tHello, world!\n\t</body>\n</html>';
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.subjectId = targetUserOrGroupOrRecordId;
input.feedElementType = ConnectApi.FeedElementType.FeedItem;

ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MarkupBeginSegmentInput markupBeginSegment;
ConnectApi.MarkupEndSegmentInput markupEndSegment;

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

markupBeginSegment = new ConnectApi.MarkupBeginSegmentInput();
markupBeginSegment.markupType = ConnectApi.MarkupType.Code;
messageInput.messageSegments.add(markupBeginSegment);

textSegment = new ConnectApi.TextSegmentInput();
```

```
textSegment.text = codeSnippet;
messageInput.messageSegments.add(textSegment);

markupEndSegment = new ConnectApi.MarkupEndSegmentInput();
markupEndSegment.markupType = ConnectApi.MarkupType.Code;
messageInput.messageSegments.add(markupEndSegment);

input.body = messageInput;

ConnectApi.ChatterFeeds.postFeedElement(communityId, input);
```

Example for Sharing a Feed Element (in Version 39.0 and Later)

```
// Define the FeedItemInput object to pass to postFeedElement
ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
feedItemInput.subjectId = 'me';
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();
textSegmentInput.text = 'Look at this post I'm sharing.';
// The MessageBodyInput object holds the text in the post
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageBodyInput.messageSegments.add(textSegmentInput);
feedItemInput.body = messageBodyInput;

ConnectApi.FeedEntityShareCapabilityInput shareInput = new
ConnectApi.FeedEntityShareCapabilityInput();
shareInput.feedEntityId = '0D5R0000000SEbc';
ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
feedElementCapabilitiesInput.feedEntityShare = shareInput;
feedItemInput.capabilities = feedElementCapabilitiesInput;
// Post the feed item.
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);
```

Example for Sending a Direct Message

```
// Define the FeedItemInput object to pass to postFeedElement
ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();

ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();
textSegmentInput.text = 'Thanks for attending my presentation test run this morning. Send
 me any feedback.';

// The MessageBodyInput object holds the text in the post
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageBodyInput.messageSegments.add(textSegmentInput);
feedItemInput.body = messageBodyInput;

// The FeedElementCapabilitiesInput object holds the capabilities of the feed item.
// For this feed item, we define a direct message capability to hold the member(s) and the
 subject.
```

```
List<String> memberIds = new List<String>();
memberIds.add('005B00000016OUQ');
memberIds.add('005B0000001rIN6');

ConnectApi.DirectMessageCapabilityInput dmInput = new
ConnectApi.DirectMessageCapabilityInput();
dmInput.subject = 'Thank you!';
dmInput.membersToAdd = memberIds;

ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
feedElementCapabilitiesInput.directMessage = dmInput;

feedItemInput.capabilities = feedElementCapabilitiesInput;

// Post the feed item.
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);
```

postFeedElementBatch(communityId, feedElements)

Post a list of feed elements.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] postFeedElementBatch(String communityId,
List<ConnectApi.BatchInput> feedElements)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElements
Type: List<`ConnectApi.BatchInput`>

The list can contain up to 500 `ConnectApi.BatchInput` objects. In the `ConnectApi.BatchInput` constructor, the input object must be a concrete instance of the abstract `ConnectApi.FeedElementInput` class.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.FeedElement` object.

The returned objects correspond to each of the input objects and are returned in the same order as the input objects.

The method call fails only if an error occurs that affects the entire operation (such as a parsing failure). If an individual object causes an error, the error is embedded within the `ConnectApi.BatchResult` list.

Usage

Use this method to post a list of feed elements efficiently. Create a list containing up to 500 objects and insert them all for the cost of one DML statement.

In version 36.0 and later, you can attach only one already uploaded file to each post. The `ConnectApi.BatchInput` has three constructors, but the `postFeedElementBatch` method supports only `ConnectApi.BatchInput(Object input)` in version 35.0 and later. This constructor doesn't support a binary input.

In version 32.0–35.0, this method supports both `ConnectApi.BatchInput(Object input)` and `ConnectApi.BatchInput(Object input, ConnectApi.BinaryInput binary)` constructors. The `ConnectApi.BatchInput(Object input, ConnectApi.BinaryInput binary)` constructor allows for a single binary input.

In each constructor, the input object must be an instance of `ConnectApi.FeedElementInput`.

Example

This trigger bulk posts to the feeds of newly inserted accounts.

```
trigger postFeedItemToAccount on Account (after insert) {
    Account[] accounts = Trigger.new;

    // Bulk post to the account feeds.

    List<ConnectApi.BatchInput> batchInputs = new List<ConnectApi.BatchInput>();

    for (Account a : accounts) {
        ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();

        input.subjectId = a.id;

        ConnectApi.MessageBodyInput body = new ConnectApi.MessageBodyInput();
        body.messageSegments = new List<ConnectApi.MessageSegmentInput>();

        ConnectApi.TextSegmentInput textSegment = new ConnectApi.TextSegmentInput();
        textSegment.text = 'Let\'s win the ' + a.name + ' account.';

        body.messageSegments.add(textSegment);
        input.body = body;

        ConnectApi.BatchInput batchInput = new ConnectApi.BatchInput(input);
        batchInputs.add(batchInput);
    }

    ConnectApi.ChatterFeeds.postFeedElementBatch(Network.getNetworkId(), batchInputs);
}
```

`publishDraftFeedElement(communityId, feedElementId, feedElement)`

Publish a draft feed element.

API Version

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement publishDraftFeedElement(String communityId, String feedElementId, ConnectApi.FeedElementInput feedElement)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element to publish.

feedElement
Type: `ConnectApi.FeedElementInput`

Use this optional parameter to edit your draft before publishing.

Return Value

Type: `ConnectApi.FeedElement`

The published feed element has a new ID.

`searchFeedElements(communityId, q)`

Get the first page of feed elements that match the search criteria.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String
q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElements(communityId, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElements(communityId, q, sortParam)`

Get the first page of sorted feed elements that match the search criteria.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String
q, ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElements(communityId, q, sortParam, result)

`searchFeedElements(communityId, q, threadedCommentsCollapsed)`

Get the feed elements and comments that match the search criteria.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String
q, Boolean threadedCommentsCollapsed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElements(communityId, q, threadedCommentsCollapsed, result)

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String q, String pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

Get a page of sorted feed elements from the `Company`, `DirectMessageModeration`, `Home`, `Isolated`, `Moderation`, and `PendingReview` feeds that match the search criteria. Each feed element includes no more than the specified number of comments.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)`

Get a page of sorted and filtered feed elements from the `Home` feed that match the search criteria. Each feed element includes no more than the specified number of comments.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q,
ConnectApi.FeedFilter filter)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

The type of feed. The only valid value is `Home`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

When the *sortParam* is `MostViewed`, you must pass in `null` for the *pageParam*.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

When the *sortParam* is `MostViewed`, the *pageSize* must be a value from 1 to 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.

- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElementsInFeed(communityId, feedType, subjectId, q)`

Search up to 5,000 of the most recent feed elements in a feed for a subject ID that match the search string. Feed elements are returned in order of most recent activity.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, `Streams`, and `Topics`.

subjectId
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)`

Get a page of sorted feed elements from a feed for a record or user that match the search criteria.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, `Streams`, and `Topics`.

subjectId
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Order of feed items in the feed.

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: String

Search term. Searches keywords in the user or group name. A minimum of one character is required. This parameter doesn't support wildcards. This parameter is required.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

Get a page of sorted feed elements from a feed that match the search criteria. Each feed element includes no more than the specified number of comments.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, `Streams`, and `Topics`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)`

Get a page of sorted and filtered feed elements from a `UserProfile` feed that match the search criteria.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedFilter filter)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren't wildcards. See Wildcards.

filter
Type: ConnectApi.FeedFilter

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

ConnectApi.FeedSortOrder sortParam, String q, String customFilter)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren't wildcards. See Wildcards.

customFilter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly,
ConnectApi.FeedFilter filter)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

40.0

Available to Guest Users

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly, String
customFilter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

filter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q)`

Get the feed elements from a feed filtered by a key prefix that match the search criteria.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFilterFeed(String
communityId, String subjectId, String keyPrefix, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

Get a page of sorted feed elements from a feed filtered by a key prefix that match the search criteria. Each feed element includes no more than the specified number of comments.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFilterFeed(String
communityId, String subjectId, String keyPrefix, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

```
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q,
ConnectApi.SortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

Return Value

Type: `ConnectApi.ChatterStreamPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchStreams(communityId, q, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`searchStreams(communityId, q, pageParam, pageSize)`

Search the Chatter feed streams for the context user and return a page of results.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
: Type: String

  ID for an Experience Cloud site, `internal`, or `null`.

q
: Type: String

  Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
: Type: Integer

  Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
: Type: Integer

  Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

Return Value

Type: `ConnectApi.ChatterStreamPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- setTestSearchStreams(communityId, q, pageParam, pageSize, result)
- *Apex Developer Guide*: Testing ConnectApi Code

`searchStreams(communityId, q, pageParam, pageSize, sortParam)`

Search the Chatter feed streams for the context user and return a sorted page of results.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q,
Integer pageParam, Integer pageSize, ConnectApi.SortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

Return Value

Type: `ConnectApi.ChatterStreamPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchStreams(communityId, q, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`searchStreams(communityId, q, pageParam, pageSize, sortParam, globalScope)`

Search the Chatter feed streams from all Experience Cloud sites for the context user and return a sorted page of results.

API Version

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q,
Integer pageParam, Integer pageSize, ConnectApi.SortOrder sortParam, Boolean globalScope)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`q`
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

`sortParam`
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).

- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

`globalScope`
Type: Boolean

Specifies whether to get streams from all the context user's Experience Cloud sites, regardless of the *`communityId`* value.

Tip: If you know the *`communityId`* for the streams, we recommend setting *`globalScope`* to `false`.

Return Value

Type: `ConnectApi.ChatterStreamPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`setCommentIsVerified(communityId, commentId, isVerified)`

Mark a comment as verified or unverified.

API Version

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.VerifiedCapability setCommentIsVerified(String communityId,
String commentId, Boolean isVerified)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`commentId`
Type: String

ID of the comment on a question post. Only one comment on a question post can be marked as verified.

`isVerified`
Type: Boolean

Specifies whether to mark the comment as verified (`true`) or unverified (`false`).

Only verified comments can be marked as unverified, and only unverified comments can be marked as verified.

Return Value

Type: `ConnectApi.VerifiedCapability`

If the comment doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

setCommentIsVerifiedByAnonymized(communityId, commentId, isVerified, isVerifiedByAnonymized)

Mark a comment as verified by an anonymous user.

API Version

43.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.VerifiedCapability setCommentIsVerifiedByAnonymized(String communityId, String commentId, Boolean isVerified, Boolean isVerifiedByAnonymized)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID of the comment on a question post. Only one comment on a question post can be marked as verified.

isVerified
Type: Boolean

Specifies whether to mark the comment as verified (`true`) or unverified (`false`).

Only verified comments can be marked as unverified, and only unverified comments can be marked as verified.

isVerifiedByAnonymized
Type: Boolean

Specifies whether to mark the comment as verified by an anonymous user (`true`).

If a user previously verified a comment and then requested the activity to be deleted, use `isVerifiedByAnonymized` to maintain the verification and anonymize the value of `lastVerifiedByUser`.

You can't set `isVerified` and `isVerifiedByAnonymized` to `true` at the same time. `isVerifiedByAnonymized` can be set to `true` only if `isVerified` is already set to `true`.

You can't set `isVerifiedByAnonymized` to `false`. After `isVerifiedByAnonymized` is set to `true`, it can be undone only when another user marks the comment as unverified and then reverifies the comment.

Return Value

Type: ConnectApi.VerifiedCapability

If the comment doesn't support this capability, the return value is ConnectApi.NotFoundException.

setCommentVote(communityId, commentId, upDownVote)

Upvote or downvote a comment.

API Version

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UpDownVoteCapability setCommentVote(String communityId, String commentId, ConnectApi.UpDownVoteCapabilityInput upDownVote)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID of the comment.

upDownVote
Type: ConnectApi.UpDownVoteCapabilityInput

A `ConnectApi.UpDownVoteCapabilityInput` object that includes your vote.

Return Value

Type: ConnectApi.UpDownVoteCapability

If the comment doesn't support this capability, the return value is ConnectApi.NotFoundException.

setFeedCommentStatus(communityId, commentId, status)

Set the status of a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.StatusCapability setFeedCommentStatus(String communityId,
String commentId, ConnectApi.StatusCapabilityInput status)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID of the comment.

status
Type: `ConnectApi.StatusCapabilityInput`

A `ConnectApi.StatusCapabilityInput` object that includes the status you want to set.

Return Value

Type: `ConnectApi.StatusCapability`

If the comment doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

Only users with the Can Approve Feed Post and Comment permission can set the status of a feed post or comment.

setFeedElementIsClosed(communityId, feedElementId, isClosed)

Set a feed element to closed.

Users can't edit (specifically the feed item body or title), comment on, or delete a closed feed element. If the closed feed element is a poll, users can't vote on it. Users can't edit (specifically the comment body) or delete a comment on a closed feed element or select or remove it as best answer.

Admins and moderators can edit and delete closed feed elements and comments on closed feed elements. Admins and moderators can select or remove the best answer status on comments on closed feed elements.

API Version

43.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CloseCapability setFeedElementIsClosed(String communityId,
String feedElementId, Boolean isClosed)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

isClosed
Type: Boolean

Specifies whether to set the feed element to closed (`true`) or not (`false`).

Return Value

Type: `ConnectApi.CloseCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`setFeedElementVote(communityId, feedElementId, upDownVote)`

Upvote or downvote a feed element.

API Version

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UpDownVoteCapability setFeedElementVote(String communityId,
String feedElementId, ConnectApi.UpDownVoteCapabilityInput upDownVote)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

upDownVote
Type: ConnectApi.UpDownVoteCapabilityInput

A ConnectApi.UpDownVoteCapabilityInput object that includes your vote.

Return Value

Type: ConnectApi.UpDownVoteCapability

If the feed element doesn't support this capability, the return value is ConnectApi.NotFoundException.

setFeedEntityStatus(communityId, feedElementId, status)

Set the status of a feed post.

API Version

37.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.StatusCapability setFeedEntityStatus(String communityId, String feedElementId, ConnectApi.StatusCapabilityInput status)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, internal, or null.

feedElementId
Type: String

ID of the feed element.

status
Type: ConnectApi.StatusCapabilityInput

A ConnectApi.StatusCapabilityInput object that includes the status you want to set.

Return Value

Type: ConnectApi.StatusCapability

If the feed element doesn't support this capability, the return value is ConnectApi.NotFoundException.

Usage

Only users with the Can Approve Feed Post and Comment permission can set the status of a feed post or comment.

setIsMutedByMe(communityId, feedElementId, isMutedByMe)

Mute or unmute a feed element.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.MuteCapability setIsMutedByMe(String communityId, String feedElementId, Boolean isMutedByMe)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

isMutedByMe
Type: Boolean

Indicates whether the feed element is muted for the context user. Default value is `false`.

Return Value

Type: `ConnectApi.MuteCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

setIsReadByMe(communityId, feedElementId, readBy)

Mark a feed element as read for the context user using an input class.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ReadByCapability setIsReadByMe(String communityId, String
feedElementId, ConnectApi.ReadByCapabilityInput readBy)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element to mark as read.

readBy
Type: `ConnectApi.ReadByCapabilityInput`

A `ConnectApi.ReadByCapabilityInput` body indicating to mark the feed elements as read.

Return Value

Type: `ConnectApi.ReadByCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

setIsReadByMe(communityId, feedElementId, isReadByMe)

Mark a feed element as read for the context user.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ReadByCapability setIsReadByMe(String communityId, String
feedElementId, Boolean isReadByMe)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element to mark as read.

isReadByMe
Type: Boolean

Specifies to mark the feed element as read (`true`) for the context user.

Return Value

Type: `ConnectApi.ReadByCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

updateComment(communityId, commentId, comment)

Edit a comment.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment updateComment(String communityId, String commentId,
ConnectApi.CommentInput comment)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID of the comment to be edited.

comment
Type: `ConnectApi.CommentInput`

Information about the comment to be edited.

Return Value

Type: `ConnectApi.Comment`

If the comment doesn't support the `edit` capability, the return value is `ConnectApi.NotFoundException`.

Example

```
String commentId;
String communityId = Network.getNetworkId();
```

```
// Get the last feed item created by the context user.
List<FeedItem> feedItems = [SELECT Id FROM FeedItem WHERE CreatedById = :UserInfo.getUserId()
 ORDER BY CreatedDate DESC];
if (feedItems.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
String feedElementId = feedItems[0].id;

ConnectApi.CommentPage commentPage =
ConnectApi.ChatterFeeds.getCommentsForFeedElement(communityId, feedElementId);
if (commentPage.items.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
commentId = commentPage.items[0].id;

ConnectApi.FeedEntityIsEditable isEditable =
ConnectApi.ChatterFeeds.isCommentEditableByMe(communityId, commentId);

if (isEditable.isEditableByMe == true){
    ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput();
    ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
    ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

    messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

    textSegmentInput.text = 'This is my edited comment.';
    messageBodyInput.messageSegments.add(textSegmentInput);

    commentInput.body = messageBodyInput;

    ConnectApi.Comment editedComment = ConnectApi.ChatterFeeds.updateComment(communityId,
 commentId, commentInput);
}
```

updateDirectMessage(communityId, feedElementId, directMessage)

Update the members of a direct message.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.DirectMessageCapability updateDirectMessage(String communityId,
String feedElementId, ConnectApi.DirectMessageCapabilityInput directMessage)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

directMessage
Type: `ConnectApi.DirectMessageCapabilityInput`

A `ConnectApi.DirectMessageCapabilityInput` body that includes the members to add and remove.

Return Value

Type: `ConnectApi.DirectMessageCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

updateFeedElement(communityId, feedElementId, feedElement)

Edit a feed element.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement updateFeedElement(String communityId, String
feedElementId, ConnectApi.FeedElementInput feedElement)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element to be edited. Feed items are the only type of feed element that can be edited.

feedElement
Type: `ConnectApi.FeedElementInput`

Information about the feed item to be edited.

Return Value

Type: `ConnectApi.FeedElement`

If the feed element doesn't support the `edit` capability, the return value is `ConnectApi.NotFoundException`.

Example for Editing a Feed Post

```
String communityId = Network.getNetworkId();

// Get the last feed item created by the context user.
List<FeedItem> feedItems = [SELECT Id FROM FeedItem WHERE CreatedById = :UserInfo.getUserId()
 ORDER BY CreatedDate DESC];
if (feedItems.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
String feedElementId = feedItems[0].id;

ConnectApi.FeedEntityIsEditable isEditable =
ConnectApi.ChatterFeeds.isFeedElementEditableByMe(communityId, feedElementId);

if (isEditable.isEditableByMe == true){
    ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
    ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
    ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

    messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

    textSegmentInput.text = 'This is my edited post.';
    messageBodyInput.messageSegments.add(textSegmentInput);

    feedItemInput.body = messageBodyInput;

    ConnectApi.FeedElement editedFeedElement =
ConnectApi.ChatterFeeds.updateFeedElement(communityId, feedElementId, feedItemInput);
}
```

Example for Editing a Question Title and Post

```
String communityId = Network.getNetworkId();

// Get the last feed item created by the context user.
List<FeedItem> feedItems = [SELECT Id FROM FeedItem WHERE CreatedById = :UserInfo.getUserId()
 ORDER BY CreatedDate DESC];
if (feedItems.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
String feedElementId = feedItems[0].id;

ConnectApi.FeedEntityIsEditable isEditable =
ConnectApi.ChatterFeeds.isFeedElementEditableByMe(communityId, feedElementId);
```

```
if (isEditable.isEditableByMe == true){

    ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
    ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
    ConnectApi.QuestionAndAnswersCapabilityInput questionAndAnswersCapabilityInput = new
ConnectApi.QuestionAndAnswersCapabilityInput();
    ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
    ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

    messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

    textSegmentInput.text = 'This is my edited question.';
    messageBodyInput.messageSegments.add(textSegmentInput);

    feedItemInput.body = messageBodyInput;
    feedItemInput.capabilities = feedElementCapabilitiesInput;

    feedElementCapabilitiesInput.questionAndAnswers = questionAndAnswersCapabilityInput;
    questionAndAnswersCapabilityInput.questionTitle = 'Where is my edited question?';

    ConnectApi.FeedElement editedFeedElement =
ConnectApi.ChatterFeeds.updateFeedElement(communityId, feedElementId, feedItemInput);
}
```

updateFeedElementBookmarks(communityId, feedElementId, bookmarks)

Bookmark a feed element or remove a bookmark from a feed element using an input class.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BookmarksCapability updateFeedElementBookmarks(String
communityId, String feedElementId, ConnectApi.BookmarksCapabilityInput bookmarks)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

bookmarks
Type: ConnectApi.BookmarksCapabilityInput

Information about a bookmark.

Return Value

Type: ConnectApi.BookmarksCapability

If the feed element doesn't support this capability, the return value is ConnectApi.NotFoundException.

updateFeedElementBookmarks(communityId, feedElementId, isBookmarkedByCurrentUser)

Bookmark a feed element or remove a bookmark from a feed element.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BookmarksCapability updateFeedElementBookmarks(String communityId, String feedElementId, Boolean isBookmarkedByCurrentUser)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

isBookmarkedByCurrentUser
Type: Boolean

Specify whether to bookmark the feed element (`true`) or not (`false`).

Return Value

Type: ConnectApi.BookmarksCapability

If the feed element doesn't support this capability, the return value is ConnectApi.NotFoundException.

Example

```
ConnectApi.BookmarksCapability bookmark =
ConnectApi.ChatterFeeds.updateFeedElementBookmarks(null, '0D5D0000000KuGh', true);
```

updateFeedElementReadByCapabilityBatch(communityId, feedElementIds, readBy)

Mark multiple feed elements as read by the context user at the same time using an input class.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] updateFeedElementReadByCapabilityBatch(String
communityId, List<String> feedElementIds, ConnectApi.ReadByCapabilityInput readBy)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementIds
Type: List<String>

Up to 500 feed element IDs to mark as read.

readBy
Type: `ConnectApi.ReadByCapabilityInput`

A `ConnectApi.ReadByCapabilityInput` body indicating to mark the feed elements as read.

Return Value

Type: `ConnectApi.BatchResult`[]

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

The returned objects correspond to each of the input objects and are returned in the same order as the input objects.

The method call fails only if an error occurs that affects the entire operation (such as a parsing failure). If an individual object causes an error, the error is embedded within the `ConnectApi.BatchResult` list.

updateFeedElementReadByCapabilityBatch(communityId, feedElementIds, isReadByMe)

Mark multiple feed elements as read by the context user at the same time.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] updateFeedElementReadByCapabilityBatch(String communityId, List<String> feedElementIds, Boolean isReadByMe)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementIds
Type: List<String>

Up to 500 feed element IDs to mark as read.

isReadByMe
Type: Boolean

Specifies to mark the feed element as read (`true`) for the context user.

Return Value

Type: `ConnectApi.BatchResult`[]

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

updateLikeForComment(communityId, commentId, isLikedByCurrentUser)

Like or unlike a comment.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage updateLikeForComment(String communityId, String commentId, Boolean isLikedByCurrentUser)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID of the comment.

isLikedByCurrentUser
Type: Boolean

Specifies if the context user likes (`true`) or unlikes (`false`) the comment.

Return Value

Type: `ConnectApi.ChatterLikePage`

updateLikeForFeedElement(communityId, feedElementId, isLikedByCurrentUser)

Like or unlike a feed element.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage updateLikeForFeedElement(String communityId,
String feedElementId, Boolean isLikedByCurrentUser)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

isLikedByCurrentUser
Type: Boolean

Specifies if the context user likes (`true`) or unlikes (`false`) the feed element.

Return Value

Type: ConnectApi.ChatterLikePage

If the feed element doesn't support the `ChatterLikes` capability, the return value is ConnectApi.NotFoundException.

updatePinnedFeedElements(communityId, feedType, subjectId, pin)

Pin or unpin feed elements to a group or topic feed.

API Version

41.0

Available to Guest Users

41.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.PinCapability updatePinnedFeedElements(String communityId,
ConnectApi.FeedType feedType, String subjectId, ConnectApi.PinCapabilityInput pin)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

The type of feed. Valid values are `Record` and `Topics`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* must be a group ID. If *feedType* is `Topics`, *subjectId* must be a topic ID.

pin
Type: ConnectApi.PinCapabilityInput

A `ConnectApi.PinCapabilityInput` object indicating the feed element to pin or unpin.

Return Value

Type: ConnectApi.PinCapability

If the feed doesn't support this capability, the return value is ConnectApi.NotFoundException.

updateStream(communityId, streamId, streamInput)

Update a Chatter feed stream.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStream updateStream(String communityId, String streamId,
ConnectApi.ChatterStreamInput streamInput)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

streamId
Type: String

ID of the Chatter feed stream.

streamInput
Type: `ConnectApi.ChatterStreamInput`

A `ConnectApi.ChatterStreamInput` object.

Return Value

Type: `ConnectApi.ChatterStream`

voteOnFeedElementPoll(communityId, feedElementId, myChoiceId)

Vote on a poll or change your vote on a poll.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.PollCapability voteOnFeedElementPoll(String communityId, String
feedElementId, String myChoiceId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

myChoiceId
Type: String

ID of the poll item you're voting for. The key prefix for poll items is 09A.

Return Value

Type: `ConnectApi.PollCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Example

```
ConnectApi.PollCapability poll = ConnectApi.ChatterFeeds.voteOnFeedElementPoll(null,
'0D5D0000000XZaUKAW', '09AD000000000TKMAY');
```

ChatterFeeds Test Methods

The following are the test methods for `ChatterFeeds`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

IN THIS SECTION:

setTestGetFeedElementsFromFeed(communityId, feedType, result)
Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)
Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)
Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, result)
Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getFeedElementsFromFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getFeedElementsFromFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, customFilter, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getFeedElementsFromFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, result)

a `ConnectApi.FeedElementPage` object to be returned when the matching `getFeedElementsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `getFeedElements FromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `getFeedElements FromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the `getFeedElementsFromFilterFeedUpdatedSince` method is called in a test context.

setTestGetFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRelatedPosts(communityId, feedElementId, filter, maxResults, result)

Register a `ConnectApi.RelatedFeedPosts` object to be returned when the matching `ConnectApi.getRelatedPosts(communityId, feedElementId, filter, maxResults)` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestGetTopUnansweredQuestions(communityId, result) (Pilot)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getTopUnansweredQuestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestGetTopUnansweredQuestions(communityId, filter, result) (Pilot)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getTopUnansweredQuestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestGetTopUnansweredQuestions(communityId, pageSize, result) (Pilot)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getTopUnansweredQuestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestGetTopUnansweredQuestions(communityId, filter, pageSize, result) (Pilot)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getTopUnansweredQuestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElements(communityId, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElements(communityId, q, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElements(communityId, q, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElements(communityId, q, pageParam, pageSize, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElements(communityId, q, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElements(communityId, q, pageParam, pageSize, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElements(communityId, q, recentCommentCount, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `searchFeedElementsInFeed` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchStreams(communityId, q, result)

Register a `ConnectApi.ChatterStreamPage` object to be returned when the matching `ConnectApi.searchStream(communityId, q)` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchStreams(communityId, q, sortParam, result)

Register a `ConnectApi.ChatterStreamPage` object to be returned when the matching `ConnectApi.searchStream(communityId, q, sortParam)` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchStreams(communityId, q, pageParam, pageSize, result)

Register a `ConnectApi.ChatterStreamPage` object to be returned when the matching `ConnectApi.searchStreams(communityId, q, pageParam, pageSize)` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchStreams(communityId, q, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.ChatterStreamPage` object to be returned when the matching `ConnectApi.searchStreams(communityId, q, pageParam, pageSize, sortParam)` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchStreams(communityId, q, pageParam, pageSize, sortParam, globalScope, result)

Register a `ConnectApi.ChatterStreamPage` object to be returned when the matching `ConnectApi.searchStreams(communityId, q, pageParam, pageSize, sortParam, globalScope)` method is called in a test context. Use the method with the same parameters or you receive an exception.

`setTestGetFeedElementsFromFeed(communityId, feedType, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

result
Type: ConnectApi.FeedElementPage

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

The only valid value for this parameter is `Company`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)
Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. The only valid value is `Home`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getFeedElementsFromFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

44.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter, Boolean threadedCommentsCollapsed, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. The only valid value is `Home`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

Apex Developer Guide: Testing ConnectApi Code

getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed)

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The feed type.

subjectId
Type: String

ID of the context user or the alias `me`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, subjectId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Isolated, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

result
Type: ConnectApi.FeedElementPage

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a ConnectApi.FeedElementPage object to be returned when getFeedElementsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, internal, or null.

feedType
Type: ConnectApi.FeedType

Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessageModeration, DirectMessages, Filter, Home, Isolated, Landing, Moderation, and PendingReview.

subjectId
Type: String

If *feedType* is Record, *subjectId* can be any record ID, including a group ID. If *feedType* is Streams, *subjectId* must be a stream ID. If *feedType* is Topics, *subjectId* must be a topic ID. If *feedType* is UserProfile, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias me.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Isolated, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

result
Type: ConnectApi.FeedElementPage

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.

- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

35.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType
feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam,
ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`filter`
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out. Currently, feed elements scoped to sites have a User or a Group parent record. However, other parent record types could be scoped to sites in the future.

`result`
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getFeedElementsFromFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

44.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType
feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam,
ConnectApi.FeedFilter filter, Boolean threadedCommentsCollapsed,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out. Currently, feed elements scoped to sites have a User or a Group parent record. However, other parent record types could be scoped to sites in the future.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, threadedCommentsCollapsed)

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

40.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String customFilter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

customFilter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.

- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

44.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedFilter filter, Boolean threadedCommentsCollapsed, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.

- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

`threadedCommentsCollapsed`
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

`result`
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, String customFilter,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

`customFilter`
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

`result`
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getFeedElementsFromFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

44.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType
feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
```

```
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, String customFilter,
Boolean threadedCommentsCollapsed, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

`customFilter`
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

`threadedCommentsCollapsed`
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

`result`
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

`setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, result)`

a `ConnectApi.FeedElementPage` object to be returned when the matching `getFeedElementsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFilterFeed(String communityId, String subjectId, String keyPrefix, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the `getFeedElementsFromFilterFeedUpdatedSince` method is called in a test context.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFilterFeedUpdatedSince(String communityId,
String subjectId, String keyPrefix, Integer recentCommentCount, Integer
```

```
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

Opaque token defining the modification timestamp of the feed and the sort order.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

setTestGetFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedElementPage
result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.

- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

`result`
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, filter)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
ConnectApi.FeedElementPage result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

One of these values:

- `Files`

- `Groups`
- `News`
- `People`
- `Record`

`subjectId`
Type: String

If *`feedType`* is `ConnectApi.Record`, *`subjectId`* can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`updatedSince`
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *`updatedSince`* parameter doesn't return feed elements that are created in the same second as the call.

`result`
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
Boolean showInternalOnly, ConnectApi.FeedElementPage result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

`subjectId`
Type: String

Any record ID, including a group ID.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

35.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

Opaque token defining the modification timestamp of the feed and the sort order.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

filter
Type: ConnectApi.FeedFilter

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out. Currently, feed elements scoped to sites have a User or a Group parent record. However, other parent record types could be scoped to sites in the future.

result
Type: ConnectApi.FeedElementPage

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, filter)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

40.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, String customFilter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`updatedSince`
Type: String

Opaque token defining the modification timestamp of the feed and the sort order.

The *`updatedSince`* parameter doesn't return feed elements that are created in the same second as the call.

`customFilter`
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

`result`
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, customFilter)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, Boolean showInternalOnly, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, Boolean showInternalOnly, ConnectApi.FeedFilter filter,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.

- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

`result`

Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, Boolean showInternalOnly, String customFilter,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

Maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

customFilter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, customFilter)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRelatedPosts(communityId, feedElementId, filter, maxResults, result)`

Register a `ConnectApi.RelatedFeedPosts` object to be returned when the matching `ConnectApi.getRelatedPosts(communityId, feedElementId, filter, maxResults)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

37.0

Signature

```
public static Void setTestGetRelatedPosts(String communityId, String feedElementId,
ConnectApi.RelatedFeedPostType filter, Integer maxResults, ConnectApi.RelatedFeedPosts
result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element. The feed element must be a question.

filter
Type: `ConnectApi.RelatedFeedPostType`

Specifies the type of related feed post. Values are:

- `Answered`—Related questions that have at least one answer.
- `BestAnswer`—Related questions that have a best answer.
- `Generic`—All types of related questions, including answered, with a best answer, and unanswered.
- `Unanswered`—Related questions that don't have answers.

`Generic` is the default value.

maxResults
Type: Integer

The maximum number of results to return. You can return up to 25 results; 5 is the default.

result
Type: `ConnectApi.RelatedFeedPosts`

Object containing test data.

In version 37.0 and later, related feed posts are questions.

Return Value

Type: Void

`setTestGetTopUnansweredQuestions(communityId, result)` (Pilot)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getTopUnansweredQuestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version

42.0

Signature

```
public static Void setTestGetTopUnansweredQuestions(String communityId,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getTopUnansweredQuestions(communityId) (Pilot)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetTopUnansweredQuestions(communityId, filter, result)` (Pilot)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.getTopUnansweredQuestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

Note: We provided top-five unanswered questions to selected customers through a pilot program that required agreement to specific terms and conditions. This pilot program is closed and not accepting new participants.

API Version

42.0

Signature

```
public static Void setTestGetTopUnansweredQuestions(String communityId,
ConnectApi.TopUnansweredQuestionsFilterType filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

filter
Type: `ConnectApi.FeedFilter`

Specifies the filter for the feed. `UnansweredQuestionsWithCandidateAnswers` is the only valid value.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getTopUnansweredQuestions(communityId, filter) (Pilot)

`setTestSearchFeedElements(communityId, q, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElements(communityId, q)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedElements(communityId, q, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q,
ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

setTestSearchFeedElements(communityId, q, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

44.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q, Boolean threadedCommentsCollapsed, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q

Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam

Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElements(communityId, q, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedElements(communityId, q, pageParam, pageSize, threadedCommentsCollapsed, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

44.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q, String
pageParam, Integer pageSize, Boolean threadedCommentsCollapsed,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

threadedCommentsCollapsed
Type: Boolean

Specifies whether to return threaded comments in a collapsed style (`true`) or not (`false`). If you pass in `null`, the default is `false`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElements(communityId, q, pageParam, pageSize, threadedCommentsCollapsed)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedElements(communityId, q, recentCommentCount, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q, Integer recentCommentCount, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.

Apex Developer Guide: Testing ConnectApi Code

`setTestSearchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Isolated, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

q
Type: String

Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: ConnectApi.FeedElementPage

Object containing test data.

Return Value

Type: Void

SEE ALSO:

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter, result)

Register a ConnectApi.FeedElementPage object to be returned when the matching ConnectApi.searchFeedElementsInFeed method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

32.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q,
ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. The only valid value is `Home`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

`result`

Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)

Apex Developer Guide: Testing ConnectApi Code

`setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, q, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String q, ConnectApi.FeedElementPage
result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, `Streams`, and `Topics`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If feed type is `UserProfile`, *subjectId* can be any user ID. If *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElementsInFeed(communityId, feedType, subjectId, q)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, `Streams`, and `Topics`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Order of feed items in the feed.

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Search term. Searches keywords in the user or group name. A minimum of one character is required. This parameter doesn't support wildcards. This parameter is required.

result
Type: ConnectApi.FeedElementPage

Object containing test data.

Return Value

Type: Void

SEE ALSO:

public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, `Streams`, and `Topics`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Apex Developer Guide: Testing ConnectApi Code

`setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter, result)`

Register a `ConnectApi.FeedElementPage` object to be returned when `searchFeedElementsInFeed` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

35.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedFilter filter,
ConnectApi.FeedElementPage result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

`subjectId`
Type: String

ID of any user. To specify the context user, use the user ID or the alias `me`.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

The amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren't wildcards. See Wildcards.

filter
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to Experience Cloud sites. Feed elements that are always visible in all sites are filtered out. Currently, feed elements scoped to sites have a User or a Group parent record. However, other parent record types could be scoped to sites in the future.

result
Type: `ConnectApi.FeedElementPage`

ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

The amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren't wildcards. See Wildcards.

customFilter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, filter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

32.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly,
ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

Value must be ConnectApi.FeedType.Record.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Isolated, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

q
Type: String

Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

`filter`
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed.
- `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

`result`
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, filter)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, customFilter, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly, String
customFilter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

The ID of a case.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

cusotmFilter
Type: String

Custom filter that applies only to the case feed. See customFeedFilter in the *Metadata API Developer Guide* for supported values.

result
Type: `ConnectApi.FeedElementPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, customFilter)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Register a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFilterFeed(String communityId, String subjectId, String keyPrefix, String q, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFilterFeed(String communityId, String subjectId, String keyPrefix, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.

- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

searchStreams(communityId, q)

Apex Developer Guide: Testing ConnectApi Code

`setTestSearchStreams(communityId, q, sortParam, result)`

Register a `ConnectApi.ChatterStreamPage` object to be returned when the matching `ConnectApi.searchStream(communityId, q, sortParam)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestSearchStreams(String communityId, String q,
ConnectApi.SortOrder sortParam, ConnectApi.ChatterStreamPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

result
Type: `ConnectApi.ChatterStreamPage`

Object containing test data.

```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam
Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).

- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

`globalScope`
Type: Boolean

Specifies whether to get streams from all the context user's Experience Cloud sites, regardless of the *`communityId`* value.

`result`
Type: `ConnectApi.ChatterStreamPage`

Object containing test data.

Return Value

Type: Void

Retired ChatterFeeds Methods

The following methods for `ChatterFeeds` are retired.

IN THIS SECTION:

deleteFeedItem(communityId, feedItemId)
Delete a feed item.

getCommentsForFeedItem(communityId, feedItemId)
Get comments for a feed item.

getCommentsForFeedItem(communityId, feedItemId, pageParam, pageSize)
Get a page of comments for a feed item.

getFeedItem(communityId, feedItemId)
Get a feed item.

getFeedItemBatch(communityId, feedItemIds)
Get a list of feed items.

getFeedItemsFromFeed(communityId, feedType)
Get feed items from the `Company`, `Home`, and `Moderation` feeds.

getFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)
Get a page of sorted feed items from the `Company`, `Home`, and `Moderation` feeds.

getFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)
Get a page of sorted feed items from the `Company`, `Home`, and `Moderation` feeds. Each feed item contains no more than the specified number of comments.

getFeedItemsFromFeed(communityId, feedType, subjectId)
Get feed items from a feed for a user or record.

getFeedItemsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam)
Get a page of sorted feed items from a feed for a user or record.

getFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam)

Get a page of sorted feed items from a feed for a user or record. Each feed item includes no more than the specified number of comments.

getFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)

Get a page of sorted feed items from a record feed for a user or record. Each feed item includes no more than the specified number of comments. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.

getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix)

Get feed items from a feed filtered by a key prefix for a user.

getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam)

Get a page of sorted feed items from a feed filtered by a key prefix for a user.

getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam)

Get a page of sorted feed items from a feed filtered by a key prefix for a user. Each feed item contains no more than the specified number of comments.

getFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, updatedSince)

Get a page of feed items from a feed filtered by a key prefix for a user. Include only feed items that have been updated since the time specified in the *`updatedSince`* parameter.

getFeedItemsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince)

Get a page of feed items from the `Company`, `Home`, and `Moderation` feeds. Include only feed items that have been updated since the time specified in the *`updatedSince`* parameter. Each feed item contains no more than the specified number of comments.

getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince)

Get a page of feed items from the `Files`, `Groups`, `News`, `People`, and `Record` feeds. Include only feed items that have been updated since the time specified in the *`updatedSince`* parameter. Each feed item contains no more than the specified number of comments.

getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly)

Get a page of feed items from a record feed. Include only feed items that have been updated since the time specified in the *`updatedSince`* parameter. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.

getFeedPoll(communityId, feedItemId)

Get the poll associated with a feed item.

getLikesForFeedItem(communityId, feedItemId)

Get likes for a feed item.

getLikesForFeedItem(communityId, feedItemId, pageParam, pageSize)

Get a page of likes for a feed item.

likeFeedItem(communityId, feedItemId)

Like a feed item for the context user.

postComment(communityId, feedItemId, text)

Post a plain-text comment to a feed item.

postComment(communityId, feedItemId, comment, feedItemFileUpload)

Post a rich-text comment to a feed item. Use this method to include mentions and to attach a file to a comment.

postFeedElement(communityId, feedElement, feedElementFileUpload)

Post a rich-text feed element. Include mentions and hashtag topics, attach a file to a feed element, and associate action link groups with a feed element. You can also use this method to share a feed element and add a comment.

postFeedItem(communityId, feedType, subjectId, text)

Post a plain-text feed item.

postFeedItem(communityId, feedType, subjectId, feedItemInput, feedItemFileUpload)

Post a rich-text feed item to a feed. Use this method to include mentions and hashtag topics and to attach a file to a feed item. You can also use this method to share a feed item and add a comment.

searchFeedItems(communityId, q)

Get the feed items that match the search criteria.

searchFeedItems(communityId, q, sortParam)

Get the sorted feed items that match the search criteria.

searchFeedItems(communityId, q, pageParam, pageSize)

Get a page of feed items that match the search criteria.

searchFeedItems(communityId, q, pageParam, pageSize, sortParam)

Get a page of sorted feed items that match the search criteria.

searchFeedItems(communityId, q, recentCommentCount, pageParam, pageSize, sortParam)

Get a page of sorted feed items that match the search criteria.

searchFeedItemsInFeed(communityId, feedType, q)

Get the feed items from the `Company`, `Home`, and `Moderation` feeds that match the search criteria.

searchFeedItemsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items from the `Company`, `Home`, and `Moderation` feeds that match the search criteria.

searchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items from the `Company`, `Home`, and `Moderation` feeds that match the search criteria. Each feed item includes no more than the specified number of comments.

searchFeedItemsInFeed(communityId, feedType, subjectId, q)

Get the feed items from a feed that match the search criteria.

searchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items from a feed for a user or record that match the search criteria.

searchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items from a feed that match the search criteria. Each feed item includes no more than the specified number of comments.

searchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly)

Get a page of sorted feed items from a feed for a user or record that match the search criteria. Each feed item includes no more than the specified number of comments. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.

searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q)

Get the feed items that match the search criteria from a feed filtered by a key prefix for a user.

searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items that match the search criteria from a feed filtered by a key prefix for a user.

searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Get a page of sorted feed items that match the search criteria from a feed filtered by a key prefix for a user. Each feed item includes no more than the specified number of comments.

shareFeedElement(communityId, subjectId, feedElementType, originalFeedElementId)

Share the *originalFeedElementId* as the context user.

shareFeedItem(communityId, feedType, subjectId, originalFeedItemId)

Share the *originalFeedItemId* to the feed specified by the *feedType*.

updateBookmark(communityId, feedItemId, isBookmarkedByCurrentUser)

Bookmark a feed item or remove a bookmark from a feed item.

voteOnFeedPoll(communityId, feedItemId, myChoiceId)

Vote or change your vote on a feed poll.

setTestGetFeedItemsFromFeed(communityId, feedType, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `getFeedItemsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `getFeedItemsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `getFeedItemsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, updatedSince, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the `getFeedItemsFromFilterFeedUpdatedSince` method is called in a test context.

setTestGetFeedItemsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, ConnectApi.FeedItemPage, results)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestSearchFeedItems(communityId, q, result)

Register a test feed item page to be returned when `searchFeedItems(communityId, q)` is called during a test.

setTestSearchFeedItems(communityId, q, sortParam, result)

Register a test feed item page to be returned when `searchFeedItems(String, String, ConnectApi.FeedSortOrder)` is called during a test.

setTestSearchFeedItems(communityId, q, pageParam, pageSize, result)

Register a test feed item page to be returned when `searchFeedItems(String, String, String, Integer)` is called during a test.

setTestSearchFeedItems(communityId, q, pageParam, pageSize, sortParam, result)

Register a test feed item page to be returned when `searchFeedItems(String, String, String, Integer, ConnectApi.FeedSortOrder)` is called during a test.

setTestSearchFeedItems(communityId, q, recentCommentCount, pageParam, pageSize, sortParam, result)

Register a test feed item page to be returned when `searchFeedItems(communityId, q, recentCommentCount, pageParam, pageSize, sortParam)` is called during a test.

setTestSearchFeedItemsInFeed(communityId, feedType, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

`deleteFeedItem(communityId, feedItemId)`

Delete a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use deleteFeedElement(communityId, feedElementId).

Requires Chatter

Yes

Signature

```
public static Void deleteFeedItem(String communityId, String feedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

Return Value

Type: Void

getCommentsForFeedItem(communityId, feedItemId)

Get comments for a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use getCommentsForFeedElement(communityId, feedElementId).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getCommentsForFeedItem(String communityId, String
feedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

Return Value

Type: `ConnectApi.CommentPage`

getCommentsForFeedItem(communityId, feedItemId, pageParam, pageSize)

Get a page of comments for a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use getCommentsForFeedElement(communityId, feedElementId, pageParam, pageSize).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommentPage getCommentsForFeedItem(String communityId, String feedItemId, String pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.CommentPage`

getFeedItem(communityId, feedItemId)

Get a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElement(communityId, feedElementId).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem getFeedItem(String communityId, String feedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

Return Value

Type: `ConnectApi.FeedItem`

Note: Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that `ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information may not be available in the trigger.

getFeedItemBatch(communityId, feedItemIds)

Get a list of feed items.

API Version

31.0–31.0

Important: In version 32.0 and later, use getFeedElementBatch(communityId, feedElementIds).

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getFeedItemBatch(String communityId, List<String>
feedItemIds)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemIds
Type: List<String>

A list of up to 500 feed item IDs.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.FeedItem` object and errors for feed items that didn't load.

Example

```
// Create a list of feed items.
ConnectApi.FeedItemPage feedItemPage = ConnectApi.ChatterFeeds.getFeedItemsFromFeed(null,
 ConnectApi.FeedType.Company);
System.debug(feedItemPage);

// Create a list of feed item IDs.
List<String> feedItemIds = new List<String>();
for (ConnectApi.FeedItem aFeedItem : feedItemPage.items){
    feedItemIds.add(aFeedItem.id);
}

// Get info about the feed items in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterFeeds.getFeedItemBatch(null,
feedItemIds);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the header for each feed item.
        ConnectApi.FeedItem aFeedItem;
        if(batchResult.getResult() instanceof ConnectApi.FeedItem) {
           aFeedItem = (ConnectApi.FeedItem) batchResult.getResult();
```

```
        }
        System.debug('SUCCESS');
        System.debug(aFeedItem.header.text);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

getFeedItemsFromFeed(communityId, feedType)

Get feed items from the `Company`, `Home`, and `Moderation` feeds.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFeed(communityId, feedType).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId,
ConnectApi.FeedType feedType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedItemsFromFeed(communityId, feedType, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)`

Get a page of sorted feed items from the `Company`, `Home`, and `Moderation` feeds.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId,
ConnectApi.FeedType feedType, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)`

Get a page of sorted feed items from the `Company`, `Home`, and `Moderation` feeds. Each feed item contains no more than the specified number of comments.

API Version

29.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)

`getFeedItemsFromFeed(communityId, feedType, subjectId)`

Get feed items from a feed for a user or record.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFeed(communityId, feedType, subjectId).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId)
```

Parameters

`communityId`

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`

Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`getFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam)`

Get a page of sorted feed items from a feed for a user or record. Each feed item includes no more than the specified number of comments.

API Version

29.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)`

Get a page of sorted feed items from a record feed for a user or record. Each feed item includes no more than the specified number of comments. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.

API Version

30.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

Apex Developer Guide: Testing ConnectApi Code

`getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix)`

Get feed items from a feed filtered by a key prefix for a user.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFilterFeed(String communityId,
String subjectId, String keyPrefix)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

Apex Developer Guide: Testing ConnectApi Code

`getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam)`

Get a page of sorted feed items from a feed filtered by a key prefix for a user.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFilterFeed(String communityId,
String subjectId, String keyPrefix, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam)`

Get a page of sorted feed items from a feed filtered by a key prefix for a user. Each feed item contains no more than the specified number of comments.

API Version

29.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFilterFeed(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`subjectId`
Type: String

ID of the context user or the alias `me`.

`keyPrefix`
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`getFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, updatedSince)`

Get a page of feed items from a feed filtered by a key prefix for a user. Include only feed items that have been updated since the time specified in the *updatedSince* parameter.

API Version

30.0–31.0

Important: In version 32.0 and later, use getFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFilterFeedUpdatedSince(String
communityId, String subjectId, String keyPrefix, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

Opaque token containing information about the last modified date of the feed. Do not construct this token. To retrieve this token, call `getFeedItemsFromFilterFeed` and take the value from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

This method returns only feed items that have been updated since the time specified in the *updatedSince* argument. A feed item is considered to be updated if it was created since the last feed request, or if `sort=LastModifiedDateDesc` and a comment was added to the feed item since the last feed request. Adding likes and topics doesn't update a feed item.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, updatedSince, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedItemsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince)`

Get a page of feed items from the `Company`, `Home`, and `Moderation` feeds. Include only feed items that have been updated since the time specified in the *updatedSince* parameter. Each feed item contains no more than the specified number of comments.

API Version

30.0–31.0

Important: In version 32.0 and later, use getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

This method returns only feed items that have been updated since the time specified in the *updatedSince* argument. A feed item is considered to be updated if it was created since the last feed request, or if `sort=LastModifiedDateDesc` and a comment was added to the feed item since the last feed request. Adding likes and topics doesn't update a feed item.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets the feed items in the company feed and grabs the `updatesToken` property from the returned object. It then passes the value of `updatesToken` to the `getFeedItemsUpdatedSince` method to get the feed items updated since the first call:

```
// Get the feed items in the company feed and return the updatesToken
String communityId = null;

// Get the feed and extract the update token
ConnectApi.FeedItemPage page = ConnectApi.ChatterFeeds.getFeedItemsFromFeed(communityId,
ConnectApi.FeedType.Company);

// page.updatesToken is opaque and has a value like '2:1384549034000'

// Get the feed items that changed since the provided updatesToken
ConnectApi.FeedItemPage feedItems= ConnectApi.ChatterFeeds.getFeedItemsUpdatedSince
  (communityId, ConnectApi.FeedType.Company, 1, ConnectApi.FeedDensity.AllUpdates, null,
1, page.updatesToken);
```

SEE ALSO:

setTestGetFeedItemsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, ConnectApi.FeedItemPage, results)

Apex Developer Guide: Testing ConnectApi Code

`getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince)`

Get a page of feed items from the `Files`, `Groups`, `News`, `People`, and `Record` feeds. Include only feed items that have been updated since the time specified in the *updatedSince* parameter. Each feed item contains no more than the specified number of comments.

API Version

30.0–31.0

Important: In version 32.0 and later, use getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

One of these values:

- `Files`
- `Groups`
- `News`
- `People`
- `Record`

subjectId
Type: String

If *feedType* is `ConnectApi.Record`, *subjectId* can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

This method returns only feed items that have been updated since the time specified in the *updatedSince* argument. A feed item is considered to be updated if it was created since the last feed request, or if `sort=LastModifiedDateDesc` and a comment was added to the feed item since the last feed request. Adding likes and topics doesn't update a feed item.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets the feed items in the news feed and grabs the `updatesToken` property from the returned object. It then passes the value of `updatesToken` to the `getFeedItemsUpdatedSince` method to get the feed items updated since the first call:

```
// Get the feed items in the news feed and return the updatesToken
String communityId = null;
String subjectId = 'me';

// Get the feed and extract the update token
ConnectApi.FeedItemPage page = ConnectApi.ChatterFeeds.getFeedItemsFromFeed(communityId,
ConnectApi.FeedType.News, subjectId);

// page.updatesToken is opaque and has a value like '2:1384549034000'

// Get the feed items that changed since the provided updatesToken
ConnectApi.FeedItemPage feedItems= ConnectApi.ChatterFeeds.getFeedItemsUpdatedSince
  (communityId, ConnectApi.FeedType.News, subjectId, 1, ConnectApi.FeedDensity.AllUpdates,
 null, 1, page.updatesToken);
```

SEE ALSO:

setTestGetFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly)`

Get a page of feed items from a record feed. Include only feed items that have been updated since the time specified in the *updatedSince* parameter. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.

API Version

30.0–31.0

Important: In version 32.0 and later, use getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
Boolean showInternalOnly)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`updatedSince`
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

This method returns only feed items that have been updated since the time specified in the *`updatedSince`* argument. A feed item is considered to be updated if it was created since the last feed request, or if `sort=LastModifiedDateDesc` and a comment was added to the feed item since the last feed request. Adding likes and topics doesn't update a feed item.

If *`showInternalOnly`* is `true` and digital experiences is enabled, feed items from Experience Cloud sites are included. Otherwise, only feed items from the internal site are included.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets the feed items in the news feed and grabs the `updatesToken` property from the returned object. It then passes the value of `updatesToken` to the `getFeedItemsUpdatedSince` method to get the feed items updated since the first call:

```
// Get the feed items in the news feed and return the updatesToken
String communityId = null;
String subjectId = 'me';

// Get the feed and extract the update token
ConnectApi.FeedItemPage page = ConnectApi.ChatterFeeds.getFeedItemsFromFeed(communityId,
ConnectApi.FeedType.News, subjectId);

// page.updatesToken is opaque and has a value like '2:1384549034000'

// Get the feed items that changed since the provided updatesToken
ConnectApi.FeedItemPage feedItems= ConnectApi.ChatterFeeds.getFeedItemsUpdatedSince
```

```
  (communityId, ConnectApi.FeedType.News, subjectId, 1, ConnectApi.FeedDensity.AllUpdates,
null, 1, page.updatesToken, true);
```

setTestGetFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)

Apex Developer Guide: Testing ConnectApi Code

`getFeedPoll(communityId, feedItemId)`

Get the poll associated with a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use getFeedElementPoll(communityId, feedElementId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedPoll getFeedPoll(String communityId, String feedItemId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedItemId`
Type: String

ID for a feed item.

Return Value

Type: `ConnectApi.FeedPoll`

Note: Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that `ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information may not be available in the trigger.

`getLikesForFeedItem(communityId, feedItemId)`

Get likes for a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use getLikesForFeedElement(communityId, feedElementId).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForFeedItem(String communityId, String feedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

Return Value

Type: `ConnectApi.ChatterLikePage`

getLikesForFeedItem(communityId, feedItemId, pageParam, pageSize)

Get a page of likes for a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use getLikesForFeedElement(communityId, feedElementId, pageParam, pageSize).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForFeedItem(String communityId, String feedItemId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterLikePage`

`likeFeedItem(communityId, feedItemId)`

Like a feed item for the context user.

API Version

28.0–31.0

Important: In version 32.0 and later, use likeFeedElement(communityId, feedElementId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLike likeFeedItem(String communityId, String feedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

Return Value

Type: `ConnectApi.ChatterLike`

If the context user already liked the feed item, this method is a non-operation and returns the existing like.

postComment(communityId, feedItemId, text)

Post a plain-text comment to a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use postCommentToFeedElement(communityId, feedElementId, text).

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment postComment(String communityId, String feedItemId,
String text)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

text
Type: String

The text of the comment. Mentions are downgraded to plain text. To include a mention that links to a user, call `postComment(communityId, feedItemId, comment, feedItemFileUpload)` and pass the mention in a `ConnectApi.CommentInput` object.

Return Value

Type: `ConnectApi.Comment`

Usage

If hashtags or links are detected in *text*, they're included in the comment as hashtag and link segments. Mentions aren't detected in *text* and aren't separated out of the text.

Feed items and comments can contain up to 10,000 characters.

postComment(communityId, feedItemId, comment, feedItemFileUpload)

Post a rich-text comment to a feed item. Use this method to include mentions and to attach a file to a comment.

API Version

28.0–31.0

Important: In version 32.0 and later, use postCommentToFeedElement(communityId, feedElementId, comment, feedElementFileUpload).

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment postComment(String communityId, String feedItemId,
ConnectApi.CommentInput comment, ConnectApi.BinaryInput feedItemFileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

comment
Type: `ConnectApi.CommentInput`

In the `CommentInput` object, specify rich text, including @mentions. Optionally, in the `CommentInput.attachment` property, specify an existing file or a new file

feedItemFileUpload
Type: `ConnectApi.BinaryInput`

If you specify a `NewFileAttachmentInput` object in the `CommentInput.attachment` property, specify the new binary file to attach in this argument. Otherwise, do not specify a value.

Return Value

Type: `ConnectApi.Comment`

Usage

Feed items and comments can contain up to 10,000 characters.

Sample: Posting a Comment with a New File Attachment

To post a comment and upload and attach a new file to the comment, create a `ConnectApi.CommentInput` object and a `ConnectApi.BinaryInput` object to pass to the `ConnectApi.ChatterFeeds.postComment` method.

```
String communityId = null;
String feedItemId = '0D5D0000000Kcd1';

ConnectApi.CommentInput input = new ConnectApi.CommentInput();
ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'Comment Text Body';

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageInput.messageSegments.add(textSegment);

input.body = messageInput;

ConnectApi.NewFileAttachmentInput attachmentInput = new ConnectApi.NewFileAttachmentInput();
attachmentInput.description = 'The description of the file';
attachmentInput.title = 'contentFile.txt';
input.attachment = attachmentInput;

String fileContents = 'This is the content of the file.';
Blob fileBlob = Blob.valueOf(fileContents);
ConnectApi.BinaryInput binaryInput = new ConnectApi.BinaryInput(fileBlob, 'text/plain',
'contentFile.txt');

ConnectApi.Comment commentRep = ConnectApi.ChatterFeeds.postComment(communityId, feedItemId,
 input, binaryInput);
```

`postFeedElement(communityId, feedElement, feedElementFileUpload)`

Post a rich-text feed element. Include mentions and hashtag topics, attach a file to a feed element, and associate action link groups with a feed element. You can also use this method to share a feed element and add a comment.

API Version

31.0–35.0

Important: In version 36.0 and later, this method is no longer available because you can't create a feed post and upload a binary file in the same call. Upload files to Salesforce first, and then use `postFeedElement(communityId, feedElement)` to create the feed post and attach the files.

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement postFeedElement(String communityId,
ConnectApi.FeedElementInput feedElement, ConnectApi.BinaryInput feedElementFileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElement
Type: `ConnectApi.FeedElementInput`

Specify rich text, including mentions. Optionally, specify a link, a poll, an existing file, or a new file.

feedElementFileUpload
Type: `ConnectApi.BinaryInput`

Specify the new binary file to attach to the post only if you also specify a `NewFileAttachmentInput` object in the *feedElement* parameter. Otherwise, pass `null`.

Return Value

Type: `ConnectApi.FeedElement`

Example for Posting a Feed Element with a New (Binary) File

```
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.subjectId = 'me';

ConnectApi.ContentCapabilityInput contentInput = new ConnectApi.ContentCapabilityInput();
contentInput.title = 'Title';

ConnectApi.FeedElementCapabilitiesInput capabilities = new
ConnectApi.FeedElementCapabilitiesInput();
capabilities.content = contentInput;

input.capabilities = capabilities;

String text = 'These are the contents of the new file.';
Blob myBlob = Blob.valueOf(text);
ConnectApi.BinaryInput binInput = new ConnectApi.BinaryInput(myBlob, 'text/plain',
'fileName');

ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), input, binInput);
```

postFeedItem(communityId, feedType, subjectId, text)

Post a plain-text feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use postFeedElement(communityId, subjectId, feedElementType, text).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem postFeedItem(String communityId, ConnectApi.FeedType feedType, String subjectId, String text)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

One of the following:

- `News`
- `Record`
- `UserProfile`

Use `Record` to post to a group.

subjectId
Type: String

The value depends on the *feedType*:

- `News`—ID of the context user or the keyword `me`.
- `Record`—ID of any record with a feed, including groups.
- `UserProfile`—ID of any user.

text
Type: String

Text of the feed item. Mentions are downgraded to plain text. To include a mention that links to the user, call the `postFeedItem(communityId, feedType, subjectId, feedItemInput, feedItemFileUpload)` method and pass the mention in a `ConnectApi.FeedItemInput` object.

Return Value

Type: `ConnectApi.FeedItem`

Note: Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that `ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information may not be available in the trigger.

Usage

Feed items and comments can contain up to 10,000 characters.

Posts to `ConnectApi.FeedType.UserProfile` in API versions 23.0 and 24.0 created user status updates, not feed items. For posts to the User Profile Feed in those API versions, the character limit is 1,000 characters.

`postFeedItem(communityId, feedType, subjectId, feedItemInput, feedItemFileUpload)`

Post a rich-text feed item to a feed. Use this method to include mentions and hashtag topics and to attach a file to a feed item. You can also use this method to share a feed item and add a comment.

API Version

28.0–31.0

Important: In version 32.0 and later, use postFeedElement(communityId, feedElement, feedElementFileUpload).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem postFeedItem(String communityId, ConnectApi.FeedType
feedType, String subjectId, ConnectApi.FeedItemInput feedItemInput,
ConnectApi.BinaryInput feedItemFileUpload)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

One of the following:

- `News`
- `Record`
- `UserProfile`

To post a feed item to a group, use `Record` and use a group ID as the *`subjectId`*.

`subjectId`
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

`feedItemInput`
Type: `ConnectApi.FeedItemInput`

In the `FeedItemInput` object, specify rich text. Optionally, in the `FeedItemInput.attachment` property, specify a link, a poll, an existing file, or a new file.

`feedItemFileUpload`
Type: `ConnectApi.BinaryInput`

If you specify a `NewFileAttachmentInput` object in the `FeedItemInput.attachment` property, specify the new binary file to attach in this argument. Otherwise, do not specify a value.

Return Value

Type: `ConnectApi.FeedItem`

Note: Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that `ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information may not be available in the trigger.

Usage

Feed items and comments can contain up to 10,000 characters. Posts to `ConnectApi.FeedType.UserProfile` in API versions 23.0 and 24.0 created user status updates, not feed items. For posts to the User Profile Feed in those API versions, the character limit is 1,000 characters.

Example for Sharing a Feed Item and Adding a Comment

To share a feed item and add a comment, create a `ConnectApi.FeedItemInput` object containing the comment and the feed item to share. Then pass the object to `ConnectApi.ChatterFeeds.postFeeditem` in the *`feedItemInput`* argument. The message segments in the message body input are used as the comment.

```
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.originalFeedItemId = '0D5D0000000JuAG';

ConnectApi.MessageBodyInput body = new ConnectApi.MessageBodyInput();
List<ConnectApi.MessageSegmentInput> segmentList = new
List<ConnectApi.MessageSegmentInput>();
ConnectApi.TextSegmentInput textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'I hope you enjoy this post I found in another group.';
segmentList.add((ConnectApi.MessageSegmentInput)textSegment);
body.messageSegments = segmentList;
input.body = body;

ConnectApi.ChatterFeeds.postFeedItem(null, ConnectApi.FeedType.UserProfile, 'me', input,
null);
```

Example for Posting a Mention to a User Profile Feed

To post to a user profile feed and include an @mention, call the `ConnectApi.ChatterFeeds.postFeedItem` method.

```
String communityId = null;
ConnectApi.FeedType feedType = ConnectApi.FeedType.UserProfile;

ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;
```

```
ConnectApi.MentionSegmentInput mentionSegment = new ConnectApi.MentionSegmentInput();

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'Hey there ';
messageInput.messageSegments.add(textSegment);

mentionSegment.id = '005D0000001LLO1';
messageInput.messageSegments.add(mentionSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = '. How are you?';
messageInput.messageSegments.add(textSegment);

input.body = messageInput;

ConnectApi.FeedItem feedItemRep = ConnectApi.ChatterFeeds.postFeedItem(communityId, feedType,
 'me', input, null);
```

`searchFeedItems(communityId, q)`

Get the feed items that match the search criteria.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElements(communityId, q).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItems(String communityId, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItems(communityId, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedItems(communityId, q, sortParam)`

Get the sorted feed items that match the search criteria.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElements(communityId, q, sortParam).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItems(String communityId, String q,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q

Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItems(communityId, q, sortParam, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedItems(communityId, q, pageParam, pageSize)`

Get a page of feed items that match the search criteria.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElements(communityId, q, pageParam, pageSize).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItems(String communityId, String q,
String pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

API Version

29.0–31.0

Important: In version 32.0 and later, use searchFeedElements(communityId, q, recentCommentCount, pageParam, pageSize, sortParam).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItems(String communityId, String q,
Integer recentCommentCount, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder
sortParam)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`q`
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Apex Developer Guide: Testing ConnectApi Code

`searchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

Get a page of sorted feed items from the `Company`, `Home`, and `Moderation` feeds that match the search criteria. Each feed item includes no more than the specified number of comments.

API Version

29.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestSearchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedItemsInFeed(communityId, feedType, subjectId, q)`

Get the feed items from a feed that match the search criteria.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFeed(communityId, feedType, subjectId, q).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String q)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

`subjectId`
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If feed type is `UserProfile`, *`subjectId`* can be any user ID. If *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

`q`
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)`

Get a page of sorted feed items from a feed for a user or record that match the search criteria.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

`subjectId`
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Order of feed items in the feed.

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

`q`
Type: String

Search term. Searches keywords in the user or group name. A minimum of one character is required. This parameter doesn't support wildcards. This parameter is required.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

Get a page of sorted feed items from a feed that match the search criteria. Each feed item includes no more than the specified number of comments.

API Version

29.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly)`

Get a page of sorted feed items from a feed for a user or record that match the search criteria. Each feed item includes no more than the specified number of comments. Specify whether to return feed items posted by internal (non-Experience Cloud site) users only.

API Version

30.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.

- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

`q`
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Apex Developer Guide: Testing ConnectApi Code

`searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q)`

Get the feed items that match the search criteria from a feed filtered by a key prefix for a user.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFilterFeed(String communityId,
String subjectId, String keyPrefix, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q)`

Get a page of sorted feed items that match the search criteria from a feed filtered by a key prefix for a user.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFilterFeed(String communityId,
String subjectId, String keyPrefix, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity
density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String
q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Apex Developer Guide: Testing ConnectApi Code

`shareFeedElement(communityId, subjectId, feedElementType, originalFeedElementId)`

Share the *`originalFeedElementId`* as the context user.

API Version

31.0–38.0

Important: In version 39.0 and later, use `postFeedElement(communityId, feedElement)` or `updateFeedElement(communityId, feedElementId, feedElement)` with the `ConnectApi.FeedEntityShareCapabilityInput` to share a feed entity with a feed element.

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement shareFeedElement(String communityId, String
subjectId, ConnectApi.FeedElementType feedElementType, String originalFeedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

The ID of the user or group with whom to share the feed element.

feedElementType
Type: `ConnectApi.FeedElementType`

Values are:

- `Bundle`—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values.
- `FeedItem`—A feed item has a single parent and is scoped to oneExperience Cloud site or across all Experience Cloud sites. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values.
- `Recommendation`—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user.

originalFeedElementId
Type: String

The ID of the feed element to share.

Return Value

Type: `ConnectApi.FeedElement`

Example

```
ConnectApi.ChatterFeeds.shareFeedElement(null, '0F9RR0000004CPw',
ConnectApi.FeedElementType.FeedItem, '0D5RR0000004Gxc');
```

shareFeedItem(communityId, feedType, subjectId, originalFeedItemId)

Share the *originalFeedItemId* to the feed specified by the *feedType*.

API Version

28.0–31.0

Important:

- In version 32.0–38.0, use `shareFeedElement(communityId, subjectId, feedElementType, originalFeedElementId)`.

- In version 39.0 and later, use `postFeedElement(communityId, feedElement)` or `updateFeedElement(communityId, feedElementId, feedElement)` with the `ConnectApi.FeedEntityShareCapabilityInput`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem shareFeedItem(String communityId, ConnectApi.FeedType
feedType, String subjectId, String originalFeedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

One of the following:

- `News`
- `Record`
- `UserProfile`

To share a feed item with a group, use `Record` and use a group ID as the *subjectId*.

subjectId
Type: String

The value depends on the value of *feedType*:

- `News`—*subjectId* must be the ID of the context user or the keyword `me`.
- `Record`—*subjectId* can be a group ID or the ID of the context user (or `me`).
- `UserProfile`—*subjectId* can be any user ID.

originalFeedItemId
Type: String

The ID of the feed item to share.

Return Value

Type: `ConnectApi.FeedItem`

Example

To share a feed item with a group, pass in the Experience Cloud site ID (or `null`), the feed type `Record`, the group ID, and the ID of the feed item to share.

```
ConnectApi.ChatterFeeds.shareFeedItem(null, ConnectApi.FeedType.Record, '0F9D00000000izf',
 '0D5D0000000JuAG');
```

updateBookmark(communityId, feedItemId, isBookmarkedByCurrentUser)

Bookmark a feed item or remove a bookmark from a feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use updateFeedElementBookmarks(communityId, feedElementId, bookmarks) or updateFeedElementBookmarks(communityId, feedElementId, isBookmarkedByCurrentUser).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem updateBookmark(String communityId, String feedItemId,
Boolean isBookmarkedByCurrentUser)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

isBookmarkedByCurrentUser
Type: Boolean

—Specifying `true` adds the feed item to the list of bookmarks for the context user. Specify `false` to remove a bookmark.

Return Value

Type: `ConnectApi.FeedItem`

voteOnFeedPoll(communityId, feedItemId, myChoiceId)

Vote or change your vote on a feed poll.

API Version

28.0–31.0

Important: In version 32.0 and later, use voteOnFeedElementPoll(communityId, feedElementId, myChoiceId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedPoll voteOnFeedPoll(String communityId, String feedItemId,
String myChoiceId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID of the feed item that is associated with the poll.

myChoiceId
Type: String

ID of the item in the poll you're voting for.

Return Value

Type: `ConnectApi.FeedPoll`

setTestGetFeedItemsFromFeed(communityId, feedType, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType
feedType, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsFromFeed(communityId, feedType)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)`

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

29.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Isolated`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsFromFeed(communityId, feedType, subjectId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Isolated, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

result
Type: ConnectApi.FeedItemPage

Object containing test data.

Return Value

Type: Void

getFeedItemsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Register a ConnectApi.FeedItemPage object to be returned when getFeedItemsFromFeed is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

29.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType
feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam,
ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

SEE ALSO:

getFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

30.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `getFeedItemsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFilterFeed(String communityId, String subjectId, String keyPrefix, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

result
Type: `ConnectApi.FeedItemPage`

getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, updatedSince, result)`

Register a `ConnectApi.FeedItemPage` object to be returned when the `getFeedItemsFromFilterFeedUpdatedSince` method is called in a test context.

API Version

30.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFilterFeedUpdatedSince(String communityId,
String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity
density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String
updatedSince, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

`updatedSince`
Type: String

Opaque token containing information about the last modified date of the feed. Do not construct this token. To retrieve this token, call `getFeedItemsFromFilterFeed` and take the value from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

`result`
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

One of these values:

- `Files`
- `Groups`
- `News`
- `People`
- `Record`

subjectId
Type: String

If *feedType* is `ConnectApi.Record`, *subjectId* can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

Apex Developer Guide: Testing ConnectApi Code

setTestGetFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)

Register a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

30.0–31.0

Signature

```
public static Void setTestGetFeedItemsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
Boolean showInternalOnly, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

One of these values:

- `Files`
- `Groups`
- `News`
- `People`
- `Record`

subjectId
Type: String

If *feedType* is `ConnectApi.Record`, *subjectId* can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-Experience Cloud site) users (`true`), or not (`false`). The default value is `false`.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedItems(communityId, q, result)

Register a test feed item page to be returned when `searchFeedItems(communityId, q)` is called during a test.

API Version

28.0–31.0

Signature

```
public static Void searchFeedItems(String communityId, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedItems(communityId, q)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedItems(communityId, q, sortParam, result)

Register a test feed item page to be returned when `searchFeedItems(String, String, ConnectApi.FeedSortOrder)` is called during a test.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItems(String communityId, String q, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

The feed item test page.

Return Value

Type: Void

SEE ALSO:

searchFeedItems(communityId, q, sortParam)

Apex Developer Guide: Testing ConnectApi Code

`setTestSearchFeedItems(communityId, q, pageParam, pageSize, result)`

Register a test feed item page to be returned when `searchFeedItems(String, String, String, Integer)` is called during a test.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItems(String communityId, String q, String pageParam,
Integer pageSize, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.FeedItemPage`

The test feed item page.

Return Value

Type: Void

SEE ALSO:

searchFeedItems(communityId, q, pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

`setTestSearchFeedItems(communityId, q, pageParam, pageSize, sortParam, result)`

Register a test feed item page to be returned when `searchFeedItems(String, String, String, Integer, ConnectApi.FeedSortOrder)` is called during a test.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItems(String communityId, String q, String pageParam,
Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

The test feed item page.

searchFeedItems(communityId, q, pageParam, pageSize, sortParam)

Apex Developer Guide: Testing ConnectApi Code

`setTestSearchFeedItems(communityId, q, recentCommentCount, pageParam, pageSize, sortParam, result)`

Register a test feed item page to be returned when `searchFeedItems(communityId, q, recentCommentCount, pageParam, pageSize, sortParam)` is called during a test.

API Version

29.0–31.0

Signature

```
public static Void setTestSearchFeedItems(String communityId, String q, Integer recentCommentCount, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`q`
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

The test feed item page.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result

Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

searchFeedItemsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

Type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessageModeration, DirectMessages, Filter, Home, Isolated, Landing, Moderation, and PendingReview.

recentCommentCount
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Isolated, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

q
Type: String

Required and can't be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: ConnectApi.FeedItemPage

Object containing test data.

Return Value

Type: Void

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedItemPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateAsc—Sorts by oldest creation date. This sort order is available only for DirectMessageModeration, Draft, Isolated, Moderation, and PendingReview feeds.
- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

q

Apex Developer Guide: Testing ConnectApi Code

setTestSearchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFilterFeed(String communityId, String subjectId, String keyPrefix, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result

result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`.

subjectId
Type: String

ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q)

Apex Developer Guide: Testing ConnectApi Code

`setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)`

Register a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFilterFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String keyPrefix, Integer
recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Isolated`, `Landing`, `Moderation`, and `PendingReview`.

`subjectId`
Type: String

ID of the context user or the alias `me`.

`keyPrefix`
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

`recentCommentCount`
Type: Integer

Maximum number of comments to return with each feed item. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedItemPage`

Specify the test feed item page.

Return Value

Type: Void

searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Apex Developer Guide: Testing ConnectApi Code

ChatterGroups Class

Information about groups, such as the group's members, photo, and the groups the specified user is a member of. Add members to a group, remove members, and change the group photo.

Namespace

ConnectApi

ChatterGroups Methods

The following are methods for `ChatterGroups`. All methods are static.

IN THIS SECTION:

addMember(communityId, groupId, userId)
Add a user to a group as a standard member.

addMemberWithRole(communityId, groupId, userId, role)
Add a user with a role to a group.

addRecord(communityId, groupId, recordId)
Associate a record with a group.

createGroup(communityId, groupInput)
Create a group.

deleteBannerPhoto(communityId, groupId)
Delete the group banner photo.

deleteGroup(communityId, groupId)
Delete a group.

deleteMember(communityId, membershipId)
Remove a member from a group.

deletePhoto(communityId, groupId)
Delete the group photo.

getAnnouncements(communityId, groupId)
Get the first page of announcements in a group.

getAnnouncements(communityId, groupId, pageParam, pageSize)
Get a page of announcements in a group.

getBannerPhoto(communityId, groupId)
Get the group banner photo.

getGroup(communityId, groupId)
Get information about a group.

getGroupBatch(communityId, groupIds)
Get information about a list of groups.

getGroupMembershipRequest(communityId, requestId)
Get information about a request to join a private group.

getGroupMembershipRequests(communityId, groupId)
Get information about every request to join a private group.

getGroupMembershipRequests(communityId, groupId, status)
Get information about every request to join a private group that has a specified status.

getGroups(communityId)
Get the first page of groups.

getGroups(communityId, pageParam, pageSize)
Get a page of groups.

getGroups(communityId, pageParam, pageSize, archiveStatus)
Get a page of groups with an archive status.

getMember(communityId, membershipId)
Get information about a group member.

getMembers(communityId, groupId)
Get the first page of information about the members of a group.

getMembers(communityId, groupId, pageParam, pageSize)
Get a page of information about the members of a group.

getMembershipBatch(communityId, membershipIds)
Get information about a list of group memberships.

getMyChatterSettings(communityId, groupId)
Get the context user's Chatter settings for a group.

getPhoto(communityId, groupId)
Get the photo for a group.

getRecord(communityId, groupRecordId)
Get a record associated with a group.

getRecords(communityId, groupId)
Get the first page of records associated with a group.

getRecords(communityId, groupId, pageParam, pageSize)
Get a page of records associated with a group.

inviteUsers(groupId, invite)
Invite internal and external users to join a group.

postAnnouncement(communityId, groupId, announcement)
Post an announcement to a group.

removeRecord(communityId, groupRecordId)
Remove the association of a record with a group.

requestGroupMembership(communityId, groupId)
Request membership in a private group.

searchGroups(communityId, q)
Get the first page of groups that match the search criteria.

searchGroups(communityId, q, pageParam, pageSize)
Get a page of groups that match the search criteria.

searchGroups(communityId, q, archiveStatus, pageParam, pageSize)
Get a page of groups with the archive status that match the search criteria.

setBannerPhoto(communityId, groupId, fileId, versionNumber)
Set an uploaded file as the group banner photo.

setBannerPhoto(communityId, groupId, fileUpload)
Set a file that hasn't been uploaded as the group banner photo.

setBannerPhotoWithAttributes(communityId, groupId, bannerPhoto)
Set and crop an uploaded file as the group banner photo.

setBannerPhotoWithAttributes(communityId, groupId, bannerPhoto, fileUpload)
Set and crop a file that hasn't been uploaded as the group banner photo.

setPhoto(communityId, groupId, fileId, versionNumber)
Set an uploaded file as the group photo.

setPhoto(communityId, groupId, fileUpload)
Set a file that hasn't been uploaded as the group photo.

setPhotoWithAttributes(communityId, groupId, photo)
Set and crop an uploaded file as the group photo.

setPhotoWithAttributes(communityId, groupId, photo, fileUpload)
Set and crop a file that hasn't been uploaded as the group photo.

updateGroup(communityId, groupId, groupInput)
Update the settings of a group.

updateGroupMember(communityId, membershipId, role)
Update the role of a group member.

updateMyChatterSettings(communityId, groupId, emailFrequency)
Update the context user's email frequency for a group.

updateRequestStatus(communityId, requestId, status)
Update a request to join a private group.

updateRequestStatus(communityId, requestId, status, responseMessage)
Update a request to join a private group and optionally provide a message when the request is denied.

`addMember(communityId, groupId, userId)`

Add a user to a group as a standard member.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMember addMember(String communityId, String groupId,
String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.GroupMember`

Usage

To execute this method, the context user must be the group owner or moderator.

addMemberWithRole(communityId, groupId, userId, role)

Add a user with a role to a group.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMember addMemberWithRole(String communityId, String
groupId, String userId, ConnectApi.GroupMembershipType role)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

userId
Type: String

ID for a user.

role
Type: ConnectApi.GroupMembershipType

The group membership type. One of these values:

- GroupManager
- StandardMember

Return Value

Type: ConnectApi.GroupMember

Usage

To execute this method, the context user must be the group owner or moderator.

addRecord(communityId, groupId, recordId)

Associate a record with a group.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupRecord addRecord(String communityId, String groupId,
String recordId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, internal, or null.

groupId
Type: String

ID of the group with which to associate the record.

recordId
Type: String

ID of the record to associate with the group.

Return Value

Type: ConnectApi.GroupRecord

createGroup(communityId, groupInput)

Create a group.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupDetail createGroup(String, communityId,
ConnectApi.ChatterGroupInput groupInput)
```

Parameters

communityId
Type: String,

ID for an Experience Cloud site, `internal`, or `null`.

groupInput
Type: `ConnectApi.ChatterGroupInput`

The properties of the group.

Return Value

Type: `ConnectApi.ChatterGroupDetail`

deleteBannerPhoto(communityId, groupId)

Delete the group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void deleteBannerPhoto(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID of the group.

Return Value

Type: Void

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

deleteGroup(communityId, groupId)

Delete a group.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static Void deleteGroup(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: Void

deleteMember(communityId, membershipId)

Remove a member from a group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static Void deleteMember(String communityId, String membershipId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

membershipId
Type: String

ID for a membership.

Return Value

Type: Void

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

deletePhoto(communityId, groupId)

Delete the group photo.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static Void deletePhoto(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: Void

Usage

This method is only successful when the context user is the group manager or owner, or has Modify All Data permission.

getAnnouncements(communityId, groupId)

Get the first page of announcements in a group.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.AnnouncementPage getAnnouncements(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: `ConnectApi.AnnouncementPage`

Usage

To post an announcement, get information about an announcement, update the expiration date of an announcement, or delete an announcement, use the methods of the `ConnectApi.Announcements` class.

getAnnouncements(communityId, groupId, pageParam, pageSize)

Get a page of announcements in a group.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.AnnouncementPage getAnnouncements(String communityId, String groupId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.AnnouncementPage`

Usage

To post an announcement, get information about an announcement, update the expiration date of an announcement, or delete an announcement, use the methods of the `ConnectApi.Announcements` class.

`getBannerPhoto(communityId, groupId)`

Get the group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto getBannerPhoto(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

The ID of the group.

Return Value

Type: `ConnectApi.BannerPhoto`

getGroup(communityId, groupId)

Get information about a group.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupDetail getGroup(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: `ConnectApi.ChatterGroupDetail`

getGroupBatch(communityId, groupIds)

Get information about a list of groups.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getGroupBatch(String communityId, List<String>
groupIds)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupIds
Type: List<String>

A list of up to 500 group IDs.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.ChatterGroup` object and errors embedded in the results for groups that didn't load.

Example

```
// Create a list of groups.
ConnectApi.ChatterGroupPage groupPage = ConnectApi.ChatterGroups.getGroups(null);

// Create a list of group IDs.
List<String> groupIds = new List<String>();
for (ConnectApi.ChatterGroup aGroup : groupPage.groups){
    groupIds.add(aGroup.id);
}

// Get info about all the groups in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterGroups.getGroupBatch(null,
groupIds);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the number of members in each group.
        ConnectApi.ChatterGroup aGroup;
        if(batchResult.getResult() instanceof ConnectApi.ChatterGroup) {
           aGroup = (ConnectApi.ChatterGroup) batchResult.getResult();
        }
```

```
        System.debug('SUCCESS');
        System.debug(aGroup.memberCount);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

SEE ALSO:

getMembershipBatch(communityId, membershipIds)

getGroupMembershipRequest(communityId, requestId)

Get information about a request to join a private group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequest getGroupMembershipRequest(String
communityId, String requestId)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

requestId

Type: String

The ID of a request to join a private group.

Return Value

Type: `ConnectApi.GroupMembershipRequest`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

getGroupMembershipRequests(communityId, groupId)

Get information about every request to join a private group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequests getGroupMembershipRequests(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: `ConnectApi.GroupMembershipRequests`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

getGroupMembershipRequests(communityId, groupId, status)

Get information about every request to join a private group that has a specified status.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequests getGroupMembershipRequests(String communityId, String groupId, ConnectApi.GroupMembershipRequestStatus status)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

status
Type: `ConnectApi.GroupMembershipRequestStatus`

status—Status of a request to join a private group.

- `Accepted`
- `Declined`
- `Pending`

Return Value

Type: `ConnectApi.GroupMembershipRequests`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

`getGroups(communityId)`

Get the first page of groups.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage getGroups(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.ChatterGroupPage`

getGroups(communityId, pageParam, pageSize)

Get a page of groups.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage getGroups(String communityId, Integer
pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterGroupPage`

getGroups(communityId, pageParam, pageSize, archiveStatus)

Get a page of groups with an archive status.

API Version

29.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage getGroups(String communityId, Integer
pageParam, Integer pageSize, ConnectApi.GroupArchiveStatus archiveStatus)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

archiveStatus
Type: `ConnectApi.GroupArchiveStatus`

Archive status of groups.

- `All`—All groups, including groups that are archived and groups that aren't archived.
- `Archived`—Groups that are archived.
- `NotArchived`—Groups that aren't archived.

If you pass in `null`, the default value is `All`.

Return Value

Type: `ConnectApi.ChatterGroupPage`

`getMember(communityId, membershipId)`

Get information about a group member.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMember getMember(String communityId, String membershipId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

membershipId
Type: String

ID for a membership.

Return Value

Type: `ConnectApi.GroupMember`

`getMembers(communityId, groupId)`

Get the first page of information about the members of a group.

API Version

28.0

Available to Guest Users

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMemberPage getMembers(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: `ConnectApi.GroupMemberPage`

getMembers(communityId, groupId, pageParam, pageSize)

Get a page of information about the members of a group.

API Version

28.0

Available to Guest Users

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMemberPage getMembers(String communityId, String groupId,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.GroupMemberPage`

getMembershipBatch(communityId, membershipIds)

Get information about a list of group memberships.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getMembershipBatch(String communityId,
List<String> membershipIds)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

membershipIds
Type: List<String>

A list of up to 500 group membership IDs.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.GroupMember` object and errors embedded in the results for group memberships that didn't load.

Example

```
// Get members of a group.
ConnectApi.GroupMemberPage membersPage = ConnectApi.ChatterGroups.getMembers(null,
'0F9D00000000oOT');

// Create a list of membership IDs.
List<String> membersList = new List<String>();
for (ConnectApi.GroupMember groupMember : membersPage.members){
    membersList.add(groupMember.id);
}

// Get info about all group memberships in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterGroups.getMembershipBatch(null,
 membersList);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the first name of each member.
        ConnectApi.GroupMember groupMember;
        if(batchResult.getResult() instanceof ConnectApi.GroupMember) {
            groupMember = (ConnectApi.GroupMember) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(groupMember.user.firstName);
    }
```

```
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

SEE ALSO:

getGroupBatch(communityId, groupIds)

getMyChatterSettings(communityId, groupId)

Get the context user's Chatter settings for a group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupChatterSettings getMyChatterSettings(String communityId,
String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: `ConnectApi.GroupChatterSettings`

getPhoto(communityId, groupId)

Get the photo for a group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo getPhoto(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: `ConnectApi.Photo`

getRecord(communityId, groupRecordId)

Get a record associated with a group.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupRecord getRecord(String communityId, String groupRecordId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupRecordId
Type: String

ID of the group record.

Return Value

Type: `ConnectApi.GroupRecord`

`getRecords(communityId, groupId)`

Get the first page of records associated with a group.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupRecordPage getRecords(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: `ConnectApi.GroupRecordPage`

`getRecords(communityId, groupId, pageParam, pageSize)`

Get a page of records associated with a group.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupRecordPage getRecords(String communityId, String groupId,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.GroupRecordPage`

inviteUsers(groupId, invite)

Invite internal and external users to join a group.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Invitations inviteUsers(String groupId, ConnectApi.InviteInput
invite)
```

Parameters

groupId
Type: String

ID of the group.

invite
Type: `ConnectApi.InviteInput`

A `ConnectApi.InviteInput` body.

Return Value

Type: `ConnectApi.Invitations`

postAnnouncement(communityId, groupId, announcement)

Post an announcement to a group.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Announcement postAnnouncement(String communityId, String groupId, ConnectApi.AnnouncementInput announcement)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

announcement
Type: `ConnectApi.AnnouncementInput`

A `ConnectApi.AnnouncementInput` object.

Return Value

Type: `ConnectApi.Announcement`

Usage

Use an announcement to highlight information. Users can discuss, like, and post comments on announcements. Deleting the feed post deletes the announcement.

To post an announcement, get information about an announcement, update the expiration date of an announcement, or delete an announcement, use the methods of the `ConnectApi.Announcements` class.

removeRecord(communityId, groupRecordId)

Remove the association of a record with a group.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static Void removeRecord(String communityId, String groupRecordId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupRecordId
Type: String

ID of the group record.

Return Value

Type: Void

requestGroupMembership(communityId, groupId)

Request membership in a private group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequest requestGroupMembership(String
communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: ConnectApi.GroupMembershipRequest

Sample: Requesting to Join a Private Group

This sample code calls `ConnectApi.ChatterGroups.requestGroupMembership` to request to join a private group.

```
String communityId = null;
ID groupId = '0F9x00000000hAZ';

ConnectApi.GroupMembershipRequest membershipRequest =
ConnectApi.ChatterGroups.requestGroupMembership(communityId, groupId);
```

searchGroups(communityId, q)

Get the first page of groups that match the search criteria.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage searchGroups(String communityId, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

Return Value

Type: ConnectApi.ChatterGroupPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchGroups(communityId, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchGroups(communityId, q, pageParam, pageSize)`

Get a page of groups that match the search criteria.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage searchGroups(String communityId, String q,
Integer pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`q`
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterGroupPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchGroups(communityId, q, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

`searchGroups(communityId, q, archiveStatus, pageParam, pageSize)`

Get a page of groups with the archive status that match the search criteria.

API Version

29.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage searchGroups(String communityId, String q,
ConnectApi.GroupArchiveStatus archiveStatus, Integer pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`q`
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

`archiveStatus`
Type: `ConnectApi.GroupArchiveStatus`

Archive status of groups.

- `All`—All groups, including groups that are archived and groups that aren't archived.
- `Archived`—Groups that are archived.

- `NotArchived`—Groups that aren't archived.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterGroupPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchGroups(communityId, q, archiveStatus, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

`setBannerPhoto(communityId, groupId, fileId, versionNumber)`

Set an uploaded file as the group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String groupId,
String fileId, Integer versionNumber)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`groupId`
Type: String

The ID of the group.

fileId
Type: String

The ID of the already uploaded file. The key prefix must be 069, and the image must be smaller than 8 MB.

versionNumber
Type: Integer

Version number of the existing file. Specify either an existing version number or, to get the latest version, specify `null`.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

setBannerPhoto(communityId, groupId, fileUpload)

Set a file that hasn't been uploaded as the group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String groupId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

The ID of the group.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.BannerPhoto

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

setBannerPhotoWithAttributes(communityId, groupId, bannerPhoto)

Set and crop an uploaded file as the group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,
String groupId, ConnectApi.BannerPhotoInput bannerPhoto)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

The ID of the group.

bannerPhoto
Type: ConnectApi.BannerPhotoInput

A `ConnectApi.BannerPhotoInput` object that specifies the ID and version of the file, and how to crop the file.

Return Value

Type: ConnectApi.BannerPhoto

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

setBannerPhotoWithAttributes(communityId, groupId, bannerPhoto, fileUpload)

Set and crop a file that hasn't been uploaded as the group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,
String groupId, ConnectApi.BannerPhotoInput bannerPhoto, ConnectApi.BinaryInput
fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

The ID of the group.

bannerPhoto
Type: `ConnectApi.BannerPhotoInput`

A `ConnectApi.BannerPhotoInput` object specifying the cropping parameters.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

setPhoto(communityId, groupId, fileId, versionNumber)

Set an uploaded file as the group photo.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String groupId, String
fileId, Integer versionNumber)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

fileId
Type: String

ID of a file already uploaded. The key prefix must be 069, and the file must be an image that is smaller than 2 GB.

versionNumber
Type: Integer

Version number of the existing file. Specify either an existing version number or, to get the latest version, specify `null`.

Return Value

Type: `ConnectApi.Photo`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

Sample: Updating a Group Photo with an Existing File

When a group is created, it doesn't have a group photo. You can set an existing photo that has already been uploaded to Salesforce as the group photo. The key prefix must be 069 and the file size must be less than 2 GB.

```
String communityId = null;
ID groupId = '0F9x00000000hAK';
ID fileId = '069x00000001Ion';

// Set photo
ConnectApi.Photo photo = ConnectApi.ChatterGroups.setPhoto(communityId, groupId, fileId,
null);
```

setPhoto(communityId, groupId, fileUpload)

Set a file that hasn't been uploaded as the group photo.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String groupId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

Sample: Uploading a New File and Using It as a Group Photo

When a group is created, it doesn't have a group photo. You can upload a photo and set it as the group photo.

```
String communityId = null;
ID groupId = '0F9x00000000hAP';
ID photoId = '069x00000001Ioo';

// Set photo
List<ContentVersion> groupPhoto = [Select c.VersionData From ContentVersion c where
ContentDocumentId=:photoId];
ConnectApi.BinaryInput binary = new ConnectApi.BinaryInput(groupPhoto.get(0).VersionData,
```

```
 'image/png', 'image.png');
ConnectApi.Photo photo = ConnectApi.ChatterGroups.setPhoto(communityId, groupId, binary);
```

setPhotoWithAttributes(communityId, groupId, photo)

Set and crop an uploaded file as the group photo.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String groupId,
ConnectApi.PhotoInput photo)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object that specifies the ID and version of the file, and how to crop the file.

Return Value

Type: `ConnectApi.Photo`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

setPhotoWithAttributes(communityId, groupId, photo, fileUpload)

Set and crop a file that hasn't been uploaded as the group photo.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String groupId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object that specifies how to crop the file specified in *`fileUpload`*.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and might not be visible right away.

`updateGroup(communityId, groupId, groupInput)`

Update the settings of a group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroup updateGroup(String communityId, String groupId,
ConnectApi.ChatterGroupInput groupInput)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

groupInput
Type: `ConnectApi.ChatterGroupInput`

A `ConnectApi.ChatterGroupInput` object.

Return Value

Type: `ConnectApi.ChatterGroup`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission. Use this method to update any settings in the `ConnectApi.ChatterGroupInput` class. These settings include the group title and text in the "Information" section, whether the group is public or private, and whether the group is archived.

Example

This example archives a group.

```
String groupId = '0F9D00000000qSz';
String communityId = null;

ConnectApi.ChatterGroupInput groupInput = new ConnectApi.ChatterGroupInput();
groupInput.isArchived = true;

ConnectApi.ChatterGroups.updateGroup(communityId, groupId, groupInput);
```

updateGroupMember(communityId, membershipId, role)

Update the role of a group member.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroup updateGroupMember(String communityId, String
membershipId, ConnectApi.GroupMembershipType role)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

membershipId
Type: String

ID for a membership.

role
Type: `ConnectApi.GroupMembershipType`

The group membership type. One of these values:

- `GroupManager`
- `StandardMember`

Return Value

Type: `ConnectApi.ChatterGroup`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

updateMyChatterSettings(communityId, groupId, emailFrequency)

Update the context user's email frequency for a group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupChatterSettings updateMyChatterSettings(String communityId,
String groupId, ConnectApi.GroupEmailFrequency emailFrequency)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

emailFrequency
Type: `ConnectApi.GroupEmailFrequency`

Frequency with which a user receives email.

- `EachPost`
- `DailyDigest`
- `WeeklyDigest`
- `Never`
- `UseDefault`

The value `UseDefault` uses the value set in a call to `updateChatterSettings(communityId, userId, defaultGroupEmailFrequency)`.

Return Value

Type: `ConnectApi.GroupChatterSettings`

updateRequestStatus(communityId, requestId, status)

Update a request to join a private group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequest updateRequestStatus(String communityId,
String requestId, ConnectApi.GroupMembershipRequestStatus status)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

requestId
Type: String

ID for a request to join a private group.

status
Type: `ConnectApi.GroupMembershipRequestStatus`

Status of the request:

- `Accepted`
- `Declined`

The `Pending` value of the enum is not valid in this method.

Return Value

Type: `ConnectApi.GroupMembershipRequest`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Sample: Accepting or Declining a Request to Join a Private Group

This sample code calls `ConnectApi.ChatterGroups.updateRequestStatus` and passes it the membership request ID and an `ConnectApi.GroupMembershipRequestStatus.Accepted` status. You can also pass `ConnectApi.GroupMembershipRequestStatus.Declined`.

```
String communityId = null;
ID groupId = '0F9x00000000hAZ';
String requestId = '0I5x000000001snCAA';

ConnectApi.GroupMembershipRequest membershipRequestRep =
ConnectApi.ChatterGroups.updateRequestStatus(communityId, requestId,
ConnectApi.GroupMembershipRequestStatus.Accepted);
```

updateRequestStatus(communityId, requestId, status, responseMessage)

Update a request to join a private group and optionally provide a message when the request is denied.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequest updateRequestStatus(String communityId,
String requestId, ConnectApi.GroupMembershipRequestStatus status, String responseMessage)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

requestId
Type: String

ID for a request to join a private group.

status
Type: `ConnectApi.GroupMembershipRequestStatus`

Status of the request:

- `Accepted`
- `Declined`

The `Pending` value of the enum is not valid in this method.

responseMessage
Type: String

Provide a message to the user if their membership request is declined. The value of this property is used only when the value of the `status` property is `Declined`.

The maximum length is 756 characters.

Return Value

Type: `ConnectApi.GroupMembershipRequest`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

ChatterGroups Test Methods

The following are the test methods for `ChatterGroups`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestSearchGroups(communityId, q, result)`

Register a `ConnectApi.ChatterGroupPage` object to be returned when the matching `ConnectApi.searchGroups` method is called in a test context. Use the test method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestSearchGroups(String communityId, String q,
ConnectApi.ChatterGroupPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

result
Type: `ConnectApi.ChatterGroupPage`

Test `ConnectApi.ChatterGroupPage` object.

Return Value

Type: Void

SEE ALSO:

searchGroups(communityId, q)

Apex Developer Guide: Testing ConnectApi Code

`setTestSearchGroups(communityId, q, pageParam, pageSize, result)`

Register a `ConnectApi.ChatterGroupPage` object to be returned when the matching `ConnectApi.searchGroups` method is called in a test context. Use the test method with the same parameters or you receive an exception.

API Version

28.0

Signature

```
public static Void setTestSearchGroups(String communityId, String q, Integer pageParam,
Integer pageSize, ConnectApi.ChatterGroupPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.ChatterGroupPage`

Test `ConnectApi.ChatterGroupPage` object.

Return Value

Type: Void

SEE ALSO:

searchGroups(communityId, q, pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

`setTestSearchGroups(communityId, q, archiveStatus, pageParam, pageSize, result)`

Register a `ConnectApi.ChatterGroupPage` object to be returned when the matching `ConnectApi.searchGroups` method is called in a test context. Use the test method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestSearchGroups(String communityId, String q,
ConnectApi.GroupArchiveStatus, archiveStatus, Integer pageParam, Integer pageSize,
ConnectApi.ChatterGroupPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

archiveStatus
Type: `ConnectApi.GroupArchiveStatus`

Archive status of groups.

- `All`—All groups, including groups that are archived and groups that aren't archived.
- `Archived`—Groups that are archived.
- `NotArchived`—Groups that aren't archived.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.ChatterGroupPage`

Test `ConnectApi.ChatterGroupPage` object.

Return Value

Type: Void

SEE ALSO:

searchGroups(communityId, q, archiveStatus, pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

ChatterMessages Class

Get, send, search, and reply to private messages. You can also get and search private conversations, mark conversations as read, and get a count of unread private messages.

Namespace

ConnectApi

Usage

Private messages and direct messages are different features. Direct messages are newer and offer a richer feature set for private communication in Experience Cloud sites. Direct messages are a capability within Chatter feeds. To work with direct messages, use the ChatterFeeds Class.

ChatterMessages Methods

The following are methods for `ChatterMessages`. All methods are static.

IN THIS SECTION:

getConversation(conversationId)
Get a conversation.

getConversation(conversationId, pageParam, pageSize)
Get a page of a conversation.

getConversation(communityId, conversationId)
Get a conversation from an Experience Cloud site.

getConversation(communityId, conversationId, pageParam, pageSize)
Get a page of a conversation from an Experience Cloud site.

getConversations()
Get the most recent conversations.

getConversations(pageParam, pageSize)
Get a page of conversations.

getConversations(communityId)
Get the most recent conversations from an Experience Cloud site.

getConversations(communityId, pageParam, pageSize)
Get a page of conversations from an Experience Cloud site.

getMessage(messageId)
Get a message.

getMessage(communityId, messageId)
Get a message from an Experience Cloud site.

getMessages()
Get the most recent messages.

getMessages(pageParam, pageSize)
Get a page of messages.

getMessages(communityId)
Get the most recent messages from an Experience Cloud site.

getMessages(communityId, pageParam, pageSize)
Get a page of messages from an Experience Cloud site.

getUnreadCount()
Get the number of conversations that are marked unread.

getUnreadCount(communityId)
Get the number of conversations that are marked unread in an Experience Cloud site.

markConversationRead(conversationId, read)
Mark a conversation as read or unread.

markConversationRead(communityId, conversationID, read)
Mark a conversation as read or unread in an Experience Cloud site.

replyToMessage(text, inReplyTo)
Reply to a message.

replyToMessage(communityId, text, inReplyTo)
Reply to a message in an Experience Cloud site.

searchConversation(conversationId, q)
Get a conversation that matches the search criteria.

searchConversation(conversationId, pageParam, pageSize, q)
Get a conversation with a page of messages that match the search criteria.

searchConversation(communityId, conversationId, q)
Get a conversation with messages that match the search criteria in an Experience Cloud site.

searchConversation(communityId, conversationId, pageParam, pageSize, q)
Get a conversation with a page of messages that match the search criteria in an Experience Cloud site.

searchConversations(q)
Get conversations in which member names and messages match the search criteria.

searchConversations(pageParam, pageSize, q)
Get a page of conversations in which member names and messages match the search criteria.

searchConversations(communityId, q)
Get conversations in which member names and messages match the search criteria in an Experience Cloud site.

searchConversations(communityId, pageParam, pageSize, q)
Get a page of conversations in which member names and messages match the search criteria in an Experience Cloud site.

searchMessages(q)
Get messages that match the search criteria.

searchMessages(pageParam, pageSize, q)
Get a page of messages that match the search criteria.

searchMessages(communityId, q)
Get messages that match the search criteria in an Experience Cloud site.

searchMessages(communityId, pageParam, pageSize, q)
Get a page of messages that match the search criteria in an Experience Cloud site.

sendMessage(text, recipients)
Send a message to a list of recipients.

sendMessage(communityId, text, recipients)
Send a message to a list of recipients in an Experience Cloud site.

`getConversation(conversationId)`

Get a conversation.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation getConversation(String conversationId)
```

Parameters

`conversationId`
Type: String

ID for the conversation.

Return Value

Type: ConnectApi.ChatterConversation

getConversation(conversationId, pageParam, pageSize)

Get a page of a conversation.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation getConversation(String conversationId,
String pageParam, Integer pageSize)
```

Parameters

conversationId
Type: String

ID for the conversation.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: ConnectApi.ChatterConversation

getConversation(communityId, conversationId)

Get a conversation from an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation getConversation(String communityId, String conversationId)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

conversationId
Type: String

ID for the conversation.

Return Value

Type: `ConnectApi.ChatterConversation`

getConversation(communityId, conversationId, pageParam, pageSize)

Get a page of a conversation from an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation getConversation(String communityId, String conversationId, String pageParam, String pageSize)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

conversationId
Type: String

ID for the conversation.

pageParam
Type:String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterConversation`

getConversations()

Get the most recent conversations.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage getConversations()
```

Return Value

Type: `ConnectApi.ChatterConversationPage`

getConversations(pageParam, pageSize)

Get a page of conversations.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage getConversations(String pageParam,
Integer pageSize)
```

Parameters

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterConversationPage`

getConversations(communityId)

Get the most recent conversations from an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage getConversations(String communityId)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.ChatterConversationPage`

getConversations(communityId, pageParam, pageSize)

Get a page of conversations from an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage getConversations(String communityId,
String pageParam, Integer pageSize)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type:String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterConversationPage`

getMessage(messageId)

Get a message.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage getMessage(String messageId)
```

Parameters

messageId
Type: String

ID for the message.

Return Value

Type: `ConnectApi.ChatterMessage`

getMessage(communityId, messageId)

Get a message from an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage getMessage(String communityId, String messageId)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

messageId
Type: String

ID for the message.

Return Value

Type:`ConnectApi.ChatterMessage`

getMessages()

Get the most recent messages.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage getMessages()
```

Return Value

Type: `ConnectApi.ChatterMessagePage`

`getMessages(pageParam, pageSize)`

Get a page of messages.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage getMessages(String pageParam, Integer pageSize)
```

Parameters

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterMessagePage`

`getMessages(communityId)`

Get the most recent messages from an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage getMessages(String communityId)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.ChatterMessagePage`

getMessages(communityId, pageParam, pageSize)

Get a page of messages from an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage getMessages(String communityId, String pageParam, Integer pageSize)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterMessagePage`

getUnreadCount()

Get the number of conversations that are marked unread.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UnreadConversationCount getUnreadCount()
```

Return Value

Type: `ConnectApi.UnreadConversationCount`

If there are fewer than 50 unread conversations, `ConnectApi.UreadConversationCount` returns the exact number of unread conversations and the `hasMore` property is `false`. If there are more than 50 unread conversations, `ConnectApi.UreadConversationCount` returns 50 unread conversations and the `hasMore` property is `true`.

Example

```
ConnectApi.UnreadConversationCount unread = ConnectApi.ChatterMessages.getUnreadCount();
```

`getUnreadCount(communityId)`

Get the number of conversations that are marked unread in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UnreadConversationCount getUnreadCount(String communityId)
```

Parameters

`communityId`
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.UnreadConversationCount`

If there are fewer than 50 unread conversations, `ConnectApi.UreadConversationCount` returns the exact number of unread conversations and the `hasMore` property is `false`. If there are more than 50 unread conversations, `ConnectApi.UreadConversationCount` returns 50 unread conversations and the `hasMore` property is `true`.

markConversationRead(conversationId, read)

Mark a conversation as read or unread.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationSummary markConversationRead(String conversationId, Boolean read)
```

Parameters

conversationId
Type: String

ID for the conversation.

read
Type: Boolean

Specify whether the conversation is read (`true`) or not (`false`).

Return Value

Type: `ConnectApi.ChatterConversationSummary`

markConversationRead(communityId, conversationID, read)

Mark a conversation as read or unread in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationSummary markConversationRead(String communityId, String conversationID, Boolean read)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

conversationId
Type: String

ID for the conversation.

read
Type: Boolean

Specify whether the conversation is read (`true`) or not (`false`).

Return Value

Type: `ConnectApi.ChatterConversationSummary`

replyToMessage(text, inReplyTo)

Reply to a message.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage replyToMessage(String text, String inReplyTo)
```

Parameters

text
Type: String

Text of the message. Can't be empty or over 10,000 characters.

inReplyTo
Type: String

ID of the message that is being responded to.

Return Value

Type: `ConnectApi.ChatterMessage`

replyToMessage(communityId, text, inReplyTo)

Reply to a message in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage replyToMessage(String communityId, String text,
String inReplyTo)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

text
Type: String

Text of the message. Can't be empty or over 10,000 characters.

inReplyTo
Type: String

ID of the message that is being responded to.

Return Value

Type: `ConnectApi.ChatterMessage`

searchConversation(conversationId, q)

Get a conversation that matches the search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation searchConversation(String conversationId,
String q)
```

Parameters

conversationId
Type: String

ID for the conversation.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversation`

searchConversation(conversationId, pageParam, pageSize, q)

Get a conversation with a page of messages that match the search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation searchConversation(String conversationId,
String pageParam, Integer pageSize, String q)
```

Parameters

conversationId
Type: String

ID for the conversation.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: ConnectApi.ChatterConversation

searchConversation(communityId, conversationId, q)

Get a conversation with messages that match the search criteria in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation searchConversation(String communityId,
String conversationId, String q)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

conversationId
Type: String

ID for the conversation.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: ConnectApi.ChatterConversation

searchConversation(communityId, conversationId, pageParam, pageSize, q)

Get a conversation with a page of messages that match the search criteria in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation searchConversation(String communityId,
String conversationId, String pageParam, Integer pageSize, String q)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

conversationId
Type: String

ID for the conversation.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversation`

searchConversations(q)

Get conversations in which member names and messages match the search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage searchConversations(String q)
```

Parameters

q

Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversationPage`

searchConversations(pageParam, pageSize, q)

Get a page of conversations in which member names and messages match the search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage searchConversations(String pageParam,
Integer pageSize, String q)
```

Parameters

pageParam

Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q

Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversationPage`

searchConversations(communityId, q)

Get conversations in which member names and messages match the search criteria in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage searchConversations(String communityId,
String q)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversationPage`

searchConversations(communityId, pageParam, pageSize, q)

Get a page of conversations in which member names and messages match the search criteria in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage searchConversations(String communityId,
String pageParam, Integer pageSize, String q)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversationPage`

searchMessages(q)

Get messages that match the search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String q)
```

Parameters

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterMessagePage`

searchMessages(pageParam, pageSize, q)

Get a page of messages that match the search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String pageParam, Integer pageSize, String q)
```

Parameters

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterMessagePage`

searchMessages(communityId, q)

Get messages that match the search criteria in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String communityId, String q)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterMessagePage`

searchMessages(communityId, pageParam, pageSize, q)

Get a page of messages that match the search criteria in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String communityId, String pageParam, Integer pageSize, String q)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: ConnectApi.ChatterMessagePage

sendMessage(text, recipients)

Send a message to a list of recipients.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage sendMessage(String text, String recipients)
```

Parameters

text
Type: String

Text of the message. Can't be empty or over 10,000 characters.

recipients
Type: String

Up to nine comma-separated IDs of the users receiving the message.

Return Value

Type: ConnectApi.ChatterMessage

sendMessage(communityId, text, recipients)

Send a message to a list of recipients in an Experience Cloud site.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage sendMessage(String communityId, String text,
String recipients)
```

Parameters

communityId
Type:String

ID for an Experience Cloud site, `internal`, or `null`.

text
Type: String

Text of the message. Can't be empty or over 10,000 characters.

recipients
Type: String

Up to nine comma-separated IDs of users to receive the message.

Return Value

Type: `ConnectApi.ChatterMessage`

ChatterUsers Class

Access information about users, such as activity, followers, subscriptions, files, and groups.

Namespace

ConnectApi

ChatterUsers Methods

The following are methods for `ChatterUsers`. All methods are static.

IN THIS SECTION:

exportUserActivities(communityId, userId)
Export Chatter-related user activity, such as bookmarks, topic endorsements, and votes.

follow(communityId, userId, subjectId)
Follow a user or record.

getChatterSettings(communityId, userId)
Get the default Chatter settings for a user.

getFollowers(communityId, userId)
Get the first page of followers for a user.

getFollowers(communityId, userId, pageParam, pageSize)
Get a page of followers for a user.

getFollowings(communityId, userId)
Get the first page of users and records that a user follows.

getFollowings(communityId, userId, pageParam)
Get a page of users and records that a user follows.

getFollowings(communityId, userId, pageParam, pageSize)
Get a page with the specified number of users and records that a user follows.

getFollowings(communityId, userId, filterType)
Get the first page of records, filtered by key prefix, that a user follows.

getFollowings(communityId, userId, filterType, pageParam)
Get a page of records, filtered by key prefix, that a user follows.

getFollowings(communityId, userId, filterType, pageParam, pageSize)
Get a page with the specified number of records, filtered by key prefix, that a user follows.

getReputation(communityId, userId)
Get a user's reputation.

getUser(communityId, userId)
Get information about a user.

getUserBatch(communityId, userIds)
Get information about a list of users.

getUserGroups(communityId, userId)
Get a user's groups.

getUserGroups(communityId, userId, pageParam, pageSize)
Get a page of a user's groups.

getUsers(communityId)
Get the first page of users.

getUsers(communityId, pageParam, pageSize)
Get a page of users.

purgeUserActivities(communityId, userId)
Start a job to purge Chatter-related user activity, such as bookmarks, topic endorsements, and votes.

searchUserGroupDetails(communityId, userId, q)
Get the user's groups that match the search criteria.

searchUserGroupDetails(communityId, userId, q, pageParam, pageSize)
Get a page of a user's groups that match the search criteria.

searchUsers(communityId, q)
Get the first page of users that match the search criteria.

searchUsers(communityId, q, pageParam, pageSize)
Get a page of users that match the search criteria.

searchUsers(communityId, q, searchContextId, pageParam, pageSize)
Get a page of users that match the search criteria.

updateChatterSettings(communityId, userId, defaultGroupEmailFrequency)
Update the default Chatter settings for a user.

updateUser(communityId, userId, userInput)
Update the About Me section for a user.

`exportUserActivities(communityId, userId)`

Export Chatter-related user activity, such as bookmarks, topic endorsements, and votes.

API Version

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserActivitiesJob exportUserActivities(String communityId,
String userId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID of the user.

Return Value

Type: `ConnectApi.UserActivitiesJob`

Usage

The following activities can be exported.

- `Bookmark`—User bookmarked a post.
- `ChatterActivity`—Total counts of posts and comments made and likes and comments received for a user.
- `ChatterLike`—User liked a post or comment.
- `Comment`—User commented on a post.
- `CompanyVerify`—User verified comment.
- `DownVote`—User downvoted a post or comment.
- `FeedEntityRead`—User read a post.
- `FeedRead`—User read a feed.
- `Mute`—User muted a post.
- `Post`—User made a post.
- `TopicEndorsement`—User endorsed another user on a topic or received endorsement on a topic.
- `UpVote`—User upvoted a post or comment.

follow(communityId, userId, subjectId)

Follow a user or record.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Subscription follow(String communityId, String userId, String subjectId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

subjectId
Type: String

ID of the user or record to follow.

Return Value

Type: `ConnectApi.Subscription`

Example

```
ChatterUsers.ConnectApi.Subscription subscriptionToRecord =
ConnectApi.ChatterUsers.follow(null, 'me', '001RR000002G4Y0');
```

SEE ALSO:

Unfollow a Record

getChatterSettings(communityId, userId)

Get the default Chatter settings for a user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserChatterSettings getChatterSettings(String communityId,
String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

Return Value

Type: `ConnectApi.UserChatterSettings`

getFollowers(communityId, userId)

Get the first page of followers for a user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowerPage getFollowers(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: ConnectApi.FollowerPage

getFollowers(communityId, userId, pageParam, pageSize)

Get a page of followers for a user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowerPage getFollowers(String communityId, String userId,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: ConnectApi.FollowerPage

getFollowings(communityId, userId)

Get the first page of users and records that a user follows.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.FollowingPage`

getFollowings(communityId, userId, pageParam)

Get a page of users and records that a user follows.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId,
Integer pageParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

Return Value

Type: `ConnectApi.FollowingPage`

getFollowings(communityId, userId, pageParam, pageSize)

Get a page with the specified number of users and records that a user follows.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.FollowingPage`

getFollowings(communityId, userId, filterType)

Get the first page of records, filtered by key prefix, that a user follows.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId,
String filterType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

filterType
Type: String

Specifies the key prefix to filter the type of objects returned. A key prefix is the first three characters of the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

Return Value

Type: ConnectApi.FollowingPage

getFollowings(communityId, userId, filterType, pageParam)

Get a page of records, filtered by key prefix, that a user follows.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId,
String filterType, Integer pageParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

filterType
Type: String

Specifies the key prefix to filter the type of objects returned. A key prefix is the first three characters of the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

Return Value

Type: ConnectApi.FollowingPage

getFollowings(communityId, userId, filterType, pageParam, pageSize)

Get a page with the specified number of records, filtered by key prefix, that a user follows.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId,
String filterType, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

filterType
Type: String

Specifies the key prefix to filter the type of objects returned. A key prefix is the first three characters of the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.FollowingPage`

getReputation(communityId, userId)

Get a user's reputation.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Reputation getReputation(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.Reputation`

getUser(communityId, userId)

Get information about a user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserSummary getUser(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.UserDetail`

Usage

If the user is external, the properties that the `ConnectApi.UserDetail` output class shares with the `ConnectApi.UserSummary` output class can have non-null values. Other properties are always `null`.

getUserBatch(communityId, userIds)

Get information about a list of users.

API Version

31.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getUserBatch(String communityId, List<String>
userIds)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userIds
Type: List<String>

A list of up to 500 user IDs.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.User` object and errors for users that didn't load.

Example

```
// Get users in an organization.
ConnectApi.UserPage userPage = ConnectApi.ChatterUsers.getUsers(null);

// Create a list of user IDs.
List<String> userList = new List<String>();
for (ConnectApi.User user : userPage.users){
    userList.add(user.id);
}

// Get info about all users in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterUsers.getUserBatch(null, userList);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print each user's username.
        ConnectApi.UserDetail user;
        if(batchResult.getResult() instanceof ConnectApi.UserDetail) {
            user = (ConnectApi.UserDetail) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(user.username);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

`getUserGroups(communityId, userId)`

Get a user's groups.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupDetailPage getUserGroups(String communityId, String
userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.UserGroupDetailPage`

getUserGroups(communityId, userId, pageParam, pageSize)

Get a page of a user's groups.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupDetailPage getUserGroups(String communityId, String
userId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserGroupDetailPage`

getUsers(communityId)

Get the first page of users.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage getUsers(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.UserPage`

getUsers(communityId, pageParam, pageSize)

Get a page of users.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage getUsers(String communityId, Integer pageParam,
Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserPage`

purgeUserActivities(communityId, userId)

Start a job to purge Chatter-related user activity, such as bookmarks, topic endorsements, and votes.

API Version

42.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserActivitiesJob purgeUserActivities(String communityId,
String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.UserActivitiesJob`

Usage

The following activities can be purged with this method.

- `Bookmark`—User bookmarked a post.
- `ChatterActivity`—Total counts of posts and comments made and likes and comments received for a user.
- `ChatterLike`—User liked a post or comment.
- `CompanyVerify`—User verified comment.
- `DownVote`—User downvoted a post or comment.
- `FeedEntityRead`—User read a post.
- `FeedRead`—User read a feed.
- `Mute`—User muted a post.
- `TopicEndorsement`—User endorsed another user on a topic or received endorsement on a topic.
- `UpVote`—User upvoted a post or comment.

To delete a user's posts and comments, use these methods, respectively.

- `deleteFeedElement(communityId, feedElementId)`
- `deleteComment(communityId, commentId)`

`searchUserGroupDetails(communityId, userId, q)`

Get the user's groups that match the search criteria.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupDetailPage searchUserGroupDetails(String communityId,
String userId, String q)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.UserGroupDetailPage`

searchUserGroupDetails(communityId, userId, q, pageParam, pageSize)

Get a page of a user's groups that match the search criteria.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupDetailPage searchUserGroupDetails(String communityId,
String userId, String q, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserGroupDetailPage`

searchUsers(communityId, q)

Get the first page of users that match the search criteria.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage searchUsers(String communityId, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.UserPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchUsers(communityId, q, result)

Apex Developer Guide: Testing ConnectApi Code

`searchUsers(communityId, q, pageParam, pageSize)`

Get a page of users that match the search criteria.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage searchUsers(String communityId, String q, Integer pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`q`
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchUsers(communityId, q, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

`searchUsers(communityId, q, searchContextId, pageParam, pageSize)`

Get a page of users that match the search criteria.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage searchUsers(String communityId, String q, String
searchContextId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

searchContextId
Type: String

A feed item ID that filters search results for feed @mentions. More useful results are listed first. When you specify this argument, you cannot query more than 500 results and you cannot use wildcards in the search term.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchUsers(communityId, q, searchContextId, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

`updateChatterSettings(communityId, userId, defaultGroupEmailFrequency)`

Update the default Chatter settings for a user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserChatterSettings updateChatterSettings(String communityId,
String userId, ConnectApi.GroupEmailFrequency defaultGroupEmailFrequency)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

defaultGroupEmailFrequency
Type: `ConnectApi.GroupEmailFrequency`

Frequency with which a user receives email. Values are:

- `EachPost`
- `DailyDigest`
- `WeeklyDigest`
- `Never`
- `UseDefault`

Don't pass the value `UseDefault` for the *`defaultGroupEmailFrequency`* parameter because calling `updateChatterSettings` sets the default value.

Return Value

Type: `ConnectApi.UserChatterSettings`

`updateUser(communityId, userId, userInput)`

Update the About Me section for a user.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserDetail updateUser(String communityId, String userId,
ConnectApi.UserInput userInput)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID for the context user or the keyword `me`.

`userInput`
Type: `ConnectApi.UserInput`

Specifies the updated information.

Return Value

Type: `ConnectApi.UserDetail`

ChatterUsers Test Methods

The following are the test methods for `ChatterUsers`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

IN THIS SECTION:

setTestSearchUsers(communityId, q, result)

Register a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchUsers(communityId, q, pageParam, pageSize, result)

Register a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

setTestSearchUsers(communityId, q, searchContextId, pageParam, pageSize, result)

Register a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

`setTestSearchUsers(communityId, q, result)`

Register a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0

Signature

```
public static Void setTestSearchUsers(String communityId, String q, ConnectApi.UserPage result)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q

Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result

Type: `ConnectApi.UserPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchUsers(communityId, q)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchUsers(communityId, q, pageParam, pageSize, result)

Register a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0

Signature

```
public static Void setTestSearchUsers(String communityId, String q, Integer pageParam,
Integer pageSize, ConnectApi.UserPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.UserPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchUsers(communityId, q, pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

setTestSearchUsers(communityId, q, searchContextId, pageParam, pageSize, result)

Register a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0

Signature

```
public static Void setTestSearchUsers(String communityId, String q, String
searchContextId, Integer pageParam, Integer pageSize, ConnectApi.UserPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

searchContextId
Type: String

A feed item ID that filters search results for feed @mentions. More useful results are listed first. When you specify this argument, you cannot query more than 500 results and you cannot use wildcards in the search term.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.UserPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

searchUsers(communityId, q, searchContextId, pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

Retired ChatterUsers Methods

The following methods for `ChatterUsers` are retired.

IN THIS SECTION:

deletePhoto(communityId, userId)
Delete a user's photo.

getGroups(communityId, userId)
Get the groups that a user is a member of.

getGroups(communityId, userId, pageParam, pageSize)
Get a page of groups that a user is a member of.

getPhoto(communityId, userId)
Get a user's photo.

searchUserGroups(communityId, userId, q)
Get the user's groups that match the search criteria.

searchUserGroups(communityId, userId, q, pageParam, pageSize)
Get a page of a user's groups that match the search criteria.

setPhoto(communityId, userId, fileId, versionNumber)
Set an uploaded file as a user's photo.

setPhoto(communityId, userId, fileUpload)
Set a file that hasn't been uploaded as the user's photo.

setPhotoWithAttributes(communityId, userId, photo)
Set and crop an uploaded file as a user's photo.

setPhotoWithAttributes(communityId, userId, photo, fileUpload)
Set and crop a file that hasn't been uploaded as a user's photo.

`deletePhoto(communityId, userId)`

Delete a user's photo.

API Version

28.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.deletePhoto(communityId, userId)`

Signature

```
public static Void deletePhoto(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

Return Value

Type: Void

getGroups(communityId, userId)

Get the groups that a user is a member of.

API Version

28.0–44.0

Important: In version 45.0 and later, use `getUserGroups(communityId, userId)`.

Available to Guest Users

32.0–44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage getGroups(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.UserGroupPage`

getGroups(communityId, userId, pageParam, pageSize)

Get a page of groups that a user is a member of.

API Version

28.0–44.0

Important: In version 45.0 and later, use `getUserGroups(communityId, userId, pageParam, pageSize)`.

Available to Guest Users

32.0–44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage getGroups(String communityId, String userId,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserGroupPage`

getPhoto(communityId, userId)

Get a user's photo.

API Version

28.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.getPhoto(communityId, userId)`.

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo getPhoto(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.Photo`

searchUserGroups(communityId, userId, q)

Get the user's groups that match the search criteria.

API Version

30.0–44.0

Important: In version 45.0 and later, use `searchUserGroupDetails(communityId, userId, q)`.

Available to Guest Users

32.0–44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage searchUserGroups(String communityId, String
userId, String q)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.UserGroupPage`

searchUserGroups(communityId, userId, q, pageParam, pageSize)

Get a page of a user's groups that match the search criteria.

API Version

30.0–44.0

Important: In version 45.0 and later, use `searchUserGroupDetails(communityId, userId, q, pageParam, pageSize)`.

Available to Guest Users

32.0–44.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage searchUserGroups(String communityId, String
userId, String q, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserGroupPage`

setPhoto(communityId, userId, fileId, versionNumber)

Set an uploaded file as a user's photo.

API Version

28.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.setPhoto(communityId, userId, fileId, versionNumber)`

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String userId, String fileId, Integer versionNumber)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

fileId
Type: String

ID of a file already uploaded. The file must be an image, and be smaller than 2 GB.

versionNumber
Type: Integer

Version number of the existing file. Specify either an existing version number, or `null` to get the latest version.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

setPhoto(communityId, userId, fileUpload)

Set a file that hasn't been uploaded as the user's photo.

API Version

28.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.setPhoto(communityId, userId, fileUpload)`

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String userId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

`setPhotoWithAttributes(communityId, userId, photo)`

Set and crop an uploaded file as a user's photo.

API Version

29.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.setPhotoWithAttributes(communityId, userId, photo)`

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

`setPhotoWithAttributes(communityId, userId, photo, fileUpload)`

Set and crop a file that hasn't been uploaded as a user's photo.

API Version

29.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.setPhotoWithAttributes(communityId, userId, photo, fileUpload)`

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the cropping parameters.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

Clm Class

Create and update Contract Lifecycle Management (CLM) contracts using object ID.

Namespace

ConnectApi

Clm Methods

The following are methods for `Clm`. All methods are static.

IN THIS SECTION:

createContract(contractInputPayload)
Create contracts using the object ID.

updateContract(contractInputPayload)
Update contracts using the object ID.

createContract(contractInputPayload)

Create contracts using the object ID.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContractOutputRepresentation
createContract(ConnectApi.ContractInputRepresentation contractInputPayload)
```

Parameters

contractInputPayload
Type: `ConnectApi.ContractInputRepresentation` on page 1769

Input payload to create contract.

Return Value

Type: `ConnectApi.ContractOutputRepresentation` on page 1966

updateContract(contractInputPayload)

Update contracts using the object ID.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContractOutputRepresentation
updateContract(ConnectApi.ContractInputRepresentation contractInputPayload)
```

Parameters

contractInputPayload
Type: ConnectApi.ContractInputRepresentation on page 1769

Input payload to update contract.

Return Value

Type: ConnectApi.ContractOutputRepresentation on page 1966

CommerceBuyerExperience Class

Create, delete, or get commerce addresses. Get order delivery group, order item, order shipments, shipment items, and order summaries. Get adjustments for order items and order summaries.

Namespace

ConnectApi

CommerceBuyerExperience Methods

These methods are for `CommerceBuyerExperience`. All methods are static.

IN THIS SECTION:

addOrderToCart(webstoreId, orderSummaryId, orderToCartInput)
Add an order to a cart using a webstore order summary.

addOrderToCart(webstoreId, orderSummaryId, orderToCartInput, effectiveAccountId)
Add an order to a cart for a specific account using a webstore order summary.

calculateAdjustmentAggregates(webstoreId, orderSummaryIds)
Submit a job to calculate adjustment aggregates for a list of order summary IDs.

createCommerceAccountAddress(webstoreId, accountId, addressInput)
Create a Commerce account address for a webstore account.

deleteCommerceAccountAddress(webstoreId, accountId, addressId)
Delete a Commerce account address for a webstore.

getCommerceAccountAddress(webstoreId, accountId)
Get a Commerce account address for a webstore.

getCommerceAccountAddress(webstoreId, accountId, defaultOnly)
Get Commerce account addresses for a webstore and account.

getCommerceAccountAddress(webstoreId, accountId, defaultOnly, addressType, fields, pageToken, pageSize, sortOrder)
Get Commerce account addresses for a webstore and account.

getCommerceAccountAddress(webstoreId, accountId, addressType, excludeUnsupportedCountries)
Get Commerce account addresses for a webstore and account.

getCommerceAccountAddress(webstoreId, accountId, defaultOnly, addressType, excludeUnsupportedCountries)
Get Commerce account addresses for a webstore and account.

getCommerceAccountAddress(webstoreId, accountId, defaultOnly, addressType, excludeUnsupportedCountries, fields, pageToken, pageSize, sortOrder)
Get Commerce account addresses for a webstore and account.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId)
Get order delivery group summaries.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageSize)
Get order delivery group summaries.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageParam)
Get a page of order delivery group summaries.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields)
Get order delivery group summaries with specific fields.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageParam, fields)
Get a page of order delivery group summaries with specific fields.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, pageSize)
Get order delivery group summaries with specific fields.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, sortParam)
Get a sorted list of order delivery group summaries with specific fields.

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, pageSize, sortParam)
Get a sorted list of order delivery group summaries with specific fields.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId)
Get order item summaries.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageSize)
Get order item summaries.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId)
Get order item summaries for a delivery group summary.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, pageSize)
Get order item summaries for a delivery group summary.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, pageParam)
Get a page of order item summaries for a delivery group summary.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields)
Get order item summaries for a delivery group summary with specific fields.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageSize)
Get order item summaries for a delivery group summary with specific fields.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageParam)
Get a page of order item summaries for a delivery group summary with specific fields.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, sortParam)
Get a sorted list of order item summaries for a delivery group summary with specific fields.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageSize, sortParam)
Get a sorted page of order item summaries for a delivery group summary with specific fields.

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageParam, pageSize, sortParam, includeAdjustmentDetails)
Get a sorted page of order item summaries for a delivery group summary with specific fields and include adjustment details.

getOrderItemSummaryAdjustments(webstoreId, orderSummaryId, orderItemSummaryAdjustmentCollectionInput)
Get adjustments for order items.

getOrderItemSummaryAdjustments(webstoreId, orderSummaryId, orderItemSummaryAdjustmentCollectionInput, effectiveAccountId)
Get adjustments for order items.

getOrderShipmentItems(webstoreId, shipmentId)
Get order shipment items.

getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId)
Get order shipment items.

getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields)
Get order shipment items with specific fields.

getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields, pageToken, pageSize)
Get a page of order shipment items with specific fields.

getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields, pageToken, pageSize, sortOrder)
Get a sorted page of order shipment items.

getOrderShipments(webstoreId, orderSummaryId)
Get order shipments.

getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId)
Get order shipments.

getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields)
Get order shipments with specific fields.

getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields, pageSize, pageToken)
Get a page of order shipments with specific fields.

getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields, pageSize, pageToken, sortOrder)
Get a sorted page of order shipments with specific fields.

getOrderSummaries(webstoreId)
Get order summaries.

getOrderSummaries(webstoreId, effectiveAccountId)
Get order summaries.

getOrderSummaries(webstoreId, effectiveAccountId, fields)
Get order summaries with specific fields.

getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken)
Get a page of order summaries with specific fields.

getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder)

Get a sorted page of order summaries with specific fields.

getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate)

Get a sorted page of order summaries with specific fields within a specific date range.

getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate, ownerScoped)

Get a sorted page of order summaries with specific fields within a specific date range and scoped to orders owned by the context user.

getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate, ownerScoped, includeAdjustmentDetails)

Get a sorted page of order summaries with specific fields within a specific date range and scoped to orders owned by the context user.

getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId)

Get an order summary.

getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId, fields)

Get an order summary with fields.

getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId, fields, includeAdjustmentDetails)

Get an order summary with fields and include adjustment details.

getOrderSummaryAdjustments(webstoreId, orderSummaryId)

Get adjustments for an order summary.

getOrderSummaryAdjustments(webstoreId, orderSummaryId, effectiveAccountId)

Get adjustments for an order summary.

lookupOrderSummary(webstoreId, effectiveAccountId, fields, excludeLineItems, excludeDeliveryGroups, excludeAdjustmentAggregates, excludeAdjustments, deliveryGroupId, orderSummaryLookupInput) (Developer Preview)

Look up details about an order summary for a guest shopper or a registered buyer using the effective account ID, requested fields, line items, delivery groups, adjustments aggregates, and adjustments.

lookupOrderSummary(webstoreId, effectiveAccountId, fields, orderSummaryLookupInput) (Developer Preview)

Look up details about an order summary for a guest shopper or a registered buyer using the effective account ID and requested fields.

lookupOrderSummary(webstoreId, effectiveAccountId, orderSummaryLookupInput) (Developer Preview)

Look up details about an order summary for a guest shopper or a registered buyer using the effective account ID.

updateCommerceAccountAddress(webstoreId, accountId, addressId, addressInput)

Update a Commerce account address for a webstore.

`addOrderToCart(webstoreId, orderSummaryId, orderToCartInput)`

Add an order to a cart using a webstore order summary.

API Version

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderToCartResult addOrderToCart(String webstoreId, String orderSummaryId, ConnectApi.OrderToCartInput orderToCartInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

orderToCartInput
Type: ConnectApi.OrderToCartInput

Input value indicating which cart the order should be added to.

Return Value

Type: ConnectApi.OrderToCartResult

addOrderToCart(webstoreId, orderSummaryId, orderToCartInput, effectiveAccountId)

Add an order to a cart for a specific account using a webstore order summary.

API Version

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderToCartResult addOrderToCart(String webstoreId, String orderSummaryId, ConnectApi.OrderToCartInput orderToCartInput, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

orderToCartInput
Type: ConnectApi.OrderToCartInput

Input value indicating which cart the order should be added to.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: ConnectApi.OrderToCartResult

calculateAdjustmentAggregates(webstoreId, orderSummaryIds)

Submit a job to calculate adjustment aggregates for a list of order summary IDs.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryAdjustmentAggregatesAsyncOutput
calculateAdjustmentAggregates(String webstoreId,
ConnectApi.OrderSummaryAdjustmentAggregatesAsyncInput orderSummaryIds)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryIds
Type: ConnectApi.OrderSummaryAdjustmentAggregatesAsyncInput

A `ConnectApi.OrderSummaryAdjustmentAggregatesAsyncInput` class with a list of order summary IDs.

Return Value

Type: ConnectApi.OrderSummaryAdjustmentAggregatesAsyncOutput

createCommerceAccountAddress(webstoreId, accountId, addressInput)

Create a Commerce account address for a webstore account.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommerceAddressOutput createCommerceAccountAddress(String
webstoreId, String accountId, ConnectApi.commerceAddressInput addressInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account.

addressInput
Type: ConnectApi.commerceAddressInput

Information about the address you want to create.

Return Value

Type: ConnectApi.CommerceAddressOutput

deleteCommerceAccountAddress(webstoreId, accountId, addressId)

Delete a Commerce account address for a webstore.

API Version

54.0

Requires Chatter

No

Signature

```
public static Void deleteCommerceAccountAddress(String webstoreId, String accountId,
String addressId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account.

addressId
Type: String

ID of the address.

Return Value

Type: Void

getCommerceAccountAddress(webstoreId, accountId)

Get a Commerce account address for a webstore.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommerceAddressCollection getCommerceAccountAddress(String
webstoreId, String accountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account.

Return Value

Type: ConnectApi.CommerceAddressCollection

getCommerceAccountAddress(webstoreId, accountId, defaultOnly)

Get Commerce account addresses for a webstore and account.

You can get the default address by itself, or you can get all of the addresses for the account.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommerceAddressCollection getCommerceAccountAddress(String webstoreId, String accountId, Boolean defaultOnly)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account.

defaultOnly
Type: Boolean

Indicate if you only want the default address (`true`) or all addresses for the account (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.CommerceAddressCollection`

getCommerceAccountAddress(webstoreId, accountId, defaultOnly, addressType, fields, pageToken, pageSize, sortOrder)

Get Commerce account addresses for a webstore and account.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommerceAddressCollection getCommerceAccountAddress(String
webstoreId, String accountId, Boolean defaultOnly, List<String> addressType, List<String>
fields, String pageToken, Integer pageSize, ConnectApi.CommerceAddressSort sortOrder)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account.

defaultOnly
Type: Boolean

Indicate if you want only the default address (`true`) or all addresses for the account (`false`). The default value is `false`.

addressType
Type: List<String>

Type of address, for example, `Billing` or `Shipping`.

fields
Type: List<String>

A list of custom fields for the address.

pageToken
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortOrder
Type: `ConnectApi.CommerceAddressSort`

Sort order for Commerce addresses.

- `CreatedDateAsc`—Sort in ascending order of created date.
- `CreatedDateDesc`—Sort in descending order of created date.
- `NameAsc`—Sort in ascending order of name.
- `NameDesc`—Sort in descending order of name.

Return Value

Type: `ConnectApi.CommerceAddressCollection`

getCommerceAccountAddress(webstoreId, accountId, addressType, excludeUnsupportedCountries)

Get Commerce account addresses for a webstore and account.

API Version

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommerceAddressCollection getCommerceAccountAddress(String webstoreId, String accountId, List<String> addressType, Boolean excludeUnsupportedCountries)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account.

addressType
Type: List<String>

Type of address, for example, `Billing` or `Shipping`.

excludeUnsupportedCountries
Type: Boolean

Indicate if you want to retrieve all addresses (`false`) or only addresses of type Shipping that are in countries included in the store's shipToCountries list (`true`). The default value is `false`.

Return Value

Type: `ConnectApi.CommerceAddressCollection`

getCommerceAccountAddress(webstoreId, accountId, defaultOnly, addressType, excludeUnsupportedCountries)

Get Commerce account addresses for a webstore and account.

API Version

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommerceAddressCollection getCommerceAccountAddress(String webstoreId, String accountId, Boolean defaultOnly, List<String> addressType, Boolean excludeUnsupportedCountries)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account.

defaultOnly
Type: Boolean

Indicate if you want only the default address (`true`) or all addresses for the account (`false`). The default value is `false`.

addressType
Type: List<String>

Type of address, for example, `Billing` or `Shipping`.

excludeUnsupportedCountries
Type: Boolean

Indicate if you want to retrieve all addresses (`false`) or only addresses of type Shipping that are in countries included in the store's shipToCountries list (`true`). The default value is `false`.

Return Value

Type: `ConnectApi.CommerceAddressCollection`

`getCommerceAccountAddress(webstoreId, accountId, defaultOnly, addressType, excludeUnsupportedCountries, fields, pageToken, pageSize, sortOrder)`

Get Commerce account addresses for a webstore and account.

API Version

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommerceAddressCollection getCommerceAccountAddress(String
webstoreId, String accountId, Boolean defaultOnly, List<String> addressType, Boolean
excludeUnsupportedCountries, List<String> fields, String pageToken, Integer pageSize,
ConnectApi.CommerceAddressSort sortOrder)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account.

defaultOnly
Type: Boolean

Indicate if you want only the default address (`true`) or all addresses for the account (`false`). The default value is `false`.

addressType
Type: List<String>

Type of address, for example, `Billing` or `Shipping`.

excludeUnsupportedCountries
Type: Boolean

Indicate if you want to retrieve all addresses (`false`) or only addresses of type Shipping that are in countries included in the store's shipToCountries list (`true`). The default value is `false`.

fields
Type: List<String>

A list of custom fields for the address.

pageToken
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortOrder
Type: `ConnectApi.CommerceAddressSort`

Sort order for Commerce addresses. Values are:

- `CreatedDateAsc`—Sort in ascending order of created date.
- `CreatedDateDesc`—Sort in descending order of created date.
- `NameAsc`—Sort in ascending order of name.
- `NameDesc`—Sort in descending order of name.

Return Value

Type: ConnectApi.CommerceAddressCollection

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId)

Get order delivery group summaries.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String
orderSummaryId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

Return Value

Type: ConnectApi.OrderDeliveryGroupSummaryCollection

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageSize)

Get order delivery group summaries.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String
orderSummaryId, Integer pageSize)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.OrderDeliveryGroupSummaryCollection`

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageParam)

Get a page of order delivery group summaries.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String
orderSummaryId, String pageParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: `ConnectApi.OrderDeliveryGroupSummaryCollection`

`getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields)`

Get order delivery group summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String
orderSummaryId, List<String> fields)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

fields
Type: List<String>

List of up to 15 order delivery group summary or order delivery method fields to display in the UI in each item row.

Return Value

Type: ConnectApi.OrderDeliveryGroupSummaryCollection

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageParam, fields)

Get a page of order delivery group summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String
orderSummaryId, String pageParam, List<String> fields)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

fields
Type: List<String>

List of up to 15 order delivery group summary or order delivery method fields to display in the UI in each item row.

Return Value

Type: ConnectApi.OrderDeliveryGroupSummaryCollection

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, pageSize)

Get order delivery group summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String
orderSummaryId, List<String> fields, Integer pageSize)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

fields
Type: List<String>

List of up to 15 order delivery group summary or order delivery method fields to display in the UI in each item row.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: ConnectApi.OrderDeliveryGroupSummaryCollection

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, sortParam)

Get a sorted list of order delivery group summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String
orderSummaryId, List<String> fields, ConnectApi.OrderDeliveryGroupSummarySort sortParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

fields
Type: List<String>

List of up to 15 order delivery group summary or order delivery method fields to display in the UI in each item row.

sortParam
Type: ConnectApi.OrderDeliveryGroupSummarySort

Sort order for order delivery group summaries. Values are:

- `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
- `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).

If `null`, `IdAsc` is the default sort order.

Return Value

Type: ConnectApi.OrderDeliveryGroupSummaryCollection

getOrderDeliveryGroupSummaries(webstoreId, effectiveAccountId, orderSummaryId, fields, pageSize, sortParam)

Get a sorted list of order delivery group summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderDeliveryGroupSummaryCollection
getOrderDeliveryGroupSummaries(String webstoreId, String effectiveAccountId, String
orderSummaryId, List<String> fields, Integer pageSize,
ConnectApi.OrderDeliveryGroupSummarySort sortParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

fields
Type: List<String>

List of up to 15 order delivery group summary or order delivery method fields to display in the UI in each item row.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: ConnectApi.OrderDeliveryGroupSummarySort

Sort order for order delivery group summaries. Values are:

- `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
- `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).

If `null`, `IdAsc` is the default sort order.

Return Value

Type: `ConnectApi.OrderDeliveryGroupSummaryCollection`

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId)

Get order item summaries.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

Return Value

Type: `ConnectApi.OrderItemSummaryCollection`

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, pageSize)

Get order item summaries.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, Integer pageSize)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.OrderItemSummaryCollection`

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId)

Get order item summaries for a delivery group summary.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

Return Value

Type: `ConnectApi.OrderItemSummaryCollection`

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, pageSize)

Get order item summaries for a delivery group summary.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String
webstoreId, String effectiveAccountId, String orderSummaryId, String
orderDeliveryGroupSummaryId, Integer pageSize)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.OrderItemSummaryCollection`

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, pageParam)

Get a page of order item summaries for a delivery group summary.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String
webstoreId, String effectiveAccountId, String orderSummaryId, String
orderDeliveryGroupSummaryId, String pageParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: `ConnectApi.OrderItemSummaryCollection`

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields)

Get order item summaries for a delivery group summary with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

fields
Type: List<String>

List of up to 15 order item summary or product fields to display in the UI in each item row.

Return Value

Type: ConnectApi.OrderItemSummaryCollection

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageSize)

Get order item summaries for a delivery group summary with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields, Integer pageSize)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

fields
Type: List<String>

List of up to 15 order item summary or product fields to display in the UI in each item row.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: ConnectApi.OrderItemSummaryCollection

`getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageParam)`

Get a page of order item summaries for a delivery group summary with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields, String pageParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

fields
Type: List<String>

List of up to 15 order item summary or product fields to display in the UI in each item row.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: `ConnectApi.OrderItemSummaryCollection`

`getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, sortParam)`

Get a sorted list of order item summaries for a delivery group summary with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields, ConnectApi.OrderItemSummarySort sortParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

fields
Type: List<String>

List of up to 15 order item summary or product fields to display in the UI in each item row.

sortParam
Type: `ConnectApi.OrderItemSummarySort`

Sort order for order item summaries. Values are:

- `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
- `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).

If `null`, `IdAsc` is the default sort order.

Return Value

Type: ConnectApi.OrderItemSummaryCollection

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageSize, sortParam)

Get a sorted page of order item summaries for a delivery group summary with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String webstoreId, String effectiveAccountId, String orderSummaryId, String orderDeliveryGroupSummaryId, List<String> fields, Integer pageSize, ConnectApi.OrderItemSummarySort sortParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

fields
Type: List<String>

List of up to 15 order item summary or product fields to display in the UI in each item row.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: ConnectApi.OrderItemSummarySort

Sort order for order item summaries. Values are:

- `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
- `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).

If `null`, `IdAsc` is the default sort order.

Return Value

Type: `ConnectApi.OrderItemSummaryCollection`

getOrderItemSummaries(webstoreId, effectiveAccountId, orderSummaryId, orderDeliveryGroupSummaryId, fields, pageParam, pageSize, sortParam, includeAdjustmentDetails)

Get a sorted page of order item summaries for a delivery group summary with specific fields and include adjustment details.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryCollection getOrderItemSummaries(String
webstoreId, String effectiveAccountId, String orderSummaryId, String
orderDeliveryGroupSummaryId, List<String> fields, String pageParam, Integer pageSize,
ConnectApi.OrderItemSummarySort sortParam, Boolean includeAdjustmentDetails)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

orderSummaryId
Type: String

ID of the order summary.

orderDeliveryGroupSummaryId
Type: String

ID of the order delivery group summary.

fields
Type: List<String>

List of up to 15 order item summary or product fields to display in the UI in each item row.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.OrderItemSummarySort`

Sort order for order item summaries. Values are:

- `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
- `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).

If `null`, `IdAsc` is the default sort order.

includeAdjustmentDetails
Type: Boolean

Specifies whether to return adjustment details (`true`) or not (`false`).

Return Value

Type: `ConnectApi.OrderItemSummaryCollection`

getOrderItemSummaryAdjustments(webstoreId, orderSummaryId, orderItemSummaryAdjustmentCollectionInput)

Get adjustments for order items.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryAdjustmentCollection
getOrderItemSummaryAdjustments(String webstoreId, String orderSummaryId,
ConnectApi.OrderItemSummaryAdjustmentCollectionInput
orderItemSummaryAdjustmentCollectionInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

orderItemSummaryAdjustmentCollectionInput
Type: ConnectApi.OrderItemSummaryAdjustmentCollectionInput

Collection of order item summaries to get adjustments for.

Return Value

Type: ConnectApi.OrderItemSummaryAdjustmentCollection

getOrderItemSummaryAdjustments(webstoreId, orderSummaryId, orderItemSummaryAdjustmentCollectionInput, effectiveAccountId)

Get adjustments for order items.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderItemSummaryAdjustmentCollection
getOrderItemSummaryAdjustments(String webstoreId, String orderSummaryId,
ConnectApi.OrderItemSummaryAdjustmentCollectionInput
orderItemSummaryAdjustmentCollectionInput, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

orderItemSummaryAdjustmentCollectionInput
Type: ConnectApi.OrderItemSummaryAdjustmentCollectionInput

Collection of order item summaries to get adjustments for.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: ConnectApi.OrderItemSummaryAdjustmentCollection

getOrderShipmentItems(webstoreId, shipmentId)

Get order shipment items.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentItemCollection getOrderShipmentItems(String
webstoreId, String shipmentId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

shipmentId
Type: String

ID of the shipment.

Return Value

Type: ConnectApi.OrderShipmentItemCollection

getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId)

Get order shipment items.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentItemCollection getOrderShipmentItems(String
webstoreId, String shipmentId, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

shipmentId
Type: String

ID of the shipment.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: `ConnectApi.OrderShipmentItemCollection`

getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields)

Get order shipment items with specific fields.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentItemCollection getOrderShipmentItems(String
webstoreId, String shipmentId, String effectiveAccountId, List<String> fields)
```

Parameters

webstoreId
Type: String

ID of the webstore.

shipmentId
Type: String

ID of the shipment.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 15 additional shipment items, order item summary, and product fields to display in the UI in each item row.

Return Value

Type: ConnectApi.OrderShipmentItemCollection

getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields, pageToken, pageSize)

Get a page of order shipment items with specific fields.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentItemCollection getOrderShipmentItems(String webstoreId, String shipmentId, String effectiveAccountId, List<String> fields, String pageToken, Integer pageSize)
```

Parameters

webstoreId
Type: String

ID of the webstore.

shipmentId
Type: String

ID of the shipment.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 15 additional shipment items, order item summary, and product fields to display in the UI in each item row.

pageToken
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: ConnectApi.OrderShipmentItemCollection

`getOrderShipmentItems(webstoreId, shipmentId, effectiveAccountId, fields, pageToken, pageSize, sortOrder)`

Get a sorted page of order shipment items.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentItemCollection getOrderShipmentItems(String webstoreId, String shipmentId, String effectiveAccountId, List<String> fields, String pageToken, Integer pageSize, ConnectApi.OrderShipmentItemSort sortOrder)
```

Parameters

webstoreId
Type: String

ID of the webstore.

shipmentId
Type: String

ID of the shipment.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 15 additional shipment items, order item summary, and product fields to display in the UI in each item row.

pageToken
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortOrder
Type: `ConnectApi.OrderShipmentItemSort`

Sort order for order shipment items. Values are:

- `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).
- `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).

If unspecified, defaults to `IdAsc`.

Return Value

Type: ConnectApi.OrderShipmentItemCollection

getOrderShipments(webstoreId, orderSummaryId)

Get order shipments.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentCollection getOrderShipments(String webstoreId,
String orderSummaryId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

Return Value

Type: ConnectApi.OrderShipmentCollection

getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId)

Get order shipments.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentCollection getOrderShipments(String webstoreId,
String orderSummaryId, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: `ConnectApi.OrderShipmentCollection`

getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields)

Get order shipments with specific fields.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentCollection getOrderShipments(String webstoreId,
String orderSummaryId, String effectiveAccountId, List<String> fields)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 15 additional shipment and order delivery method fields to display in the UI in each item row.

Return Value

Type: ConnectApi.OrderShipmentCollection

getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields, pageSize, pageToken)

Get a page of order shipments with specific fields.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentCollection getOrderShipments(String webstoreId, String orderSummaryId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 15 additional shipment and order delivery method fields to display in the UI in each item row.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

pageToken
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

Return Value

Type: ConnectApi.OrderShipmentCollection

`getOrderShipments(webstoreId, orderSummaryId, effectiveAccountId, fields, pageSize, pageToken, sortOrder)`

Get a sorted page of order shipments with specific fields.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderShipmentCollection getOrderShipments(String webstoreId, String orderSummaryId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken, ConnectApi.OrderShipmentSort sortOrder)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 15 additional shipment and order delivery method fields to display in the UI in each item row.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

pageToken
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

sortOrder
Type: `ConnectApi.OrderShipmentSort`

Sort order for order shipments. Values are:

- `ExpectedDeliveryDateAsc`—Sorts by the oldest expected delivery date.
- `ExpectedDeliveryDateDesc`—Sorts by the most recent expected delivery date.
- `ShipmentNumberAsc`—Sorts by shipment number in ascending order (0–9).

- `ShipmentNumberDesc`—Sorts by shipment number in descending order (9–0).

If unspecified, defaults to `ShipmentNumberAsc`.

If you're sorting by expected delivery date, make sure the expected delivery date is populated on your shipment records. A `null` value isn't supported and results in an error.

Return Value

Type: `ConnectApi.OrderShipmentCollection`

`getOrderSummaries(webstoreId)`

Get order summaries.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

Return Value

Type: `ConnectApi.OrderSummaryCollectionRepresentation`

`getOrderSummaries(webstoreId, effectiveAccountId)`

Get order summaries.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: `ConnectApi.OrderSummaryCollectionRepresentation`

getOrderSummaries(webstoreId, effectiveAccountId, fields)

Get order summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- `createdDate`
- `orderSummaryId`
- `orderNumber`
- `orderedDate`
- `ownerId`
- `status`
- `totalAmount`

Return Value

Type: `ConnectApi.OrderSummaryCollectionRepresentation`

`getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken)`

Get a page of order summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

`effectiveAccountId`
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

`fields`
Type: List<String>

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- `createdDate`
- `orderSummaryId`
- `orderNumber`

- orderedDate
- ownerId
- status
- totalAmount

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

pageToken
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

Return Value

Type: `ConnectApi.OrderSummaryCollectionRepresentation`

getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder)

Get a sorted page of order summaries with specific fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken, ConnectApi.OrderSummarySortOrder sortOrder)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- `createdDate`
- `orderSummaryId`
- `orderNumber`
- `orderedDate`
- `ownerId`
- `status`
- `totalAmount`

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`pageToken`
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

`sortOrder`
Type: `ConnectApi.OrderSummarySortOrder`

Sort order for order summaries. Values are:

- `CreatedDateAsc`—Sorts by the oldest created date.
- `CreatedDateDesc`—Sorts by the most recent created date.
- `OrderedDateAsc`—Sorts by the oldest ordered date.
- `OrderedDateDesc`—Sorts by the most recent ordered date.

If unspecified, defaults to `OrderedDateDesc`.

If you're sorting by ordered date, make sure the ordered date is populated on your order summary records. A `null` value isn't supported and results in an error.

Return Value

Type: `ConnectApi.OrderSummaryCollectionRepresentation`

`getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate)`

Get a sorted page of order summaries with specific fields within a specific date range.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken, ConnectApi.OrderSummarySortOrder sortOrder, String earliestDate, String latestDate)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- `createdDate`
- `orderSummaryId`
- `orderNumber`
- `orderedDate`
- `ownerId`
- `status`
- `totalAmount`

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

pageToken
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

sortOrder
Type: `ConnectApi.OrderSummarySortOrder`

Sort order for order summaries. Values are:

- `CreatedDateAsc`—Sorts by the oldest created date.
- `CreatedDateDesc`—Sorts by the most recent created date.
- `OrderedDateAsc`—Sorts by the oldest ordered date.
- `OrderedDateDesc`—Sorts by the most recent ordered date.

If unspecified, defaults to `OrderedDateDesc`.

If you're sorting by ordered date, make sure the ordered date is populated on your order summary records. A `null` value isn't supported and results in an error.

earliestDate
Type: String

Oldest created or ordered date, depending on the `sortOrder` value, for order summaries to return. Results include any orders on and after this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

latestDate
Type: String

Most recent created or ordered date, depending on the `sortOrder` value, for order summaries to return. Results include any orders before this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

Return Value

Type: `ConnectApi.OrderSummaryCollectionRepresentation`

`getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate, ownerScoped)`

Get a sorted page of order summaries with specific fields within a specific date range and scoped to orders owned by the context user.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken, ConnectApi.OrderSummarySortOrder sortOrder, String earliestDate, String latestDate, Boolean ownerScoped)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- `createdDate`

- `orderSummaryId`
- `orderNumber`
- `orderedDate`
- `ownerId`
- `status`
- `totalAmount`

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`pageToken`
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

`sortOrder`
Type: `ConnectApi.OrderSummarySortOrder`

Sort order for order summaries. Values are:

- `CreatedDateAsc`—Sorts by the oldest created date.
- `CreatedDateDesc`—Sorts by the most recent created date.
- `OrderedDateAsc`—Sorts by the oldest ordered date.
- `OrderedDateDesc`—Sorts by the most recent ordered date.

If unspecified, defaults to `OrderedDateDesc`.

If you're sorting by ordered date, make sure the ordered date is populated on your order summary records. A `null` value isn't supported and results in an error.

`earliestDate`
Type: String

Oldest created or ordered date, depending on the `sortOrder` value, for order summaries to return. Results include any orders on and after this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

`latestDate`
Type: String

Most recent created or ordered date, depending on the `sortOrder` value, for order summaries to return. Results include any orders before this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

`ownerScoped`
Type: Boolean

Specifies whether the results are scoped to orders owned by the context user (`true`) or to orders owned by and shared with the context user (`false`). If unspecified, defaults to `true`.

Return Value

Type: `ConnectApi.OrderSummaryCollectionRepresentation`

`getOrderSummaries(webstoreId, effectiveAccountId, fields, pageSize, pageToken, sortOrder, earliestDate, latestDate, ownerScoped, includeAdjustmentDetails)`

Get a sorted page of order summaries with specific fields within a specific date range and scoped to orders owned by the context user.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryCollectionRepresentation getOrderSummaries(String webstoreId, String effectiveAccountId, List<String> fields, Integer pageSize, String pageToken, ConnectApi.OrderSummarySortOrder sortOrder, String earliestDate, String latestDate, Boolean ownerScoped, Boolean includeAdjustmentDetails)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- `createdDate`
- `orderSummaryId`
- `orderNumber`
- `orderedDate`
- `ownerId`
- `status`
- `totalAmount`

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

pageToken
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

sortOrder
Type: ConnectApi.OrderSummarySortOrder

Sort order for order summaries. Values are:

- `CreatedDateAsc`—Sorts by the oldest created date.
- `CreatedDateDesc`—Sorts by the most recent created date.
- `OrderedDateAsc`—Sorts by the oldest ordered date.
- `OrderedDateDesc`—Sorts by the most recent ordered date.

If unspecified, defaults to `OrderedDateDesc`.

If you're sorting by ordered date, make sure the ordered date is populated on your order summary records. A `null` value isn't supported and results in an error.

earliestDate
Type: String

Oldest created or ordered date, depending on the `sortOrder` value, for order summaries to return. Results include any orders on and after this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

latestDate
Type: String

Most recent created or ordered date, depending on the `sortOrder` value, for order summaries to return. Results include any orders before this date. Expected format is an ISO 8601 date string, for example, 2020-02-25T18:24:31.000Z.

ownerScoped
Type: Boolean

Specifies whether the results are scoped to orders owned by the context user (`true`) or to orders owned by and shared with the context user (`false`). If unspecified, defaults to `true`.

includeAdjustmentDetails
Type: Boolean

Specifies whether to fetch price adjustment details based on their type (`true`). If unspecified, defaults to `false`.

Return Value

Type: ConnectApi.OrderSummaryCollectionRepresentation

getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId)

Get an order summary.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryRepresentation getOrderSummary(String webstoreId,
String orderSummaryId, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: `ConnectApi.OrderSummaryRepresentation`

`getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId, fields)`

Get an order summary with fields.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryRepresentation getOrderSummary(String webstoreId,
String orderSummaryId, String effectiveAccountId, List<String> fields)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- `createdDate`
- `orderSummaryId`
- `orderNumber`
- `orderedDate`
- `ownerId`
- `status`
- `totalAmount`

Return Value

Type: `ConnectApi.OrderSummaryRepresentation`

`getOrderSummary(webstoreId, orderSummaryId, effectiveAccountId, fields, includeAdjustmentDetails)`

Get an order summary with fields and include adjustment details.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryRepresentation getOrderSummary(String webstoreId,
String orderSummaryId, String effectiveAccountId, List<String> fields, Boolean
includeAdjustmentDetails)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

fields
Type: List<String>

List of up to 35 additional order summary fields to display in the UI in each item row.

These order summary fields are returned regardless of fields specified.

- `createdDate`
- `orderSummaryId`
- `orderNumber`
- `orderedDate`
- `ownerId`
- `status`
- `totalAmount`

includeAdjustmentDetails
Type: Boolean

Specifies whether to return adjustment details (`true`) or not (`false`). If unspecified, the default value is `false`.

Return Value

Type: `ConnectApi.OrderSummaryRepresentation`

getOrderSummaryAdjustments(webstoreId, orderSummaryId)

Get adjustments for an order summary.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryAdjustmentCollection
getOrderSummaryAdjustments(String webstoreId, String orderSummaryId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

Return Value

Type: ConnectApi.OrderSummaryAdjustmentCollection

getOrderSummaryAdjustments(webstoreId, orderSummaryId, effectiveAccountId)

Get adjustments for an order summary.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryAdjustmentCollection
getOrderSummaryAdjustments(String webstoreId, String orderSummaryId, String
effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

orderSummaryId
Type: String

ID of the order summary.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: ConnectApi.OrderSummaryAdjustmentCollection

lookupOrderSummary(webstoreId, effectiveAccountId, fields, excludeLineItems, excludeDeliveryGroups, excludeAdjustmentAggregates, excludeAdjustments, deliveryGroupId, orderSummaryLookupInput) (Developer Preview)

Look up details about an order summary for a guest shopper or a registered buyer using the effective account ID, requested fields, line items, delivery groups, adjustments aggregates, and adjustments.

Note: This API is available as a developer preview. It isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. All commands, parameters, and other features are subject to change or deprecation at any time, with or without notice. Don't implement functionality developed with these commands or tools.

No

Signature

```
public static ConnectApi.OrderSummaryLookupOutput lookupOrderSummary(String webstoreId,
String effectiveAccountId, List<String> fields, Boolean excludeLineItems, Boolean
excludeDeliveryGroups, Boolean excludeAdjustmentAggregates, Boolean excludeAdjustments,
String deliveryGroupId, ConnectApi.OrderSummaryLookupInput orderSummaryLookupInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user or, for guest users, the guest buyer profile ID of the current store.

fields
Type: List<String>

List of specific fields, including custom fields, to return in the response along with default fields. For example, `OrderSummary.TotalAmount`, `OrderItemSummary.Quantity`, `Product2.Description`, `OrderDeliveryGroupSummary.GrandTotalAmount`, `OrderDeliveryMethod.Carrier`.

excludeLineItems
Type: Boolean

Specifies whether to exclude line items from the response. If unspecified, the default value is `false`.

excludeDeliveryGroups
Type: Boolean

Specifies whether to exclude delivery groups from the response. If unspecified, the default value is `false`.

excludeAdjustmentAggregates
Type: Boolean

Specifies whether to exclude adjustment aggregates associated with an order summary. Adjustment aggregates include fields detailing promotional amounts by price, tax, and total. Aggregates are calculated asynchronously and results returned to the order summary. If unspecified, the default value is `false`.

excludeAdjustments
Type: Boolean

Specifies whether to exclude adjustments associated with an order summary. Adjustments include promotional discounts. If unspecified, the default value is `false`.

deliveryGroupId
Type: String

ID of the delivery group associated with the order summary.

orderSummaryLookupInput
Type: `ConnectApi.OrderSummaryLookupInput`

Order summary lookup input representation.

Return Value

Type: `ConnectApi.OrderSummaryLookupOutput`

`lookupOrderSummary(webstoreId, effectiveAccountId, fields, orderSummaryLookupInput)` (Developer Preview)

Look up details about an order summary for a guest shopper or a registered buyer using the effective account ID and requested fields.

Note: This API is available as a developer preview. It isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. effectiveAccountId
Type: String

ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user or, for guest users, the guest buyer profile ID of the current store.

orderSummaryLookupInput
Type: ConnectApi.OrderSummaryLookupInput

Order summary lookup input representation.

Return Value

Type: ConnectApi.OrderSummaryLookupOutput

updateCommerceAccountAddress(webstoreId, accountId, addressId, addressInput)

Update a Commerce account address for a webstore.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommerceAddressOutput updateCommerceAccountAddress(String webstoreId, String accountId, String addressId, ConnectApi.commerceAddressInput addressInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account.

addressId
Type: String

ID of the address.

addressInput
Type: ConnectApi.commerceAddressInput

Information about the address fields you want to update.

Return Value

Type: `ConnectApi.CommerceAddressOutput`

CommerceCart Class

Get, create, update, and delete carts. Get cart items, add items to carts, update and delete cart items.

Namespace

ConnectApi

CommerceCart Methods

These methods are for `CommerceCart`. All methods are static.

IN THIS SECTION:

addItemToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItemInput, currencyIsoCode)
Add an item to a cart of a specific currency.

addItemsToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItems)
Add a batch of up to 100 items to a cart.

addItemsToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItems, currencyIsoCode)
Add a batch of up to 100 items to a cart of a specific currency.

addItemToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItemInput)
Add an item to a cart.

applyCartCoupon(webstoreId, effectiveAccountId, activeCartOrId, cartCouponInput)
Apply a coupon to a cart.

applyCartCoupon(webstoreId, effectiveAccountId, activeCartOrId, cartCouponInput, currencyIsoCode)
Apply a coupon to a cart.

copyCartToWishlist(webstoreId, effectiveAccountId, activeCartOrId, cartToWishlistInput)
Copy the products from a cart to a wishlist.

createCart(webstoreId, cart)
Create a cart.

cloneCart(webstoreId, activeCartOrId, targetEffectiveAccountId, targetType)
Clones an existing cart to create a secondary, read-only cart to support Pay Now functionality.

deleteCart(webstoreId, effectiveAccountId, activeCartOrId)
Delete a cart.

deleteCartCoupon(webstoreId, effectiveAccountId, activeCartOrId, cartCouponId)
Delete a coupon from a cart.

deleteCartCoupon(webstoreId, effectiveAccountId, activeCartOrId, cartCouponId, currencyIsoCode)
Delete a coupon from a cart.

deleteCartItem(webstoreId, effectiveAccountId, activeCartOrId, cartItemId)
Delete an item from a cart.

deleteInventoryReservation(webstoreId, activeCartOrId, effectiveAccountId) (Pilot)
Delete an inventory reservation.

getCartCoupons(webstoreId, effectiveAccountId, activeCartOrId)
Get coupons for a cart.

getCartCoupons(webstoreId, effectiveAccountId, activeCartOrId, currencyIsoCode)
Get coupons for a cart.

getCartItemPromotion(webstoreId, effectiveAccountId, activeCartOrId, cartItemPromotionCollectionInput)
Get promotions for a cart item.

getCartItemPromotion(webstoreId, effectiveAccountId, activeCartOrId, cartItemPromotionCollectionInput, currencyIsoCode)
Get a promotion for a cart item.

getCartItems(webstoreId, effectiveAccountId, activeCartOrId)
Get items in a cart.

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam)
Get a page of items in a cart.

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, sortParam)
Get a sorted page of items in a cart.

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, pageSize)
Get a specified size page of items in a cart.

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, pageSize, sortParam)
Get a specified size, sorted page of items in a cart.

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, productFields, pageParam, pageSize, sortParam)
Get a specified size, sorted page of items filtered by product fields in a cart.

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, productFields, pageParam, pageSize, sortParam, currencyIsoCode)
Get a specified size, sorted page of items filtered by product fields in a cart.

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, productFields, pageParam, pageSize, sortParam, currencyIsoCode, includePromotions, includeCoupons)
Get a sorted page of items in a cart, including coupons and promotions.

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, productFields, pageParam, pageSize, sortParam, currencyIsoCode, includePromotions, includeCoupons, pageNumber)
Get a specific, sorted page of items in a cart, including coupons and promotions.

getCartPromotions(webstoreId, effectiveAccountId, activeCartOrId)
Get promotions for a cart.

getCartPromotions(webstoreId, effectiveAccountId, activeCartOrId, currencyIsoCode)
Get promotions for a cart in a specific currency.

getCartSummary(webstoreId, effectiveAccountId, activeCartOrId)
Get a cart.

getCartSummary(webstoreId, effectiveAccountId, activeCartOrId, currencyIsoCode)
Get a cart in a specific currency.

getOrCreateActiveCartSummary(webstoreId, effectiveAccountId, activeCartOrId)
Get a cart or create an active cart if one doesn't exist.

getOrCreateActiveCartSummary(webstoreId, effectiveAccountId, activeCartOrId, currencyIsoCode)
Get a cart in a specific currency, or create an active cart if one doesn't exist.

getProductCartItem(webstoreId, effectiveAccountId, activeCartOrId, productId, currencyIsoCode)
Get cart items of a specific product.

getProductCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageSize, pageNumber, currencyIsoCode)
Get the items in a cart, sorted by product ID.

makeCartPrimary(webstoreId, activeCartOrId, effectiveAccountId)
Make a secondary cart a primary cart.

preserveGuestCart(webstoreId, effectiveAccountId, activeCartOrId, currencyIsoCode)
Preserve cart contents when a guest logs in as an authenticated customer.

setCartMessagesVisibility(webstoreId, activeCartOrId, effectiveAccountId, messageVisibility)
Set the visibility for cart messages.

updateCartItem(webstoreId, effectiveAccountId, activeCartOrId, cartItemId, cartItem)
Update an item in a cart.

updateCartItem(webstoreId, effectiveAccountId, activeCartOrId, cartItemId, cartItem, currencyIsoCode)
Update an item in a cart of a specific currency.

upsertInventoryReservation(webstoreId, activeCartOrId, effectiveAccountId, cartInventoryReservationInput) (Pilot)
Create or update an inventory reservation.

`addItemToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItemInput, currencyIsoCode)`

Add an item to a cart of a specific currency.

API Version

57.0

Available to Guest Users

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItem addItemToCart(String webstoreId, String
effectiveAccountId, String activeCartOrId, ConnectApi.CartItemInput cartItemInput,
String currencyIsoCode)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value indicates a cart with a status that isn't `Closed` or `PendingDelete`.

cartItemInput
Type: `ConnectApi.CartItemInput`

A `ConnectApi.CartItemInput` object representing an item to add to the cart.

currencyIsoCode
Type: String

The currency ISO code of the cart.

Return Value

Type: `ConnectApi.CartItem`

Usage

Buyers with read access to carts can add, update, and delete items in carts.

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

addItemsToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItems)

Add a batch of up to 100 items to a cart.

API Version

49.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.BatchResult[] addItemsToCart(String webstoreId, String
effectiveAccountId, String activeCartOrId, List<ConnectApi.BatchInput> cartItems)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

cartItems
Type: List<`ConnectApi.BatchInput`>

The list can contain up to 100 `ConnectApi.BatchInput` objects. In the `ConnectApi.BatchInput` constructor, the input object must be `ConnectApi.CartItemInput`.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.CartItem` object.

The returned objects correspond to each of the input objects and are returned in the same order as the input objects.

The method call fails only if an error occurs that affects the entire operation (such as a parsing failure). If an individual object causes an error, the error is embedded within the `ConnectApi.BatchResult` list.

Usage

Buyers with read access to carts can add, update, and delete items in carts.

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

`addItemsToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItems, currencyIsoCode)`

Add a batch of up to 100 items to a cart of a specific currency.

API Version

57.0

Available to Guest Users

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.BatchResult[] addItemsToCart(String webstoreId, String effectiveAccountId, String activeCartOrId, List<ConnectApi.BatchInput> cartItems, String currencyIsoCode)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

cartItems
Type: List<`ConnectApi.BatchInput`>

The list can contain up to 100 `ConnectApi.BatchInput` objects. In the `ConnectApi.BatchInput` constructor, the input object must be `ConnectApi.CartItemInput`.

currencyIsoCode
Type: String

The currency ISO code of the cart.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.CartItem` object.

The returned objects correspond to each of the input objects and are returned in the same order as the input objects.

The method call fails only if an error occurs that affects the entire operation (such as a parsing failure). If an individual object causes an error, the error is embedded within the `ConnectApi.BatchResult` list.

Usage

Buyers with read access to carts can add, update, and delete items in carts.

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

addItemToCart(webstoreId, effectiveAccountId, activeCartOrId, cartItemInput)

Add an item to a cart.

API Version

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItem addItemToCart(String webstoreId, String
effectiveAccountId, String activeCartOrId, ConnectApi.CartItemInput cartItemInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

cartItemInput
Type: `ConnectApi.CartItemInput`

A `ConnectApi.CartItemInput` object representing an item to add to the cart.

Return Value

Type: `ConnectApi.CartItem`

Usage

Buyers with read access to carts can add, update, and delete items in carts.

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

applyCartCoupon(webstoreId, effectiveAccountId, activeCartOrId, cartCouponInput)

Apply a coupon to a cart.

API Version

54.0

Available to Guest Users

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartCouponCollection applyCartCoupon(String webstoreId, String effectiveAccountId, String activeCartOrId, ConnectApi.cartCouponInput cartCouponInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

cartCouponInput
Type: `ConnectApi.cartCouponInput`

Coupon code for the coupon.

Return Value

Type: `ConnectApi.CartCouponCollection`

applyCartCoupon(webstoreId, effectiveAccountId, activeCartOrId, cartCouponInput, currencyIsoCode)

Apply a coupon to a cart.

API Version

57.0

Available to Guest Users

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartCouponCollection applyCartCoupon(String webstoreId, String effectiveAccountId, String activeCartOrId, ConnectApi.cartCouponInput cartCouponInput, String currencyIsoCode)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value indicates a cart with a status that isn't `Closed` or `PendingDelete`.

cartCouponInput
Type: `ConnectApi.cartCouponInput`

Coupon code for the coupon.

currencyIsoCode
Type: String

Currency ISO code of the cart.

Return Value

Type: `ConnectApi.CartCouponCollection`

copyCartToWishlist(webstoreId, effectiveAccountId, activeCartOrId, cartToWishlistInput)

Copy the products from a cart to a wishlist.

API Version

50.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartToWishlistResult copyCartToWishlist(String webstoreId,
String effectiveAccountId, String activeCartOrId, ConnectApi.CartToWishlistInput
cartToWishlistInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

cartToWishlistInput
Type: `ConnectApi.CartToWishlistInput`

A `ConnectApi.CartToWishlistInput` object indicating the wishlist to copy products to.

Return Value

Type: `ConnectApi.CartToWishlistResult`

createCart(webstoreId, cart)

Create a cart.

API Version

49.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartSummary createCart(String webstoreId, ConnectApi.CartInput
cart)
```

Parameters

webstoreId
Type: String

ID of the webstore.

cart
Type: ConnectApi.CartInput

A ConnectApi.CartInput object representing a cart.

Return Value

Type: ConnectApi.CartSummary

Usage

Buyers with read access to carts can create and delete carts.

cloneCart(webstoreId, activeCartOrId, targetEffectiveAccountId, targetType)

Clones an existing cart to create a secondary, read-only cart to support Pay Now functionality.

API Version

60.0

Available to Guest Users

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartSummary cloneCart(String webstoreId, String activeCartOrId,
String targetEffectiveAccountId, String targetType)
```

Parameters

webstoreId
Type: String

ID of the webstore.

activeCartOrId
Type: String

ID of the cart, active, or current. The current value is available in version 50.0 and later and indicates a cart with a status that isn't Closed or PendingDelete.

targetEffectiveAccountId
Type: String

Effective Account ID associated with the cloned cart.

targetType
Type: String

Type of the cloned cart. Value is `PayNowReadOnly`.

Return Value

Type: `ConnectApi.CartSummary` on page 1917

Usage

The cloneCart method is valid only for the Pay Now feature. See Salesforce Pay Now for Embedded Payment Solutions.

deleteCart(webstoreId, effectiveAccountId, activeCartOrId)

Delete a cart.

API Version

49.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static Void deleteCart(String webstoreId, String effectiveAccountId, String activeCartOrId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

Return Value

Type: Void

Usage

Buyers with read access to carts can create and delete carts.

deleteCartCoupon(webstoreId, effectiveAccountId, activeCartOrId, cartCouponId)

Delete a coupon from a cart.

API Version

54.0

Available to Guest Users

57.0

Requires Chatter

No

Signature

```
public static Void deleteCartCoupon(String webstoreId, String effectiveAccountId, String activeCartOrId, String cartCouponId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

cartCouponId
Type: String

ID of the cart coupon.

Return Value

Type: Void

deleteCartCoupon(webstoreId, effectiveAccountId, activeCartOrId, cartCouponId, currencyIsoCode)

Delete a coupon from a cart.

API Version

57.0

Available to Guest Users

57.0

Requires Chatter

No

Signature

```
public static Void deleteCartCoupon(String webstoreId, String effectiveAccountId, String activeCartOrId, String cartCouponId, String currencyIsoCode)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value indicates a cart with a status that isn't `Closed` or `PendingDelete`.

cartCouponId
Type: String

ID of the cart coupon.

currencyIsoCode
Type: String

Currency ISO code of the cart.

Return Value

Type: Void

deleteCartItem(webstoreId, effectiveAccountId, activeCartOrId, cartItemId)

Delete an item from a cart.

API Version

49.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static Void deleteCartItem(String webstoreId, String effectiveAccountId, String activeCartOrId, String cartItemId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

cartItemId
Type: String

ID of the cart item.

Return Value

Type: Void

Usage

Buyers with read access to carts can add, update, and delete items in carts.

`deleteInventoryReservation(webstoreId, activeCartOrId, effectiveAccountId)` (Pilot)

Delete an inventory reservation.

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

Return Value

Type: ConnectApi.CartItemCollection

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam)

Get a page of items in a cart.

API Version

49.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String pageParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: ConnectApi.CartItemCollection

`getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, sortParam)`

Get a sorted page of items in a cart.

API Version

49.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String pageParam, ConnectApi.CartItemSortOrder sortParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

sortParam
Type: `ConnectApi.CartItemSortOrder`

Sort order for items in a cart. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `NameAsc`—Sorts by name in ascending alphabetical order (A–Z).
- `NameDesc`—Sorts by name in descending alphabetical order (Z–A).

- `SalesPriceAsc`—Sorts from lowest to highest negotiated price.
- `SalesPriceDesc`—Sorts from highest to lowest negotiated price.

If `null`, the default is `CreatedDateDesc`.

Return Value

Type: `ConnectApi.CartItemCollection`

`getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, pageSize)`

Get a specified size page of items in a cart.

API Version

49.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String pageParam, Integer pageSize)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

`effectiveAccountId`
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

`activeCartOrId`
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

`pageParam`
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.CartItemCollection`

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageParam, pageSize, sortParam)

Get a specified size, sorted page of items in a cart.

API Version

49.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String pageParam, Integer pageSize, ConnectApi.CartItemSortOrder sortParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.CartItemSortOrder`

Sort order for items in a cart. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `NameAsc`—Sorts by name in ascending alphabetical order (A–Z).
- `NameDesc`—Sorts by name in descending alphabetical order (Z–A).
- `SalesPriceAsc`—Sorts from lowest to highest negotiated price.
- `SalesPriceDesc`—Sorts from highest to lowest negotiated price.

If `null`, the default is `CreatedDateDesc`.

Return Value

Type: `ConnectApi.CartItemCollection`

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, productFields, pageParam, pageSize, sortParam)

Get a specified size, sorted page of items filtered by product fields in a cart.

API Version

49.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String productFields, String pageParam, Integer pageSize, ConnectApi.CartItemSortOrder sortParam)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

productFields
Type: String

Comma-separated list of up to five product fields. Results include fields that you have access to. Some product fields (such as `productName` and `sku`) are returned even when not included in the *productFields* parameter.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.CartItemSortOrder`

Sort order for items in a cart. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `NameAsc`—Sorts by name in ascending alphabetical order (A–Z).
- `NameDesc`—Sorts by name in descending alphabetical order (Z–A).
- `SalesPriceAsc`—Sorts from lowest to highest negotiated price.
- `SalesPriceDesc`—Sorts from highest to lowest negotiated price.

If `null`, the default is `CreatedDateDesc`.

Return Value

Type: `ConnectApi.CartItemCollection`

`getCartItems(webstoreId, effectiveAccountId, activeCartOrId, productFields, pageParam, pageSize, sortParam, currencyIsoCode)`

Get a specified size, sorted page of items filtered by product fields in a cart.

Available to Guest Users

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String productFields, String pageParam, Integer pageSize, ConnectApi.CartItemSortOrder sortParam, String currencyIsoCode)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

productFields
Type: String

Comma-separated list of up to five product fields. Results include fields that you have access to. Some product fields (such as `productName` and `sku`) are returned even when not included in the *productFields* parameter.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

currencyIsoCode
Type: String

Currency ISO code of the cart.

Return Value

Type: `ConnectApi.CartItemCollection`

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, productFields, pageParam, pageSize, sortParam, currencyIsoCode, includePromotions, includeCoupons)

Get a sorted page of items in a cart, including coupons and promotions.

API Version

59.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String productFields, String pageParam, Integer pageSize, ConnectApi.CartItemSortOrder sortParam, String currencyIsoCode, Boolean includePromotions, Boolean includeCoupons)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

productFields
Type: String

Comma-separated list of up to five product fields. Results include fields that you have access to. Some product fields (such as `productName` and `sku`) are returned even when not included in the *`productFields`* parameter.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

includePromotions
Type: Boolean

Indicates whether to include coupons (`True`) or not (`False`)

includeCoupons
Type: Boolean

Indicates whether to include promotions (`True`) or not (`False`).

Return Value

Type: `ConnectApi.CartItemCollection`

getCartItems(webstoreId, effectiveAccountId, activeCartOrId, productFields, pageParam, pageSize, sortParam, currencyIsoCode, includePromotions, includeCoupons, pageNumber)

Get a specific, sorted page of items in a cart, including coupons and promotions.

API Version

60.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItemCollection getCartItems(String webstoreId, String effectiveAccountId, String activeCartOrId, String productFields, String pageParam, Integer pageSize, ConnectApi.CartItemSortOrder sortParam, String currencyIsoCode, Boolean includePromotions, Boolean includeCoupons, Integer pageNumber)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

`productFields`
Type: String

Comma-separated list of up to five product fields. Results include fields that you have access to. Some product fields (such as `productName` and `sku`) are returned even when not included in the *`productFields`* parameter.

`pageParam`
Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Description

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.CartItemSortOrder`

Sort order for items in a cart. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `NameAsc`—Sorts by name in ascending alphabetical order (A–Z).
- `NameDesc`—Sorts by name in descending alphabetical order (Z–A).
- `SalesPriceAsc`—Sorts from lowest to highest negotiated price.
- `SalesPriceDesc`—Sorts from highest to lowest negotiated price.

If `null`, the default is `CreatedDateDesc`.

`includePromotions`
Type: Boolean

Indicates whether to include coupons (`True`) or not (`False`)

`includeCoupons`
Type: Boolean

Indicates whether to include promotions (`True`) or not (`False`).

`pageNumber`
Type: Integer

Specifies the requested page number.

Return Value

Type: `ConnectApi.CartItemCollection`

`getCartPromotions(webstoreId, effectiveAccountId, activeCartOrId)`

Get promotions for a cart.

API Version

53.0

Available to Guest Users

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartPromotionCollection getCartPromotions(String webstoreId,
String effectiveAccountId, String activeCartOrId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value indicates a cart with a status that isn't `Closed` or `PendingDelete`.

Return Value

Type: `ConnectApi.CartPromotionCollection`

`getCartPromotions(webstoreId, effectiveAccountId, activeCartOrId, currencyIsoCode)`

Get promotions for a cart in a specific currency.

API Version

57.0

Available to Guest Users

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartPromotionCollection getCartPromotions(String webstoreId,
String effectiveAccountId, String activeCartOrId, String currencyIsoCode)

49.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartSummary getCartSummary(String webstoreId, String
effectiveAccountId, String activeCartOrId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`. If you specify `active` and there isn't an active cart, you get an error.

Return Value

Type: `ConnectApi.CartSummary`

getCartSummary(webstoreId, effectiveAccountId, activeCartOrId, currencyIsoCode)

Get a cart in a specific currency.

API Version

57.0

Available to Guest Users

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartSummary getCartSummary(String webstoreId, String
effectiveAccountId, String activeCartOrId, String currencyIsoCode)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`. If you specify `active` and there isn't an active cart, you get an error.

currencyIsoCode
Type: String

Currency ISO code of the cart.

Return Value

Type: `ConnectApi.CartSummary`

getOrCreateActiveCartSummary(webstoreId, effectiveAccountId, activeCartOrId)

Get a cart or create an active cart if one doesn't exist.

API Version

49.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartSummary getOrCreateActiveCartSummary(String webstoreId,
String effectiveAccountId, String activeCartOrId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`. If you specify `active` and there isn't an active cart, one is created.

Return Value

Type: `ConnectApi.CartSummary`

Usage

Buyers with read access to carts can create and delete carts.

getOrCreateActiveCartSummary(webstoreId, effectiveAccountId, activeCartOrId, currencyIsoCode)

Get a cart in a specific currency, or create an active cart if one doesn't exist.

API Version

57.0

Available to Guest Users

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartSummary getOrCreateActiveCartSummary(String webstoreId,
String effectiveAccountId, String activeCartOrId, String currencyIsoCode)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`. If you specify `active` and there isn't an active cart, one is created.

currencyIsoCode
Type: String

Currency ISO code of the cart.

Return Value

Type: `ConnectApi.CartSummary`

Usage

Buyers with read access to carts can create and delete carts.

getProductCartItem(webstoreId, effectiveAccountId, activeCartOrId, productId, currencyIsoCode)

Get cart items of a specific product.

API Version

60.0

Available to Guest Users

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductCartItem getProductCartItem(String webstoreId, String effectiveAccountId, String activeCartOrId, String productId, String currencyIsoCode)
```

Parameters

effectiveAccountId
: Type: String

  ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.

currencyIsoCode
: Type: String

  Currency ISO code of the cart.

Return Value

Type: ConnectApi.ProductCartItem on page 2118

getProductCartItems(webstoreId, effectiveAccountId, activeCartOrId, pageSize, pageNumber, currencyIsoCode)

Get the items in a cart, sorted by product ID.

API Version

60.0

Available to Guest Users

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductCartItemCollection getProductCartItems(String webstoreId,
String effectiveAccountId, String activeCartOrId, Integer pageSize, Integer pageNumber,
String currencyIsoCode)
```

Parameters

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 25.

pageNumber
Type: Integer

Specifies the requested page number.

currencyIsoCode
Type: String

Currency ISO code of the cart.

Return Value

Type: `ConnectApi.ProductCartItemCollection` on page 2118

makeCartPrimary(webstoreId, activeCartOrId, effectiveAccountId)

Make a secondary cart a primary cart.

API Version

53.0

Available to Guest Users

56.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommerceActionResult makeCartPrimary(String webstoreId, String activeCartOrId, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

Return Value

Type: `ConnectApi.CommerceActionResult`

preserveGuestCart(webstoreId, effectiveAccountId, activeCartOrId, currencyIsoCode)

Preserve cart contents when a guest logs in as an authenticated customer.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.PreserveCart preserveGuestCart(String webstoreId, String effectiveAccountId, String activeCartOrId, String currencyIsoCode)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

currencyIsoCode
Type: String

The currency ISO code of the cart.

Return Value

Type: `ConnectApi.PreserveCart` on page 2112

setCartMessagesVisibility(webstoreId, activeCartOrId, effectiveAccountId, messageVisibility)

Set the visibility for cart messages.

API Version

50.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartMessagesVisibilityResult setCartMessagesVisibility(String webstoreId, String activeCartOrId, String effectiveAccountId, ConnectApi.CartMessagesVisibilityInput messageVisibility)
```

Parameters

webstoreId
Type: String

ID of the webstore.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

messageVisibility
Type: ConnectApi.CartMessagesVisibilityInput

A ConnectApi.CartMessagesVisibilityInput object specifying the visibility setting.

Return Value

Type: ConnectApi.CartMessagesVisibilityResult

updateCartItem(webstoreId, effectiveAccountId, activeCartOrId, cartItemId, cartItem)

Update an item in a cart.

API Version

49.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItem updateCartItem(String webstoreId, String effectiveAccountId, String activeCartOrId, String cartItemId, ConnectApi.CartItemInput cartItem)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, active, or current. The current value is available in version 50.0 and later and indicates a cart with a status that isn't Closed or PendingDelete.

cartItemId
Type: String

ID of the cart item.

cartItem
Type: ConnectApi.CartItemInput

A ConnectApi.CartItemInput object representing a cart item to update.

Return Value

Type: ConnectApi.CartItem

Usage

Buyers with read access to carts can add, update, and delete items in carts.

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

updateCartItem(webstoreId, effectiveAccountId, activeCartOrId, cartItemId, cartItem, currencyIsoCode)

Update an item in a cart of a specific currency.

API Version

57.0

Available to Guest Users

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CartItem updateCartItem(String webstoreId, String
effectiveAccountId, String activeCartOrId, String cartItemId, ConnectApi.CartItemInput
cartItem, String currencyIsoCode)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If null, the default value is determined from context.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value is available in version 50.0 and later and indicates a cart with a status that isn't `Closed` or `PendingDelete`.

`cartItemId`
Type: String

ID of the cart item.

`cartItem`
Type: `ConnectApi.CartItemInput`

A `ConnectApi.CartItemInput` object representing a cart item to update.

`currencyIsoCode`
Type: String

The currency ISO code of the cart.

Return Value

Type: `ConnectApi.CartItem`

Usage

Buyers with read access to carts can add, update, and delete items in carts.

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

`upsertInventoryReservation(webstoreId, activeCartOrId, effectiveAccountId, cartInventoryReservationInput)` (Pilot)

Create or update an inventory reservation.

Note: This feature is not generally available and is being piloted with certain Customers subject to additional terms and conditions. It is not part of your purchased Services. Signature

```
public static ConnectApi.CartInventoryReservationOutputRepresentation
upsertInventoryReservation(String webstoreId, String activeCartOrId, String
```

```
effectiveAccountId, ConnectApi.CartInventoryReservationInputRepresentation
cartInventoryReservationInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

activeCartOrId
Type: String

ID of the cart, `active`, or `current`. The `current` value indicates a cart with a status that isn't `Closed` or `PendingDelete`.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

cartInventoryReservationInput
Type: `ConnectApi.CartInventoryReservationInputRepresentation`

A `ConnectApi.CartInventoryReservationInputRepresentation` input class indicating the reservation duration.

Return Value

Type: `ConnectApi.CartInventoryReservationOutputRepresentation`

CommerceCatalog Class

Get products, product categories, and product category paths.

Namespace

ConnectApi

CommerceCatalog Methods

These methods are for `CommerceCatalog`. All methods are static.

IN THIS SECTION:

getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory)

Get a product.

getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo)

Get a product with variation and attribute information.

getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo, excludeQuantityRule)

Get a product with quantity rule information.

getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo, excludeQuantityRule, excludeProductSellingModels)
Get detailed information for a product, optionally including information about its product selling models.

getProduct(webstoreId, productId, effectiveAccountId, fields, mediaGroups, excludeFields, excludeMedia, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo, excludeQuantityRule, excludeProductSellingModels)
Get detailed information for a product without its entitlement information.

getProductCategory(webstoreId, productCategoryId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia)
Get a product category.

getProductCategoryChildren(webstoreId, effectiveAccountId, parentProductCategoryId, fields, excludeFields, mediaGroups, excludeMedia)
Get product categories.

getProductCategoryPath(webstoreId, productCategoryId)
Get the product category path from the root category to the current category.

getProductChildCollection(webstoreId, productId, effectiveAccountId, fields, mediaGroups, excludeFields, excludeMedia, excludeAttributeSetInfo, excludeQuantityRule, pageToken, pageSize)
Get a collection of child products related to a parent product.

getProducts(webstoreId, effectiveAccountId, ids, skus, fields, excludeMedia, excludePrices)
Get fields, prices, and default images for a list of products.

getProducts(webstoreId, effectiveAccountId, ids, skus, fields, excludeMedia)
Get fields and default images for a list of products.

`getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory)`

Get a product.

API Version

49.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductDetail getProduct(String webstoreId, String productId,
String effectiveAccountId, List<String> fields, Boolean excludeFields, List<String>
mediaGroups, Boolean excludeMedia, Boolean excludeEntitlementDetails, Boolean
excludePrimaryProductCategory)
```

Parameters

webstoreId
Type: String

ID of the webstore.

productId
Type: String

ID of the product.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

fields
Type: List<String>

Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

excludeFields
Type: Boolean

Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

mediaGroups
Type: List<String>

Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

excludeMedia
Type: Boolean

Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeEntitlementDetails
Type: Boolean

Specifies whether the entitlement details of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludePrimaryProductCategory
Type: Boolean

Specifies whether the primary category path of the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

Return Value

Type: `ConnectApi.ProductDetail`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

`getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo)`

Get a product with variation and attribute information.

API Version

50.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductDetail getProduct(String webstoreId, String productId, String effectiveAccountId, List<String> fields, Boolean excludeFields, List<String> mediaGroups, Boolean excludeMedia, Boolean excludeEntitlementDetails, Boolean excludePrimaryProductCategory, Boolean excludeVariationInfo, Boolean excludeAttributeSetInfo)
```

Parameters

webstoreId
Type: String

ID of the webstore.

productId
Type: String

ID of the product.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

fields
Type: List<String>

Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

excludeFields
Type: Boolean

Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

mediaGroups
Type: List<String>

Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

excludeMedia
Type: Boolean

Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeEntitlementDetails
Type: Boolean

Specifies whether the entitlement details of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludePrimaryProductCategory
Type: Boolean

Specifies whether the primary category path of the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeVariationInfo
Type: Boolean

Specifies whether the variation information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeAttributeSetInfo
Type: Boolean

Specifies whether the attribute set information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

Return Value

Type: `ConnectApi.ProductDetail`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo, excludeQuantityRule)

Get a product with quantity rule information.

API Version

52.0

Available to Guest Users

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductDetail getProduct(String webstoreId, String productId,
String effectiveAccountId, List<String> fields, Boolean excludeFields, List<String>
mediaGroups, Boolean excludeMedia, Boolean excludeEntitlementDetails, Boolean
excludePrimaryProductCategory, Boolean excludeVariationInfo, Boolean
excludeAttributeSetInfo, Boolean excludeQuantityRule)
```

Parameters

webstoreId
Type: String

ID of the webstore.

productId
Type: String

ID of the product.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

fields
Type: List<String>

Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

excludeFields
Type: Boolean

Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

mediaGroups
Type: List<String>

Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

excludeMedia
Type: Boolean

Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeEntitlementDetails
Type: Boolean

Specifies whether the entitlement details of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludePrimaryProductCategory
Type: Boolean

Specifies whether the primary category path of the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeVariationInfo
Type: Boolean

Specifies whether the variation information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeAttributeSetInfo
Type: Boolean

Specifies whether the attribute set information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeQuantityRule
Type: Boolean

Specifies whether the quantity rule information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

Return Value

Type: `ConnectApi.ProductDetail`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

getProduct(webstoreId, productId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia, excludeEntitlementDetails, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo, excludeQuantityRule, excludeProductSellingModels)

Get detailed information for a product, optionally including information about its product selling models.

API Version

56.0

Available to Guest Users

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductDetail getProduct(String webstoreId, String productId,
String effectiveAccountId, List<String> fields, Boolean excludeFields, List<String>
mediaGroups, Boolean excludeMedia, Boolean excludeEntitlementDetails, Boolean
excludePrimaryProductCategory, Boolean excludeVariationInfo, Boolean
```

```
excludeAttributeSetInfo, Boolean excludeQuantityRule, Boolean
excludeProductSellingModels)
```

Parameters

webstoreId
Type: String

ID of the webstore.

productId
Type: String

ID of the product.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

fields
Type: List<String>

Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

excludeFields
Type: Boolean

Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

mediaGroups
Type: List<String>

Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

excludeMedia
Type: Boolean

Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeEntitlementDetails
Type: Boolean

Specifies whether the entitlement details of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludePrimaryProductCategory
Type: Boolean

Specifies whether the primary category path of the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeVariationInfo
Type: Boolean

Specifies whether the variation information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeAttributeSetInfo
Type: Boolean

Specifies whether the attribute set information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeQuantityRule
Type: Boolean

Specifies whether the quantity rule information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeProductSellingModels
Type: Boolean

Specifies whether product selling models are returned or not. The behavior of this parameter depends on whether you turn on the CommerceSubscription permission. If the permission is on, and if you set the parameter to `false` (or if you omit the parameter), product selling models are returned. If the permission is on, and if you set the parameter to `true`, product selling models are not returned. If the permission is off, product selling models are not returned, regardless of whether you omit the parameter or provide a value.

Return Value

Type: `ConnectApi.ProductDetail`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

getProduct(webstoreId, productId, effectiveAccountId, fields, mediaGroups, excludeFields, excludeMedia, excludePrimaryProductCategory, excludeVariationInfo, excludeAttributeSetInfo, excludeQuantityRule, excludeProductSellingModels)

Get detailed information for a product without its entitlement information.

API Version

57.0

Available to Guest Users

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductDetail getProduct(String webstoreId, String productId,
String effectiveAccountId, List<String> fields, List<String> mediaGroups, Boolean
excludeFields, Boolean excludeMedia, Boolean excludePrimaryProductCategory, Boolean
excludeVariationInfo, Boolean excludeAttributeSetInfo, Boolean excludeQuantityRule,
Boolean excludeProductSellingModels)
```

Parameters

webstoreId
Type: String

ID of the webstore.

productId
Type: String

ID of the product.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

fields
Type: List<String>

Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

mediaGroups
Type: List<String>

Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

excludeFields
Type: Boolean

Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeMedia
Type: Boolean

Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludePrimaryProductCategory
Type: Boolean

Specifies whether the primary category path of the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeVariationInfo
Type: Boolean

Specifies whether the variation information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeAttributeSetInfo
Type: Boolean

Specifies whether the attribute set information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeQuantityRule
Type: Boolean

Specifies whether the quantity rule information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeProductSellingModels
Type: Boolean

Specifies whether product selling models are returned or not. The behavior of this parameter depends on whether you turn on the CommerceSubscription permission. If the permission is on, and if you set the parameter to `false` (or if you omit the parameter), product selling models are returned. If the permission is on, and if you set the parameter to `true`, product selling models are not returned. If the permission is off, product selling models are not returned, regardless of whether you omit the parameter or provide a value.

Return Value

Type: `ConnectApi.ProductDetail`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

getProductCategory(webstoreId, productCategoryId, effectiveAccountId, fields, excludeFields, mediaGroups, excludeMedia)

Get a product category.

API Version

49.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductCategoryDetail getProductCategory(String webstoreId,
String productCategoryId, String effectiveAccountId, List<String> fields, Boolean
excludeFields, List<String> mediaGroups, Boolean excludeMedia)
```

Parameters

webstoreId
Type: String

ID of the webstore.

productCategoryId
Type: String

ID of the product category.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

fields
Type: List<String>

Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

excludeFields
Type: Boolean

Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

mediaGroups
Type: List<String>

Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

excludeMedia
Type: Boolean

Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

Return Value

Type: `ConnectApi.ProductCategoryDetail`

`getProductCategoryChildren(webstoreId, effectiveAccountId, parentProductCategoryId, fields, excludeFields, mediaGroups, excludeMedia)`

Get product categories.

API Version

52.0

Available to Guest Users

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductCategoryDetailCollection
getProductCategoryChildren(String webstoreId, String effectiveAccountId, String
parentProductCategoryId, List<String> fields, Boolean excludeFields, List<String>
mediaGroups, Boolean excludeMedia)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

parentProductCategoryId
Type: String

ID of the product category for which you want to get all the children product categories. If `null`, returns all the top-level product categories for the store.

fields
Type: List<String>

Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

excludeFields
Type: Boolean

Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

mediaGroups
Type: List<String>

Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

excludeMedia
Type: Boolean

Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

Return Value

Type: `ConnectApi.ProductCategoryDetailCollection`

`getProductCategoryPath(webstoreId, productCategoryId)`

Get the product category path from the root category to the current category.

API Version

49.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductCategoryPath getProductCategoryPath(String webstoreId,
String productCategoryId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

productCategoryId
Type: String

ID of the product category.

Return Value

Type: `ConnectApi.ProductCategoryPath`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

getProductChildCollection(webstoreId, productId, effectiveAccountId, fields, mediaGroups, excludeFields, excludeMedia, excludeAttributeSetInfo, excludeQuantityRule, pageToken, pageSize)

Get a collection of child products related to a parent product.

API Version

57.0

Available to Guest Users

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductChildCollection getProductChildCollection(String
webstoreId, String productId, String effectiveAccountId, List<String> fields,
List<String> mediaGroups, Boolean excludeFields, Boolean excludeMedia, Boolean
excludeAttributeSetInfo, Boolean excludeQuantityRule, String pageToken, Integer pageSize)
```

Parameters

webstoreId
Type: String

ID of the webstore.

productId
Type: String

ID of the product.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.

fields
Type: List<String>

Comma-separated list of field names.

If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If `excludeFields` and `fields` are specified, the `excludeFields` parameter takes precedence.

mediaGroups
Type: List<String>

Comma-separated list of developer names of media group records.

If this list is empty or unspecified, all media groups are returned. If `excludeMedia` and `mediaGroups` are specified, the `excludeMedia` parameter takes precedence.

excludeFields
Type: Boolean

Specifies whether the fields are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeMedia
Type: Boolean

Specifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeAttributeSetInfo
Type: Boolean

Specifies whether the attribute set information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

excludeQuantityRule
Type: Boolean

Specifies whether the quantity rule information for the product is returned (`false`) or not (`true`). If unspecified, defaults to `false`.

pageToken
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 20.

Return Value

Type: `ConnectApi.ProductChildCollection`

`getProducts(webstoreId, effectiveAccountId, ids, skus, fields, excludeMedia, excludePrices)`

Get fields, prices, and default images for a list of products.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductOverviewCollection getProducts(String webstoreId, String effectiveAccountId, List<String> ids, List<String> skus, List<String> fields, Boolean excludeMedia, Boolean excludePrices)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.

ids
Type: List<String>

List of product IDs. Specify either a list of up to 20 product IDs or SKUs, but not both.

skus
Type: List<String>

List of SKUs. Specify either a list of up to 20 SKUs or product IDs, but not both.

fields
Type: List<String>

Comma-separated list of field names to return for each product. If the list is empty or not specified, all fields are returned. You can specify any number of fields.

excludeMedia
Type: Boolean

Specifies whether default images are returned for the products (`false`) or not (`true`). The default is `false`.

excludePrices
Type: Boolean

Specifies whether prices are returned for the products (`false`) or not (`true`). The default is `false`.

Note: In version 58.0 and later, prices aren't returned for products regardless of this parameter. To get pricing information for products in version 58.0 and later, use the CommerceStorePricing Class.

Return Value

Type: `ConnectApi.ProductOverviewCollection`

`getProducts(webstoreId, effectiveAccountId, ids, skus, fields, excludeMedia)`

Get fields and default images for a list of products.

API Version

58.0

Available to Guest Users

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductOverviewCollection getProducts(String webstoreId, String effectiveAccountId, List<String> ids, List<String> skus, List<String> fields, Boolean excludeMedia)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

ids
Type: List<String>

List of product IDs. Specify either a list of up to 20 product IDs or SKUs, but not both.

skus
Type: List<String>

List of SKUs. Specify either a list of up to 20 SKUs or product IDs, but not both.

fields
Type: List<String>

Comma-separated list of field names to return for each product. If the list is empty or not specified, all fields are returned. You can specify any number of fields.

excludeMedia
Type: Boolean

Specifies whether default images are returnedSpecifies whether the media groups and default images of the product are returned (`false`) or not (`true`). If unspecified, defaults to `false`.

Return Value

Type: `ConnectApi.ProductOverviewCollection`

CommercePromotions Class

Evaluate promotions for Commerce orders. Get coupon code redemption usage.

Namespace

ConnectApi

CommercePromotions Methods

The following are methods for `CommercePromotions`. All methods are static.

IN THIS SECTION:

decreaseRedemption(couponCodeRedemption)
Get coupon code redemption usage to revert a previously redeemed coupon code.

evaluate(salesTransaction)

Determine which promotions the customer is eligible for based on the store and buyer group, and compute the applicable price adjustments based on the coupons and the items in the cart. This API evaluates only the first 50 active manual promotions and first 50 active automatic promotions, based on priority. This API computes and returns applicable price adjustments, but it does not apply those adjustments to the webcart record. If you want to enable promotions based on shipping, contact Salesforce Customer Support.

increaseRedemption(couponCodeRedemption)

Get coupon code redemption addition (increase) usage.

`decreaseRedemption(couponCodeRedemption)`

Get coupon code redemption usage to revert a previously redeemed coupon code.

API Version

58.0

Available to Guest Users

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.CouponCodeRedemptionCollection
decreaseRedemption(ConnectApi.CouponCodeRedemptionInput couponCodeRedemption)
```

Parameters

couponCodeRedemption

Type: `ConnectApi.CouponCodeRedemptionInput` on page 1770

Tracks each coupon code redemption.

Return Value

Type: `ConnectApi.CouponCodeRedemptionCollection` on page 1967

`evaluate(salesTransaction)`

Determine which promotions the customer is eligible for based on the store and buyer group, and compute the applicable price adjustments based on the coupons and the items in the cart. This API evaluates only the first 50 active manual promotions and first 50 active automatic promotions, based on priority. This API computes and returns applicable price adjustments, but it does not apply those adjustments to the webcart record. If you want to enable promotions based on shipping, contact Salesforce Customer Support.

```
global static ConnectApi.PromotionEvaluation evaluate(ConnectApi.PromotionEvaluateInput
salesTransaction)
```

Parameters

salesTransaction
Type: ConnectApi.PromotionEvaluateInput

Find promotions that the customer is eligible for and compute their discounts.

Return Value

Type: ConnectApi.PromotionEvaluation

increaseRedemption(couponCodeRedemption)

Get coupon code redemption addition (increase) usage.

API Version

58.0

Available to Guest Users

58.0

Requires Chatter

Signature

```
public static ConnectApi.CouponCodeRedemptionCollection
increaseRedemption(ConnectApi.CouponCodeRedemptionInput couponCodeRedemption)
```

Parameters

couponCodeRedemption
Type: ConnectApi.CouponCodeRedemptionInput on page 1770

Tracks each coupon code redemption.

Return Value

Type: `ConnectApi.CouponCodeRedemptionCollection` on page 1967

CommerceSearch Class

Get sort rules for the live search index. Get product search suggestions. Search products.

Namespace

ConnectApi

CommerceSearch Methods

These methods are for `CommerceSearch`. All methods are static.

IN THIS SECTION:

getSortRules(webstoreId)
Get sort rules for the live index.

getSuggestions(webstoreId, effectiveAccountId, searchTerm, maxResults)
Get suggestions for product searches.

getSuggestions(webstoreId, effectiveAccountId, searchTerm, maxResults, includeSuggestedProducts, maxSuggestedProducts)
Get suggestions for product searches.

searchProducts(webstoreId, effectiveAccountId, productSearchInput)
Search products.

`getSortRules(webstoreId)`

Get sort rules for the live index.

API Version

52.0

Available to Guest Users

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.SortRulesCollection getSortRules(String webstoreId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

Return Value

Type: ConnectApi.SortRulesCollection

getSuggestions(webstoreId, effectiveAccountId, searchTerm, maxResults)

Get suggestions for product searches.

API Version

52.0

Available to Guest Users

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductSearchSuggestionsResults getSuggestions(String
webstoreId, String effectiveAccountId, String searchTerm, Integer maxResults)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

searchTerm
Type: String

Search term with up to 10 characters. If specified, the service returns autocomplete suggestions from the user's recent searches. If unspecified, the service returns suggestions from the user's recent searches.

maxResults
Type: Integer

Maximum number of suggestions. Values are from 1 through 10. If unspecified, defaults to 10.

Return Value

Type: `ConnectApi.ProductSearchSuggestionsResults`

`getSuggestions(webstoreId, effectiveAccountId, searchTerm, maxResults, includeSuggestedProducts, maxSuggestedProducts)`

Get suggestions for product searches.

API Version

58.0

Available to Guest Users

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductSearchSuggestionsResults getSuggestions(String
webstoreId, String effectiveAccountId, String searchTerm, Integer maxResults, Boolean
includeSuggestedProducts, Integer maxSuggestedProducts)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

`effectiveAccountId`
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

`searchTerm`
Type: String

Search term with up to 10 characters. If specified, the service returns autocomplete suggestions from the user's recent searches. If unspecified, the service returns suggestions from the user's recent searches.

`maxResults`
Type: Integer

Maximum number of suggestions. Values are from 1 through 10. If unspecified, defaults to 10.

`includeSuggestedProducts`
Type: Boolean

Specifies whether a search term returns product suggestions (`true`) or not (`false`). If unspecified, defaults to `false`. If `true`, the service returns the suggested product IDs.

maxSuggestedProducts
Type: String

Maximum number of product suggestions. Values are from 1 through 10. If unspecified, defaults to 4.

Return Value

Type: `ConnectApi.ProductSearchSuggestionsResults`

searchProducts(webstoreId, effectiveAccountId, productSearchInput)

Search products.

API Version

52.0

Available to Guest Users

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductSearchResults searchProducts(String webstoreId, String effectiveAccountId, ConnectApi.ProductSearchInput productSearchInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

productSearchInput
Type: `ConnectApi.ProductSearchInput`

A `ConnectApi.ProductSearchInput` body with either a category ID or search terms.

Return Value

Type: `ConnectApi.ProductSearchResults`

Usage

Searching products respects buyer View Product entitlements and only users entitled to view product data can access this resource.

CommerceSearchConnectFamily Class

Search products by search term or category in a webstore.

Namespace

ConnectApi

CommerceSearchConnectFamily Methods

The following are methods for `CommerceSearchConnectFamily`. All methods are static.

IN THIS SECTION:

searchProducts(webstoreId, searchTerm, categoryId, sortRuleId, grouping, fields, refinements, pageParam, pageSize, effectiveAccountId, includeQuantityRule)
Search products by search term or category in a webstore.

`searchProducts(webstoreId, searchTerm, categoryId, sortRuleId, grouping, fields, refinements, pageParam, pageSize, effectiveAccountId, includeQuantityRule)`

Search products by search term or category in a webstore.

API Version

58.0

Available to Guest Users

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommerceProductSearchResults searchProducts(String webstoreId, String searchTerm, String categoryId, String sortRuleId, String grouping, List<String> fields, String refinements, Integer pageParam, Integer pageSize, String effectiveAccountId, Boolean includeQuantityRule)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

searchTerm
Type: String

List of up to 32 space-separated search terms.

categoryId
Type: String

Category ID returns results for products in this category or its subcategories.

sortRuleId
Type: String

ID of the sort rule that specifies the order of products in the search results. If unspecified, the default sort type is relevancy.

grouping
Type: String

Grouping option for search results. If unspecified, the default is the value specified in **Search** > **Results Display Settings** > **Results Grouping**.

fields
Type: List<String>

Product fields to return in search results. Search results include fields you have access to.

refinements
Type: String

List up to nine refinements (facets) for search results. Buyers or shoppers can select up to 20 values for each refinement. The `refinements` parameter is encoded as a Base64 string from the JSON representation of ConnectApi.DistinctValueRefinementInput .

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 200. If unspecified, defaults to 20.

effectiveAccountId
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.

includeQuantityRule
Type: Boolean

Specifies whether to include purchase quantity rule information for products in search results (`true`) or not (`false`). If unspecified, defaults to `false`.

Return Value

Type: `ConnectApi.CommerceProductSearchResults`

Usage

Searching products respects buyer View Product entitlements and only users entitled to view product data can access this resource.

CommerceSearchSettings Class

Get indexes. Get index logs. Create an index of a product catalog.

Namespace

ConnectApi

CommerceSearchSettings Methods

These methods are for `CommerceSearchSettings`. All methods are static.

IN THIS SECTION:

createCommerceSearchIndex(webstoreId, indexBuildType)
Create an index of a product catalog.

getCommerceSearchIndex(webstoreId, indexId)
Get a Commerce search index.

getCommerceSearchIndexes(webstoreId)
Get Commerce search indexes.

getCommerceSearchIndexLogs(webstoreId)
Get Commerce search index logs.

`createCommerceSearchIndex(webstoreId, indexBuildType)`

Create an index of a product catalog.

API Version

57.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommerceSearchIndex postCommerceSearchIndex(String webstoreId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

indexBuildType
Type: `ConnectApi.CommerceSearchIndexBuildType`

Build type of the index. Values are:

- `Full`
- `Incremental`

Return Value

Type: `ConnectApi.CommerceSearchIndex`

Usage

This method creates a live index that replaces the current live index. Any indexes that are in progress are removed when you manually create an index with this method.

`getCommerceSearchIndex(webstoreId, indexId)`

Get a Commerce search index.

API Version

52.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommerceSearchIndex getSingleCommerceSearchIndex(String webstoreId, String indexId)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

`indexId`
Type: String

ID of the index.

Return Value

Type: `ConnectApi.CommerceSearchIndex`

`getCommerceSearchIndexes(webstoreId)`

Get Commerce search indexes.

API Version

52.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.CommerceSearchIndexCollection getCommerceSearchIndexes(String webstoreId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

Return Value

Type: ConnectApi.CommerceSearchIndexCollection

getCommerceSearchIndexLogs(webstoreId)

Get Commerce search index logs.

API Version

57.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommerceSearchIndexLogCollection getCommerceSearchIndexLogs(String webstoreId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

Return Value

Type: ConnectApi.CommerceSearchIndexLogCollection

CommerceStorePricing Class

Get product prices.

Namespace

ConnectApi

CommerceStorePricing Methods

These methods are for `CommerceStorePricing`. All methods are static.

IN THIS SECTION:

getProductPrice(webstoreId, productId, effectiveAccountId)
Get the list and buyer price for a product.

getProductPrice(webstoreId, productId, effectiveAccountId, productSellingModelIds)
Get a product's list and buyer price for specified product selling models.

getProductPrices(webstoreId, effectiveAccountId, pricingInput)
Get the prices for multiple products.

`getProductPrice(webstoreId, productId, effectiveAccountId)`

Get the list and buyer price for a product.

API Version

49.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductPrice getProductPrice(String webstoreId, String
productId, String effectiveAccountId)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

`productId`
Type: String

ID of the product.

`effectiveAccountId`
Type: String

ID of the buyer account or guest buyer profile for which the request is made.

Return Value

Type: `ConnectApi.ProductPrice`

Usage

This method respects buyer entitlements and only users entitled to view product and price data can access it.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper's locale and returns the appropriate values.

`getProductPrice(webstoreId, productId, effectiveAccountId, productSellingModelIds)`

Get a product's list and buyer price for specified product selling models.

API Version

56.0

Available to Guest Users

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductPrice getProductPrice(String webstoreId, String
productId, String effectiveAccountId, List<String> productSellingModelIds)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

`productId`
Type: String

ID of the product.

`effectiveAccountId`
Type: String

ID of the buyer account or guest buyer profile for which the request is made.

`productSellingModelIds`
Type: List<String>

List of product selling model IDs for the product.

Return Value

Type: `ConnectApi.ProductPrice`

`getProductPrices(webstoreId, effectiveAccountId, pricingInput)`

Get the prices for multiple products.

API Version

49.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.PricingResult getProductPrices(String webstoreId, String effectiveAccountId, ConnectApi.PricingInput pricingInput)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

`effectiveAccountId`
Type: String

ID of the buyer account or guest buyer profile for which the request is made. If `null`, the default value is determined from context.

`pricingInput`
Type: `ConnectApi.PricingInput`

A `ConnectApi.PricingInput` body with the list of line items to price.

Return Value

Type: `ConnectApi.PricingResult`

Usage

This method respects buyer entitlements and only users entitled to view product and price data can access it.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper's locale and returns the appropriate values.

CommerceWishlist Class

Get, create, update, and delete wishlists. Add wishlists to carts. Get wishlist items, add items to wishlists, and delete wishlist items.

Namespace

ConnectApi

CommerceWishlist Methods

These methods are for `CommerceWishlist`. All methods are static.

IN THIS SECTION:

addItemToWishlist(webstoreId, wishlistId, wishlistItemInput)
Add an item to a wishlist for the context user.

addItemToWishlist(webstoreId, effectiveAccountId, wishlistId, wishlistItemInput)
Add an item to a wishlist.

addWishlistToCart(webstoreId, wishlistId)
Add a wishlist to the active cart for the context user.

addWishlistToCart(webstoreId, wishlistId, effectiveAccountId)
Add a wishlist to the active cart.

addWishlistToCartWithCartId(webstoreId, wishlistId, cartId)
Add a wishlist to a cart.

addWishlistToCartWithCartId(webstoreId, wishlistId, cartId, effectiveAccountId)
Add a wishlist to a cart.

createWishlist(webstoreId, wishlistInput)
Create a wishlist for the context user.

createWishlist(webstoreId, effectiveAccountId, wishlistInput)
Create a wishlist.

deleteWishlist(webstoreId, wishlistId)
Delete a wishlist for the context user.

deleteWishlist(webstoreId, effectiveAccountId, wishlistId)
Delete a wishlist.

getWishlist(webstoreId, effectiveAccountId, wishlistId, productFields, sortItemsBy)
Get a wishlist with product fields sorted by items.

getWishlist(webstoreId, effectiveAccountId, wishlistId, productFields, pageSize, sortItemsBy)
Get a wishlist with product fields sorted by items with a specified number of items per page.

getWishlistItems(webstoreId, effectiveAccountId, wishlistId, productFields, pageParam, sortItemsBy)
Get a page of sorted wishlist items with product fields.

getWishlistItems(webstoreId, effectiveAccountId, wishlistId, productFields, pageParam, pageSize, sortItemsBy)
Get a page of specified size of sorted wishlist items with product fields.

getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList)
Get wishlist summaries.

getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList, productFields, sortItemsBy)
Get wishlist summaries with product fields sorted by items.

getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList, productFields, pageSize, sortItemsBy)
Get wishlist summaries with product fields sorted by items with a specified number of items per page.

removeWishlistItem(webstoreId, effectiveAccountId, wishlistId, wishlistItemId)
Remove an item from a wishlist.

updateWishlist(webstoreId, wishlistId, wishlistUpdateInput)
Update the name of a wishlist for the context user.

updateWishlist(webstoreId, effectiveAccountId, wishlistId, wishlistUpdateInput)
Update the name of a wishlist.

`addItemToWishlist(webstoreId, wishlistId, wishlistItemInput)`

Add an item to a wishlist for the context user.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistItem addItemToWishlist(String webstoreId, String
wishlistId, ConnectApi.WishlistItemInput wishlistItemInput)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

`wishlistId`
Type: String

ID of the wishlist.

`wishlistItemInput`
Type: `ConnectApi.WishlistItemInput`

A `ConnectApi.WishlistItemInput` body with the item to add to the wishlist.

Return Value

Type: `ConnectApi.WishlistItem`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

addItemToWishlist(webstoreId, effectiveAccountId, wishlistId, wishlistItemInput)

Add an item to a wishlist.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistItem addItemToWishlist(String webstoreId, String effectiveAccountId, String wishlistId, ConnectApi.WishlistItemInput wishlistItemInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

wishlistId
Type: String

ID of the wishlist.

wishlistItemInput
Type: `ConnectApi.WishlistItemInput`

A `ConnectApi.WishlistItemInput` body with the item to add to the wishlist.

Return Value

Type: `ConnectApi.WishlistItem`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

addWishlistToCart(webstoreId, wishlistId)

Add a wishlist to the active cart for the context user.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistToCartResult addWishlistToCart(String webstoreId,
String wishlistId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

wishlistId
Type: String

ID of the wishlist.

Return Value

Type: `ConnectApi.WishlistToCartResult`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

addWishlistToCart(webstoreId, wishlistId, effectiveAccountId)

Add a wishlist to the active cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistToCartResult addWishlistToCart(String webstoreId,
String wishlistId, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

wishlistId
Type: String

ID of the wishlist.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: `ConnectApi.WishlistToCartResult`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

addWishlistToCartWithCartId(webstoreId, wishlistId, cartId)

Add a wishlist to a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistToCartResult addWishlistToCartWithCartId(String
webstoreId, String wishlistId, String cartId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

wishlistId
Type: String

ID of the wishlist.

cartId
Type: String

ID of the cart. If `null`, wishlist items are added to the active cart.

Return Value

Type: `ConnectApi.WishlistToCartResult`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

addWishlistToCartWithCartId(webstoreId, wishlistId, cartId, effectiveAccountId)

Add a wishlist to a cart.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistToCartResult addWishlistToCartWithCartId(String webstoreId, String wishlistId, String cartId, String effectiveAccountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

wishlistId
Type: String

ID of the wishlist.

cartId
Type: String

ID of the cart. If `null`, wishlist items are added to the active cart.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

Return Value

Type: `ConnectApi.WishlistToCartResult`

Usage

This method respects buyer View Product entitlements and only users entitled to view product data can access it.

createWishlist(webstoreId, wishlistInput)

Create a wishlist for the context user.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.Wishlist createWishlist(String webstoreId,
ConnectApi.WishlistInput wishlistInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

wishlistInput
Type: ConnectApi.WishlistInput

A `ConnectApi.WishlistInput` body that includes the wishlist name and items.

Return Value

Type: ConnectApi.Wishlist

createWishlist(webstoreId, effectiveAccountId, wishlistInput)

Create a wishlist.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.Wishlist createWishlist(String webstoreId, String
effectiveAccountId, ConnectApi.WishlistInput wishlistInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

wishlistInput
Type: `ConnectApi.WishlistInput`

A `ConnectApi.WishlistInput` body that includes the wishlist name and items.

Return Value

Type: `ConnectApi.Wishlist`

deleteWishlist(webstoreId, wishlistId)

Delete a wishlist for the context user.

API Version

49.0

Requires Chatter

No

Signature

```
public static Void deleteWishlist(String webstoreId, String wishlistId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

wishlistId
Type: String

ID of the wishlist.

Return Value

Type: Void

deleteWishlist(webstoreId, effectiveAccountId, wishlistId)

Delete a wishlist.

API Version

51.0

Requires Chatter

No

Signature

```
public static Void deleteWishlist(String webstoreId, String effectiveAccountId, String wishlistId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

wishlistId
Type: String

ID of the wishlist.

Return Value

Type: Void

getWishlist(webstoreId, effectiveAccountId, wishlistId, productFields, sortItemsBy)

Get a wishlist with product fields sorted by items.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Wishlist getWishlist(String webstoreId, String effectiveAccountId, String wishlistId, String productFields, ConnectApi.WishlistItemSortOrder sortItemsBy)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

wishlistId
Type: String

ID of the wishlist.

productFields
Type: String

Comma-separated list of custom product fields. Fields aren't case-sensitive. For example, `ProductCode` and `productcode` return the same results.

sortItemsBy
Type: `ConnectApi.WishlistItemSortOrder`

Sort order for wishlist items. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.

The default sort order is `CreatedDateDesc`.

Return Value

Type: `ConnectApi.Wishlist`

`getWishlist(webstoreId, effectiveAccountId, wishlistId, productFields, pageSize, sortItemsBy)`

Get a wishlist with product fields sorted by items with a specified number of items per page.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Wishlist getWishlist(String webstoreId, String
effectiveAccountId, String wishlistId, String productFields, Integer pageSize,
ConnectApi.WishlistItemSortOrder sortItemsBy)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

wishlistId
Type: String

ID of the wishlist.

productFields
Type: String

Comma-separated list of custom product fields. Fields aren't case-sensitive. For example, `ProductCode` and `productcode` return the same results.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortItemsBy
Type: `ConnectApi.WishlistItemSortOrder`

Sort order for wishlist items. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.

The default sort order is `CreatedDateDesc`.

Return Value

Type: `ConnectApi.Wishlist`

`getWishlistItems(webstoreId, effectiveAccountId, wishlistId, productFields, pageParam, sortItemsBy)`

Get a page of sorted wishlist items with product fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistItemCollection getWishlistItems(String webstoreId,
String effectiveAccountId, String wishlistId, String productFields, String pageParam,
ConnectApi.WishlistItemSortOrder sortItemsBy)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

wishlistId
Type: String

ID of the wishlist.

productFields
Type: String

Comma-separated list of custom product fields. Fields aren't case-sensitive. For example, `ProductCode` and `productcode` return the same results.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

sortItemsBy
Type: `ConnectApi.WishlistItemSortOrder`

Sort order for wishlist items. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.

The default sort order is `CreatedDateDesc`.

Return Value

Type: `ConnectApi.WishlistItemCollection`

`getWishlistItems(webstoreId, effectiveAccountId, wishlistId, productFields, pageParam, pageSize, sortItemsBy)`

Get a page of specified size of sorted wishlist items with product fields.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistItemCollection getWishlistItems(String webstoreId,
String effectiveAccountId, String wishlistId, String productFields, String pageParam,
Integer pageSize, ConnectApi.WishlistItemSortOrder sortItemsBy)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

wishlistId
Type: String

ID of the wishlist.

productFields
Type: String

Comma-separated list of custom product fields. Fields aren't case-sensitive. For example, `ProductCode` and `productcode` return the same results.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 200. If you pass in `null`, the default size is 25.

sortItemsBy
Type: `ConnectApi.WishlistItemSortOrder`

Sort order for wishlist items. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.

The default sort order is `CreatedDateDesc`.

Return Value

Type: `ConnectApi.WishlistItemCollection`

getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList)

Get wishlist summaries.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistsSummary getWishlistSummaries(String webstoreId, String effectiveAccountId, Boolean includeDisplayedList)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

includeDisplayedList
Type: Boolean

Specifies whether to include the displayed list (`true`) or not (`false`). If `null`, defaults to `false`.

Return Value

Type: `ConnectApi.WishlistsSummary`

getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList, productFields, sortItemsBy)

Get wishlist summaries with product fields sorted by items.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistsSummary getWishlistSummaries(String webstoreId, String effectiveAccountId, Boolean includeDisplayedList, String productFields, ConnectApi.WishlistItemSortOrder sortItemsBy)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

includeDisplayedList
Type: Boolean

Specifies whether to include the displayed list (`true`) or not (`false`).

productFields
Type: String

Comma-separated list of custom product fields. Fields aren't case-sensitive. For example, `ProductCode` and `productcode` return the same results.

If *includeDisplayedList* is `false`, *productFields* is ignored.

sortItemsBy
Type: `ConnectApi.WishlistItemSortOrder`

Sort order for wishlist items. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.

The default sort order is `CreatedDateDesc`.

If *includeDisplayedList* is `false`, *sortItemsBy* is ignored.

Return Value

Type: `ConnectApi.WishlistsSummary`

getWishlistSummaries(webstoreId, effectiveAccountId, includeDisplayedList, productFields, pageSize, sortItemsBy)

Get wishlist summaries with product fields sorted by items with a specified number of items per page.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistsSummary getWishlistSummaries(String webstoreId, String effectiveAccountId, Boolean includeDisplayedList, Integer pageSize, String productFields, pageSize, ConnectApi.WishlistItemSortOrder sortItemsBy)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

includeDisplayedList
Type: Boolean

Specifies whether to include the displayed list (`true`) or not (`false`).

productFields
Type: String

Comma-separated list of custom product fields. Fields aren't case-sensitive. For example, `ProductCode` and `productcode` return the same results.

If *includeDisplayedList* is `false`, *productFields* is ignored.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortItemsBy
Type: `ConnectApi.WishlistItemSortOrder`

Sort order for wishlist items. Values are:

- `CreatedDateAsc`—Sorts by oldest creation date.
- `CreatedDateDesc`—Sorts by most recent creation date.

The default sort order is `CreatedDateDesc`.

If *includeDisplayedList* is `false`, *sortItemsBy* is ignored.

Return Value

Type: `ConnectApi.WishlistsSummary`

removeWishlistItem(webstoreId, effectiveAccountId, wishlistId, wishlistItemId)

Remove an item from a wishlist.

API Version

49.0

Requires Chatter

No

Signature

```
public static Void removeWishlistItem(String webstoreId, String effectiveAccountId,
String wishlistId, String wishlistItemId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If `null`, defaults to the account ID for the context user.

wishlistId
Type: String

ID of the wishlist.

wishlistItemId
Type: String

ID of the wishlist item to remove.

Return Value

Type: Void

updateWishlist(webstoreId, wishlistId, wishlistUpdateInput)

Update the name of a wishlist for the context user.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistSummary updateWishlist(String webstoreId, String
wishlistId, ConnectApi.WishlistUpdateInput wishlistUpdateInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

wishlistId
Type: String

ID of the wishlist.

wishlistUpdateInput
Type: ConnectApi.WishlistUpdateInput

A ConnectApi.WishlistUpdateInput body with the wishlist name to update.

Return Value

Type: ConnectApi.WishlistSummary

updateWishlist(webstoreId, effectiveAccountId, wishlistId, wishlistUpdateInput)

Update the name of a wishlist.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.WishlistSummary updateWishlist(String webstoreId, String effectiveAccountId, String wishlistId, ConnectApi.WishlistUpdateInput wishlistUpdateInput)
```

Parameters

webstoreId
Type: String

ID of the webstore.

effectiveAccountId
Type: String

ID of the account for which the request is made. If null, defaults to the account ID for the context user.

wishlistId
Type: String

ID of the wishlist.

wishlistUpdateInput
Type: ConnectApi.WishlistUpdateInput

A ConnectApi.WishlistUpdateInput body with the wishlist name to update.

Return Value

Type: ConnectApi.WishlistSummary

Communities Class

Get information about Experience Cloud sites in your org.

Namespace

ConnectApi

Communities Methods

The following are methods for Communities. All methods are static.

IN THIS SECTION:

getCommunities()
Get a list of Experience Cloud sites that the context user has access to.

getCommunities(communityStatus)
Get a list of Experience Cloud sites with the specified status that the context user has access to.

getCommunity(communityId)
Get information about an Experience Cloud site.

getCommunities()

Get a list of Experience Cloud sites that the context user has access to.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommunityPage getCommunities()
```

Return Value

Type: ConnectApi.CommunityPage

getCommunities(communityStatus)

Get a list of Experience Cloud sites with the specified status that the context user has access to.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommunityPage getCommunities(ConnectApi.CommunityStatus
communityStatus)
```

Parameters

communityStatus
Type: `ConnectApi.CommunityStatus`

communityStatus—Status of the Experience Cloud site. Values are:

- `Live`
- `Inactive`
- `UnderConstruction`

Return Value

Type: `ConnectApi.CommunityPage`

getCommunity(communityId)

Get information about an Experience Cloud site.

API Version

28.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.Community getCommunity(String communityId)
```

Parameters

communityId
Type: String

ID of an Experience Cloud site. You can't specify `null` or `internal`.

Return Value

Type: `ConnectApi.Community`

CommunityModeration Class

Get information about flagged feed items and comments in an Experience Cloud site. Add and remove flags from comments and feed items.

Namespace

ConnectApi

CommunityModeration Methods

The following are methods for `CommunityModeration`. All methods are static.

IN THIS SECTION:

addFlagToComment(communityId, commentId)
Add a moderation flag to a comment.

addFlagToComment(communityId, commentId, visibility)
Add a moderation flag of the specified visibility to a comment.

addFlagToComment(communityId, commentId, type)
Add a moderation flag of the specified type to a comment.

addFlagToComment(communityId, commentId, note)
Add a moderation flag with a note to a comment.

addFlagToComment(communityId, commentId, type, note)
Add a moderation flag of the specified type with a note to a comment.

addFlagToComment(communityId, commentId, type, visibility)
Add a moderation flag of the specified type and visibility to a comment.

addFlagToComment(communityId, commentId, visibility, note)
Add a moderation flag of the specified visibility with a note to a comment.

addFlagToComment(communityId, commentId, type, visibility, note)
Add a moderation flag of the specified type and visibility with a note to a comment.

addFlagToFeedElement(communityId, feedElementId)
Add a moderation flag to a feed element.

addFlagToFeedElement(communityId, feedElementId, visibility)
Add a moderation flag of the specified visibility to a feed element.

addFlagToFeedElement(communityId, feedElementId, type)
Add a moderation flag of the specified type to a feed element.

addFlagToFeedElement(communityId, feedElementId, note)
Add a moderation flag with a note to a feed element.

addFlagToFeedElement(communityId, feedElementId, type, note)
Add a moderation flag of the specified type with a note to a feed element.

addFlagToFeedElement(communityId, feedElementId, type, visibility)
Add a moderation flag of the specified type and visibility to a feed element.

addFlagToFeedElement(communityId, feedElementId, visibility, note)
Add a moderation flag of the specified visibility with a note to a feed element.

addFlagToFeedElement(communityId, feedElementId, type, visibility, note)
Add a moderation flag of the specified type and visibility with a note to a feed element.

getFlagsOnComment(communityId, commentId)
Get the moderation flags on a comment.

getFlagsOnComment(communityId, commentId, visibility)
Get the moderation flags with specified visibility on a comment.

getFlagsOnComment(communityId, commentId, pageSize, pageParam)
Get a page of moderation flags on a comment.

getFlagsOnComment(communityId, commentId, visibility, pageSize, pageParam)
Get a page of moderation flags with specified visibility on a comment.

getFlagsOnFeedElement(communityId, feedElementId)
Get the moderation flags on a feed element.

getFlagsOnFeedElement(communityId, feedElementId, visibility)
Get the moderation flags with specified visibility on a feed element.

getFlagsOnFeedElement(communityId, feedElementId, pageParam, pageSize)
Get a page of moderation flags on a feed element.

getFlagsOnFeedElement(communityId, feedElementId, visibility, pageSize, pageParam)
Get a page of moderation flags with specified visibility on a feed element.

removeFlagFromComment(communityId, commentId, userId)
Remove a moderation flag from a comment.

removeFlagFromFeedElement(communityId, feedElementId, userId)
Remove a moderation flag from a feed element.

`addFlagToComment(communityId, commentId)`

Add a moderation flag to a comment.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToComment(communityId, commentId, visibility)

Add a moderation flag of the specified visibility to a comment.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToComment(communityId, commentId, type)

Add a moderation flag of the specified type to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String
commentId, ConnectApi.CommunityFlagType type)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

type
Type: `ConnectApi.CommunityFlagType`

Type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

`addFlagToComment(communityId, commentId, note)`

Add a moderation flag with a note to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, String note)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`commentId`
Type: String

ID for a comment.

`note`
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToComment(communityId, commentId, type, note)

Add a moderation flag of the specified type with a note to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagType type, String note)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

type
Type: `ConnectApi.CommunityFlagType`

Type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToComment(communityId, commentId, type, visibility)

Add a moderation flag of the specified type and visibility to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagType type, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

type
Type: `ConnectApi.CommunityFlagType`

Type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

`addFlagToComment(communityId, commentId, visibility, note)`

Add a moderation flag of the specified visibility with a note to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagVisibility visibility, String note)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

`addFlagToComment(communityId, commentId, type, visibility, note)`

Add a moderation flag of the specified type and visibility with a note to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagType type, ConnectApi.CommunityFlagVisibility visibility, String note)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

type
Type: `ConnectApi.CommunityFlagType`

Type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, Allow members to flag content must be selected for an Experience Cloud site.

`addFlagToFeedElement(communityId, feedElementId)`

Add a moderation flag to a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: `ConnectApi.ModerationCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedElement(communityId, feedElementId, visibility)

Add a moderation flag of the specified visibility to a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

`addFlagToFeedElement(communityId, feedElementId, type)`

Add a moderation flag of the specified type to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagType type)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

type
Type: `ConnectApi.CommunityFlagType`

Type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedElement(communityId, feedElementId, note)

Add a moderation flag with a note to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, String note)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: ConnectApi.ModerationCapability

Usage

To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedElement(communityId, feedElementId, type, note)

Add a moderation flag of the specified type with a note to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagType type, String note)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

type
Type: ConnectApi.CommunityFlagType

Type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: ConnectApi.ModerationCapability

Usage

To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedElement(communityId, feedElementId, type, visibility)

Add a moderation flag of the specified type and visibility to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagType type,
ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

type
Type: `ConnectApi.CommunityFlagType`

Type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedElement(communityId, feedElementId, visibility, note)

Add a moderation flag of the specified visibility with a note to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility, String note)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedElement(communityId, feedElementId, type, visibility, note)

Add a moderation flag of the specified type and visibility with a note to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagType type,
ConnectApi.CommunityFlagVisibility visibility, String note)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

type
Type: `ConnectApi.CommunityFlagType`

Type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, Allow members to flag content must be selected for an Experience Cloud site.

getFlagsOnComment(communityId, commentId)

Get the moderation flags on a comment.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String commentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

getFlagsOnComment(communityId, commentId, visibility)

Get the moderation flags with specified visibility on a comment.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String commentId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`getFlagsOnComment(communityId, commentId, pageSize, pageParam)`

Get a page of moderation flags on a comment.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String commentId, Integer pageSize, String pageParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

getFlagsOnComment(communityId, commentId, visibility, pageSize, pageParam)

Get a page of moderation flags with specified visibility on a comment.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String commentId, ConnectApi.CommunityFlagVisibility visibility, Integer pageSize, String pageParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

visibility
Type: ConnectApi.CommunityFlagVisibility

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: ConnectApi.ModerationFlags

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

getFlagsOnFeedElement(communityId, feedElementId)

Get the moderation flags on a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: `ConnectApi.ModerationCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`getFlagsOnFeedElement(communityId, feedElementId, visibility)`

Get the moderation flags with specified visibility on a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`
Type: String

ID of the feed element.

`visibility`
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

getFlagsOnFeedElement(communityId, feedElementId, pageParam, pageSize)

Get a page of moderation flags on a feed element.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId, String pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

Return Value

Type: `ConnectApi.ModerationCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`getFlagsOnFeedElement(communityId, feedElementId, visibility, pageSize, pageParam)`

Get a page of moderation flags with specified visibility on a feed element.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId, String feedElementId, ConnectApi.CommunityFlagVisibility visibility, Integer pageSize, String pageParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: `ConnectApi.ModerationCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

removeFlagFromComment(communityId, commentId, userId)

Remove a moderation flag from a comment.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags removeFlagFromComment(String communityId,
String commentId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

userId
Type: String

ID of the context user for whom the flag is removed. Specify `null` to remove the flag for all users.

Return Value

Type: Void

Usage

To remove a moderation flag, the context user must have added the flag or must have the Moderate Experiences Feeds permission.

removeFlagFromFeedElement(communityId, feedElementId, userId)

Remove a moderation flag from a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static void removeFlagFromFeedElement(String communityId, String feedElementId,
String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

userId
Type: String

ID of the context user for whom the flag is removed. Specify `null` to remove the flag for all users.

Return Value

Type: `ConnectApi.ModerationCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To remove a moderation flag, the context user must have added the flag or must have the Moderate Experiences Feeds permission.

Retired CommunityModeration Methods

The following methods for `CommunityModeration` are retired.

IN THIS SECTION:

addFlagToFeedItem(communityId, feedItemId)
Add a moderation flag to a feed item.

addFlagToFeedItem(communityId, feedItemId, visibility)
Add a moderation flag with specified visibility to a feed item.

getFlagsOnFeedItem(communityId, feedItemId)
Get the moderation flags on a feed item.

getFlagsOnFeedItem(communityId, feedItemId, visibility)
Get the moderation flags with specified visibility on a feed item.

removeFlagsOnFeedItem(communityId, feedItemId, userId)
Remove a moderation flag from a feed item.

addFlagToFeedItem(communityId, feedItemId)

Add a moderation flag to a feed item.

API Version

29.0–31.0

Important: In version 32.0 and later, use addFlagToFeedElement(communityId, feedElementId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToFeedItem(String communityId, String feedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a feed item, Allow members to flag content must be selected for an Experience Cloud site.

addFlagToFeedItem(communityId, feedItemId, visibility)

Add a moderation flag with specified visibility to a feed item.

API Version

30.0–31.0

Important: In version 32.0 and later, use addFlagToFeedElement(communityId, feedElementId, visibility).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToFeedItem(String communityId, String feedItemId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a feed item, Allow members to flag content must be selected for an Experience Cloud site.

`getFlagsOnFeedItem(communityId, feedItemId)`

Get the moderation flags on a feed item.

API Version

29.0–31.0

Important: In version 32.0 and later, use getFlagsOnFeedElement(communityId, feedElementId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnFeedItem(String communityId, String feedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`getFlagsOnFeedItem(communityId, feedItemId, visibility)`

Get the moderation flags with specified visibility on a feed item.

API Version

30.0–31.0

Important: In version 32.0 and later, use getFlagsOnFeedElement(communityId, feedElementId, visibility).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnFeedItem(String communityId, String feedItemId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types. Values are:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.

- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`removeFlagsOnFeedItem(communityId, feedItemId, userId)`

Remove a moderation flag from a feed item.

API Version

29.0–31.0

Important: In version 32.0 and later, use removeFlagFromFeedElement(communityId, feedElementId, userId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags removeFlagsOnFeedItem(String communityId,
String feedItemId, String userId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedItemId`
Type: String

ID for a feed item.

`userId`
Type: String

ID of the context user for whom the flag is removed. Specify `null` to remove the flag for all users.

Return Value

Type: Void

Usage

To remove a moderation flag, the context user must have added the flag or must have the Moderate Experiences Feeds permission.

ContentHub Class

Access Files Connect repositories and their files and folders.

Namespace

ConnectApi

ContentHub Methods

The following are methods for `ContentHub`. All methods are static.

Use `ContentHub` methods to work with Files Connect repositories.

IN THIS SECTION:

addRepositoryItem(repositoryId, repositoryFolderId, file)
Add a repository item.

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)
Add a repository item in an Experience Cloud site.

addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)
Add a repository item, including the binary file.

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)
Add a repository item, including the binary file, in an Experience Cloud site.

getAllowedItemTypes(repositoryId, repositoryFolderId)
Get the item types that the context user is allowed to create in the repository folder.

getAllowedItemTypes(repositoryId, repositoryFolderId, filter)
Get the item types, filtered by type, that the context user is allowed to create in the repository folder.

getAllowedItemTypes(communityId, repositoryId, repositoryFolderId)
Get the item types that the context user is allowed to create in the repository folder in an Experience Cloud site.

getAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter)
Get the item types, filtered by type, that the context user is allowed to create in the repository folder in an Experience Cloud site.

getFilePreview(repositoryId, repositoryFileId, formatType)
Get a repository file preview.

getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)
Get a page or page range of a repository file preview.

getFilePreview(communityId, repositoryId, repositoryFileId, formatType)
Get a repository file preview in an Experience Cloud site.

getFilePreview(communityId, repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)
Get a page or page range of a repository file preview in an Experience Cloud site.

getItemType(repositoryId, repositoryItemTypeId)
Get information about an item type associated with a repository.

getItemType(communityId, repositoryId, repositoryItemTypeId)
Get information about an item type associated with a repository in an Experience Cloud site.

getPreviews(repositoryId, repositoryFileId)
Get information about a repository file's supported previews.

getPreviews(communityId, repositoryId, repositoryFileId)
Get information about a repository file's supported previews in an Experience Cloud site.

getRepositories()
Get a list of repositories.

getRepositories(communityId)
Get a list of repositories in an Experience Cloud site.

getRepositories(pageParam, pageSize)
Get a page of repositories.

getRepositories(communityId, pageParam, pageSize)
Get a page of repositories in an Experience Cloud site.

getRepository(repositoryId)
Get a repository.

getRepository(communityId, repositoryId)
Get a repository in an Experience Cloud site.

getRepositoryFile(repositoryId, repositoryFileId)
Get a repository file.

getRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)
Get a repository file with or without permissions information.

getRepositoryFile(communityId, repositoryId, repositoryFileId)
Get a repository file in an Experience Cloud site.

getRepositoryFile(communityId, repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)
Get a repository file with or without permissions information in an Experience Cloud site.

getRepositoryFolder(repositoryId, repositoryFolderId)
Get a repository folder.

getRepositoryFolder(communityId, repositoryId, repositoryFolderId)
Get a repository folder in an Experience Cloud site.

getRepositoryFolderItems(repositoryId, repositoryFolderId)
Get repository folder items.

getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId)
Get repository folder items in an Experience Cloud site.

getRepositoryFolderItems(repositoryId, repositoryFolderId, pageParam, pageSize)
Get a page of repository folder items.

getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize)
Get a page of repository folder items in an Experience Cloud site.

updateRepositoryFile(repositoryId, repositoryFileId, file)
Update the name of a repository file.

updateRepositoryFile(repositoryId, repositoryFileId, file, fileData)
Update the content of a repository file.

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file)
Update the name of a repository file in an Experience Cloud site.

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData)
Update the content of a repository file in an Experience Cloud site.

addRepositoryItem(repositoryId, repositoryFolderId, file)

Add a repository item.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file)
```

Parameters

repositoryId
Type: String
The ID of the repository.

repositoryFolderId
Type: String
The ID of the repository folder.

file
Type: ConnectApi.ContentHubItemInput
The item type ID and fields of the item type.

Return Value

Type: ConnectApi.RepositoryFolderItem

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example creates a file without binary content (metadata only) in a Google Drive repository folder. After the file is created, we show the file's ID, name, description, external URL, and download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs';

final ConnectApi.ContentHubItemInput newItem = new ConnectApi.ContentHubItemInput();
newItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
for creation/update
newItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
final ConnectApi.ContentHubFieldValueInput fieldValueInput = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInput.name = 'name';
fieldValueInput.value = 'new folder item name.txt';
newItem.fields.add(fieldValueInput);

//Metadata: description field
final ConnectApi.ContentHubFieldValueInput fieldValueInputDesc = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputDesc.name = 'description';
fieldValueInputDesc.value = 'It does describe it';
newItem.fields.add(fieldValueInputDesc);

final ConnectApi.RepositoryFolderItem newFolderItem =
ConnectApi.ContentHub.addRepositoryItem(gDriveRepositoryId, gDriveFolderId, newItem);
final ConnectApi.RepositoryFileSummary newFile = newFolderItem.file;
System.debug(String.format('New file - id: \'\'{0}\'\', name: \'\'{1}\'\', description:
\'\'{2}\'\' \n external URL: \'\'{3}\'\', download URL: \'\'{4}\'\'', new String[]{
newFile.id, newFile.name, newFile.description, newFile.externalDocumentUrl,
newFile.downloadUrl}));
```

SEE ALSO:

setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, result)

Apex Developer Guide: Testing ConnectApi Code

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)

Add a repository item in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String communityId,
String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

Return Value

Type: `ConnectApi.RepositoryFolderItem`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, result)

Apex Developer Guide: Testing ConnectApi Code

`addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)`

Add a repository item, including the binary file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput
fileData)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: ConnectApi.ContentHubItemInput

The item type ID and fields of the item type.

fileData
Type: ConnectApi.BinaryInput

The binary file.

Return Value

Type: ConnectApi.RepositoryFolderItem

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example creates a file with binary content and metadata in a Google Drive repository folder. After the file is created, we show the file's ID, name, description, external URL, and download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs';

final ConnectApi.ContentHubItemInput newItem = new ConnectApi.ContentHubItemInput();
newItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
for creation/update
newItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
Final String newFileName = 'new folder item name.txt';
final ConnectApi.ContentHubFieldValueInput fieldValueInput = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInput.name = 'name';
fieldValueInput.value = newFileName;
newItem.fields.add(fieldValueInput);
```

```
//Metadata: description field
final ConnectApi.ContentHubFieldValueInput fieldValueInputDesc = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputDesc.name = 'description';
fieldValueInputDesc.value = 'It does describe it';
newItem.fields.add(fieldValueInputDesc);

//Binary content
final Blob newFileBlob = Blob.valueOf('awesome content for brand new file');
final String newFileMimeType = 'text/plain';
final ConnectApi.BinaryInput fileBinaryInput = new ConnectApi.BinaryInput(newFileBlob,
newFileMimeType, newFileName);

final ConnectApi.RepositoryFolderItem newFolderItem =
ConnectApi.ContentHub.addRepositoryItem(gDriveRepositoryId, gDriveFolderId, newItem,
fileBinaryInput);
final ConnectApi.RepositoryFileSummary newFile = newFolderItem.file;
System.debug(String.format('New file - id: \'\'{0}\'\', name: \'\'{1}\'\', description:
\'\'{2}\'\' \n external URL: \'\'{3}\'\', download URL: \'\'{4}\'\'', new String[]{
newFile.id, newFile.name, newFile.description, newFile.externalDocumentUrl,
newFile.downloadUrl}));
```

SEE ALSO:

setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, fileData, result)

Apex Developer Guide: Testing ConnectApi Code

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)

Add a repository item, including the binary file, in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String communityId,
String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file,
ConnectApi.BinaryInput fileData)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

fileData
Type: `ConnectApi.BinaryInput`

The binary file.

Return Value

Type: `ConnectApi.RepositoryFolderItem`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData, result)

Apex Developer Guide: Testing ConnectApi Code

`getAllowedItemTypes(repositoryId, repositoryFolderId)`

Get the item types that the context user is allowed to create in the repository folder.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String repositoryId, String repositoryFolderId)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: ConnectApi.ContentHubAllowedItemTypeCollection

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, result)

Apex Developer Guide: Testing ConnectApi Code

`getAllowedItemTypes(repositoryId, repositoryFolderId, filter)`

Get the item types, filtered by type, that the context user is allowed to create in the repository folder.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String
repositoryId, String repositoryFolderId, ConnectApi.ConnectContentHubItemType filter)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

filter
Type: ConnectApi.ContentHubItemType

Item types. Values are:

- Any—Includes files and folders.
- FilesOnly—Includes files only.
- FoldersOnly—Includes folders only.

Return Value

Type: ConnectApi.ContentHubAllowedItemTypeCollection

Usage

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

Example

This example calls getAllowedItemTypes(repositoryId, repositoryFolderId, ConnectApi.ContentHubItemType.FilesOnly) to get the first ConnectApi.ContentHubItemTypeSummary.id of a file. The context user can create allowed files in a repository folder in the external system.

```
final ConnectApi.ContentHubAllowedItemTypeCollection allowedItemTypesColl =
ConnectApi.ContentHub.getAllowedItemTypes(repositoryId, repositoryFolderId,
ConnectApi.ContentHubItemType.FilesOnly);
final List<ConnectApi.ContentHubItemTypeSummary> allowedItemTypes =
allowedItemTypesColl.allowedItemTypes;
string allowedFileItemTypeId = null;
if(allowedItemTypes.size() > 0){
   ConnectApi.ContentHubItemTypeSummary allowedItemTypeSummary = allowedItemTypes.get(0);

   allowedFileItemTypeId = allowedItemTypeSummary.id;
}
```

SEE ALSO:

setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, filter, result)

Apex Developer Guide: Testing ConnectApi Code

getAllowedItemTypes(communityId, repositoryId, repositoryFolderId)

Get the item types that the context user is allowed to create in the repository folder in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String communityId, String repositoryId, String repositoryFolderId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetAllowedItemTypes(communityId, repositoryId, repositoryFolderId, result)

Apex Developer Guide: Testing ConnectApi Code

`getAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter)`

Get the item types, filtered by type, that the context user is allowed to create in the repository folder in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String communityId, String repositoryId, String repositoryFolderId, ConnectApi.ConnectContentHubItemType filter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

filter
Type: `ConnectApi.ContentHubItemType`

Item types. Values are:

- `Any`—Includes files and folders.
- `FilesOnly`—Includes files only.
- `FoldersOnly`—Includes folders only.

Return Value

Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter, result)

Apex Developer Guide: Testing ConnectApi Code

`getFilePreview(repositoryId, repositoryFileId, formatType)`

Get a repository file preview.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String repositoryId, String
repositoryFileId, ConnectApi.FilePreviewFormat formatType)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: ConnectApi.FilePreviewFormat

Specifies the format of the file preview. Values are:

- `Jpg`—Preview format is JPG.
- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you're concerned that feature-rich SVG previews don't work in your org, choose alternative file previews. To use JPG file previews, enter *general* in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.

Return Value

Type: ConnectApi.FilePreview

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example calls `getFilePreview(repositoryId, repositoryFileId, ConnectApi.FilePreviewFormat.Thumbnail)` to get the thumbnail format preview along with its respective URL and number of thumbnail renditions. For each thumbnail format, we show every rendition URL available.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'document:1-zcA1BaeoQbo2_yNFiHCcK6QJTPmOke-kHFC4TYg3rk';final ConnectApi.FilePreview
filePreview =
ConnectApi.ContentHub.getFilePreview(gDriveRepositoryId, gDriveFileId,
ConnectApi.FilePreviewFormat.Thumbnail);System.debug(String.format('Preview - URL:
\'\'{0}\'\', format: \'\'{1}\'\', nbr of
renditions for this format: {2}', new String[]{ filePreview.url,
filePreview.format.name(),String.valueOf(filePreview.previewUrls.size())}));for(ConnectApi.FilePreviewUrl
 filePreviewUrl : filePreview.previewUrls){
```

```
    System.debug('-----> Rendition URL: ' + filePreviewUrl.previewUrl);
}
```

SEE ALSO:

setTestGetFilePreview(repositoryId, repositoryFileId, formatType, result)

Apex Developer Guide: Testing ConnectApi Code

`getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)`

Get a page or page range of a repository file preview.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType, Integer startPageNumber, Integer endPageNumber)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: `ConnectApi.FilePreviewFormat`

Specifies the format of the file preview. Values are:

- `Jpg`—Preview format is JPG.
- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you're concerned that feature-rich SVG previews don't work in your org, choose alternative file previews. To use JPG file previews, enter *general* in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.

startPageNumber
Type: Integer

The starting page number in the range of file preview URLs.

endPageNumber
Type: Integer

The ending page number in the range of file preview URLs.

Return Value

Type: `ConnectApi.FilePreview`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber, result)

`getFilePreview(communityId, repositoryId, repositoryFileId, formatType)`

Get a repository file preview in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String communityId, String
repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: `ConnectApi.FilePreviewFormat`

Specifies the format of the file preview. Values are:

- `Jpg`—Preview format is JPG.
- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you're concerned that feature-rich SVG previews don't work in your org, choose alternative file previews. To use JPG file previews, enter *general* in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.

Return Value

Type: `ConnectApi.FilePreview`

Usage

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: `ConnectApi.FilePreviewFormat`

Specifies the format of the file preview. Values are:

- `Jpg`—Preview format is JPG.
- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.

`getItemType(communityId, repositoryId, repositoryItemTypeId)`

Get information about an item type associated with a repository in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubItemTypeDetail getItemType(String communityId, String repositoryId, String repositoryItemTypeId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`repositoryId`
Type: String

The ID of the repository.

`repositoryItemTypeId`
Type: String

The ID of the repository item type.

Return Value

Type: `ConnectApi.ContentHubItemTypeDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetItemType(communityId, repositoryId, repositoryItemTypeId, result)

`getPreviews(repositoryId, repositoryFileId)`

Get information about a repository file's supported previews.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreviewCollection getPreviews(String repositoryId, String
repositoryFileId)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

Return Value

Type: `ConnectApi.FilePreviewCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets all supported preview formats and their respective URLs and number of renditions. For each supported preview format, we show every rendition URL available.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'document:1-zcA1BaeoQbo2_yNFiHCcK6QJTPmOke-kHFC4TYg3rk';
final ConnectApi.FilePreviewCollection previewsCollection =
ConnectApi.ContentHub.getPreviews(gDriveRepositoryId, gDriveFileId);
for(ConnectApi.FilePreview filePreview : previewsCollection.previews){
   System.debug(String.format('Preview - URL: \'\'{0}\'\', format: \'\'{1}\'\', nbr of
renditions for this format: {2}', new String[]{ filePreview.url,
filePreview.format.name(),String.valueOf(filePreview.previewUrls.size())}));
   for(ConnectApi.FilePreviewUrl filePreviewUrl : filePreview.previewUrls){
      System.debug('-----> Rendition URL: ' + filePreviewUrl.previewUrl);
```

```
        }
}
```

SEE ALSO:

setTestGetPreviews(repositoryId, repositoryFileId, result)

`getPreviews(communityId, repositoryId, repositoryFileId)`

Get information about a repository file's supported previews in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreviewCollection getPreviews(String communityId, String repositoryId, String repositoryFileId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

Return Value

Type: `ConnectApi.FilePreviewCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`getRepositories()`

Get a list of repositories.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepositoryCollection getRepositories()
```

Return Value

Type: `ConnectApi.ContentHubRepositoryCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets all repositories and gets the first SharePoint online repository found.

```
final string sharePointOnlineProviderType ='ContentHubSharepointOffice365';
final ConnectApi.ContentHubRepositoryCollection repositoryCollection =
ConnectApi.ContentHub.getRepositories();
ConnectApi.ContentHubRepository sharePointOnlineRepository = null;
for(ConnectApi.ContentHubRepository repository : repositoryCollection.repositories){
   if(sharePointOnlineProviderType.equalsIgnoreCase(repository.providerType.type)){
      sharePointOnlineRepository = repository;
      break;
```

```
    }
}
```

`getRepositories(pageParam, pageSize)`

Get a page of repositories.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepositoryCollection getRepositories(Integer pageParam, Integer pageSize)
```

Parameters

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

Return Value

Type: `ConnectApi.ContentHubRepositoryCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`getRepositoryFile(repositoryId, repositoryFileId)`

Get a repository file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail getRepositoryFile(String repositoryId,
String repositoryFileId)
```

Parameters

`repositoryId`
Type: String

The ID of the repository.

`repositoryFileId`
Type: String

The ID of the repository file.

Return Value

Type: `ConnectApi.RepositoryFileDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'file:0B0lTys1KmM3sTmxKNjVJbWZja00';
final ConnectApi.RepositoryFileDetail file =
ConnectApi.ContentHub.getRepositoryFile(gDriveRepositoryId, gDriveFileId);
System.debug(String.format('File - name: \'\'{0}\'\', size: {1}, external URL: \'\'{2}\'\',
 download URL: \'\'{3}\'\'',
   new String[]{ file.name, String.valueOf(file.contentSize), file.externalDocumentUrl,
file.downloadUrl}));
```

SEE ALSO:

setTestGetRepositoryFile(repositoryId, repositoryFileId, result)

getRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)

Get a repository file with or without permissions information.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail getRepositoryFile(String repositoryId,
String repositoryFileId, Boolean includeExternalFilePermissionsInfo)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

includeExternalFilePermissionsInfo
Type: Boolean

Specifies whether to include permission information, such as whether the file is shared and what are the available permission types.

Managing external file permissions is supported for Google Drive, SharePoint Online, and OneDrive for Business.

Return Value

Type: ConnectApi.RepositoryFileDetail

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'file:0B0lTys1KmM3sTmxKNjVJbWZja00';

final ConnectApi.RepositoryFileDetail file =
ConnectApi.ContentHub.getRepositoryFile(gDriveRepositoryId, gDriveFileId, true);
System.debug(String.format('File - name: \'\'{0}\'\', size: {1}, external URL: \'\'{2}\'\',
 download URL: \'\'{3}\'\'', new String[]{ file.name, String.valueOf(file.contentSize),
file.externalDocumentUrl, file.downloadUrl}));
final ConnectApi.ExternalFilePermissionInformation externalFilePermInfo =
file.externalFilePermissionInformation;

//permission types
final List<ConnectApi.ContentHubPermissionType> permissionTypes =
externalFilePermInfo.externalFilePermissionTypes;
for(ConnectApi.ContentHubPermissionType permissionType : permissionTypes){
   System.debug(String.format('Permission type - id: \'\'{0}\'\', label: \'\'{1}\'\'', new
 String[]{ permissionType.id, permissionType.label}));
}

//permission groups
final List<ConnectApi.RepositoryGroupSummary> groups =
externalFilePermInfo.repositoryPublicGroups;
for(ConnectApi.RepositoryGroupSummary ggroup : groups){
   System.debug(String.format('Group - id: \'\'{0}\'\', name: \'\'{1}\'\', type:
\'\'{2}\'\'', new String[]{ ggroup.id, ggroup.name, ggroup.type.name()}));
}
```

`getRepositoryFolderItems(repositoryId, repositoryFolderId)`

Get repository folder items.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItemsCollection getRepositoryFolderItems(String
repositoryId, String repositoryFolderId)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: ConnectApi.RepositoryFolderItemsCollection

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets the collection of items in a repository folder. For files, we show the file's name, size, external URL, and download URL. For folders, we show the folder's name, description, and external URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs';
final ConnectApi.RepositoryFolderItemsCollection folderItemsColl =
ConnectApi.ContentHub.getRepositoryFolderItems(gDriveRepositoryId,gDriveFolderId);
final List<ConnectApi.RepositoryFolderItem> folderItems = folderItemsColl.items;
System.debug('Number of items in repository folder: ' + folderItems.size());
for(ConnectApi.RepositoryFolderItem item : folderItems){
   ConnectApi.RepositoryFileSummary fileSummary = item.file;
   if(fileSummary != null){
      System.debug(String.format('File item - name: \'\'{0}\'\', size: {1}, external URL:
 \'\'{2}\'\', download URL: \'\'{3}\'\'', new String[]{ fileSummary.name,
String.valueOf(fileSummary.contentSize), fileSummary.externalDocumentUrl,
fileSummary.downloadUrl}));
      }else{
         ConnectApi.RepositoryFolderSummary folderSummary = item.folder;
         System.debug(String.format('Folder item - name: \'\'{0}\'\', description:
\'\'{1}\'\'',  new String[]{ folderSummary.name, folderSummary.description}));
      }
}
```
